| Received path trace, Transmitted path trace | <p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other routing device manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the routing device at the other end of the fiber. The transmitted path trace value is the message that this routing device transmits.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | extensive       |

| <b>Generation</b>        | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>detail extensive</b>            |
| <b>Flags</b>             | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | All levels                         |
| <b>VLAN-Tag</b>          | Rewrite profile applied to incoming or outgoing frames on the outer ( <b>Out</b> ) VLAN tag or for both the outer and inner ( <b>In</b> ) VLAN tags. <ul style="list-style-type: none"> <li>• <b>push</b>—An outer VLAN tag is pushed in front of the existing VLAN tag.</li> <li>• <b>pop</b>—The outer VLAN tag of the incoming frame is removed.</li> <li>• <b>swap</b>—The outer VLAN tag of the incoming frame is overwritten with the user specified VLAN tag information.</li> <li>• <b>push-pop</b>—An outer VLAN tag is pushed in front of the existing VLAN tag, and then removed.</li> <li>• <b>push-push</b>—Two VLAN tags are pushed in from the incoming frame.</li> <li>• <b>swap-push</b>—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame.</li> <li>• <b>swap-swap</b>—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user specified VLAN tag value.</li> <li>• <b>pop-swap</b>—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame.</li> <li>• <b>pop-pop</b>—Both the outer and inner VLAN tags of the incoming frame are removed.</li> </ul> | <b>brief detail extensive</b> none |

Table 127: show interfaces Fast Ethernet Output Fields (continued)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Level of Output              |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Demux:</b>                  | IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following: <ul style="list-style-type: none"> <li>Source Family Inet</li> <li>Destination Family Inet</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive none</b> |
| <b>Encapsulation</b>           | Encapsulation on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | All levels                   |
| <b>Protocol</b>                | Protocol family. Possible values are described in the “Protocol Field” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive none</b> |
| <b>MTU</b>                     | Maximum transmission unit size on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive none</b> |
| <b>Maximum labels</b>          | Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>detail extensive none</b> |
| <b>Traffic statistics</b>      | Number and rate of bytes and packets received and transmitted on the specified interface set. <ul style="list-style-type: none"> <li><b>Input bytes, Output bytes</b>—Number of bytes received and transmitted on the interface set</li> <li><b>Input packets, Output packets</b>—Number of packets received and transmitted on the interface set.</li> </ul>                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b>      |
| <b>IPv6 transit statistics</b> | Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>extensive</b>             |
| <b>Local statistics</b>        | Number and rate of bytes and packets destined to the routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>extensive</b>             |
| <b>Transit statistics</b>      | Number and rate of bytes and packets transiting the switch. <p><b>NOTE:</b> For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the <b>Output bytes</b> and <b>Output packets</b> interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.</p> | <b>extensive</b>             |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b>      |
| <b>Route Table</b>             | Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive none</b> |
| <b>Flags</b>                   | Information about protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive</b>      |
| <b>Donor interface</b>         | (Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive none</b> |

Table 127: show interfaces Fast Ethernet Output Fields (continued)

| Field Name                      | Field Description                                                                                                                                                                                    | Level of Output              |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Preferred source address</b> | (Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.                                        | <b>detail extensive none</b> |
| <b>Input Filters</b>            | Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.  | <b>detail extensive</b>      |
| <b>Output Filters</b>           | Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces. | <b>detail extensive</b>      |
| <b>Mac-Validate Failures</b>    | Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.                                           | <b>detail extensive none</b> |
| <b>Addresses, Flags</b>         | Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .                                                  | <b>detail extensive none</b> |
| <b>protocol-family</b>          | Protocol family configured on the logical interface. If the protocol is <b>inet</b> , the IP address of the interface is also displayed.                                                             | <b>brief</b>                 |
| <b>Flags</b>                    | Information about address flag (possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .                                                       | <b>detail extensive none</b> |
| <b>Destination</b>              | IP address of the remote side of the connection.                                                                                                                                                     | <b>detail extensive none</b> |
| <b>Local</b>                    | IP address of the logical interface.                                                                                                                                                                 | <b>detail extensive none</b> |
| <b>Broadcast</b>                | Broadcast address of the logical interface.                                                                                                                                                          | <b>detail extensive none</b> |
| <b>Generation</b>               | Unique number for use by Juniper Networks technical support only.                                                                                                                                    | <b>detail extensive</b>      |

## Sample Output

### show interfaces (Fast Ethernet)

```
user@host> show interfaces fe-0/0/0
```

```
Physical interface: fe-0/0/0, Enabled, Physical link is Up
Interface index: 128, SNMP ifIndex: 22
Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback: Disabled,
Source filtering: Disabled, Flow control: Enabled
Device flags   : Present Running
Interface flags: SNMP-Traps Internal: 0x4000
CoS queues    : 4 supported, 4 maximum usable queues
Current address: 00:00:5e:00:53:38, Hardware address: 00:00:5e:00:53:38
Last flapped  : 2006-01-20 14:50:58 PST (2w4d 00:44 ago)
Input rate    : 0 bps (0 pps)
Output rate   : 0 bps (0 pps)
Active alarms : None
Active defects : None
Logical interface fe-0/0/0.0 (Index 66) (SNMP ifIndex 198)
```

```

Flags: SNMP-Traps Encapsulation: ENET2
Protocol inet, MTU: 1500
  Flags: None
  Addresses, Flags: Is-Preferred Is-Primary
    Destination: 203.0.113/24, Local: 203.0.113.1, Broadcast: 203.0.113.255

```

### show interfaces brief (Fast Ethernet)

```
user@host> show interfaces fe-0/0/0 brief
```

```

Physical interface: fe-0/0/0, Enabled, Physical link is Up
Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback: Disabled,
Source filtering: Disabled, Flow control: Enabled
Device flags   : Present Running
Interface flags: SNMP-Traps Internal: 0x4000
Logical interface fe-0/0/0.0
  Flags: SNMP-Traps Encapsulation: ENET2
  inet 203.0.113.1/24

```

### show interfaces detail (Fast Ethernet)

```
user@host> show interfaces fe-0/0/0 detail
```

```

Physical interface: fe-0/0/0, Enabled, Physical link is Up
Interface index: 128, SNMP ifIndex: 22, Generation: 5391
Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback: Disabled,
Source filtering: Disabled, Flow control: Enabled
Device flags   : Present Running
Interface flags: SNMP-Traps Internal: 0x4000
CoS queues     : 4 supported, 4 maximum usable queues
Hold-times     : Up 0 ms, Down 0 ms
Current address: 00:00:5e:00:53:38, Hardware address: 00:00:5e:00:53:3f:38
Last flapped   : 2006-01-20 14:50:58 PST (2w4d 00:45 ago)

```

**Release Information** Command introduced before Junos OS Release 7.4 for Gigabit interfaces.  
 Command introduced in Junos OS Release 8.0 for 10 Gigabit interfaces.  
 Command modified in Junos OS Release 9.5 for SRX Series devices.  
 Command introduced in Junos OS Release 18.1 for Gigabit interfaces.

**Description** Display status information about the specified Gigabit Ethernet interface.

(M320, M120, MX Series, and T Series routers only) Display status information about the specified 10-Gigabit Ethernet interface.

Display the IPv6 interface traffic statistics about the specified Gigabit Ethernet interface for MX series routers. The input and output bytes (bps) and packets (pps) rates are not displayed for IFD and local traffic.

Display status information and statistics about interfaces on SRX Series appliance running Junos OS.

**NOTE:** On SRX Series appliances, on configuring identical IPs on a single interface, you will not see a warning message; instead, you will see a syslog message.

**Options** For Gigabit interfaces:

***ge-fpc/pic/port***—Display standard information about the specified Gigabit Ethernet interface.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**descriptions**—(Optional) Display interface description strings.

**media**—(Optional) Display media-specific information about network interfaces.

**snmp-index *snmp-index***—(Optional) Display information for the specified SNMP index of the interface.

**statistics**—(Optional) Display static interface statistics.

For 10 Gigabit interfaces:

***xe-fpc/pic/port***—Display standard information about the specified 10-Gigabit Ethernet interface.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**descriptions**—(Optional) Display interface description strings.

**media**—(Optional) Display media-specific information about network interfaces.

**snmp-index *snmp-index***—(Optional) Display information for the specified SNMP index of the interface.

**statistics**—(Optional) Display static interface statistics.

For SRX interfaces:

- **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace *pim* with the PIM slot and port with the port number.
  - **at-*pim*/0/*port***—ATM-over-ADSL or ATM-over-SHDSL interface.
  - **ce1-*pim*/0/*port***—Channelized E1 interface.
  - **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
  - **ct1-*pim*/0/*port***—Channelized T1 interface.
  - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
  - **e1-*pim*/0/*port***—E1 interface.
  - **e3-*pim*/0/*port***—E3 interface.
  - **fe-*pim*/0/*port***—Fast Ethernet interface.
  - **ge-*pim*/0/*port***—Gigabit Ethernet interface.
  - **se-*pim*/0/*port***—Serial interface.
  - **t1-*pim*/0/*port***—T1 (also called DS1) interface.
  - **t3-*pim*/0/*port***—T3 (also called DS3) interface.
  - **wx-slot/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).
- **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace *pim* with the PIM slot and port with the port number.
  - **at-*pim*/0/*port***—ATM-over-ADSL or ATM-over-SHDSL interface.
  - **ce1-*pim*/0/*port***—Channelized E1 interface.
  - **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
  - **ct1-*pim*/0/*port***—Channelized T1 interface.
  - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
  - **e1-*pim*/0/*port***—E1 interface.
  - **e3-*pim*/0/*port***—E3 interface.
  - **fe-*pim*/0/*port***—Fast Ethernet interface.
  - **ge-*pim*/0/*port***—Gigabit Ethernet interface.
  - **se-*pim*/0/*port***—Serial interface.
  - **t1-*pim*/0/*port***—T1 (also called DS1) interface.

- **t3-pim/0/port**—T3 (also called DS3) interface.
- **wx-slot/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).

**Additional Information** In a logical system, this command displays information only about the logical interfaces and not about the physical interfaces.

**Output Fields** [Table 128 on page 1956](#) describes the output fields for the **show interfaces** (Gigabit Ethernet) command. Output fields are listed in the approximate order in which they appear. For Gigabit Ethernet IQ and IQE PICs, the traffic and MAC statistics vary by interface type. For more information, see [Table 129 on page 1984](#).

**Table 128: show interfaces (Gigabit Ethernet) Output Fields**

| Field Name                | Field Description                                                                                                                    | Level of Output              |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Physical Interface</b> |                                                                                                                                      |                              |
| <b>Physical interface</b> | Name of the physical interface.                                                                                                      | All levels                   |
| <b>Enabled</b>            | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels                   |
| <b>Interface index</b>    | Index number of the physical interface, which reflects its initialization sequence.                                                  | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>       | SNMP index number for the physical interface.                                                                                        | <b>detail extensive none</b> |

Table 128: show interfaces (Gigabit Ethernet) Output Fields (continued)

| Field Name              | Field Description                                                                                                                                                                                                                                   | Level of Output              |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Generation</b>       | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                   | <b>detail extensive</b>      |
| <b>Link-level type</b>  | Encapsulation being used on the physical interface.                                                                                                                                                                                                 | All levels                   |
| <b>MTU</b>              | Maximum transmission unit size on the physical interface.                                                                                                                                                                                           | All levels                   |
| <b>Speed</b>            | Speed at which the interface is running.                                                                                                                                                                                                            | All levels                   |
| <b>Loopback</b>         | Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .                                                                                                                      | All levels                   |
| <b>Source filtering</b> | Source filtering status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                        | All levels                   |
| <b>LAN-PHY mode</b>     | 10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.                                                       | All levels                   |
| <b>WAN-PHY mode</b>     | 10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.                           | All levels                   |
| <b>Unidirectional</b>   | Unidirectional link mode status for 10-Gigabit Ethernet interface: <b>Enabled</b> or <b>Disabled</b> for parent interface; <b>Rx-only</b> or <b>Tx-only</b> for child interfaces.                                                                   | All levels                   |
| <b>Flow control</b>     | Flow control status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                            | All levels                   |
| <b>Auto-negotiation</b> | (Gigabit Ethernet interfaces) Autonegotiation status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                           | All levels                   |
| <b>Remote-fault</b>     | (Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> <li>• <b>Online</b>—Autonegotiation is manually configured as online.</li> <li>• <b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul> | All levels                   |
| <b>Device flags</b>     | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .                                                                                                  | All levels                   |
| <b>Interface flags</b>  | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                     | All levels                   |
| <b>Link flags</b>       | Information about the link. Possible values are described in the “Links Flags” section under <i>Common Output Fields Description</i> .                                                                                                              | All levels                   |
| <b>Wavelength</b>       | (10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).                                                                                                              | All levels                   |
| <b>Frequency</b>        | (10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).                                                                                                                    | All levels                   |
| <b>CoS queues</b>       | Number of CoS queues configured.                                                                                                                                                                                                                    | <b>detail extensive none</b> |

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output  |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Input errors</b> | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b> |

Table 128: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output         |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Output errors</b> | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the <b>Drops</b> field does not always use the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> <ul style="list-style-type: none"> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number must always be 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field must never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>        |
| <b>Egress queues</b> | <p>Total number of egress queues supported on the specified interface.</p> <p><b>NOTE:</b> In DPCs that are not of the enhanced type, such as DPC 40x 1GER, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the <b>show interfaces</b> command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |

| Ingress queues                   | Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | extensive             |
| Queue counters (Ingress)         | <p>CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>                                                                                                                                                                                                                                                                                                              | extensive             |
| Active alarms and Active defects | <p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul> | detail extensive none |
| Interface transmit statistics    | <p>(On MX Series devices) Status of the <b>interface-transmit-statistics</b> configuration: Enabled or Disabled.</p> <ul style="list-style-type: none"> <li>• <b>Enabled</b>—When the <b>interface-transmit-statistics</b> statement is included in the configuration. If this is configured, the interface statistics show the actual transmitted load on the interface.</li> <li>• <b>Disabled</b>—When the <b>interface-transmit-statistics</b> statement is not included in the configuration. If this is not configured, the interface statistics show the offered load on the interface.</li> </ul>                                                                                     | detail extensive      |
| OTN FEC statistics               | <p>The forward error correction (FEC) counters provide the following statistics:</p> <ul style="list-style-type: none"> <li>• <b>Corrected Errors</b>—Count of corrected errors in the last second.</li> <li>• <b>Corrected Error Ratio</b>—Corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits.</li> </ul>                                                                                                                                                                                                                                                                                                                                        | detail extensive      |

Table 128: show interfaces (Gigabit Ethernet) Output Fields (continued)

| Field Name            | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output         |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>PCS statistics</b> | <p>(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device.</p> <ul style="list-style-type: none"> <li>• <b>Bit errors</b>—Number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode.</li> <li>• <b>Errored blocks</b>—Number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |
| <b>Link Degrad</b>    | <p>Shows the link degrade status of the physical link and the estimated bit error rates (BERs). This field is available only for the PICs supporting the physical link monitoring feature.</p> <ul style="list-style-type: none"> <li>• <b>Link Monitoring</b>—Indicates if physical link degrade monitoring is enabled on the interface. <ul style="list-style-type: none"> <li>• <b>Enable</b>—Indicates that link degrade monitoring has been enabled (using the <b>link-degrade-monitor</b> statement) on the interface.</li> <li>• <b>Disable</b>—Indicates that link degrade monitoring has not been enabled on the interface. If link degrade monitoring has not been enabled, the output does not show any related information, such as BER values and thresholds.</li> </ul> </li> <li>• <b>Link Degrad Set Threshold</b>—The BER threshold value at which the link is considered degraded and a corrective action is triggered.</li> <li>• <b>Link Degrad Clear Threshold</b>—The BER threshold value at which the degraded link is considered recovered and the corrective action applied to the interface is reverted.</li> <li>• <b>Estimated BER</b>—The estimated bit error rate.</li> <li>• <b>Link-degrade event</b>—Shows link degrade event information. <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Time (in seconds) elapsed after a link degrade event occurred.</li> <li>• <b>Count</b>—The number of link degrade events recorded.</li> <li>• <b>State</b>—Shows the link degrade status (example: <b>Defect Active</b>).</li> </ul> </li> </ul> | <b>detail extensive</b> |

Table 128: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Level of Output |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| MAC statistics                 | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> <li>• <b>Total octets</b> and <b>total packets</b>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see Table 31 under the <a href="#">show interfaces</a> command.</li> <li>• <b>Unicast packets</b>, <b>Broadcast packets</b>, and <b>Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—There are two possible conditions regarding the number of oversized frames: <ul style="list-style-type: none"> <li>• Packet length exceeds 1518 octets, or</li> <li>• Packet length exceeds MRU</li> </ul> </li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. <p><b>NOTE:</b> The 20-port Gigabit Ethernet MIC (MIC-3D-20GE-SFP) does not have hardware counters for VLAN frames. Therefore, the <b>VLAN tagged frames</b> field displays 0 when the <a href="#">show interfaces</a> command is executed on a 20-port Gigabit Ethernet MIC. In other words, the number of VLAN tagged frames cannot be determined for the 20-port Gigabit Ethernet MIC.</p> </li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul> | extensive       |

Table 128: show interfaces (Gigabit Ethernet) Output Fields (continued)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Level of Output |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Filter statistics | <p>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet may enter the system or be rejected.</p> <ul style="list-style-type: none"> <li>• <b>Input packet count</b>—Number of packets received from the MAC hardware that the filter processed.</li> <li>• <b>Input packet rejects</b>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</li> <li>• <b>Input DA rejects</b>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the router from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local router (which the router is rejecting).</li> <li>• <b>Input SA rejects</b>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field must increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</li> <li>• <b>Output packet count</b>—Number of packets that the filter has given to the MAC hardware.</li> <li>• <b>Output packet pad count</b>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</li> <li>• <b>Output packet error count</b>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field must not increment.</li> <li>• <b>CAM destination filters, CAM source filters</b>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields must be 0.</li> </ul> | extensive       |
| PMA PHY           | <p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:</p> <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Number of seconds the defect has been active.</li> <li>• <b>Count</b>—Number of times that the defect has gone from inactive to active.</li> <li>• <b>State</b>—State of the error. For Gigabit Ethernet interfaces, types are <b>Symmetric</b> (link partner supports <b>PAUSE</b> on receive and transmit), <b>Asymmetric</b> (link partner supports <b>PAUSE</b> on transmit), <b>Symmetric/Asymmetric</b> (link partner supports <b>PAUSE</b> on receive and transmit or only <b>PAUSE</b> on transmit), and <b>None</b> (link partner does not support flow control).</li> <li>• <b>Remote fault</b>—Remote fault information from the link partner—<b>Failure</b> indicates a receive link error. <b>OK</b> indicates that the link partner is receiving. <b>Negotiation error</b> indicates a negotiation error. <b>Offline</b> indicates that the link partner is going offline.</li> </ul> </li> <li>• <b>Local resolution</b>—Information from the local Ethernet device: <ul style="list-style-type: none"> <li>• <b>Flow control</b>—Types of flow control supported by the local device. For Gigabit Ethernet interfaces, advertised capabilities are <b>Symmetric/Asymmetric</b> (local device supports <b>PAUSE</b> on receive and transmit or only <b>PAUSE</b> on receive) and <b>None</b> (local device does not support flow control). Depending on the result of the negotiation with the link partner, local resolution flow control type will display <b>Symmetric</b> (local device supports <b>PAUSE</b> on receive and transmit), <b>Asymmetric</b> (local device supports <b>PAUSE</b> on receive), and <b>None</b> (local device does not support flow control).</li> <li>• <b>Remote fault</b>—Remote fault information. <b>Link OK</b> (no error detected on receive), <b>Offline</b> (local interface is offline), and <b>Link Failure</b> (link error detected on receive).</li> </ul> </li> </ul> | extensive       |
| Received path trace, Transmitted path trace | <p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | extensive       |

Table 128: show interfaces (Gigabit Ethernet) Output Fields (continued)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Level of Output       |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| Max Sessions            | Maximum number of PPPoE logical interfaces that can be activated on the underlying interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | detail extensive none |
| Duplicate Protection    | State of PPPoE duplicate protection: <b>On</b> or <b>Off</b> . When duplicate protection is configured for the underlying interface, a dynamic PPPoE logical interface cannot be activated when an existing active logical interface is present for the same PPPoE client.                                                                                                                                                                                                                                                                                                                                                                                              | detail extensive none |
| Direct Connect          | State of the configuration to ignore DSL Forum VSAs: <b>On</b> or <b>Off</b> . When configured, the router ignores any of these VSAs received from a directly connected CPE device on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | detail extensive none |
| AC Name                 | Name of the access concentrator.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | detail extensive none |
| Maximum labels          | Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | detail extensive none |
| Traffic statistics      | <p>Number and rate of bytes and packets received and transmitted on the specified interface set.</p> <ul style="list-style-type: none"> <li><b>Input bytes, Output bytes</b>—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.</li> <li><b>Input packets, Output packets</b>—Number of packets received and transmitted on the interface set.</li> </ul>                                                                               | detail extensive      |
| IPv6 transit statistics | Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | extensive             |
| Local statistics        | Number and rate of bytes and packets destined to the router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | extensive             |
| Transit statistics      | <p>Number and rate of bytes and packets transiting the switch.</p> <p><b>NOTE:</b> For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the <b>Output bytes</b> and <b>Output packets</b> interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.</p> | extensive             |
| Generation              | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | detail extensive      |
| Route Table             | Route table in which the logical interface address is located. For example, <b>0</b> refers to the routing table inet.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | detail extensive none |
| Flags                   | Information about protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | detail extensive      |

Table 128: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

| Field Name                      | Field Description                                                                                                                                                                                    | Level of Output              |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Donor interface</b>          | (Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.                                                                                                 | <b>detail extensive none</b> |
| <b>Preferred source address</b> | (Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.                                        | <b>detail extensive none</b> |
| <b>Input Filters</b>            | Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parentheses next to all interfaces.  | <b>detail extensive</b>      |
| <b>Output Filters</b>           | Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parentheses next to all interfaces. | <b>detail extensive</b>      |
| <b>Mac-Validate Failures</b>    | Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.                                           | <b>detail extensive none</b> |
| <b>Addresses, Flags</b>         | Information about the address flags. Possible values are described in the "Addresses Flags" section under <i>Common Output Fields Description</i> .                                                  | <b>detail extensive none</b> |
| <b><i>protocol-family</i></b>   | Protocol family configured on the logical interface. If the protocol is <b>inet</b> , the IP address of the interface is also displayed.                                                             | <b>brief</b>                 |
| <b>Flags</b>                    | Information about the address flag. Possible values are described in the "Addresses Flags" section under <i>Common Output Fields Description</i> .                                                   | <b>detail extensive none</b> |
| <b>Destination</b>              | IP address of the remote side of the connection.                                                                                                                                                     | <b>detail extensive none</b> |
| <b>Local</b>                    | IP address of the logical interface.                                                                                                                                                                 | <b>detail extensive none</b> |
| <b>Broadcast</b>                | Broadcast address of the logical interface.                                                                                                                                                          | <b>detail extensive none</b> |
| <b>Generation</b>               | Unique number for use by Juniper Networks technical support only.                                                                                                                                    | <b>detail extensive</b>      |

The following table describes the output fields for the **show interfaces** (10-Gigabit Ethernet) command.

| Field Name                | Field Description                                                                                                                    | Level of Output              |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Physical interface</b> | Name of the physical interface.                                                                                                      | All levels                   |
| <b>Enabled</b>            | State of the interface. Possible values are described in the "Enabled Field" section under <i>Common Output Fields Description</i> . | All levels                   |
| <b>Interface index</b>    | Index number of the physical interface, which reflects its initialization sequence.                                                  | <b>detail extensive none</b> |

|                         |                                                                                                                                                                                                                                                     |                                 |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <b>SNMP ifIndex</b>     | SNMP index number for the physical interface.                                                                                                                                                                                                       | <b>detail extensive</b><br>none |
| <b>Generation</b>       | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                   | <b>detail extensive</b>         |
| <b>Link-level type</b>  | Encapsulation being used on the physical interface.                                                                                                                                                                                                 | All levels                      |
| <b>MTU</b>              | Maximum transmission unit size on the physical interface.                                                                                                                                                                                           | All levels                      |
| <b>Speed</b>            | Speed at which the interface is running.                                                                                                                                                                                                            | All levels                      |
| <b>Loopback</b>         | Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .                                                                                                                      | All levels                      |
| <b>Source filtering</b> | Source filtering status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                        | All levels                      |
| <b>LAN-PHY mode</b>     | 10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.                                                       | All levels                      |
| <b>WAN-PHY mode</b>     | 10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.                           | All levels                      |
| <b>Unidirectional</b>   | Unidirectional link mode status for 10-Gigabit Ethernet interface: <b>Enabled</b> or <b>Disabled</b> for parent interface; <b>Rx-only</b> or <b>Tx-only</b> for child interfaces.                                                                   | All levels                      |
| <b>Flow control</b>     | Flow control status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                            | All levels                      |
| <b>Auto-negotiation</b> | (Gigabit Ethernet interfaces) Autonegotiation status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                           | All levels                      |
| <b>Remote-fault</b>     | (Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> <li>• <b>Online</b>—Autonegotiation is manually configured as online.</li> <li>• <b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul> | All levels                      |
| <b>Device flags</b>     | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .                                                                                                  | All levels                      |
| <b>Interface flags</b>  | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                     | All levels                      |
| <b>Link flags</b>       | Information about the link. Possible values are described in the “Links Flags” section under <i>Common Output Fields Description</i> .                                                                                                              | All levels                      |
| <b>Wavelength</b>       | (10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).                                                                                                              | All levels                      |
| <b>Frequency</b>        | (10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).                                                                                                                    | All levels                      |
| <b>CoS queues</b>       | Number of CoS queues configured.                                                                                                                                                                                                                    | <b>detail extensive</b><br>none |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                  |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Input errors</b>  | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>                                                                                                                                                       | <b>extensive</b> |
| <b>Output errors</b> | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b> |

|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------|
| <b>Egress queues</b>                    | Total number of egress queues supported on the specified interface.<br><br><b>NOTE:</b> In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the <b>show interfaces</b> command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs | <b>detail extensive</b>                |

| <b>PCS statistics</b>                 | <p>(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device.</p> <ul style="list-style-type: none"> <li>• <b>Bit errors</b>—The number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode.</li> <li>• <b>Errored blocks</b>—The number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b> |
| <b>MAC statistics</b>                 | <p><b>Receive and Transmit</b> statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> <li>• <b>Total octets and total packets</b>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type.</li> <li>• <b>Unicast packets, Broadcast packets, and Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—Number of frames that exceed 1518 octets.</li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul> | <b>extensive</b>        |
| <b>OTN Received Overhead Bytes</b>    | APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>extensive</b>        |

|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| Filter statistics | <p><b>Receive and Transmit</b> statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> <li>• <b>Input packet count</b>—Number of packets received from the MAC hardware that the filter processed.</li> <li>• <b>Input packet rejects</b>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</li> <li>• <b>Input DA rejects</b>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting).</li> <li>• <b>Input SA rejects</b>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</li> <li>• <b>Output packet count</b>—Number of packets that the filter has given to the MAC hardware.</li> <li>• <b>Output packet pad count</b>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</li> <li>• <b>Output packet error count</b>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</li> <li>• <b>CAM destination filters, CAM source filters</b>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.</li> </ul> | extensive |

| <b>Received path trace,<br/>Transmitted path trace</b> | (10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the routing device at the other end of the fiber. The transmitted path trace value is the message that this routing device transmits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>extensive</b>                       |

| <b>Transit statistics</b>       | Number and rate of bytes and packets transiting the switch.<br><br><b>NOTE:</b> For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the <b>Output bytes</b> and <b>Output packets</b> interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler. | <b>extensive</b>                       |

For Gigabit Ethernet IQ PICs, traffic and MAC statistics output varies. The following table describes the traffic and MAC statistics for two sample interfaces, each of which is sending traffic in packets of 500 bytes (including 478 bytes for the Layer 3 packet, 18 bytes for the Layer 2 VLAN traffic header, and 4 bytes for cyclic redundancy check [CRC] information). The **ge-0/3/0** interface is the inbound physical interface, and the **ge-0/0/0** interface is the outbound physical interface. On both interfaces, traffic is carried on logical unit **.50** (VLAN 50).

**Table 129: Gigabit and 10 Gigabit Ethernet IQ PIC Traffic and MAC Statistics by Interface Type**

| <b>Physical interface</b> | Name of the physical interface.                                                                                                                                                                                                                     | All levels                   |
| <b>Enabled</b>            | State of the interface.                                                                                                                                                                                                                             | All levels                   |
| <b>Interface index</b>    | Index number of the physical interface, which reflects its initialization sequence.                                                                                                                                                                 | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>       | SNMP index number for the physical interface.                                                                                                                                                                                                       | <b>detail extensive none</b> |
| <b>Link-level type</b>    | Encapsulation being used on the physical interface.                                                                                                                                                                                                 | All levels                   |
| <b>Generation</b>         | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                   | <b>detail extensive</b>      |
| <b>MTU</b>                | Maximum transmission unit size on the physical interface.                                                                                                                                                                                           | All levels                   |
| <b>Link mode</b>          | Link mode: Full-duplex or Half-duplex.                                                                                                                                                                                                              |                              |
| <b>Speed</b>              | Speed at which the interface is running.                                                                                                                                                                                                            | All levels                   |
| <b>BPDU error</b>         | Bridge protocol data unit (BPDU) error: Detected or None                                                                                                                                                                                            |                              |
| <b>Loopback</b>           | Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .                                                                                                                      | All levels                   |
| <b>Source filtering</b>   | Source filtering status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                        | All levels                   |
| <b>Flow control</b>       | Flow control status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                            | All levels                   |
| <b>Auto-negotiation</b>   | (Gigabit Ethernet interfaces) Autonegotiation status: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                           | All levels                   |
| <b>Remote-fault</b>       | (Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> <li>• <b>Online</b>—Autonegotiation is manually configured as online.</li> <li>• <b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul> | All levels                   |
| <b>Device flags</b>       | Information about the physical device.                                                                                                                                                                                                              | All levels                   |
| <b>Interface flags</b>    | Information about the interface.                                                                                                                                                                                                                    | All levels                   |
| <b>Link flags</b>         | Information about the physical link.                                                                                                                                                                                                                | All levels                   |
| <b>CoS queues</b>         | Number of CoS queues configured.                                                                                                                                                                                                                    | <b>detail extensive none</b> |
| <b>Current address</b>    | Configured MAC address.                                                                                                                                                                                                                             | <b>detail extensive none</b> |

Table 130: show interfaces Output Fields (continued)

| Field Name                              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output              |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Last flapped</b>                     | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .                                                                                                                                                                                                                                                                          | <b>detail extensive none</b> |
| <b>Input Rate</b>                       | Input rate in bits per second (bps) and packets per second (pps).                                                                                                                                                                                                                                                                                                                                                                                                                                                             | None                         |
| <b>Output Rate</b>                      | Output rate in bps and pps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | None                         |
| <b>Active alarms and Active defects</b> | <p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul> | <b>detail extensive none</b> |
| <b>Statistics last cleared</b>          | Time when the statistics for the interface were last set to zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive</b>      |
| <b>Traffic statistics</b>               | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                  | <b>detail extensive</b>      |

Table 130: show interfaces Output Fields (continued)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Level of Output  |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Input errors</b>  | <p>Input errors on the interface.</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <code>ignore-l3-incompletes</code>.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>                                                                                                                                                            | <b>extensive</b> |
| <b>Output errors</b> | <p>Output errors on the interface.</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation; therefore, for Gigabit Ethernet PICs, this number must always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field must never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b> |

Table 130: show interfaces Output Fields (continued)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Level of Output         |

| <b>MAC statistics</b>                  | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> <li>• <b>Total octets and total packets</b>—Total number of octets and packets.</li> <li>• <b>Unicast packets, Broadcast packets, and Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—There are two possible conditions regarding the number of oversized frames: <ul style="list-style-type: none"> <li>• Packet length exceeds 1518 octets, or</li> <li>• Packet length exceeds MRU</li> </ul> </li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul> | <b>extensive</b>        |

Table 130: show interfaces Output Fields (continued)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Level of Output |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Filter statistics                      | <p>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> <li>• <b>Input packet count</b>—Number of packets received from the MAC hardware that the filter processed.</li> <li>• <b>Input packet rejects</b>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</li> <li>• <b>Input DA rejects</b>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local device (which the router is rejecting).</li> <li>• <b>Input SA rejects</b>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</li> <li>• <b>Output packet count</b>—Number of packets that the filter has given to the MAC hardware.</li> <li>• <b>Output packet pad count</b>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</li> <li>• <b>Output packet error count</b>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</li> <li>• <b>CAM destination filters, CAM source filters</b>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields must be 0.</li> </ul> | extensive       |
| Autonegotiation information            | <p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> <li>• <b>Negotiation status:</b> <ul style="list-style-type: none"> <li>• <b>Incomplete</b>—Ethernet interface has the speed or link mode configured.</li> <li>• <b>No autonegotiation</b>—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.</li> <li>• <b>Complete</b>—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | extensive       |

| <b>Transit statistics</b>                             | Number and rate of bytes and packets transiting the switch.<br><br><b>NOTE:</b> For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the <b>Output bytes</b> and <b>Output packets</b> interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler. | <b>extensive</b>             |

## Sample Output Gigabit Ethernet

### show interfaces (Gigabit Ethernet)

```
user@host> show interfaces ge-3/0/2
```

```
Physical interface: ge-3/0/2, Enabled, Physical link is Up
  Interface index: 167, SNMP ifIndex: 35
  Link-level type: 52, MTU: 1522, Speed: 1000mbps, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled
  Remote fault: Online
  Device flags   : Present Running
  Interface flags: SNMP-Traps Internal: 0x4000
  CoS queues     : 4 supported, 4 maximum usable queues
  Current address: 00:00:5e:00:53:7c, Hardware address: 00:00:5e:00:53:7c
  Last flapped   : 2006-08-10 17:25:10 PDT (00:01:08 ago)
  Input rate     : 0 bps (0 pps)
  Output rate    : 0 bps (0 pps)
  Ingress rate at Packet Forwarding Engine : 0 bps (0 pps)
  Ingress drop rate at Packet Forwarding Engine : 0 bps (0 pps)
  Active alarms  : None
  Active defects : None

Logical interface ge-3/0/2.0 (Index 72) (SNMP ifIndex 69)
  Flags: SNMP-Traps 0x4000
  VLAN-Tag [ 0x8100.512 0x8100.513 ] In(pop-swap 0x8100.530) Out(swap-push
  0x8100.512 0x8100.513)
  Encapsulation: VLAN-CCC
  Egress account overhead: 100
  Ingress account overhead: 90
  Input packets : 0
  Output packets: 0
  Protocol ccc, MTU: 1522
  Flags: Is-Primary
```

### show interfaces (Gigabit Ethernet on MX Series Routers)

```
user@host> show interfaces ge-2/2/2
```

```
Physical interface: ge-2/2/2, Enabled, Physical link is Up
  Interface index: 156, SNMP ifIndex: 188
  Link-level type: Ethernet, MTU: 1514, Speed: 1000mbps, MAC-REWRITE Error: None,
  Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
  Remote fault: Online
  Device flags   : Present Running
  Interface flags: SNMP-Traps Internal: 0x4000
  Link flags     : None
  CoS queues     : 8 supported, 4 maximum usable queues
  Schedulers     : 0
  Current address: 00:00:5e:00:53:c0, Hardware address: 00:00:5e:00:53:76
  Last flapped   : 2008-09-05 16:44:30 PDT (3d 01:04 ago)
  Input rate     : 0 bps (0 pps)
  Output rate    : 0 bps (0 pps)
  Active alarms  : None
  Active defects : None

Logical interface ge-2/2/2.0 (Index 82) (SNMP ifIndex 219)
  Flags: Up SNMP-Traps 0x4004000 Encapsulation: ENET2
  Input packets : 10232
  Output packets: 10294
```

```

Protocol inet, MTU: 1500
  Flags: Sendbroadcast-pkt-to-re
  Addresses, Flags: Is-Preferred Is-Primary
    Destination: 203.0.113/24, Local: 203.0.113.1, Broadcast: 203.0.113.255
Protocol inet6, MTU: 1500
  Max nh cache: 4, New hold nh limit: 100000, Curr nh cnt: 4, Curr new hold
  cnt: 4, NH drop cnt: 0
  Flags: Is-Primary
  Addresses, Flags: Is-Default Is-Preferred Is-Primary
    Destination: 2001:db8:/32, Local: 2001:db8::5
  Addresses, Flags: Is-Preferred
    Destination: 2001:db8:1::/32, Local: 2001:db8:223:9cff:fe9f:3e78
Protocol multiservice, MTU: Unlimited
  Flags: Is-Primary

```

### show interfaces (link degrade status)

```
user@host> show interfaces et-3/0/0
```

```

Physical interface: et-3/0/0, Enabled, Physical link is Down
  Interface index: 157, SNMP ifIndex: 537
  Link-level type: Ethernet, MTU: 1514, MRU: 0, Speed: 100Gbps, BPDU Error: None,
  Loopback: Disabled, Source filtering: Disabled, Flow control: Enabled
  Device flags   : Present Running Down
  Interface flags: Hardware-Down SNMP-Traps Internal: 0x4000
  Link flags     : None
  CoS queues    : 8 supported, 8 maximum usable queues
  Current address: 54:e0:32:23:9d:38, Hardware address: 54:e0:32:23:9d:38
  Last flapped  : 2014-06-18 02:36:38 PDT (02:50:50 ago)

```

**NOTE:** For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics displayed in the **show interfaces** command output might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the interface counters. For detailed information, see the description of the logical interface **Transit statistics** fields in [Table 128 on page 1956](#).

### show interfaces (Gigabit Ethernet Unnumbered Interface)

```
user@host> show interfaces ge-3/2/0
```

#### show interfaces mac-database mac-address

```

user@host> show interfaces mac-database xe-0/3/3 mac-address (SRX devices)
00:00:c8:01:01:09

Physical interface: xe-0/3/3, Enabled, Physical link is Up
  Interface index: 372, SNMP ifIndex: 788
  Link-level type: Ethernet, MTU: 1514, LAN-PHY mode, Speed: 10Gbps, Loopback:
None, Source filtering: Disabled, Flow control: Enabled
  Device flags   : Present Running
  Interface flags: SNMP-Traps Internal: 0x4000
  Link flags     : None

  Logical interface xe-0/3/3.0 (Index 364) (SNMP ifIndex 829)
    Flags: SNMP-Traps 0x4004000 Encapsulation: ENET2
  MAC address: 00:00:c8:01:01:09, Type: Configured,
    Input bytes   : 202324652
    Output bytes  : 202324560
    Input frames  : 4398362
    Output frames : 4398360
  Policer statistics:
    Policer type   Discarded frames  Discarded bytes
  Output aggregate      3992386          183649756

```

#### show interfaces mc-ae (SRX devices)

```

user@host> show interfaces mc-ae ae0 unit 512

Member Links   : ae0
Local Status   : active
Peer Status    : active
Logical Interface : ae0.512

```

```
Core Facing Interface : Label Ethernet Interface
ICL-PL               : Label Ethernet Interface
```

### show interfaces media (SONET/SDH)

The following example displays the output fields unique to the **show interfaces media** command for a SONET interface (with no level of output specified):

```
user@host> show interfaces media so-4/1/2
```

```
Physical interface: so-4/1/2, Enabled, Physical link is Up
Interface index: 168, SNMP ifIndex: 495
Link-level type: PPP, MTU: 4474, Clocking: Internal, SONET mode, Speed: OC48,
Loopback: None, FCS: 16, Payload scrambler: Enabled
Device flags   : Present Running
Interface flags: Point-To-Point SNMP-Traps 16384
Link flags     : Keepalives
Keepalive settings: Interval 10 seconds, Up-count 1, Down-count 3
Keepalive: Input: 1783 (00:00:00 ago), Output: 1786 (00:00:08 ago)
LCP state: Opened
NCP state: inet: Not-configured, inet6: Not-configured, iso: Not-configured,
mpls: Not-configured
CHAP state: Not-configured
CoS queues    : 8 supported
Last flapped  : 2005-06-15 12:14:59 PDT (04:31:29 ago)
Input rate    : 0 bps (0 pps)
Output rate   : 0 bps (0 pps)
SONET alarms  : None
SONET defects : None
SONET errors:
    BIP-B1: 121, BIP-B2: 916, REI-L: 0, BIP-B3: 137, REI-P: 16747, BIP-BIP2: 0
Received path trace: routerb so-1/1/2
Transmitted path trace: routera so-4/1/2
```

### show interfaces policers (SRX devices)

```
user@host> show interfaces policers
```

| Interface  | Admin | Link | Proto | Input                 | Policer | Output                 | Policer |
|------------|-------|------|-------|-----------------------|---------|------------------------|---------|

### show interfaces policers interface-name (SRX devices)

```
user@host> show interfaces policers so-2/1/0
```

| Interface  | Admin | Link | Proto | Input                 | Policer | Output                 | Policer |
|------------|-------|------|-------|-----------------------|---------|------------------------|---------|
| so-2/1/0   | up    | down |       |                       |         |                        |         |
| so-2/1/0.0 | up    | down | inet  | so-2/1/0.0-in-policer |         | so-2/1/0.0-out-policer |         |
|            |       |      | iso   |                       |         |                        |         |
|            |       |      | inet6 |                       |         |                        |         |

### show interfaces queue (SRX devices)

The following truncated example shows the CoS queue sizes for queues 0, 1, and 3. Queue 1 has a queue buffer size (guaranteed allocated memory) of 9192 bytes.

```
user@host> show interfaces queue
```

```
Physical interface: ge-0/0/0, Enabled, Physical link is Up
  Interface index: 134, SNMP ifIndex: 509
  Forwarding classes: 8 supported, 8 in use
  Egress queues: 8 supported, 8 in use
  Queue: 0, Forwarding classes: class0
    Queued:
      Packets          :                0          0 pps
      Bytes            :                0          0 bps
    Transmitted:
      Packets          :                0          0 pps
      Bytes            :                0          0 bps
      Tail-dropped packets :                0          0 pps
      RL-dropped packets :                0          0 pps
      RL-dropped bytes   :                0          0 bps
      RED-dropped packets :                0          0 pps
      Low               :                0          0 pps
      Medium-low        :                0          0 pps
      Medium-high       :                0          0 pps
      High              :                0          0 pps
      RED-dropped bytes  :                0          0 bps
      Low               :                0          0 bps
      Medium-low        :                0          0 bps
      Medium-high       :                0          0 bps
      High              :                0          0 bps
    Queue Buffer Usage:
      Reserved buffer   :          118750000 bytes
      Queue-depth bytes :
      Current           :                0
  ..
  ..
  Queue: 1, Forwarding classes: class1
  ..
  ..
    Queue Buffer Usage:
      Reserved buffer   :           9192 bytes
      Queue-depth bytes :
      Current           :                0
  ..
  ..
  Queue: 3, Forwarding classes: class3
    Queued:
  ..
  ..
    Queue Buffer Usage:
      Reserved buffer   :          6250000 bytes
```

```

Queue-depth bytes      :
Current                : 0
..
..

```

### show interfaces redundancy (SRX devices)

```
user@host> show interfaces redundancy
```

| Interface | State        | Last change | Primary   | Secondary | Current status |
|-----------|--------------|-------------|-----------|-----------|----------------|

### show security zones (SRX devices)

```
user@host> show security zones

Functional zone: management
  Description: This is the management zone.
  Policy configurable: No
  Interfaces bound: 1
  Interfaces:
    ge-0/0/0.0
Security zone: Host
  Description: This is the host zone.
  Send reset for non-SYN session TCP packets: Off
  Policy configurable: Yes
  Interfaces bound: 1
  Interfaces:
    fxp0.0
Security zone: abc
  Description: This is the abc zone.
  Send reset for non-SYN session TCP packets: Off
  Policy configurable: Yes
  Interfaces bound: 1
  Interfaces:
    ge-0/0/1.0
Security zone: def
  Description: This is the def zone.
  Send reset for non-SYN session TCP packets: Off
  Policy configurable: Yes
  Interfaces bound: 1
  Interfaces:
    ge-0/0/2.0
```

## show interfaces (M Series, MX Series, T Series Routers, and PTX Series Management and Internal Ethernet)

**Output Fields** [Table 131 on page 2033](#) lists the output fields for the **show interfaces** (management) command on the M Series routers, T Series routers, TX Matrix Plus routers, and PTX Series. Output fields are listed in the approximate order in which they appear.

**Table 131: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface**

| Field Name                | Field Description                                                                                                                    | Level of Output              |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Physical Interface</b> |                                                                                                                                      |                              |
| <b>Physical interface</b> | Name of the physical interface.                                                                                                      | All levels                   |
| <b>Enabled</b>            | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels                   |
| <b>Interface index</b>    | Physical interface index number, which reflects its initialization sequence.                                                         | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>       | SNMP index number for the physical interface.                                                                                        | <b>detail extensive none</b> |
| <b>Generation</b>         | Unique number for use by Juniper Networks technical support only.                                                                    | <b>detail extensive</b>      |
| <b>Type</b>               | Type of interface.                                                                                                                   | All levels                   |

**Table 131: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface (continued)**

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                 | Level of Output              |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Link-level type</b>         | Encapsulation type used on the physical interface.                                                                                                                                                                                                                                                                                                                | All levels                   |
| <b>MTU</b>                     | Maximum transmission unit (MTU)—Size of the largest packet to be transmitted.                                                                                                                                                                                                                                                                                     | All levels                   |
| <b>Clocking</b>                | Reference clock source of the interface.                                                                                                                                                                                                                                                                                                                          | All levels                   |
| <b>Speed</b>                   | Network speed on the interface.                                                                                                                                                                                                                                                                                                                                   | All levels                   |
| <b>Device flags</b>            | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                | All levels                   |
| <b>Interface flags</b>         | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                   | All levels                   |
| <b>Link type</b>               | Data transmission type.                                                                                                                                                                                                                                                                                                                                           | <b>detail extensive none</b> |
| <b>Link flags</b>              | Information about the link. Possible values are described in the “Link Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                             | <b>detail extensive</b>      |
| <b>Physical info</b>           | Information about the physical interface.                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b>      |
| <b>Hold-times</b>              | Current interface hold-time up and hold-time down. Value is in milliseconds.                                                                                                                                                                                                                                                                                      | <b>detail extensive</b>      |
| <b>Current address</b>         | Configured MAC address.                                                                                                                                                                                                                                                                                                                                           | <b>detail extensive none</b> |
| <b>Hardware address</b>        | Media access control (MAC) address of the interface.                                                                                                                                                                                                                                                                                                              | <b>detail extensive none</b> |
| <b>Alternate link address</b>  | Backup link address.                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b>      |
| <b>Last flapped</b>            | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .                                                                                                              | <b>detail extensive none</b> |
| <b>Input packets</b>           | Number of packets received on the physical interface.                                                                                                                                                                                                                                                                                                             | None specified               |
| <b>Output packets</b>          | Number of packets transmitted on the physical interface.                                                                                                                                                                                                                                                                                                          | None specified               |
| <b>Statistics last cleared</b> | Time when the statistics for the interface were last set to zero.                                                                                                                                                                                                                                                                                                 | <b>detail extensive</b>      |
| <b>Traffic statistics</b>      | Number and rate of bytes and packets received and transmitted on the logical and physical interface. <ul style="list-style-type: none"> <li>• <b>Input bytes, Output bytes</b>—Number of bytes received and transmitted on the interface.</li> <li>• <b>Input packets, Output packets</b>—Number of packets received and transmitted on the interface.</li> </ul> | <b>detail extensive</b>      |

**Table 131: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface (continued)**

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output              |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Input errors</b>      | <ul style="list-style-type: none"> <li>• <b>Errors</b>—Input errors on the interface.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Frames received smaller than the runt threshold.</li> <li>• <b>Giants</b>—Frames received larger than the giant threshold.</li> <li>• <b>Policed Discards</b>—Frames that the incoming packet match code discarded because they were not recognized or were not of interest. Usually, this field reports protocols that Junos does not support.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>                                                                                                    | <b>extensive</b>             |
| <b>Output errors</b>     | <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly, possibly once every 10 seconds, the cable, the remote system, or the interface is malfunctioning.</li> <li>• <b>Errors</b>—Sum of outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet dropped by the ASIC RED mechanism.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>             |
| <b>Logical Interface</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                              |
| <b>Logical interface</b> | Name of the logical interface                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | All levels                   |
| <b>Index</b>             | Logical interface index number, which reflects its initialization sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>      | Logical interface SNMP interface index number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive none</b> |

**Table 131: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface (continued)**

| Field Name              | Field Description                                                                                                                                        | Level of Output       |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| <b>Route table</b>      | Route table in which this address exists. For example, <b>Route table:0</b> refers to inet.0.                                                            | detail extensive      |
| <b>Flags</b>            | Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> . | detail extensive none |
| <b>Addresses, Flags</b> | Information about address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .          | detail extensive none |
| <b>Destination</b>      | IP address of the remote side of the connection.                                                                                                         | detail extensive none |
| <b>Local</b>            | IP address of the logical interface.                                                                                                                     | detail extensive none |
| <b>Broadcast</b>        | Broadcast address.                                                                                                                                       | detail extensive none |
| <b>Generation</b>       | Unique number for use by Juniper Networks technical support only.                                                                                        | detail extensive      |

## Sample Output

### show interfaces brief (Management Ethernet)

```

user@host> show interfaces fxp0 brief

Physical interface: fxp0, Enabled, Physical link is Up
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Clocking: Unspecified,
  Speed: 100mbps
  Device flags   : Present Running
  Interface flags: SNMP-Traps

Logical interface fxp0.0
  Flags: SNMP-Traps Encapsulation: ENET2
  inet 192.168.70.143/21

```

### show interfaces (Management Ethernet)

```

user@host> show interfaces fxp0

Physical interface: fxp0, Enabled, Physical link is Up
  Interface index: 1, SNMP ifIndex: 1
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Speed: 100mbps
  Device flags   : Present Running
  Interface flags: SNMP-Traps
  Link type      : Half-Duplex
  Current address: 00:00:5E:00:53:89, Hardware address: 00:00:5E:00:53:89
  Last flapped   : Never
    Input packets : 80804
    Output packets: 1105

Logical interface fxp0.0 (Index 2) (SNMP ifIndex 13)
  Flags: SNMP-Traps Encapsulation: ENET2
  Protocol inet, MTU: 1500

```

```
Flags: Is-Primary
Addresses, Flags: Is-Preferred Is-Primary
Destination: 192.168.64/21, Local: 192.168.70.143,
Broadcast: 192.168.71.255
```

### show interfaces (Management Ethernet [TX Matrix Plus Router])

```
user@host> show interfaces em0

Physical interface: em0, Enabled, Physical link is Up
  Interface index: 8, SNMP ifIndex: 17
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Speed: 100mbps
  Device flags   : Present Running
  Interface flags: SNMP-Traps
  Link type      : Full-Duplex
  Current address: 00:00:5E:00:53:c0, Hardware address: 00:00:5E:00:53:c0
  Last flapped   : Never
    Input packets : 1424
    Output packets: 5282

  Logical interface em0.0 (Index 3) (SNMP ifIndex 18)
    Flags: SNMP-Traps Encapsulation: ENET2
    Input packets : 1424
    Output packets: 5282
    Protocol inet, MTU: 1500
      Flags: Is-Primary
      Addresses, Flags: Is-Preferred Is-Primary
        Destination: 192.168.178.0/25, Local: 192.168.178.11, Broadcast:
        192.168.178.127
```

### show interfaces (Management Ethernet [PTX Series Packet Transport Routers])

```
user@host> show interfaces em0

Physical interface: em0, Enabled, Physical link is Up
  Interface index: 8, SNMP ifIndex: 0
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Speed: 1000mbps
  Device flags   : Present Running
  Interface flags: SNMP-Traps
  Link type      : Full-Duplex
  Current address: 00:00:5E:00:53:1b, Hardware address: 00:00:5E:00:53:1b
  Last flapped   : Never
    Input packets : 212581
    Output packets: 71

  Logical interface em0.0 (Index 3) (SNMP ifIndex 0)
    Flags: SNMP-Traps Encapsulation: ENET2
    Input packets : 212551
    Output packets: 71
    Protocol inet, MTU: 1500
      Flags: Is-Primary
      Addresses, Flags: Is-Default Is-Preferred Is-Primary
        Destination: 192.168.3/24, Local: 192.168.3.30,
        Broadcast: 192.168.3.255
```

### show interfaces detail (Management Ethernet)

```
user@host> show interfaces fxp0 detail
```

```

Physical interface: fxp0, Enabled, Physical link is Up
  Interface index: 1, SNMP ifIndex: 1, Generation: 0
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Clocking: Unspecified,
  Speed: 100mbps
  Device flags   : Present Running
  Interface flags: SNMP-Traps
  Link type      : Half-Duplex
  Physical info   : Unspecified
  Hold-times     : Up 0 ms, Down 0 ms
  Current address: 00:00:5E:00:53:89, Hardware address: 00:00:5E:00:53:89

### show interfaces extensive (internal Ethernet)

```
user@host> show interfaces fxp1 extensive
```

```

Physical interface: fxp1, Enabled, Physical link is Up
  Interface index: 2, SNMP ifIndex: 2, Generation: 1
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Clocking: Unspecified,
  Speed: 100mbps
  Device flags   : Present Running
  Interface flags: SNMP-Traps
  Link type      : Full-Duplex
  Physical info   : Unspecified
  Hold-times     : Up 0 ms, Down 0 ms
  Current address: 00:00:5E:00:53:04, Hardware address: 00:00:5E:00:53:04
  Alternate link address: Unspecified
  Last flapped   : Never
  Statistics last cleared: Never
  Traffic statistics:
    Input bytes :          2349897
    Output bytes :         15888605
    Input packets:          30896
    Output packets:         33607
  Input errors:
    Errors: 0, Drops: 0, Framing errors: 0, Runts: 0, Giants: 0,
    Policed discards: 0, Resource errors: 0
  Output errors:
    Carrier transitions: 0, Errors: 0, Drops: 0, MTU errors: 0,
    Resource errors: 0

Logical interface fxp1.0 (Index 3) (SNMP ifIndex 14) (Generation 2)
  Flags: SNMP-Traps Encapsulation: ENET2
  Protocol inet, MTU: 1500, Generation: 7, Route table: 1
  Flags: Is-Primary
  Addresses, Flags: Is-Default Is-Preferred Is-Primary

## show interfaces (PPPoE)

**Syntax** `show interfaces pp0.logical`  
`<brief | detail | extensive | terse>`  
`<descriptions>`  
`<media>`  
`<snmp-index snmp-index>`  
`<statistics>`

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** (M120 routers, M320 routers, and MX Series routers only). Display status information about the PPPoE interface.

**Options** `pp0.logical`—Display standard status information about the PPPoE interface.

`brief | detail | extensive | terse`—(Optional) Display the specified level of output.

`descriptions`—(Optional) Display interface description strings.

`media`—(Optional) Display media-specific information about PPPoE interfaces.

`snmp-index snmp-index`—(Optional) Display information for the specified SNMP index of the interface.

`statistics`—(Optional) Display PPPoE interface statistics.

**Required Privilege Level** view

**List of Sample Output** [show interfaces \(PPPoE\) on page 2055](#)  
[show interfaces \(PPPoE over Aggregated Ethernet\) on page 2055](#)  
[show interfaces brief \(PPPoE\) on page 2056](#)  
[show interfaces detail \(PPPoE\) on page 2056](#)  
[show interfaces extensive \(PPPoE on M120 and M320 Routers\) on page 2057](#)

**Output Fields** [Table 132 on page 2049](#) lists the output fields for the `show interfaces (PPPoE)` command. Output fields are listed in the approximate order in which they appear.

*Table 132: show interfaces (PPPoE) Output Fields*

| Field Name                | Field Description                                                                                                                    | Level of Output |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Physical Interface</b> |                                                                                                                                      |                 |
| <b>Physical interface</b> | Name of the physical interface.                                                                                                      | All levels      |
| <b>Enabled</b>            | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels      |

Table 132: show interfaces (PPPoE) Output Fields (continued)

| Field Name                     | Field Description                                                                                                                                  | Level of Output              |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Interface index</b>         | Physical interface index number, which reflects its initialization sequence.                                                                       | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>            | SNMP index number for the physical interface.                                                                                                      | <b>detail extensive none</b> |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.                                                                                  | <b>detail extensive</b>      |
| <b>Type</b>                    | Physical interface type (PPPoE).                                                                                                                   | All levels                   |
| <b>Link-level type</b>         | Encapsulation on the physical interface (PPPoE).                                                                                                   | All levels                   |
| <b>MTU</b>                     | MTU size on the physical interface.                                                                                                                | All levels                   |
| <b>Clocking</b>                | Reference clock source. It can be <b>Internal</b> or <b>External</b> .                                                                             | All levels                   |
| <b>Speed</b>                   | Speed at which the interface is running.                                                                                                           | All levels                   |
| <b>Device flags</b>            | Information about the physical device. Possible values are described in the "Device Flags" section under <i>Common Output Fields Description</i> . | All levels                   |
| <b>Interface flags</b>         | Information about the interface. Possible values are described in the "Interface Flags" section under <i>Common Output Fields Description</i> .    | All levels                   |
| <b>Link type</b>               | Physical interface link type: <b>full duplex</b> or <b>half duplex</b> .                                                                           | All levels                   |
| <b>Link flags</b>              | Information about the interface. Possible values are described in the "Link Flags" section under <i>Common Output Fields Description</i> .         | All levels                   |
| <b>Input rate</b>              | Input rate in bits per second (bps) and packets per second (pps).                                                                                  | None specified               |
| <b>Output rate</b>             | Output rate in bps and pps.                                                                                                                        | None specified               |
| <b>Physical Info</b>           | Physical interface information.                                                                                                                    | All levels                   |
| <b>Hold-times</b>              | Current interface hold-time up and hold-time down, in milliseconds.                                                                                | <b>detail extensive</b>      |
| <b>Current address</b>         | Configured MAC address.                                                                                                                            | <b>detail extensive</b>      |
| <b>Hardware address</b>        | MAC address of the hardware.                                                                                                                       | <b>detail extensive</b>      |
| <b>Alternate link address</b>  | Backup address of the link.                                                                                                                        | <b>detail extensive</b>      |
| <b>Statistics last cleared</b> | Time when the statistics for the interface were last set to zero.                                                                                  | <b>detail extensive</b>      |

Table 132: show interfaces (PPPoE) Output Fields (continued)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Level of Output         |

| <b>Traffic statistics</b>      | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |
| <b>IPv6 transit statistics</b> | <p>Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled.</p> <p><b>NOTE:</b> These fields include dropped traffic and exception traffic, as those fields are not separately defined.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b> |
| <b>Input errors</b>            | <p>Input errors on the interface:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>Resource errors</b>—Sum of B chip Tx drops and IXP Tx net transmit drops.</li> </ul>                                                                                                            | <b>extensive</b>        |
| <b>Output errors</b>           | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b> —Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), then the cable, the far-end system, or the PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of B chip Tx drops and IXP Tx net transmit drops.</li> </ul> | <b>extensive</b>        |

| <b>Logical interface</b>  | Name of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | All levels                   |
| <b>Index</b>              | Logical interface index number (which reflects its initialization sequence).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>       | Logical interface SNMP interface index number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail extensive none</b> |
| <b>Generation</b>         | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b>      |
| <b>Flags</b>              | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | All levels                   |
| <b>Encapsulation</b>      | Type of encapsulation configured on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | All levels                   |
| <b>PPP parameters</b>     | PPP status: <ul style="list-style-type: none"> <li>• LCP restart timer—Length of time (in milliseconds) between successive Link Control Protocol (LCP) configuration requests.</li> <li>• NCP restart timer—Length of time (in milliseconds) between successive Network Control Protocol (NCP) configuration requests.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail</b>                |
| <b>PPPoE</b>              | PPPoE status: <ul style="list-style-type: none"> <li>• <b>State</b>—State of the logical interface (<b>up</b> or <b>down</b>).</li> <li>• <b>Session ID</b>—PPPoE session ID.</li> <li>• <b>Service name</b>—Type of service required. Can be used to indicate an Internet service provider (ISP) name or a class or quality of service.</li> <li>• <b>Configured AC name</b>—Configured access concentrator name.</li> <li>• <b>Auto-reconnect timeout</b>—Time after which to try to reconnect after a PPPoE session is terminated, in seconds.</li> <li>• <b>Idle Timeout</b>—Length of time (in seconds) that a connection can be idle before disconnecting.</li> <li>• <b>Underlying interface</b>—Interface on which PPPoE is running.</li> </ul> | All levels                   |
| <b>Link</b>               | Name of the physical interfaces for member links in an aggregated Ethernet bundle for a PPPoE over aggregated Ethernet configuration. PPPoE traffic goes out on these interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | All levels                   |
| <b>Traffic statistics</b> | Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize.                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b>      |

Table 132: show interfaces (PPPoE) Output Fields (continued)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Level of Output  |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| IPv6 transit statistics | <p>Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.</p> <p><b>NOTE:</b> The packet and byte counts in these fields include traffic that is dropped and does not leave the router.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                                                                                                                                                                                                                        | detail extensive |
| Local statistics        | <p>Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | detail extensive |
| Transit statistics      | <p>Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize.</p> <p><b>NOTE:</b> The packet and byte counts in these fields include traffic that is dropped and does not leave the router.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | detail extensive |
| Keepalive settings      | <p>(PPP and HDLC) Configured settings for keepalives.</p> <ul style="list-style-type: none"> <li>• <b>interval seconds</b>—The time in seconds between successive keepalive requests. The range is 10 seconds through 32,767 seconds, with a default of 10 seconds.</li> <li>• <b>down-count number</b>—The number of keepalive packets a destination must fail to receive before the network takes a link down. The range is 1 through 255, with a default of 3.</li> <li>• <b>up-count number</b>—The number of keepalive packets a destination must receive to change a link's status from down to up. The range is 1 through 255, with a default of 1.</li> </ul>                                                                                                                                                                                                                                                                       | detail extensive |
| Keepalive statistics    | <p>(PPP and HDLC) Information about keepalive packets.</p> <ul style="list-style-type: none"> <li>• <b>Input</b>—Number of keepalive packets received by PPP. <ul style="list-style-type: none"> <li>• <b>(last seen 00:00:00 ago)</b>—Time the last keepalive packet was received, in the format <i>hh:mm:ss</i>.</li> </ul> </li> <li>• <b>Output</b>—Number of keepalive packets sent by PPP and how long ago the last keepalive packets were sent and received. <ul style="list-style-type: none"> <li>• <b>(last seen 00:00:00 ago)</b>—Time the last keepalive packet was sent, in the format <i>hh:mm:ss</i>.</li> </ul> </li> </ul> <p>(MX Series routers with MPCs/MICs) When an MX Series router with MPCs/MICs is using PPP fast keepalive for a PPP link, the display does not include the number of keepalive packets received or sent, or the amount of time since the router received or sent the last keepalive packet.</p> | detail extensive |
| Input packets           | Number of packets received on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | None specified   |

For example, <b>0</b> refers to the routing table <b>inet.0</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> none |
| <b>Flags</b>                  | Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b> none |

Table 132: show interfaces (PPPoE) Output Fields (continued)

| Field Name              | Field Description                                                                                                                                                                  | Level of Output              |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Addresses, Flags</b> | Information about the addresses configured for the protocol family. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> . | <b>detail extensive none</b> |
| <b>Destination</b>      | IP address of the remote side of the connection.                                                                                                                                   | <b>detail extensive none</b> |
| <b>Local</b>            | IP address of the logical interface.                                                                                                                                               | <b>detail extensive none</b> |
| <b>Broadcast</b>        | Broadcast address.                                                                                                                                                                 | <b>detail extensive none</b> |

## Sample Output

### show interfaces (PPPoE)

```

user@host> show interfaces pp0
Physical interface: pp0, Enabled, Physical link is Up
  Interface index: 128, SNMP ifIndex: 24
  Type: PPPoE, Link-level type: PPPoE, MTU: 1532
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps
  Link type      : Full-Duplex
  Link flags     : None
  Input rate     : 0 bps (0 pps)
  Output rate    : 0 bps (0 pps)

Logical interface pp0.0 (Index 72) (SNMP ifIndex 72)
  Flags: Hardware-Down Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPPoE
  PPPoE:
    State: SessionDown, Session ID: None,
    Service name: None, Configured AC name: sapphire,
    Auto-reconnect timeout: 100 seconds, Idle timeout: Never,
    Underlying interface: at-5/0/0.0 (Index 70)
  Input packets : 0
  Output packets: 0
  LCP state: Not-configured
  NCP state: inet: Not-configured, inet6: Not-configured, iso: Not-configured,
  mpls: Not-configured
  CHAP state: Closed
    Protocol inet, MTU: 100
    Flags: User-MTU, Negotiate-Address

```

### show interfaces (PPPoE over Aggregated Ethernet)

```

user@host> show interfaces pp0.1073773821
Logical interface pp0.1073773821 (Index 80) (SNMP ifIndex 32584)
  Flags: Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPPoE
  PPPoE:
    State: SessionUp, Session ID: 1,
    Session AC name: alcor, Remote MAC address: 00:00:5e:00:53:01,
    Underlying interface: demux0.100 (Index 88)
  Link:

```

```

ge-1/0/0.32767
ge-1/0/1.32767
  Input packets : 6
  Output packets: 6
  LCP state: Opened
  NCP state: inet: Opened, inet6: Not-configured, iso: Not-configured, mp1s:
Not-configured
  CHAP state: Closed
  PAP state: Success
  Protocol inet, MTU: 1500
  Flags: Sendbroadcast-pkt-to-re
  Addresses, Flags: Is-Primary
  Local: 203.0.113.1

```

### show interfaces brief (PPPoE)

```
user@host> show interfaces pp0 brief
```

```

Physical interface: pp0, Enabled, Physical link is Up
  Type: PPPoE, Link-level type: PPPoE, MTU: 1532, Speed: Unspecified
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps

Logical interface pp0.0
  Flags: Hardware-Down Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPPoE
  PPPoE:
    State: SessionDown, Session ID: None,
    Service name: None, Configured AC name: sapphire,
    Auto-reconnect timeout: 100 seconds, Idle timeout: Never,
    Underlying interface: at-5/0/0.0 (Index 70)
  inet

```

### show interfaces detail (PPPoE)

```
user@host> show interfaces pp0 detail
```

```

Physical interface: pp0, Enabled, Physical link is Up
  Interface index: 128, SNMP ifIndex: 24, Generation: 9
  Type: PPPoE, Link-level type: PPPoE, MTU: 1532, Speed: Unspecified
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps
  Link type      : Full-Duplex
  Link flags     : None
  Physical info  : Unspecified
  Hold-times     : Up 0 ms, Down 0 ms
  Current address: Unspecified, Hardware address: Unspecified
  Alternate link address: Unspecified
  Statistics last cleared: Never
  Traffic statistics:
    Input bytes   : 0 0 bps
    Output bytes  : 0 0 bps
    Input packets : 0 0 pps
    Output packets: 0 0 pps
  Logical interface pp0.0 (Index 72) (SNMP ifIndex 72) (Generation 14)
  Flags: Hardware-Down Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPPoE
  PPPoE:
    State: SessionDown, Session ID: None,
    Service name: None, Configured AC name: sapphire,
    Auto-reconnect timeout: 100 seconds, Idle timeout: Never,

```

```

    Underlying interface: at-5/0/0.0 (Index 70)
Traffic statistics:
  Input bytes : 0
  Output bytes : 0
  Input packets: 0
  Output packets: 0
Local statistics:
  Input bytes : 0
  Output bytes : 0
  Input packets: 0
  Output packets: 0
Transit statistics:
  Input bytes : 0 0 bps
  Output bytes : 0 0 bps
  Input packets: 0 0 pps
  Output packets: 0 0 pps
LCP state: Not-configured
NCP state: inet: Not-configured, inet6: Not-configured, iso: Not-configured,
mpls: Not-configured
CHAP state: Closed
  Protocol inet, MTU: 100, Generation: 14, Route table: 0
  Flags: User-MTU, Negotiate-Address

```

#### show interfaces extensive (PPPoE on M120 and M320 Routers)

```
user@host> show interfaces pp0 extensive
```

```

Physical interface: pp0, Enabled, Physical link is Up
Interface index: 128, SNMP ifIndex: 93, Generation: 129
Type: PPPoE, Link-level type: PPPoE, MTU: 1532, Speed: Unspecified
Device flags : Present Running
Interface flags: Point-To-Point SNMP-Traps
Link type : Full-Duplex
Link flags : None
Physical info : Unspecified
Hold-times : Up 0 ms, Down 0 ms
Current address: Unspecified, Hardware address: Unspecified
Alternate link address: Unspecified
Statistics last cleared: Never
Traffic statistics:
  Input bytes : 972192 0 bps
  Output bytes : 975010 0 bps
  Input packets: 1338 0 pps
  Output packets: 1473 0 pps
IPv6 transit statistics:
  Input bytes : 0
  Output bytes : 0
  Input packets: 0
  Output packets: 0
Input errors:
  Errors: 0, Drops: 0, Framing errors: 0, Runts: 0, Giants: 0, Policed discards:
0,
  Resource errors: 0
Output errors:
  Carrier transitions: 0, Errors: 0, Drops: 0, MTU errors: 0, Resource errors:
0

Logical interface pp0.0 (Index 69) (SNMP ifIndex 96) (Generation 194)
Flags: Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPPoE
PPPoE:

```

```
State: SessionUp, Session ID: 26,
Session AC name: None, AC MAC address: 00:00:5e:00:53:12,
Service name: None, Configured AC name: None,
Auto-reconnect timeout: Never, Idle timeout: Never,
Underlying interface: ge-3/0/1.0 (Index 67)
Traffic statistics:
Input bytes :                252
Output bytes :                296
Input packets:                7
Output packets:              8
IPv6 transit statistics:
Input bytes :                0
Output bytes :                0
Input packets:                0
Output packets:              0
Local statistics:
Input bytes :                252
Output bytes :                296
Input packets:                7
Output packets:              8
Transit statistics:
Input bytes :                0                0 bps
Output bytes :                0                0 bps
Input packets:                0                0 pps
Output packets:              0                0 pps
IPv6 transit statistics:
Input bytes :                0
Output bytes :                0
Input packets:                0
Output packets:              0
Keepalive settings: Interval 10 seconds, Up-count 1, Down-count 3
Keepalive statistics:
Input : 1 (last seen 00:00:00 ago)
Output: 1 (last sent 00:00:03 ago)
LCP state: Opened
NCP state: inet: Opened, inet6: Not-configured, iso: Not-configured, mpls:
Not-configured
CHAP state: Closed
PAP state: Closed
Protocol inet, MTU: 1492, Generation: 171, Route table: 0
Flags: None
Addresses, Flags: Is-Preferred Is-Primary
Destination: 203.0.113.2, Local: 203.0.113.1, Broadcast: Unspecified,
Generation: 206
```

## show interfaces interface-set (Ethernet Interface Set)

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### Physical Interface

Table 133: Ethernet show interfaces interface-set Output Fields (continued)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output    |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| <b>Interface set</b>           | <p>Name of the interface set or sets.</p> <p>For ACI interface sets, the set name is prefixed with <b>aci-</b>.</p> <p>For ALI interface sets, the set name is prefixed with the trusted option that the interface set is based on:</p> <ul style="list-style-type: none"> <li>• <b>aci</b>— The ACI is configured as the trusted option.</li> <li>• <b>ari</b>— The ARI is configured as the trusted option.</li> <li>• <b>aci+ari</b>— Both ACI and ARI are configured as the trusted option.</li> <li>• <b>noids</b>— Neither the ACI nor the ARI is configured as the trusted option and neither ACI nor ARI is received.</li> </ul>                                                             | All levels         |
| <b>Interface set index</b>     | Index number of the interface set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail none</b> |
| <b>ACI VLAN</b>                | <p>For ACI interface sets, the string received in DHCP or PPPoE control packets that uniquely identifies the subscriber's access node and the DSL line on the access node. Only the <b>Agent Circuit ID</b> can be used to create the interface set.</p> <p><b>NOTE:</b> The ACI VLAN field is replaced with the Line Identity field when an ALI interface set is configured with the <b>line-identity</b> autoconfiguration stanza.</p>                                                                                                                                                                                                                                                             | <b>detail none</b> |
| <b>Line Identity</b>           | <p>For ALI interface sets, the trusted option received in DHCP or PPPoE control packets that uniquely identifies the subscriber's access node and the DSL line on the access node. The trusted option can be either or both of the following:</p> <ul style="list-style-type: none"> <li>• <b>Agent Circuit ID</b>—The ACI value</li> <li>• <b>Agent Remote ID</b>—The ARI value.</li> </ul> <p><b>NOTE:</b> When only <b>accept-no-ids</b> is configured as the trusted option, this field is not displayed.</p> <p><b>NOTE:</b> The Line Identity field is replaced with the ACI VLAN field when an ACI interface set is configured with the <b>agent-circuit-id</b> autoconfiguration stanza.</p> | <b>detail none</b> |
| <b>PPPoE</b>                   | Dynamic PPPoE subscriber interface that the router creates using the ACI or ALI interface set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail none</b> |
| <b>Max Sessions</b>            | For dynamic PPPoE subscriber interfaces, maximum number of PPPoE logical interfaces that that can be activated on the underlying interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail none</b> |
| <b>Max Sessions VSA Ignore</b> | For dynamic PPPoE subscriber interfaces, whether the router is configured to ignore (clear) the PPPoE maximum session value returned by RADIUS in the Max-Clients-Per-Interface Juniper Networks VSA [26-143] and restore the PPPoE maximum session value on the underlying interface to the value configured with the <b>max-sessions</b> statement: <b>Off</b> (default) or <b>On</b> .                                                                                                                                                                                                                                                                                                            | <b>detail none</b> |

Table 133: Ethernet show interfaces interface-set Output Fields (continued)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output    |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| <b>Traffic statistics</b>      | Number and rate of bytes and packets received and transmitted on the specified interface set.<br><br><ul style="list-style-type: none"> <li><b>Input bytes, Output bytes</b>—Number of bytes and number of bytes per second received and transmitted on the interface set</li> <li><b>Input packets, Output packets</b>—Number of packets and number of packets per second received and transmitted on the interface set.</li> </ul> | <b>detail</b>      |
| <b>Egress queues supported</b> | Total number of egress queues supported on the specified interface set.                                                                                                                                                                                                                                                                                                                                                              | <b>detail</b>      |
| <b>Egress queues in use</b>    | Total number of egress queues used on the specified interface set.                                                                                                                                                                                                                                                                                                                                                                   | <b>detail</b>      |
| <b>Queue counters</b>          | <b>Queued packets, Transmitted packets, and Dropped packets</b> statistics for the four forwarding classes.                                                                                                                                                                                                                                                                                                                          | <b>detail</b>      |
| <b>Members</b>                 | List of all interface sets or, for ACI interface sets, list of all subscriber interfaces belonging to the specified ACI interface set.                                                                                                                                                                                                                                                                                               | <b>detail none</b> |

## Sample Output

### show interfaces interface-set terse

| <b>Release Information</b>      | Command introduced in Junos OS Release 8.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | Display information about the gigabit or 10-Gigabit Ethernet interface set queue. Supported in MX Series routers with enhanced queuing DPCs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                  | <p><b><i>interface-set-name</i></b>—(Optional) Display information about the specified gigabit or 10-Gigabit Ethernet interface set. Wildcard values can be used in the interface set name.</p> <p><b>aggregate</b>—(Optional) Display the aggregated queuing statistics of all member logical interfaces for interface sets that have traffic-control profiles configured.</p> <p><b>both-ingress-egress</b>—(Optional) On Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs, display both ingress and egress queue statistics.</p> <p><b>egress</b>—(Optional) Display egress queue statistics.</p> <p><b>forwarding-class <i>class-name</i></b>—(Optional) Display queuing statistics for the specified forwarding class.</p> <p><b>ingress</b>—(Optional) On Gigabit Ethernet IQ2 PICs, display ingress queue statistics.</p> <p><b>remaining-traffic</b>—(Optional) Display the queuing statistics of all member logical interfaces for interface sets that do not have traffic-control profiles configured.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## show interfaces interval

**Syntax** `show interfaces interval  
<interface-name>`

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** Display the channel service unit (CSU) interface alarm and error count in 15-minute intervals for the past 24 hours. If the system has been operational for less than 24 hours, the maximum number of intervals available is displayed.

**Options** *interface-name*—(Optional) Name of a particular interface.

**Required Privilege Level** view

**Related Documentation**

- [clear interfaces interval on page 1525](#)

**List of Sample Output** [show interfaces interval \(Channelized OC12\) on page 2074](#)  
[show interfaces interval \(E3\) on page 2074](#)  
[show interfaces interval \(SONET/SDH\) on page 2074](#)

**Output Fields** [Table 135 on page 2072](#) lists the output fields for the **show interfaces interval** command. Output fields are listed in the approximate order in which they appear.

*Table 135: show interfaces interval Output Fields*

| Field Name         | Field Description                                                                                                                                                                                                                                                                                                                                             |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Physical interface | Name of the interface.                                                                                                                                                                                                                                                                                                                                        |
| SNMP ifIndex       | SNMP index number for the physical interface.                                                                                                                                                                                                                                                                                                                 |
| hh:mm-current      | Time of day (in hours and minutes) at the beginning of the latest counter interval. The value of the latest counter interval is always less than 15 minutes.                                                                                                                                                                                                  |
| hh:mm-hh:mm        | Time of day (in hours and minutes) at the beginning and end of each 15-minute interval.                                                                                                                                                                                                                                                                       |
| alarm or event: n  | Count of alarms and events within each 15-minute interval. The specific alarm or event depends on the interface media type. For a description of the alarm or event listed, see the <i>interface-type media</i> field (for example, <b>T1 media</b> ) under the <b>show interfaces</b> command for the particular interface type in which you are interested. |
| Interval Total     | Sum of all the alarm and defect counters for the last 24-hour period.                                                                                                                                                                                                                                                                                         |

*Table 135: show interfaces interval Output Fields (continued)*

| Field Name                         | Field Description                                                                                                                                  |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interval Total</b>              | Sum of all the alarm and defect counters for the last 24-hour period.                                                                              |
| <b>Current Day Interval Total</b>  | Sum of all the alarm and defect counters in the current day.<br><b>NOTE:</b> The <b>Current Day Interval</b> output field is reset after 24 hours. |
| <b>Previous Day Interval Total</b> | Sum of all the alarm and defect counters in the previous day.                                                                                      |

## Sample Output

### show interfaces interval (Channelized OC12)

```
user@host> show interfaces interval t3-0/3/0:0

Physical interface: t3-0/3/0:0, SNMP ifIndex: 23
17:43-current:
  LCV: 0, PCV: 0, CCV: 0, LES: 0, PES: 0, PSES: 0, CES: 0, CSES: 0,
  SEFS: 0, UAS: 0
17:28-17:43:
  LCV: 0, PCV: 0, CCV: 0, LES: 0, PES: 0, PSES: 0, CES: 0, CSES: 0,
  SEFS: 0, UAS: 0
17:13-17:28:
  LCV: 0, PCV: 0, CCV: 0, LES: 0, PES: 0, PSES: 0, CES: 0, CSES: 0,
  SEFS: 0, UAS: 0
16:58-17:13:
  LCV: 0, PCV: 0, CCV: 0, LES: 0, PES: 0, PSES: 0, CES: 0, CSES: 0,
  SEFS: 0, UAS: 0
16:43-16:58:
  LCV: 0, PCV: 0, CCV: 0, LES: 0, PES: 0, PSES: 0, CES: 0, CSES: 0,
  ...
Interval Total:
  LCV: 230, PCV: 1145859, CCV: 455470, LES: 0, PES: 230, PSES: 230,
  CES: 230, CSES: 230, SEFS: 230, UAS: 238
```

### show interfaces interval (E3)

```
user@host> show interfaces interval e3-0/3/0

Physical interface: e3-0/3/0, SNMP ifIndex: 23
17:43-current:
  LCV: 0, PCV: 0, CCV: 0, LES: 0, PES: 0, PSES: 0, CES: 0, CSES: 0,
  SEFS: 0, UAS: 0
17:28-17:43:
  LCV: 0, PCV: 0, CCV: 0, LES: 0, PES: 0, PSES: 0, CES: 0, CSES: 0,
  SEFS: 0, UAS: 0
17:13-17:28:

## show interfaces irb

**Syntax** `show interfaces irb`  
`<brief | detail | extensive | terse>`  
`<descriptions>`  
`<media>`  
`<snmp-index snmp-index>`  
`<statistics>`

**Release Information** Command introduced in Junos OS Release 8.4.

**Description** Display integrated routing and bridging interfaces information.

**Options** **brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**descriptions**—(Optional) Display interface description strings.

**mac**—Display hardware MAC address

**media**—(Optional) Display media-specific information about network interfaces.

**snmp-index *snmp-index***—(Optional) Display information for the interface with the specified SNMP index.

**statistics**—(Optional) Display static interface statistics.

**Additional Information** Integrated routing and bridging (IRB) provides simultaneous support for Layer 2 bridging and Layer 3 IP routing on the same interface. IRB enables you to route local packets to another routed interface or to another bridging domain that has a Layer 3 protocol configured.

**Required Privilege Level** view

**List of Sample Output** [show interfaces irb extensive on page 2080](#)  
[show interfaces irb snmp-index on page 2081](#)

**Output Fields** [Table 136 on page 2076](#) lists the output fields for the **show interfaces irb** command. Output fields are listed in the approximate order in which they appear.

*Table 136: show interfaces irb Output Fields*

| Field Name                | Field Description               | Level of Output |
|---------------------------|---------------------------------|-----------------|
| <b>Physical Interface</b> |                                 |                 |
| <b>Physical interface</b> | Name of the physical interface. | All levels      |

Table 136: show interfaces irb Output Fields (continued)

| Field Name                    | Field Description                                                                                                                                                                                                                                          | Level of Output                    |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|
| <b>Enabled</b>                | State of the physical interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .                                                                                                              | All levels                         |
| <b>Proto</b>                  | Protocol configured on the interface.                                                                                                                                                                                                                      | <b>terse</b>                       |
| <b>Interface index</b>        | Physical interface index number, which reflects its initialization sequence.                                                                                                                                                                               | <b>detail extensive none</b>       |
| <b>SNMP ifIndex</b>           | SNMP index number for the physical interface.                                                                                                                                                                                                              | <b>detail extensive none</b>       |
| <b>Type</b>                   | Physical interface type.                                                                                                                                                                                                                                   | <b>detail extensive none</b>       |
| <b>Link-level type</b>        | Encapsulation being used on the physical interface.                                                                                                                                                                                                        | <b>detail extensive brief none</b> |
| <b>MTU</b>                    | MTU size on the physical interface.                                                                                                                                                                                                                        | <b>detail extensive brief none</b> |
| <b>Clocking</b>               | Reference clock source: <b>Internal</b> or <b>External</b> . Always unspecified on IRB interfaces.                                                                                                                                                         | <b>detail extensive brief</b>      |
| <b>Speed</b>                  | Speed at which the interface is running. Always unspecified on IRB interfaces.                                                                                                                                                                             | <b>detail extensive brief</b>      |
| <b>Device flags</b>           | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .                                                                                                         | <b>detail extensive brief none</b> |
| <b>Interface flags</b>        | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                            | <b>detail extensive brief none</b> |
| <b>Link type</b>              | Physical interface link type: <b>full duplex</b> or <b>half duplex</b> .                                                                                                                                                                                   | <b>detail extensive none</b>       |
| <b>Link flags</b>             | Information about the link. Possible values are described in the “Links Flags” section under <i>Common Output Fields Description</i> .                                                                                                                     | <b>detail extensive none</b>       |
| <b>Physical Info</b>          | Physical interface information.                                                                                                                                                                                                                            | All levels                         |
| <b>Hold-times</b>             | Current interface hold-time up and hold-time down, in milliseconds.                                                                                                                                                                                        | <b>detail extensive</b>            |
| <b>Current address</b>        | Configured MAC address.                                                                                                                                                                                                                                    | <b>detail extensive none</b>       |
| <b>Hardware address</b>       | MAC address of the hardware.                                                                                                                                                                                                                               | <b>detail extensive none</b>       |
| <b>Alternate link address</b> | Backup address of the link.                                                                                                                                                                                                                                | <b>detail extensive</b>            |
| <b>Last flapped</b>           | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hours:minutes:seconds timezone (hours:minutes:seconds ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> . | <b>detail extensive none</b>       |

Table 136: show interfaces irb Output Fields (continued)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Level of Output         |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Statistics last cleared</b> | Time when the statistics for the interface were last set to zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| <b>Traffic statistics</b>      | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b> |
| <b>IPv6 transit statistics</b> | <p>Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |
| <b>Input errors</b>            | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>           | <b>detail extensive</b> |
| <b>Output errors</b>           | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the DPC is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>detail extensive</b> |

| <b>Logical Interface</b>       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                 |
| <b>Logical interface</b>       | Name of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels                      |
| <b>Index</b>                   | Index number of the logical interface (which reflects its initialization sequence).                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive</b><br>none |
| <b>SNMP ifIndex</b>            | SNMP interface index number of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>detail extensive</b><br>none |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b>         |
| <b>Flags</b>                   | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                 | <b>detail extensive</b>         |
| <b>Encapsulation</b>           | Encapsulation on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b>         |
| <b>Bandwidth</b>               | Dummy value that is ignored by an IRB interface. IRB interfaces are pseudo interfaces and do not have physical bandwidth associated with them.                                                                                                                                                                                                                                                                                                                                                  | <b>detail extensive</b>         |
| <b>Routing Instance</b>        | Routing instance IRB is configured under.                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b>         |
| <b>Bridging Domain</b>         | Bridging domain IRB is participating in.                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b>         |
| <b>Traffic statistics</b>      | Number and rate of bytes and packets received and transmitted on the logical interface. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                             | <b>detail extensive</b>         |
| <b>IPv6 transit statistics</b> | Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> | <b>detail extensive</b>         |
| <b>Local statistics</b>        | Statistics for traffic received from and transmitted to the Routing Engine.                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b>         |
| <b>Transit statistics</b>      | Statistics for traffic transiting the router.                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b>         |
| <b>Protocol</b>                | Protocol family configured on the local interface. Possible values are described in the “Protocol Field” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b>         |
| <b>MTU</b>                     | Maximum transmission unit size on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b>         |

Table 136: show interfaces irb Output Fields (continued)

| Field Name              | Field Description                                                                                                                                               | Level of Output                 |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <b>Maximum labels</b>   | Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.                                                                 | <b>detail extensive</b><br>none |
| <b>Generation</b>       | Unique number for use by Juniper Networks technical support only.                                                                                               | <b>detail extensive</b>         |
| <b>Route table</b>      | Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.                                             | <b>detail extensive</b>         |
| <b>Addresses, Flags</b> | Information about address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .                 | <b>detail extensive</b>         |
| <b>Policer</b>          | The policer that is to be evaluated when packets are received or transmitted on the interface.                                                                  | <b>detail extensive</b>         |
| <b>Flags</b>            | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> . | <b>detail extensive</b>         |

## Sample Output

### show interfaces irb extensive

```

user@host> show interfaces irb extensive

Physical interface: irb, Enabled, Physical link is Up
  Interface index: 129, SNMP ifIndex: 23, Generation: 130
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Clocking: Unspecified,
Speed: Unspecified
  Device flags   : Present Running
  Interface flags: SNMP-Traps
  Link type      : Full-Duplex
  Link flags     : None
  Physical info  : Unspecified
  Hold-times    : Up 0 ms, Down 0 ms
  Current address: 02:00:00:00:00:30, Hardware address: 02:00:00:00:00:30
  Alternate link address: Unspecified
  Last flapped   : Never
  Statistics last cleared: Never
  Traffic statistics:
    Input bytes : 0
    Output bytes : 0
    Input packets: 0
    Output packets: 0
  IPv6 transit statistics:
    Input bytes : 0
    Output bytes : 0
    Input packets: 0
    Output packets: 0
  Input errors:
    Errors: 0, Drops: 0, Framing errors: 0, Runts: 0, Giants: 0, Policed discards:
0, Resource errors: 0
  Output errors:
    Carrier transitions: 0, Errors: 0, Drops: 0, MTU errors: 0, Resource errors:
0

```

```

Logical interface irb.0 (Index 68) (SNMP ifIndex 70) (Generation 143)
  Flags: Hardware-Down SNMP-Traps 0x4000 Encapsulation: ENET2
  Bandwidth: 1000mbps
  Routing Instance: customer_0 Bridging Domain: bd0
  Traffic statistics:
    Input bytes : 0
    Output bytes : 0
    Input packets: 0
    Output packets: 0
  IPv6 transit statistics:
    Input bytes : 0
    Output bytes : 0
    Input packets: 0
    Output packets: 0
  Local statistics:
    Input bytes : 0
    Output bytes : 0
    Input packets: 0
    Output packets: 0
  Transit statistics:
    Input bytes : 0 0 bps
    Output bytes : 0 0 bps
    Input packets: 0 0 pps
    Output packets: 0 0 pps
  IPv6 transit statistics:
    Input bytes : 0
    Output bytes : 0
    Input packets: 0
    Output packets: 0
  Protocol inet, MTU: 1500, Generation: 154, Route table: 0
    Addresses, Flags: Dest-route-down Is-Preferred Is-Primary
      Destination: 10.51.1/24, Local: 10.51.1.2, Broadcast: 10.51.1.255,
      Generation: 155
  Protocol multiservice, MTU: 1500, Generation: 155, Route table: 0
    Flags: Is-Primary
    Policer: Input: __default_arp_policer

```

### show interfaces irb snmp-index

```
user@host> show interfaces snmp-index 25
```

```

Physical interface: irb, Enabled, Physical link is Up
  Interface index: 128, SNMP ifIndex: 25
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514
  Device flags : Present Running
  Interface flags: SNMP-Traps
  Link type : Full-Duplex
  Link flags : None
  Current address: 02:00:00:00:00:30, Hardware address: 02:00:00:00:00:30
  Last flapped : Never
    Input packets : 0
    Output packets: 0

Logical interface irb.0 (Index 68) (SNMP ifIndex 70)
  Flags: Hardware-Down SNMP-Traps 0x4000 Encapsulation: ENET2
  Bandwidth: 1000mbps
  Routing Instance: customer_0 Bridging Domain: bd0
  Input packets : 0
  Output packets: 0

```

```
Protocol inet, MTU: 1500
  Addresses, Flags: Dest-route-down Is-Preferred Is-Primary
    Destination: 10.51.1/24, Local: 10.51.1.2, Broadcast: 10.51.1.255
Protocol multiservice, MTU: 1500
  Flags: Is-Primary

| <b>Description</b>              | (M Series, T Series, MX Series routers, and PTX Series Packet Transport Routers only)<br>Display media access control (MAC) address information for the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                  | <p><b>ge-fpc/pic/port</b>—Display MAC addresses that have been learned on all logical interfaces on a particular physical interface.</p> <p><b>ge-fpc/pic/port.n</b>—Display MAC addresses that have been learned on a particular logical interface.</p> <p><b>aex</b>—Display MAC addresses that have been learned on a particular aggregated Ethernet interface.</p> <p><b>xe-fpc/pic/port</b>—Display MAC addresses that have been learned on all logical interfaces on a particular physical interface.</p> <p><b>xe-fpc/pic/port.n</b>—Display MAC addresses that have been learned on a particular logical interface.</p> <p><b>et-fpc/pic/port</b>—Display MAC addresses that have been learned on all logical interfaces on a particular physical interface.</p> <p><b>et-fpc/pic/port.n</b>—Display MAC addresses that have been learned on a particular logical interface.</p> <p><b>mac-address mac-address</b>—(Optional) Display detailed MAC address statistics, including policer information for <b>ge</b>, <b>xe</b>, and <b>et</b> interfaces.</p> |
| <b>Additional Information</b>   | On IQ2 PIC interfaces, the default value for maximum retention of entries in the MAC address table has changed, for cases in which the table is not full. The new holding time is 12 hours. The previous retention time of 3 minutes is still in effect when the table is full.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Physical interface</b>       | Name of the physical interface.                                                                                                                                                                                                                                                                                         |
| <b>Enabled</b>                  | State of the physical interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .                                                                                                                                                                           |
| <b>Interface index</b>          | Physical interface index number, which reflects its initialization sequence.                                                                                                                                                                                                                                            |
| <b>SNMP ifIndex</b>             | SNMP index number for the physical interface.                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | Description and name of the interface.                                                                                                                                                                                                                                                                                  |
| <b>Link-level type</b>          | Encapsulation being used on the physical interface.                                                                                                                                                                                                                                                                     |
| <b>MTU</b>                      | MTU size on the physical interface.                                                                                                                                                                                                                                                                                     |
| <b>Speed</b>                    | Speed at which the interface is running.                                                                                                                                                                                                                                                                                |
| <b>Loopback</b>                 | Whether loopback is enabled and the type of loopback: <b>local</b> or <b>remote</b> .                                                                                                                                                                                                                                   |
| <b>Source filtering</b>         | Whether source filtering is configured.                                                                                                                                                                                                                                                                                 |
| <b>Flow control</b>             | Whether flow control is enabled or disabled.                                                                                                                                                                                                                                                                            |
| <b>Minimum links needed</b>     | (Aggregated Ethernet interfaces only) Number of child links that must be operational for the aggregated interface to be operational.                                                                                                                                                                                    |
| <b>Minimum bandwidth needed</b> | (Aggregated Ethernet interfaces only) Minimum amount of bandwidth of child links that must be operational for the aggregated interface to be operational.                                                                                                                                                               |
| <b>Device flags</b>             | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                      |
| <b>Current address</b>          | (Aggregated Ethernet interfaces only) Configured MAC address.                                                                                                                                                                                                                                                           |
| <b>Hardware address</b>         | (Aggregated Ethernet interfaces only) Hardware MAC address.                                                                                                                                                                                                                                                             |
| <b>Last flapped</b>             | (Aggregated Ethernet interfaces only) Date, time, and how long ago the interface went from down to up or from up to down. The format is <b>Last flapped: year-month-day hours:minutes:seconds timezone (wwksddays hours:minutes ago)</b> . For example, <b>Last flapped: 2013-12-18 04:33:22 PST (1w5d 22:23 ago)</b> . |

Table 137: show interfaces mac-database Output Fields (continued)

| Field Name                                                                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Input Rate</b>                                                          | (Aggregated Ethernet interfaces only) Input rate in bits per second (bps) and packets per second (pps).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Output Rate</b>                                                         | (Aggregated Ethernet interfaces only) Output rate in bps and pps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Interface flags</b>                                                     | Information about the interface. | <b>Output Fields</b>            | <a href="#">Table 139 on page 2094</a> lists the output fields for the <b>show interfaces transport pm optics</b> command. Fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 139: show interfaces transport pm Output Fields

| Field Name                    | Field Description                                                                                                    |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------|
| Physical interface            | Name of the physical interface.                                                                                      |
| Interval                      | The 15 minute interval for performance monitoring.                                                                   |
| Suspect Flag                  | TRUE if the performance monitoring data for the interval appears to                                                  |
| Reason                        | Reason for setting the suspect flag.                                                                                 |
| COUNT                         | Measured value.                                                                                                      |
| THRESHOLD                     | Threshold value set.                                                                                                 |
| TCA-ENABLED                   | Threshold crossing alert. Set to TRUE if enabled.                                                                    |
| TCA-RAISED                    | TRUE if enabled and the value crosses the threshold.                                                                 |
| Near End PM                   | Near end threshold crossing defect trigger. For more information about                                               |
| Far End PM                    | Far end threshold crossing defect trigger. For more information about                                                |
| FEC PM                        | Forwarding equivalence class threshold crossing defect trigger. For more information about see <a href="#">tca</a> . |
| BER PM                        | Bit error rate threshold crossing defect trigger. For more information about                                         |
| CURRENT                       | Current value measured.                                                                                              |
| PM                            | Performance monitor.                                                                                                 |
| MIN                           | Minimum value measured.                                                                                              |
| MAX                           | Maximum value measured.                                                                                              |
| AVG                           | Average value.                                                                                                       |
| Lane Chromatic dispersion     | Residual chromatic dispersion measured.                                                                              |
| Lane differential group delay | Measured differential group delay.                                                                                   |
|                               |                                                                                                                      |
| q Value                       | Measured Quality factor value.                                                                                       |
| SNR                           | Signal to noise ratio.                                                                                               |
| Tx output power               | The transmit laser output power.                                                                                     |

Table 139: show interfaces transport pm Output Fields (continued)

| Field Name                     | Field Description                                                                                  |
|--------------------------------|----------------------------------------------------------------------------------------------------|
| Rx input power                 | The laser's received optical power.                                                                |
| Module temperature (Celsius)   | The laser's temperature.                                                                           |
| Tx Laser bias current (0.1mA)  | Magnitude of the laser bias power setting current. The laser bias provides and modulates currents. |
| Rx Laser bias current (0.1mA)  | Magnitude of the laser bias power setting current.                                                 |
| Carrier frequency offset (MHz) | Measured carrier frequency offset.                                                                 |

## Sample Output

|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <b>show l2-learning instance</b>                                                                                                                                                             |
| <b>Release Information</b>      | (MX Series routers only) Command introduced in Junos OS Release 8.4.                                                                                                                         |
| <b>Description</b>              | Display Layer 2 learning properties for all the configured routing instances.                                                                                                                |
| <b>Options</b>                  | This command has no options.                                                                                                                                                                 |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                         |
| <b>List of Sample Output</b>    | <a href="#">show l2-learning instance on page 2100</a>                                                                                                                                       |
| <b>Output Fields</b>            | <a href="#">Table 140 on page 2099</a> describes the output fields for the <b>show l2-learning instance</b> command. Output fields are listed in the approximate order in which they appear. |

*Table 140: show l2-learning instance Output Fields*

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Routing Instance</b>       | Name of routing instance.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Bridging Domain</b>        | Name of bridging domain.<br><br>On MX Series routers you can use the <b>show l2-learning instance &lt;extensive&gt;</b> command option to display the Bridge Service-id information which includes the Config Service ID and the Active Service ID.                                                                                                                                                                                                      |
| <b>Index</b>                  | Number associated with the routing instance or bridging domain.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Logical System</b>         | Name of logical system or <b>Default</b> if no logical system is configured.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Routing instance flags</b> | Status of Layer 2 learning properties for each routing instance: <ul style="list-style-type: none"> <li><b>DL</b>—MAC learning is disabled.</li> <li><b>SE</b>—MAC accounting is enabled.</li> <li><b>AD</b>—Packets are dropped after MAC address limit is reached.</li> <li><b>LH</b>—The maximum number of MAC addresses has been learned on the routing instance. The routing instance is not able to learn any additional MAC addresses.</li> </ul> |
| <b>MAC limit</b>              | Maximum number of MAC addresses that can be learned from each interface in the routing instance or bridging domain.                                                                                                                                                                                                                                                                                                                                      |

## Sample Output

### show l2-learning instance

```
user@host> show l2-learning instance
```

```
Information for routing instance:
```

```
Routing Instance flags (DL -disable learning, SE -stats enabled,  
AD -packet action drop, LH -mac limit hit)
```

| Routing Instance     | Bridging Domain | Index | Logical System | Routing flags | MAC limit |
|----------------------|-----------------|-------|----------------|---------------|-----------|
| __juniper_private1__ |                 | 1     | Default        |               | 5000      |
| vs1                  | vlan100         | 3     | Default        |               | 5120      |
| vs1                  | vlan200         | 4     | Default        |               | 5120      |

## show l2-learning redundancy-groups

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Description</b>              | <p>(MX Series routers only) Display ARP statistics, Neighbor Discovery statistics, or remote MAC addresses for the Multi-Chassis Aggregated Ethernet (MC-AE) nodes for all or specified redundancy groups on a router or switch or logical systems on a router or switch. Note that the Redundancy Group ID is inherited by the bridging domain or VLAN from member AE interfaces.</p>                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <p><b>logical-system [<i>system-name</i>   all]</b>—(Optional) Display information for a specified logical system or all systems.</p> <p><b>redundancy-group-id</b>—(Optional) The redundancy group identification number. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate the routing or switching devices contained in a redundancy group.</p> <p><b>arp-statistics</b>—(Optional) Count of ARP packets sent and received by the two MC-AE nodes.</p> <p><b>nd-statistics</b>—(Optional) Count of Neighbor Discovery packets sent and received by the two MC-AE nodes.</p> <p><b>remote-macs</b> —(Optional) List of remote MAC addresses in the “Installed” state, as learned from the remote MC-AE node.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Output Fields** Output fields are listed in the approximate order in which they appear.

**Table 141: show l2-learning redundancy-groups arp-statistics Output Fields**

| Field Name                        | Field Description                                                              |
|-----------------------------------|--------------------------------------------------------------------------------|
| Redundancy Group ID               | Redundancy Group to which the following details apply.                         |
| MCLAG ARP Statistics Group ID     | ARP statistics for this Multichassis Link Aggregation Group (MC-LAG) instance. |
| ARP Rx Count From Line            | Total number of ARPs received from the Line.                                   |
| ARP Tx Count To Peer              | Total number of ARPs sent to the peer.                                         |
| ARP Rx Count From Peer            | Total number of ARPs received from the peer.                                   |
| ARP Drop Count received from line | Total number of ARPs sent by the peer that were received.                      |
| ARP Drop Count received from peer | Total number of ARPs sent by the peer that were dropped                        |
| Service-id                        | Service ID (configured at the routing instance level).                         |

**Table 142: show l2-learning redundancy-groups nd-statistics Output Fields**

| Field Name                   | Field Description                                                                             |
|------------------------------|-----------------------------------------------------------------------------------------------|
| Redundancy Group ID          | Redundancy Group to which the following details apply.                                        |
| MCLAG ND Statistics Group ID | Neighbor Discovery statistics for this Multichassis Link Aggregation Group (MC-LAG) instance. |
| ND Rx Count From Line        | Total number of Neighbor Discovery packets received from the Line.                            |
| ND Tx Count To Peer          | Total number of Neighbor Discovery packets sent to the peer.                                  |
| NDRx Count From Peer         | Total number of Neighbor Discovery packets received from the peer.                            |

*Table 142: show l2-learning redundancy-groups nd-statistics Output Fields (continued)*

| Field Name                       | Field Description                                                               |
|----------------------------------|---------------------------------------------------------------------------------|
| ND Drop Count received from line | Total number of Neighbor Discovery packets sent by the peer that were received. |
| ND Drop Count received from peer | Total number of Neighbor Discovery packets sent by the peer that were dropped   |
| Service-id                       | Service ID (configured at the routing instance level).                          |

*Table 143: show l2-learning redundancy-groups remote-macs Output Fields*

| Field Name          | Field Description                                                                                                  |
|---------------------|--------------------------------------------------------------------------------------------------------------------|
| Redundancy Group ID | Redundancy Group to which the following details apply.                                                             |
| Peer-Addr           | IP address of the remote peer.                                                                                     |
| VLAN                | Virtual LAN identifier associated with the redundancy group.                                                       |
| MAC                 | Hardware media access control address associated with the redundancy group.                                        |
| MCAE-ID             | ID number of the MC-AE used by the redundancy group.                                                               |
| Flags               | Connection state: local connect or Remote connect. If no flag is shown, the redundancy group may not be connected. |
| Status              | Installation state: Installed or Not Installed.                                                                    |

## Sample Output

### show l2-learning redundancy-groups arp-statistics

```

user@host> show l2-learning redundancy-groups arp-statistics

Logical System : default
Redundancy Group ID : 1      Flags : Local Connect, Remote Connect

MCLAG ARP Statistics
Group ID                : 1
ARP Rx Count From Line  : 52
ARP Tx Count To Peer    : 15
ARP Rx Count From Peer  : 39
ARP Install Count       : 34
ARP Drop Count received from line : 37
ARP Drop Count received from peer  : 5

```

### show l2-learning redundancy-groups nd-statistics

```

user@host> show l2-learning redundancy-groups nd-statistics

```

```

Logical System : default
Redundancy Group ID : 1      Flags : Local Connect, Remote Connect

MCLAG ND Statistics
Group ID                    : 1
ND Rx Count From Line       : 52
ND Tx Count To Peer         : 15
ND Rx Count From Peer       : 39
ND Install Count            : 34
ND Drop Count received from line : 37
ND Drop Count received from peer : 5

```

### show l2-learning redundancy-groups remote-macs

```

user@host> show l2-learning redundancy-groups <redundancy-group-id> remote-macs

Redundancy Group ID : 1      Flags : Local Connect, Remote Connect

Service-id Peer-Addr  VLAN      MAC              MCAE-ID  Subunit  Opcode
Flags      Status
10          10.1.1.2   100     64:87:88:6a:df:f0  1         0        1
0           Installed

```

### show l2-learning redundancy-groups logical-system arp-statistics (for Logical Systems)

```

user@host> show l2-learning redundancy-groups logical-system LSI arp-statistics

Redundancy Group ID : 1      Flags : Local Connect, Remote Connect

MCLAG ARP Statistics
Group ID                    : 1
ARP Rx Count From Line      : 52
ARP Tx Count To Peer        : 15
ARP Rx Count From Peer      : 39
ARP Install Count           : 34
ARP Drop Count received from line : 37
ARP Drop Count received from peer : 5

```

### show l2-learning redundancy-groups logical-system nd-statistics (for Logical Systems)

```

user@host> show l2-learning redundancy-groups logical-system LSI nd-statistics

Redundancy Group ID : 1      Flags : Local Connect, Remote Connect

MCLAG ND Statistics
Group ID                    : 1
ND Rx Count From Line       : 52
ND Tx Count To Peer         : 15
ND Rx Count From Peer       : 39
ND Install Count            : 34
ND Drop Count received from line : 37
ND Drop Count received from peer : 5

```

### show l2-learning redundancy-groups group-id

```

user@host> show l2-learning redundancy-groups 1

```

```
Redundancy Group ID : 1      Flags : Local Connect,Remote Connect
```

#### `show l2-learning redundancy-groups logical-system`

```
user@host> show l2-learning redundancy-groups logical-system ls1
```

```
Redundancy Group ID : 2      Flags : Local Connect,Remote Connect
```

## show lacp interfaces

**Syntax** `show lacp interfaces`  
`<interface-name>`  
**extensive**

**Release Information** Command introduced in Junos OS Release 7.6.  
**extensive** statement introduced in Junos OS Release 16.1R1  
 Command introduced in Junos OS Release 10.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.  
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.  
 Command introduced in Junos OS Release 14.2R3

**Description** Display Link Aggregation Control Protocol (LACP) information about the specified aggregated Ethernet, Fast Ethernet, or Gigabit Ethernet interface.

**Options** **none**—Display LACP information for all interfaces.

**interface-name**—(Optional) Display LACP information for the specified interface:

- Aggregated Ethernet—**aenumber**
- Fast Ethernet—**fe-fpc/pic/port**
- Gigabit Ethernet—**ge-fpc/pic/port**
- 10 Gigabit Ethernet—**xe-fpc/pic/port**

**extensive**—Display LACP information for the interface in detail.

**NOTE:** The `show lacp interfaces` command returns the following error message if your system is not configured in either active or passive LACP mode:

“Warning: lacp subsystem not running – not needed by configuration”

**Required Privilege Level** view

| LACP State           | For a child interface configured with the force-up statement, LACP state displays FUP along with the interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | All Levels      |
| Aggregated interface | Aggregated interface value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All Levels      |
| LACP State           | <p>LACP state information for each aggregated interface:</p> <ul style="list-style-type: none"> <li>• <b>Role</b>—Role played by the interface. It can be one of the following: <ul style="list-style-type: none"> <li>• <b>Actor</b>—Local device participating in LACP negotiation.</li> <li>• <b>Partner</b>—Remote device participating in LACP negotiation.</li> </ul> </li> <li>• <b>Exp</b>—Expired state. <b>Yes</b> indicates the actor or partner is in an expired state. <b>No</b> indicates the actor or partner is not in an expired state.</li> <li>• <b>Def</b>—Default. <b>Yes</b> indicates that the actor's receive machine is using the default operational partner information, administratively configured for the partner. <b>No</b> indicates the operational partner information in use has been received in an LACP PDU.</li> <li>• <b>Dist</b>—Distribution of outgoing frames. <b>No</b> indicates distribution of outgoing frames on the link is currently disabled and is not expected to be enabled. Otherwise, the value is <b>Yes</b>.</li> <li>• <b>Col</b>—Collection of incoming frames. <b>Yes</b> indicates collection of incoming frames on the link is currently enabled and is not expected to be disabled. Otherwise, the value is <b>No</b>.</li> <li>• <b>Syn</b>—Synchronization. If the value is <b>Yes</b>, the link is considered synchronized. It has been allocated to the correct link aggregation group, the group has been associated with a compatible aggregator, and the identity of the link aggregation group is consistent with the system ID and operational key information transmitted. If the value is <b>No</b>, the link is not synchronized. It is currently not in the right aggregation.</li> <li>• <b>Aggr</b>—Ability of aggregation port to aggregate (<b>Yes</b>) or to operate only as an individual link (<b>No</b>).</li> <li>• <b>Timeout</b>—LACP timeout preference. Periodic transmissions of LACP PDUs occur at either a slow or fast transmission rate, depending upon the expressed LACP timeout preference (<b>Long Timeout</b> or <b>Short Timeout</b>).</li> <li>• <b>Activity</b>—Actor or partner's port activity. <b>Passive</b> indicates the port's preference for not transmitting LAC PDUs unless its partner's control value is <b>Active</b>. <b>Active</b> indicates the port's preference to participate in the protocol regardless of the partner's control value.</li> </ul> | All Levels      |

| <b>Output Fields</b>            | <a href="#">Table 145 on page 2111</a> describes the output fields for the <b>show lldp</b> command. Output fields are listed in the approximate order in which they appear. |

*Table 145: show lldp Output Fields*

| Field Name             | Field Description                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LLDP                   | Status of LLDP: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                                                                                                                                                                               |
| Advertisement interval | Value of the advertisement interval parameter.                                                                                                                                                                                                                                                                                                                                                    |
| Transmit delay         | Value of the transmit delay parameter.                                                                                                                                                                                                                                                                                                                                                            |
| Hold timer             | Value of the hold timer parameter.                                                                                                                                                                                                                                                                                                                                                                |
| Notification interval  | Value of the notification interval parameter.                                                                                                                                                                                                                                                                                                                                                     |
| Config Trap Interval   | Value of the configuration trap parameter.                                                                                                                                                                                                                                                                                                                                                        |
| Connection Hold timer  | Value of the connection hold timer parameter.                                                                                                                                                                                                                                                                                                                                                     |
| Port ID TLV subtype    | <ul style="list-style-type: none"> <li><i>interface-name</i>—Indicates the interface name as the port information for the local device.</li> <li><i>locally-assigned</i>—Indicates that the sub-type for port ID TLV generation is locally assigned value of SNMP index of the interface.</li> </ul> <p>For more information about port ID TLV subtype, see <a href="#">port-id-subtype..</a></p> |

Table 145: show lldp Output Fields (continued)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port Description TLV type | <p>Following value used for port description TLV:</p> <ul style="list-style-type: none"> <li><b>interface-alias (ifAlias)</b>—Indicates that the <i>ifAlias</i> MIB object value is used to generate the port description TLV.</li> <li><b>interface-description (ifDescr)</b>—Indicates that the <i>ifDescr</i> MIB object value is used to generate the port description TLV.</li> </ul> <p>For more information about port description TLV type, see <a href="#">port-description-type</a>.</p> |
| Interface                 | <p>Name of the interface for which LLDP configuration information is being reported</p> <p>For information about interface names, see <i>Interface Naming Overview</i>. For information about interface names for TX Matrix routers, see <i>TX Matrix Router Chassis and Interface Names</i>. For information about FPC numbering on TX Matrix routers, see <i>Routing Matrix with a TX Matrix Router FPC Numbering</i>.</p>                                                                       |
| Parent Interface          | Name of the aggregated Ethernet interface, if any, to which the interface belongs.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| LLDP                      | LLDP operating state. The state can be Enabled or Disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| LLDP-MED                  | LLDP-MED operating state. The state can be Enabled or Disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Power Negotiation         | LLDP power negotiation operating state. The state can be Enabled or Disabled.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| LLDP basic TLVs supported | List of basic LLDP TLVs supported by this device ( <b>detail</b> only).                                                                                                                                                                                                                                                                                                                                                                                                                            |
| LLDP 802 TLVs supported   | List of IEEE 802.1 LLDP TLVs supported by this device ( <b>detail</b> only).                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Sample Output

### show lldp

```
user@host> show lldp
```

```
LLDP : Enabled
Advertisement interval : 30 seconds
Transmit delay : 2 seconds
Hold timer : 120 seconds
Notification interval : 0 Second(s)
Config Trap Interval : 0 seconds
Connection Hold timer : 300 seconds
Port ID TLV subtype : locally-assigned
Port Description TLV type : interface-description (ifDescr)
```

| Interface | Parent Interface | LLDP    | LLDP-MED | Power Negotiation |
|-----------|------------------|---------|----------|-------------------|
| all       | -                | Enabled |          |                   |

## Sample Output

### show lldp detail

```
user@host> show lldp detail
```

```
LLDP : Enabled
Advertisement interval : 30 seconds
Transmit delay : 2 seconds
Hold timer : 120 seconds
Notification interval : 0 Second(s)
Config Trap Interval : 0 seconds
Connection Hold timer : 300 seconds
Port ID TLV subtype : locally-assigned
Port Description TLV type : interface-description (ifDescr)
```

| Interface      | Parent Interface | LLDP    | LLDP-MED | Power Negotiation |
|----------------|------------------|---------|----------|-------------------|
| Neighbor count |                  |         |          |                   |
| all            | -                | Enabled |          |                   |
| 2              |                  |         |          |                   |

| Interface | Parent Interface | Vlan-id | Vlan-name |
|-----------|------------------|---------|-----------|
| xe-0/0/0  | -                | 4080    | vlan-4080 |
| xe-0/0/1  | -                | 4080    | vlan-4080 |

Basic Management TLVs supported:

End Of LLDPDU, Chassis ID, Port ID, Time To Live, Port Description, System Name, System Description, System Capabilities, Management Address

Organizationally Specific TLVs supported:

Port VLAN tag, VLAN Name, MAC/PHY Configuration/Status, Link Aggregation, Maximum Frame Size

```

## show lldp neighbors

**Syntax** `show lldp neighbors`  
`<interface interface-name>`

**Release Information** Command introduced in Junos OS Release 9.6.

**Description** Display information about LLDP neighbors.

For information about interface names, see *Interface Naming Overview*. For information about interface names for TX Matrix routers, see *TX Matrix Router Chassis and Interface Names*. For information about FPC numbering on TX Matrix routers, see *Routing Matrix with a TX Matrix Router FPC Numbering*.

For information about extended port names in the Junos Fusion technology, see *Understanding Junos Fusion Ports*.

**Options** `interface interface-name`—(Optional) Display the neighbor information about a particular physical interface.

**NOTE:** Starting with Junos OS Release 14.2, you can also display LLDP neighbor details for management interfaces, such as fxp or me, on MX Series routers.

**Required Privilege Level** view

**Output Fields** [Table 147 on page 2117](#) describes the output fields for the `show lldp neighbors` command. Output fields are listed in the approximate order in which they appear.

*Table 147: show lldp neighbors Output Fields*

| Field Name                      | Field Description                 |
|---------------------------------|-----------------------------------|
| LLDP Remote Devices Information | Information about remote devices. |

Table 147: show lldp neighbors Output Fields (continued)

| Field Name                       | Field Description                                                                                                      |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>LocalInterface</b>            | List of local interfaces for which neighbor information is available.                                                  |
| <b>ChassisId</b>                 | List of chassis identifiers for neighbors.                                                                             |
| <b>PortInfo</b>                  | List of port information gathered from neighbors. This could be the port identifier or port description.               |
| <b>SysName</b>                   | List of system names gathered from neighbors.                                                                          |
| <b>LLDP Neighbor Information</b> | Information about both local and neighbor systems on the interface (appears when the <b>interface</b> option is used). |
| <b>Local Information</b>         | Information about local systems on the interface (appears when the <b>interface</b> option is used).                   |
| <b>Neighbor Information</b>      | Information about both local and neighbor system on the interface (appears when the <b>interface</b> option is used).  |
| <b>Index</b>                     | Local interface index (appears when the <b>interface</b> option is used).                                              |
| <b>Time Mark</b>                 | Date and timestamp of information (appears when the <b>interface</b> option is used).                                  |
| <b>Time To Live</b>              | Number of seconds for which this information is valid (appears when the <b>interface</b> option is used).              |
| <b>Local Interface</b>           | Name of the local physical interface (appears when the <b>interface</b> option is used).                               |
| <b>Parent Interface</b>          | Name of the <b>ae</b> interface to which the interface belongs                                                         |
| <b>Local Port ID</b>             | Local port identifier (appears when the <b>interface</b> option is used).                                              |
| <b>Neighbor Information</b>      | Information about neighbor systems on the interface (appears when the <b>interface</b> option is used).                |
| <b>Chassis type</b>              | Type of chassis identifier supplied, such as <b>MAC address</b> (appears when the <b>interface</b> option is used).    |
| <b>Chassis ID</b>                | Chassis identifier of type listed (appears when the <b>interface</b> option is used).                                  |
| <b>Port type</b>                 | Type of port identifier supplied, such as <b>local</b> (appears when the <b>interface</b> option is used).             |
| <b>Port ID</b>                   | Port identifier of type listed (appears when the <b>interface</b> option is used).                                     |
| <b>Port description</b>          | Port description (appears when the <b>interface</b> option is used).                                                   |

```

```
LLDP Remote Database Table Counters
```

| LastchangeTime    | Inserts | Deletes | Drops | Ageouts |
|-------------------|---------|---------|-------|---------|
| 00:00:76 (76 sec) | 192     | 0       | 0     | 0       |

## show lldp statistics

**Syntax** `show lldp statistics`  
`<interface interface-name>`

**Release Information** Command introduced in Junos OS Release 9.6.

**Description** Display information about Link Layer Discovery Protocol (LLDP) statistics.

**Options** `interface interface-name`—(Optional) Display the statistics about a particular physical interface.

**NOTE:** Starting with Junos OS Release 14.2, you can also display LLDP statistical details for management interfaces, such as `fxp` or `me`, on MX Series routers.

**Required Privilege Level** view

**Related Documentation** • [clear lldp statistics on page 1532](#)

**List of Sample Output** [show lldp statistics on page 2127](#)  
[show lldp statistics interface ge-0/1/1 on page 2127](#)

**Output Fields** [Table 149 on page 2125](#) describes the output fields for the `show lldp statistics` command. Output fields are listed in the approximate order in which they appear.

*Table 149: show lldp statistics Output Fields*

| Field Name         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Output Fields** Table 150 on page 2129 lists the output fields for the **show oam ethernet connectivity-fault-management delay-statistics** command and the **show oam ethernet connectivity-fault-management mep-statistics** command. Output fields are listed in the approximate order in which they appear.

*Table 150: show oam ethernet connectivity-fault-management delay-statistics and mep-statistics Output Fields*

| Output Field Name               | Field Description                                                                                                                                                                                                                                                                                                  |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MEP identifier                  | Maintenance association end point (MEP) numeric identifier.                                                                                                                                                                                                                                                        |
| MAC address                     | Unicast MAC address configured for the MEP.                                                                                                                                                                                                                                                                        |
| Remote MEP count                | Number of remote MEPs (unless you specify the <b>remote-mep</b> option).                                                                                                                                                                                                                                           |
| Remote MEP identifier           | Numeric identifier of the remote MEP.                                                                                                                                                                                                                                                                              |
| Remote MAC address              | Unicast MAC address of the remote MEP.                                                                                                                                                                                                                                                                             |
| Index                           | Index number that corresponds to the ETH-DM entry in the CFM database.                                                                                                                                                                                                                                             |
| One-way delay (usec)            | For a one-way ETH-DM session, the frame delay time, in microseconds, measured at the receiver MEP.<br><br>For a detailed description of one-way Ethernet frame delay measurement, see the <i>ITU-T Y.1731 Ethernet Service OAM</i> topics in the <i>Junos OS Network Interfaces Library for Routing Devices</i> .  |
| Two-way delay (usec)            | For a two-way ETH-DM session, the frame delay time, in microseconds, measured at the initiator MEP.<br><br>For a detailed description of two-way Ethernet frame delay measurement, see the <i>ITU-T Y.1731 Ethernet Service OAM</i> topics in the <i>Junos OS Network Interfaces Library for Routing Devices</i> . |
| Average one-way delay           | Average one-way frame delay for the statistics displayed.                                                                                                                                                                                                                                                          |
| Average one-way delay variation | Average one-way “frame jitter” for the statistics displayed.                                                                                                                                                                                                                                                       |
| Best-case one-way delay         | Lowest one-way frame delay for the statistics displayed.                                                                                                                                                                                                                                                           |
| Worst-case one-way delay        | Highest one-way frame delay for the statistics displayed.                                                                                                                                                                                                                                                          |
| Average two-way delay           | Average two-way frame delay for the statistics displayed.                                                                                                                                                                                                                                                          |
| Average two-way delay variation | Average two-way “frame jitter” for the statistics displayed.                                                                                                                                                                                                                                                       |
| Best-case two-way delay         | Lowest two-way frame delay for the statistics displayed.                                                                                                                                                                                                                                                           |
| Worst-case two-way delay        | Highest two-way frame delay calculated in this session.                                                                                                                                                                                                                                                            |

| <b>Interface</b>                        | Interface identifier.                                                                                                                                                                                        | All levels              |
| <b>Interface status</b>                 | Local interface status.                                                                                                                                                                                      | All levels              |
| <b>Link status</b>                      | Local link status. <b>Up</b> , <b>down</b> , or <b>oam-down</b> .                                                                                                                                            | All levels              |
| <b>Maintenance domain name</b>          | Maintenance domain name.                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>Format (Maintenance domain)</b>      | Maintenance domain name format configured.                                                                                                                                                                   | <b>detail extensive</b> |
| <b>Level</b>                            | Maintenance domain level configured.                                                                                                                                                                         | All levels              |
| <b>Maintenance association name</b>     | Maintenance association name.                                                                                                                                                                                | <b>detail extensive</b> |
| <b>Format (Maintenance association)</b> | Maintenance association name format configured.                                                                                                                                                              | <b>detail extensive</b> |
| <b>Continuity-check status</b>          | Continuity-check status.                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>Ethernet-ais status</b>              | Status of alarm indication signal (AIS). <b>active</b> or <b>in-active</b> .                                                                                                                                 | <b>detail extensive</b> |
| <b>Interval</b>                         | Continuity-check message interval.                                                                                                                                                                           | <b>detail extensive</b> |
| <b>Loss-threshold</b>                   | Lost continuity-check message threshold.                                                                                                                                                                     | <b>detail extensive</b> |
| <b>Interface status TLV</b>             | Status of the interface status TLV, if configured on the MEP interface: <b>none</b> , <b>up</b> , <b>down</b> , <b>testing</b> , <b>unknown</b> , <b>dormant</b> , <b>notPresent</b> , <b>lowerLayerDown</b> | <b>detail extensive</b> |
| <b>Port status TLV</b>                  | Status of the port status TLV, if configured on the MEP interface: <b>none</b> , <b>no</b> , <b>yes</b>                                                                                                      | <b>detail extensive</b> |

Table 152: show oam ethernet connectivity-fault-management interfaces Output Fields (continued)

| Field Name                                  | Field Description                                                                                                                                                                                                                                                                               | Level of Output         |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Connection Protection TLV</b>            | Status of the connection protection TLV if configured on the MEP interface: <b>no</b> , <b>yes</b><br><br>If <b>yes</b> , then the transmitted connection protection TLV is decoded and the following three fields are displayed: <b>Prefer me</b> , <b>Protection in use</b> , <b>FRR Flag</b> | <b>detail extensive</b> |
| <b>Prefer me</b>                            | If set to <b>yes</b> , the path through which CCM was transmitted is preferred (unless the path fails). It is used for signaling a manual-switch command to the remote side.<br><br>Its value can be <b>yes</b> or <b>no</b> .                                                                  | <b>detail extensive</b> |
| <b>Protection in use</b>                    | Used for protection decision coordination. Its value is set to <b>yes</b> if the endpoint transmitting the CCM is currently transmitting the user traffic to protection path.<br><br>Its value can be <b>yes</b> or <b>no</b> .                                                                 | <b>detail extensive</b> |
| <b>FRR Flag</b>                             | LSR/LER forwarding the CCM Frame into a bypass tunnel is set.<br><br>Its value can be <b>yes</b> or <b>no</b> .                                                                                                                                                                                 | <b>detail extensive</b> |
| <b>MEP identifier</b>                       | Maintenance association end point (MEP) identifier.                                                                                                                                                                                                                                             | All levels              |
| <b>Neighbors</b>                            | Number of MEP neighbors.                                                                                                                                                                                                                                                                        | All levels              |
| <b>Direction</b>                            | MEP direction configured.                                                                                                                                                                                                                                                                       | <b>detail extensive</b> |
| <b>MAC address</b>                          | MAC address configured for the MEP.                                                                                                                                                                                                                                                             | <b>detail extensive</b> |
| <b>MEP status</b>                           | Indicates the status of the connectivity fault management (CFM) protocol running on the MEP: <b>Running</b> , <b>inactive</b> , <b>disabled</b> , or <b>unsupported</b> .                                                                                                                       | <b>detail extensive</b> |
| <b>Remote MEP not receiving CCM</b>         | Whether the remote MEP is not receiving connectivity check messages (CCMs).                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>Erroneous CCM received</b>               | Whether erroneous CCMs have been received.                                                                                                                                                                                                                                                      | <b>detail extensive</b> |
| <b>Cross-connect CCM received</b>           | Whether cross-connect CCMs have been received.                                                                                                                                                                                                                                                  | <b>detail extensive</b> |
| <b>RDI sent by some MEP</b>                 | Whether the remote defect indication (RDI) bit is set in messages that have been received. The absence of the RDI bit in a CCM indicates that the transmitting MEP is receiving CCMs from all configured MEPs.                                                                                  | <b>detail extensive</b> |
| <b>Some remote MEP's MAC in error state</b> | Indicates whether the remote MEP's MAC is in error state.                                                                                                                                                                                                                                       | <b>detail extensive</b> |
| <b>Alarm Indication Signal</b>              | Indicates whether the AIS is triggered or is cleared.                                                                                                                                                                                                                                           | <b>detail extensive</b> |

Table 152: show oam ethernet connectivity-fault-management interfaces Output Fields (continued)

| Field Name                          | Field Description                                                                                                                                                                                                                   | Level of Output  |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| CCMs sent                           | Number of CCMs transmitted.                                                                                                                                                                                                         | detail extensive |
| CCMs received out of sequence       | Number of CCMs received out of sequence.                                                                                                                                                                                            | detail extensive |
| LBM sent                            | Number of loopback request messages (LBMs) sent.                                                                                                                                                                                    | detail extensive |
| Valid in-order LBRs received        | Number of loopback response messages (LBRs) received that were valid messages and in sequence.                                                                                                                                      | detail extensive |
| Valid out-of-order LBRs received    | Number of LBRs received that were valid messages and not in sequence.                                                                                                                                                               | detail extensive |
| LBRs received with corrupted data   | Number of LBRs received that were corrupted.                                                                                                                                                                                        | detail extensive |
| LBRs sent                           | Number of LBRs transmitted.                                                                                                                                                                                                         | detail extensive |
| LTM sent                            | Linktrace messages (LTMs) transmitted.                                                                                                                                                                                              | detail extensive |
| LTM received                        | Linktrace messages received.                                                                                                                                                                                                        | detail extensive |
| LTR sent                            | Linktrace responses (LTRs) transmitted.                                                                                                                                                                                             | detail extensive |
| LTR received                        | Linktrace responses received.                                                                                                                                                                                                       | detail extensive |
| Sequence number of next LTM request | Sequence number of next LTM request to be transmitted.                                                                                                                                                                              | detail extensive |
| 1DMs sent                           | <p>If the interface is attached to an initiator MEP for a one-way ETH-DM session: Number of one-way delay measurement (1DM) PDU frames sent to the peer MEP in this session.</p> <p>For all other cases, this field displays 0.</p> | detail extensive |
| Valid 1DMs received                 | <p>If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of valid 1DM frames received.</p> <p>For all other cases, this field displays 0.</p>                                                         | detail extensive |
| Invalid 1DMs received               | <p>If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of invalid 1DM frames received.</p> <p>For all other cases, this field displays 0.</p>                                                       | detail extensive |
| Out of sync 1DMs received           | <p>If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of out-of-sync one-way delay measurement request packets received.</p>                                                                       | detail extensive |

Table 152: show oam ethernet connectivity-fault-management interfaces Output Fields (continued)

| Field Name                          | Field Description                                                                                                                                                                                                            | Level of Output         |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>DMMs sent</b>                    | If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of Delay Measurement Message (DMM) PDU frames sent to the peer MEP in this session.<br><br>For all other cases, this field displays 0. | <b>detail extensive</b> |
| <b>Valid DMMs received</b>          | If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of valid two-way delay measurement request packets received.                                                                           | <b>detail extensive</b> |
| <b>Invalid DMMs received</b>        | If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of invalid two-way delay measurement request packets received.                                                                         | <b>detail extensive</b> |
| <b>DMRs sent</b>                    | If the interface is attached to a responder MEP for a two-way ETH-DM session: Number of delay measurement reply (DMR) frames sent.<br><br>For all other cases, this field displays 0.                                        | <b>detail extensive</b> |
| <b>Valid DMRs received</b>          | If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of valid DMRs received.<br><br>For all other cases, this field displays 0.                                                             | <b>detail extensive</b> |
| <b>Invalid DMRs received</b>        | If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of invalid DMRs received.<br><br>For all other cases, this field displays 0.                                                           | <b>detail extensive</b> |
| <b>LMM sent</b>                     | If the interface is attached to an initiator MEP for a ETH-LM session: Number of loss measurement message (LMM) PDU frames sent to the peer MEP in this session.                                                             | <b>detail extensive</b> |
| <b>Valid LMM received</b>           | If the interface is attached to an initiator MEP for a ETH-LM session: Number of valid loss measurement request packets received.                                                                                            | <b>detail extensive</b> |
| <b>Invalid LMM received</b>         | If the interface is attached to an initiator MEP for a ETH-LM session: Number of invalid loss measurement request packets received.                                                                                          | <b>detail extensive</b> |
| <b>LMR sent</b>                     | If the interface is attached to a responder MEP for a ETH-LM session: Number of loss measurement reply (LMR) frames sent.                                                                                                    | <b>detail extensive</b> |
| <b>Valid LMR received</b>           | If the interface is attached to an initiator MEP for a ETH-LM session: Number of valid LMR frames received.                                                                                                                  | <b>detail extensive</b> |
| <b>Invalid LMR received</b>         | If the interface is attached to an initiator MEP for a ETH-LM session: Number of invalid LMR frames received.                                                                                                                | <b>detail extensive</b> |
| <b>Valid AIS frames transmitted</b> | Number of valid AIS frames transmitted to the peer MEPs.                                                                                                                                                                     | <b>detail extensive</b> |
| <b>Valid AIS frames received</b>    | Number of valid AIS frames received from the peer MEPs.                                                                                                                                                                      | <b>detail extensive</b> |

Table 152: show oam ethernet connectivity-fault-management interfaces Output Fields (continued)

| Field Name                      | Field Description                                                                                                                                                                                                    | Level of Output         |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>SLM sent</b>                 | If the interface is attached to an initiator MEP for a ETH-SLM session: Number of synthetic loss measurement (SLM) request packets transmitted from the source MEP to the remote or destination MEP in this session. | <b>detail extensive</b> |
| <b>Valid SLM received</b>       | If the interface is attached to a responder MEP for a ETH-SLM session: Number of valid SLM PDUs transmitted from the source MEP to the remote or destination MEP.                                                    | <b>detail extensive</b> |
| <b>Invalid SLM received</b>     | If the interface is attached to a responder MEP for a ETH-SLM session: Number of invalid SLM PDUs transmitted from the source MEP to the remote or destination MEP.                                                  | <b>detail extensive</b> |
| <b>SLR sent</b>                 | If the interface is attached to a responder MEP for a ETH-SLM session: Number detail extensive of synthetic loss reply (SLR) frames sent.                                                                            | <b>detail extensive</b> |
| <b>Valid SLR received</b>       | If the interface is attached to an initiator MEP for a ETH-SLM session: Number of valid SLR PDUs that the source MEP received from the remote or destination MEP.                                                    | <b>detail extensive</b> |
| <b>Invalid SLR received</b>     | If the interface is attached to an initiator MEP for a ETH-SLM session: Number of invalid SLR PDUs that the source MEP received from the remote or destination MEP.                                                  | <b>detail extensive</b> |
| <b>Remote MEP count</b>         | Number of remote MEPs.                                                                                                                                                                                               | <b>extensive</b>        |
| <b>Identifier (remote MEP)</b>  | MEP identifier of the remote MEP.                                                                                                                                                                                    | <b>extensive</b>        |
| <b>MAC address (remote MEP)</b> | MAC address of the remote MEP.                                                                                                                                                                                       | <b>extensive</b>        |
| <b>State (remote MEP)</b>       | State of the remote MEP.                                                                                                                                                                                             | <b>extensive</b>        |
| <b>Interface (remote MEP)</b>   | Interface of the remote MEP.                                                                                                                                                                                         | <b>extensive</b>        |

### show oam ethernet connectivity-fault-management interfaces detail

```

user@host> show oam ethernet connectivity-fault-management interfaces detail

Interface name: ge-5/2/9.0, Interface status: Active, Link status: Up
Maintenance domain name: md0, Format: string, Level: 5
Maintenance association name: ma1, Format: string
Continuity-check status: enabled, Interval: 100ms, Loss-threshold: 3 frames
MEP identifier: 1, Direction: down, MAC address: 00:90:69:0b:4b:94
MEP status: running
Defects:
  Remote MEP not receiving CCM                : no
  Erroneous CCM received                       : yes
  Cross-connect CCM received                   : no
  RDI sent by some MEP                         : yes
  Alarm Indication Signal                      : yes
Statistics:
  CCMs sent                                   : 76
  CCMs received out of sequence                : 0
  LBMs sent                                   : 0
  Valid in-order LBRs received                 : 0
  Valid out-of-order LBRs received             : 0
  LBRs received with corrupted data            : 0
  LBRs sent                                    : 0
  LTMs sent                                    : 0
  LTRs received                               : 0

| <b>Output Fields</b>            | Table 153 on page 2147 lists the output fields for the <code>show oam ethernet connectivity-fault-management linktrace path-database</code> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                      |

*Table 153: show oam ethernet connectivity-fault-management linktrace path-database Output Fields*

| Field Name                     | Field Description                                                           |
|--------------------------------|-----------------------------------------------------------------------------|
| <b>Linktrace to</b>            | MAC address of the 802.1ag node to which the linktrace message is targeted. |
| <b>Interface</b>               | Interface used by the local MEP to send the linktrace message (LTM).        |
| <b>Maintenance Domain</b>      | Maintenance domain identifier specified in the traceroute command.          |
| <b>Maintenance Association</b> | Maintenance association identifier specified in the traceroute command.     |
| <b>Level</b>                   | Maintenance domain level configured for the maintenance domain.             |
| <b>Local Mep</b>               | MEP identifier of the local MEP originating the linktrace.                  |

Table 153: show oam ethernet connectivity-fault-management linktrace path-database Output Fields (continued)

| Field Name                    | Field Description                                                                                                                                                                                                                                                             |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Hop</b>                    | Sequential hop count of the linktrace path.                                                                                                                                                                                                                                   |
| <b>TTL</b>                    | Number of hops remaining in the linktrace message (LTM). The time to live (TTL) is decremented at each hop.                                                                                                                                                                   |
| <b>Source MAC address</b>     | MAC address of the 802.1ag node responding to the LTM or the source MAC address of the LTR.                                                                                                                                                                                   |
| <b>Next hop MAC address</b>   | MAC address of the egress interface of the node to which the LTM is forwarded or the next-hop MAC address derived from the next egress identifier in the Egress-ID TLV of the LTR PDU.                                                                                        |
| <b>Transaction Identifier</b> | 4-byte identifier maintained by the MEP. Each LTM uses a transaction identifier. The transaction identifier is maintained globally across all maintenance domains. Use the transaction identifier to match an incoming linktrace responses (LTR), with a previously sent LTM. |

## Sample Output

### show oam ethernet connectivity-fault-management linktrace path-database

```
user@host> show oam ethernet connectivity-fault-management linktrace path-database
maintenance-domain MD1 maintenance-association MA1 00:01:02:03:04:05
```

```
Linktrace to 00:01:02:03:04:05, Interface : ge-5/0/0.0
Maintenance Domain: MD1, Level: 7
Maintenance Association: MA1, Local Mep: 1
```

| <b>Output Fields</b>            | Table 154 on page 2150 lists the output fields for the <b>show oam ethernet connectivity-fault-management loss-statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 154: show oam ethernet connectivity-fault-management loss-statistics Output Fields

| Output Field Name     | Field Description                                                        |
|-----------------------|--------------------------------------------------------------------------|
| MEP identifier        | Maintenance association end point (MEP) numeric identifier.              |
| MAC address           | Unicast MAC address configured for the MEP.                              |
| Remote MEP count      | Number of remote MEPs (unless you specify the <b>remote-mep</b> option). |
| Remote MEP identifier | Numeric identifier of the remote MEP.                                    |

Table 154: show oam ethernet connectivity-fault-management loss-statistics Output Fields (continued)

| Output Field Name              | Field Description                                                                                                                                                              |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote MAC address             | Unicast MAC address of the remote MEP.                                                                                                                                         |
| Index                          | Index number that corresponds to the ETH-LM entry in the CFM database.                                                                                                         |
| Near-end frame loss            | Count of frame loss associated with ingress data frames.                                                                                                                       |
| Far-end frame loss             | Count of frame loss associated with egress data frames.                                                                                                                        |
| Near-end loss ratio            | Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the ingress interface. |
| Far-end loss ratio             | Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the egress interface.  |
| Average near-end frame loss    | Average frame loss measured in this session associated with ingress data frames.                                                                                               |
| Average near-end loss ratio    | Average frame loss ratio measured in this session associated with ingress data frames.                                                                                         |
| Average far-end frame loss     | Average frame loss measured in this session associated with egress data frames.                                                                                                |
| Average far-end loss ratio     | Average frame loss ratio measured in this session associated with egress data frames.                                                                                          |
| Near-end best case loss        | Lowest frame loss measured in this session associated with ingress data frames.                                                                                                |
| Near-end best case loss ratio  | Lowest frame loss ratio measured in this session associated with ingress data frames.                                                                                          |
| Near-end worst case loss       | Highest frame loss measured in this session associated with ingress data frames.                                                                                               |
| Near-end worst case loss ratio | Highest frame loss ratio measured in this session associated with ingress data frames.                                                                                         |
| Far-end best case frame loss   | Lowest frame loss measured in this session associated with egress data frames.                                                                                                 |
| Far-end best case loss ratio   | Lowest frame loss ratio measured in this session associated with egress data frames.                                                                                           |
| Far-end worst case loss        | Highest frame loss measured in this session associated with egress data frames.                                                                                                |
| Far-end worst case loss ratio  | Highest frame loss ratio measured in this session associated with egress data frames.                                                                                          |

| Field Name                           | Field Description                                                                                                                                                                                              |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>FRR Flag</b>                      | LSR/LER forwarding the CCM Frame into a bypass tunnel is set.<br><br>Its value can be <b>yes</b> or <b>no</b> .                                                                                                |
| <b>MEP identifier</b>                | Maintenance association end point (MEP) identifier.                                                                                                                                                            |
| <b>Direction</b>                     | MEP direction configured.                                                                                                                                                                                      |
| <b>MAC address</b>                   | MAC address configured for the MEP.                                                                                                                                                                            |
| <b>Auto-discovery</b>                | Whether automatic discovery is enabled or disabled.                                                                                                                                                            |
| <b>Priority</b>                      | Priority used for CCMs and linktrace messages transmitted by the MEP.                                                                                                                                          |
| <b>Interface name</b>                | Interface identifier.                                                                                                                                                                                          |
| <b>Interface status</b>              | Local interface status.                                                                                                                                                                                        |
| <b>Link status</b>                   | Local link status.                                                                                                                                                                                             |
| <b>Remote MEP not receiving CCM</b>  | Whether the remote MEP is not receiving CCMs.                                                                                                                                                                  |
| <b>Erroneous CCM received</b>        | Whether erroneous CCMs have been received.                                                                                                                                                                     |
| <b>Cross-connect CCM received</b>    | Whether cross-connect CCMs have been received.                                                                                                                                                                 |
| <b>RDI sent by some MEP</b>          | Whether the remote defect indication (RDI) bit is set in messages that have been received. The absence of the RDI bit in a CCM indicates that the transmitting MEP is receiving CCMs from all configured MEPs. |
| <b>CCMs sent</b>                     | Number of CCMs transmitted.                                                                                                                                                                                    |
| <b>CCMs received out of sequence</b> | Number of CCMs received out of sequence.                                                                                                                                                                       |
| <b>LBMs sent</b>                     | Number of loopback messages (LBMs) sent.                                                                                                                                                                       |
| <b>Valid in-order LBRs received</b>  | Number of loopback response messages (LBRs) received that were valid messages and in sequence.                                                                                                                 |
| <b>IDMs sent</b>                     | If the MEP is an initiator for a one-way ETH-DM session: Number of one-way delay measurement (IDM) PDU frames sent to the peer MEP in this session.<br><br>For all other cases, this field displays <b>0</b> . |

Table 155: show oam ethernet connectivity-fault-management mep-database Output Fields (continued)

| Field Name                               | Field Description                                                                                                                                                                                  |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Valid 1DMs received</b>               | If the MEP is a receiver for a one-way ETH-DM session: Number of valid 1DM frames received.<br>For all other cases, this field displays 0.                                                         |
| <b>Invalid 1DMs received</b>             | If the MEP is a receiver for a one-way ETH-DM session: Number of invalid 1DM frames received.<br>For all other cases, this field displays 0.                                                       |
| <b>Out of sync 1DMs received</b>         | If the MEP is a receiver for a one-way ETH-DM session: Number of out-of-sync one-way delay measurement request packets received.                                                                   |
| <b>DMMs sent</b>                         | If the MEP is an initiator for a two-way ETH-DM session: Number of Delay Measurement Message (DMM) PDU frames sent to the peer MEP in this session.<br>For all other cases, this field displays 0. |
| <b>Valid DMMs received</b>               | If the MEP is an initiator for a two-way ETH-DM session: Number of valid two-way delay measurement packets received.                                                                               |
| <b>Invalid DMMs received</b>             | If the MEP is an initiator for a two-way ETH-DM session: Number of invalid two-way delay measurement packets received.                                                                             |
| <b>DMRs sent</b>                         | If the MEP is a responder for a ETH-DM session: Number of Delay Measurement Reply (DMR) frames sent.<br>For all other cases, this field displays 0.                                                |
| <b>Valid DMRs received</b>               | If the MEP is an initiator for a two-way ETH-DM session: Number of valid DMRs received.<br>For all other cases, this field displays 0.                                                             |
| <b>Invalid DMRs received</b>             | If the MEP is an initiator for a two-way ETH-DM session: Number of invalid DMRs received.<br>For all other cases, this field displays 0.                                                           |
| <b>Valid out-of-order LBRs received</b>  | Number of LBRs received that were valid messages and not in sequence.                                                                                                                              |
| <b>LBRs received with corrupted data</b> | Number of LBRs received that were corrupted.                                                                                                                                                       |
| <b>LBRs sent</b>                         | Number of LBRs transmitted.                                                                                                                                                                        |
| <b>LTMs sent</b>                         | Linktrace messages (LTMs) transmitted.                                                                                                                                                             |
| <b>LTMs received</b>                     | Linktrace messages received.                                                                                                                                                                       |
| <b>LTRs sent</b>                         | Linktrace responses (LTRs) transmitted.                                                                                                                                                            |
| <b>LTRs received</b>                     | Linktrace responses received.                                                                                                                                                                      |

Table 155: show oam ethernet connectivity-fault-management mep-database Output Fields (continued)

| Field Name                                 | Field Description                                                                                                                                                                                                    |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Sequence number of next LTM request</b> | Sequence number of the next linktrace message request to be transmitted.                                                                                                                                             |
| <b>LMM sent</b>                            | If the interface is attached to an initiator MEP for a ETH-LM session: Number of loss measurement message (LMM) PDU frames sent to the peer MEP in this session.                                                     |
| <b>Valid LMM received</b>                  | If the interface is attached to an initiator MEP for a ETH-LM session: Number of valid loss measurement request packets received.                                                                                    |
| <b>Invalid LMM received</b>                | If the interface is attached to an initiator MEP for a ETH LM session: Number of invalid loss measurement request packets received.                                                                                  |
| <b>LMR sent</b>                            | If the interface is attached to a responder MEP for a ETH-LM session: Number of loss measurement reply (LMR) frames sent.                                                                                            |
| <b>Valid LMR received</b>                  | If the interface is attached to an initiator MEP for a ETH LM session: Number of valid LMR frames received.                                                                                                          |
| <b>Invalid LMR received</b>                | If the interface is attached to an initiator MEP for a ETH-LM session: Number of invalid LMR frames received.                                                                                                        |
| <b>SLM sent</b>                            | If the interface is attached to an initiator MEP for a ETH-SLM session: Number of synthetic loss measurement (SLM) request packets transmitted from the source MEP to the remote or destination MEP in this session. |
| <b>Valid SLM received</b>                  | If the interface is attached to a responder MEP for a ETH-SLM session: Number of valid SLM PDUs transmitted from the source MEP to the remote or destination MEP.                                                    |
| <b>Invalid SLM received</b>                | If the interface is attached to a responder MEP for a ETH-SLM session: Number of invalid SLM PDUs transmitted from the source MEP to the remote or destination MEP.                                                  |
| <b>SLR sent</b>                            | If the interface is attached to a responder MEP for a ETH-SLM session: Number detail extensive of synthetic loss reply (SLR) frames sent.                                                                            |
| <b>Valid SLR received</b>                  | If the interface is attached to an initiator MEP for a ETH-SLM session: Number of valid SLR PDUs that the source MEP received from the remote or destination MEP.                                                    |
| <b>Invalid SLR received</b>                | If the interface is attached to an initiator MEP for a ETH-SLM session: Number of invalid SLR PDUs that the source MEP received from the remote or destination MEP.                                                  |
| <b>Remote MEP identifier</b>               | MEP identifier of the remote MEP.                                                                                                                                                                                    |
| <b>State (remote MEP)</b>                  | State of the remote MEP: <b>idle</b> , <b>start</b> , <b>ok</b> , or <b>failed</b> .                                                                                                                                 |
| <b>MAC address</b>                         | MAC address of the remote MEP.                                                                                                                                                                                       |
| <b>Type</b>                                | Whether the remote MEP MAC address was learned using automatic discovery or configured.                                                                                                                              |

Table 155: show oam ethernet connectivity-fault-management mep-database Output Fields (continued)

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                | Interface of the remote MEP. A seven-digit number is appended if CFM is configured to run on a routing instance of type VPLS.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Last flapped             | Date, time, and how long ago the remote MEP interface went from down to up. The format is <b>Last flapped: year-month-day hours:minutes:seconds timezone (hours:minutes:seconds ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .                                                                                                                                                                                                                                                                               |
| Remote defect indication | Whether the remote defect indication (RDI) bit is set in messages that have been received or transmitted.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Port status TLV          | <ul style="list-style-type: none"> <li>In the Maintenance domain section, displays the last transmitted port status TLV value.</li> <li>In the Remote MEP section, displays the last value of port status TLV received from the remote MEP.</li> </ul> <p>In the Action profile section, displays, the last occurred event <b>port-status-tlv blocked</b> event. This event occurred due to the reception of <b>blocked</b> value in the port status TLV from remote MEP.</p>                                                                       |
| Interface status TLV     | <ul style="list-style-type: none"> <li>In the Maintenance domain section, displays the last transmitted interface status TLV value.</li> <li>In the Remote MEP section, displays the last value of interface status TLV received from the remote MEP.</li> </ul> <p>In the Action profile section, if displays, the last occurred event interface-status-tlv event ( either <b>lower-layer-down</b> or <b>down</b>). This event occurred due to the reception of either lower or <b>down</b> value in the interface status TLV from remote MEP.</p> |
| Action profile           | Name of the action profile occurrence associated with a remote MEP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Last event               | When an action profile occurs, displays the last event that triggered it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Last event cleared       | When all the configured and occurred events (under action profile) are cleared, then the action taken gets reverted (such as down interface is made up) and the corresponding time is noted and displayed.                                                                                                                                                                                                                                                                                                                                          |
| Action                   | Action taken and the corresponding time of the action occurrence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### show oam ethernet connectivity-fault-management mep-database

## (Connection Protection TLV Configured)

```
user@host>show oam ethernet connectivity-fault-management mep-database
maintenance-domain md5 maintenance-association ma5
```

If connection-protection is not enabled on down MEPs, but connection-protection TLV is used, MX always sets the protection-in-use flag in connection-protection tlv, while CCMs are sent out. During reversion, this is an indicator to the receiver that protect-path is in use, otherwise the peer (receiver) assumes working is active and reversion does not work as expected. Setting this bit does not affect protection-switching/traffic-loss.

|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MEP identifier                | Maintenance association end point (MEP) numeric identifier.                                                                                                                                                                                                                                                              |
| MAC address                   | Unicast MAC address configured for the MEP.                                                                                                                                                                                                                                                                              |
| Remote MEP count              | Number of remote MEPs (unless you specify the <b>remote-mep</b> option).                                                                                                                                                                                                                                                 |
| CCMs sent                     | Number of continuity check messages (CCMs) sent.                                                                                                                                                                                                                                                                         |
| CCMs received                 | Number of continuity check messages (CCMs) received for a specific remote MEP and maintenance association.                                                                                                                                                                                                               |
| CCMs received out of sequence | Number of continuity check messages (CCMs) received that were not in sequence.                                                                                                                                                                                                                                           |
| Remote MEP identifier         | Numeric identifier of the remote MEP.                                                                                                                                                                                                                                                                                    |
| Remote MAC address            | Unicast MAC address of the remote MEP.                                                                                                                                                                                                                                                                                   |
| Index                         | Index number that corresponds to the ETH-DM entry in the CFM database.                                                                                                                                                                                                                                                   |
| One-way delay (usec)          | <p>For a one-way ETH-DM session, the frame delay time, in microseconds, measured at the receiver MEP.</p> <p>For a detailed description of one-way Ethernet frame delay measurement, see the <i>ITU-T Y.1731 Ethernet Service OAM</i> topics in the <i>Junos OS Network Interfaces Library for Routing Devices</i>.</p>  |
| Two-way delay (usec)          | <p>For a two-way ETH-DM session, the frame delay time, in microseconds, measured at the initiator MEP.</p> <p>For a detailed description of two-way Ethernet frame delay measurement, see the <i>ITU-T Y.1731 Ethernet Service OAM</i> topics in the <i>Junos OS Network Interfaces Library for Routing Devices</i>.</p> |
| Average one-way delay         | Average one-way frame delay for the statistics displayed.                                                                                                                                                                                                                                                                |

*Table 156: show oam ethernet connectivity-fault-management delay-statistics and mep-statistics Output Fields (continued)*

| Output Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Average one-way delay variation   | Average one-way “frame jitter” for the statistics displayed.                                                                                                                                                                                                                                                                      |
| Best-case one-way delay           | Lowest one-way frame delay for the statistics displayed.                                                                                                                                                                                                                                                                          |
| Worst-case one-way delay          | Highest one-way frame delay for the statistics displayed.                                                                                                                                                                                                                                                                         |
| Average two-way delay             | Average two-way frame delay for the statistics displayed.                                                                                                                                                                                                                                                                         |
| Average two-way delay variation   | Average two-way “frame jitter” for the statistics displayed.                                                                                                                                                                                                                                                                      |
| Best-case two-way delay           | Lowest two-way frame delay for the statistics displayed.                                                                                                                                                                                                                                                                          |
| Worst-case two-way delay          | Highest two-way frame delay calculated in this session.                                                                                                                                                                                                                                                                           |
| SLM packets sent                  | Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.                                                                                                                                                                                                   |
| SLM packets received              | Total number of synthetic loss message (SLM) PDU frames that the remote MEP received from the source MEP during this ETH-SLM session.                                                                                                                                                                                             |
| SLR packets sent                  | Total number of synthetic loss reply (SLR) PDU frames that the remote MEP sent to the source MEP during this measurement session.                                                                                                                                                                                                 |
| SLR packets received              | Total number of synthetic loss reply (SLR) PDU frames that the source MEP received from the remote MEP during this measurement session.                                                                                                                                                                                           |
| Local TXFC1 value                 | Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.   |
| Local RXFC1 value                 | Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet. |
| Last Received SLR frame TXFCf(tc) | Value of the local counter TxFC1 at the time of SLM frame transmission.                                                                                                                                                                                                                                                           |
| Last Received SLR frame TXFCb(t   | Value of the local counter RxFC1 at the time of SLR frame transmission.                                                                                                                                                                                                                                                           |
| Frame loss (near-end)             | Count of frame loss associated with ingress data frames.                                                                                                                                                                                                                                                                          |
| Frame loss (far-end)              | Count of frame loss associated with egress data frames.                                                                                                                                                                                                                                                                           |

## Sample Output

**show oam ethernet connectivity-fault-management mep-statistics (CIR counters only)**

## show oam ethernet connectivity-fault-management path-database

**Syntax** `show oam ethernet connectivity-fault-management path-database`  
`<host-mac-address>`  
`<maintenance-association ma-name>`  
`<maintenance-domain domain-name>`

**Release Information** Command introduced in Junos OS Release 8.4.

**Description** On M7i and M10i with Enhanced CFEB (CFEB-E), M320, MX Series, ACX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management path database information for a host configured with an MEP.

**Options** ***host-mac-address***—(Optional) Display connectivity fault management path database information for a specified Ethernet host.

***maintenance-association ma-name***—(Optional) Display connectivity fault management path database information for the specified maintenance association.

***maintenance-domain domain-name***—(Optional) Display connectivity fault management path database information for the specified maintenance domain.

**Required Privilege Level** view

**List of Sample Output** [show oam ethernet connectivity-fault-management path-database on page 2178](#)

**Output Fields** [Table 157 on page 2177](#) lists the output fields for the **show oam ethernet connectivity-fault-management path-database** command. Output fields are listed in the approximate order in which they appear.

*Table 157: show oam ethernet connectivity-fault-management path-database Output Fields*

| Field Name                  | Field Description                           |
|-----------------------------|---------------------------------------------|
| Linktrace to                | MAC address of the remote MEPs in the path. |
| Interface                   | Interface identifier.                       |
| Maintenance domain name     | Maintenance domain name.                    |
| Format (Maintenance domain) | Maintenance domain name format configured.  |
| Level                       | Maintenance domain level configured.        |

*Table 157: show oam ethernet connectivity-fault-management path-database Output Fields (continued)*

| Field Name                   | Field Description             |
|------------------------------|-------------------------------|
| Maintenance association name | Maintenance association name. |
| Local Mep                    | Local MEP identifier.         |

## Sample Output

```
show oam ethernet
connectivity-fault
-management
path-database
```

```
user@host> show oam ethernet connectivity-fault-management path-database
maintenance-domain md1 maintenance-association ma1 00:05:85:79:39:ef
```

```
Linktrace to 00:05:85:79:39:ef, Interface : ge-3/0/0
  Maintenance Domain: md1, Level: 7
  Maintenance Association: ma1, Local Mep: 201
```

## show oam ethernet connectivity-fault-management policer

| Type                    | Policer type. Value <b>cc</b> means this policer is used only to police continuity check CFM messages. Value <b>other</b> means this policer is used only to police non-continuity check CFM messages. Value <b>all</b> means this policer is used to police all CFM messages. |
| Scope                   | Policer scope. Displays whether the <i>global</i> (G) policer configuration is applicable or the session (S) specific policer config is applicable.                                                                                                                            |
| Drop count              | Displays the number of packets dropped by the indicated policer.                                                                                                                                                                                                               |

## Sample Output

```
show oam ethernet
connectivity-fault
-management
policer
```

Displays the policer information for all maintenance associations and their maintenance domains.

```
show oam ethernet connectivity-fault-management policer
```

```
Legend for Policer

Table 159: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields

| Output Field Name                     | Output Field Description                                                                                     |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------|
| Maintenance domain                    | Name of the maintenance domain.                                                                              |
| Level                                 | Level of the maintenance domain level configured.                                                            |
| Maintenance association               | Name of the maintenance association.                                                                         |
| Local MEP id                          | Numeric identifier of the local MEP.                                                                         |
| Remote MEP id                         | Numeric identifier of the remote MEP.                                                                        |
| Remote MAC address                    | Unicast MAC address of the remote MEP.                                                                       |
| Iterator name                         | Name of iterator.                                                                                            |
| Iterator Id                           | Numeric identifier of the iterator.                                                                          |
| Iterator cycle time                   | Number of cycles (in milliseconds) taken between back-to-back transmission of SLA frames for this connection |
| Iteration period                      | Maximum number of cycles per iteration                                                                       |
| Iterator status                       | Current status of iterator whether running or stopped.                                                       |
| Infinite iterations                   | Status of iteration as infinite or finite.                                                                   |
| Counter reset time                    | Date and time when the counter was reset.                                                                    |
| Reset reason                          | Reason to reset counter.                                                                                     |
| Delay weight                          | Calculation weight of delay.                                                                                 |
| Delay variation weight                | Calculation weight of delay variation.                                                                       |
| DMM sent                              | Delay measurement message (DMM) PDU frames sent to the peer MEP in this session.                             |
| DMM skipped for threshold hit         | Number of DMM frames sent to the peer MEP in this session skipped during threshold hit.                      |
| DMM skipped for threshold hit window  | Number of DMM frames sent to the peer MEP in this session skipped during the last threshold hit window.      |
| DMR received                          | Number of delay measurement reply (DMR) frames received.                                                     |
| DMR out of sequence                   | Total number of DMR out of sequence packets received.                                                        |
| DMR received with invalid time stamps | Total number of DMR frames received with invalid timestamps.                                                 |

| Weighted average one-way forward delay variation  | Weighted average one-way forward delay variation for the statistics displayed in microseconds.                                                                                                                                                                                                                                    |
| SLM packets sent                                  | Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.                                                                                                                                                                                                   |
| SLM packets received                              | Total number of synthetic loss message (SLM) PDU frames that the remote MEP received from the source MEP during this ETH-SLM session.                                                                                                                                                                                             |
| SLR packets sent                                  | Total number of synthetic loss reply (SLR) PDU frames that the remote MEP sent to the source MEP during this measurement session.                                                                                                                                                                                                 |
| SLR packets received                              | Total number of synthetic loss reply (SLR) PDU frames that the source MEP received from the remote MEP during this measurement session.                                                                                                                                                                                           |
| Local TXFCI value                                 | Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.   |
| Local RXFCI value                                 | Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFCI is sent in the packet. |
| Last Received SLR frame TXFCf(tc)                 | Value of the local counter TxFCI at the time of SLM frame transmission.                                                                                                                                                                                                                                                           |
| Last Received SLR frame TXFCb(t)                  | Value of the local counter RxFCI at the time of SLR frame transmission.                                                                                                                                                                                                                                                           |

Table 159: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields (continued)

| Output Field Name     | Output Field Description                                 |
|-----------------------|----------------------------------------------------------|
| Frame loss (near-end) | Count of frame loss associated with ingress data frames. |
| Frame loss (far-end)  | Count of frame loss associated with egress data frames.  |

## Sample Output

### show oam ethernet connectivity-fault-management sla-iterator-statistics

```
user@switch> show oam ethernet connectivity-fault-management sla-iterator-statistics
maintenance-domain default-1 maintenance-association ma1 local-mep 1
remote-mep 2
```

```
Iterator statistics:
Maintenance domain: md6, Level: 6

| Release Information      | Command introduced in Junos OS Release 13.2 for MX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Description              | On MX Series routers with Modular Port Concentrators (MPCs) with Ethernet interfaces, display the on-demand ETH-SLM statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Options                  | <p><b>count</b> <i>entry-count</i>—(Optional) Number of entries to display from the statistics table. The range of values is from 1 through 100. The default value is 100.</p> <p><b>local-mep</b> <i>local-mep-id</i>—(Optional) Numeric identifier of the local MEP. The range of values is from 1 through 8192.</p> <p><b>maintenance-association</b> <i>ma-name</i>—Name of an existing CFM maintenance association.</p> <p><b>maintenance-domain</b> <i>md-name</i>—Name of an existing connectivity fault management (CFM) maintenance domain.</p> <p><b>remote-mep</b> <i>remote-mep-id</i>—(Optional) Numeric identifier of the remote MEP. The range of values is from 1 through 8192.</p> |
| Required Privilege Level | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Output Fields            | <a href="#">Table 160 on page 2188</a> lists the output fields for the <b>show oam ethernet connectivity-fault-management synthetic-loss-statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

*Table 160: show oam ethernet connectivity-fault-management synthetic-loss-statistics Output Fields*

| Output Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MEP identifier                    | Maintenance association end point (MEP) numeric identifier.                                                                                                                                                                                                                                                                       |
| MAC address                       | Unicast MAC address configured for the MEP.                                                                                                                                                                                                                                                                                       |
| Remote MEP count                  | Number of remote MEPs (unless you specify the <b>remote-mep</b> option).                                                                                                                                                                                                                                                          |
| Remote MEP identifier             | Numeric identifier of the remote MEP.                                                                                                                                                                                                                                                                                             |
| Remote MAC address                | Unicast MAC address of the remote MEP.                                                                                                                                                                                                                                                                                            |
| SLM packets sent                  | Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.                                                                                                                                                                                                   |
| SLM packets received              | Total number of synthetic loss message (SLM) PDU frames that the remote MEP received from the source MEP during this ETH-SLM session.                                                                                                                                                                                             |
| SLR packets sent                  | Total number of synthetic loss reply (SLR) PDU frames that the remote MEP sent to the source MEP during this measurement session.                                                                                                                                                                                                 |
| SLR packets received              | Total number of synthetic loss reply (SLR) PDU frames that the source MEP received from the remote MEP during this measurement session.                                                                                                                                                                                           |
| Local TXFCI value                 | Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.   |
| Local RXFCI value                 | Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TxFCI is sent in the packet. |
| Last Received SLR frame TXFCf(tc) | Value of the local counter TxFCI at the time of SLM frame transmission.                                                                                                                                                                                                                                                           |
| Last Received SLR frame TXFCb(t)  | Value of the local counter RxFCI at the time of SLR frame transmission.                                                                                                                                                                                                                                                           |
| Frame loss (near-end)             | Count of frame loss associated with ingress data frames.                                                                                                                                                                                                                                                                          |
| Frame loss (far-end)              | Count of frame loss associated with egress data frames.                                                                                                                                                                                                                                                                           |

  uni2             ge-1/1/1    Not Operational

```

## show oam ethernet fnp interface

**Syntax** `show oam ethernet fnp interface`  
`<ethernet-interface-name>`  
`<routing-instance routing-instance-name>`

**Release Information** Command introduced in Junos OS Release 11.4.

**Description** On MX Series routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet PICs, displays OAM Ethernet Failure Notification Protocol (FNP) information for Ethernet interfaces.

**Options** *interface-name*—(Optional) Display Ethernet FNP information for the specified Ethernet interface only.

*routing-instance-name*—(Optional) Display FNP for the specified routing instance.

**Required Privilege Level** view

**List of Sample Output** [show oam ethernet fnp interface on page 2192](#)

**Output Fields** [Table 162 on page 2192](#) lists the output fields for the `show oam ethernet fnp interface` command. Output fields are listed in the approximate order in which they appear.

*Table 162: show oam ethernet fnp interface Output Fields*

| Field Name                    | Field Description                                    |
|-------------------------------|------------------------------------------------------|
| <b>Interface</b>              | Name of the interface for the displayed information. |
| <b>VLAN</b>                   | Name of the VLAN.                                    |
| <b>State</b>                  | Displays state of the interface.                     |
| <b>FNP Message Interface</b>  | Displays the message interface type.                 |
| <b>FNP Message Source MAC</b> | Displays the source MAC address.                     |

## Sample Output

### show oam ethernet fnp interface

```
user@host> show oam ethernet fnp interface
```

```
The FNP controlled interfaces are:
Interface  VLAN   State  FNP message  FNP message
Interface  Source MAC
```

```
ge-0/0/0.30 30 down lsi.1054976 a0:aa:aa:aa:aa:aa
ge-0/0/0.20 20 down lsi.1054976 a0:aa:aa:aa:aa:aa
```

## show oam ethernet fnp messages

**Syntax** `show oam ethernet fnp messages`  
`<interface interface-name>`  
`<routing instance routing-instance-name>`

**Release Information** Command introduced in Junos OS Release 11.4

**Description** On MX Series routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet PICs, displays OAM Ethernet Failure Notification Protocol (FNP) messages.

**Options** *interface-name*—(Optional) Display Ethernet FNP messages for the specified Ethernet interface only.

*routing-instance-name*—(Optional) Display FNP messages for the specified routing instance.

**Required Privilege Level** view

**List of Sample Output** [show oam ethernet fnp messages on page 2195](#)

**Output Fields** [Table 163 on page 2194](#) lists the output fields for the `show oam ethernet fnp messages` command. Output fields are listed in the approximate order in which they appear.

*Table 163: show oam ethernet fnp messages Output Fields*

| Field Name                      | Field Description                                                                |
|---------------------------------|----------------------------------------------------------------------------------|
| Message from source MAC address | The source MAC address of the message.                                           |
| Originating port number         | Port number of the original message.                                             |
| Time since last message         | Elapsed time in hours, minutes, and seconds since the last message was received. |
| Time since last message update  | Elapsed time in hours, minutes, and seconds since the last message was updated.  |
| Total messages received         | Number of messages received.                                                     |
| Domain ID                       | Domain ID of the message.                                                        |
| STP Root ID                     | The spanning tree Root ID of the message.                                        |
| Trigger Reason                  | The reason why the message was triggered.                                        |

*Table 163: show oam ethernet fnp messages Output Fields (continued)*

| Field Name          | Field Description                         |
|---------------------|-------------------------------------------|
| Effectuated VLANs   | Number of VLANs that are affected.        |
| Disabled interfaces | Name of the interfaces that are disabled. |

## Sample Output

### show oam ethernet fnp messages

```
user@host> show oam ethernet fnp messages
Active FNP messages on interface lsi.1054465
Message source MAC: a0:aa:aa:aa:aa:aa
Originating port number: 141077
Time since last message: 00:00:00
Time since last message update: 00:00:00
Total messages received: 1
Domain ID: 0
STP Root ID: 0.f0:ff:ff:ff:ff:ff
Trigger reason: todo
Effectuated VLANs: 10
Disabled interfaces:
  Interface VLAN
  ge-0/0/0.10 10
```

## show oam ethernet fnp status

**Syntax** `show oam ethernet fnp status`  
`<interface interface-name>`  
`<routing instance routing-instance-name>`

**Release Information** Command introduced in Junos OS Release 11.4

**Description** On MX Series routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet PICs, displays OAM Ethernet Failure Notification Protocol (FNP) status.

**Options** *interface-name*—(Optional) Display Ethernet FNP information for the specified Ethernet interface only.

*routing-instance-name*—(Optional) Display FNP for the specified routing instance.

**Required Privilege Level** view

**List of Sample Output** [show oam ethernet fnp status on page 2196](#)

**Output Fields** [Table 164 on page 2196](#) lists the output fields for the **show oam ethernet fnp status** command. Output fields are listed in the approximate order in which they appear.

*Table 164: show oam ethernet fnp status Output Fields*

| Field Name             | Field Description                                                     |
|------------------------|-----------------------------------------------------------------------|
| FNP interval           | The time interval between messages.                                   |
| Loss threshold         | The number of messages that can be lost before FNP is marked as down. |
| FNP enabled interfaces | Displays interfaces that are enabled.                                 |
| Interface              | The name of the interface.                                            |
| Domain ID              | Domain ID of the message.                                             |
| STP Root ID            | The spanning tree Root ID of the message.                             |
| FNP Messages           | The total number of messages received.                                |

## Sample Output

**show oam ethernet fnp status**

```
user@host> show oam ethernet status
```

```
FNP interval:
Loss threshold
FNP enabled interfaces
Interface      Domain ID      STP Root ID      FNP Messages
ge-0/0/0.1278  100            0.f0:ff:ff:ff:ff:ff  0
```

## show oam ethernet link-fault-management

**Syntax**     `show oam ethernet link-fault-management`  
                  `<brief | detail>`  
                  `<interface-name>`

**Release Information**     Command introduced in Junos OS Release 8.2.

**Description**     On EX Series switches and M320, M120, MX Series, T320, and T640 routers, display Operation, Administration, and Management (OAM) link fault management information for Ethernet interfaces.

**Options**     **brief | detail**—(Optional) Display the specified level of output.

**interface-name**—(Optional) Display link fault management information for the specified Ethernet interface only.

**Required Privilege Level**     view

**List of Sample Output**     [show oam ethernet link-fault-management brief on page 2203](#)  
                                      [show oam ethernet link-fault-management brief \(Loopback tracking\) on page 2203](#)  
                                      [show oam ethernet link-fault-management detail on page 2203](#)  
                                      [show oam ethernet link-fault-management detail \(backup Routing Engine\) on page 2204](#)

**Output Fields**     [Table 165 on page 2198](#) lists the output fields for the **show oam ethernet link-fault-management** command. Output fields are listed in the approximate order in which they appear.

*Table 165: show oam ethernet link-fault-management Output Fields*

| Field Name             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Level of Output |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Status</b>          | Indicates the status of the OAM discovery state mechanism . <ul style="list-style-type: none"> <li>• <b>Down</b>—Discovery mechanism is not running..</li> <li>• <b>Running</b>—Discovery mechanism is running.</li> </ul>                                                                                                                                                                                                                                                                | All levels      |
| <b>Discovery state</b> | State of the discovery mechanism. If the status of the discovery mechanism is Down then the state of discovery mechanism is Fault. However, if the status of the discovery mechanism is Running then the state can be any one of the following: <ul style="list-style-type: none"> <li>• <b>Passive Wait</b></li> <li>• <b>Active Send Local</b></li> <li>• <b>Send Any</b></li> <li>• <b>Send Local Remote</b></li> <li>• <b>Send Local Remote Ok</b></li> <li>• <b>Fault</b></li> </ul> | All levels      |

Table 165: show oam ethernet link-fault-management Output Fields (continued)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| ISSU                      | Specifies that the local end is undergoing a unified in-service software upgrade (ISSU).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | All levels      |
| Peer address              | Address of the OAM peer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | All levels      |
| Flags                     | <p>Information about the interface. Possible values are described in the “Link Flags” section under <i>Common Output Fields Description</i>.</p> <ul style="list-style-type: none"> <li>• <b>Remote-Stable</b>—Indicates remote OAM client acknowledgment of and satisfaction with local OAM state information. <b>False</b> indicates that remote DTE either has not seen or is unsatisfied with local state information. <b>True</b> indicates that remote DTE has seen and is satisfied with local state information.</li> <li>• <b>Local-Stable</b>—Indicates local OAM client acknowledgment of and satisfaction with remote OAM state information. <b>False</b> indicates that local DTE either has not seen or is unsatisfied with remote state information. <b>True</b> indicates that local DTE has seen and is satisfied with remote state information.</li> <li>• <b>Remote-State-Valid</b>—Indicates the OAM client has received remote state information found within Local Information TLVs of received Information OAM PDUs. <b>False</b> indicates that OAM client has not seen remote state information. <b>True</b> indicates that the OAM client has seen remote state information.</li> </ul>                                                                             | All levels      |
| Remote loopback status    | Indicates the remote loopback status. An OAM entity can put its remote peer into loopback mode using the Loopback control OAM PDU. In loopback mode, every frame received is transmitted back on the same port (except for OAM PDUs, which are needed to maintain the OAM session).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | All levels      |
| Remote entity information | <p>Remote entity information.</p> <ul style="list-style-type: none"> <li>• <b>Remote MUX action</b>—Indicates the state of the multiplexer functions of the OAM sublayer. Device is forwarding non-OAM PDUs to the lower sublayer or discarding non-OAM PDUs.</li> <li>• <b>Remote parser action</b>—Indicates the state of the parser function of the OAM sublayer. Device is forwarding non-OAM PDUs to higher sublayer, looping back non-OAM PDUs to the lower sublayer, or discarding non-OAM PDUs.</li> <li>• <b>Discovery mode</b>—Indicates whether discovery mode is active or inactive.</li> <li>• <b>Unidirectional mode</b>—Indicates the ability to operate a link in a unidirectional mode for diagnostic purposes.</li> <li>• <b>Remote loopback mode</b>—Indicates whether remote loopback is supported or unsupported.</li> <li>• <b>Link events</b>—Indicates whether interpreting link events is supported or unsupported on the remote peer.</li> <li>• <b>Variable requests</b>—Indicates whether variable requests are supported. The Variable Request OAM PDU, is used to request one or more MIB variables from the remote peer.</li> <li>• <b>Remote in ISSU</b>—Indicates that the remote end is undergoing a unified in-service software upgrade (ISSU).</li> </ul> | All levels      |
| Loopback Tracking         | Indicates that loopback detection is enabled or disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels      |

Table 165: show oam ethernet link-fault-management Output Fields (continued)

| Field Name                                         | Field Description                                                                                                                                                                  | Level of Output |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Loop Status</b>                                 | Indicates that a loopback issue is either found, not found, or unknown when loopback tracking is enabled.                                                                          | All levels      |
| <b>Detect LOC</b>                                  | Indicates that loss-of-continuity (LOC) detection is enabled or disabled.                                                                                                          | All levels      |
| <b>LOC status</b>                                  | Indicates that a LOC issue is either found, not found, or unknown when Detect LOC is enabled. Status is unknown when LOC detection is disabled.                                    | All levels      |
| <b>OAM Receive Statistics</b>                      |                                                                                                                                                                                    |                 |

## show oam ethernet lmi

**Syntax** `show oam ethernet lmi (interface <interface-name>)`

**Release Information** Command introduced in Junos OS Release 9.5.

**Description** On routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet, and OAM Ethernet Local Management Interface (E-LMI) configuration, display the LMI information for the configured interfaces or optionally for a specified interface.

**NOTE:** On MX Series routers, E-LMI is supported on Gigabit Ethernet (ge), 10-Gigabit Ethernet (xe), and Aggregated Ethernet (ae) interfaces configured on MX Series routers with DPC only.

**Options** **interface**—(Optional) Display LMI information for a specified interface.

**interface-name**—(Optional) Display Ethernet LMI information for the specified interface only.

**Required Privilege Level** View

**Output Fields** [Table 166 on page 2206](#) lists the output fields for the **show oam ethernet lmi** command. Output fields are listed in the approximate order in which they appear.

*Table 166: show oam ethernet lmi Output Fields*

| Field Name                 | Field Description                                                                                                          |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Physical Interface         | Header for the EVC information showing the Ethernet virtual circuit (EVC) name, configuration, and active/inactive status. |
| UNI Identifier             | Name of the UNI.                                                                                                           |
| EVC map type               | EVC configuration.                                                                                                         |
| Polling verification timer | Polling verification timer status.                                                                                         |
| E-LMI state                | Operational status of the E-LMI configuration in the interfaces or specified interface.                                    |
| Priority/Untagged VLAN ID  | To be provided.                                                                                                            |
| Default EVC                | The EVC set as the default EVC.                                                                                            |

Table 166: show oam ethernet lmi Output Fields (continued)

| Field Name      | Field Description                        |
|-----------------|------------------------------------------|
| Associated EVCs | Heading for the list of configured EVCs. |
| EVC Identifier  | EVC name.                                |
| Reference ID    | To be provided.                          |
| Status          | Status active or not active.             |
| CE VLAN IDs     | Customer edge VLAN ID numbers.           |

## Sample Output

### show oam ethernet lmi interface

```

user@host> show oam ethernet lmi interface ge-1/1/1
Physical interface: ge-1/1/1, Physical link is Up
UNI identifier: uni-ce1, EVC map type: Bundling
Polling verification timer: Enabled, E-LMI state: Operational
Priority/Untagged VLAN ID: 20, Default EVC: evc1
Associated EVCs:
  EVC      Reference   Status      CE VLAN IDs
  Identifier ID
  evc1      1       Active (New)  1-2048
  evc2      2       Not Active   2049-4096

```

## show oam ethernet lmi statistics

**Syntax** `show oam ethernet lmi statistics <interface interface-name>`

**Release Information** Command introduced in Junos OS Release 9.5.

**Description** On MX Series routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet PICs, displays OAM Ethernet Local Management Interface (LMI) statistics.

**Options** **interface**—(Optional) Display LMI statistics for a specified interface.  
**interface-name**—(Optional) Display Ethernet LMI information for the specified Ethernet interface only.

**Required Privilege Level** view

**List of Sample Output** [show oam ethernet lmi statistics on page 2209](#)

**Output Fields** [Table 167 on page 2208](#) lists the output fields for the **show oam ethernet lmi statistics** command. Output fields are listed in the approximate order in which they appear.

*Table 167: show oam ethernet lmi statistics Output Fields*

| Field Name                     | Field Description                                   |
|--------------------------------|-----------------------------------------------------|
| Physical interface             | Name of the interface for the displayed statistics. |
| Reliability errors             | Number of E-LMI reliability errors logged.          |
| Protocol errors                | Number of E-LMI protocol errors.                    |
| Status check received          | Number of E-LMI status check receive errors.        |
| Status check sent              | Number of E-LMI status check sent errors.           |
| Full status received           | Number of E-LMI full status receive errors.         |
| Full status sent               | Number of E-LMI full status sent errors.            |
| Full status continued received | Number of E-LMI status continued received errors.   |
| Full status continued sent     | Number of E-LMI full status continued sent errors.  |
| Asynchronous status sent       | Number of E-LMI asynchronous status sent errors.    |

## Sample Output

### show oam ethernet lmi statistics

```
user@host> show oam ethernet lmi statistics interface ge-1/1/1

Physical interface: ge-1/1/1
Reliability errors          4  Protocol errors
0
Status check received      0  Status check sent
0
Full status received       694 Full status sent
694
Full status continued received 0 Full status continued sent
0
Asynchronous status sent   0
```

## show pppoe interfaces

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Output fields are listed in the approximate order in which they appear. Not all fields are displayed for PPPoE interfaces on M120 and M320 routers in server mode.</p>                                                                                                                                                                           |

*Table 168: show pppoe interfaces Output Fields*

| Field Name               | Field Description                                                                  | Level of Output              |
|--------------------------|------------------------------------------------------------------------------------|------------------------------|
| <b>Logical Interface</b> |                                                                                    |                              |
| <b>Logical interface</b> | Name of the logical interface.                                                     | All levels                   |
| <b>Index</b>             | Index number of the logical interface, which reflects its initialization sequence. | <b>detail extensive none</b> |
| <b>State</b>             | State of the logical interface: <b>up</b> or <b>down</b> .                         | All levels                   |
| <b>Session ID</b>        | Session ID.                                                                        | All levels                   |

Table 168: show pppoe interfaces Output Fields (continued)

| Field Name                              | Field Description                                                                                                                                                                                                                                                                                                                                      | Level of Output              |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Type</b>                             | Origin of the logical interface: <b>Static</b> or <b>Dynamic</b> . Indicates whether the interface was statically or dynamically created.                                                                                                                                                                                                              | <b>detail extensive none</b> |
| <b>Service name</b>                     | Type of service required (can be used to indicate an ISP name or a class or quality of service).                                                                                                                                                                                                                                                       | <b>detail extensive none</b> |
| <b>Configured AC name</b>               | Configured access concentrator name.                                                                                                                                                                                                                                                                                                                   | <b>detail extensive none</b> |
| <b>Session AC name</b>                  | Name of the access concentrator.                                                                                                                                                                                                                                                                                                                       | <b>detail extensive none</b> |
| <b>Remote MAC address or Remote MAC</b> | MAC address of the remote side of the connection, either the access concentrator or the PPPoE client.                                                                                                                                                                                                                                                  | All levels                   |
| <b>Session uptime</b>                   | Length of time the session has been up, in <i>hh:mm:ss</i> .                                                                                                                                                                                                                                                                                           | <b>detail extensive none</b> |
| <b>Dynamic Profile</b>                  | Name of the dynamic profile that was used to create this interface. If the interface was statically created, this field is not displayed.                                                                                                                                                                                                              | <b>detail extensive none</b> |
| <b>Underlying interface</b>             | Interface on which PPPoE is running.                                                                                                                                                                                                                                                                                                                   | All levels                   |
| <b>Agent Circuit ID</b>                 | Agent circuit identifier (ACI) that corresponds to the DSLAM interface that initiated the client service request. An asterisk is interpreted as a wildcard character and can appear at the beginning, the end, or both the beginning and end of the string. If the agent circuit ID is not configured, this field is not displayed.                    | <b>detail extensive none</b> |
| <b>Agent Remote ID</b>                  | Agent remote identifier that corresponds to the subscriber associated with the DSLAM interface that initiated the service request. An asterisk is interpreted as a wildcard character and can appear at the beginning, the end, or both at the beginning and end of the string. If the agent remote ID is not configured, this field is not displayed. | <b>detail extensive none</b> |
| <b>ACI Interface Set</b>                | Internally-generated name of the dynamic ACI interface set, if configured, and the set index number of the ACI entry in the session database.                                                                                                                                                                                                          | <b>detail extensive none</b> |

Table 168: show pppoe interfaces Output Fields (continued)

| Field Name         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output  |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Packet Type</b> | <p>Number of packets sent and received during the PPPoE session, categorized by packet type and packet errors:</p> <ul style="list-style-type: none"> <li>• <b>PADI</b>—PPPoE Active Discovery Initiation packets.</li> <li>• <b>PADO</b>—PPPoE Active Discovery Offer packets.</li> <li>• <b>PADR</b>—PPPoE Active Discovery Request packets.</li> <li>• <b>PADS</b>—PPPoE Active Discovery Session-Confirmation packets.</li> <li>• <b>PADT</b>—PPPoE Active Discovery Termination packets.</li> <li>• <b>Service name error</b>—Packets for which the Service-Name request could not be honored.</li> <li>• <b>AC system error</b>—Packets for which the access concentrator experienced an error in performing the host request. For example, the host had insufficient resources to create a virtual circuit.</li> <li>• <b>Generic error</b>—Packets that indicate an unrecoverable error occurred.</li> <li>• <b>Malformed packets</b>—Malformed or short packets that caused the packet handler to discard the frame as unreadable.</li> <li>• <b>Unknown packets</b>—Unrecognized packets.</li> </ul> | <b>extensive</b> |

## Sample Output

### show pppoe interfaces

```
user@host> show pppoe interfaces
pp0.0 Index 66
  State: Down, Session ID: None,
  Service name: None, Configured AC name: sapphire,
  Session AC name: None, Remote MAC address: 00:00:5e:00:53:00,
  Auto-reconnect timeout: 100 seconds, Idle timeout: Never,
  Underlying interface: at-5/0/0.0 Index 71
```

### show pppoe interfaces (Status for the Specified Interface)

```
user@host> show pppoe interfaces pp0.1073741827
pp0.1073741827 Index 70
  State: Session Up, Session ID: 30, Type: Dynamic,
  Session AC name: velorum,
  Remote MAC address: 00:00:5e:00:53:c1,
  Session uptime: 16:45:46 ago,
  Underlying interface: ge-2/0/3.1 Index 73
  Service name: premium
  Dynamic Profile: PppoeProfile
  Agent Circuit ID: velorum-ge-2/0/3
  Agent Remote ID: westford
```

### show pppoe interfaces brief

```
user@host> show pppoe interfaces brief
```

| Interface | Underlying interface | State | Session ID | Remote MAC |
|-----------|----------------------|-------|------------|------------|
|-----------|----------------------|-------|------------|------------|

|                |            |            |    |                   |
|----------------|------------|------------|----|-------------------|
| pp0.0          | ge-2/0/3.2 | Session Up | 27 | 00:00:5e:00:53:c1 |
| pp0.1          | ge-2/0/3.2 | Session Up | 28 | 00:00:5e:00:53:c1 |

## show pppoe service-name-tables

**Syntax** `show pppoe service-name-tables  
<table-name>`

**Release Information** Command introduced in Junos OS Release 10.0.

**Description** Display configuration information about PPPoE service name tables.

**Options** **none**—Display the names of configured PPPoE service name tables.  
**table-name**—(Optional) Name of a configured PPPoE service name table.

**Required Privilege Level** view

**Related Documentation**

[show pppoe service-name-tables \(For the Specified Table Name\) on page 2215](#)

**Output Fields** [Table 169 on page 2214](#) lists the output fields for the **show pppoe service-name-tables** command. Output fields are listed in the approximate order in which they appear.

*Table 169: show pppoe service-name-tables Output Fields*

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Level of Output |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Service Name Table</b> | Name of the PPPoE service name table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | none            |
| <b>Service Name</b>       | Name of a configured service in the PPPoE service name table: <ul style="list-style-type: none"> <li>• <b>&lt;empty&gt;</b>—Service of zero length that represents an unspecified service</li> <li>• <b>&lt;any&gt;</b>—Default service for non-empty service entries that do not match the configured empty or named service entries</li> <li>• <b>service-name</b>—Named service entry</li> </ul>                                                                                                                                          | none            |
| <b>Action</b>             | Action taken when the PPPoE underlying interface receives a PPPoE Active Discovery Initiation (PADI) packet with the specified named service, <b>empty</b> service, <b>any</b> service, or ACI/ARI pair: <ul style="list-style-type: none"> <li>• <b>Delay seconds</b>—Number of seconds that the interface delays before responding with a PPPoE Active Discovery Offer (PADO) packet</li> <li>• <b>Drop</b>—Interface drops (ignores) the packet.</li> <li>• <b>Terminate</b>—Interface responds immediately with a PADO packet</li> </ul> | none            |

Table 169: show pppoe service-name-tables Output Fields (continued)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                           | Level of Output |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Dynamic Profile</b>  | Name of the dynamic profile with which the router creates a dynamic PPPoE subscriber interface. A dynamic profile can be assigned to a named service, <b>empty</b> service, <b>any</b> service, or ACI/ARI pair.                                                                                                                                                                                            | none            |
| <b>Routing Instance</b> | Name of the routing instance in which to instantiate the dynamic PPPoE subscriber interface. A routing instance can be assigned to a named service, <b>empty</b> service, <b>any</b> service, or ACI/ARI pair.                                                                                                                                                                                              | none            |
| <b>Max Sessions</b>     | Maximum number of active PPPoE sessions that the router can establish with the specified named service, <b>empty</b> service, or <b>any</b> service.                                                                                                                                                                                                                                                        | none            |
| <b>Active Sessions</b>  | Current count of active PPPoE sessions created using the specified named service, <b>empty</b> service, or <b>any</b> service. The Active Sessions value cannot exceed the Max Sessions value.                                                                                                                                                                                                              | none            |
| <b>ACI</b>              | Agent circuit identifier (ACI) that corresponds to the DSLAM interface that initiated the client service request. An asterisk is interpreted as a wildcard character and can appear at the beginning, the end, or both the beginning and end of the string. An ACI can be configured as part of an ACI/ARI pair for a named service, <b>empty</b> service, or <b>any</b> service.                           | none            |
| <b>ARI</b>              | Agent remote identifier (ARI) that corresponds to the subscriber associated with the DSLAM interface that initiated the service request. An asterisk is interpreted as a wildcard character and can appear at the beginning, the end, or both at the beginning and end of the string. An ARI can be configured as part of an ACI/ARI pair for a named service, <b>empty</b> service, or <b>any</b> service. | none            |
| <b>Static Interface</b> | Name of the static PPPoE interface reserved for exclusive use by the PPPoE client with matching ACI/ARI information. A static interface can be configured only for an ACI/ARI pair.                                                                                                                                                                                                                         | none            |

## Sample Output

### show pppoe service-name-tables

```
user@host> show pppoe service-name-tables

Service Name Table: test1
Service Name Table: test2
Service Name Table: test3
```

### show pppoe service-name-tables (For the Specified Table Name)

```
user@host> show pppoe service-name-tables Table1

Service Name Table: Table1
Service Name: <empty>
Action: Terminate
Dynamic Profile: BasicPppoeProfile
Max Sessions: 100
Active Sessions: 3
Service Name: <any>
```

```
Action: Drop
ACI: velorum-ge-2/0/3
ARI: westford
  Action: Terminate
    Static Interface: pp0.100
ACI: volantis-ge-5/0/5
ARI: sunnyvale
  Action: Terminate
    Static Interface: pp0.101
Service Name: Wholesale
Action: Terminate
Dynamic Profile: WholesalePppoeProfile
Routing Instance: WholesaleRI
Max Sessions: 16000
Active Sessions: 4
```

## show pppoe sessions

**Syntax** `show pppoe sessions`  
`<aci circuit-id-string>`  
`<ari remote-id-string>`  
`<service service-name>`

**Release Information** Command introduced in Junos OS Release 10.2.

**Description** Display information about all active PPPoE sessions on the router, or about the active PPPoE sessions established for a specified service name, agent circuit identifier (ACI), or agent remote identifier (ARI).

**Options** **none**—Display information for all active PPPoE sessions on the router.

**aci circuit-id-string**—(Optional) Display information only for active PPPoE sessions established with the specified agent circuit identifier. The agent circuit identifier corresponds to the DSLAM interface that initiated the service request.

**ari remote-id-string**—(Optional) Display information only for active PPPoE sessions established with the specified agent remote identifier. The agent remote identifier corresponds to the subscriber associated with the DSLAM interface that initiated the service request.

**service service-name**—(Optional) Display information only for active PPPoE sessions established with the specified service, where *service-name* can be **empty**, **any**, or a named service.

**Required Privilege Level** view

| <b>Output Fields</b>            | <a href="#">Table 171 on page 2219</a> lists the output fields for the <b>show pppoe statistics</b> command. Output fields are listed in the approximate order in which they appear. |

Table 171: show pppoe statistics Output Fields

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Active PPPoE sessions</b> | <p>Total number of active PPPoE sessions and the number of packets sent and received during the PPPoE session, categorized by packet type and packet errors:</p> <ul style="list-style-type: none"> <li>• <b>PADI</b>—PPPoE Active Discovery Initiation packets.</li> <li>• <b>PADO</b>—PPPoE Active Discovery Offer packets.</li> <li>• <b>PADR</b>—PPPoE Active Discovery Request packets.</li> <li>• <b>PADS</b>—PPPoE Active Discovery Session-Confirmation packets.</li> <li>• <b>PADT</b>—PPPoE Active Discovery Termination packets.</li> <li>• <b>Service name error</b>—Packets for which the Service-Name request could not be honored.</li> <li>• <b>AC system error</b>—Packets for which the access concentrator experienced an error in performing the host request. For example, the host had insufficient resources to create a virtual circuit.</li> <li>• <b>Generic error</b>—Packets that indicate an unrecoverable error occurred.</li> <li>• <b>Malformed packets</b>—Malformed or short packets that caused the packet handler to discard the frame as unreadable.</li> <li>• <b>Unknown packets</b>—Unrecognized packets.</li> </ul> |

Table 171: show pppoe statistics Output Fields (continued)

| Field Name      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Timeouts</b> | <p>Information about timeouts that occurred during the PPPoE session (not displayed for M120, M320, and MX Series routers):</p> <ul style="list-style-type: none"> <li>• <b>PADI</b>—No PADR packet has been received within the timeout period. (This value is always zero and is not supported.)</li> <li>• <b>PADO</b>—No PPPoE Active Discovery Offer packet has been received within the timeout period.</li> <li>• <b>PADR</b>—No PADS packet has been received within the timeout period.</li> </ul> |

## Sample Output

### show pppoe statistics

```
user@host> show pppoe statistics
```

```
Active PPPoE sessions: 1
```

| PacketType         | Sent | Received |
|--------------------|------|----------|
| PADI               | 0    | 0        |
| PADO               | 0    | 0        |
| PADR               | 0    | 0        |
| PADS               | 0    | 0        |
| PADT               | 0    | 0        |
| Service name error | 0    | 0        |
| AC system error    | 0    | 0        |
| Generic error      | 0    | 0        |
| Malformed packets  | 0    | 0        |
| Unknown packets    | 0    | 0        |
| Timeouts           |      |          |
| PADI               | 0    |          |
| PADO               | 0    |          |
| PADR               | 0    |          |

### show pppoe statistics (For the Specified Underlying Interface Only)

```
user@host> show pppoe statistics ge-4/0/3.2
```

```
Active PPPoE sessions: 4
```

| PacketType         | Sent | Received |
|--------------------|------|----------|
| PADI               | 0    | 5        |
| PADO               | 5    | 0        |
| PADR               | 0    | 5        |
| PADS               | 4    | 0        |
| PADT               | 0    | 1        |
| Service name error | 0    | 0        |
| AC system error    | 0    | 0        |
| Generic error      | 0    | 0        |
| Malformed packets  | 0    | 0        |
| Unknown packets    | 0    | 0        |

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 172: show pppoe underlying-interfaces Output Fields

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Level of Output              |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Underlying Interface</b>     | Name of the PPPoE underlying logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | All levels                   |
| <b>Service Name Table</b>       | Name of the service name table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | All levels                   |
| <b>Dynamic Profile</b>          | Name of the dynamic profile that was used to create this interface. If the interface was statically created, then the value is <b>none</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | All levels                   |
| <b>Index</b>                    | Index number of the logical interface, which reflects its initialization sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>detail extensive</b>      |
| <b>State</b>                    | Origin of the logical interface: <b>Static</b> or <b>Dynamic</b> . Indicates whether the interface was statically or dynamically created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail extensive</b>      |
| <b>Operational States</b>       | Fields in this block are actual operational values rather than simply the configured values. The operational values can be the result of RADIUS-initiated changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>detail extensive</b>      |
| <b>Max Sessions</b>             | Maximum number of PPPoE logical interfaces that can be activated on the underlying interface. When this number of logical interfaces has been established, all subsequent PPPoE Active Discovery Initiation (PADI) packets are dropped and all subsequent PPPoE Active Discovery Request (PADR) packets trigger PPPoE Active Discovery Session (PADS) error responses.                                                                                                                                                                                                                                                                                                             | <b>detail extensive</b>      |
| <b>Max Sessions VSA Ignore</b>  | Whether the router is configured to ignore (clear) the PPPoE maximum session value returned by RADIUS in the Max-Clients-Per-Interface Juniper Networks VSA [26-143] and restore the PPPoE maximum session value on the underlying interface to the value configure with the <b>max-sessions</b> statement: <b>Off</b> (default) or <b>On</b> .                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive none</b> |
| <b>Active Sessions</b>          | Number of active PPPoE sessions on the underlying interface. If a dynamic profile is listed, then it is the number of active PPPoE sessions on the underlying interface that are using this profile. The Active Sessions value must not exceed the Max Sessions value.                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive</b>      |
| <b>Agent Circuit Identifier</b> | <p>Whether the underlying interface is configured with the <b>agent-circuit-identifier</b> statement to enable creation of autosensed dynamic VLAN subscriber interfaces based on agent circuit identifier (ACI) information.</p> <p><b>Autosensing</b> indicates that creation of ACI-based dynamic VLAN interfaces is enabled on the underlying interface. If creation of ACI-based dynamic VLANs is not configured on the underlying interface, this field does not appear.</p> <p><b>NOTE:</b> The Agent Circuit Identifier field is replaced with the Line Identity field when an ALI interface set is configured with the <b>line-identity</b> autoconfiguration stanza.</p> | <b>detail extensive none</b> |

Table 172: show pppoe underlying-interfaces Output Fields (continued)

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output              |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Line Identity</b>          | <p>Whether the underlying interface is configured with the <b>line-identity</b> statement to enable creation of autosensed dynamic VLAN subscriber interfaces based on the specified trusted option: ACI, ARI, both, or neither.</p> <p><b>Autosensing</b> indicates that creation of ALI-based dynamic VLAN interfaces is enabled on the underlying interface. If creation of ALI dynamic VLANs based on trusted options is not configured on the underlying interface, this field does not appear.</p> <p><b>NOTE:</b> The Line Identity field is replaced with the ACI VLAN field when an ACI interface set is configured with the <b>agent-circuit-id</b> autoconfiguration stanza.</p>                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive none</b> |
| <b>Duplicate Protection</b>   | State of PPPoE duplicate protection: <b>On</b> or <b>Off</b> . When duplicate protection is configured for the underlying interface, a dynamic PPPoE logical interface cannot be activated when an existing active logical interface is present for the same PPPoE client. The uniqueness of the PPPoE client is determined by the client's MAC address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b>      |
| <b>Short Cycle Protection</b> | State of PPPoE short cycle protection: <b>mac-address</b> , <b>circuit-id</b> , or <b>Off</b> . Enabling short cycle protection, also known as PPPoE lockout, on the PPPoE underlying interface temporarily prevents (locks out) a failed or short-lived (short-cycle) PPPoE subscriber session from reconnecting to the router for a default or configurable period of time. PPPoE client sessions are identified by their unique media access control (MAC) source address or agent circuit identifier (ACI) value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail extensive</b>      |
| <b>Direct Connect</b>         | State of the configuration to ignore DSL Forum VSAs: <b>On</b> or <b>Off</b> . When configured, the router ignores any of these VSAs received from a directly connected CPE device on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>detail extensive none</b> |
| <b>AC Name</b>                | Name of the access concentrator.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b>      |
| <b>PacketType</b>             | <p>Number of packets sent and received during the PPPoE session, categorized by packet type and packet errors:</p> <ul style="list-style-type: none"> <li>• <b>PADI</b>—PPPoE Active Discovery Initiation packets.</li> <li>• <b>PADO</b>—PPPoE Active Discovery Offer packets.</li> <li>• <b>PADR</b>—PPPoE Active Discovery Request packets.</li> <li>• <b>PADS</b>—PPPoE Active Discovery Session-Confirmation packets.</li> <li>• <b>PADT</b>—PPPoE Active Discovery Termination packets.</li> <li>• <b>Service name error</b>—Packets for which the Service-Name request could not be honored.</li> <li>• <b>AC system error</b>—Packets for which the access concentrator experienced an error in performing the host request. For example, the host had insufficient resources to create a virtual circuit.</li> <li>• <b>Generic error</b>—Packets that indicate an unrecoverable error occurred.</li> <li>• <b>Malformed packets</b>—Malformed or short packets that caused the packet handler to discard the frame as unreadable.</li> <li>• <b>Unknown packets</b>—Unrecognized packets.</li> </ul> | <b>detail extensive</b>      |

Table 172: show pppoe underlying-interfaces Output Fields (continued)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Level of Output  |

*Table 173: show pppoe version Output Fields*

| Field Name                | Field Description                                                                                                                                                                                                                                                                   |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| version <i>n</i>          | PPPoE version number and RFC. For example, <b>version 1, rfc 2516</b> .                                                                                                                                                                                                             |
| PPPoE protocol            | State of the PPPoE protocol: <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                                                    |
| Maximum Sessions          | Maximum active sessions supported per router. The default is 256 sessions.                                                                                                                                                                                                          |
| PADI resend timeout       | Initial time, in seconds, that the router waits to receive a PPoE Active Discovery Offer (PADO) packet for the PPoE Active Discovery Initiation (PADI) packet sent. This timeout doubles for each successive PADI packet sent. Not displayed for M120 and M320 routers.             |
| PADR resend timeout       | Initial time, in seconds, that the router waits to receive a PPoE Active Discovery Session Confirmation (PADS) packet for the PPoE Active Discovery Request (PADR) packet sent. This timeout doubles for each successive PADR packet sent. Not displayed for M120 and M320 routers. |
| Max resend timeout        | Maximum value, in seconds, that the PADI or PADR resend timer can accept. The maximum value is 64. Not displayed for M120 and M320 routers.                                                                                                                                         |
| Max Configured AC timeout | Time, in seconds, during which the configured access concentrator must respond. Not displayed for M120 and M320 routers.                                                                                                                                                            |

| <b>Output Fields</b>            | <a href="#">Table 174 on page 2231</a> lists the output fields for the <b>show protection-group ethernet-ring aps</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 174: *show protection-group ethernet-ring aps* Output Fields

| Field Name                          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Ethernet Ring</b>                | Name configured for the Ethernet ring.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Request/State</b>                | <p>Status of the Ethernet ring RAPS messages.</p> <ul style="list-style-type: none"> <li><b>NR</b>—Indicates that there is no request for APS on the ring.</li> <li><b>SF</b>—Indicates that there is a signal failure on the ring.</li> <li><b>FS</b>—Indicates that there are active forced-switch requests in the ring.</li> <li><b>MS</b>—Indicates that there are active manual-switch requests in the ring.</li> </ul> <p><b>NOTE:</b> Both <b>FS</b> and <b>MS</b> values are valid only when G.8032v2 is supported.</p> |
| <b>Ring Protection Link Blocked</b> | Blocking on the ring protection link: <b>Yes</b> or <b>No</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>No Flush</b>                     | Indicates the value of the Do Not Flush (DNF) flag in the received RAPS PDU. If the value is Yes, then FDB flush is not triggered as part of processing of the received RAPS PDU.                                                                                                                                                                                                                                                                                                                                               |
| <b>Blocked Port Reference</b>       | This parameter is the reference to the blocked ring port. If the east ring port is blocked, the Blocked Port Reference (BPR) value is 0. If the west ring port is blocked, the BPR value is 1. If both ring ports are blocked, this parameter can take any value. If both east and west ports are blocked or not blocked, the value would be 0. This field is valid only when G.8032v2 is supported.                                                                                                                            |
| <b>Blocked Port Reference</b>       | Reference of the ring port on which traffic is blocked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Originator</b>                   | Indicates whether the node is the originator of the RAPS messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Remote Node ID</b>               | Identifier (in MAC address format) of the remote node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Sample Output

### *show protection-group ethernet-ring aps* (EX Switches)

```
user@switch>show protection-group ethernet-ring aps
```

| Ring Name | Request/state | No Flush | RPL Blocked | Originator | Remote Node ID    |
|-----------|---------------|----------|-------------|------------|-------------------|
| erp1      | NR            | No       | Yes         | No         | 00:1F:12:30:B8:81 |

## Sample Output

### *show protection-group ethernet-ring aps* (Owner Node, Normal Operation on ACX and MX Routers)

```
user@host> show protection-group ethernet-ring aps
```

| Ethernet Ring | Request/state | RPL Blocked | No Flush | BPR | Originator | Remote Node ID    |
|---------------|---------------|-------------|----------|-----|------------|-------------------|
| erp1          | NR            | No          | No       | 0   | No         | 00:1F:12:30:B8:81 |

|                   |    |     |    |   |    |
|-------------------|----|-----|----|---|----|
| Erp_1             | NR | Yes | No | 1 | No |
| 00:00:00:02:00:01 |    |     |    |   |    |

## Sample Output

### show protection-group ethernet-ring aps detail (Owner Node, Normal Operation on ACX and MX Routers)

```
user@host> show protection-group ethernet-ring aps detail
```

```

Ethernet-Ring name      : Erp_1

| <b>Output Fields</b>            | <a href="#">Table 175 on page 2234</a> lists the output fields for the <b>show protection-group ethernet-ring configuration</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

*Table 175: show protection-group ethernet-ring configuration Output Fields*

| Output Fields                      | Field Description                                                                                                                                                  |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>G8032 Compatability Version</b> | This is the compatibility version mode of ERP. This parameter always takes the value 1 in the case of G8032v1. This parameter is valid only for MX Series routers. |
| <b>East Interface</b>              | One of the two switch interfaces that participates in a ring link. When Junos supports G8032v2, this interface is treated as interface 0.                          |
| <b>West Interface</b>              | One of the two interfaces in a switch that participates in a ring link. When Junos supports G8032v2, this interface is treated as interface 1.                     |

Table 175: show protection-group ethernet-ring configuration Output Fields (continued)

| Output Fields                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Restore Interval</b>       | <p>Configured interval of wait time after a link is restored. When a link goes down, the RPL link is activated. When the down link becomes active again, the RPL owner receives a notification. The RPL owner waits for the restore interval before issuing a block on the RPL link. The configured restore interval can be 5 through 12 minutes for ERIPv1 and 1 through 12 minutes for ERIPv2. This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value.</p> <p><b>NOTE:</b> Wait to Restore (WTR) configuration values on EX2300 and EX3400 switches must be 5-12 minutes.</p>               |
| <b>Wait to Block Interval</b> | <p>Configured interval of wait time for link restoration when a manual command (manual switch or force switch) is cleared. On clearing the manual command, the RPL owner receives NR messages, which starts a timer with interval 'Wait to Block' to restore the RPL link after its expiration. This delay timer is set to be 5 seconds longer than the guard timer. The configured number can be from 5 seconds through 10 seconds. The parameter is valid only for G.8032v2.</p> <p><b>NOTE:</b> The Wait To Block Timer (WTB) is always disabled on EX2300 and EX3400 switches because it is not supported in ERPSv1. Any configuration you make to the WTB setting has no effect. The output from the CLI command 'show protection-group ethernet-ring node-state detail' lists a WTB setting but that setting has no effect.</p> |
| <b>Guard Interval</b>         | <p>Configured number of milliseconds (in 10 millisecond intervals, 10 milliseconds through 2000 milliseconds) that the node does not process any Ethernet ring protection protocol data units (PDUs). This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value.</p>                                                                                                                                                                                                                                                                                                                             |
| <b>Hold off interval</b>      | <p>This is the interval at which the link is held down even before declaring that the link is down. Because the parameter is not supported at present, its value is always considered 0. This parameter is valid only for MX Series routers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Node ID</b>                | <p>Node ID for the switch or router. If the node ID is not configured, it is assigned by default. For EX Series switches, the Node ID value cannot be configured, whereas for MX Series routers, it can be configured.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Ring ID</b>                | <p>In G8032v2, the ring ID can be within the range 1–239. All the nodes in a ring should have the same ring ID. In the case of G8032v1, the value of the ring ID is always 1. This parameter is valid only for MX Series routers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Node Role</b>              | <p>Indicates whether the ring node is operating as a normal ring-node or RPL-owner or RPL-neighbor. For G8032v1 RPL-neighbor role is not supported. This parameter is valid only for MX Series routers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Table 175: show protection-group ethernet-ring configuration Output Fields (continued)

| Output Fields                          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Revertive Mode of Operation</b>     | This parameter indicates whether the ring is operating in revertive mode or nonrevertive mode. In nonrevertive mode of operation, when all links in the ring and Ethernet Ring Nodes have recovered and no external requests are active, the Ethernet Ring does not automatically revert. G8032v1 supports only revertive mode of operation. This parameter is valid only for MX Series routers.                         |
| <b>RAPS Tx Dot1p priority</b>          | The RAPS Tx Dot1p priority is a parameter with which the RAPS is transmitted from the ring node. For G8032v1, the value of this parameter is always 0. For G8032v2, the value of this parameter can be within the range 0–7. This parameter is valid only for MX Series routers.                                                                                                                                         |
| <b>Node type</b>                       | Indicates whether ring node is a normal ring node having two ring-links or a open ring-node having only a single ring-link or a interconnection ring-node. An interconnection ring node can be connected to major ring in non virtual-channel mode or in virtual channel mode. Ring interconnection is not supported for G8032v1. This parameter is valid only for MX Series routers.                                    |
| <b>Major ring name</b>                 | If the node type is interconnection in the ring, this parameter takes the name of the major ring to which the sub-ring node is connected. This parameter is valid only for MX Series routers.                                                                                                                                                                                                                            |
| <b>Interconnection mode</b>            | Indicates the interconnection mode if the type of the node is interconnection. An interconnection ring node can be connected to major ring in non-virtual channel mode or in virtual channel mode. This parameter is valid only for MX Series routers.                                                                                                                                                                   |
| <b>Propagate Topology Change event</b> | When Propagate Topology Change event is set to 1, the change in the topology of sub-ring is propagated to the major ring, enabling the transmission of EVENT FLUSH RAPS PDU in the major ring. When the parameter is set to 0, the topology change in the sub-ring is not propagated to the major ring blocking EVENT FLUSH RAPS PDU transmission in the major ring. This parameter is valid only for MX Series routers. |
| <b>Control Vlan</b>                    | The VLAN that transfers ERP PDUs from one node to another.                                                                                                                                                                                                                                                                                                                                                               |
| <b>Physical Ring</b>                   | Physical ring if the east and west interfaces are nontrunk ports. For MX Series routers, the ring is termed a physical ring if no data channels are defined for the ring and the entire physical port forwarding is controlled by ERP.                                                                                                                                                                                   |
| <b>Data Channel VLAN(s)</b>            | Data VLANs for which forwarding behavior is controlled by the ring instance.                                                                                                                                                                                                                                                                                                                                             |

## Sample Output

### show protection-group ethernet-ring configuration (EX Switch)

```

user@switch>show protection-group ethernet-ring configuration
Ethernet ring configuration parameters for protection group erp1
East Interface   : ge-0/0/3.0
West Interface   : ge-0/0/9.0
Restore Interval : 5 minutes
Guard Interval   : 500 ms

```

```

Node Id       : 00:1F:12:30:B8:81
Control Vlan  : 101
Physical Ring : yes

```

### show protection-group ethernet-ring configuration detail (MX Series Router)

Table 176: show protection-group ethernet-ring data-channel Output Fields (continued)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>STP Index</b>     | The Spanning Tree Protocol (STP) index number used by each interface in an Ethernet ring. The STP index controls the forwarding behavior for a set of VLANs on a data channel on an Ethernet ring port. For multiple Ethernet ring instances on an physical ring port, there are multiple STP index numbers. Different ring instances will have different STP index numbers and may have different forwarding behavior. |
| <b>Forward State</b> | Forwarding state on the Ethernet ring. <ul style="list-style-type: none"> <li><b>forwarding</b>—Indicates packets are being forwarded.</li> <li><b>discarding</b>—Indicates packets are being discarded.</li> </ul>                                                                                                                                                                                                     |

## Sample Output

### show protection-group ethernet-ring data-channel

```

user@host> show protection-group ethernet-ring data-channel
Ethernet ring data channel information for protection group pg301

Interface    STP index  Forward State
xe-5/0/2     78         forwarding
xe-2/2/0     79         discarding

Ethernet ring data channel parameters for protection group pg302

Interface    STP index  Forward State
xe-5/0/2     80         forwarding
xe-2/2/0     81         forwarding

```

### show protection-group ethernet-ring data-channel detail

```

user@host> show protection-group ethernet-ring data-channel detail
Ethernet ring data channel parameters for protection group pg301

Interface name      : xe-5/0/2
STP index           : 78
Forward State       : forwarding

Interface name      : xe-2/2/0
STP index           : 79
Forward State       : discarding

Ethernet ring data channel parameters for protection group pg302

Interface name      : xe-5/0/2
STP index           : 80
Forward State       : forwarding

Interface name      : xe-2/2/0

```

|               |              |

| <b>Output Fields</b>            | Table 177 on page 2244 lists the output fields for the <b>show protection-group ethernet-ring flush-info</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                    |

*Table 177: show protection-group ethernet-ring flush-info Output Fields*

| Field Name                    | Field Description                                                                                  |
|-------------------------------|----------------------------------------------------------------------------------------------------|
| <b>Interface</b>              | Physical interface configured for the Ethernet ring. This can be an aggregated Ethernet link also. |
| <b>Originating Node</b>       | Node from which RAPS protocol data units originates on the Ethernet Ring.                          |
| <b>Blocked Port Reference</b> | Reference of the ring port on which traffic is blocked.                                            |

## Sample Output

### show protection-group ethernet-ring flush-info (ACX and MX Series Routers)

```
user@host> show protection-group ethernet-ring flush-info
Ethernet ring flush port information for protection group pg100

Interface      Originating Node  Blocked Port Reference
xe-5/0/2.4001  00:00:00:00:00:00  0
xe-2/2/0.4001  00:00:00:00:00:00  0
```

### show protection-group ethernet-ring flush-info detail (ACX and MX Series Routers)

```
user@host> show protection-group ethernet-ring flush-info detail
Ethernet ring flush port information for protection group pg100

Interface name      : xe-5/0/2.4001
Originating Node    : 00:00:00:00:00:00
Blocked Port Reference : 0

Interface name      : xe-2/2/0.4001
Originating Node    : 00:00:00:00:00:00
Blocked Port Reference : 0
```

*Table 178: MX Series Routers show protection-group ethernet-ring interface Output Fields*

| Field Name                                                           | Field Description                                                                                                                                        |
|----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ethernet ring port parameters for protection group <i>group-name</i> | Output is organized by configured protection group.                                                                                                      |
| Interface                                                            | Physical interfaces configured for the Ethernet ring. This can be an aggregated Ethernet link also.                                                      |
| Control Channel                                                      | (MX Series router only) Logical unit configured on the physical interface.                                                                               |
| Direction                                                            | Direction of the traffic.                                                                                                                                |
| Forward State                                                        | State of the ring forwarding on the interface: <b>discarding</b> or <b>forwarding</b> .                                                                  |
| Ring Protection Link End                                             | Whether this interface is the end of the ring: <b>Yes</b> or <b>No</b> .                                                                                 |
| Signal Failure                                                       | Whether there a signal failure exists on the link: <b>Clear</b> or <b>Set</b> .                                                                          |
| Admin State                                                          | State of the interface: For EX switches, <b>ready</b> , <b>ifl ready</b> , or <b>waiting</b> . For MX routers, <b>IFF ready</b> or <b>IFF disabled</b> . |

## Sample Output

### show protection-group ethernet-ring interface (EX Series Switch Owner Node)

```
user@host> show protection-group ethernet-ring interface
Ethernet ring port parameters for protection group pg101
```

| Interface  | Forward State | RPL End | Signal Failure | Admin State |
|------------|---------------|---------|----------------|-------------|
| ge-0/0/3.0 | discarding    | Yes     | Clear          | ready       |
| ge-0/0/9.0 | forwarding    | No      | Clear          | ready       |

### show protection-group ethernet-ring interface (Owner Node MX Series Router )

```
user@host> show protection-group ethernet-ring interface
Ethernet ring port parameters for protection group pg101
```

| Interface | Control Channel | Direction | Forward State | RPL End | SF    | Admin State |
|-----------|-----------------|-----------|---------------|---------|-------|-------------|
| ge-1/2/0  | ge-1/2/0.100    | east      | forwarding    | No      | Clear | IFF ready   |
| ge-1/2/2  | ge-1/2/2.100    | west      | forwarding    | No      | Clear | IFF ready   |

### show protection-group ethernet-ring interface detail (Owner Node MX Series Router )

```
user@host> show protection-group ethernet-ring interface detail
```

Ethernet ring port parameters for protection group pg101

```
Interface name           : ge-1/2/0
Control channel name     : ge-1/2/0.100
Interface direction      : east
Ring Protection Link End : No
Signal Failure           : Clear
Forward State            : forwarding
Interface Admin State    : IFF ready
```

```
Interface name           : ge-1/2/2
Control channel name     : ge-1/2/2.100
Interface direction      : west
Ring Protection Link End : No
Signal Failure           : Clear
Forward State            : forwarding
Interface Admin State    : IFF ready
```

### show protection-group ethernet-ring interface (EX Series Switch Ring Node)

```
user@host> show protection-group ethernet-ring interface
```

Ethernet ring port parameters for protection group pg102

Ethernet ring port parameters for protection group pg101

| Interface  | Forward State | RPL End | Signal Failure | Admin State |
|------------|---------------|---------|----------------|-------------|
| ge-0/0/3.0 | discarding    | Yes     | Clear          | ready       |
| ge-0/0/9.0 | forwarding    | No      | Clear          | ready       |

### show protection-group ethernet-ring interface detail (ACX Series and MX Series)

```
user@host> show protection-group ethernet-ring interface detail
```

Ethernet ring port parameters for protection group Erp\_1

```
Interface name           : xe-0/0/0
Control channel name     : xe-0/0/0.1
Interface direction      : east
Ring Protection Link End : No
Signal Failure           : Clear
Forward State            : forwarding
Interface Admin State    : IFF ready
```

```
Interface name           : et-0/0/48
Control channel name     : et-0/0/48.1
Interface direction      : west
Ring Protection Link End : No
Signal Failure           : Clear
Forward State            : forwarding
Interface Admin State    : IFF ready
```

### show protection-group ethernet-ring interface detail (EX2300 and EX3400 Switches)

```
user@switch> show protection-group ethernet-ring interface detail
```

Ethernet ring port parameters for protection group pg1001

|                          |               |
|--------------------------|---------------|
| Interface name           | : ge-0/0/14   |
| Control channel name     | : ge-0/0/14.0 |
| Interface direction      | : east        |
| Ring Protection Link End | : No          |
| Signal Failure           | : Clear       |
| Forward State            | : forwarding  |

| <b>Output Fields</b>            | <a href="#">Table 179 on page 2251</a> lists the output fields for the <b>show protection-group ethernet-ring node-state</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Table 179: show protection-group ethernet-ring node-state Output Fields

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Sample Output

### show protection-group ethernet-ring node-state (MX Series Router - RPL Owner Node, Normal Operation)

```
user@host> show protection-group ethernet-ring node-state
```

| Ethernet ring | APS State | Event | RPL Owner | WTR Timer | WTB Timer | Guard    |
|---------------|-----------|-------|-----------|-----------|-----------|----------|
| pg101         | idle      | NR-RB | Yes       | disabled  | disabled  | disabled |
| operational   |           |       |           |           |           |          |
| pg102         | idle      | NR-RB | No        | disabled  | disabled  | disabled |
| operational   |           |       |           |           |           |          |

### show protection-group ethernet-ring node-state (MX Series Router - Normal Ring Node, Normal Operation)

```
user@host> show protection-group ethernet-ring node-state
```

| Ethernet ring | APS State | Event | RPL Owner |
|---------------|-----------|-------|-----------|
| pg102         | idle      | NR-RB | No        |

| WTR Timer | WTB Timer | Guard Timer | Operation state |
|-----------|-----------|-------------|-----------------|
| disabled  | disabled  | disabled    | operational     |

### show protection-group ethernet-ring node-state (MX Series Router - RPL Owner Node, Remote Failure Condition)

```
user@host> show protection-group ethernet-ring node-state
```

| Ethernet ring | APS State | Event     | RPL Owner |
|---------------|-----------|-----------|-----------|
| pg101         | protected | remote SF | Yes       |

| WTR Timer | WTB Timer | Guard Timer | Operation state |
|-----------|-----------|-------------|-----------------|
| disabled  | disabled  | disabled    | operational     |

### show protection-group ethernet-ring node-state detail (ACX Series and MX Series Router)

```
user@host> show protection-group ethernet-ring node-state detail
```

|                    |         |
|--------------------|---------|
| Ethernet-Ring name | : Erp_1 |

*Table 180: show protection-group ethernet-ring statistics Output Fields*

| Field Name                             | Field Description                                                                                                                                               |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Ethernet Ring Statistics for PG</b> | Name of the protection group for which statistics are displayed.                                                                                                |
| <b>RAPS event sent</b>                 | Number of times Ring Automatic Protection Switching (RAPS) message transmission event occurred locally. This field is applicable only to MX Series routers.     |
| <b>RAPS event received</b>             | Number of RAPS messages received and processed by ERP state-machine and which resulted in state transition. This field is applicable only to MX Series routers. |
| <b>Local SF</b>                        | Number of times a signal failure has occurred locally.                                                                                                          |
| <b>Remote SF</b>                       | Number of times a signal failure has occurred anywhere else on the ring.                                                                                        |
| <b>NR event</b>                        | Number of times a No Request event has occurred on the ring. This field is applicable only to EX Series switches.                                               |
| <b>NR event sent</b>                   | Number of times a No Request event has occurred locally. This field is applicable only to MX Series routers.                                                    |
| <b>NR event received</b>               | Number of times a No Request event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.                                  |
| <b>NR-RB event</b>                     | Number of times a No Request, Ring Blocked event has occurred on the ring. This field is applicable only to EX Series switches.                                 |
| <b>NR-RB event sent</b>                | Number of times a No Request, Ring Blocked event has occurred locally. This field is applicable only to MX Series routers.                                      |
| <b>NR-RB event received</b>            | Number of times a No Request, Ring Blocked event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.                    |
| <b>Flush event sent</b>                | Number of times flush-event RAPS message transmission event occurred locally. This field is applicable only to MX Series routers.                               |
| <b>Flush event received</b>            | Number of flush-event RAPS messages received and processed by the ring instance control process. This field is applicable only to MX Series routers.            |
| <b>Local FS event sent</b>             | Number of times a forced switch event has occurred locally. This field is applicable only to MX Series routers.                                                 |
| <b>Remote FS event received</b>        | Number of times a forced switch event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.                               |
| <b>Local MS event sent</b>             | Number of times a manual switch event has occurred locally. This field is applicable only to MX Series routers.                                                 |

*Table 180: show protection-group ethernet-ring statistics Output Fields (continued)*

| Field Name               | Field Description                                                                                                                 |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Remote MS event received | Number of times a manual switch event has occurred anywhere else on the ring. This field is applicable only to MX Series routers. |

Table 181 on page 2257 lists the output fields for the **show protection-group ethernet-ring statistics** command when the **detail** option is used. These fields are valid only for MX Series routers.

*Table 181: show protection-group ethernet-ring statistics detail Output Fields (for MX Series Routers)*

| Field Name                               | Field Description                                                                                                                |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| Total number of FDB flush                | Number of times forwarding database (FDB) flush has happened for the ring instance.                                              |
| Flush-logic triggered flush              | Number of times FDB flush has happened because of flush-logic based on node ID and Blocked Port Reference (BPR).                 |
| Remote RAPS PDU received                 | Number of valid RAPS PDU messages received. This counter counts only RAPS messages generated by other devices on the ring.       |
| Remote RAPS dropped due to guard-timer   | Number of RAPS messages dropped by the device because the guard timer is running.                                                |
| Invalid remote RAPS PDU dropped          | Number of RAPS messages dropped by the device because the messages are invalid.                                                  |
| RAPS dropped due to miscellaneous errors | Number of RAPS messages dropped because of any other reason. For example, messages dropped because of unsupported functionality. |
| Local received RAPS PDU dropped          | Number of self-generated RAPS messages received and dropped.                                                                     |

## Sample Output

### show protection-group ethernet-ring statistics (EX Series Switch)

```
user@switch> show protection-group ethernet-ring statistics
Ring Name Local SF Remote SF NR Event NR-RB Event
erp1      2      1      2      3
```

### show protection-group ethernet-ring statistics (MX Series Router)

```
user@host> show protection-group ethernet-ring statistics
Ethernet Ring statistics for PG Pg-1
RAPS event sent           : 1
RAPS event received       : 1152
```

```

Local SF happened:           : 0
Remote SF happened:          : 428
NR event sent:               : 1
NR event received:           : 133
NR-RB event sent:            : 0
NR-RB event received:        : 591
Flush event sent             : 0
Flush event received:         : 0
Local FS event sent:          : 0
Remote FS event received:     : 0
Local MS event sent:          : 0
Remote MS event received:     : 0

```

### show protection-group ethernet-ring statistics detail (Specific Group)(MX Series Router)

```
user@host> show protection-group ethernet-ring statistics detail
```

```

Ethernet Ring statistics for PG Pg-1
RAPS event sent              : 1
RAPS event received          : 0
Local SF happened            : 0
Remote SF happened           : 0
NR event sent                : 1
NR event received            : 0
NR-RB event sent             : 0
NR-RB event received         : 0

Table 182: show protection-group ethernet-ring vlan Output Fields (continued)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Vlan</b>          | Name of the VLAN associated with the interface configured for the Ethernet protection ring.                                                                                                                                                                                                                                                                                                                             |
| <b>STP Index</b>     | The Spanning Tree Protocol (STP) index number used by each interface in an Ethernet ring. The STP index controls the forwarding behavior for a set of VLANs on a data channel on an Ethernet ring port. For multiple Ethernet ring instances on an physical ring port, there are multiple STP index numbers. Different ring instances will have different STP index numbers and may have different forwarding behavior. |
| <b>Bridge Domain</b> | Name of the bridge domain that is associated with the VLAN configured for the Ethernet protection ring.                                                                                                                                                                                                                                                                                                                 |

## Sample Output

### show protection-group ethernet-ring vlan

```
user@host> show protection-group ethernet-ring vlan
```

```
Ethernet ring IFBD parameters for protection group vkm01
```

| Interface | Vlan | STP Index | Bridge Domain       |

| <b>Interface name</b>       | Name of the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>CA name</b>              | <p>Name of the connectivity association.</p> <p>A connectivity association is named using the <b>connectivity-association</b> statement when you are enabling MACsec.</p>                                                                                                                                                                                                                                                                                    |
| <b>Cipher suite</b>         | Name of the cipher suite used for encryption.                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Encryption</b>           | <p>Encryption setting. Encryption is enabled when this output is <b>on</b> and disabled when this output is <b>off</b>.</p> <p>The encryption setting is set using the <b>no-encryption</b> statement in the connectivity association when using static connectivity association key (CAK) security mode and is set using the <b>encryption</b> statement in the secure channel when using static secure association key (SAK) or dynamic security mode.</p> |

Table 183: show security macsec connections Output Fields (continued)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Key server offset | <p>The offset value in a packet from which encryption can be performed.</p> <p>The offset is set using the <b>offset</b> statement when configuring the connectivity association when using static connectivity association key (CAK) or dynamic security mode or the secure channel when using static secure association key (SAK) security mode.</p>                                                                |
| Include SCI       | <p>SCI tagging. The SCI tag is included on packets in a secure channel when this output is <b>yes</b>, and not included on packets in a secure channel when this output is <b>no</b>. SCI tagging is automatically enabled on MX Series routers.</p> <p>By default, include SCI tag is disabled. You can enable SCI tagging using the <b>include-sci</b> statement in the connectivity association configuration.</p> |
| Replay protect    | <p>By default, replay protection is disabled. Replay protection ensures that a snooped packet is not replayed or a packet number is reused. Replay protection is enabled when this output is <b>on</b> and disabled when this output is <b>off</b>.</p> <p>You can enable replay protection using the <b>replay-protect</b> statement in the connectivity association configuration.</p>                              |
| Replay window     | <p>Number of packets that can be replayed. Must be configured with replay protection. This output is set to <b>0</b> when replay protection is disabled, and is the size of the replay window, in number of packets, when replay protection is enabled.</p> <p>The size of the replay window is configured using the <b>replay-window-size</b> statement in the connectivity association configuration.</p>           |

## Sample Output

### show security macsec connections

```

user@host> show security macsec connections
Interface name: xe-0/1/0
  CA name: CA1
  Cipher suite: GCM-AES-128   Encryption: on
  Key server offset: 0       Include SCI: no
  Replay protect: off        Replay window: 0

```

### show security macsec connections (MX480 routers with MPC7E-10G)

```

user@host> show security macsec connections
Interface name: xe-4/0/18
  CA name: ca1
  Cipher suite: GCM-AES-128   Encryption: on
  Key server offset: 30       Include SCI: no
  Replay protect: off        Replay window: 0
  Outbound secure channels
    SC Id: 54:1E:56:B4:0D:3A/1
    Outgoing packet number: 11
  Secure associations
    AN: 1 Status: inuse Create time: 1d 17:31:10

```

```
Inbound secure channels
  SC Id: 54:1E:56:B3:CA:A7/1
  Secure associations
    AN: 1 Status: inuse Create time: 1d 17:31:10
```

#### show security macsec connections (MX480 routers with MPC7E-10G)

```
user@host> show security macsec connections interface xe-1/0/7
```

```
CA name: caae1
  Cipher suite: AES_GCM_128   Encryption: off
  Key server offset: 0         Include SCI: no
  Replay protect: off         Replay window: 0
  Outbound secure channels
    SC Id: 54:1E:56:B3:CA:9C/1
    Outgoing packet number: 1
    Secure associations
      AN: 0 Status: inuse Create time: 4d 05:56:06
  Inbound secure channels
    SC Id: 54:1E:56:B4:0D:2F/1
    Secure associations
      AN: 0 Status: inuse Create time: 4d 05:56:06
```

## show security macsec statistics (MX Series)

**Syntax** `show security macsec statistics  
<brief | detail>  
<interface interface-name>`

**Release Information** Command introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers. Support for MPC7E-10G introduced in Junos OS Release 16.1R1 for MX240, MX480, and MX960 routers.

**Description** Display Media Access Control Security (MACsec) statistics.

**Options** **none**—Display MACsec statistics in brief form for all interfaces on the router.

**brief | detail**—(Optional) Display the specified level of output. Using the **brief** option is equivalent to entering the command with no options (the default). The **detail** option displays additional fields that are not visible in the **brief** output.

**NOTE:** The field names that only appear in this command output when you enter the **detail** option are mostly useful for debugging purposes by Juniper Networks support personnel.

**interface *interface-name***—(Optional) Display MACsec statistics for the specified interface only.

**Required Privilege Level** view

**Output Fields** [Table 184 on page 2269](#) lists the output fields for the **show security macsec statistics** command. Output fields are listed in the approximate order in which they appear.

The field names that appear in this command's output only when you enter the **detail** option are mostly useful for debugging purposes by Juniper Networks support personnel. Those field names are, therefore, not included in this table.

*Table 184: show security macsec statistics Output Fields*

| Field Name     | Field Description      | Level of Output |
|----------------|------------------------|-----------------|
| Interface name | Name of the interface. | All levels      |

Table 184: show security macsec statistics Output Fields (continued)

| Field Name                                       | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                 | Level of Output |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Fields for Secure Channel transmitted</b>     |                                                                                                                                                                                                                                                                                                                                                                                                                                   |                 |

## show security mka sessions (MX Series)

|                                 |                                                                                                                                                                                                                                                        |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>show security mka sessions</code><br><code>&lt;interface <i>interface-name</i>&gt;</code>                                                                                                                                                        |
| <b>Release Information</b>      | Command introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers. Support for MPC7E-10G introduced in Junos OS Release 16.1R1 for MX240, MX480, and MX960 routers.                                                                      |
| <b>Description</b>              | Display MACsec Key Agreement (MKA) session information for all interfaces. The MKA protocol is responsible for maintaining MACsec on the link, and decides which router on the point-to-point link becomes the key server.                             |
| <b>Options</b>                  | <ul style="list-style-type: none"> <li><b>interface <i>interface-name</i></b>—(Optional) Display the MKA session information for the specified interface only.</li> <li><b>none</b>—Display the MKA session information for all interfaces.</li> </ul> |

| <b>Output Fields</b>            | <a href="#">Table 185 on page 2274</a> lists the output fields for the <b>show security mka sessions</b> command. Output fields are listed in the approximate order in which they appear.                                                              |

*Table 185: show security mka sessions Output Fields*

| Field Name        | Field Description                                                                                                                                                                    |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface name    | Name of the interface.                                                                                                                                                               |
| Member identifier | Name of the member identifier.                                                                                                                                                       |
| CAK name          | Name of the connectivity association key (CAK). The CAK is configured using the <b>cak</b> keyword when configuring the pre-shared key.                                              |
| Transmit interval | The transmit interval. Both ends of the point-to-point link should be configured to the same value. Default value is 2000 seconds. Possible values: 2000 through 10000 milliseconds. |
| Outbound SCI      | Name of the outbound secure channel identifier.                                                                                                                                      |
| Message number    | Number of the last data message.                                                                                                                                                     |
| Key number        | Key number.                                                                                                                                                                          |

Table 185: show security mka sessions Output Fields (continued)

| Field Name           | Field Description                                                                                                                                                                 |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Key server           | Key server status.<br><br>The router is the key server when this output is <b>yes</b> . The router is not the key server when this output is <b>no</b> .                          |
| Key server priority  | Displays the priority of the key server. Lower value indicates higher priority. Use the <b>key-server-priority</b> statement to set the priority. Possible values: 0 through 255. |
| Latest SAK AN        | Name of the latest secure association key (SAK) association number.                                                                                                               |
| Latest SAK KI        | Name of the latest secure association key (SAK) key identifier.                                                                                                                   |
| Fields for Peer list |                                                                                                                                                                                   |
| Member identifier    | Name of the member identifier.                                                                                                                                                    |
| Hold time            | Hold time, in seconds.                                                                                                                                                            |
| Message number       | Number of the last data message                                                                                                                                                   |
| SCI                  | Name of the secure channel identifier.                                                                                                                                            |
| Lowest acceptable PN | Number of the lowest acceptable packet number (PN).                                                                                                                               |

## Sample Output

### show security mka sessions

```

| <b>Master router</b>                         | IP address of the interface that is acting as the master. If the VRRP interface is down, the output is <b>N/A</b> .                                                                                                                                                                                                                               | <b>detail extensive</b> |
| <b>Virtual router uptime</b>                 | How long, in seconds, that the virtual router has been up.                                                                                                                                                                                                                                                                                        | <b>detail extensive</b> |
| <b>Master router uptime</b>                  | How long, in seconds, that the master route has been up.                                                                                                                                                                                                                                                                                          | <b>detail extensive</b> |
| <b>Virtual MAC</b>                           | MAC address associated with the virtual IP address.                                                                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| <b>Tracking</b>                              | Whether tracking is <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                                                                                                                           | <b>detail extensive</b> |
| <b>Current priority</b>                      | Current operational priority for being the VRRP master.                                                                                                                                                                                                                                                                                           | <b>detail extensive</b> |
| <b>Configured priority</b>                   | Configured base priority for being the VRRP master.                                                                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| <b>Priority hold-time</b>                    | Minimum time interval, in seconds, between successive changes to the current priority. <b>Disabled</b> indicates no minimum interval.                                                                                                                                                                                                             | <b>detail extensive</b> |
| <b>Remaining-time</b>                        | ( <b>track</b> option only) Displays the time remaining in the priority hold-time interval.                                                                                                                                                                                                                                                       | <b>detail</b>           |
| <b>Interface tracking</b>                    | Whether interface tracking is enabled or disabled. When enabled, the output also displays the number of tracked interfaces.                                                                                                                                                                                                                       | <b>detail extensive</b> |
| <b>Interface/Tracked interface/Track Int</b> | Name of the tracked interface.                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b> |

Table 187: show vrrp Output Fields (continued)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                              | Level of Output         |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Int state/Interface state/State</b> | Current operational state of the tracked interface: <b>up</b> or <b>down</b> .                                                                                                                                                                                                                                 | <b>detail extensive</b> |
| <b>Int speed/Speed</b>                 | Current operational speed, in bits per second, of the tracked interface.                                                                                                                                                                                                                                       | <b>detail extensive</b> |
| <b>Incurred priority cost</b>          | Operational priority cost incurred due to the state and speed of this tracked interface. This cost is applied to the configured priority to obtain the current priority.                                                                                                                                       | <b>detail extensive</b> |
| <b>Threshold</b>                       | Speed below which the corresponding priority cost is incurred. In other words, when the speed of the interface drops below the threshold speed, the corresponding priority cost is incurred.<br><br>An entry of <b>down</b> means that the corresponding priority cost is incurred when the interface is down. | <b>detail extensive</b> |
| <b>Route tracking</b>                  | Whether route tracking is enabled or disabled. When enabled, the output also displays the number of tracked routes.                                                                                                                                                                                            | <b>detail extensive</b> |
| <b>Route count</b>                     | The number of routes being tracked.                                                                                                                                                                                                                                                                            | <b>detail extensive</b> |
| <b>Route</b>                           | The IP address of the route being tracked.                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>VRF name</b>                        | The VPN routing and forwarding (VRF) routing instance that the tracked route is in.                                                                                                                                                                                                                            | <b>detail extensive</b> |
| <b>Route state</b>                     | The state of the route being tracked: <b>up</b> , <b>down</b> , or <b>unknown</b> .                                                                                                                                                                                                                            | <b>detail extensive</b> |
| <b>Priority cost</b>                   | Configured priority cost. This value is incurred when the interface speed drops below the corresponding threshold or when the tracked route goes down.                                                                                                                                                         | <b>detail extensive</b> |
| <b>Active</b>                          | Whether the threshold is active (*). If the threshold is active, the corresponding priority cost is incurred.                                                                                                                                                                                                  | <b>detail extensive</b> |
| <b>Group VRRP PDU statistics</b>       | Number of VRRP advertisements sent and received by the group.                                                                                                                                                                                                                                                  | <b>extensive</b>        |

Table 187: show vrrp Output Fields (continued)

| Field Name                        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Level of Output    |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| Group VRRP PDU error statistics   | <p>Errored statistics for the VRRP group:</p> <ul style="list-style-type: none"> <li>• <b>Bad authentication type received</b>—Number of VRRP PDUs received with an invalid authentication type. The received authentication can be <b>none</b>, <b>simple</b>, or <b>md5</b> and must be the same for all routers in the VRRP group.</li> <li>• <b>Bad password received</b>—Number of VRRP PDUs received with an invalid key (password). The password for simple authentication must be the same for all routers in the VRRP group</li> <li>• <b>Bad MD5 digest received</b>—Number of VRRP PDUs received for which the MD5 digest computed from the VRRP PDU differs from the digest expected by the VRRP instance configured on the router.</li> <li>• <b>Bad advertisement timer received</b>—Number of VRRP PDUs received with an advertisement time interval that is inconsistent with the one in use among the routers in the VRRP group.</li> <li>• <b>Bad VIP count received</b>—Number of VRRP PDUs whose virtual IP address counts differ from the count that has been configured on the VRRP instance.</li> <li>• <b>Bad VIPADDR received</b>—Number of VRRP PDUs whose virtual IP addresses differ from the list of virtual IP addresses configured on the VRRP instance.</li> </ul> | extensive          |
| Group state transition statistics | <p>State transition statistics for the VRRP group:</p> <ul style="list-style-type: none"> <li>• <b>Idle to master transitions</b>—Number of times that the VRRP instance transitioned from the idle state to the master state.</li> <li>• <b>Idle to backup transitions</b>—Number of times that the VRRP instance transitioned from the idle state to the backup state.</li> <li>• <b>Backup to master transitions</b>—Number of times that the VRRP instance transitioned from the backup state to the master state.</li> <li>• <b>Master to backup transitions</b>—Number of times that the VRRP instance transitioned from the master state to the backup state.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | extensive          |
| VR state                          | <p>The state of the VRRP:</p> <ul style="list-style-type: none"> <li>• <b>backup</b>—The interface is acting as the backup router interface.</li> <li>• <b>bringup</b>—VRRP is just starting, and the physical device is not yet present.</li> <li>• <b>idle</b>—VRRP is configured on the interface and is disabled. This can occur when VRRP is first enabled on an interface whose link is established.</li> <li>• <b>init</b>—VRRP is initializing.</li> <li>• <b>master</b>—The interface is acting as the master router interface.</li> <li>• <b>transition</b>—The interface is changing between being the backup and being the master router.</li> </ul> <p><b>NOTE:</b> When show vrrp nsr is used on the backup Routing Engine, it displays the current VRRP state on the master Routing Engine, which is the future VRRP state for the backup Routing Engine. Do not use on the master Routing Engine.</p>                                                                                                                                                                                                                                                                                                                                                                              | brief none summary |

```

### show vrrp nsr

This command is similar to **show vrrp**. Here, the **VR state** column displays the current VRRP state on the master Routing Engine, which is the future VRRP state for the backup Routing Engine. Do not use on the master Routing Engine.

NSR is yes if VRRP nonstop active routing is enabled for the configured VRRP group.

RPD-NSR is yes if the routing options have been set to nonstop active routing.

```
user@host>show vrrp nsr
```

| Interface  | State | Group | VR state | VR Mode | Type | NSR | RPD-NSR | Address  |

| <b>Description</b>              | <p>Triggers the linktrace protocol to trace the route between two maintenance points. The result of the traceroute protocol is stored in the path database. To display the path database, use the <b>show oam ethernet connectivity-fault-management path-database</b> command.</p> <p>Before using the traceroute command, you can verify the remote MEP's MAC address using the <b>show oam ethernet connectivity-fault-management path-database</b> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>                  | <p><b>local-mep <i>mep-id</i></b>—(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.</p> <p><b>detail</b>—(Optional) Provide detailed information of the responder hostname, ingress port name, egress port name, TTL, and relay action.</p> <p><b>mac-address</b>—Destination unicast MAC address of the remote maintenance point.</p> <p><b>mep-id</b>—MEP identifier of the remote maintenance point. The range of values is 1 through 8191.</p> <p><b>maintenance-association <i>ma-name</i></b>—Specifies an existing maintenance association from the set of configured maintenance associations.</p> <p><b>maintenance-domain <i>md-name</i></b>—Specifies an existing maintenance domain from the set of configured maintenance domains.</p> <p><b>ttl <i>value</i></b>—Number of hops to use in the linktrace request. The range is 1 to 255 hops. The default is 4.</p> <p><b>wait <i>seconds</i></b>—(Optional) Maximum time to wait for a response to the traceroute request. The range is 1 to 255 seconds. The default is 5.</p> |
| <b>Required Privilege Level</b> | network                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

List of Sample Output [traceroute ethernet on page 2293](#)  
[traceroute ethernet detail on page 2293](#)

**Output Fields** [Table 188 on page 2292](#) lists the output fields for the **traceroute ethernet** command. Output fields are listed in the approximate order in which they appear.

*Table 188: traceroute ethernet Output Fields*

| Field Name                     | Field Description                                                                                                                                                                                                                                                            |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Linktrace to</b>            | MAC address of the destination maintenance point.                                                                                                                                                                                                                            |
| <b>Interface</b>               | Local interface used to send the linktrace message (LTM).                                                                                                                                                                                                                    |
| <b>Maintenance Domain</b>      | Maintenance domain specified in the traceroute command.                                                                                                                                                                                                                      |
| <b>Level</b>                   | Maintenance domain level configured.                                                                                                                                                                                                                                         |
| <b>Maintenance Association</b> | Maintenance association specified in the traceroute command.                                                                                                                                                                                                                 |
| <b>Local Mep</b>               | The local maintenance end point identifier.                                                                                                                                                                                                                                  |
| <b>Transaction Identifier</b>  | 4-byte identifier maintained by the MEP. Each LTM uses a transaction identifier. The transaction identifier is maintained globally across all Maintenance Domains. Use the transaction identifier to match an incoming linktrace response (LTR), with a previously sent LTM. |
| <b>Hop</b>                     | Sequential hop count of the linktrace path.                                                                                                                                                                                                                                  |
| <b>TTL</b>                     | Number of hops remaining in the linktrace message. The time to live (TTL) is decremented at each hop.                                                                                                                                                                        |
| <b>Source MAC address</b>      | MAC address of the 802.1ag node responding to the LTM or the source MAC address of the LTR.                                                                                                                                                                                  |
| <b>Next-hop MAC address</b>    | MAC address of the egress interface of the node to which the LTM is forwarded or<br><br>the next-hop MAC address derived from the next egress identifier in the Egress-ID TLV of the LTR PDU.                                                                                |
| <b>Responder Hostname</b>      | The hostname of the responding router. A valid hostname is received only when the responding system is a Juniper Networks router.                                                                                                                                            |
| <b>Ingress port name</b>       | The port name for ingress connections.                                                                                                                                                                                                                                       |
| <b>Egress port name</b>        | The port name for egress connections.                                                                                                                                                                                                                                        |

*Table 188: traceroute ethernet Output Fields (continued)*

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Flags</b>        | <p>The configurable flags can include:</p> <ul style="list-style-type: none"> <li>• H— Hardware only, incoming LT frame has hardware bit set.</li> <li>• T— Terminal MEP, responder is a terminating MEP.</li> <li>• F— FWD yes, LTM frame is relayed further.</li> </ul>                                                                                               |
| <b>Relay Action</b> | <p>The associated relay action. Relay action can be one of the following:</p> <ul style="list-style-type: none"> <li>• RlyHit— Relay hit; target MAC address matches the MP mac address.</li> <li>• RlyFDB— Relay FDB; output port decided by consulting forwarding database.</li> <li>• RlyMPDB— Relay MIP; output port decided by consulting MIP database.</li> </ul> |

## Sample Output

### traceroute ethernet

```
user@host> traceroute ethernet maintenance-domain md1 maintenance-association ma1
00:01:02:03:04:05
```

```
Linktrace to 00:01:02:03:04:05, Interface : ge-5/0/0.0
Maintenance Domain: MD1, Level: 7
Maintenance Association: MA1, Local Mep: 1
```

| Hop                           | TTL | Source MAC address | Next hop MAC address |
|-------------------------------|-----|--------------------|----------------------|
| Transaction Identifier:100001 |     |                    |                      |
| 1                             | 63  | 00:00:aa:aa:aa:aa  | 00:00:ab:ab:ab:ab    |
| 2                             | 62  | 00:00:bb:bb:bb:bb  | 00:00:bc:bc:bc:bc    |
| 3                             | 61  | 00:00:cc:cc:cc:cc  | 00:00:cd:cd:cd:cd    |
| 4                             | 60  | 00:01:02:03:04:05  | 00:00:00:00:00:00    |

### traceroute ethernet detail

```
user@host> run traceroute ethernet maintenance-domain md6 maintenance-association ma6
mep 101 detail
```

```
Linktrace to 00:00:5E:00:53:CC, Interface : ge-1/0/0.1
Maintenance Domain: md6, Level: 6
Maintenance Association: ma6, Local Mep: 201
Transaction Identifier: 2077547465
```

#### Legend for RelayAction:

```
RlyHit -- Relay hit, Target MAC address matches the MP mac address
RlyFDB -- Relay FDB, output port decided by consulting FDB database
RlyMPDB -- Relay MIP, output port decided by consulting MIP database
```

#### Legend for Flags:

```
H -- Hardware only,incoming LT frame has hardware bit set
T -- Terminal MEP, responder is a terminating MEP
F -- FWD yes, LTM frame is relayed further
```

| TTL         | Responder | Hostname | Ingress port name   | Egress port name   |        |
|-------------|-----------|----------|---------------------|--------------------|--------|
| RelayAction |           |          |                     |                    |        |
|             | Responder | Service  | Ingress MAC address | Egress MAC address | Flags  |
