| <b>Description</b>              | Configure algorithm-based allocation of blocks of destination ports. By specifying this method, you ensure that an incoming (source) IP address and port always map to the same destination IP address and port block, thus eliminating the need for logging address translations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                  | <p><b><i>block-size</i></b>—Maximum number of ports that can be allocated to a user.</p> <p>If <b><i>block-size</i></b> is configured as zero, the method for computing the block size is as follows:</p> $\text{block-size} = \text{int}(65412 / \text{ceil}[(\text{Number of subscribers} / \text{Number of IP addresses in the NAT pool})]).$ <p>where</p> <p>64512 is derived from (65535 - 1023) because the regular port assignments start from 1024.</p> <p>Number of subscribers is derived from the from clause of the applicable NAT rule.</p> <p><b>Default:</b> 256</p> <p><b>Range:</b> 0 through 32,000</p> <p><b><i>include-boundary-addresses</i></b>—(Optional) Specifies that the lowest and highest addresses (the network and broadcast addresses) in the source address range of a NAT rule should be translated when the NAT pool is used. If the source address has a prefix of /32, the lowest and highest address are automatically translated.</p> |

| <b>Description</b>              | <p>Disable NAT-traversal (NAT-T) when a NAT device is present between two IPsec gateways to cause the Encapsulating Security Payload (ESP) protocol to be used for encapsulation.</p> <p>In traditional network deployments, IPsec does not work when packets traverse across a device that is configured for network address translation (NAT) or network address port translation (NAPT) for translating packets, IPsec does not work when either one of the device or both the devices that terminate the IPsec tunnel is behind a NAT device. This behavior occurs because NAT checks the port information, which is not present for IPsec-protected traffic.</p> <p>When NAT-T is configured, IPsec traffic is encapsulated using the UDP header and port information is provided for the NAT devices. By default, Junos OS detects whether either one of the IPsec tunnel is behind a NAT device and automatically switches to using NAT-T for the protected traffic. However, in certain cases, NAT-T support on MX Series routers might not work as desired. Also, you might require NAT-traversal to be disabled if you are aware that the network uses IPsec-aware NAT.</p> <p>To avoid problems with NAT-T on MX series routers, you can disable NAT-T. When you disable NAT-T, the NAT-T functionality is globally switched off. Also, even when a NAT device is present between the two IPsec gateways, only ESP encapsulation is used when you disable NAT-T.</p> |

| <b>Description</b>         | <p>Configure the settings for filtering DNS requests for blacklisted website domains. Filtering can result in either:</p> <ul style="list-style-type: none"> <li>Blocking access to the site by sending the client a DNS response that includes an IP address or domain name of a sinkhole server instead of the blacklisted domain.</li> <li>Logging the DNS request and allowing access.</li> </ul> <p>Settings at the [edit services web-filter profile <i>profile-name</i> dns-filter-template <i>template-name</i>] hierarchy level override the corresponding settings at the [edit services web-filter profile <i>profile-name</i>] hierarchy level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <p><b>database-file <i>filename</i></b>—Name of the domain filter database file to use when filtering DNS requests.</p> <p><b>dns-resp-ttl <i>seconds</i></b>— Number of seconds to live while sending the DNS response after taking the DNS sinkhole action.<br/> <b>Default:</b> 1800<br/> <b>Range:</b> 0 through 86,400</p> <p><b>dns-server [ <i>ip-address</i> ]</b>—(Optional) IP addresses (IPv4 or IPv6) for up to three specific DNS servers. DNS filtering examines only DNS requests that are destined for those DNS servers.</p> <p><b>hash-key <i>key-string</i></b>—Hash key that you used to create the hashed domain name in the domain filter database file.</p> <p><b>hash-method <i>hash-method-name</i></b>—Hash method that you used to create the hashed domain name in the domain filter database file. The only supported hash method is <b>hmac-sha2-256</b>.</p> <p><b>statistics-log-timer <i>minutes</i></b>—Number of minutes in the interval for logging statistics for DNS requests and for sinkhole actions performed for each customer IP address.</p> |

**Default:** 5

**Range:** 0 through 60

**wildcarding-level *level***—Level of subdomains that are searched for a match. A value of 0 indicates that subdomains are not searched.

For example, if you set the **wildcarding-level** to 4 and the database file includes an entry for **example.com**, the following comparisons are made for a DNS request that arrives with the domain **198.51.100.0.example.com**:

- **198.51.100.0.example.com**: no match
- **51.100.0.example.com**: no match for one level down
- **100.0.example.com**: no match for two levels down
- **0.example.com**: no match for three levels down
- **example.com**: match for four levels down

**Range:** 0 through 10

             `dns-sinkhole;`  
         `}`  
     `}`  
`}`

**Hierarchy Level** [edit services web-filter profile *profile-name*]

**Release Information** Statement introduced in Junos OS Release 18.3R1 on MX Series.

**Description** Configure filtering of DNS requests for blacklisted website domains for requests on specific uplink and downlink logical interfaces or routing instances, or for requests from specific source IP address prefixes. The DNS filter template overrides the corresponding settings at the DNS profile level. You can configure up to 32 DNS filter templates in a profile.

Filtering can result in either:

- Blocking access to the site by sending the client a DNS response that includes an IP address or domain name of a sinkhole server instead of the blacklisted domain.
- Logging the DNS request and allowing access.

**Options** **accept**—Accept DNS requests for DNS filtering.

**client-interfaces [ *client-interface-name* ]**—(Optional) Client-facing (uplink) logical interfaces on which the DNS filter template settings are applied.

**client-routing-instance *client-routing-instance-name***—(Optional) Client-facing (uplink) routing instance on which the DNS filter template settings are applied.

**dns-filter-template *template-name***—Name of the DNS filter template.

**dns-sinkhole**—Perform the sinkhole action identified in the domain filter database for blacklisted DNS requests.

**server-interfaces [ *server-interface-name* ]**—(Optional) Server-facing logical interfaces (downlink) on which the DNS filter template settings are applied.

**server-routing-instance *server-routing-instance-name***—(Optional) Server-facing (downlink) routing instance on which the DNS filter template settings are applied.

**NOTE:** If you configure the client and server interfaces or the client and server routing instances, implicit filters are installed on the interfaces or routing instances to direct DNS traffic to the MS-MPC for DNS filtering. If you configure neither the client and server interfaces nor the routing instances, you must provide a way to direct DNS traffic to the MS-MPC (for example, via routes).

**src-ip-prefix [ *source-prefix* ]**—(Optional) Source IP address prefixes of DNS requests you want to filter. You can configure a maximum of 64 prefixes in a term. If you do not specify any source prefixes, then all DNS requests are filtered.

**term *term-name***—Name for a term. You can configure a maximum of 64 terms in a template.

The remaining statements are explained separately. See [CLI Explorer](#).

**Syntax** `dscp (alias | bits);`

**Hierarchy Level** [edit services cos [application-profile](#) *profile-name* ([ftp](#) | sip) ([data](#) | [video](#) | [voice](#))],  
[edit services cos [rule](#) *rule-name* [term](#) *term-name* [then](#)],  
[edit services cos [rule](#) *rule-name* [term](#) *term-name* [then](#) reverse]

**Release Information** Statement introduced in Junos OS Release 8.1.

**Description** Define the Differentiated Services code point (DSCP) mapping that is applied to the packets.

**Options** *alias*—Name assigned to a set of CoS markers.  
*bits*—Mapping value in the packet header.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## ecmp-alb

**Syntax**    `ecmp-alb {  
              apply-groups;  
              apply-groups-except;  
              tolerance;  
              }`

**Hierarchy Level**    [edit chassis]

**Release Information**    Statement introduced in Junos OS Release 14.2.

**Description**    Enable adaptive load balancing for equal-cost multipath (ECMP) next hops.

**NOTE:** The `ecmp-alb` statement can be enabled only when the `[edit chassis network-services enhanced-ip]` statement is configured.

**Options**    **apply-groups**—Specify the groups from which to inherit configuration data.

**apply-groups-except**—Specify the groups from which configuration data should not be inherited.

**tolerance**—Specify the adaptive tolerance in percentage.

**Default:** 20%.

**Required Privilege**    interface—To view this statement in the configuration.

**Level**    interface-control—To add this statement to the configuration.

| Description              | <p>Specify the maximum number of inbound flows allowed on EIF mapping to the configured value. This limit is per EIF mapping and is per given instance of time. For example, if <b>eif-flow-limit</b> is configured as n, then only n inbound connections are allowed at a given instance of time. The n+1 and subsequent connections arriving when n connections are alive are dropped . A new inbound connection is allowed only when one of the n connections times out or is closed. This limit is applied for all type of flows.</p> <p>Starting in Junos OS Release 15.1R3, <b>eif-flow-limit</b> is also supported on the MS-MPC and MS-MIC.</p> |
| Required Privilege Level | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## encryption

|                            |                                                                                                                                                              |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <pre> encryption {     algorithm <i>algorithm</i>;     key (ascii-text <i>key</i>   hexadecimal <i>key</i>); } </pre>                                        |
| <b>Hierarchy Level</b>     | [edit services ipsec-vpn <b>rule</b> <i>rule-name</i> <b>term</b> <i>term-name</i> <b>then manual</b> direction <i>direction</i> ]                           |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br><b>aes-128-cbc</b> , <b>aes-192-cbc</b> , and <b>aes-256-cbc</b> options added in Junos OS Release 7.6. |
| <b>Description</b>         | Configure an encryption algorithm and key for manual SA.                                                                                                     |

**Options** **algorithm**—Type of encryption algorithm. The algorithm can be one of the following:

- **des-cbc**—Has a block size of 8 bytes (64 bits); the key size is 48 bits long.
- **3des-cbc**—Has a block size of 8 bytes (64 bits); the key size is 192 bits long.
- **aes-128-cbc**—Advanced Encryption Standard (AES) 128-bit encryption algorithm.
- **aes-192-cbc**—Advanced Encryption Standard (AES) 192-bit encryption algorithm.
- **aes-256-cbc**—Advanced Encryption Standard (AES) 256-bit encryption algorithm.

**NOTE:** For **3des-cbc**, the first 8 bytes should differ from the second 8 bytes, and the second 8 bytes should be the same as the third 8 bytes.

**key**—Type of encryption key. The key can be one of the following:

- **ascii-text**—ASCII text key. Following are the key lengths, in ASCII characters, for the different encryption options:
  - **des-cbc** option, 8 ASCII characters
  - **3des-cbc** option, 24 ASCII characters
  - **aes-128-cbc** option, 16 ASCII characters
  - **aes-192-cbc** option, 24 ASCII characters
  - **aes-256-cbc** option, 32 ASCII characters
- **hexadecimal**—Hexadecimal key. Following are the key lengths, in hexadecimal characters, for the different encryption options:
  - **des-cbc** option, 16 hexadecimal characters
  - **3des-cbc** option, 48 hexadecimal characters
  - **aes-128-cbc** option, 32 hexadecimal characters

- **aes-192-cbc** option, 48 hexadecimal characters
- **aes-256-cbc** option, 64 hexadecimal characters

## family (Voice Services)

---

**Syntax**    family (inet | mlppp | ...) {  
              address address {  
              ...  
              }  
              bundle interface-name;  
              }

**Hierarchy Level**    [edit interfaces *interface-name* unit *logical-unit-number*]

**Release Information**    Statement introduced before Junos OS Release 7.4.

**Description**    Configure protocol family information for the logical interface.

**Options**    *family*—Protocol family:

- **inet**—IP version 4
- **mlppp**—MLPPP

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

## fragmentation-maps

---

**Syntax**    fragmentation-maps {  
              map-name {  
                  forwarding-class class-name {  
                      drop-timeout milliseconds;  
                      fragment-threshold bytes;  
                      multilink-class number;  
                      no-fragmentation;  
                  }  
              }  
          }

**Hierarchy Level**    [edit class-of-service]

**Release Information**    Statement introduced before Junos OS Release 7.4.

**Description**    For Multiservices and Services PIC link services IQ (**lsq**) and virtual LSQ redundancy (**rlsq**) interfaces, define fragmentation properties for individual forwarding classes.

**Default**    If you do not include this statement, traffic in all forwarding classes is fragmented.

**Options**    **map-name**—Name of the fragmentation map.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

               source-prefix-list *list-name* <except>;  
               }

**Hierarchy Level**    [edit services pcp rule *rule-name* term *term-name*]

**Release Information**    Statement introduced in Junos OS Release 13.2R1.

**Description**    Specify the match conditions for a PCP rule term. A PCP rule assigns the PCP server that handles selected traffic.

PCP is supported on the MS-DPC, MS-100, MS-400, and MS-500 MultiServices PICS. Starting in Junos OS Release 17.4R1, PCP is also supported on the MS-MPC and MS-MIC.

The remaining statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                   interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 17.2 on MX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | <p>Enable the cleanup of IKE triggers and IKE and IPsec SAs when an IPsec tunnel's local gateway IP address goes down or the MS-MIC or MS-MPC being used in the tunnel's service set goes down. If the local gateway IP address for an IPsec tunnel's service set goes down or the MS-MIC or MS-MPC that is being used in the service set goes down, the service set no longer sends IKE triggers. In addition, when the local gateway IP address goes down, the IKE and IPsec SAs are cleared for next-hop service sets, and go to the Not Installed state for interface-style service sets. The SAs that have the Not Installed state are deleted when the local gateway IP address comes back up.</p> <p>If the local gateway IP address that goes down is for the responder peer, then you need to manually clear the IKE and IPsec SAs on the initiator peer so that the IPsec tunnel comes back up once the local gateway IP address comes back up (see <a href="#">clear services ipsec-vpn ike security-associations</a> and <a href="#">clear services ipsec-vpn ipsec security-associations</a>).</p> |
| <b>Options</b>                  | <p><b><i>interface-name</i></b>—Name of the interface of the IPsec local gateway.</p> <p><b><i>logical-unit-number</i></b>—Number of the logical unit of the IPsec local gateway interface. You must include the logical unit number.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## hash-keys (Aggregated Multiservices)

---

**Syntax**    hash-keys {  
              egress-key (destination-ip | source-ip);  
              ingress-key (destination-ip | source-ip);  
              }

**Hierarchy Level**    [edit services service-set *service-set-name* interface-service load-balancing-options]

**Release Information**    Statement introduced in Junos OS Release 11.4.

**Description**    Configure the hash keys used for load balancing in aggregated multiservices (AMS) for service applications (Network Address Translation [NAT], stateful firewall, application-level gateway [ALG], HTTP header enrichment, and mobility). The hash keys supported in the ingress and egress direction are the source IP address and destination IP address.

Hash keys are used to define the load-balancing behavior among the various members in the AMS group. For example, if **hash-keys** is configured as **source-ip**, then the hashing would be performed based on the source IP address of the packet. Therefore, all packets with the same source IP address land on the same member. Hash keys must be configured with respect to the traffic direction: ingress or egress. For example, if **hash-keys** is configured as **source-ip** in the ingress direction, then it should be configured as **destination-ip** in the egress direction. This is required to ensure that the packets of the same flow reach the same member of the AMS group.

The configuration of the ingress and egress hash keys is mandatory if you are using AMS for NAT. This configuration is not mandatory if you are using AMS for stateful firewall; if the hash keys are not configured, then the defaults are chosen. Refer to [Table 32 on page 1013](#) for the supported hash keys.

The resource-triggered option enables anchor session PICs to use the load or resource information from the anchor services PICs to select the AMS member will anchor the services for the subscriber for load balancing among AMS members. In addition, for mobile subscriber-aware services (such as HTTP header enrichment), you must configure the **resource-triggered** statement, which means that the load balancing is not done using the ingress and egress keys.

**Table 32: Hash Keys Supported for AMS for Service Applications**

| Service Set at Ingress Interface        |                        |                        | Service Set at Egress Interface |                        |
|-----------------------------------------|------------------------|------------------------|---------------------------------|------------------------|
| Hash Keys for NAT                       |                        |                        |                                 |                        |
| NAT Type                                | Ingress hash key       | Egress hash key        | Ingress hash key                | Egress hash key        |
| source static                           | Destination IP address | Source IP address      | Source IP address               | Destination IP address |
| source dynamic                          | Source IP address      | Destination IP address | Destination IP address          | Source IP address      |
| Network Address Port Translation (NAPT) | Source IP address      | Destination IP address | Destination IP address          | Source IP address      |
| destination static                      | Source IP address      | Destination IP address | Destination IP address          | Source IP address      |
| Hash Keys for Stateful Firewall         |                        |                        |                                 |                        |
| Stateful Firewall                       | Destination IP address | Source IP address      | Destination IP address          | Source IP address      |
| Stateful Firewall                       | Source IP address      | Destination IP address | Source IP address               | Destination IP address |

**NOTE:** If NAT is used in the service set (along with stateful firewall and ALG), then the hash keys should be based on the NAT type; otherwise, the hash keys of the stateful firewall should be used.

## Options

**NOTE:** The `egress-keys` option is hidden and is deprecated in Junos OS Release 15.1 and later, and is only maintained for backward compatibility. It might be removed completely in a future software release. Load-balancing or steering of traffic occurs, based on the hash keys in the forward direction. Load-balancing of traffic also occurs, based on the hash keys in the reverse direction except in dynamic NAT scenarios (dynamic NAT, NAT64, and NAPT44). For interface-style services, the ingress hash-key is used for the forward direction and the egress hash-key is used for the reverse direction. These hash-keys are configured within the service-set definition by using the `ingress-key` and `egress-key` statements at the `[edit services service-set service-set-name interface-service load-balancing-options]` hierarchy level. For next-hop style services, the ingress hash-key on the inside-domain next-hop is used in the forward direction and the ingress hash-key (not the egress hash-key) on outside-domain next-hop is used for the reverse direction. These hash-keys are configured at the logical AMS interface level by using the `ingress-key` and `egress-key` statements at the `[edit interfaces amsN unit logical-unit-number load-balancing-options hash-keys]` hierarchy level.

**ingress-key destination-ip**—Use the destination IP address of the flow to compute the hash used in load balancing in the ingress flow direction.

**ingress-key source-ip**—Use the source IP address of the flow to compute the hash used in load balancing in the ingress flow direction.

**egress-key destination-ip**—Use the destination IP address of the flow to compute the hash used in load balancing. Configure the hash keys to be used in the egress flow direction. The configuration is mandatory if you are using AMS for Network Address Translation (NAT). This configuration is not mandatory if you are using AMS for stateful firewall; if the hash keys are not configured, then the defaults are chosen.

**egress-key source-ip**—Use the source IP address of the flow to compute the hash used in load balancing. Configure the hash keys to be used in the egress flow direction.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure the hash keys used for load balancing in aggregated multiservices (AMS) for next-hop style services. The hash keys supported in the ingress and egress direction are the source IP address and destination IP address.</p> <p>Hash keys are used to define the load-balancing behavior among the various members in the AMS. For example, if <b>hash-keys</b> is configured as <b>source-ip</b>, then the hashing is performed based on the source IP address of the packet, so that all packets with the same source IP address land on the same member. When you use <b>ingress-key</b> and <b>egress-key</b>, you must configure hash keys to take the traffic direction into consideration. For example, if you configure <b>hash-keys</b> as <b>source-ip</b> in the ingress direction, then you must configure <b>hash-keys</b> as <b>destination-ip</b> in the egress direction. This is required to ensure that the packets of the same flow reach the same member of the AMS group.</p> <p>If you are configuring an AMS interface used in a service set for DS-Lite,</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p> |
| <b>Options</b>                  | <p><b>egress-key destination-ip</b>—Use the destination IP address of the flow to compute the hash used in load balancing. Configure the hash keys to be used in the egress flow direction.</p> <p><b>egress-key source-ip</b>—Use the source IP address of the flow to compute the hash used in load balancing. Configure the hash keys to be used in the egress flow direction.</p> <p><b>ingress-key destination-ip</b>—Use the destination IP address of the flow to compute the hash used in load balancing. Configure the hash keys to be used in the ingress flow direction.</p> <p><b>ingress-key source-ip</b>—Use the source IP address of the flow to compute the hash used in load balancing. Configure the hash keys to be used in the ingress flow direction.</p>                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## header-integrity-check

**Syntax**    header-integrity-check {  
                  enable-all;  
                  }

**Hierarchy Level**    [edit services service-set *service-set* service-set-options]

**Release Information**    Statement introduced in Release 13.2.

**Description**    Configure Junos OS to verify the packet header for anomalies in IP, TCP, UDP, and ICMP information and to flag such anomalies and errors.

Starting in Junos OS release 17.1R1, the header integrity check on the MS-MPC or MS-MIC drops any packets with header anomalies and includes the following checks:

- ICMP ping of death
- IP unknown protocol
- TCP no flag
- TCP SYN FIN
- TCP FIN no ACK

**NOTE:** The header-integrity-check option that is supported on MS-MICs and MS-MPCs to verify the packet header for anomalies in IP, TCP, UDP, and ICMP information and flag such anomalies and errors has a functionality that is opposite to the functionality caused by passive mode tunneling. If you configure both the header-integrity-check statement and the passive-mode tunneling statement on MS-MICs and MS-MPCs, and attempt to commit such a configuration, an error is displayed during commit.

The passive mode tunneling functionality (by including the passive-mode-tunnelin statement at the [edit services service-set *service-set-name* ipsec-vpn-options] hierarchy level) is a superset of the capability to disable IPsec tunnel endpoint in the traceroute output (by including no-ipsec-tunnel-in-traceroute statement at the [edit services ipsec-vpn] hierarchy level). Passive mode tunneling also bypasses the active IP checks and tunnel MTU check in addition to not treating an IPsec tunnel as a next-hop as configured by the no-ipsec-tunnel-in-traceroute statement.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                          interface-control—To add this statement to the configuration.

## high-availability-options (Aggregated Multiservices)

**Syntax**    high-availability-options {  
                   ([many-to-one](#) | [one-to-one](#)) {  
                     preferred-backup *preferred-backup*;  
                   }  
           }

**Hierarchy Level**    [edit interfaces *interface-name* load-balancing-options]

**Release Information**    Statement introduced in Junos OS Release 11.4.

**Description**    Configure the high availability options for the aggregated multiservices (AMS) interface. For service applications, if only the load-balancing feature is being used, then this configuration is optional.

For many-to-one (N:1) high availability support for service applications like Network Address Translation (NAT), the preferred backup MS-PIC, in hot standby mode, backs up one or more (N) active MS-PICs.

**NOTE:** In both cases, if one of the active MS-PICs goes down, then the backup replaces it as the active MS-PIC. When the failed PIC comes back up, it becomes the new backup. This is called *floating backup*.

One-to-one (1:1) high availability support associates a single backup interface with a single active interface. In 1:1 (stateful) configurations, synchronization causes the active and back up PICs to synchronize traffic states and data structures, preventing data loss during a failover event. Stateful synchronization is required for IPsec high availability support. 1:1 configuration is supported only on the MS-MPC).

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                   interface-control—To add this statement to the configuration.

## host (service-set)

**Syntax**    `host hostname {`  
               `class {`  
                   `alg-logs;`  
                   `deterministic-nat-configuration-log;`  
                   `ids-logs;`  
                   `nat-logs;`  
                   `packet-logs;`  
                   `pcp-logurlf-logs;`  
                   `session-logs <open | close>;`  
                   `stateful-firewall-logs;`  
                   `urlf-logs;`  
                   `}`  
               `facility-override facility-name;`  
               `interface-service prefix-value;`  
               `log-prefix prefix-value;`  
               `port port-number;`  
               `services severity-level;`  
               `source-address source-address;`  
               `}`

**Hierarchy Level**    [edit services [service-set](#) *service-set-name* [syslog](#)]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                               **class** option introduced in Junos OS Release 13.2.  
                               You can configure multiple system log hosts from Junos OS Release 17.4R1 onwards.

**Description**    Specify the hostname for the system logging utility.

Starting in Junos OS Release 17.4R1, you can configure up to a maximum of four system log servers (combination of local system log hosts and remote system log collectors) for each service set at the [edit services **service-set** *service-set-name* **syslog** host *hostname* class] hierarchy level.

**NOTE:** Starting with Junos OS release 14.1X55, 14.2R5, 15.1R3, and 16.1R1, for multiservices (ms-) interfaces, you cannot configure system logging for PCP and ALGs by including the pcp-logs and alg-logs statements at the [edit services **service-set** *service-set-name* **syslog** host *hostname* class] hierarchy level. An error message is displayed if you attempt to commit a configuration that contains the pcp-logs and alg-logs options to define system logging for PCP and ALGs for ms- interfaces.

**Options**    *hostname*—Name of the system logging utility host machine.

From Junos OS Release 17.4R1, you can configure up to four system log hosts.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

## hot-standby

---

**Syntax** hot-standby;

**Hierarchy Level** [edit interfaces rlsqnumber [redundancy-options](#)],  
[edit interfaces rlsqnumber:number [redundancy-options](#)]  
[edit interfaces rspnumber [redundancy-options](#)]  
[edit interfaces rmsnumber [redundancy-options](#)]

**Release Information** Statement introduced in Junos OS Release 7.6.

**Description** For one-to-one AS, rsp, or rms redundancy configurations, specify that the failure detection and recovery must take place in less than 5 seconds. For FRF.15 (MLFR) and FRF.16 (MFR) configuration, specify the switch over time of 5 seconds and less for FRF.15 and a maximum of 10 seconds for FRF.16.

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

See [force-entry](#)

## ike

```

Syntax ike {
 proposal proposal-name {
 authentication-algorithm (sha1 | sha-256 | sha-384);
 authentication-method (ecdsa-signatures-256 | ecdsa-signatures-384 | pre-shared-keys
 | rsa-signatures);
 description description;
 dh-group (group1 | group2 | group5 | group14 | group15 | group16 | group19 | group20 |
 group24);
 encryption-algorithm algorithm;
 lifetime-seconds seconds;
 }
 policy policy-name {
 description description;
 local-certificate identifier;
 local-id (ipv4_addr ipv4-address | ipv6_addr ipv6-address | key-id identifier);
 version (1 | 2);
 mode (aggressive | main);
 pre-shared-key (ascii-text key | hexadecimal key);
 proposals [proposal-names];
 remote-id {
 any-remote-id;
 ipv4_addr [values];
 ipv6_addr [values];
 key_id [values];
 }
 }
 }

```

**Hierarchy Level** [edit services ipsec-vpn]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Configure IKE.

The remaining statements are explained separately.

**NOTE:** In Junos FIPS mode, the aggressive option of the **mode** statement is not supported.

**NOTE:** In Junos FIPS mode, ECDSA options of the **authentication-method** statement are not supported in Junos OS Release 17.3R1. Starting in Junos OS Release 17.4R1, ECDSA is supported in Junos FIPS mode.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

---

## ike-access-profile

---

**Syntax** ike-access-profile *profile-name*;

**Hierarchy Level** [edit services [service-set](#) *service-set-name* [ipsec-vpn-options](#)]

**Release Information** Statement introduced in Junos OS Release 7.4.

**Description** Define the access profile for the IPsec traffic on dynamic tunnels.

**Options** *profile-name*—Identifier for access profile, which must match the name configured at the [edit access profile *name* client \* ike] hierarchy level.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Hierarchy Level** [edit services traffic-load-balance]

**Release Information** Statement introduced in Junos OS Release 16.1 on MX Series.

**Description** Configure a Traffic Load Balancer instance.

**Options** **client-interface** *client-interface*—For translated mode, client interface where the implicit filter is installed to direct the traffic in the forward direction.

**client-vrf** *client-vrf*—Use the specified name of the routing instance in which the data traffic in the reverse direction is routed to the clients.

**instance** *instance-name*—Identifier (text string) for a TLB configuration.

**server-inet-bypass-filter** *server-inet-bypass-filter*—Name of the firewall filter from which the terms are referenced and added to the server-side implicit filters. This enables the operator to bypass reverse (RIP to VIP) translation of IPv4 traffic.

**server-inet6-bypass-filter** *server-inet6-bypass-filter*—Name of the firewall filter from which the terms are referenced and added to the server-side implicit filters. This enables the operator to bypass reverse (RIP to VIP) translation of IPv6 traffic.

**server-interface** *server-interface*—For translated mode, specifies the server interfaces where the server filters are implicitly installed to direct the return traffic to the load balancing next hop.

**server-vrf** *server-vrf-name*—The routing instance in which the data traffic in the forward direction is routed to the servers

The remaining statements are explained separately. See [CLI Explorer](#).

## interfaces (Aggregated Multiservices)

```
Syntax interfaces interface-name {
 load-balancing-options {
 hash-keys {
 egress-key (source-ip | destination-ip);
 ingress-key (source-ip | destination-ip);
 }
 high-availability-options {
 (many-to-one | one-to-one) {
 preferred-backup preferred-backup;
 }
 }
 member-failure-options {
 drop-member-traffic {
 rejoin-timeout rejoin-timeout;
 }
 redistribute-all-traffic {
 enable-rejoin;
 }
 }
 member-interface interface-name;
 }
 redundancy-options {
 primary mams-a/b/0;
 secondary mams-a/b/0;
 }
 unit interface-unit-number {
 family family;
 }
 }
```

Hierarchy Level [edit]

Release Information Statement introduced in Junos OS Release 11.4.

Description Configure the aggregated Multiservices (AMS) interface. The AMS interface provides the infrastructure for load balancing and high availability (HA).

Options ***interface-name***—Name of a valid aggregated multiservices interface (ams)—for example, ams0 or ams1.

The remaining statements are explained separately. See [CLI Explorer](#).

Required Privilege  
Level interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## land-attack-check

---

**Syntax** `land-attack-check (ip-only | ip-port );`

**Hierarchy Level** `[edit services service-set service-set-name nat-options]`

**Release Information** Statement introduced with Junos OS Release 12.3.

**Description** Enable land attack checks based on either IP address only or both IP address and IP port number.

**NOTE:** If you do not configure this statement, there is no land attack check for hairpinning NAT packets.

---

**Options** `ip-only`—Land attack check is based on IP address only.

`ip-port`—Land attack check is based on IP address and IP port number.

**Required Privilege** `interface`—To view this statement in the configuration.

**Level** `interface-control`—To add this statement to the configuration.

| <b>Description</b>              | <p>Learn potential incoming SIP calls by inspecting the SIP register method.</p> <p>More information: You can enable the router to accept any incoming SIP calls for the endpoint devices that are behind the NAT firewall. When a device behind the firewall registers with the proxy that is outside the firewall, the AS or Multiservices PIC maintains the registration state. When the <b>learn-sip-register</b> statement is enabled, the router can use this information to accept inbound calls. If this statement is not configured, no inbound calls are accepted; only the devices behind the firewall can call devices outside the firewall.</p> |
|                                 | <div>  <p><b>NOTE:</b> You can manually inspect the SIP register by running the <code>show services stateful-firewall sip-register</code> command.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                              |

 }
```

**Hierarchy Level** [edit interfaces *interface-name*]

**Release Information** Statement introduced in Junos OS Release 11.4.

**Description** Configure the high availability (HA) options for the aggregated multiservices (AMS) interface.

Many-to-one (N:1) high availability mode for service applications like Network Address Translation (NAT) is supported. In the case of N:1 high availability mode, one MS-PIC is the backup (in hot standby mode) for one or more (N) active MS-PICs. If one of the active MS-PICs goes down, then the backup replaces it as the active MS-PIC. When the failed PIC comes back online, it becomes the new backup. This is called *floating backup mode*. In an N:1 (stateless) configuration, traffic states and data structures are not synchronized between active PICs and the backup PIC.

The MS-MPC also supports one-to-one (1:1) high availability mode. In the 1:1 configuration, a single interface is configured as the backup for another single active interface. If the active interface goes down, the backup interface replaces it as the active interface. A 1:1 (stateful) configuration synchronizes traffic states and data structures between the active MS-PIC and the backup PIC. This is required for IPsec connections.

Load-balancing might not be uniform among member interfaces in certain network deployments. The variance can be because of a misconfiguration, which causes the traffic itself not to be sufficiently randomly distributed, causing the hash keys to be ineffective (for example, the hash key is destination IP but all sessions have only source IP address). The variation can be within the expected range and the load balancing depends on the IP addresses chosen. The hash calculation performs a checksum on several bits of the IP address and not only on the last few lower significant bits of the IP

address. In such a scenario, the load-balancing ratio can change, for instance, if the source IP address is changed from 20.0.0.0/24 to 20.0.1.0/24.

The distribution of traffic across member interfaces of an AMS interface is static load-balancing. Flows are load balanced based on a packet hash on parameters such as source IP or destination IP. Load-balancing effectiveness depends on the IP address or protocol diversity. For example, if the hash key is destination IP and all packets have the same destination, then all flows are directed to the same member. This is flow-level load balancing and not per packet. As a result, traffic between a pair of addresses may be 10,000 pps, whereas another pair of addresses may have 1 pps. The load of the former is not distributed among members. High availability is limited to stateless HA. When a backup interface takes over as an active interface, all flows are reestablished (for example, packets may undergo NAT processing differently after failover).

With a stateful firewall, static NAT as `basic-nat44` or `destination-nat44`, and dynamic NAT as `nat64`, `napt-44`, `dynamic-nat44`, and with application layer gateways (ALGs) configured, NAT hairpinning is not supported. Input direction for rule match to be applied is supported only for dynamic NAT types (`NAT64`, `NAT44`, and `dynamic-NAT44`). Service-set policies need to have input or input-output direction only. Flows on all active members are reset when the number of actives changes. The resetting of flows can be avoided at the cost of failed-member's traffic loss using certain options.

The remaining statements are explained separately. See [CLI Explorer](#).

## manual

```
Syntax manual {
 direction (inbound | outbound | bidirectional) {
 authentication {
 algorithm (hmac-md5-96 | hmac-sha1-96);
 key (ascii-text key | hexadecimal key);
 }
 auxiliary-spi spi-value;
 encryption {
 algorithm algorithm;
 key (ascii-text key | hexadecimal key);
 }
 spi spi-value;
 protocol (ah | esp | bundle);
 }
}
```

**Hierarchy Level** [edit services ipsec-vpn [rule rule-name](#) [term term-name](#) [then](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Define a manual IPsec SA.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Related Documentation**

## many-to-one (Aggregated Multiservices)

---

**Syntax**    `many-to-one {  
                  preferred-backup preferred-backup;  
                  }`

**Hierarchy Level**    [edit interfaces *interface-name* load-balancing-options high-availability-options]

**Release Information**    Statement introduced in Junos OS Release 11.4.

**Description**    Configure the many-to-one (N:1) preferred backup for the aggregated multiservices (AMS) interface.

**NOTE:** The preferred backup must be one of the member interfaces (mams–) that have already been configured at the [edit interfaces *interface-name* load-balancing-options] hierarchy level. Even in the case of mobile control plane redundancy, which is one-to-one (1:1), the initial preferred backup is configured at this hierarchy level.

---

**Options**    `preferred-backup preferred-backup`—Use the specified interface as the preferred backup member interface. The member interface format is mams-*a*/*b*/0, where *a* is the FPC slot number and *b* is the PIC slot number.

**Required Privilege**    interface—To view this statement in the configuration.  
**Level**    interface-control—To add this statement to the configuration.

**Related Documentation**

## map-e

**Syntax**    `map-e name {  
               ea-bits-len ea-bits-len;  
               ipv4-prefix ipv4-prefix;  
               mape-prefix mape-prefix;  
               mtu-v6 mtu-v6;  
               psid-length psid-length;  
               psid-offset psid-offset;  
               software-address software-address;  
               v4-reassembly;  
               v6-reassembly;  
               version-03;  
           }`

**Hierarchy Level**    [edit services software software-concentrator]

**Release Information**    Statement introduced in Junos OS Release 18.2R1 for MX Series Routers with MPC and MIC interfaces.

**Description**    Configure Mapping of Address and port – Encapsulation (MAP-E) as an inline service on MX Series routers that use MPC and MIC interfaces. MAP-E is an automatic tunneling mechanism that encapsulates IPv4 packets within an IPv6 address. The IPv4 packets are carried in an IPV4-over-IPV6 tunnel from the MAP-E Customer Edge (CE) devices to the MAP-E Provider Edge (PE) devices (also called as Border Relay (BR) devices) through an IPV6 routing topology, where they are de-tunneled for further processing.

**Options**    **name**—Name of the MAP-E software concentrator.

**ea-bits-len**—Configure rule for Embedded Address (EA) length for the MAP-E domain.

### NOTE:

- If **v4-prefix-len** is 0 then **ea-bits-len** must be non-zero, and vice versa.
- It is possible that **ea-bits-len** is equal to 0, but **psid-len** is non-zero.
- If the sum of **v4-prefix-len** and **ea-bits-len** is less than 32, then the **psid-len** must be equal to the difference between 32 and the sum total of **v4-prefix-len** and **ea-bits-len**.

**Range:** 0 through 48

**ipv4-prefix**—Configure rule for IPv4 prefix and length of the MAP-E domain.

**Range:** 0 through 32

**mape-prefix**—Configure rule for IPV6 prefix and length for the MAP-E domain. The MAP-E IPv4 and IPv6 prefix must be unique per software concentrator.

**mtu-v6**—(Optional) Specify the Maximum transmission unit (MTU) for the MAP-E software tunnel.

**Default:** 9192

**Range:** 1280 through 9192

**psid-length**—Configure Port Set ID (PSID) length value for the MAP-E domain.

NOTE:

- If the sum of **v4-prefix-len** and **ea-bits-len** is less than 32, then the **psid-len** must be equal to the difference between 32 and the sum total of **v4-prefix-len** and **ea-bits-len**.

**Range:** 0 through 16

**psid-offset**—(Optional) Configure PSID offset value for the MAP-E domain.

**Default:** 4

**Range:** 0 through 16

**software-address**—Specify the Border Relay device unicast IPv6 address as the software concentrator IPV6 address.

**v4-reassembly | v6-reassembly**—(Optional) Enable IPv4 and IPv6 reassembly for MAP-E.

**version-03**—Configure version number to distinguish between currently supported version of the Internet draft draft-ietf-software-map-03 (expires on July 28, 2013), *Mapping of Address and Port with Encapsulation (MAP)* and the latest available version.

**Required Privilege Level**    system

**Related Documentation**    .

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | <p>Specify how the flow timer should be refreshed based on the mapping refresh configured for all types of fwnat flows. For TCP flows, if <b>tcp-tickles</b> is configured, then tickles are sent only on the flow matching the mapping-refresh direction. For inbound-outbound mapping, refresh tickles will be sent on both the flows (default behavior).</p> <p>Starting in Junos OS Release 15.1R3, <b>mapping-refresh</b> is also supported on the MS-MPC and MS-MIC.</p> |
| <b>Options</b>                  | <p><b>inbound</b>—Refresh the flow timer for inbound flows only.</p> <p><b>inbound-outbound</b>—Refresh the flow timer for all flows.</p> <p><b>outbound</b>—Refresh the flow timer for outbound flows only.</p>                                                                                                                                                                                                                                                               |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                             |

## mapping-timeout

---

**Syntax**    mapping-timeout *seconds*;

**Hierarchy Level**    [edit [services](#) nat [pool](#) *nat-pool-name*]

**Release Information**    mapping-timeout statement introduced in JUNOS Release 10.1.

**NOTE:** This configuration option has been replaced by [app-mapping-timeout](#). This option is currently retained only for backward compatibility.

---

**Description**    Specify the duration for mappings that use the specified NAT pool.

**Options**    *seconds*—Lifetime of mappings in seconds.

**Default:** 300

**Range:** 120 through 864,000

**Required Privilege**    interface—To view this statement in the configuration.

**Level**    interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure the maximum drop flows allowed per ingress and egress direction. The configuration is per service set. The configured limits indicate the maximum number of drop flows that can be created at a given instance of time in both directions. If max drop flows ingress is 10 and egress is 5 then at a given instance of time maximum of 10 ingress drop flows and 5 egress drop flows can be present. Two counters, one for each direction ingress and egress, are to be added to service set stateful-firewall statistics to track the number of drop flows not created due to the drop flow limits exceeded. These limits applies to all types of drop flows i.e., TCP, UDP, ICMP etc. Ingress drop flows are forward flows for match-direction input rules and reverse flows for match-direction output rules. Similarly egress drop flows are reverse flows for match-direction input and forward flows for match-direction output rules. The limits are applied cumulatively on all the NAT rules associated with the service-set.</p> <p>If you specify the maximum drop flows to be zero, it indicates that the configuration is not effective. You must specify a value higher than zero for maximum drop flows.</p> |
| <b>Default</b>                  | <p>If the <b>max-drop-flows</b> command is not configured, a 40,000 drop flow limit per Physical Interface Card (PIC) is used. This 40,000 default drop flow limit is shared between all ingress and egress drop flows for all service sets using this default <b>max-drop-flows</b> configuration on the PIC. For instance, if two service sets—SS1 and SS2—are configured without the <b>max-drop-flows</b> command and are running on the same PIC, SS1 and SS2 combined cannot support more than 40,000 drop flows.</p> <p>Traffic that is dropped due to the default exceeded drop flow limit when a drop flow is not configured is dropped silently. Syslog messages are not generated for this dropped traffic.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <div> <b>NOTE:</b> When an aggregated multiservices (AMS) interface is configured as the service interface for a service set, the <code>max-flow</code> value configured for the service set is applied to each of the member interfaces in the AMS interface. That is, if you have configured 1000 as the <code>max-flow</code> value for a service set that uses an AMS interface with four active member interfaces, each of the member interfaces can handle 1000 flows each, resulting in an effective <code>max-flow</code> value of 4000.</div> |                                                                                                                         |

member-failure-options (Aggregated Multiservices)

Syntax `member-failure-options {  
 drop-member-traffic {  
 rejoin-timeout rejoin-timeout;  
 }  
 redistribute-all-traffic {  
 enable-rejoin;  
 }  
}`

Hierarchy Level [edit interfaces *interface-name* load-balancing-options]

Release Information Statement introduced in Junos OS Release 11.4.

Description Configure the possible behavior for the aggregated Multiservices (AMS) interface in case of failure of more than one active member.

NOTE: The `drop-member-traffic` configuration and the `redistribute-all-traffic` configuration are mutually exclusive.

Table 33 on page 1075 displays the behavior of the member interface after the failure of the first Multiservices PIC. Table 34 on page 1076 displays the behavior of the member interface after the failure of two Multiservices PICs.

NOTE: The AMS infrastructure has been designed to handle one failure automatically. However, in the unlikely event that more than one Multiservices PIC fails, the AMS infrastructure provides configuration options to minimize the impact on existing traffic flows.

Table 33: Behavior of Member Interface After One Multiservices PIC Fails

| High Availability Mode                                               | Member Interface Behavior                       |
|----------------------------------------------------------------------|-------------------------------------------------|
| Many-to-one (N:1) high availability support for service applications | Automatically handled by the AMS infrastructure |

**Table 34: Behavior of Member Interface After Two Multiservices PICs Fail**

| High Availability Mode                                               | Configuration                   | rejoin-timeout | Behavior when member rejoins before rejoin-timeout expires                                                                                                                                                                                                                                    | Behavior when member rejoins after rejoin-timeout expires                                                                                                                                                                                                   |
|----------------------------------------------------------------------|---------------------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Many-to-one (N:1) high availability support for service applications | <b>drop-member-traffic</b>      | Configured     | <p>The existing traffic for the second failed member will <i>not</i> be redistributed to the other members.</p> <p>The first member to rejoin becomes an active member. The second member to rejoin becomes the backup. This behavior is handled automatically by the AMS infrastructure.</p> | <p>The existing traffic for the second failed member will <i>not</i> be redistributed to the other members.</p> <p>The first member will rejoin the AMS automatically. However, the other members who are rejoining will be moved to the discard state.</p> |
| Many-to-one (N:1) high availability support for service applications | <b>redistribute-all-traffic</b> | Not applicable | <p>Before rejoin, the traffic is redistributed to existing active members.</p> <p>After a failed member rejoins, the traffic is load-balanced afresh. This may impact existing traffic flows.</p>                                                                                             |                                                                                                                                                                                                                                                             |

The remaining statements are explained separately. See [CLI Explorer](#).

**Default** If **member-failure-options** are not configured, then the default behavior is to drop member traffic with a rejoin timeout of 120 seconds.

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | <p>Specify the member interfaces for the aggregated multiservices (AMS) interface. You can configure multiple interfaces by specifying each interface in a separate statement.</p> <p>Starting with Junos OS Release 16.2, an AMS interface can have up to 32 member interfaces. In Junos OS Release 16.1 and earlier, an AMS interface can have a maximum of 24 member interfaces. If you configure more than 24 member interfaces, you must set the <code>pic-boot-timeout</code> value to 240 or 300 seconds at the <code>[edit interfaces <i>interface-name</i> multiservice-options]</code> hierarchy level for every services PIC interface on the MX Series router.</p> <p>For high availability service applications like Network Address Translation (NAT) that support many-to-one (N:1) redundancy, you can specify two or more interfaces.</p> <p>On an MS-MPC, you can configure one-to-one (1:1) redundancy. In a 1:1 (stateful) configuration, a single backup interface provides redundancy for a single active interface. A 1:1 configuration is required for IPsec.</p> |
|                                 | <div>  <p><b>NOTE:</b> The member interfaces that you specify must be members of aggregated multiservices interfaces (mams-).</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <i>interface-name</i> —Name of the member interface. The member interface format is <code>mams-a/b/0</code> , where <i>a</i> is the FPC slot number and <i>b</i> is the PIC slot number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>mode (aggressive   main);</code>                                                                                                   |
| <b>Hierarchy Level</b>     | <code>[edit services ipsec-vpn ike policy <i>policy-name</i>]</code>                                                                     |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.                                                                                        |
| <b>Description</b>         | Define an IKE policy mode.                                                                                                               |
| <b>Default</b>             | <code>main</code>                                                                                                                        |
| <b>Options</b>             | <b>aggressive</b> —Takes half the number of messages of main mode, has less negotiation power, and does not provide identity protection. |

**NOTE:** In Junos FIPS mode, the **aggressive** option is not supported.

---

**main**—Uses six messages, in three peer-to-peer exchanges, to establish the IKE SA. These three steps include the IKE SA negotiation, a Diffie-Hellman exchange, and authentication of the peer. Also provides identity protection.

## next-hop-service

---

**Syntax**    `next-hop-service {  
          inside-service-interface interface-name.unit-number;  
          outside-service-interface interface-name.unit-number;  
          outside-service-interface-type interface-type;  
          service-interface-pool name;  
          }`

**Hierarchy Level**    `[edit services service-set service-set-name]`

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                              **service-interface-pool** option added in Junos OS Release 9.3.

**Description**    Specify interface names or a service interface pool for the forwarding next-hop service set. You cannot specify both a service interface pool and an inside or outside interface.

**Options**    **inside-service-interface *interface-name.unit-number***—Name and logical unit number of the service interface associated with the service set applied inside the network.

**outside-service-interface *interface-name.unit-number***—Name and logical unit number of the service interface associated with the service set applied outside the network.

**outside-service-interface-type *interface-type***—Identifies the interface type of the service interface associated with the service set applied outside the network. For inline IP reassembly, set the interface type to local.

**service-interface-pool *name***—Name of the pool of logical interfaces configured at the `[edit services service-interface-pools pool pool-name]` hierarchy level. You can configure a service interface pool only if the service set has a PGCP rule configured. The service set cannot contain any other type of rule.

**NOTE:** **service-interface-pool** is not applicable for IP reassembly configuration on L2TP.

---

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

| Syntax                   | no-anti-replay;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Hierarchy Level          | [edit services service-set <i>service-set-name</i> ipsec-vpn-options]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Release Information      | Statement introduced in Junos OS Release 10.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Description              | <p>Disable IPsec antireplay service for this service set, which occasionally causes interoperability issues for security associations. This statement is useful for dynamic endpoint tunnels for which you cannot configure the <b>no-anti-reply</b> statement at the [edit services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then] hierarchy level.</p> <p>For static IPsec tunnels, this statement disables the antireplay check for all the tunnels within this service set. If antireplay check has to be enabled for a particular tunnel, then set the <b>anti-replay-window-size</b> statement at the [edit services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then] hierarchy level.</p> <div> <b>NOTE:</b> Setting the anti-replay-window-size and no-anti-replay statements at the [edit services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then] hierarchy level overrides the settings specified at the [edit services service-set <i>service-set-name</i> ipsec-vpn-options] hierarchy level.</div> |
| Required Privilege Level | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>              | <p>For link services IQ (<b>lsq</b>) interfaces only, set traffic on a particular forwarding class to be interleaved, rather than fragmented. This statement specifies that no extra fragmentation header is prepended to the packets received on this queue and that static-link load balancing is used to ensure in-order packet delivery.</p> <p>Static-link load balancing is done based on packet payload. For IP version 4 (IPv4) and IP version 6 (IPv6) traffic, the link is chosen based on a hash computed from the source address, destination address, and protocol. If the IP payload is Transmission Control Protocol (TCP) or User Datagram Protocol (UDP) traffic, the hash also includes source port and destination port. For MPLS traffic, the hash includes all MPLS labels and fields in the payload, whether the MPLS payload is IPv4 or IPv6.</p> |
| <b>Default</b>                  | If you do not include this statement, the traffic in forwarding class <b>class-name</b> is fragmented.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.2.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | <p>Configure a single interface to be the preferred one-to-one (1:1) backup for an active aggregated multiservices (AMS) interface. If the active interface fails, the backup interface takes over. A 1:1 (stateful) configuration synchronizes traffic states and data structures between the active and backup PICs. This is required for high availability of IPsec connections. 1:1 configuration is supported only on MS-MPCs.</p> |
|                                 | <div>  <p><b>NOTE:</b> The preferred backup must be one of the member interfaces (mams--) that have already been configured at the [edit interfaces <i>interface-name</i> load-balancing-options] hierarchy level.</p> </div>                                                                                                                          |
| <b>Options</b>                  | <p><b>preferred-backup <i>preferred-backup</i></b>—Use the specified interface as the preferred backup member interface. The member interface format is mams-<i>a</i>/<i>b</i>/0, where <i>a</i> is the Flexible PIC Concentrator (FPC) slot number and <i>b</i> is the PIC slot number.</p>                                                                                                                                            |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | <p>Allows tunneling of malformed packets. When this statement is enabled, traffic bypasses the usual active IP checks. The IPsec tunnel is not treated as a next hop and TTL is not decremented. If the packet size exceeds the tunnel MTU value, an ICMP error is not generated. Starting with Junos OS Release 13.3R4 and 14.2R1, passive mode tunneling is supported on MS-MICs and MS-MPCs.</p> <div> <b>NOTE:</b> The header-integrity-check option that is supported on MS-MICs and MS-MPCs to verify the packet header for anomalies in IP, TCP, UDP, and ICMP information and flag such anomalies and errors has a functionality that is opposite to the functionality caused by passive mode tunneling. If you configure both the header-integrity-check statement and the passive-mode tunneling statement on MS-MICs and MS-MPCs, and attempt to commit such a configuration, an error is displayed during commit.</div> <p>The passive mode tunneling functionality (by including the <code>passive-mode-tunnelin</code> statement at the [edit services <code>service-set</code> <i>service-set-name</i> ipsec-vpn-options] hierarchy level) is a superset of the capability to disable IPsec tunnel endpoint in the traceroute output (by including <code>no-ipsec-tunnel-in-traceroute</code> statement at the [edit services ipsec-vpn] hierarchy level). Passive mode tunneling also bypasses the active IP checks and tunnel MTU check in addition to not treating an IPsec tunnel as a next-hop as configured by the <code>no-ipsec-tunnel-in-traceroute</code> statement.</p> |

| <b>Description</b>              | Port block allocation (PBA) generates one syslog entry per set of ports allocated to a subscriber. These logs are UDP based and can be lost in the network, especially for long running flows. Interim logging resends the above logs at a configured interval for all active blocks that have traffic on at least one block. For the MS-MIC and MS-MPC, log messages are generated for sessions which have a port in a block, even if the block has no traffic. |
| <b>Options</b>                  | <p><b><i>seconds</i></b>—Interval, in seconds, for re-sending of session logs</p> <p><b>Default:</b> 0—This indicates that interim logging is not used.</p> <p><b>Range:</b> 1800 to 86,400seconds.</p>                                                                                                                                                                                                                                                          |

## per-unit-scheduler

**Syntax** per-unit-scheduler;

**Hierarchy Level** [edit interfaces *interface-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 13.2 on 16x10GE MPC and MPC3E line cards.  
Statement introduced in Junos OS Release 13.2 on PTX Series Packet Transport Routers.  
Statement introduced in Junos OS Release 13.3 on MPC4E line cards.  
Statement introduced in Junos OS Release 15.1 on MPC6E line cards.

**Description** For Channelized OC3 IQ, Channelized OC12 IQ, Channelized STM1 IQ, Channelized T3 IQ, Channelized E1 IQ, E3 IQ, link services IQ interfaces (lsq-), Gigabit Ethernet IQ, Gigabit Ethernet IQ2 and IQ2-E, and 10-, 40-, and 100-Gigabit Ethernet interfaces (including the 16x10GE MPC), enable the association of scheduler maps with logical interfaces.

**CAUTION:** Turning on per-unit scheduling causes the interface to reinitialize, which means all logical interfaces (units) on the interface are deleted and recreated.

**NOTE:** To enable per-unit scheduling on MX80 and MX104 routers, configure the per-unit-scheduler statement at each member physical interface level of a particular aggregated Ethernet interface as well as at that aggregated Ethernet interface level. On other routing platforms, it is enough if you include this statement at the aggregated Ethernet interface level.

**NOTE:** Per-unit scheduling is not supported on T1 interfaces configured on the Channelized OC12 IQ PIC.

**NOTE:** On Gigabit Ethernet IQ2 and IQ2-E PICs without the per-unit-scheduler statement, the entire PIC supports 4071 VLANs and the user can configure all the VLANs on the same port.

On Gigabit Ethernet IQ2 and IQ2-E PICs with the per-unit-scheduler statement, the entire PIC supports  $1024 - 2 * \text{number of ports}$  (1024 minus two times the number of ports), because each port is allocated two default schedulers.

When including the **per-unit-scheduler** statement, you must also include the **vlan-tagging** statement or the **flexible-vlan-tagging** statement (to apply scheduling to VLANs) or the **encapsulation frame-relay** statement (to apply scheduling to DLCIs) at the **[edit interfaces interface-name]** hierarchy level.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.2 on MX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | <p>Set the service PIC boot timeout value to 240 or 300 seconds for every services PIC on the MX Series router if you are configuring more than 24 members in an aggregated multiservices (AMS) interface. We recommend setting the boot timeout value to 240. Starting with Junos OS Release 16.2, an AMS interface can have up to 32 member interfaces. In Junos OS Release 16.1 and earlier, an AMS interface can have a maximum of 24 member interfaces.</p> <p>If you do not set the timeout value to 240 or 300 and you configure an AMS interface with more than 24 members, the default value of 180 causes some of the service PICs to go offline.</p> |
| <b>Options</b>                  | <p><b>240</b>—Service PIC boot timeout is set to 240 seconds.</p> <p><b>300</b>—Service PIC boot timeout is set to 300 seconds.</p> <p><b>Default:</b> 180</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## policy (Services IKE)

---

**Syntax**    `policy policy-name {  
              description description;  
              local-certificate identifier;  
              local-id (ipv4_addr ipv4-address | ipv6_addr ipv6-address | key-id identifier);  
              version (1 | 2);  
              mode (aggressive | main);  
              pre-shared-key (ascii-text key | hexadecimal key);  
              proposals [ proposal-names ];  
              remote-id {  
                  any-remote-id;  
                  ipv4_addr [ values ];  
                  ipv6_addr [ values ];  
                  key_id [ values ];  
              }  
              respond-bad-spi max-responses  
          }`

**Hierarchy Level**    [edit services ipsec-vpn [ike](#)]

**Release Information**    Statement introduced before Junos OS Release 7.4.

**Description**    Define an IKE policy.

**Options**    *policy-name*—IKE policy name.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**    admin—To view this statement in the configuration.  
                                  admin-control—To add this statement to the configuration.

**Related Documentation**    • [Configuring IKE Policies on page 553](#)

## policy (IPsec)

---

**Syntax**    `policy policy-name {  
                   description description;  
                   perfect-forward-secrecy {  
                     keys (group1 | group2 | group5 | group14 | group15 | group16 | group24);  
                   }  
                   proposals [ proposal-names ];  
                 }`

**Hierarchy Level**    [edit services ipsec-vpn [ipsec](#)]

**Release Information**    Statement introduced before Junos OS Release 7.4.

**Description**    Define an IPsec policy.

**Options**    *policy-name*—IPsec policy name.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**    admin—To view this statement in the configuration.  
                                   admin-control—To add this statement to the configuration.

**Related Documentation**    • [Configuring IPsec Policies on page 565](#)

## pool

**Syntax** `pool nat-pool-name {`  
     `address ip-prefix </prefix-length>;`  
     `address-allocation round-robin;`  
     `address-range low minimum-value high maximum-value;`  
     `app-mapping-timeout app-mapping-timeout;`  
     `ei-mapping-timeout ei-mapping-timeout;`  
     `limit-ports-per-address number;`  
     `mapping-timeout mapping-timeout;`  
     `pgcp {`  
         `hint [ hint-strings ];`  
         `ports-per-session ports;`  
         `remotely-controlled;`  
     `}`  
     `port {`  
         `automatic (sequential | random-allocation);`  
         `range low minimum-value high maximum-value random-allocation;`  
         `preserve-parity;`  
         `preserve-range;`  
         `secured-port-block-allocation {`  
             `active-block-timeout timeout-seconds;`  
             `block-size block-size;`  
             `max-blocks-per-user max-blocks;`  
         `}`  
     `}`  
`}`

**Hierarchy Level** [edit [services](#) nat]

**Release Information** Statement introduced before Junos OS Release 7.4.  
**pgcp** statement added in Junos OS Release 8.4.  
**remotely-controlled** and **ports-per-session** statements added in Junos OS Release 8.5.  
**hint** statement added in Junos OS Release 9.0.  
**address-allocation** statement added in Junos OS Release 11.2.  
**sequential** statement introduced in Junos OS Release 14.2.

**Description** Specify the NAT name and properties.

**Options** *nat-pool-name*—Identifier for the NAT address pool.

The remaining statements are explained separately. See [CLI Explorer](#).

**NOTE:** If you make any configuration changes to a NAT pool that has secured port block allocation configured, you must delete the existing NAT address pool, wait at least 5 seconds, and then configure a new NAT address pool. We also strongly recommend that you perform this procedure if you make any changes to the NAT pool configuration, even when secured port block allocation is not configured.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

---

## pool (Service Interface)

---

**Syntax** `pool pool-name {  
    interface interface-name.unit-number;  
}`

**Hierarchy Level** [edit services [service-interface-pools](#)]

**Release Information** Statement introduced in Junos OS Release 9.3.

**Description** Configure a service interface pool for VPN aggregation for the BGF feature.

**Options** *pool-name*—Name of the service interface pool.

The remaining options are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation** • [Configuring Service Interface Pools on page 22](#)

## port (Services NAT)

**Syntax**    `port {`  
               `automatic (sequential | random-allocation);`  
               `range low minimum-value high maximum-value random-allocation;`  
               `preserve-parity;`  
               `preserve-range;`  
               `deterministic-port-block-allocation <block-size block-size> <include-boundary-addresses>;`  
               `secured-port-block-allocation {`  
                   `active-block-timeout timeout-seconds;`  
                   `block-size block-size;`  
                   `max-blocks-per-user max-blocks;`  
               `}`  
               `}`

**Hierarchy Level**    [edit `services` nat `pool` *nat-pool-name*]

**Release Information**    `port` statement introduced before Junos OS Release 7.4.  
                               `random-allocation` statement introduced in Junos OS Release 9.3.  
                               `secured-port-block-allocation` statement introduced in Junos OS Release 11.2.  
                               `deterministic-port-block-allocation` statement introduced in Junos OS Release 12.1.  
                               `sequential` statement introduced in Junos OS Release 14.2R1.

**Description**    Specify the NAT pool port or range. You can configure an automatically assigned port or specify a range with minimum and maximum values.

**NOTE:** Starting in Junos OS Release 14.2R1, the `sequential` option is introduced to enable you to configure sequential allocation of ports. The `sequential` and `random-allocation` options available with the `port automatic` statement at the [edit `services` nat `pool` *nat-pool-name*] hierarchy level are mutually exclusive. You can include the `sequential` option for sequential allocation and the `random-allocation` option for random delegation of ports. By default, sequential allocation of ports takes place if you include only the `port automatic` statement at the [edit `services` nat `pool` *nat-pool-name*] hierarchy level.

For releases earlier than Junos OS Release 14.2R1, configure automatic sequential port assignment by using the `auto` option at the [edit `services` nat `pool` *nat-pool-name* `port automatic`] hierarchy level.

If you upgrade a router running a Junos OS release earlier than Release 14.2R1 to Release 14.2 and if the router contains the `port automatic` statement defined without the `auto` option included with the configuration, the router validates the `auto` option present in the configuration for sequential allocation of ports.

**Options**    `automatic`—Cause the port assignment type to be automatically performed by the router.

**sequential**—Allocate ports in a sequential manner. With sequential allocation, the next available address in the NAT pool is selected only when all the ports available from an address are exhausted.

**minimum-value**—Lower boundary for the port range.

**maximum-value**—Upper boundary for the port range.

**NOTE:** Starting with Junos OS Release 15.1R1, the **preserve-port** and **preserve-range** functionalities are supported on MX Series routers with MS-MPCs and MS-MICs.

**preserve-parity**—Allocate ports with same parity as the original port.

**preserve-range**—Preserve privileged port range after translation.

**random-allocation**—Allocate ports within a specified range randomly.

Other options are described separately.

| <b>Description</b>              | <p>Provide link PIC replication, providing MLPPP link redundancy at the port level. This feature is supported with SONET APS and the following link PICs:</p> <ul style="list-style-type: none"> <li>• Channelized OC3 IQ PIC</li> <li>• Channelized OC12 IQ PIC</li> <li>• Channelized STM1 IQ PIC</li> </ul> <p>Link PIC replication provides the ability to add two sets of links, one from the active SONET PIC and the other from the standby SONET PIC, to the same bundle. If the active SONET PIC fails, links from the standby PIC are used without triggering link renegotiation. All the negotiated state is replicated from the active links to the standby links to prevent link renegotiation.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

 port port;
 ssl-version;
 }
 tcp {
 port tcp-port-number;
 }
 }
```

**Hierarchy Level** [edit services network-monitoring]

**Release Information** Statement introduced in Junos OS Release 16.1 on MX Series.

**Description** Configure a monitoring profile that can be used for health-checking a group of TLB servers.

**Options** **custom**—Use custom probes for server health checking.

**cmd *priority***—Use the specified command priority to send for a custom probe.

**Values:** 1 or 2

**default-real-service-status (down | up)**—Assign a server status for when the probe times out. The **up** value is used when the server or the intermediate network nodes are only expected to send a negative response to a probe.

**Default:** down

**expect (ascii | binary) *receive-string*** —Use the specified ascii or binary string as an expected probe response.

**Range:** 1 through 512 characters

**port *port***—Use the specified port for custom probes.

**protocol (tcp | udp)**—Use the selected protocol for custom probes.

**real-service-action (down | up)**—Assign a server status for when the expected response to the probe is received.

**Default:** down

**send (ascii | binary) *send-string***—Send the specified ascii or binary string as a probe.

**Range:** 1 through 512 characters

**failure-retries *number-of-retries***—Use the specified number of probes that are sent after which the real server is tagged as down.

**Default:** 5

**http**—Use HTTP probes for server health checking.

**host *hostname***—Use the specified hostname for HTTP probes for server health checks.

**method (get | option)**—Use the get or option HTTP method for server health checks.

**port *http-port-number***—Use the specified port number for HTTP probes.

**url *url***—Use the specified URL for HTTP probes. Maximum length is 128 bytes.

**icmp**—Use ICMP probes for server health checking.

**probe-interval *interval***—Use the specified interval of time, in seconds, at which health check probes are sent.

**Default:** 5

***profile-name***—Identifier for the network monitoring profile.

**recovery-retries *number-of-recovery-retries***—Use the specified number of successful probe attempts after which the server is declared up.

**Default:** 5

**ssl-hello**—Use a Client Hello for server health checks

**port *port***—Use the specified port number for Client Hello server health checks.

***ssl-version***—SSL version.

**Default:** 3

**tcp**—Use TCP probes for server health checks.

**port *tcp-port-number***—Use the specified port number for TCP probes.

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

| Description                                                 | <p>Define URL filter profile or DNS filter profile.</p> <p>A URL filter profile is for filtering access to blacklisted URLs. A URL filter profile includes a general database setting and templates. The template settings apply to specific interfaces or to access from specific source IP address prefixes, and override the database setting at the profile level.</p> <p>A DNS filter profile is used to filter DNS requests for blacklisted website domains. A DNS filter profile includes general DNS filtering settings and up to 32 templates. The template settings apply to DNS requests on specific interfaces or to DNS requests from specific source IP address prefixes, and override the corresponding settings at the profile level. You can configure up to eight DNS filter profiles.</p> |
|                                                             | <div>  <p><b>NOTE:</b> For URL filtering, use the <b>url-filter-template</b> option starting in Junos OS Release 18.3R1 and use the <b>template</b> option in Junos OS Releases before 18.3R1.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Options                                                     | <p><b>profile-name</b>—Name of the filter profile.</p> <p><b>url-filter-database filename</b>—Specify the filename of the URL filter database. ## proposal (Services IKE)

---

**Syntax** `proposal proposal-name {  
    authentication-algorithm (md5 | sha1 | sha-256);  
    authentication-method (ecdsa-signatures-256 | ecdsa-signatures-384 | pre-shared-keys  
        | rsa-signatures);  
    description description;  
    dh-group (group1 | group2 | group5 | group14 | group15 | group16 | group19 | group20 |  
        group24);  
    encryption-algorithm algorithm;  
    lifetime-seconds seconds;  
}`

**Hierarchy Level** [edit services ipsec-vpn [ike](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Define an IKE proposal for a dynamic SA.

**NOTE:** In Junos FIPS mode, ECDSA options of the **authentication-method** statement are not supported in Junos OS Release 17.3R1. Starting in Junos OS Release 17.4R1, ECDSA is supported in Junos FIPS mode.

---

**Options** *proposal-name*—IKE proposal name.  
  
The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## protocol (Applications)

---

**Syntax**    `protocol type;`

**Hierarchy Level**    [edit [applications application application-name](#)]

**Release Information**    Statement introduced before Junos OS Release 7.4.

**Description**    Networking protocol type or number.

**Options**    *type*—Networking protocol type. The following text values are supported:

ah  
egp  
esp  
gre  
icmp  
icmp6  
igmp  
ipip  
ospf  
pim  
rsvp  
tcp  
udp

**NOTE:** IP version 6 (IPv6) is not supported as a network protocol in application definitions.

---

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                         interface-control—To add this statement to the configuration.

## receive-window

---

**Syntax** `receive-window packets;`

**Hierarchy Level** `[edit services l2tp tunnel-group name]`

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Specify the size of the receive window for L2TP tunnels, which limits the number of packets the server processes concurrently.

**NOTE:** This statement is not supported for L2TP LNS on MX Series routers.

**Options** *packets*—Maximum number of packets the receive window can hold at one time.  
**Default:** 16

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 17.2 on MX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | <p>Configure warm standby for an aggregated multiservices (AMS) interface. Specify a primary and a secondary (backup) member services interface for the AMS interface. The primary interface is the service interface that you want to back up, and it is the active interface unless it fails. The secondary interface is the backup interface, and does not handle any traffic unless the primary interface fails. You can use the same services interface as the backup in multiple warm standby AMS interfaces.</p> <p>You cannot use both the <b>redundancy-options</b> and the <b>load-balancing-options</b> statements in the same AMS interface.</p> |
| <b>Options</b>                  | <p><b>primary mams-a/b/0</b>—Name of the primary services interface, where <i>a</i> is the FPC slot number and <i>b</i> is the PIC slot number.</p> <p><b>secondary mams-a/b/0</b>—Name of the secondary (backup) services interface, where <i>a</i> is the FPC slot number and <i>b</i> is the PIC slot number.</p>                                                                                                                                                                                                                                                                                                                                         |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## redundancy-policy (Services Redundancy Daemon)

**Syntax**

```

redundancy-policy policy-name {
 redundancy-events [event-list]
 then {
 acquire-mastership;
 <add-static-route destination {
 (next-hop next-hop | receive);
 routing-instance routing-instance
 }>
 <broadcast-warning> ;
 <delete-static-route destination {
 routing-instance routing-instance;
 }>
 <(release-mastership | release-mastership-force);>
 }
}

```

**Hierarchy Level** [edit policy-options]

**Release Information** Statement introduced in Junos OS Release 17.1 on MX Series.

**Description** Specify the actions to be taken for redundancy events. These include acquiring or releasing mastership and adding or deleting static routes.

**Options** **acquire-mastership**—Switch from standby to master role.

**add-static-route *destination***—(Optional) Use the specified destination IP address and prefix for an added signal route.

**broadcast-warning**—(Optional) Switch status from Standby to Standby (Warned).

**delete-static-route *destination***—(Optional) Use the specified destination IP address and prefix for a deleted signal route.

***event-list***—List of names of one or more monitored events that trigger the actions specified in this policy.

***next-hop***—Interface name for the next hop for an added signal route.

***policy-name***—Name of the redundancy policy.

**receive**—Use the added signal route as a receive route.

**release-mastership**—(Optional) Switch from master to standby role.

**release-mastership-force**—(Optional) Force switch from master to standby role.

**routing-instance *routing-instance***—(Optional) Name of the vrf used for the added signal route.

**Required Privilege Level** maintenance—To view this statement in the configuration.  
maintenance-control—To add this statement to the configuration.

## redundancy-set

**Syntax** `redundancy-set redundancy-set {  
healthcheck-timer-interval healthcheck-timer-interval;  
hold-time hold-time;  
keepalive keepalive;  
redundancy-group redundancy-group;  
redundancy-policy [redundancy-policy-list]  
}`

**Hierarchy Level** [edit services]

**Release Information** Statement introduced in Junos OS Release 17.1 on MX Series.

**Description** Specify the characteristics of a redundancy set.

**Options** **healthcheck-timer-interval *healthcheck-timer-interval***—Frequency of health check probes in seconds.  
**Range:** 0 through 3600 seconds

**hold-time**—Maximum wait time for a health check response. When this time expires, the peer is considered down.  
**Range:** 0 through 3600 seconds

**keepalive**—Frequency of srd hello messages in seconds.  
**Range:** 1 through 60 seconds

**redundancy-group**—Redundancy group identifier. This must match a redundancy group ID in the ICCP configuration.  
**Range:** 1 through 100

**redundancy-policy-list**—Names of one or more redundancy policies applied to the redundancy set.

**redundancy-set**—Redundancy set identifier.  
**Range:** 1 through 100

**Required Privilege Level** maintenance—To view this statement in the configuration.  
maintenance-control—To add this statement to the configuration.

## rule (PCP)

```
Syntax rule rule-name {
 match-direction (input | output);
 term term-name {
 from {
 application-sets set-name;
 applications [application-name];
 destination-address address <except>;
 destination-address-range high maximum-value low minimum-value <except>;
 destination-port high maximum-value low minimum-value;
 destination-prefix-list list-name <except>;
 source-address address <except>;
 source-address-range high maximum-value low minimum-value <except>;
 source-prefix-list list-name <except>;
 }
 then {
 pcp-server server-name;
 }
 }
 }
```

**Hierarchy Level** [edit services pcp]

**Release Information** Statement introduced in Junos OS Release 13.2R1.

**Description** Configure a rule to assign the port control protocol (PCP) server that handles selected traffic. PCP enables hosts to operate servers for a long time (as in the case of a webcam) or a short time (for example, while playing a game or on a phone call) when behind a NAT device, including when behind a carrier-grade NAT operated by their ISP. PCP enables applications to create mappings from an external IP address and port to an internal IP address and port.

PCP is supported on the MS-DPC, MS-100, MS-400, and MS-500 MultiServices PICS. Starting in Junos OS Release 17.4R1, PCP is also supported on the MS-MPC and MS-MIC.

**Options** *rule-name*—Rule name

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

 }
 }
 }
 syslog;
 }
}
```

**Hierarchy Level** [edit [services nat](#)],  
[edit [services nat rule-set rule-set-name](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Specify the rule the router uses when applying this service.

**NOTE:** You are limited to a maximum of 200 terms for a NAT rule that is applied to an inline services (type si) interface. If you specify more than 200 terms, you will receive following error when you commit the configuration:

```
[edit]
'service-set service-set-name'
 NAT rule rule-name with more than 200 terms is disallowed for
 si-n/n/n.n
error: configuration check-out failed
```

---

**Options** *rule-name*—Identifier for the collection of terms that make up this rule.

The remaining statements are explained separately.

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

## secured-port-block-allocation

**Syntax**    `secured-port-block-allocation {  
                  active-block-timeout timeout-seconds;  
                  block-size block-size;  
                  max-blocks-per-address max-blocks;  
                  }`

**Hierarchy Level**    [edit [services](#) nat [pool](#) *pool-name* port]

**Release Information**    Statement introduced in Junos OS Release 11.2.

**Description**    When you use block allocation, one or more blocks of ports in a NAT pool address range are available for assignment to a subscriber.

Port block allocation is supported on MX series routers with MS-DPCs and on M Series routers with MS-100, MS-400, and MS-500 MultiServices PICS. Port block allocation is supported on MX series routers with MS-MPCs and MS-MICs starting in Junos OS release 14.2R2.

**NOTE:** If you define the session lifetime globally for a Multiservices (*ms-*) interface (by using the `session-timeout seconds` statement at the [edit *interfaces interface-name services-options*] hierarchy level), the session is terminated even if traffic continues to flow beyond that time period. When continuous traffic transmission occurs, the session is reset immediately after the timeout period. When you configure the same value for the session timeout and the active port block allocation timeout, the system might not determine that the active port block timeout period has elapsed. As a result, when the active port block timeout elapses, the system might use the same block for the initial port allocation that was used previously. However, for the subsequent allocation of a port block, the system identifies the active block timeout value correctly and allocates a port from a new block. This behavior is expected when the session timeout and port block timeout values are identical. To avoid this problem, we recommend that you configure different values for session timeout and port block timeout so that the `JSERVICES_NAT_PORT_BLOCK_ALLOC` system logging message is generated at correct intervals of the active port block timeout value.

**NOTE:** If you make any configuration changes to a NAT pool that has secured port block allocation configured, you must delete the existing NAT address pool, wait at least 5 seconds, and then configure a new NAT address pool. We also strongly recommend that you perform this procedure if you make any changes to the NAT pool configuration, even when secured port block allocation is not configured.

**Options**    **active-block-timeout** *timeout-seconds*—Interval, in seconds, during which a block is active. After the timeout elapses, a new block is allocated, even if ports are available in the active block.

**Range:** 0 through 86400. When you specify 0, the active block transitions to inactive only when it runs out of ports and a new block is allocated. Any inactive block without any ports in use will be freed to the NAT pool, unless it is active block.

**Default:** 120

**block-size** *block-size*—Number of ports included in a block.

**Range:** For the Multiservices DPC only, 1 through 32,000

**Range:** For the Multiservices MPC and Multiservices MIC only, 1 through the total number of configured ports. For example, for a port range of 1024 through 61,024, the block-size range is 1 through 60,000.

**Default:** 128

**max-blocks-per-address** *max-blocks*—Maximum number of blocks that can be allocated to a user address.

**Range:** 1 to 512

**timeout-seconds**—Interval, in seconds, during which a block is active. After timeout, a new block is allocated, even if ports are available in the active block.

**Default:** 120

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                         interface-control—To add this statement to the configuration.

## server (pcp)

**Syntax**

```
server server-name {
 ipv4-address ipv4-address;
 ipv6-address ipv6-address;
 long-lifetime-error long-lifetime-error;
 mapping-lifetime-max mapping-lifetime-max;
 mapping-lifetime-min mapping-lifetime-min;
 max-mappings-per-client max-mappings-per-client;
 nat-options {
 pool pool-name ;
 }
 pcp-options {
 prefer-failure;
 third-party;
 }
 short-lifetime-error short-lifetime-error;
 software-concentrator software-concentrator-name;
}
```

**Hierarchy Level** [edit services pcp]

**Release Information** Statement introduced in Junos OS Release 13.2R1.

**Description** Configure PCP server options. PCP enables hosts to operate servers for a long time (as in the case of a webcam) or a short time (for example, while playing a game or on a phone call) when behind a NAT device, including when behind a carrier-grade NAT operated by their ISP. PCP enables applications to create mappings from an external IP address and port to an internal IP address and port.

PCP is supported on the MS-DPC, MS-100, MS-400, and MS-500 MultiServices PICS. Starting in Junos OS Release 17.4R1, PCP is also supported on the MS-MPC and MS-MIC.

**Options** *ipv4-address*—IPv4 address of the PCP server.

*ipv6-address*—IPv6 address of the PCP server.

*long-lifetime-error* —Time limit for generating long lifetime errors.

**Default:** 1800 seconds

**Range:** 900 through 18,000 seconds

*mapping-lifetime-max*—Maximum lifetime, in seconds, for PCP mapping. If the PCP client requests a lifetime less than the maximum configured, the server will assign the maximum lifetime and respond accordingly.

**Default:** 86,400 seconds

**Range:** 3600 through 4294667 seconds

*mapping-lifetime-min*—Minimum lifetime, in seconds, for PCP mapping. If a PCP client requests a lifetime less than the minimum configured, the server will assign a minimum lifetime and respond accordingly.

**Default:** 300 seconds

**Range:** 120 through 3600 seconds

***max-mappings-per-client***—Maximum number of PCP mappings that the PCP client can request.

**Default:** 32

**Range:** 1 through 32

***pool-name***—Name of the NAT pool to use for PCP mapping. You can identify multiple pools. If you do not specify a NAT pool for mapping, the Junos OS performs a partial rule match based on the source IP, source port, and protocol, and the Junos OS uses the NAT pool configured for the first matching rule to allocate mappings for PCP.

***prefer-failure***—Generate an error message when the PCP client requests a specific IP address or port that is not available, rather than assigning another available address from the NAT pool.

***short-lifetime-error***—Time limit for generating short lifetime errors.

**Default:** 30 seconds

**Range:** 15 through 300 seconds

***softwire-concentrator-name***—Softwire concentrator name whose softwire-address is used in creating PCP mappings. The PCP server address must be the same as the softwire-concentrator address.

***third-party***—Enable third-party requests by the PCP client.

The other statements are explained separately.

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | Define the filter to be applied to traffic before it is accepted for service processing. Configuration of a service filter is optional; if you include the <b>service-set</b> statement without a <b>service-filter</b> definition, Junos OS assumes the match condition is true and selects the service set for processing automatically.         |
| <b>Options</b>                  | <i>filter-name</i> —Identifies the filter to be applied in service processing. You can include special characters, such as a forward slash (/), colon (:), or a period (.).                                                                                                                                                                        |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                            |

Hierarchy Level [edit services]

**Release Information** Statement introduced before Junos OS Release 7.4.  
**pcp-rules** option added in Junos OS Release 13.2R1.  
**pgcp-rules** and **pgcp-rule-sets** options added in Junos OS Release 8.4.  
**server-set-options** option added in Junos OS Release 10.1.  
**ptsp-rules** and **ptsp-rule-sets** options added in Junos OS Release 10.2.  
**software-rules** and **clear-rule-sets** options added in Junos OS Release 10.4.  
**software-options** option added in Junos OS Release 14.1.  
**url-filter-profile** option added in Junos OS Release 17.2R1.  
**match-rules-on-reverse-flow** option added in Junos OS Release 16.1R5 and 17.4R1  
**web-filter-profile** option added in Junos OS Release 18.3R1.

**Description** Define the service set.

**NOTE:** Use the **web-filter-profile** option starting in Junos OS Release 18.3R1 and use the **url-filter-profile** option in Junos OS Releases before 18.3R1.

---

**Options** **service-set-name**—Name of the service set. You can include special characters, such as a forward slash (/), colon (:), or a period (.).

**Range:** Up to 64 alphanumeric characters.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## services (NAT)

---

**Syntax**    `services nat { ... }`

**Hierarchy Level**    [\[edit\]](#)

**Release Information**    Statement introduced before Junos OS Release 7.4.

**Description**    Define the service rules to be applied to traffic.

**Options**    `nat`—Identifies the NAT set of rules statements.

**Required Privilege Level**    `interface`—To view this statement in the configuration.  
                                         `interface-control`—To add this statement to the configuration.

## session-limit (IDS MS-DPC)

```
Syntax session-limit {
 by-destination (IDS MS-DPC) {
 hold-time seconds;
 maximum number;
 packets number;
 rate number;
 }
 by-pair (IDS MS-DPC) {
 hold-time seconds;
 maximum number;
 packets number;
 rate number;
 }
 by-source (IDS MS-DPC) {
 hold-time seconds;
 maximum number;
 packets number;
 rate number;
 }
 }
```

**Hierarchy Level** [edit services ids *rule rule-name term term-name then*]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Enable flow limitation by configuring thresholds on source, destination, or stateful firewall and network address translation (NAT) paired traffic flows when using the MS-DPC.

**Options** The remaining statements are described separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## session-limit (IDS MS-MPC and MS-MIC)

```
Syntax session-limit {
 by-destination {
 by-protocol {
 icmp {
 maximum number;
 packets number;
 rate number;
 }
 tcp {
 maximum number;
 packets number;
 rate number;
 }
 udp {
 maximum number;
 packets number;
 rate number;
 }
 }
 maximum number;
 packets number;
 rate number;
 }
 by-source {
 by-protocol {
 icmp {
 maximum number;
 packets number;
 rate number;
 }
 tcp {
 maximum number;
 packets number;
 rate number;
 }
 udp {
 maximum number;
 packets number;
 rate number;
 }
 }
 maximum number;
 packets number;
 rate number;
 }
}
```

**Hierarchy Level** [edit services ids rule *rule-name* term *term-name* then]

**Release Information** Statement introduced in Junos OS Release 17.1 on MX Series.

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>              | <p>Configure the IDS rule session limits for an individual destination or source address or subnet. This protects against network probing attacks and network flooding attacks. This IDS rule can only be assigned to a service set on an MS-MPC or MS-MIC.</p> <p>You can specify limits for specific protocols (ICMP, TCP, and UDP), or specify limits independent of a protocol.</p> <p>When a session limit is exceeded for a source or destination, packets from the source or to the destination are dropped until the session limit is no longer exceeded.</p> <p>To specify limits for destination or source subnets rather than individual addresses, include the <b>aggregation</b> statement at the <b>[edit services ids rule <i>rule-name</i> term <i>term-name</i> then]</b> hierarchy level.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>Configure the do not fragment (DF) bit in only the outer header of the IPsec packet and leave the inner header unmodified for dynamic endpoint tunnels. If the encapsulated packet size exceeds the tunnel maximum transmission unit (MTU), the packet is fragmented before encapsulation. These settings apply for dynamic endpoint tunnels and not for static tunnels, for which you need to include the <b>set-dont-fragment-bit</b> statement at the [edit services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then] hierarchy level to set the DF bit in the outer header of the IPv4 packets that enter the static IPsec tunnel. This functionality is supported on MX Series routers with MS-MICs and MS-MPCs.</p> <p>By default, this statement is disabled on MS-MICs and MS-MPCs (the DF bit value is not configured in the outer header by default).</p> |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | <p>Configure the do not fragment (DF) bit in only the outer header of the IPsec packet and leave the inner header unmodified. If the encapsulated packet size exceeds the tunnel maximum transmission unit (MTU), the packet is fragmented before encapsulation. These settings apply for static endpoint tunnels and not for dynamic tunnels, for which you need to include the <b>set-dont-fragment-bit</b> statement at the [edit services <b>service-set</b> <b>service-set-name</b> ipsec-vpn-options] hierarchy level to set the DF bit in the outer header of the IPv4 packets that enter the dynamic IPsec tunnel. This functionality is supported on MX Series routers with MS-MICs and MS-MPCs.</p> <p>By default, this statement is disabled on MS-MICs and MS-MPCs (the DF bit value is not configured in the outer header by default).</p> |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## sip

**Syntax**

```
sip {
 video {
 dscp (alias | bits);
 forwarding-class class-name;
 }
 voice {
 dscp (alias | bits);
 forwarding-class class-name;
 }
}
```

**Hierarchy Level** [edit services cos [application-profile](#) *profile-name*]

**Release Information** Statement introduced in Junos OS Release 9.3.

**Description** Set the appropriate **dscp** and **forwarding-class** value for SIP traffic.

**Default** By default, the system will not alter the DSCP or forwarding class for SIP traffic.  
The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## snmp-trap-thresholds

**Syntax** `snmp-trap-thresholds {  
    flows high high-threshold | low low-threshold;  
    nat-address-port high high-threshold | low low-threshold;  
}`

**Hierarchy Level** [edit services [service-set](#) *service-set-name*]

**Release Information** Statement introduced in Junos OS Release 13.1.

**Description** Configures SNMP flow thresholds for all flows for a service set or flows for all NAT pools configured for a service set..

**Options** The remaining options are described separately.

**flows high *high-threshold***—Configure the upper limit for all flows on the service set. The limit is expressed as a percentage of **max-flows** configured for the service set. When the number of active flows exceeds this limit, an SNMP trap is set.

**Default:** 90 percent of **max-flows**

**flows low *low-threshold***—Configure the lower limit for all flows on the service set . The limit is expressed as a percentage of **max-flows** configured for the service set. When the number of active flows falls below this limit, an SNMP trap is set.

**Default:** 70 percent of **max-flows**

**nat-address-port high *high-threshold***—Configure the upper limit for flows for all NAT pools on the service set. The limit is expressed as a percentage of **max-flows** configured for the service set. When the number of active flows exceeds this limit, an SNMP trap is set.

**Default:** 90 percent of **max-flows**

**nat-address-port low *low-threshold***—Configure the lower limit for flows. The limit is expressed as a percentage of **max-flows** configured for the service set. When the number of active flows falls below this limit, an SNMP trap is set.

**Default:** 80 percent of **max-flows**

**NOTE:** SNMP traps that are generated when you modify the threshold value for flows of NAT address pools in a service set (by using the `snmp-trap-thresholds nat-address-port (high high-threshold | low low-threshold)` statement) are not effective in the PIC. Only the initial threshold value that is set is effective on the PIC and subsequent changes to the threshold value are not reflected on the PIC. As a workaround, for the configuration changes under the [edit services nat pool *nat-pool-name*] hierarchy level, you must deactivate and activate the relevant service-set to enable the updated

configuration to become effective. Otherwise, you must reboot the PIC for the updated threshold value of to take effect.

.....

.....

**NOTE:** Until Junos OS Release 14.1, when the NAT pool utilization exceeded the high threshold value configured, an SNMP trap was sent. However, a similar SNMP trap was not triggered when the NAT pool utilization fell below the configured lower limit or threshold. Because NMS systems are being used to monitor and set alarm for threshold values, the absence of an SNMP trap when the low threshold value was reached caused NMS to retain an active alarm in the alarms list. As a result, starting with Release 14.2R1, an SNMP trap is generated when the NAT pool utilization reaches the lower threshold, thereby causing the alarm in NMS to be reset.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.4.                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | <p>Specify the DS-Lite or 6rd rules or rule set included in this service set. You can configure multiple rules; however, you can only configure one rule set for each service set.</p> <p>Software rules are supported on the MS-DPC, MS-100, MS-400, and MS-500 line cards. Starting in Junos OS release 17.4R1, software rules for DS-Lite are supported on MX Series routers with MS-MPCs and MS-MICs.</p> |
| <b>Options</b>                  | <p><b>rule-name</b>—Identifier for the collection of terms that constitute this rule.</p> <p><b>rule-set-name</b>—Identifier for the set of rules to be included.</p>                                                                                                                                                                                                                                         |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.2R1.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | <p>Specify the source prefix list that must be matched for the PCP rule. You configure the prefix list by including the <b>prefix-list</b> statement at the <b>[edit policy-options]</b> hierarchy level. A PCP rule assigns the PCP server that handles selected traffic.</p> <p>PCP is supported on the MS-DPC, MS-100, MS-400, and MS-500 MultiServices PICS. Starting in Junos OS Release 17.4R1, PCP is also supported on the MS-MPC and MS-MIC.</p> |
| <b>Options</b>                  | <p><b><i>list-name</i></b>—Source prefix list.</p> <p><b>except</b>—(Optional) Prevent the specified prefix list from matching the PCP rule.</p>                                                                                                                                                                                                                                                                                                          |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                        |

| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                            |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"><li>• <a href="#">Network Address Translation Rules Overview on page 84</a></li></ul>                            |

## syslog (Services Service Set)

**Syntax**

```

syslog {
 host hostname {
 class {
 alg-logs;
 deterministic-nat-configuration-log;
 ids-logs;
 nat-logs;
 packet-logs;
 pcp-logs;
 session-logs <open | close>;
 stateful-firewall-logs;
 urlf-logs;
 }
 facility-override facility-name;
 interface-service prefix-value;
 log-prefix prefix-value;
 port port-number;
 services severity-level;
 source-address source-address;
 }
}

```

**Hierarchy Level** [edit services **service-set** *service-set-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Configure generation of system log messages for the service set. The system log information is passed to the kernel for logging in the **/var/log** directory. These settings override the values defined at the [edit interfaces *interface-name* **services-options**] hierarchy level; for more information on configuring those values, see *Configuring System Logging for Services Interfaces*.

**NOTE:** Starting with Junos OS release 14.1X55, 14.2R5, 15.1R3, and 16.1R1, for multiservices (ms-) interfaces, you cannot configure system logging for PCP and ALGs by including the pcp-logs and alg-logs statements at the [edit services service-set service-set-name syslog host hostname class] hierarchy level. An error message is displayed if you attempt to commit a configuration that contains the pcp-logs and alg-logs options to define system logging for PCP and ALGs for ms- interfaces.

**Options** The remaining statements are described separately.

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

**Related Documentation** • [Configuring System Logging for Service Sets on page 32](#)

## **syslog (Services Stateful Firewall)**

---

**Syntax**    `syslog;`

**Hierarchy Level**    `[edit services stateful-firewall rule rule-name term term-name then]`

**Release Information**    Statement introduced before Junos OS Release 7.4.

**Description**    Enable system logging. The system log information from the Adaptive Services or Multiservices PIC is passed to the kernel for logging in the `/var/log` directory. This setting overrides any **syslog** statement setting included in the service set or interface default configuration.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                         interface-control—To add this statement to the configuration.

**Related Documentation** • [Configuring Actions in Stateful Firewall Rules on page 455](#)

| <b>Description</b>              | <p>Enable SYN-cookie defenses against SYN attacks when using the MS-DPC. By default, SYN-cookie techniques are not applied.</p> <p>When SYN cookie is enabled on Junos OS and becomes the TCP-negotiating proxy for the destination server, it replies to each incoming SYN segment with a SYN/ACK containing an encrypted cookie as its initial sequence number (ISN). The cookie is an MD5 hash of the original source address and port number, destination address and port number, and ISN from the original SYN packet. After sending the cookie, Junos OS drops the original SYN packet and deletes the calculated cookie from memory. If there is no response to the packet containing the cookie, the attack is noted as an active SYN attack and is effectively stopped.</p> <p>If the initiating host responds with a TCP packet containing the cookie +1 in the TCP ACK field, Junos OS extracts the cookie, subtracts 1 from the value, and recomputes the cookie to validate that it is a legitimate ACK. If it is legitimate, Junos OS starts the TCP proxy process by setting up a session and sending a SYN to the server containing the source information from the original SYN. When Junos OS receives a SYN/ACK from the server, it sends ACKs to the server and to the initiation host. At this point the connection is established and the host and server are able to communicate directly.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 17.2.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | Specify how TCP Fast Open (TFO) enabled packets are to be handled.                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Default</b>                  | By default, all TFO packets are forwarded by the service PIC.                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>                  | <b>disabled</b> —Any TCP packet with the TFO option present has the TFO option stripped from the TCP header of the packet, and the rest of the packet is forwarded as is. The benefit of stripping the header over dropping the packet is that the client does not have to wait for the retransmission timer to go off and then retransmit the SYN packet without the TFO option.<br><br><b>drop</b> —Any TCP packet with the TFO option present is dropped. |

                           `http-status-code http-status-code;`  
                           `redirect-url redirect-url;`  
                           `tcp-reset;`  
                       `}`  
                   `}`  
                   `url-filter-database filename`  
                   `}`

**Hierarchy Level**    [edit services url-filter profile *profile-name*]

**Release Information**    Statement introduced in Junos OS Release 17.2.  
                               **disable-url-filtering** option introduced in Junos OS Release 17.2R2 and 17.4R1.

**Description**    Configure a URL filter template.

**NOTE:** Starting in Junos OS Release 18.3R1, the **template** statement is deprecated and has been replaced by the **url-filter-template** statement. The **template** statement is supported for backward compatibility.

**Options**    ***template-name***—Name of the template.

***client-interfaces* [ *client-interface-name1* *client-interface-name2* ]**—The list of client-facing logical interfaces (uplink) on which the URL filtering is configured. This option is mandatory.

**disable-url-filtering**—Disables the filtering of HTTP traffic that contains an embedded IP address (for example, `http://10.1.1.1`) belonging to a blacklisted domain name in the URL filter database.

**dns-resolution-interval *minutes***—DNS resolution time interval in minutes.

**Default:** 1440

**Range:** 60 through 1440 minutes.

**dns-resolution-rate *seconds***—Number of DNS queries per second sent out from the system before initiating further DNS queries.

**Default:** 50

**Range:** 50 through 100.

**dns-retries *number***—Number of retries for a DNS query in case query fails or times out.

**Default:** 3

**Range:** 1 through 5.

**dns-routing-instance *dns-routing-instance-name***—The VRF on which the DNS server is reachable. This option is mandatory. You can use the default routing instance `inet.0` or a defined routing instance.

**dns-server [ *ip-address1 ip-address2 ip-address3* ]**—One or more IP (IPv4 or IPv6) addresses of DNS servers to which the DNS queries are sent out. This option is mandatory.

**dns-source-interface *loopback-interface-name***—The loopback interface for which source IP address is picked for sending DNS queries. This option is mandatory.

**routing-instance *routing-instance-name***—The VRF on which URL filtering feature is configured. This option is mandatory. You can use the default routing instance `inet.0` or a defined routing instance.

**server-interfaces [ *server-interface-name1 server-interface-name2* ]**—Server-facing interfaces to which traffic is destined. This option is mandatory.

The list of server-facing logical interfaces (downlink) on which the URL filtering is configured. This option is mandatory.

**url-filter-database *filename***—The filename of the URL filter database. The file should be placed in the `/var/db/url-filterd` directory, but indicate just the filename here and not the full path.

The remaining statements are explained separately.

## term (URL Filter)

**Syntax**

```
term term-name {
 from {
 src-ip-prefix [prefix1 prefix2];
 dest-port [port1 port2];
 }
 then {
 accept;
 custom-page custom-page;
 http-status-code http-status-code;
 redirect-url redirect-url;
 tcp-reset;
 }
}
```

**Hierarchy Level** (starting in Junos OS Release 18.3R1) [edit services web-filter profile *profile-name* url-filter-template *template-name*]

**Hierarchy Level** (before Junos OS Release 18.3R1) [edit services url-filter profile *profile-name* template *template-name*]

**Release Information** Statement introduced in Junos OS Release 17.2.

**Description** Define a URL filtering term. A term is a set of match criteria with actions to be taken if the match criteria is met. You must configure **term** to configure URL filtering.

**Options** *term-name*—Name of the term.

**from**—Define match criteria.

The **from** statement is optional. If you omit the **from** statement, all source IP prefixes and all destination ports are considered to match. All such combinations then take the configured actions of the term.

Only one term in a template can have an optional **from** statement. If you omit more than one **from** statement per template, you will get the following error message on commit:

```
URLFD_CONFIG_FAILURE: Configuration not valid:
Cannot have two wild card terms in template template1
error: configuration check-out failed
```

Similarly, no two templates within a profile can have a term without a **from** statement.

**dest-ports**—Destination port list specification.

**Range:** 1 through 65535

**src-ip-prefix**—Source IP prefix list specification.

**then**—Specify one of the following actions to be taken if the **from** condition is matched:

**accept**—Accept the traffic and allow it to flow as normal.

**custom-page** *custom-page*—Custom-page string.

**http-status-code** *http-status-code*—HTTP status code value.

**Range:** 400 through 599

**redirect-url** *redirect-url*—URL to redirect traffic to.

**tcp-reset**—Reset TCP.

**Syntax**    then {  
              `pcp-server` *server-name*;  
              }

**Hierarchy Level**    [edit services pcp rule *rule-name* term *term-name*]

**Release Information**    Statement introduced in Junos OS Release 13.2R1.

**Description**    Specify the PCP server to handle the traffic that matches the PCP rule term.

PCP is supported on the MS-DPC, MS-100, MS-400, and MS-500 MultiServices PICS.  
Starting in Junos OS Release 17.4R1, PCP is also supported on the MS-MPC and MS-MIC.

The remaining statements are explained separately.

**Required Privilege**    interface—To view this statement in the configuration.  
**Level**    interface-control—To add this statement to the configuration.

## traceoptions (Health Check Monitoring)

**Syntax**

```
traceoptions {
 file file-name ;
 flag flag;
 level (all | error | info | notice | verbose | warning);
 monitor monitor-object-name {
 group-name group-name;
 real-services-name real-service-name;
 }
 no-remote-trace;
}
```

**Hierarchy Level** [edit services network-monitoring]

**Release Information** Statement introduced in Junos OS Release 16.1 on MX Series.

**Description** Specify tracing options for the traffic load balancer health check monitoring function.

**Options** **file *file-name***—Use the specified name of the file to receive the output of the tracing operation.

**flag *flag***—Specify which operations are to be traced. To specify more than one operation, include multiple flag statements.

- **all**—Trace all operations.
- **all-real-services**—Trace all real services.
- **database**—Trace database events.
- **file-descriptor-queue**—Trace file descriptor queue events.
- **inter-thread**—Trace inter-thread communication events.
- **messages**—Trace normal events.
- **probe**—Trace probe events.
- **probe-infra**—Trace probe infra events.

**group-name *group-name***—Specify which server group is to be traced.

**level**—Use the specified level of tracing. You can specify any of the following levels:

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages
- **notice**—Match conditions that must be handled specially.
- **verbose**—Match verbose messages.

- **warning**—Match warning messages.

**monitor** *monitor-object-name*—Name of a monitoring object that contains server group or real service.

**no-remote-trace**—Disable remote tracing.

**real-services-name** *real-service-name*—Specify which real service is to be traced.

| <b>Hierarchy Level</b> | [edit security pki]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>     | Configure security public key infrastructure (PKI) trace options. To specify more than one trace option, include multiple <b>flag</b> statements. Trace option output is recorded in the <code>/var/log/pkid</code> file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>         | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. To include the <b>file</b> statement, you must specify a filename.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file (for example, <b>pkid</b>) reaches its maximum size, it is renamed <b>pkid.0</b>, then <b>pkid.1</b>, and so on, until the maximum number of trace files is reached. When the maximum number is reached, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p><b>flag</b>—Trace operation to perform. To specify more than one trace operation, include multiple flag statements:</p> <p><b>all</b>—Trace with all flags enabled.</p> <p><b>certificate-verification</b>—Trace PKI certificate verification events.</p> <p><b>online-crl-check</b>—Trace PKI online certificate revocation list (CRL) events.</p> <p><b>enrollment</b>—PKI certificate enrollment tracing.</p> <p><b>match <i>regular-expression</i></b>—(Optional) Refine the output to include lines that contain the regular expression.</p> <p><b>size <i>maximum-file-size</i></b>—(Optional) Maximum size of each trace file, in kilobytes (KB). If you specify a maximum file size, you also must specify a maximum number of trace files with the <b>files <i>number</i></b> option.</p> <p><b>Default:</b> 1024 KB</p> <p><b>world-readable   no-world-readable</b>—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The <b>world-readable</b> option enables any user to read the file. To explicitly set the default behavior, use the <b>no-world-readable</b> option.</p> |

## traceoptions (Services L2TP)

**Syntax**

```

traceoptions {
 debug-level level;
 file filename <files number> <match regular-expression > <size maximum-file-size>
 <world-readable | no-world-readable>;
 filter {
 protocol name;
 user user@domain;
 user-name username;
 }
 flag flag;
 interfaces interface-name {
 debug-level level;
 flag flag;
 }
 level (all | error | info | notice | verbose | warning);
 no-remote-trace;
}

```

**Hierarchy Level** [edit services l2tp]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Define tracing operations for L2TP processes.

**Options** **debug-level *level***—Trace level for PPP, L2TP, RADIUS, and UDP; this option does not apply to L2TP on MX Series routers:

- **detail**—Trace detailed debug information.
- **error**—Trace error information.
- **packet-dump**—Trace packet decoding information.

**file *filename***—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**.

**files *number***—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000

**Default:** 3 files

**filter**—Additional filter to refine the output to display particular subscribers. Filtering based on the following subscriber identifiers simplifies troubleshooting in a scaled environment.

- **protocol *name***—One of the following protocols; this option does not apply to L2TP on MX Series routers:

- **l2tp**
- **ppp**
- **radius**
- **udp**
- **user** *user@domain*—Username of a subscriber; this option does not apply to L2TP on M Series routers. Optionally use an asterisk (\*) as a wildcard to substitute for characters at the beginning or end of either term or both terms.
- **user-name** *username*—Username of a subscriber; this option does not apply to L2TP on MX Series routers.

**flag flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—Trace all operations.
- **configuration**—Trace configuration events.
- **events**—Trace interface events.
- **general**—Trace general events.
- **gres**—Trace GRES events.
- **init**—Trace daemon initialization.
- **ipc-rx**—Trace IPC receive events.
- **ipc-tx**—Trace IPC transmit events.
- **memory**—Trace memory management code.
- **message**—Trace message processing code.
- **packet-error**—Trace packet error events.
- **parse**—Trace parsing events.
- **protocol**—Trace L2TP events.
- **receive-packets**—Trace received L2TP packets.
- **routing-process**—Trace routing process interactions.
- **routing-socket**—Trace routing socket events.
- **session-db**—Trace session database interactions.
- **states**—Trace state machine events.
- **timer**—Trace timer events.
- **transmit-packets**—Trace transmitted L2TP packets.
- **tunnel**—Trace tunnel events.

**interfaces *interface-name***—Apply L2TP traceoptions to a specific services interface. This option does not apply to L2TP on MX Series routers.

- **debug-level *level***—Trace level for the interface; this option does not apply to L2TP on MX Series routers:
  - **detail**—Trace detailed debug information.
  - **error**—Trace error information.
  - **extensive**—Trace all PIC debug information.
- **flag *flag***—Tracing operation to perform for the interface. This option does not apply to L2TP on MX Series routers. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:
  - **all**—Trace everything.
  - **ipc**—Trace L2TP Inter-Process Communication (IPC) messages between the PIC and the Routing Engine.
  - **packet-dump**—Dump each packet content based on debug level.
  - **protocol**—Trace L2TP, PPP, and multilink handling.
  - **system**—Trace packet processing on the PIC.

**level**—Specify level of tracing to perform. The option you configure enables tracing of events at that level and all higher (more restrictive) levels. You can specify any of the following levels:

- **all**—Match messages of all levels.
- **error**—Match error messages.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages. This is the lowest (least restrictive) severity level; when you configure **verbose**, messages at all higher levels are traced. Therefore, the result is the same as when you configure **all**.
- **warning**—Match warning messages.

**Default:** **error**

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size** *maximum-file-size*—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**world-readable**—(Optional) Enable unrestricted file access.

## traceoptions (Services Logging)

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <pre> traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;match <i>regular-expression</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable       no-world-readable&gt;;     flag <i>flag</i>;     no-remote-trace; } </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Hierarchy Level</b>     | <p>[edit services <a href="#">adaptive-services-pics</a>],<br/> [edit services <a href="#">logging</a>]</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.<br/> <b>file</b> option added in Release 8.0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>         | <p>Configure Adaptive Services or Multiservices PIC tracing operations. The messages are output to <b>/var/log/serviced</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b><i>trace-file</i></b> reaches its maximum size, it is renamed <b><i>trace-file.0</i></b>, then <b><i>trace-file.1</i></b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files<br/> <b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace everything.</li> <li>• <b>command-queued</b>—Trace command enqueue events.</li> <li>• <b>config</b>—Trace configuration events.</li> <li>• <b>handshake</b>—Trace handshake events.</li> <li>• <b>init</b>—Trace initialization events.</li> <li>• <b>interfaces</b>—Trace interface events.</li> <li>• <b>mib</b>—Trace GGSN SNMP MIB events.</li> <li>• <b>removed-client</b>—Trace client cleanup events.</li> <li>• <b>show</b>—Trace CLI command servicing.</li> </ul> |

**match *regex***—(Optional) Match output to a defined regular expression (regex).

**Default:** If you do not include this option, the trace operation output includes all lines relevant to the logged events.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file.0***. When the ***trace-file*** again reaches its maximum size, ***trace-file.0*** is renamed ***trace-file.1*** and ***trace-file*** is renamed ***trace-file.0***. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

| <b>Description</b>         | Configure tracing options for the traffic load balancer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>             | <p><b>file <i>file-name</i></b>—Name of the file to receive the output of the tracing operation.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <i>trace-file</i> reaches its maximum size, it is renamed <i>trace-file.0</i>, then <i>trace-file.1</i>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Specify which operations are to be traced. To specify more than one operation, include multiple flag statements.</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace everything.</li> <li>• <b>config</b>—Trace traffic load balancer configuration events.</li> <li>• <b>connect</b>—Trace traffic load balancer ipc events.</li> <li>• <b>filter</b>—Trace traffic load balancer filter programming events.</li> <li>• <b>health</b>—Trace traffic load balancer health events.</li> <li>• <b>normal</b>—Trace normal events.</li> <li>• <b>operational-commands</b>—Trace traffic load balancer show events.</li> <li>• <b>parse</b>—Trace traffic load balancer parse events.</li> <li>• <b>probe</b>—Trace traffic load balancer probe events.</li> <li>• <b>route</b>—Trace traffic load balancer route events.</li> </ul> |

- **snmp**—Trace traffic load balancer SNMP events.
- **statistics**—Trace traffic load balancer statistics events.
- **system**—Trace traffic load balancer system events.

**instance-name** *instance-name*—(Optional) Name of the TLB instance to monitor.

**level**—Use the specified level of tracing. You can specify any of the following levels:

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match conditions that must be handled specially.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**monitor** *monitor-object-name*—Name of a monitoring object that contains an instance name or virtual service name.

**no-remote-trace**—(Optional) Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size** *size*—(Optional) Use the maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named *trace-file* reaches this size, it is renamed *trace-file.0*. When the *trace-file* again reaches its maximum size, *trace-file.0* is renamed *trace-file.1* and *trace-file* is renamed *trace-file.0*. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the *size* option.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB.

**Range:** 10,240 through 1,073,741,824 bytes.

**Default:** 128 KB

**virtual-svc-name** *virtual-service-name*—(Optional) Name of the virtual service to monitor.

**word-readable**—(Optional) Enable unrestricted file access.

| <b>Release Information</b> | Statement introduced in Junos OS Release 16.1 on MX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>         | Specify the level of redundancy system events to be traced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>             | <p><b>file <i>file-name</i></b>—Name of the file to receive the output of the tracing operation.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Specify which operations are to be traced. To specify more than one operation, include multiple flag statements.</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace everything.</li> <li>• <b>config</b>—Trace services redundancy configuration events.</li> <li>• <b>connect</b>—Trace services redundancy ipc events.</li> <li>• <b>error</b>—Trace services redundancy errors.</li> <li>• <b>database</b>—Trace services database events.</li> <li>• <b>normal</b>—Trace normal events.</li> <li>• <b>opcmd</b>—Trace services redundancy opcmd events.</li> <li>• <b>parse</b>—Trace services redundancy parse events.</li> <li>• <b>route</b>—Trace services redundancy route events.</li> <li>• <b>snmp</b>—Trace services redundancy snmp events.</li> <li>• <b>state</b>—Trace services redundancy set state-machine.</li> <li>• <b>switchover</b>—Trace switchover events.</li> <li>• <b>system</b>—Trace services redundancy system events.</li> </ul> |

**level**—Use the specified level of tracing. You can specify any of the following levels:

- **all**—Match all levels.
- **critical**—Match critical conditions.
- **error**—Match error conditions.
- **info**—Match informational messages
- **notice**—Match conditions that must be handled specially.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**no-remote-trace**—(Optional) Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size size**—(Optional) Use the maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named `trace-file` reaches this size, it is renamed `trace-file.0`. When the trace-file again reaches its maximum size, `trace-file.0` is renamed `trace-file.1` and `trace-file` is renamed `trace-file.0`. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the `size` option.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB.

**Range:** 10,240 through 1,073,741,824 bytes.

**Default:** 128 KB

**word-readable**—(Optional) Enable unrestricted file access.

| Description         | <p>Specify the NAT translation types. To identify the interface cards and Junos OS releases that support each translations type, see "<a href="#">Carrier-Grade NAT Feature Comparison for Junos Address Aware by Type of Interface Card</a>" on page 69.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Options             | <p><b>basic-nat44</b>—Translate the source address statically (IPv4 to IPv4).</p> <p><b>basic-nat66</b>—Translate the source address statically (IPv6 to IPv6).</p> <p><b>basic-nat-pt</b>—Translate the addresses of IPv6 hosts as they originate sessions to the IPv4 hosts in the external domain. The <b>basic-nat-pt</b> option is always implemented with DNS ALG.</p> <p><b>deterministic-napt44</b>—Translate as deterministic NAPT44.</p> <p><b>deterministic-napt64</b>—Translate as deterministic NAPT64.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**dnat-44**—Translate the destination address statically (IPv4 to IPv4).

**dynamic-nat44**—Translate only the source address by dynamically choosing the NAT address from the source address pool.

**napt-44**—Translate the transport identifier of the IPv4 private network to a single IPv4 external address.

**napt-66**—Translate the transport identifier of the IPv6 private network to a single IPv6 external address.

**napt-pt**—Bind addresses in an IPv6 network with addresses in an IPv4 network and vice versa to provide transparent routing for the datagrams traversing between the address realms.

**nptv6**—Translate the source address prefix in a stateless manner (IPv6 to IPv6).

**stateful-nat464**—Implement 464XLAT Provider-Side Translator (PLAT) address translation for source IP addresses and IPv6 prefix removal translation for destination IPv4 addresses.

**stateful-nat64**—Implement dynamic address and port translation for source IP addresses (IPv6-to-IPv4) and prefix removal translation for the destination IP addresses (IPv6-to-IPv4).

**twice-basic-nat-44**—Translate the source and destination addresses statically (IPv4 to IPv4).

**NOTE:** Starting with Junos OS Release 15.1R1, the twice NAT functionality (**twice-basic-nat-44**, **twice-dynamic-nat-44**, and **twice-dynamic-napt-44** options) is supported on MX Series routers with MS-MPCs and MS-MICs.

**twice-dynamic-nat-44**—Translate the source address by dynamically choosing the NAT address from the source address pool. Translate the destination address statically.

**twice-dynamic-napt-44**—Translate the transport identifier of the IPv4 private network to a single IPv4 external address. Translate the destination address statically.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## tunnel-mtu (Services IPsec VPN)

---

**Syntax** tunnel-mtu *bytes*;

**Hierarchy Level** [edit services ipsec-vpn *rule rule-name term term-name then*]

**Release Information** Statement introduced in Junos OS Release 7.5.

**Description** Maximum transmission unit (MTU) size for IPsec tunnels. This defines the maximum size of an IP packet, including the IPsec overhead.

**Options** *bytes*—MTU size.  
**Default:** 1500 bytes  
**Range:** 256 through 9192 bytes

**NOTE:** Clear the IPsec SA in tunnel-mtu to accomodate Jumbo frames larger than 1500 bytes.

---

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## tunnel-mtu (Services Service Set)

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | <p>Maximum transmission unit (MTU) size for IPsec tunnels. This statement is useful for dynamic endpoint tunnels for which you cannot configure the <code>tunnel-mtu</code> statement at the <code>[edit services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then]</code> hierarchy level.</p> <p>For static IPsec tunnels, this statement sets the tunnel MTU value for all the tunnels within this service set. If you need a specific value for a particular tunnel, then set the <code>tunnel-mtu</code> statement at the <code>[edit services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then]</code> hierarchy level.</p> |
|                                 | <div>  <p><b>NOTE:</b> The <code>tunnel-mtu</code> setting at the <code>[edit services ipsec-vpn rule <i>rule-name</i> term <i>term-name</i> then]</code> hierarchy level overrides the value specified at the <code>[edit services service-set <i>service-set-name</i> ipsec-vpn-options]</code> hierarchy level.</p> </div>                                                                                                                                                                                                                                        |
| <b>Options</b>                  | <p><i>bytes</i>—MTU size.</p> <p><b>Default:</b> 1500 bytes</p> <p><b>Range:</b> 256 through 9192 bytes</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.1 on the MX Series.                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | <p>Enable multiple path forwarding of IPsec traffic by adding a UDP header to the IPsec encapsulation of packets. Doing this increases the throughput of IPsec traffic. If you do not enable UDP encapsulation, all the IPsec traffic follows a single forward path rather than using multiple available paths.</p>                                      |
| <b>Options</b>                  | <p><b>udp-dest-port <i>destination-port</i></b>—(Optional) Use the specified UDP destination port for the UDP header that is appended to the ESP encapsulation.</p> <p><b>Range:</b> 1025 through 65536. Do not use 4500.</p> <p><b>Default:</b> If you do not include the <b>udp-dest-port</b> statement, the default UDP destination port is 4565.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                       |

## unit (Aggregated Multiservices)

---

**Syntax**     `unit interface-unit-number {  
                  family family;  
                  }`

**Hierarchy Level**     [edit interfaces *interface-name*]

**Release Information**     Statement introduced in Junos OS Release 11.4.

**Description**     Configure the logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

The remaining statements are explained separately. See [CLI Explorer](#).

**Options**     *interface-unit-number*—Number of the logical unit.

**NOTE:** Unit 0 is reserved and cannot be configured under the aggregated Multiservices interface (ams).

---

**Range:** 1 through 16,384

**Required Privilege Level**     interface—To view this statement in the configuration.  
                                      interface-control—To add this statement to the configuration.

**Related Documentation**

- [Understanding Aggregated Multiservices Interfaces on page 831](#)
- [Example: Configuring an Aggregated Multiservices Interface \(AMS\) on page 843](#)

## unit (Interfaces)

**Syntax**

```

unit logical-unit-number {
 family inet {
 address address {
 }
 service {
 input {
 [service-set service-set-name <service-filter filter-name>];
 post-service-filter filter-name;
 }
 output {
 [service-set service-set-name <service-filter filter-name>];
 }
 }
 service-domain (inside | outside);
 }
}

```

**Hierarchy Level** [edit interfaces *interface-name* ]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Configure a logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

**Options** *logical-unit-number*—Number of the logical unit.

**Range:** 0 through 16,384

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

- *Junos OS Network Interfaces Library for Routing Devices* for other statements that do not affect services interfaces.

## unit (Voice Services)

---

**Syntax**

```
unit logical-unit-number {
 compression {
 rtp {
 f-max-period number;
 maximum-contexts number <force>;
 port {
 minimum port-number;
 maximum port-number;
 }
 queues [queue-numbers];
 }
 }
 compression-device interface-name;
 encapsulation type;
 family family {
 address address {
 ...
 }
 bundle (lsq-fpc/pic/port | ...);
 }
}
```

**Hierarchy Level** [edit [interfaces interface-name](#) ]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Configure a logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

**Options** *logical-unit-number*—Number of the logical unit.

**Range:** 0 through 16,384

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

- *Junos OS Network Interfaces Library for Routing Devices* for other statements that do not affect services interfaces.

- [Configuring Services Interfaces for Voice Services on page 858](#)

## url-filter

```
Syntax url-filter {
 profile profile-name {
 template template-name {
 client-interfaces [client-interface-name1 client-interface-name2];
 disable-url-filtering;
 dns-resolution-interval minutes;
 dns-resolution-rate seconds;
 dns-retries number;
 dns-routing-instance dns-routing-instance-name;
 dns-server [ip-address1 ip-address2 ip-address3];
 dns-source-interface loopback-interface-name;
 routing-instance routing-instance-name;
 server-interfaces [server-interface-name1 server-interface-name2];
 term term-name {
 from {
 src-ip-prefix [prefix1 prefix2];
 dest-port [port1 port2];
 }
 then {
 accept;
 custom-page custom-page;
 http-status-code http-status-code;
 redirect-url redirect-url;
 tcp-reset;
 }
 }
 }
 url-filter-database filename
 }
 url-filter-database filename;
 }
```

**Hierarchy Level** [edit services]

**Release Information** Statement introduced in Junos OS Release 17.2.

**Description** Configure URL filtering service.

**NOTE:** Starting in Junos OS Release 18.3R1, the `url-filter` statement is deprecated and has been replaced by the `web-filter` statement. The `url-filter` statement is supported for backward compatibility.

**Options** `url-filter-database filename`—Specify the filename of the URL filter database. This option is mandatory.

The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation**

- [URL Filtering Overview on page 46](#)

---

## url-filter-profile

---

**Syntax** url-filter-profile *profile-name*;

**Hierarchy Level** [edit services service-set *service-set-name*]

**Release Information** Statement introduced in Junos OS Release 17.2.

**Description** Specify the URL filter profile that the service set uses. The URL filter profile specifies how to filter access to blacklisted URLs, and is configured at the **[edit services url-filter]** hierarchy level.

**NOTE:** You must also configure the next-hop-service statement with this statement.

**NOTE:** Starting in Junos OS Release 18.3R1, the url-filter-profile statement is deprecated and has been replaced by the web-filter-profile statement. The url-filter-profile statement is supported for backward compatibility.

**Options** *profile-name*—Name of the URL filter profile.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation**

## url-filter-template

**Syntax** `url-filter-template template-name {`  
     `client-interfaces [ client-interface-name1 client-interface-name2 ];`  
     `disable-url-filtering;`  
     `dns-resolution-interval minutes;`  
     `dns-resolution-rate seconds;`  
     `dns-retries number;`  
     `dns-routing-instance dns-routing-instance-name;`  
     `dns-server [ ip-address1 ip-address2 ip-address3 ];`  
     `dns-source-interface loopback-interface-name;`  
     `routing-instance routing-instance-name;`  
     `server-interfaces [ server-interface-name1 server-interface-name2 ];`  
     `term term-name {`  
         `from {`  
             `src-ip-prefix [ prefix1 prefix2 ];`  
             `dest-port [ port1 port2 ];`  
         `}`  
         `then {`  
             `accept;`  
             `custom-page custom-page;`  
             `http-status-code http-status-code;`  
             `redirect-url redirect-url;`  
             `tcp-reset;`  
         `}`  
     `}`  
     `url-filter-database filename`  
     `}`

**Hierarchy Level** [edit services web-filter profile *profile-name*]

**Release Information** Statement introduced in Junos OS Release 18.3R1 on MX Series.

**Description** Configure a URL filter template.

**Options** *template-name*—Name of the URL filter template.

*client-interfaces* [ *client-interface-name1* *client-interface-name2* ]—The list of client-facing logical interfaces (uplink) on which the URL filtering is configured. This option is mandatory.

*disable-url-filtering*—Disables the filtering of HTTP traffic that contains an embedded IP address (for example, `http://10.1.1.1`) belonging to a blacklisted domain name in the URL filter database.

*dns-resolution-interval minutes*—DNS resolution time interval in minutes.

**Default:** 1440

**Range:** 60 through 1440 minutes.

*dns-resolution-rate seconds*—Number of DNS queries per second sent out from the system before initiating further DNS queries.

**Default:** 50

**Range:** 50 through 100.

**dns-retries *number***—Number of retries for a DNS query in case query fails or times out.

**Default:** 3

**Range:** 1 through 5.

**dns-routing-instance *dns-routing-instance-name***—The VRF on which the DNS server is reachable. This option is mandatory. You can use the default routing instance `inet.0` or a defined routing instance.

**dns-server [ *ip-address1 ip-address2 ip-address3* ]**—One or more IP (IPv4 or IPv6) addresses of DNS servers to which the DNS queries are sent out. This option is mandatory.

**dns-source-interface *loopback-interface-name***—The loopback interface for which source IP address is picked for sending DNS queries. This option is mandatory.

**routing-instance *routing-instance-name***—The VRF on which URL filtering feature is configured. This option is mandatory. You can use the default routing instance `inet.0` or a defined routing instance.

**server-interfaces [ *server-interface-name1 server-interface-name2* ]**—Server-facing interfaces to which traffic is destined. This option is mandatory.

The list of server-facing logical interfaces (downlink) on which the URL filtering is configured. This option is mandatory.

**url-filter-database *filename***—The filename of the URL filter database. The file should be placed in the `/var/db/url-filterd` directory, but indicate just the filename here and not the full path.

The remaining statements are explained separately.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | <p>Configure settings for a 6rd concentrator used to process IPv6 packets encapsulated in IPv4 packets.</p> <p>The <b>v6rd</b> statement is supported only on the MS-DPC, MS-100, MS-400, and MS-500 line cards. The <b>v6rd</b> statement is <i>not</i> supported on MS-MPCs and MS-MICs.</p>                                                                                                                                                                                                         |
| <b>Options</b>                  | <p><i>ipv4-prefix</i>—IPv4 prefix of the customer edge (CE) network</p> <p><i>ipv6-prefix</i>—IPv6 prefix of the 6rd domain.</p> <p><i>mtu-v4</i>—Maximum transmission unit (MTU), in bytes (576 through 9192), for IPv6 packets encapsulated into IPv4. If the final length is greater than the configured value, the IPv4 packet will be dropped.</p> <p><i>address</i>—IPv4 address of a software concentrator. This is an IPv4 address independent of any interface and on a different prefix.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                     |

## virtual-service (Traffic Load Balancer)

```
Syntax virtual-service virtual-service-name {
 address virtual-ip-address;
 group group-name;
 load-balance-method {
 hash {
 hash-key method;
 }
 random;
 }
 mode (layer2-direct-server-return | direct-server-return | translated);
 <routing-instance routing-instance-name>;
 <routing-metric route-metric>;
 server-interface server-interface;
 service service-name {
 protocol (udp | tcp);
 server-listening-port port;
 virtual-port virtual-port;
 }
 }
```

**Hierarchy Level** [edit services traffic-load-balance instance *instance-name*]

**Release Information** Statement introduced in Junos OS Release 16.1 on MX Series.

**Description** Configure a TLB virtual service.

**Options** **address** *virtual-ip-address*—Address of the virtual service.

**group** *group-name*—Server group for the virtual service.

**load-balance method hash hash-key** *method*—Use a combination of these hash-key methods for the session distribution API:

**dest-ip**—Hash on destination IP address.

**proto**—Hash on protocol.

**source-ip**—Hash on source IP address.

**load-balance-method random**—Use randomizing algorithm for session distribution.

**mode ( layer2-direct-server-return | direct-server-return | translated )**—Traffic load balancer mode of operation:

**direct-server-return**—Transparent mode Layer 3 direct server return.

**layer2-direct-server-return**—Transparent mode Layer 2 direct server return. Load balancing works by changing the Layer 2 MAC of packets; Layer 3 and higher level headers are not modified.

**translated**—The Packet Forwarding Engine performs stateless load balancing.

**route-metric**—(Optional) Route metric

**Range:** 1 through 255

**routing-instance-name**—(Optional) Routing instance for the virtual service. Default is `inet.0`.

**server-interface server-interface**—(Optional) The server-interface specified under the virtual-service, will be used instead of the values provided under the instance level.

**service service-name**—Translated mode details. Packets destined to this virtual ip-address + virtual-port + protocol will be load balanced to the appropriate server. The destination IP address and port are replaced by the real services IP address and the server-listening-port (configured here).

**protocol (udp | tcp)**—Protocol.

**server-listening-port port**—Port number.

**virtual-port virtual-port**—Virtual port number.

**virtual-ip-address**—Local address for the virtual service.

**virtual-service-name**—Identifier for the virtual service.

### Sample Output

#### clear services inline nat statistics

```
user@host> clear services inline nat statistics
```

## clear services inline software statistics

**Syntax** clear services inline software statistics  
<interface *interface-name*>

**Release Information** Command introduced in Junos OS Release 13.3R3.

**Description** Clear global inline software statistics.

**NOTE:** The following two limitations apply to the clearing of data plane statistics using the `clear services inline software statistics` command:

- When traffic is continuously flowing and the counters are being updated in the data plane, none of the statistical values except the counter for 6rd decapsulation errors is reset.
- When you delete the software concentrator or the service set associated with an inline services (si-) interface, the counter for 6rd decapsulation errors might display all the previously accumulated values.

**Options** `interface interface-name`—(Optional) Clear inline software statistics for the specified interface only.

**Required Privilege Level** clear

**List of Sample Output** [clear services inline software statistics on page 1305](#)

**Output Fields** When you enter this command, the global inline software statistics are cleared. There is no specific output.

## Sample Output

### clear services inline software statistics

```
user@host> clear services inline software statistics
```

## clear services ipsec-vpn certificates

## Sample Output

### clear services ipsec-vpn ipsec statistics

```
user@host> clear services ipsec-vpn ipsec statistics
```

## clear services l2tp destination

**Syntax** clear services l2tp destination  
<all | local-gateway *gateway-address* | peer-gateway *gateway-address*>

**Release Information** Command introduced in Junos OS Release 10.4.

**Description** Clear all Layer 2 Tunneling Protocol (L2TP) destinations and all tunnels and sessions that belong to the destinations. This command is available only for LAC on MX Series routers.

**NOTE:** You cannot issue the clear services l2tp destination command in parallel with statistics-related show services l2tp commands from separate terminals. If this clear command is running, then you must press Ctrl+c to make the command run in the background before issuing any of the show commands listed in the following table:

|                                           |                                       |
|-------------------------------------------|---------------------------------------|
| show services l2tp destination extensive  | show services l2tp summary statistics |
| show services l2tp destination statistics | show services l2tp tunnel extensive   |
| show services l2tp session extensive      | show services l2tp tunnel statistics  |
| show services l2tp session statistics     |                                       |

**Options** all—Close all L2TP destinations.

**BEST PRACTICE:** The all option is not intended to be used as a means to perform a bulk logout of L2TP subscribers. We recommend that you do not use the all option in a production environment. Instead of clearing all subscribers at once, consider clearing subscribers in smaller group, based on interface, tunnel, or destination end point.

**local-gateway *gateway-address***—Clear only the L2TP destinations and all tunnels and sessions associated with the specified local gateway address.

**peer-gateway *gateway-address***—Clear only the L2TP destinations and all tunnels and sessions associated with the peer gateway with the specified address.

**Required Privilege Level** clear

**Related Documentation** • *show services l2tp destination*

**List of Sample Output** [clear services l2tp destination all on page 1311](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear services l2tp multilink statistics all

```
user@host> clear services l2tp multilink statistics all
Multilink 1 statistics cleared
```

## clear services l2tp session

**Syntax** clear services l2tp session (all | interface *interface-name* | local-gateway *gateway-address* | local-gateway-name *gateway-name* | local-session-id *session-id* | local-tunnel-id *tunnel-id* | peer-gateway *gateway-address* | peer-gateway-name *gateway-name* | tunnel-group *group-name* | user *username*)

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** (M10i and M7i routers only) Clear Layer 2 Tunneling Protocol (L2TP) sessions on LNS.  
(MX Series routers only) Clear L2TP sessions on LAC and LNS.

**NOTE:** On MX Series routers, you cannot issue the clear services l2tp session command in parallel with statistics-related show services l2tp commands from separate terminals. If this clear command is running, then you must press Ctrl+c to make the command run in the background before issuing any of the show commands listed in the following table:

|                                           |                                       |
|-------------------------------------------|---------------------------------------|
| show services l2tp destination extensive  | show services l2tp summary statistics |
| show services l2tp destination statistics | show services l2tp tunnel extensive   |
| show services l2tp session extensive      | show services l2tp tunnel statistics  |
| show services l2tp session statistics     |                                       |

**Options** all—Close all L2TP sessions.

**BEST PRACTICE:** The all option is not intended to be used as a means to perform a bulk logout of L2TP subscribers. We recommend that you do not use the all option in a production environment. Instead of clearing all subscribers at once, consider clearing subscribers in smaller group, based on interface, tunnel, or destination end point.

**interface *interface-name***—Clear only the L2TP sessions using the specified adaptive services or inline services interface. The interface type depends on the line card as follows:

- **si-fpc/pic/port**—MPCs on MX Series routers only. This option is not available for L2TP on M Series routers.

- **sp-fpc/pic/port**—AS or Multiservices PICs on M7i, M10i, and M120 routers only. This option is not available for L2TP on MX Series routers.

**local-gateway gateway-address**—Clear only the L2TP sessions associated with the specified local gateway address.

**local-gateway-name gateway-name**—Clear only the L2TP sessions associated with the specified local gateway name.

**local-session-id session-id**—Clear only the L2TP sessions with this identifier for the local endpoint of the L2TP session.

**local-tunnel-id tunnel-id**—Clear only the L2TP sessions associated with the specified local tunnel identifier.

**peer-gateway gateway-address**—Clear only the L2TP sessions associated with the peer gateway with the specified address.

**peer-gateway-name gateway-name**—Clear only the L2TP sessions associated with the peer gateway with the specified name.

**tunnel-group group-name**—Clear only the L2TP sessions associated with the specified tunnel group. This option is not available for L2TP LAC on MX Series routers.

**user username**—(M Series routers only) Clear only the L2TP sessions for the specified username.

**Required Privilege Level** clear

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

[clear services l2tp session](#)

```
user@host> clear services l2tp session 31694
```

```
Session 31694 closed
```

## Sample Output

### clear services l2tp session interface

```
user@host> show services l2tp session Tunnel local ID: 17185
```

| Local ID | Remote ID | State       | Interface unit | Interface Name |
|----------|-----------|-------------|----------------|----------------|

## Sample Output

[clear services l2tp session statistics all](#)

```
user@host> clear services l2tp session statistics all
Session 26497 statistics cleared
```

## clear services l2tp tunnel

**Syntax** clear services l2tp tunnel (all | interface *sp-fpc/pic/port* | local-gateway *gateway-address* | local-gateway-name *gateway-name* | local-tunnel-id *tunnel-id* | peer-gateway *gateway-address* | peer-gateway-name *gateway-name* | tunnel-group *group-name*)

**Release Information** Command introduced before Junos OS Release 7.4.  
Support for LAC on MX Series routers introduced in Junos OS Release 10.4.  
Support for LNS on MX Series routers introduced in Junos OS Release 11.4.

**Description** (M10i and M7i routers: LNS only. MX Series routers: LAC and LNS.) Clear Layer 2 Tunneling Protocol (L2TP) tunnels.

**NOTE:** On MX Series routers, you cannot issue the `clear services l2tp tunnel` command in parallel with statistics-related `show services l2tp` commands from separate terminals. If this clear command is running, then you must press Ctrl+c to make the command run in the background before issuing any of the `show` commands listed in the following table:

|                                           |                                       |
|-------------------------------------------|---------------------------------------|
| show services l2tp destination extensive  | show services l2tp summary statistics |
| show services l2tp destination statistics | show services l2tp tunnel extensive   |
| show services l2tp session extensive      | show services l2tp tunnel statistics  |
| show services l2tp session statistics     |                                       |

**Options** all—Clear all L2TP tunnels.

**BEST PRACTICE:** The `all` option is not intended to be used as a means to perform a bulk logout of L2TP subscribers. We recommend that you do not use the `all` option in a production environment. Instead of clearing all subscribers at once, consider clearing subscribers in smaller group, based on interface, tunnel, or destination end point.

***sp-fpc/pic/port***—(Optional) Clear only the L2TP tunnels using the specified adaptive services interface. This option is not available for L2TP on MX Series routers.

**local-gateway *gateway-address***—Clear only the L2TP tunnels associated with the local gateway with the specified address.

**local-gateway-name *gateway-name***—Clear only the L2TP tunnels associated with the local gateway with the specified name.

**local-tunnel-id *tunnel-id***—Clear only the L2TP tunnels that have the specified local tunnel identifier.

**peer-gateway *gateway-address***—Clear only the L2TP tunnels associated with the peer gateway with the specified address.

**peer-gateway-name *gateway-name***—Clear only the L2TP tunnels associated with the peer gateway with the specified name.

**tunnel-group *group-name***—Clear only the L2TP tunnels in the specified tunnel group. This option is not available for L2TP LAC on MX Series routers.

| <b>Flows removed</b> | Number of flows removed.                                    |

## Sample Output

### clear services nat flows subscriber (IPv4 address)

```

user@host> clear services nat flows subscriber ip 198.51.100.3
Interface Service set Flows removed

sp-2/0/0 ss1 0

```

## Sample Output

## clear services nat mappings

**Syntax** clear services nat mappings  
 <app>  
 <eim>  
 <pcp>  
 <service-set service-set>

**Release Information** Command introduced in Junos OS Release 14.1.

**Description** Clear NAT mappings.

**Options** **none**—Clear all NAT mappings.

**app**—(Optional) Clear address-pooling paired NAT mappings.

**eim**—(Optional) Clear endpoint-independent NAT mappings.

**pcp**—(Optional) Clear Port Control Protocol NAT mappings.

**service-set service-set**—(Optional) Clear NAT mappings for a specified service set..

**Required Privilege Level** clear

## clear services sessions

---

**Syntax**    clear services sessions  
              <application-protocol *protocol*>  
              <destination-port *destination-port*>  
              <destination-prefix *destination-prefix*>  
              <interface *interface-name*>  
              <ip-action>  
              <protocol *protocol*>  
              <service-set *service-set*>  
              <source-port *source-port*>  
              <source-prefix *source-prefix*>

**Release Information**    Command introduced in Junos OS Release 13.1.

**Description**    Clear services sessions currently active on the embedded PIC or MIC. When you enter this command, the sessions are marked for deletion and are cleared thereafter. The time that is taken to clear the currently active sessions varies, depending on the scaled nature of the environment.

**Options**    **none**—Clear all sessions.

**application-protocol *protocol***—(Optional) Clear sessions for one of the following application protocols:

- **bootp**—Bootstrap protocol
- **dce-rpc**—Distributed Computing Environment-Remote Procedure Call protocols
- **dce-rpc-portmap**—Distributed Computing Environment-Remote Procedure Call protocols portmap service
- **dns**—Domain Name System protocol
- **exec**—Exec
- **ftp**—File Transfer Protocol
- **h323**—H.323 standards
- **icmp**—Internet Control Message Protocol
- **iiop**—Internet Inter-ORB Protocol
- **ip**—IP
- **login**—Login
- **netbios**—NetBIOS
- **netshow**—NetShow
- **pptp**—Point-to-Point Tunneling Protocol
- **realaudio**—RealAudio

- **rpc**—Remote Procedure Call protocol
- **rpc-portmap**—Remote Procedure Call protocol portmap service
- **rtsp**—Real-Time Streaming Protocol
- **shell**—Shell
- **sip**—Session Initiation Protocol
- **snmp**—Simple Network Management Protocol
- **sqlnet**—SQLNet
- **talk**—Talk Program
- **tftp**—Trivial File Transfer Protocol
- **traceroute**—Traceroute
- **winframe**—WinFrame

**destination-port** *destination-port*—(Optional) Clear sessions for the specified destination port. The range of values is from 0 to 65535.

**destination-prefix** *destination-prefix*—(Optional) Clear sessions for the specified destination prefix.

**interface** *interface-name*—(Optional) Clear sessions for the specified interface. On M Series and T Series routers, the *interface-name* can be *ms-fpc/pic/port* or *rspnumber*.

**ip-action**—(Optional) Clear **ip-action** entries generated by the router to log, drop, or block traffic based on previous matches. The IP action options and targets are configured at the **{edit security idp idp-policy *policy-name* rulebase-ips rule *rule-name* then}** hierarchy level.

**protocol** *protocol*—(Optional) Clear sessions for one of the following IP types:

- **number**—Numeric protocol value from 0 to 255
- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **icmp6**—Internet Control Message Protocol version 6
- **igmp**—Internet Group Management Protocol
- **ipip**—IP-over-IP Encapsulation Protocol
- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol

- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Transmission Protocol
- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

**service-set** *service-set*—(Optional) Clear sessions for the specified service set.

**source-port** *source-port*—(Optional) Clear sessions for the specified source port. The range of values is from 0 through 65535.

**source-prefix** *source-prefix*—(Optional) Clear sessions for the specified source prefix.

**Required Privilege Level** clear

**List of Sample Output** [clear services sessions on page 1346](#)

**Output Fields** [Table 40 on page 1346](#) lists the output fields for the **clear services sessions** command. Output fields are listed in the approximate order in which they appear.

*Table 40: clear services sessions Output Fields*

| Field Name                   | Field Description                                                             |
|------------------------------|-------------------------------------------------------------------------------|
| Interface                    | Name of an interface.                                                         |
| Service set                  | Name of the service set from which sessions are being cleared.                |
| Sessions marked for deletion | Number of sessions that are marked for deletion and are subsequently cleared. |

## Sample Output

### clear services sessions

```

user@hosts>clear services sessions
Interface Service set Sessions marked for deletion
ms-0/0/0 sset 10

```

## clear services stateful-firewall flows

**Syntax** clear services stateful-firewall flows  
 <application-protocol *protocol*>  
 <destination-port *destination-port*>  
 <destination-prefix *destination-prefix*>  
 <interface *interface-name*>  
 <protocol *protocol*>  
 <service-set *service-set*>  
 <source-port *source-port*>  
 <source-prefix *source-prefix*>

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** Clear stateful firewall flows. Issue this command to clear the stateful firewall flows for the specified option. The default option is "none", that is, to close all stateful firewall flows unless another option is specified.

Starting in Junos Release 14.1, the method for closing flows has changed. With the change, even for peak flows, the command prompt now returns to an active state after 30 seconds and the clear command completes in 90 to 120 seconds. In previous releases, closing peak flows could take as long as 4 minutes, after which the command prompt would return. Note too that during the first 30 seconds of issuing the command, the flows to be deleted remain visible in the **show services stateful-firewall flows** command output.

**Options** **none**—Clear all stateful firewall flows.

**destination-port *destination-port***—(Optional) Clear stateful firewall flows for a particular destination port. The range of values is 0 to 65535.

**destination-prefix *destination-prefix***—(Optional) Clear stateful firewall flows for a particular destination prefix.

**interface *interface-name***—(Optional) Clear stateful firewall flows for a particular interface. On M Series and T Series routers, the *interface-name* can be *ms-fpc/pic/port* or *rspnumber*.

**protocol**—(Optional) Clear stateful firewall flows for one of the following IP types:

- **number**—Numeric protocol value from 0 to 255.
- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **igmp**—Internet Group Management Protocol

- **ipip**—IP-over-IP Encapsulation Protocol
- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Protocol
- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

**service-set *service-set***—(Optional) Clear stateful firewall flows for a particular service set.

**source-port *source-port***—(Optional) Clear stateful firewall flows for a particular source port. The range of values is from 0 through 65535.

**source-prefix *source-prefix***—(Optional) Clear stateful firewall flows for a particular source prefix.

**Output Fields**

[Table 41 on page 1348](#) lists the output fields for the **clear services stateful-firewall flows** command. Output fields are listed in the approximate order in which they appear.

*Table 41: clear services stateful-firewall flows Output Fields*

| Field Name          | Field Description                                           |
|---------------------|-------------------------------------------------------------|
| <b>Interface</b>    | Name of an adaptive services interface.                     |
| <b>Service set</b>  | Name of the service set from which flows are being cleared. |
| <b>Conv removed</b> | Number of conversations removed.                            |

## Sample Output

### clear services stateful-firewall flows

```

user@host> clear services stateful-firewall flows
Interface Service set Conv removed
ms-0/3/0 svc_set_trust 0
ms-0/3/0 svc_set_untrust 0

```

## clear services stateful-firewall sip-call

---

**Syntax** clear services stateful-firewall sip-call  
<application-protocol *protocol*>  
<destination-port *destination-port*>  
<destination-prefix *destination-prefix*>  
<interface *interface-name*>  
<protocol *protocol*>  
<service-set *service-set*>  
<source-port *source-port*>  
<source-prefix *source-prefix*>

**Release Information** Command introduced in Junos OS Release 7.4.

**Description** Clear Session Initiation Protocol (SIP) call information in stateful firewall flows.

**Options** **none**—Clear stateful firewall statistics for all interfaces and all service sets.

**application-protocol**—(Optional) Clear information about one of the following application protocols:

- **bootp**—(SIP only) Bootstrap protocol
- **dce-rpc**—(SIP only) Distributed Computing Environment-Remote Procedure Call protocols
- **dce-rpc-portmap**—(SIP only) Distributed Computing Environment-Remote Procedure Call protocols portmap service
- **dns**—(SIP only) Domain Name System protocol
- **exec**—(SIP only) Exec
- **ftp**—(SIP only) File Transfer Protocol
- **h323**—H.323 standards
- **icmp**—Internet Control Message Protocol
- **iiop**—Internet Inter-ORB Protocol
- **login**—Login
- **netbios**—NetBIOS
- **netshow**—NetShow
- **realaudio**—RealAudio
- **rpc**—Remote Procedure Call protocol
- **rpc-portmap**—Remote Procedure Call protocol portmap service
- **rtsp**—Real-Time Streaming Protocol
- **shell**—Shell

- **sip**—Session Initiation Protocol
- **snmp**—Simple Network Management Protocol
- **sqlnet**—SQLNet
- **tftp**—Trivial File Transfer Protocol
- **traceroute**—Traceroute
- **winframe**—WinFrame

**destination-port** *destination-port*—(Optional) Clear information for a particular destination port. The range of values is 0 to 65535.

**destination-prefix** *destination-prefix*—(Optional) Clear information for a particular destination prefix.

**interface** *interface-name*—(Optional) Clear information for a particular adaptive services interface. On M Series and T Series routers, the *interface-name* can be *sp-fpc/pic/port* or *rspnumber*.

**protocol**—(Optional) Clear information about one of the following IP types:

- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **igmp**—Internet Group Management Protocol
- **ipip**—IP-within-IP Encapsulation Protocol
- **ipv6**—IPv6 within IP
- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Protocol
- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

**service-set** *service-set*—(Optional) Clear information for a particular service set.

**source-port** *source-port*—(Optional) Clear information for a particular source port. The range of values is 0 to 65535.

**source-prefix** *source-prefix*—(Optional) Clear information for a particular source prefix.

*Table 42: clear services stateful-firewall sip-call Output Fields*

| Field Name        | Field Description                                           |
|-------------------|-------------------------------------------------------------|
| Interface         | Name of an adaptive services interface.                     |
| Service set       | Name of the service set from which flows are being cleared. |
| SIP calls removed | Number of SIP calls removed.                                |

## Sample Output

### [clear services stateful-firewall sip-call](#)

```
user@host> clear services stateful-firewall sip-call
Interface Service set SIP calls removed
sp-0/3/0 test_sip_777 1
```

## clear services stateful-firewall sip-register

**Syntax** clear services stateful-firewall sip-register  
 <application-protocol *protocol*>  
 <destination-port *destination-port*>  
 <destination-prefix *destination-prefix*>  
 <interface *interface-name*>  
 <protocol *protocol*>  
 <service-set *service-set*>  
 <source-port *source-port*>  
 <source-prefix *source-prefix*>

**Release Information** Command introduced in Junos OS Release 7.4.

**Description** Clear Session Initiation Protocol (SIP) register information in stateful firewall flows.

**Options** **application-protocol**—(Optional) Clear information about one of the following application protocols:

- **bootp**—(SIP only) Bootstrap protocol
- **dce-rpc**—(SIP only) Distributed Computing Environment-Remote Procedure Call protocols
- **dce-rpc-portmap**—(SIP only) Distributed Computing Environment-Remote Procedure Call protocols portmap service
- **dns**—(SIP only) Domain Name System protocol
- **exec**—(SIP only) Exec
- **ftp**—(SIP only) File Transfer Protocol
- **h323**—H.323 standards
- **icmp**—Internet Control Message Protocol
- **iiop**—Internet Inter-ORB Protocol
- **login**—Login
- **netbios**—NetBIOS
- **netshow**—NetShow
- **realaudio**—RealAudio
- **rpc**—Remote Procedure Call protocol
- **rpc-portmap**—Remote Procedure Call protocol portmap service
- **rtsp**—Real-Time Streaming Protocol
- **shell**—Shell
- **sip**—Session Initiation Protocol

- **snmp**—Simple Network Management Protocol
- **sqlnet**—SQLNet
- **tftp**—Trivial File Transfer Protocol
- **traceroute**—Traceroute
- **winframe**—WinFrame

**destination-port** *destination-port*—(Optional) Clear information for a particular destination port. The range of values is 0 to 65535.

**destination-prefix** *destination-prefix*—(Optional) Clear information for a particular destination prefix.

**interface** *interface*—(Optional) Clear information about a particular interface. On M Series and T Series routers, the *interface-name* can be *sp-fpc/pic/port* or *rspnumber*.

**protocol**—(Optional) Clear information about one of the following IP types:

- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **igmp**—Internet Group Management Protocol
- **ipip**—IP-within-IP Encapsulation Protocol
- **ipv6**—IPv6 within IP
- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Protocol
- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

**service-set** *service-set*—(Optional) Clear information for a particular service set.

**source-port** *source-port*—(Optional) Clear information for a particular source port. The range of values is 0 through 65535.

**source-prefix** *source-prefix*—(Optional) Clear information for a particular source prefix.

## Sample Output

```
user@host> request security pki local-certificate enroll certificate-id r3-entrust-scep ca-profile
entrust domain-name router3.example.net subject "CN=router3,OU=Engineering,O=juniper,C=US"
challenge-password 123
```

Certificate enrollment has started. To view the status of your enrollment, check the public key infrastructure log (pkid) log file at /var/log/pkid. Please save the challenge-password for revoking this certificate in future. Note that this password is not stored on the router.

### Sample Output

#### request security pki local-certificate load

```
user@host> request security pki local-certificate load filename /tmp/router2-cert certificate-id
local-entrust2
Local certificate local-entrust2 loaded successfully
```

## request security pki local-certificate verify

|                                 |                                                                                                                      |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>request security pki local-certificate verify certificate-id <i>certificate-id-name</i></code>                 |
| <b>Release Information</b>      | Command introduced in Junos OS Release 8.5.                                                                          |
| <b>Description</b>              | Verify the validity of the local digital certificate identifier.                                                     |
| <b>Options</b>                  | <code>certificate-id <i>certificate-id-name</i></code> —Display the specified certificate identifier name.           |
| <b>Required Privilege Level</b> | maintenance                                                                                                          |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">show security pki local-certificate on page 1451</a></li> </ul> |
| <b>Output Fields</b>            | When you enter this command, you are provided feedback on the status of your request.                                |

## Sample Output

You receive the following response before the certificate revocation list (CRL) is downloaded:

```
request security pki local-certificate verify certificate-id bme1 (not downloaded)
user@host> request security pki local-certificate verify certificate-id bme1
```

```
Local certificate bme1: CRL verification in progress. Please check the PKId debug
logs for completion status
```

You receive the following response after the certificate revocation list (CRL) is downloaded:

```
request security pki local-certificate verify certificate bme1 (downloaded)
user@host> request security pki local-certificate verify certificate-id bme1
Local certificate bme1 verification success
```

## request services ipsec-vpn ipsec switch tunnel

---

## Sample Output

### request services ipsec-vpn ipsec switch tunnel

```
user@host> request services ipsec-vpn ipsec switch tunnel local-gateway 10.1.1.1 remote gateway 10.100.10.1
```

## request services redundancy-set trigger

---

**Syntax**    request services redundancy-set (*redundancy-set* |all) trigger *redundancy-event*

**Release Information**    Statement introduced in Junos OS Release 16.1 on MX Series.

**Description**    Manually trigger a redundancy event for the specified redundancy set or all sets on the current gateway.

## request services url-filter delete gencfg-data

---

**Syntax**    request services url-filter delete gencfg-data

**Release Information**    Command introduced in Junos OS Release 17.2.

**Description**    Delete url-filterd-based objects. This is historical information.

**WARNING:** Do not use this command unless explicitly instructed to do so.

**NOTE:** Starting in Junos OS Release 18.3R1, the request services url-filter delete gencfg-data command is deprecated and has been replaced by the request services web-filter delete gencfg-data command.

## Sample Output

### request services url-filter force dns-resolution profile profile1

```
user@host> request services url-filter force dns-resolution profile profile1
STATUS: DNS resolution is triggered for profile profile1
```

### request services url-filter force dns-resolution profile profile1 template template1

```
user@host> request services url-filter force dns-resolution profile profile1 template template1
STATUS: DNS resolution is triggered for template template1 in profile profile1
```

**request services url-filter force dns-resolution all**

```
user@host> request services url-filter force dns-resolution all
STATUS: DNS resolution has been triggered for all profiles
```

## request services url-filter update url-filter-database file

---

**Syntax**    `request services url-filter update url-filter-database file filename`

**Release Information**    Command introduced in Junos OS Release 17.2.

**Description**    Update the URL filter database. If you change the database file, run this command. It sends a request to the DNS server for only the new hostnames that were not in the previous version of URL database file.

**NOTE:** Starting in Junos OS Release 18.3R1, the `request services url-filter update url-filter-database file` command is deprecated and has been replaced by the `request services web-filter update url-filter-database file` command.

**Options**    *filename*—Use the database filename.

## request services url-filter validate

---

**Syntax**    request services url-filter validate (all | file-name *filename*)

**Release Information**    Command introduced in Junos OS Release 17.2.

**Description**    Validate the URL filter database to ensure the database is correct.

**NOTE:** Starting in Junos OS Release 18.3R1, the `request services url-filter validate` command is deprecated and has been replaced by the `request services web-filter validate url-filter-file-name` command.

**Options**    **all**—Validate the URL filter database for all profiles.

**file-name *filename***—Validate the URL filter database for the database file specified.

## request services web-filter delete gencfg-data

---

**Syntax**    request services web-filter delete gencfg-data

**Release Information**    Command introduced in Junos OS Release 18.3R1.

**Description**    Delete url-filterd-based objects. This is historical information.

**WARNING:** Do not use this command unless explicitly instructed to do so.

## show interfaces (Adaptive Services)

**Syntax** `show interfaces interface-type`  
`<brief | detail | extensive | terse>`  
`<descriptions>`  
`<media>`  
`<snmp-index snmp-index>`  
`<statistics>`

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** Display status information about the specified adaptive services interface.

**Options** *interface-type*—On M Series and T Series routers, the interface type is *sp-fpc/pic/port*.  
**brief | detail | extensive | terse**—(Optional) Display the specified level of output.  
**descriptions**—(Optional) Display interface description strings.  
**media**—(Optional) Display media-specific information about network interfaces.  
**snmp-index *snmp-index***—(Optional) Display information for the specified SNMP index of the interface.  
**statistics**—(Optional) Display static interface statistics.

**Required Privilege Level** view

**List of Sample Output** [show interfaces \(Adaptive Services\) on page 1392](#)  
[show interfaces brief \(Adaptive Services\) on page 1392](#)  
[show interfaces detail \(Adaptive Services\) on page 1392](#)  
[show interfaces extensive \(Adaptive Services\) on page 1393](#)

**Output Fields** [Table 44 on page 1387](#) lists the output fields for the **show interfaces** (adaptive services and redundant adaptive services) command. Output fields are listed in the approximate order in which they appear.

*Table 44: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields*

| Field Name                | Field Description                                                                                                                    | Level of Output              |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Physical Interface</b> |                                                                                                                                      |                              |
| <b>Physical interface</b> | Name of the physical interface.                                                                                                      | All levels                   |
| <b>Enabled</b>            | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels                   |
| <b>Interface index</b>    | Physical interface's index number, which reflects its initialization sequence.                                                       | <b>detail extensive none</b> |

Table 44: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (continued)

| Field Name              | Field Description                                                                                                                                                                                                                                    | Level of Output       |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| SNMP ifIndex            | SNMP index number for the physical interface.                                                                                                                                                                                                        | detail extensive none |
| Generation              | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                    | detail extensive      |
| Type                    | Encapsulation being used on the interface.                                                                                                                                                                                                           | All levels            |
| Link-level type         | Encapsulation being used on the physical interface.                                                                                                                                                                                                  | All levels            |
| MTU                     | MTU size on the physical interface.                                                                                                                                                                                                                  | All levels            |
| Clocking                | Reference clock source: can be <b>Internal</b> or <b>External</b> .                                                                                                                                                                                  | All levels            |
| Speed                   | Speed at which the interface is running.                                                                                                                                                                                                             | All levels            |
| Device flags            | Information about the physical device. Possible values are described in the "Device Flags" section under <i>Common Output Fields Description</i> .                                                                                                   | All levels            |
| Interface flags         | Information about the interface. Possible values are described in the "Interface Flags" section under <i>Common Output Fields Description</i> .                                                                                                      | All levels            |
| Link type               | Physical interface link type: <b>Full-Duplex</b> or <b>Half-Duplex</b> .                                                                                                                                                                             | detail extensive none |
| Link flags              | Information about the link. Possible values are described in the "Link Flags" section under <i>Common Output Fields Description</i> .                                                                                                                | detail extensive none |
| Physical info           | Information about the physical interface.                                                                                                                                                                                                            | detail extensive      |
| Hold-times              | Current interface hold-time up and hold-time down, in milliseconds.                                                                                                                                                                                  | detail extensive      |
| Current address         | Configured MAC address.                                                                                                                                                                                                                              | detail extensive none |
| Hardware address        | MAC address of the hardware.                                                                                                                                                                                                                         | detail extensive none |
| Alternate link address  | Backup address of the link.                                                                                                                                                                                                                          | detail extensive none |
| Last flapped            | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> . | detail extensive none |
| Input Rate              | Input rate in bits per second (bps) and packets per second (pps).                                                                                                                                                                                    | None specified        |
| Output Rate             | Output rate in bps and pps.                                                                                                                                                                                                                          | None specified        |
| Statistics last cleared | Time when the statistics for the interface were last set to zero.                                                                                                                                                                                    | detail extensive      |

Table 44: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (continued)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output              |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Traffic statistics</b> | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <p><b>NOTE:</b> With static NAT configured as basic NAT44 or destination NAT44 on MX Series routers with MS-MICs and MS-MPCs, the Input bytes field might show 16 more bytes than the Output bytes field. This is caused by the accounting of 16 bytes of the Juniper Forwarding Module cookie.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                                                                                                                                                                                                      | <b>detail extensive</b>      |
| <b>Input errors</b>       | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Frames received smaller than the runt threshold.</li> <li>• <b>Giants</b>—Frames received larger than the giant threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>                                       | <b>extensive</b>             |
| <b>Output errors</b>      | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>MTU errors</b>—Number of packets larger than the MTU threshold.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>             |
| <b>Logical Interface</b>  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                              |
| <b>Logical interface</b>  | Name of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | All levels                   |
| <b>Index</b>              | Logical interface index number, which reflects its initialization sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>       | SNMP interface index number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail extensive none</b> |

Table 44: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (continued)

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                           | Level of Output              |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Generation</b>             | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                           | <b>detail extensive</b>      |
| <b>Flags</b>                  | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                             | All levels                   |
| <b>Encapsulation</b>          | Encapsulation on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels                   |
| <b>Input packets</b>          | Number of packets received on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                        | None specified               |
| <b>Output packets</b>         | Number of packets transmitted on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                     | None specified               |
| <b>Traffic statistics</b>     | <p>Number and rate of bytes and packets received and transmitted on the logical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> | <b>detail extensive</b>      |
| <b>Local statistics</b>       | Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.                                                                                                                                                                          | <b>detail extensive</b>      |
| <b>Transit statistics</b>     | Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes generally less than 1 second for the counter to stabilize.                                                                                                                                                                                                                   | <b>detail extensive</b>      |
| <b><i>protocol-family</i></b> | Protocol family configured on the logical interface. If the protocol is <b>inet</b> , the IP address of the interface is also displayed.                                                                                                                                                                                                                                                                                                                    | <b>brief</b>                 |
| <b>Protocol</b>               | Protocol family configured on the logical interface, such as <b>iso</b> , <b>inet6</b> , <b>mpls</b> .                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive none</b> |
| <b>MTU</b>                    | MTU size on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail extensive none</b> |
| <b>Generation</b>             | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                           | <b>detail extensive</b>      |
| <b>Route table</b>            | Routing table in which the logical interface address is located. For example, <b>0</b> refers to the routing table <b>inet.0</b> .                                                                                                                                                                                                                                                                                                                          | <b>detail extensive</b>      |
| <b>Flags</b>                  | Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                    | <b>detail extensive none</b> |
| <b>Addresses, Flags</b>       | Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                         | <b>detail extensive none</b> |
| <b>Destination</b>            | IP address of the remote side of the connection.                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive none</b> |
| <b>Local</b>                  | IP address of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive none</b> |

*Table 44: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (continued)*

| Field Name        | Field Description                                                 | Level of Output              |
|-------------------|-------------------------------------------------------------------|------------------------------|
| <b>Broadcast</b>  | Broadcast address.                                                | <b>detail extensive none</b> |
| <b>Generation</b> | Unique number for use by Juniper Networks technical support only. | <b>detail extensive</b>      |

## Sample Output

### show interfaces (Adaptive Services)

```
user@host> show interfaces sp-1/2/0
Physical interface: sp-1/2/0, Enabled, Physical link is Up
 Interface index: 147, SNMP ifIndex: 72
 Type: Adaptive-Services, Link-level type: Adaptive-Services, MTU: 9192,
 Speed: 800mbps
 Device flags : Present Running
 Interface flags: Point-To-Point SNMP-Traps Internal: 0x4000
 Link type : Full-Duplex
 Link flags : None
 Last flapped : 2006-03-06 11:37:18 PST (00:57:29 ago)
 Input rate : 0 bps (0 pps)
 Output rate : 0 bps (0 pps)

Logical interface sp-1/2/0.16383 (Index 68) (SNMP ifIndex 73)
 Flags: Point-To-Point SNMP-Traps Encapsulation: Adaptive-Services
 Input packets : 3057
 Output packets: 3044
 Protocol inet, MTU: 9192
 Flags: Receive-options, Receive-TTL-Exceeded
 Addresses, Flags: Is-Preferred Is-Primary
 Destination: 10.0.0.34, Local: 10.0.0.1
```

### show interfaces brief (Adaptive Services)

```
user@host> show interfaces sp-1/2/0 brief
Physical interface: sp-1/2/0, Enabled, Physical link is Up
 Type: Adaptive-Services, Link-level type: Adaptive-Services, MTU: 9192,
 Clocking: Unspecified, Speed: 800mbps
 Device flags : Present Running
 Interface flags: Point-To-Point SNMP-Traps Internal: 0x4000

Logical interface sp-1/2/0.16383
 Flags: Point-To-Point SNMP-Traps Encapsulation: Adaptive-Services
 inet 10.0.0.1 --> 10.0.0.34
```

### show interfaces detail (Adaptive Services)

```
user@host> show interfaces sp-1/2/0 detail
Physical interface: sp-1/2/0, Enabled, Physical link is Up
 Interface index: 147, SNMP ifIndex: 72, Generation: 30
 Type: Adaptive-Services, Link-level type: Adaptive-Services, MTU: 9192,
 Clocking: Unspecified, Speed: 800mbps
 Device flags : Present Running
 Interface flags: Point-To-Point SNMP-Traps Internal: 0x4000
 Link type : Full-Duplex
 Link flags : None
 Physical info : Unspecified
 Hold-times : Up 0 ms, Down 0 ms
 Current address: Unspecified, Hardware address: Unspecified
 Alternate link address: Unspecified
 Last flapped : 2006-03-06 11:37:18 PST (00:57:56 ago)
 Statistics last cleared: Never
 Traffic statistics:
 Input bytes : 125147 0 bps
 Output bytes : 1483113 0 bps
```

```

Input packets: 3061 0 pps
Output packets: 3048 0 pps

Logical interface sp-1/2/0.16383 (Index 68) (SNMP ifIndex 73) (Generation 7)
Flags: Point-To-Point SNMP-Traps Encapsulation: Adaptive-Services
Traffic statistics:
 Input bytes : 125147
 Output bytes : 1483113
 Input packets: 3061
 Output packets: 3048
Local statistics:
 Input bytes : 125147
 Output bytes : 1483113
 Input packets: 3061
 Output packets: 3048
Transit statistics:
 Input bytes : 0 0 bps
 Output bytes : 0 0 bps
 Input packets: 0 0 pps
 Output packets: 0 0 pps
Protocol inet, MTU: 9192, Generation: 20, Route table: 1
Flags: Receive-options, Receive-TTL-Exceeded
Addresses, Flags: Is-Preferred Is-Primary
Destination: 10.0.0.34, Local: 10.0.0.1, Broadcast: Unspecified,
Generation: 22

```

### show interfaces extensive (Adaptive Services)

```

user@host> show interfaces sp-1/2/0 extensive
Physical interface: sp-1/2/0, Enabled, Physical link is Up
Interface index: 147, SNMP ifIndex: 72, Generation: 30
Type: Adaptive-Services, Link-level type: Adaptive-Services, MTU: 9192,
Clocking: Unspecified, Speed: 800mbps
Device flags : Present Running
Interface flags: Point-To-Point SNMP-Traps Internal: 0x4000
Link type : Full-Duplex
Link flags : None
Physical info : Unspecified
Hold-times : Up 0 ms, Down 0 ms
Current address: Unspecified, Hardware address: Unspecified
Alternate link address: Unspecified
Last flapped : 2006-03-06 11:37:18 PST (00:58:40 ago)
Statistics last cleared: Never
Traffic statistics:
 Input bytes : 125547 0 bps
 Output bytes : 1483353 0 bps
 Input packets: 3065 0 pps
 Output packets: 3052 0 pps
Input errors:
 Errors: 0, Drops: 0, Framing errors: 0, Runt: 0, Giants: 0,
 Policed discards: 0, Resource errors: 0
Output errors:
 Carrier transitions: 2, Errors: 0, Drops: 0, MTU errors: 0,
 Resource errors: 0

Logical interface sp-1/2/0.16383 (Index 68) (SNMP ifIndex 73) (Generation 7)
Flags: Point-To-Point SNMP-Traps Encapsulation: Adaptive-Services
Traffic statistics:
 Input bytes : 125547
 Output bytes : 1483353
 Input packets: 3065

```

```
Output packets: 3052
Local statistics:
Input bytes : 125547
Output bytes : 1483353
Input packets: 3065
Output packets: 3052
Transit statistics:
Input bytes : 0 0 bps
Output bytes : 0 0 bps
Input packets: 0 0 pps
Output packets: 0 0 pps
Protocol inet, MTU: 9192, Generation: 20, Route table: 1
Flags: Receive-options, Receive-TTL-Exceeded
Addresses, Flags: Is-Preferred Is-Primary
Destination: 10.0.0.34, Local: 10.0.0.1, Broadcast: Unspecified,
Generation: 22
```

## show interfaces (Link Services IQ)

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>              | (M Series, MX Series, and T Series routers only) Display status information about the specified link services intelligent queuing (IQ) interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b>lsq-fpc/pic/port</b>—Display standard status information about the specified link services IQ interface.</p> <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b>descriptions</b>—(Optional) Display interface description strings.</p> <p><b>l2-statistics</b>—(Optional) Display Layer 2 queue statistics for Multilink Point-to-Point Protocol (MLPPP), FRF.15, and FRF.16 bundles.</p> <p><b>media</b>—(Optional) Display media-specific information about network interfaces.</p> <p><b>snmp-index snmp-index</b>—(Optional) Display information for the specified SNMP index of the interface.</p> <p><b>statistics</b>—(Optional) Display static interface statistics.</p> |
| <b>Additional Information</b>   | Link services IQ interfaces are similar to link services interfaces. The important difference is that link services IQ interfaces fully support Junos OS class-of-service (CoS) components.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

[show interfaces extensive \(Multiclass MLPPP on Link Services IQ\) on page 1416](#)

**Output Fields** [Table 45 on page 1396](#) lists the output fields for the **show interfaces** (link services IQ) command. Output fields are listed in the approximate order in which they appear.

*Table 45: show interfaces (Link Services IQ) Output Fields*

| Field Name                | Field Description                                                                                                                                                                                                                                    | Level of Output              |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Physical Interface</b> |                                                                                                                                                                                                                                                      |                              |
| <b>Physical interface</b> | Name of the physical interface.                                                                                                                                                                                                                      | All levels                   |
| <b>Enabled</b>            | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .                                                                                                                 | All levels                   |
| <b>Interface index</b>    | Physical interface index number, which reflects its initialization sequence.                                                                                                                                                                         | <b>detail extensive</b> none |
| <b>SNMP ifIndex</b>       | SNMP index number for the physical interface.                                                                                                                                                                                                        | <b>detail extensive</b> none |
| <b>Generation</b>         | Unique number for use by Juniper Networks technical support.                                                                                                                                                                                         | <b>detail extensive</b>      |
| <b>Link-level type</b>    | Encapsulation being used on the physical interface:<br><b>Multilink-Frame-Relay-UNI-NNI</b> Multilink-Frame-Relay-UNI-NNI (default), LinkService, Frame-relay, Frame-relay-ccc, or Frame-relay-tcc.                                                  | All levels                   |
| <b>MTU</b>                | Maximum transmission unit size on the physical interface.                                                                                                                                                                                            | All levels                   |
| <b>Device flags</b>       | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .                                                                                                   | All levels                   |
| <b>Interface flags</b>    | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                      | All levels                   |
| <b>Last flapped</b>       | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> . | <b>detail extensive</b> none |

Table 45: show interfaces (Link Services IQ) Output Fields (continued)

| Field Name                                          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output              |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Multilink Frame Relay UNI NNI bundle options</b> | <p>(Multilink Frame Relay UNI NNI only) Configured information about Multilink Frame Relay bundle options.</p> <ul style="list-style-type: none"> <li>• <b>Device type</b>—DCE (data communication equipment) or DTE (data terminal equipment).</li> <li>• <b>MRRU</b>—Configured size of the maximum received reconstructed unit (MRRU): 1500 to 4500 bytes. The default is 1524 bytes.</li> <li>• <b>Bandwidth</b>—Speed at which the interface is running.</li> <li>• <b>Fragmentation threshold</b>—Configured fragmentation threshold: 128 through 16,320 bytes, in integer multiples of 64 bytes. The default setting is 0, which disables fragmentation.</li> <li>• <b>Red differential delay limit</b>—Red differential delay limit among bundle links has been reached, indicating an action will occur.</li> <li>• <b>Yellow differential delay limit</b>—Yellow differential delay among bundle links has been reached, indicating a warning will occur.</li> <li>• <b>Red differential delay action</b>—Type of actions taken when the red differential delay exceeds the red limit: <i>Disable link transmit</i> or <i>Remove link from service</i>.</li> <li>• <b>Link layer overhead</b>—Percentage of bundle bandwidth to be set aside for link layer overhead.</li> <li>• <b>Reassembly drop timer</b>—Drop timeout value to provide a recovery mechanism if individual links in the link services bundle drop one or more packets: 1 through 127 milliseconds. By default, the drop timeout parameter is 0 (disabled). A value under 5 ms is not recommended.</li> <li>• <b>Links needed to sustain bundle</b>—Minimum number of links to sustain the bundle: 1 through 8.</li> <li>• <b>LIP Hello timer</b>—Link Interleaving Protocol hello timer: 1 through 180 seconds. <ul style="list-style-type: none"> <li>• <b>Acknowledgement timer</b>—Maximum period to wait for an add link acknowledgement, hello acknowledgement, or remove link acknowledgement: 1 through 10 seconds.</li> <li>• <b>Acknowledgement retries</b>—Number of retransmission attempts to be made for consecutive hello or remove link messages after the expiration of the acknowledgement timer: 1 through 5.</li> </ul> </li> </ul> | <b>detail extensive none</b> |

Table 45: show interfaces (Link Services IQ) Output Fields (continued)

| Field Name                                               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output       |

| <b>Traffic statistics</b>      | Number and rate of bytes and packets received and transmitted on the physical interface. All references to traffic direction (input or output) are defined with respect to the router. Input fragments received by the router are assembled into input packets; output packets are segmented into output fragments for transmission out of the router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive</b> |
| <b>Frame exceptions</b>        | <p>Information about framing exceptions. Includes events recorded under <b>Exception Events</b> for each logical interface.</p> <ul style="list-style-type: none"> <li>• <b>Oversized frames</b>—Number of frames received that exceed maximum frame length. Maximum length is 4500 Kb (kilobits).</li> <li>• <b>Errored input frames</b>—Number of input frame errors.</li> <li>• <b>Input on disabled link/bundle</b>—Number of frames received on disabled links. These frames can result either from an inconsistent configuration, or from a bundle or link being brought up or down with traffic actively flowing through it.</li> <li>• <b>Output for disabled link/bundle</b>—Number of frames sent for a disabled or unavailable link. These frames can result either from an inconsistent configuration, or from a bundle being brought up or down while traffic is flowing through it.</li> <li>• <b>Queuing drops</b>—Total number of packets dropped before traffic enters the link services IQ interface. Indicates that the interface is becoming oversubscribed.</li> </ul> | <b>extensive</b>        |
| <b>Buffering exceptions</b>    | <p>Information about buffering exceptions. Includes events recorded under <b>Exception Events</b> for each logical interface:</p> <ul style="list-style-type: none"> <li>• <b>Packet data buffer overflow</b>—Packet buffer memory is full. This overflow can occur when the aggregate data rate exceeds the physical link services IQ interface capacity.</li> <li>• <b>Fragment data buffer overflow</b>—Fragment buffer memory is full. This overflow can occur when excessive differential delay is experienced across the links within a single bundle, or when the aggregate data rate exceeds the physical link services IQ capacity. Check the logical interface exception event counters to determine which bundle is responsible.</li> </ul>                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b>        |

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Level of Output              |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Assembly exceptions</b>      | <p>(Multilink Frame Relay end-to-end only) Information about assembly exceptions. Includes events recorded under <b>Exception Events</b> for each logical interface.</p> <p>An assembly exception does not necessarily indicate an operational problem with the physical link services IQ interface itself. If multilink-encapsulated traffic is dropped or reordered after a sequence number has been assigned, the interface records one or more exception events. The physical interface can drop multilink-encapsulated fragments itself as a result. Any multilink packets or fragments dropped by the interface itself result in packet or fragment drop counts on individual logical interfaces. If the logical interface drop counts are zero, but exception events are seen, the most likely cause is a problem with the individual link interfaces. Even if the logical interface fragment drop counts are nonzero, excess differential delay or traffic losses on individual interfaces can be the root cause.</p> <ul style="list-style-type: none"> <li>• <b>Fragment timeout</b>—The drop timer expired while a fragment sequence number was outstanding. Occurs only if the drop timer is enabled. This timeout can occur if the differential delay across the links in a bundle exceeds the drop-timer setting, or if a multilink packet is lost in transit while the drop timer is enabled. These events do not necessarily indicate any problem with the operation of the physical link services IQ interface itself, but can occur when one or more individual links drop traffic. Check the logical interface exception event counters to determine which bundle is responsible.</li> <li>• <b>Missing sequence number</b>—A gap was detected in the sequence numbers of fragments on a bundle. These events do not necessarily indicate any problem with the operation of the physical link services IQ interface itself, but can occur when one or more individual links drop traffic. Check the logical interface exception event counters to determine which bundle is responsible.</li> <li>• <b>Out-of-order sequence number</b>—Two frames with out-of-order sequence numbers within a single link. This event indicates that an individual link within a bundle reordered traffic, making the link services IQ interface unable to correctly process the resulting stream. Check the logical interface exception event counters to determine which bundle is responsible.</li> <li>• <b>Out-of-range sequence number</b>—Received a frame with an out-of-range sequence number. These events can occur when a large amount of multilink-encapsulated traffic is lost or the multilink peer is reset, so that a large jump in sequence numbers results. A small number of these events can occur when the far end of a bundle is taken down or brought up. Check the logical interface exception event counters to determine which bundle is responsible.</li> </ul> | <b>extensive</b>             |
| <b>Hardware errors (sticky)</b> | <p>(Multilink Frame Relay end-to-end only) Information about hardware errors:</p> <ul style="list-style-type: none"> <li>• <b>Data memory error</b>—A memory error was detected on the interface DRAM. Indicates possible hardware failure. Contact Juniper Networks technical support.</li> <li>• <b>Control memory error</b>—A memory error was detected on the interface DRAM. Indicates possible hardware failure. Contact Juniper Networks technical support.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>extensive</b>             |
| <b>Egress queues</b>            | Total number of egress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive none</b> |

| <b>Flags</b>             | Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels                   |
| <b>Encapsulation</b>     | Encapsulation being used: PPP or Multilink PPP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels                   |
| <b>Bandwidth</b>         | Speed at which the interface is running.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | All levels                   |
| <b>Bundle options</b>    | (Multilink Frame Relay end-to-end interfaces only) <ul style="list-style-type: none"> <li><b>MRRU</b>—Configured size of the maximum received reconstructed unit (MRRU): 1500 through 4500 bytes. The default is 1504 bytes.</li> <li><b>Drop timer period</b>—Drop timeout value to provide a recovery mechanism if individual links in link services bundle drop one or more packets: 0 through 2000 milliseconds. Values under 5 ms are not recommended. The default setting is 0, which disables the timer.</li> <li><b>Sequence number format</b>—Short sequence number header format (MLPPP only).</li> <li><b>Fragmentation threshold</b>—Configured fragmentation threshold: 64 through 16,320 bytes, in integer multiples of 64 bytes. The default setting is 0, which disables fragmentation.</li> <li><b>Links needed to sustain bundle</b>—Minimum number of links to sustain the bundle: 1 through 8.</li> <li><b>Multilink classes</b>—Number of multilink classes negotiated.</li> <li><b>Link layer overhead</b>—Percentage of bundle bandwidth to be set aside for link-layer overhead.</li> </ul> | <b>detail extensive none</b> |

Table 45: show interfaces (Link Services IQ) Output Fields (continued)

| Field Name                                                                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Level of Output              |
|----------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Bundle status</b><br>(MLPPP) or<br><b>Multilink class status</b> (Multiclass MLPPP) | Information about bundle status: <ul style="list-style-type: none"> <li>• <b>Remote MRRU</b>—MRRU value received from remote peer. If negotiation has not been initiated, the default value is displayed.</li> <li>• <b>Received sequence number</b>—Sequence number for received packets.</li> <li>• <b>Transmitted sequence number</b>—Sequence number for transmitted packets.</li> <li>• <b>Packet drops</b>—Number and byte count of output packets that were dropped, rather than being encapsulated and sent out of the router as fragments. The packet drop counter is incremented if there is a temporary shortage of packet memory on the AS PIC, which causes packet fragmentation to fail.</li> <li>• <b>Fragment drops</b>—Number and byte count of input fragments that were dropped, rather than being reassembled and handled by the router as packets. This counter also includes fragments that have been received successfully, but had to be dropped because not all fragments that constituted a packet had been received. The fragment drop counter is incremented when a fragment received on constituent links is dropped. Drop fragments can be triggered by sequence ordering errors, duplicate fragments, timed-out fragments, and bad multilink headers.</li> <li>• <b>MRRU exceeded</b>—Number of reassembled packets exceeding the MRRU. This counter is not implemented in this release.</li> <li>• <b>Fragment timeout</b>—The drop timer expired while a fragment sequence number was outstanding. Occurs only if the drop timer is enabled. This timeout can occur if the differential delay across the links in a bundle exceeds the drop-timer setting, or if a multilink packet is lost in transit while the drop timer is enabled.</li> <li>• <b>Missing sequence number</b>—A gap was detected in the sequence numbers of fragments on a bundle.</li> <li>• <b>Out-of-order sequence number</b>—Two frames with out-of-order sequence numbers within a single link. This event indicates that an individual link within a bundle reordered traffic, making the multilink interface unable to correctly process the resulting stream.</li> <li>• <b>Out-of-range sequence number</b>—Received a frame with an out-of-range sequence number. These events can occur when a large amount of multilink-encapsulated traffic is lost or the multilink peer is reset, so that a large jump in sequence numbers results. A small number of these events can occur when the far end of a bundle is taken down or brought up.</li> <li>• <b>Packet data buffer overflow</b>—Packet buffer memory is full. This overflow can occur when the aggregate data rate exceeds the physical link services IQ interface capacity.</li> <li>• <b>Fragment data buffer overflow</b>—Fragment buffer memory is full. This overflow can occur when excessive differential delay is experienced across the links within a single bundle, or when the aggregate data rate exceeds the physical link services IQ capacity.</li> </ul> | <b>detail extensive none</b> |

Table 45: show interfaces (Link Services IQ) Output Fields (continued)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Level of Output              |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Statistics</b>       | <p>Information about fragments and packets received and sent by the router. All references to traffic direction (input or output) are defined with respect to the router. Input fragments received by the router are assembled into input packets; output packets are segmented into output fragments for transmission out of the router. Each field has columns that indicate the number of frames received and transmitted, frames per second (fps), the number of bytes received and transmitted, and bits per second (bps).</p> <ul style="list-style-type: none"> <li>• <b>Bundle</b>—Information for each active bundle link. <ul style="list-style-type: none"> <li>• <b>Fragments: Input and Output</b>—Total number and rate of fragments received and transmitted.</li> <li>• <b>Packets: Input and Output</b>—Total number and rate of packets received and transmitted.</li> <li>• <b>Multilink class</b>—(Multiclass MLPPP only) Information about multiclass links used in the multilink operation.</li> </ul> </li> <li>• <b>Link</b>—Information about links used in the multilink operation. <ul style="list-style-type: none"> <li>• <b>Link name</b>—Interface name of the link services IQ channel and state information (physical link <b>up</b> or <b>down</b>).</li> <li>• <b>Input and Output</b>—Total number and rate of fragments and packets received and transmitted.</li> </ul> </li> </ul> | <b>detail extensive</b>      |

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Level of Output              |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Bundle status</b><br>(MLPPP) | <p>Information about bundle status:</p> <ul style="list-style-type: none"> <li>• <b>Received sequence number</b>—Sequence number for received packets.</li> <li>• <b>Transmit sequence number</b>—Sequence number for transmitted packets.</li> <li>• <b>Packet drops</b>—Number and byte count of output packets that were dropped, rather than being encapsulated and sent out of the router as fragments. The packet drop counter is incremented if there is a temporary shortage of packet memory on the AS PIC, which causes packet fragmentation to fail.</li> <li>• <b>Fragment drops</b>—Number and byte count of input fragments that were dropped, rather than being reassembled and handled by the router as packets. This counter also includes fragments that have been received successfully but had to be dropped because not all fragments that constituted a packet had been received. The fragment drop counter is incremented when a fragment received on constituent links is dropped. Drop fragments can be triggered by sequence ordering errors, duplicate fragments, timed-out fragments, and bad multilink headers.</li> <li>• <b>MRRU exceeded</b>—Number of reassembled packets exceeding the MRRU. This counter is not implemented in this release.</li> <li>• <b>Fragment timeout</b>—The drop timer expired while a fragment sequence number was outstanding. Occurs only if the drop timer is enabled. This timeout can occur if the differential delay across the links in a bundle exceeds the drop-timer setting, or if a multilink packet is lost in transit while the drop timer is enabled.</li> <li>• <b>Missing sequence number</b>—A gap was detected in the sequence numbers of fragments on a bundle.</li> <li>• <b>Out-of-order sequence number</b>—Two frames with out-of-order sequence numbers occurred within a single link. This event indicates that an individual link within a bundle reordered traffic, making the multilink interface unable to correctly process the resulting stream.</li> <li>• <b>Out-of-range sequence number</b>—A frame was received with an out-of-range sequence number. These events can occur when a large amount of multilink-encapsulated traffic is lost or the multilink peer is reset, so that a large jump in sequence numbers results. A small number of these events can occur when the far end of a bundle is taken down or brought up.</li> <li>• <b>Packet data buffer overflow</b>—Packet buffer memory is full. This overflow can occur when the aggregate data rate exceeds the physical link services IQ interface capacity.</li> <li>• <b>Fragment data buffer overflow</b>—Fragment buffer memory is full. This overflow can occur when excessive differential delay is experienced across the links within a single bundle, or when the aggregate data rate exceeds the physical link services IQ capacity.</li> </ul> | <b>detail extensive none</b> |

Table 45: show interfaces (Link Services IQ) Output Fields (continued)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Level of Output  |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Statistics</b> | <p>Information about frames, bytes, and bits per second received and sent by the router. All references to traffic direction (input or output) are defined with respect to the router. Each field has columns that indicate the number of frames received and transmitted, frames per second (fps), the number of bytes received and transmitted, and bits per second (bps).</p> <p>The bundle, multilink, and network statistics are reported by the Packet Forwarding Engine (PFE). The Multi Link Detail statistics like fragments, non-fragments and LFI are reported by the PIC.</p> <p>However, the PFE reports an extra overhead of 2 bytes in the output when compared with the Multilink Detail Statistics. This is due to the service-cookie in the PFE which does the link demux for the ML header.</p> <p>The difference in the bytes received and transmitted from Network and Multilink interfaces and Multilink statistics for each member link is divided between the ML and the PPP headers. For example the header counter for a long sequence configuration would be as follows.</p> <ul style="list-style-type: none"> <li>• Input side - Total overhead = 6 bytes. <ul style="list-style-type: none"> <li>• ML: 4 bytes of ML header = 1 byte of Flag + 3 bytes of long sequence number.</li> <li>• PPP: 2 bytes of protocol field.</li> </ul> </li> <li>• Output side - Total overhead = 11 bytes. <ul style="list-style-type: none"> <li>• ML: 4 bytes of ML Header = 1 byte of Flag + 3 bytes of Long sequence number.</li> <li>• PPP: 5 bytes = 4 bytes of header + 1 byte of Idle flag.</li> <li>• 2 bytes of Service Cookie.</li> </ul> </li> <li>• <b>Bundle</b>—Information for each active bundle link. <ul style="list-style-type: none"> <li>• <b>Multilink: Input and Output</b>—Total number and rate of multilink frames, bytes, and bits per second received and transmitted. It is a module connecting LSQ PIC and its member link. Multilink Input displays L2 fragments received from the member link to the LSQ PIC. Multilink Output displays the L2 fragments transmitted from LSQ PIC to the member links.</li> <li>• <b>Network: Input and Output</b>—Total number of network frames, bytes, and bits per second received and transmitted. It refers to the packets transmitted from an ingress interface to the PFE and then to the LSQ PIC. Network Input displays the L3 packets received from the LSQ PIC to the PFE. Network Output displays the L3 packets transmitted from PFE to LSQ PIC.</li> </ul> </li> <li>• <b>Link</b>—Information about links used in the multilink operation. <ul style="list-style-type: none"> <li>• <b>Link name</b>—The interface name of the link services IQ channel and state information (physical link <i>up</i> or <i>down</i>) and up time.</li> <li>• <b>Input and Output</b>—Total number and rate of frames, bytes, and bits per second received and transmitted.</li> </ul> </li> </ul> | <b>extensive</b> |

For example, <b>Route table:0</b> refers to inet.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>detail extensive</b>      |
| <b>Addresses, Flags</b>            | Information about the addresses configured on the logical interface. Possible values are described in the "Addresses Flags" section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive none</b> |
| <b>Destination</b>                 | IP address of the remote side of the connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive none</b> |
| <b>Local</b>                       | IP address of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive none</b> |
| <b>Broadcast</b>                   | Broadcast address on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive none</b> |
| <b>Generation</b>                  | Unique number for use by Juniper Networks technical support.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b>      |

## Sample Output

### show interfaces extensive (MLPPP on Link Services IQ)

```

user@host> show interfaces lsq-0/2/0 extensive
Physical interface: lsq-0/2/0, Enabled, Physical link is Up
 Interface index: 140, SNMP ifIndex: 25, Generation: 23
 Link-level type: LinkService, MTU: 1504
 Device flags : Present Running
 Interface flags: Point-To-Point SNMP-Traps
 Last flapped : 2005-06-02 08:54:36 PDT (00:05:45 ago)
 Statistics last cleared: Never
 Traffic statistics:
 Input bytes : 8872424 229080 bps
 Output bytes : 9856960 234448 bps
 Input packets : 38202 117 pps
 Output packets: 39453 117 pps
 Frame exceptions:
 Oversized frames 0
 Errored input frames 0
 Input on disabled link/bundle 0
 Output for disabled link/bundle 0
 Queuing drops 0
 Buffering exceptions:
 Packet data buffer overflow 0
 Fragment data buffer overflow 0
 Assembly exceptions:
 Fragment timeout 0
 Missing sequence number 0
 Out-of-order sequence number 0
 Out-of-range sequence number 0
 Hardware errors (sticky):
 Data memory error 0
 Control memory error 0
 Queue counters:
 Queued packets Transmitted packets Dropped packets

 0 be 0 0 0
 1 ef 0 0 0
 2 af 0 0 0
 3 nc 0 0 0

 Logical interface lsq-0/2/0.0 (Index 66) (SNMP ifIndex 26) (Generation 5)
 Flags: Point-To-Point SNMP-Traps Encapsulation: Multilink-PPP
 Bandwidth: 256kbps
 Bundle options:
 MRRU 1504
 Drop timer period 2000
 Sequence number format long (24 bits)
 Fragmentation threshold 0
 Links needed to sustain bundle 1
 Multilink classes 0
 Link layer overhead 4.0 %
 Bundle status:
 Remote MRRU 1500
 Received sequence number 0x0
 Transmit sequence number 0x0
 Packet drops 0 (0 bytes)

```

```

Fragment drops 9 (1401 bytes)
MRRU exceeded 0
Fragment timeout 0

| <b>Output Fields</b>            | See the output field table for the <a href="#">show interfaces (Adaptive Services)</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Sample Output

### show interfaces extensive (Redundant Adaptive Services)

```
user@host> show interfaces rsp0 extensive
Physical interface: rsp0, Enabled, Physical link is Up
 Interface index: 150, SNMP ifIndex: 40, Generation: 44
 Type: Adaptive-Services, Link-level type: Adaptive-Services, MTU: 9192,
 Clocking: Unspecified, Speed: 800mbps
 Device flags : Present Running
 Interface flags: Point-To-Point SNMP-Traps Redundancy-Device 16384
 Link type : Full-Duplex
 Link flags : None
 Physical info : Unspecified
 Hold-times : Up 0 ms, Down 0 ms
 Current address: Unspecified, Hardware address: Unspecified
 Alternate link address: Unspecified
```

```
Last flapped : 2005-03-11 18:36:37 UTC (00:00:08 ago)
Statistics last cleared: Never
Traffic statistics:
 Input bytes : 0 0 bps
 Output bytes : 0 0 bps
 Input packets : 0 0 pps
 Output packets: 0 0 pps
Input errors:
 Errors: 0, Drops: 0, Framing errors: 0, Runts: 0, Giants: 0,
 Policed discards: 0, Resource errors: 0
Output errors:
 Carrier transitions: 0, Errors: 0, Drops: 0, MTU errors: 0,
 Resource errors: 0

Logical interface rsp0.0 (Index 68) (SNMP ifIndex 42) (Generation 30)
Flags: Point-To-Point SNMP-Traps Encapsulation: Adaptive-Services
Traffic statistics:
 Input bytes : 0
 Output bytes : 0
 Input packets : 0
 Output packets: 0
Local statistics:
 Input bytes : 0
 Output bytes : 0
 Input packets : 0
 Output packets: 0
Transit statistics:
 Input bytes : 0 0 bps
 Output bytes : 0 0 bps
 Input packets : 0 0 pps
 Output packets: 0 0 pps
Protocol inet, MTU: 9192, Generation: 37, Route table: 0
Flags: Receive-options, Receive-TTL-Exceeded
```

## show interfaces (Redundant Link Services IQ)

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Output Fields</b>            | <a href="#">Table 46 on page 1422</a> lists the output fields for the <b>show interfaces</b> (redundant link services IQ) command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Table 46: show interfaces (Redundant Link Services IQ) Output Fields

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                      | Level of Output       |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| <b>Physical Interface</b>      |                                                                                                                                                                                                                                                                                                                                                        |                       |
| <b>Physical interface</b>      | Name of the physical interface.                                                                                                                                                                                                                                                                                                                        | All levels            |
| <b>Enabled</b>                 | State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                   | All levels            |
| <b>Interface index</b>         | Physical interface's index number, which reflects its initialization sequence.                                                                                                                                                                                                                                                                         | detail extensive none |
| <b>SNMP ifIndex</b>            | SNMP index number for the physical interface.                                                                                                                                                                                                                                                                                                          | detail extensive none |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support.                                                                                                                                                                                                                                                                                           | detail extensive      |
| <b>Link-level type</b>         | Encapsulation being used on the physical interface:<br><b>Multilink-Frame-Relay-UNI-NNI</b> (default), <b>LinkService</b> , <b>Frame-relay</b> , <b>Frame-relay-ccc</b> , or <b>Frame-relay-tcc</b> .                                                                                                                                                  | All levels            |
| <b>MTU</b>                     | Maximum transmission unit size on the physical interface.                                                                                                                                                                                                                                                                                              | All levels            |
| <b>Device flags</b>            | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                     | All levels            |
| <b>Interface flags</b>         | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                        | All levels            |
| <b>Last flapped</b>            | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .                                                                                                   | detail extensive none |
| <b>Input rate</b>              | (Redundant LSQ) Rate of bits and packets received on the interface.                                                                                                                                                                                                                                                                                    | None specified        |
| <b>Output rate</b>             | (Redundant LSQ) Rate of bits and packets transmitted on the interface.                                                                                                                                                                                                                                                                                 | None specified        |
| <b>Statistics last cleared</b> | Time when the statistics for the interface were last set to zero.                                                                                                                                                                                                                                                                                      | detail extensive      |
| <b>Traffic statistics</b>      | Number and rate of bytes and packets received and transmitted on the physical interface. All references to traffic direction (input or output) are defined with respect to the router. Input fragments received by the router are assembled into input packets; output packets are segmented into output fragments for transmission out of the router. | detail extensive      |

Table 46: show interfaces (Redundant Link Services IQ) Output Fields (continued)

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Level of Output  |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Frame exceptions</b>     | <p>Information about framing exceptions. Includes events recorded under <b>Exception Events</b> for each logical interface.</p> <ul style="list-style-type: none"> <li>• <b>Oversized frames</b>—Number of frames received that exceed maximum frame length. Maximum length is 4500 Kb (kilobits).</li> <li>• <b>Errored input frames</b>—Number of input frame errors.</li> <li>• <b>Input on disabled link/bundle</b>—Number of frames received on disabled links. These frames can result either from an inconsistent configuration, or from a bundle or link being brought up or down with traffic actively flowing through it.</li> <li>• <b>Output for disabled link/bundle</b>—Number of frames sent for a disabled or unavailable link. These frames can result either from an inconsistent configuration, or from a bundle being brought up or down while traffic is flowing through it.</li> <li>• <b>Queuing drops</b>—Total number of packets dropped before traffic enters the link services IQ interface. Indicates that the interface is becoming oversubscribed.</li> </ul> | <b>extensive</b> |
| <b>Buffering exceptions</b> | <p>Information about buffering exceptions. Includes events recorded under <b>Exception Events</b> for each logical interface:</p> <ul style="list-style-type: none"> <li>• <b>Packet data buffer overflow</b>—Packet buffer memory is full. This overflow can occur when the aggregate data rate exceeds the physical link services IQ interface capacity.</li> <li>• <b>Fragment data buffer overflow</b>—Fragment buffer memory is full. This overflow can occur when excessive differential delay is experienced across the links within a single bundle, or when the aggregate data rate exceeds the physical link services IQ capacity. Check the logical interface exception event counters to determine which bundle is responsible.</li> </ul>                                                                                                                                                                                                                                                                                                                                      | <b>extensive</b> |

Table 46: show interfaces (Redundant Link Services IQ) Output Fields (continued)

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Level of Output              |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Assembly exceptions</b>      | <p>(Multilink Frame Relay end-to-end only) Information about assembly exceptions. Includes events recorded under <b>Exception Events</b> for each logical interface.</p> <p>An assembly exception does not necessarily indicate an operational problem with the physical link services IQ interface itself. If multilink-encapsulated traffic is dropped or reordered after a sequence number has been assigned, the interface records one or more exception events. The physical interface can drop multilink-encapsulated fragments itself as a result. Any multilink packets or fragments dropped by the interface itself result in packet or fragment drop counts on individual logical interfaces. If the logical interface drop counts are zero, but exception events are seen, the most likely cause is a problem with the individual link interfaces. Even if the logical interface fragment drop counts are nonzero, excess differential delay or traffic losses on individual interfaces can be the root cause.</p> <ul style="list-style-type: none"> <li>• <b>Fragment timeout</b>—The drop timer expired while a fragment sequence number was outstanding. Occurs only if the drop timer is enabled. This timeout can occur if the differential delay across the links in a bundle exceeds the drop-timer setting, or if a multilink packet is lost in transit while the drop timer is enabled. These events do not necessarily indicate any problem with the operation of the physical link services IQ interface itself, but can occur when one or more individual links drop traffic. Check the logical interface exception event counters to determine which bundle is responsible.</li> <li>• <b>Missing sequence number</b>—A gap was detected in the sequence numbers of fragments on a bundle. These events do not necessarily indicate any problem with the operation of the physical link services IQ interface itself, but can occur when one or more individual links drop traffic. Check the logical interface exception event counters to determine which bundle is responsible.</li> <li>• <b>Out-of-order sequence number</b>—Two frames with out-of-order sequence numbers within a single link. This event indicates that an individual link within a bundle reordered traffic, making the link services IQ interface unable to correctly process the resulting stream. Check the logical interface exception event counters to determine which bundle is responsible.</li> <li>• <b>Out-of-range sequence number</b>—Received a frame with an out-of-range sequence number. These events can occur when a large amount of multilink-encapsulated traffic is lost or the multilink peer is reset, so that a large jump in sequence numbers results. A small number of these events can occur when the far end of a bundle is taken down or brought up. Check the logical interface exception event counters to determine which bundle is responsible.</li> </ul> | <b>extensive</b>             |
| <b>Hardware errors (sticky)</b> | <p>(Multilink Frame Relay end-to-end only) Information about hardware errors:</p> <ul style="list-style-type: none"> <li>• <b>Data memory error</b>—A memory error was detected on the interface DRAM. Indicates possible hardware failure. Contact Juniper Networks technical support.</li> <li>• <b>Control memory error</b>—A memory error was detected on the interface DRAM. Indicates possible hardware failure. | <b>Flags</b>             | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels                   |
| <b>Encapsulation</b>     | Encapsulation being used: PPP or Multilink PPP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels                   |
| <b>Bandwidth</b>         | Speed at which the interface is running.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | All levels                   |
| <b>Bundle options</b>    | (Multilink Frame Relay end-to-end interfaces only) <ul style="list-style-type: none"> <li>• <b>MRRU</b>—Configured size of the maximum received reconstructed unit (MRRU): 1500 through 4500 bytes. The default is 1504 bytes.</li> <li>• <b>Drop timer period</b>—Drop timeout value to provide a recovery mechanism if individual links in link services bundle drop one or more packets: 0 through 2000 milliseconds. Values under 5 ms are not recommended. The default setting is 0, which disables the timer.</li> <li>• <b>Sequence number format</b>—Short sequence number header format (MLPPP only).</li> <li>• <b>Fragmentation threshold</b>—Configured fragmentation threshold: 64 through 16,320 bytes, in integer multiples of 64 bytes. The default setting is 0, which disables fragmentation.</li> <li>• <b>Links needed to sustain bundle</b>—Minimum number of links to sustain the bundle: 1 through 8.</li> <li>• <b>Multilink classes</b>—Number of multilink classes negotiated.</li> <li>• <b>Link layer overhead</b>—Percentage of bundle bandwidth to be set aside for link-layer overhead.</li> </ul> | <b>detail extensive none</b> |

Table 46: show interfaces (Redundant Link Services IQ) Output Fields (continued)

| Field Name                                                                        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Level of Output       |
|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| <b>Bundle status</b><br>(MLPPP) or<br><b>Multilink class status</b><br>(MC-MLPPP) | Information about bundle status: <ul style="list-style-type: none"> <li>• <b>Remote MRRU</b>—MRRU value received from remote peer. If negotiation has not been initiated, the default value is displayed.</li> <li>• <b>Received sequence number</b>—Sequence number for received packets.</li> <li>• <b>Transmitted sequence number</b>—Sequence number for transmitted packets.</li> <li>• <b>Packet drops</b>—Number and byte count of output packets that were dropped, rather than being encapsulated and sent out of the router as fragments. The packet drop counter is incremented if there is a temporary shortage of packet memory on the AS PIC, which causes packet fragmentation to fail.</li> <li>• <b>Fragment drops</b>—Number and byte count of input fragments that were dropped, rather than being reassembled and handled by the router as packets. This counter also includes fragments that have been received successfully but had to be dropped because not all fragments that constituted a packet had been received. The fragment drop counter is incremented when a fragment received on constituent links is dropped. Drop fragments can be triggered by sequence ordering errors, duplicate fragments, timed-out fragments, and bad multilink headers.</li> <li>• <b>MRRU exceeded</b>—Number of reassembled packets exceeding the MRRU. This counter is not implemented in this release.</li> <li>• <b>Fragment timeout</b>—The drop timer expired while a fragment sequence number was outstanding. Occurs only if the drop timer is enabled. This timeout can occur if the differential delay across the links in a bundle exceeds the drop-timer setting, or if a multilink packet is lost in transit while the drop timer is enabled.</li> <li>• <b>Missing sequence number</b>—A gap was detected in the sequence numbers of fragments on a bundle.</li> <li>• <b>Out-of-order sequence number</b>—Two frames with out-of-order sequence numbers within a single link. This event indicates that an individual link within a bundle reordered traffic, making the multilink interface unable to correctly process the resulting stream.</li> <li>• <b>Out-of-range sequence number</b>—Received a frame with an out-of-range sequence number. These events can occur when a large amount of multilink-encapsulated traffic is lost or the multilink peer is reset, so that a large jump in sequence numbers results. A small number of these events can occur when the far end of a bundle is taken down or brought up.</li> <li>• <b>Packet data buffer overflow</b>—Packet buffer memory is full. This overflow can occur when the aggregate data rate exceeds the physical link services IQ interface capacity.</li> <li>• <b>Fragment data buffer overflow</b>—Fragment buffer memory is full. This overflow can occur when excessive differential delay is experienced across the links within a single bundle, or when the aggregate data rate exceeds the physical link services IQ capacity.</li> </ul> | detail extensive none |

Table 46: show interfaces (Redundant Link Services IQ) Output Fields (continued)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Level of Output              |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Statistics</b>       | <p>Information about fragments and packets received and sent by the router. All references to traffic direction (input or output) are defined with respect to the router. Input fragments received by the router are assembled into input packets; output packets are segmented into output fragments for transmission out of the router. Each field has columns that indicate the number of frames received and transmitted, frames per second (fps), the number of bytes received and transmitted, and bits per second (bps).</p> <ul style="list-style-type: none"> <li>• <b>Bundle</b>—Information for each active bundle link. <ul style="list-style-type: none"> <li>• <b>Fragments: Input and Output</b>—Total number and rate of fragments received and transmitted.</li> <li>• <b>Packets: Input and Output</b>—Total number and rate of packets received and transmitted.</li> <li>• <b>Multilink class</b>—(MC-MLPPP only) Information about multiclass links used in the multilink operation.</li> </ul> </li> <li>• <b>Link</b>—Information about links used in the multilink operation. <ul style="list-style-type: none"> <li>• <b>Link name</b>—Interface name of the link services IQ channel and state information (physical link <b>up</b> or <b>down</b>).</li> <li>• <b>Input and Output</b>—Total number and rate of fragments and packets received and transmitted.</li> </ul> </li> </ul> | <b>detail extensive</b>      |

| <b>Bundle status</b><br>(MLPPP) | <p>Information about bundle status:</p> <ul style="list-style-type: none"> <li>• <b>Received sequence number</b>—Sequence number for received packets.</li> <li>• <b>Transmit sequence number</b>—Sequence number for transmitted packets.</li> <li>• <b>Packet drops</b>—Number and byte count of output packets that were dropped, rather than being encapsulated and sent out of the router as fragments. The packet drop counter is incremented if there is a temporary shortage of packet memory on the AS PIC, which causes packet fragmentation to fail.</li> <li>• <b>Fragment drops</b>—Number and byte count of input fragments that were dropped, rather than being reassembled and handled by the router as packets. This counter also includes fragments that have been received successfully but had to be dropped because not all fragments that constituted a packet had been received. The fragment drop counter is incremented when a fragment received on constituent links is dropped. Drop fragments can be triggered by sequence ordering errors, duplicate fragments, timed-out fragments, and bad multilink headers.</li> <li>• <b>MRRU exceeded</b>—Number of reassembled packets exceeding the MRRU. This counter is not implemented in this release.</li> <li>• <b>Fragment timeout</b>—The drop timer expired while a fragment sequence number was outstanding. Occurs only if the drop timer is enabled. This timeout can occur if the differential delay across the links in a bundle exceeds the drop-timer setting, or if a multilink packet is lost in transit while the drop timer is enabled.</li> <li>• <b>Missing sequence number</b>—A gap was detected in the sequence numbers of fragments on a bundle.</li> <li>• <b>Out-of-order sequence number</b>—Two frames with out-of-order sequence numbers occurred within a single link. This event indicates that an individual link within a bundle reordered traffic, making the multilink interface unable to correctly process the resulting stream.</li> <li>• <b>Out-of-range sequence number</b>—A frame was received with an out-of-range sequence number. These events can occur when a large amount of multilink-encapsulated traffic is lost or the multilink peer is reset, so that a large jump in sequence numbers results. A small number of these events can occur when the far end of a bundle is taken down or brought up.</li> <li>• <b>Packet data buffer overflow</b>—Packet buffer memory is full. This overflow can occur when the aggregate data rate exceeds the physical link services IQ interface capacity.</li> <li>• <b>Fragment data buffer overflow</b>—Fragment buffer memory is full. This overflow can occur when excessive differential delay is experienced across the links within a single bundle, or when the aggregate data rate exceeds the physical link services IQ capacity.</li> </ul> | detail extensive none |

Table 46: *show interfaces (Redundant Link Services IQ) Output Fields (continued)*

| Field Name                         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Level of Output              |

| <b>Broadcast</b>                   | Broadcast address on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive none</b> |

Table 46: show interfaces (Redundant Link Services IQ) Output Fields (continued)

| Field Name | Field Description                                            | Level of Output  |
|------------|--------------------------------------------------------------|------------------|
| Generation | Unique number for use by Juniper Networks technical support. | detail extensive |

## Sample Output

### show interfaces (Redundant Link Services IQ)

```

user@host> show interfaces rlsq0
Physical interface: rlsq0, Enabled, Physical link is Up
 Interface index: 196, SNMP ifIndex: 27
 Link-level type: LinkService, MTU: 1504
 Device flags : Present Running
 Interface flags: SNMP-Traps Internal: 0x4000
 Last flapped : Never
 Input rate : 0 bps (0 pps)
 Output rate : 0 bps (0 pps)

Logical interface rlsq0.0 (Index 72) (SNMP ifIndex 88)
 Flags: Point-To-Point SNMP-Traps 0x4000 Encapsulation: Multilink-PPP
 Bandwidth: 0
 Statistics
 Bundle:
 Fragments:
 Input : 3 0 255 0
 Output: 3 0 264 0
 Packets:
 Input : 3 0 252 0
 Output: 0 0 0 0
 Link:
 t1-1/3/0:1.0
 Input : 3 0 255 0
 Output: 0 0 0 0
 t1-1/3/0:2.0
 Input : 0 0 0 0
 Output: 3 0 264 0
 NCP state: inet: Opened, inet6: Not-configured, iso: Not-configured,
 mpls: Not-configured
 Protocol inet, MTU: 1500
 Flags: None
 Addresses, Flags: Is-Preferred Is-Primary
 Destination: 192.0.2.0/30, Local: 192.0.2.1

```

### show interfaces brief (Redundant Link Services IQ)

```

user@host> show interfaces rlsq0 brief
Physical interface: rlsq0, Enabled, Physical link is Up
 Link-level type: LinkService, MTU: 1504
 Device flags : Present Running
 Interface flags: SNMP-Traps Internal: 0x4000

Logical interface rlsq0.0
 Flags: Point-To-Point SNMP-Traps 0x4000 Encapsulation: Multilink-PPP
 inet 192.0.2.1/30

```

## show interfaces detail (Redundant Link Services IQ)

```

user@host> show interfaces rlsq0 detail
Physical interface: rlsq0, Enabled, Physical link is Up
 Interface index: 196, SNMP ifIndex: 27, Generation: 144
 Link-level type: LinkService, MTU: 1504
 Device flags : Present Running
 Interface flags: SNMP-Traps Internal: 0x4000
 Last flapped : Never
 Statistics last cleared: Never
 Traffic statistics:
 Input bytes : 252 0 bps
 Output bytes : 276 0 bps
 Input packets: 3 0 pps
 Output packets: 3 0 pps
 Frame exceptions:
 Oversized frames 0
 Errored input frames 0
 Input on disabled link/bundle 0
 Output for disabled link/bundle 0
 Queuing drops 0
 Buffering exceptions:
 Packet data buffer overflow 0
 Fragment data buffer overflow 0
 Assembly exceptions:
 Fragment timeout 0
 Missing sequence number 0
 Out-of-order sequence number 0
 Out-of-range sequence number 0
 Hardware errors (sticky):
 Data memory error 0
 Control memory error 0
 Egress queues: 8 supported, 4 in use
 Queue counters:

```

|                | Queued packets | Transmitted packets | Dropped packets |
|----------------|----------------|---------------------|-----------------|
| 0 be           | 0              | 0                   | 0               |

#### show interfaces extensive (Redundant Link Services IQ)

The output for the **show interfaces rlsq extensive** command is identical to that for the **show interfaces rlsq detail** command. For sample output, see [show interfaces detail \(Redundant Link Services IQ\)](#) on page 1433.

## show interfaces load-balancing (Aggregated Multiservices)

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## show interfaces redundancy

**Syntax** `show interfaces redundancy`  
`<brief | detail>`

**Release Information** Command introduced before Junos OS Release 7.4.  
**detail** option added in Junos OS Release 10.0.

**Description** (M Series, T Series, and MX Series routers only) Display general information about redundancy for aggregated multiservices (AMS) interfaces configured for warm standby, adaptive services and link services intelligent queuing (IQ) interfaces, aggregated Ethernet interfaces redundancy, and LNS aggregated inline service interfaces.

**NOTE:** When you run the `show interfaces redundancy` command on an MX80 router, it displays the error message, `error:the redundancy-interface-process subsystem is not running`. This is because an MX80 router does not have a redundant FPC and does not support link protection.

**Options** `brief | detail`—(Optional) Display the specified level of output.

**Required Privilege Level** view

**List of Sample Output** [show interfaces redundancy on page 1440](#)  
[show interfaces redundancy \(Aggregated Ethernet\) on page 1440](#)  
[show interfaces redundancy \(Aggregated Inline Service Interface\) on page 1440](#)  
[show interfaces redundancy detail on page 1440](#)

**Output Fields** [Table 48 on page 1439](#) lists the output fields for the `show interfaces redundancy` command. Output fields are listed in the approximate order in which they appear.

*Table 48: show interfaces redundancy Output Fields*

| Field Name       | Field Description                                                                                                                                                 | Level of Output |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Interface</b> | Name of the AMS interface, redundant adaptive services, link services IQ interfaces, aggregated Ethernet interfaces, or LNS aggregated inline service interfaces. | All levels      |
| <b>State</b>     | State of the redundant interface: <b>Not present</b> , <b>On primary</b> , <b>On secondary</b> , or <b>Waiting for primary MS PIC</b> .                           | All levels      |

Table 48: show interfaces redundancy Output Fields (continued)

| Field Name            | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Level of Output |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Last Change</b>    | Timestamp for the last change in status. This value resets after a master Routing Engine switchover event if any of the following conditions is met: <ul style="list-style-type: none"> <li>• GRES is not configured on the router.</li> <li>• The <b>rlsq</b> interface is configured without the <b>hot-standby</b> or <b>warm-standby</b> statements and the backup <b>lsq</b> interface was active before the switchover.</li> <li>• No logical interfaces are configured or all of the configured logical interfaces are down at the time of the switchover.</li> </ul> | All levels      |
| <b>Primary</b>        | Name of the interface configured to be the primary interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | All levels      |
| <b>Secondary</b>      | Name of the interface configured to be the backup interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels      |
| <b>Current Status</b> | Physical status of the primary and secondary interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels      |
| <b>Mode</b>           | Standby mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail</b>   |

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Level of Output   |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <b>Certificate identifier</b> | Name of the digital certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                                    | All levels        |
| <b>Certificate version</b>    | Revision number of the digital certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail</b>     |
| <b>Serial number</b>          | Unique serial number of the digital certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail</b>     |
| <b>Issued by</b>              | Authority that issued the digital certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>none brief</b> |
| <b>Issued to</b>              | Device that was issued the digital certificate.                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>none brief</b> |
| <b>Issuer</b>                 | <p>Authority that issued the digital certificate, including details of the authority organized using the distinguished name format. Possible subfields are:</p> <ul style="list-style-type: none"> <li>• <b>Common name</b>—Name of the authority.</li> <li>• <b>Organization</b>—Organization of origin.</li> <li>• <b>Organizational unit</b>—Department within an organization.</li> <li>• <b>State</b>—State of origin.</li> <li>• <b>Country</b>—Country of origin.</li> </ul> | <b>detail</b>     |

Table 49: *show security pki ca-certificate Output Fields (continued)*

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Subject</b>              | Details of the digital certificate holder organized using the distinguished name format. Possible subfields are: <ul style="list-style-type: none"> <li>• <b>Common name</b>—Name of the requestor.</li> <li>• <b>Organization</b>—Organization of origin.</li> <li>• <b>Organizational unit</b>—Department within an organization.</li> <li>• <b>State</b>—State of origin.</li> <li>• <b>Country</b>—Country of origin.</li> </ul> | <b>detail</b>   |
| <b>Validity</b>             | Time period when the digital certificate is valid. Values are: <ul style="list-style-type: none"> <li>• <b>Not before</b>—Start time when the digital certificate becomes valid.</li> <li>• <b>Not after</b>—End time when the digital certificate becomes invalid.</li> </ul>                                                                                                                                                       | All levels      |
| <b>Public key algorithm</b> | Encryption algorithm used with the private key, such as <b>rsaEncryption(1024 bits)</b> .                                                                                                                                                                                                                                                                                                                                            | All levels      |
| <b>Signature algorithm</b>  | Encryption algorithm that the CA used to sign the digital certificate, such as <b>sha1WithRSAEncryption</b> .                                                                                                                                                                                                                                                                                                                        | <b>detail</b>   |
| <b>Fingerprint</b>          | Secure Hash Algorithm (SHA1) and Message Digest 5 (MD5) hashes used to identify the digital certificate.                                                                                                                                                                                                                                                                                                                             | <b>detail</b>   |
| <b>Distribution CRL</b>     | Distinguished name information and the URL for the certificate revocation list (CRL) server.                                                                                                                                                                                                                                                                                                                                         | <b>detail</b>   |
| <b>Use for key</b>          | Use of the public key, such as <b>Certificate signing</b> , <b>CRL signing</b> , <b>Digital signature</b> , or <b>Key encipherment</b> .                                                                                                                                                                                                                                                                                             | <b>detail</b>   |

## Sample Output

### show security pki ca-certificate

```

user@host> show security pki ca-certificate
Certificate identifier: abc
 Issued to: example, Issued by: example
 Validity:
 Not before: 2005 Oct 18th, 23:54:22 GMT
 Not after: 2025 Oct 19th, 00:24:22 GMT
 Public key algorithm: rsaEncryption(1024 bits)

Certificate identifier: entrust
 Issued to: First Officer, Issued by: example
 Validity:
 Not before: 2005 Oct 18th, 23:55:59 GMT
 Not after: 2008 Oct 19th, 00:25:59 GMT
 Public key algorithm: rsaEncryption(1024 bits)

Certificate identifier:abe
 Issued to: First Officer, Issued by: example
 Validity:

```

```

Not before: 2005 Oct 18th, 23:55:59 GMT
Not after: 2008 Oct 19th, 00:25:59 GMT
Public key algorithm: rsaEncryption(1024 bits)

```

### show security pki ca-certificate detail

```

Output fields are listed in the approximate order in which they appear.                                                                                                                                   |

*Table 50: show security pki certificate-request Output Fields*

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                           | Level of Output   |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <b>Certificate identifier</b> | Name of the digital certificate.                                                                                                                                                                                                                                                                                                                                                                                                            | All levels        |
| <b>Certificate version</b>    | Revision number of the digital certificate.                                                                                                                                                                                                                                                                                                                                                                                                 | <b>detail</b>     |
| <b>Issued to</b>              | Device that was issued the digital certificate.                                                                                                                                                                                                                                                                                                                                                                                             | <b>none brief</b> |
| <b>Subject</b>                | <p>Details of the digital certificate holder organized using the distinguished name format. Possible subfields are:</p> <ul style="list-style-type: none"> <li>• <b>Common name</b>—Name of the authority.</li> <li>• <b>Organization</b>—Organization of origin.</li> <li>• <b>Organizational unit</b>—Department within an organization.</li> <li>• <b>State</b>—State of origin.</li> <li>• <b>Country</b>—Country of origin.</li> </ul> | <b>detail</b>     |

Table 50: show security pki certificate-request Output Fields (continued)

| Field Name                     | Field Description                                                                                                                                                                                                                                                        | Level of Output |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Alternate subject              | Domain name or IP address of the device related to the digital certificate.                                                                                                                                                                                              | detail          |
| Validity                       | Time period when the digital certificate is valid. Values are: <ul style="list-style-type: none"> <li>• <b>Not before</b>—Time when the digital certificate becomes valid.</li> <li>• <b>Not after</b>—End time when the digital certificate becomes invalid.</li> </ul> | All levels      |
| Public key algorithm           | Encryption algorithm used with the private key, such as <b>rsaEncryption(1024 bits)</b> .                                                                                                                                                                                | All levels      |
| Public key verification status | Public key verification status: <b>Failed</b> or <b>Passed</b> . The <b>detail</b> output also provides the verification hash.                                                                                                                                           | All levels      |
| Fingerprint                    | Secure Hash Algorithm (SHA1) and Message Digest 5 (MD5) hashes used to identify the digital certificate.                                                                                                                                                                 | detail          |
| Use for key                    | Use of the public key, such as <b>Certificate signing</b> , <b>CRL signing</b> , <b>Digital signature</b> , or <b>Key encipherment</b> .                                                                                                                                 | detail          |

## Sample Output

### show security pki certificate-request

```

user@host> show security pki certificate-request
Certificate identifier: local-microsoft-2
Issued to: router2.example.com
Public key algorithm: rsaEncryption(1024 bits)
Public key verification status: Passed

```

### show security pki certificate-request detail

```

user@host> show security pki certificate-request detail
Certificate identifier: local-entrust3
Certificate version: 3
Subject:
 Common name: router3.example.com
 Alternate subject: router3.example.com
 Public key algorithm: rsaEncryption(1024 bits)
 Public key verification status: Passed

| <b>Subject</b>                        | Details of the digital certificate holder organized using the distinguished name format. Possible subfields are: <ul style="list-style-type: none"> <li>• <b>Common name</b>—Name of the authority.</li> <li>• <b>Organization</b>—Organization of origin.</li> <li>• <b>Organizational unit</b>—Department within an organization.</li> <li>• <b>State</b>—State of origin.</li> <li>• <b>Country</b>—Country of origin.</li> </ul>                                         | <b>detail</b>   |
| <b>Alternate subject</b>              | Domain name or IP address of the device related to the digital certificate.                                                                                                                                                                                                                                                                                                                                                                                                  | <b>detail</b>   |
| <b>Validity</b>                       | Time period when the digital certificate is valid. Values are: <ul style="list-style-type: none"> <li>• <b>Not before</b>—Start time when the digital certificate becomes valid.</li> <li>• <b>Not after</b>—End time when the digital certificate becomes invalid.</li> </ul>                                                                                                                                                                                               | All levels      |
| <b>Public key algorithm</b>           | Encryption algorithm used with the private key, such as <b>rsaEncryption (1024 bits)</b> .                                                                                                                                                                                                                                                                                                                                                                                   | All levels      |
| <b>Public key verification status</b> | Public key verification status: <b>Failed</b> or <b>Passed</b> . The <b>detail</b> output also provides the verification hash.                                                                                                                                                                                                                                                                                                                                               | All levels      |
| <b>Signature algorithm</b>            | Encryption algorithm that the CA used to sign the digital certificate, such as <b>sha1WithRSAEncryption</b> .                                                                                                                                                                                                                                                                                                                                                                | <b>detail</b>   |
| <b>Fingerprint</b>                    | Secure Hash Algorithm (SHA1) and Message Digest 5 (MD5) hashes used to identify the digital certificate.                                                                                                                                                                                                                                                                                                                                                                     | <b>detail</b>   |
| <b>Distribution CRL</b>               | Distinguished name information and URL for the certificate revocation list (CRL) server.                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail</b>   |
| <b>Use for key</b>                    | Use of the public key, such as <b>Certificate signing</b> , <b>CRL signing</b> , <b>Digital signature</b> , or <b>Key encipherment</b> .                                                                                                                                                                                                                                                                                                                                     | <b>detail</b>   |

## Sample Output

### show security pki local-certificate

```
user@host> show security pki local-certificate
```

```

Certificate identifier: local-entrust2
Issued to: router2.example.com, Issued by: juniper
Validity:
 Not before: 2005 Nov 21st, 23:28:22 GMT
 Not after: 2008 Nov 21st, 23:58:22 GMT
Public key algorithm: rsaEncryption(1024 bits)
Public key verification status: Passed

```

### show security pki local-certificate detail

```

user@host> show security pki local-certificate detail
Certificate identifier: local-entrust3
Certificate version: 3
Serial number: 4355 94f9
Issuer:
 Organization: juniper, Country: us
Subject:
 Organization: juniper, Country: us, Common name: router3.example.com
Alternate subject: router3.example.com
Validity:
 Not before: 2005 Nov 21st, 23:33:58 GMT
 Not after: 2008 Nov 22nd, 00:03:58 GMT
Public key algorithm: rsaEncryption(1024 bits)
Public key verification status: Passed

## show services alg conversations

---

**Syntax**    show services alg conversations  
              <brief >  
              <application-protocol *protocol*>  
              <extensive>  
              <interface *interface-name*>

**Release Information**    Command introduced in Junos OS Release 10.4.  
                              **h323** option introduced in Junos OS Release 17.1.  
                              **ike-esp-nat** option introduced in Junos OS Release 17.1.

**Description**    Display ALG information for Junos OS extension-provider packages.

**NOTE:** In Junos OS releases earlier than 12.3, the extension-provider packages were variously referred to as Junos Services Framework (JSF), MP-SDK, and eJunos.

**Options**    **none**—Display standard information about all Junos OS extension-provider packages ALG sessions.

**brief** —(Optional) Display the specified level of output.

**application-protocol**—(Optional) Display information about one of the following application protocols:

**dce-rpc**—Distributed Computing Environment-Remote Procedure Call protocols

**dce-rpc-portmap**—Distributed Computing Environment-Remote Procedure Call protocols portmap service

**dns**—Domain Name System protocol

**ftp**—File Transfer Protocol

**h323**—H323 protocol

**ike-esp-nat**—IKE ALG

**pptp**—Point-to-Point Tunneling Protocol

**rpc**—Remote Procedure Call protocol

**rpc-portmap**—Remote Procedure Call protocol portmap service

**rtsp**—Real-Time Streaming Protocol

**rsh**—Remote Shell

**sip**—Session Initiation Protocol

**sql**—SQLNet

**talk**—Talk Program

**extensive**—Display extensive information

**interface *interface-name***—(Optional) Display information about a particular interface.

**Required Privilege Level** view

[show services alg conversations extensive on page 1456](#)  
[show services alg conversations application-protocol on page 1457](#)  
[show services alg conversations interface on page 1459](#)

**Output Fields** [Table 53 on page 1455](#) lists the output fields for the **show services alg conversations** command. Output fields are listed in the approximate order in which they appear.

*Table 53: show services alg conversations Output Fields*

| Field Name                     | Field Description                                                                                                        |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b>               | Name of the interface.                                                                                                   |
| <b>ALG</b>                     | Name of the ALG in use.                                                                                                  |
| <b>Number of conversations</b> | Number of ALG conversations open. A conversation is a group of parent and child sessions.                                |
| <b>Group ID</b>                | Numeric identifier for the session.                                                                                      |
| <b>Parent session status</b>   | Status of the parent session: <ul style="list-style-type: none"> <li>• <b>Active</b></li> <li>• <b>Closed</b></li> </ul> |
| <b>Parent session ID</b>       | Numeric identifier for the parent session.                                                                               |
| <b>Protocol</b>                | Protocol used for the parent session.                                                                                    |
| <b>Forward Flow</b>            | The source and destination prefixes for forward flow.                                                                    |
| <b>Reverse Flow</b>            | The source and destination prefixes for reverse flow.                                                                    |

Table 53: *show services alg conversations* Output Fields (continued)

| Field Name           | Field Description                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------|
| Child session status | Status of the child session: <ul style="list-style-type: none"> <li>• Active</li> <li>• Closed</li> </ul> |
| Child session ID     | Numeric identifier for the child session.                                                                 |
| Number of Resources  | Total number of active child sessions associated with the parent session.                                 |
| Resource ID          | Numeric identifier for the resources associated with the parent session.                                  |
| Protocol             | Protocol used for the child session.                                                                      |

## Sample Output

### show services alg conversations

```

user@host> show services alg conversations
Interface name: ms-2/1/0
ALG : SQLV2 ALG, State : active
Number of conversations: 1
Parent session status: closed
Child session : 1, protocol: TCP
Forward Flow : {10.50.50.2:37244 -> 10.40.40.10:4334}
Reverse Flow : {10.40.40.10:4334 -> 10.11.11.10:37244}

```

### show services alg conversations brief

The output for the **show services alg conversations brief** command is identical to that for the **show services alg conversations** command. For sample output, see [show services alg conversations on page 1456](#).

### show services alg conversations extensive

```

user@router> show services alg conversations extensive
Interface name: ms-1/0/0
ALG : H323 ALG, State : active
Number of conversations: 1
Group ID : 3499913712, State : active
Parent session state: active
Parent session ID: 33554433, protocol : TCP
Forward Flow : {198.51.100.2:30000 -> 192.0.2.2:1720}
Reverse Flow : {192.0.2.2:1720 -> 203.0.113.1:57730}
Number of resources: 4
Resource ID: 3499927656, State: active
Number of sessions: 1
Child session ID: 33554436, protocol : UDP
Forward Flow : {198.51.100.2:5086 -> 192.0.2.2:5090}
Reverse Flow : {192.0.2.2:5090 -> 203.0.113.3:55916}
Resource ID: 3499927376, State: active

```

```

Number of sessions: 1
Child session ID: 67108867, protocol : UDP
Forward Flow : {192.0.2:5091 -> 203.0.113.3:55917}
Reverse Flow : {198.51.100.2:5087 -> 192.0.2.2:5091}
Resource ID: 3499926816, State: active
Number of sessions: 1
Child session ID: 33554438, protocol : UDP
Forward Flow : {198.51.100.2:5089 -> 192.0.2.2:5093}
Reverse Flow : {192.0.2.2:5093 -> 203.0.113.2:63435}
Resource ID: 3499926536, State: active
Number of sessions: 1
Child session ID: 33554437, protocol : UDP
Forward Flow : {198.51.100.2:5088 -> 192.0.2.2:5092}
Reverse Flow : {192.0.2.2:5092 -> 203.0.113.2:63434}
ALG : RAS ALG, State : active
Number of conversations: 1
Group ID : 799037592, State : active
Parent session state: closed
Number of resources: 0

```

### show services alg conversations application-protocol

This command has the same output for the rpc, dce-rpc, rpc-portmap and dce-rpc-portmap ALGs.

```

user@router> show services alg conversations application-protocol rpc
Interface name: ms-1/1/0
ALG : SUNRPC ALG, State : active
 Number of conversations: 2
 Parent session status: closed
 Child session : 1, protocol: UDP
 Forward Flow : {192.168.203.198:1019 -> 192.168.203.194:2049}
 Reverse Flow : {192.168.203.194:2049 -> 192.168.203.198:1019}
 Child session : 2, protocol: UDP
 Forward Flow : {192.168.203.198:36595 -> 192.168.203.194:2049}
 Reverse Flow : {192.168.203.194:2049 -> 192.168.203.198:36595}
 Parent session status: closed
 Child session : 1, protocol: UDP
 Forward Flow : {192.168.203.198:954 -> 192.168.203.194:613}
 Reverse Flow : {192.168.203.194:613 -> 192.168.203.198:954}
 Child session : 2, protocol: UDP
 Forward Flow : {192.168.203.198:53836 -> 192.168.203.194:613}
 Reverse Flow : {192.168.203.194:613 -> 192.168.203.198:53836}

```

```

user@router> show services alg conversations application-protocol dns
Interface name: ms-1/1/0
ALG : DNS ALG, State : active
 Number of conversations: 1
 Parent session status: closed
 Child session : 1, protocol: UDP
 Forward Flow : {192.168.203.198:1019 -> 192.168.203.194:2049}
 Reverse Flow : {192.168.203.194:2049 -> 192.168.203.198:1019}

```

```

user@router> show services alg conversations application-protocol ftp
Interface name: ms-1/1/0
ALG : DNS ALG, State : active
 Number of conversations: 1
 Parent session status: closed
 Child session : 1, protocol: UDP

```

```

## show services alg statistics

---

**Syntax**    `show services alg statistics`  
              `<application-protocol protocol>`  
              `<interface interface-name>`

**Release Information**    Command introduced in Junos OS Release 10.4.  
                              **h323** option introduced in Junos OS Release 17.1.  
                              **ike-esp-nat** option introduced in Junos OS Release 17.1.

**Description**    Display ALG statistics for Junos OS extension-provider packages.

**NOTE:** In Junos OS releases earlier than 12.3, the extension-provider packages were variously referred to as Junos Services Framework (JSF), MP-SDK, and eJunos.

---

**Options**    **application-protocol**—(Optional) Display statistics for one of the following application protocols:

**dce-rpc**—Distributed Computing Environment-Remote Procedure Call protocols

**dce-rpc-portmap**—Distributed Computing Environment-Remote Procedure Call protocols portmap service

**dns**—Domain Name System protocol

**ftp**—File Transfer Protocol

**h323**—H323 protocol

**ike-esp-nat**—IKE ALG

**pptp**—Point-to-Point Tunneling Protocol

**rpc**—Remote Procedure Call protocol

**rpc-portmap**—Remote Procedure Call protocol portmap service

**rtsp**—Real-Time Streaming Protocol

**rsh**—Remote Shell

**sip**—Session Initiation Protocol

**sql**—SQLNet

**talk**—Talk Program

**tftp**—Trivial File Transfer Protocol

**interface *interface-name***—(Optional) Display information about a particular interface.

**Required Privilege Level** view

**List of Sample Output** [show services alg statistics application-protocol on page 1468](#)  
[show services alg statistics interface on page 1471](#)

**Output Fields** [Table 54 on page 1461](#) lists the output fields for the **show services alg statistics** command. Output fields are listed in the approximate order in which they appear.

*Table 54: show services alg statistics Output Fields*

| Field Name                 | Field Description                                       |
|----------------------------|---------------------------------------------------------|
| Interface                  | Name of the interface.                                  |
| ALG statistics             | Name of the ALG for which the statistics are displayed. |
| Packets with wrong header  | Number of packets with wrong header.                    |
| Non epm 3.0 packets        | Number of non epm 3.0 packets.                          |
| Packets with type mismatch | Number of packets with type mismatch.                   |
| Packets with id mismatch   | Number of packets with id mismatch.                     |
| Packets with call mismatch | Number of packets with call mismatch.                   |
| Packets fragmented         | Number of packets fragmented.                           |
| Packets queued             | Number of packets queued.                               |
| Packets dropped            | Number of packets dropped.                              |
| Packets released           | Number of packets released.                             |
| Invalid packets received   | Number of invalid packets received.                     |
| Reply packets received     | Number of reply packets received.                       |
| Oversized packets received | Number of oversized packets received.                   |

Table 54: show services alg statistics Output Fields (continued)

| Field Name                   | Field Description                                                                   |
|------------------------------|-------------------------------------------------------------------------------------|
| ALG parser errors            | Number of parsing failed errors.                                                    |
| Packets translated           | Number of packets translated.                                                       |
| H323 total calls             | Total number of audio/video calls that have been established.                       |
| H323 active calls            | Current number of active H.323 calls.                                               |
| H323 gate install failed     | Number of gate installation failures for child sessions.                            |
| H323 pinhole opened too late | Number of H323 parent sessions that released the resources before pinhole creation. |
| H323 pinhole hit dropped     | Number of H323 gate hits that have been dropped.                                    |
| H323 gate timeout failed     | Number of gate timeout failures due to an error.                                    |
| H323 packets dropped         | Number of packets dropped.                                                          |
| H323 get virtual ctx failed  | Number of failures to get the session virtualization ctx information.               |
| H323 obj alloc failed        | Number of memory allocation failures for H323 session cookie.                       |
| H323 group alloc failed      | Number of H323 session resource/group memory allocation failures.                   |
| H323 ce alloc failed         | Number of H323 session call entity object memory allocation failures.               |
| H323 Q931 decode error       | Number of errors in decoding Q931 packets.                                          |
| H323 H245 decode error       | Number of errors in decoding H245 packets.                                          |
| H323 Q931 process error      | Number of errors in processing Q931 packets.                                        |
| H323 H245 process error      | Number of errors in processing H245 packets.                                        |
| H323 do nat failed           | Number of NAT translation failures after packet decode.                             |
| H323 do rm failed            | Number of H323 vsip table creation failures.                                        |

Table 54: show services alg statistics Output Fields (continued)

| Field Name                        | Field Description                                                                         |
|-----------------------------------|-------------------------------------------------------------------------------------------|
| H323 dscp marked                  | Number of Differentiated Services code point (DSCP) packets marked.                       |
| H323 dscp marked error            | Number of Differentiated Services code point (DSCP) packets marked as errors.             |
| RAS obj alloc failed              | Number of RAS session object memory allocation failures.                                  |
| RAS group alloc failed            | Number of RAS session group memory allocation failures.                                   |
| RAS packets dropped               | Number of RAS packets dropped.                                                            |
| RAS packet exists in cookie error | Number of times that some packets exist in existing RAS sessions cookie.                  |
| RAS decode error                  | Number of errors in decoding RAS packets.                                                 |
| RAS flood error                   | Number of gatekeeper requests that were dropped because of too many RAS request messages. |
| RAS do nat failed                 | Number of RAS session payload IP translation errors.                                      |
| PPTP Objects Active               | Number of PPTP objects active.                                                            |
| PPTP Objects Total                | Number of PPTP objects in total.                                                          |
| PPTP Objects Error                | Number of PPTP objects having errors.                                                     |
| PPTP ASL Group Active             | Number of PPTP groups active.                                                             |
| PPTP ASL Group Total              | Number of PPTP groups in total.                                                           |
| PPTP ASL Group Error              | Number of PPTP groups having errors.                                                      |
| PPTP Packets received             | Number of PPTP packets received.                                                          |
| PPTP Packets Discarded            | Number of PPTP packets discarded.                                                         |
| PPTP Packets Free                 | Number of PPTP packets freed.                                                             |
| PPTP OCRQ Received                | Number of Outgoing Call Requests received.                                                |

*Table 54: show services alg statistics Output Fields (continued)*

| Field Name                      | Field Description                                    |
|---------------------------------|------------------------------------------------------|
| <b>PPTP OCRQ Discarded</b>      | Number of Outgoing Call Requests discarded.          |
| <b>PPTP OCRP Received</b>       | Number of Outgoing Call Packets received.            |
| <b>PPTP OCRP Discarded</b>      | Number of Outgoing Call Packets discarded.           |
| <b>PPTP WEN(SLI) Received</b>   | Number of WEN (SLI) packets received.                |
| <b>PPTP WEN(SLI) Discarded</b>  | Number of WEN (SLI) packets discarded.               |
| <b>PPTP CCRQ-CDSN Received</b>  | Number of Call Clear Requests received.              |
| <b>PPTP CDSN Received</b>       | Number of Call Disconnection Notifications received. |
| <b>PPTP CCRQ-CDSN Discarded</b> | Number of Call Clear Requests discarded.             |
| <b>PPTP Session Create</b>      | Number of PPTP sessions created.                     |
| <b>PPTP Session Destroy</b>     | Number of PPTP sessions destroyed.                   |
| <b>PPTP Gate Create</b>         | Number of PPTP gates created.                        |
| <b>PPTP Gate Hit</b>            | Number of PPTP gates hit.                            |
| <b>PPTP Gate Timeout</b>        | Number of PPTP gates timed out.                      |
| <b>PPTP NAT Events</b>          | Number of NAT events.                                |
| <b>PPTP DO-NAT Total</b>        | Number of DO NATs in total.                          |
| <b>PPTP DO-NAT Ok</b>           | Number of DO NATs okay.                              |
| <b>PPTP DO-NAT Pending</b>      | Number of DO NATs pending.                           |
| <b>PPTP DO-NAT Fail</b>         | Number of DO NATs failed.                            |
| <b>PPTP DO-RM Total</b>         | Number of DO RMs in total.                           |

Table 54: show services alg statistics Output Fields (continued)

| Field Name                    | Field Description                       |
|-------------------------------|-----------------------------------------|
| PPTP DO-RM Ok                 | Number of DO RMs okay.                  |
| PPTP DO-RM Pending            | Number of DO RMs pending.               |
| PPTP DO-RM Fail               | Number of DO RMs failed.                |
| PPTP NAT-ASYNC Total          | Number of NAT-ASYNCs in total.          |
| PPTP NAT-ASYNC Invalid        | Number of NAT-ASYNCs invalid.           |
| PPTP NAT-ASYNC Error1         | Number of NAT-ASYNCs error1.            |
| PPTP NAT-ASYNC Error2         | Number of NAT-ASYNCs error2.            |
| PPTP ASL Hole Ok              | Number of ASYNC holes okay.             |
| PPTP ASL Hole Error           | Number of ASYNC hole errors.            |
| PPTP ASL First Hit            | Number of ASYNC holes first hit.        |
| PPTP ASL Hole Timeout         | Number of ASYNC holes timed out.        |
| PPTP ASL Invalid              | Number of ASYNC holes invalid.          |
| PPTP NAT Ctx Free             | Number of NAT Ctxs free.                |
| PPTP Create Resource Error    | Number of create resource errors.       |
| PPTP set S2C hole error       | Number of server-to-client hole errors. |
| PPTP set C2S hole error       | Number of client-to-server hole errors. |
| PPTP Inbrk error              | Number of PPTP Inbrk errors.            |
| PPTP Mpool Create Error       | Number of Mpool create errors.          |
| PPTP RM register client Error | Number of client registration errors.   |

*Table 54: show services alg statistics Output Fields (continued)*

| Field Name                           | Field Description                                                   |
|--------------------------------------|---------------------------------------------------------------------|
| Call packet with rpcbind2            | Number of call packets with rpcbind2.                               |
| Call packet with rpcbind3            | Number of call packets with rpcbind3.                               |
| Call packet with rpcbind4            | Number of call packets with rpcbind4.                               |
| Invalid rpcbind call                 | Number of invalid rpcbind calls.                                    |
| Reply packet with rpcbind2           | Number of reply packets with rpcbind2.                              |
| Reply packet with rpcbind3           | Number of reply packets with rpcbind3.                              |
| Reply packet with rpcbind4           | Number of reply packets with rpcbind4.                              |
| Invalid rpcbind reply                | Number of invalid rpcbind replies.                                  |
| Packets exceeded maximum length      | Number of packets exceeding maximum length.                         |
| Packets dropped by ALG               | Number of packets dropped by the ALG.                               |
| Number of describe messages received | Number of describe messages received.                               |
| Number of setup messages received    | Number of setup messages received.                                  |
| Number of teardown messages received | Number of teardown messages received.                               |
| Total packets dropped                | Total number of SIP packets dropped.                                |
| Unexpected requests dropped          | Number of unexpected requests dropped.                              |
| Unexpected responses dropped         | Number of unexpected responses dropped.                             |
| Packets DSCP marked                  | Number of Differentiated Services code point (DSCP) packets marked. |

*Table 54: show services alg statistics Output Fields (continued)*

| Field Name                                     | Field Description                                                            |
|------------------------------------------------|------------------------------------------------------------------------------|
| <b>Packets DSCP marked error</b>               | Number of Differentiated Services code point (DSCP) packets marked as error. |
| <b>NAT errors</b>                              | Number of Network Address Translation errors.                                |
| <b>RR headers exceeded maximum limits</b>      | Number of RR headers exceeded maximum limits.                                |
| <b>Contact headers exceeded maximum limits</b> | Number of contact headers exceeded maximum limits.                           |
| <b>Invite dropped due to call limit</b>        | Number of invites dropped due to call limit.                                 |
| <b>Messages not processed by sip stack</b>     | Number of messages not processed by sip stack.                               |
| <b>Unknown packets dropped</b>                 | Number of unknown packets dropped.                                           |
| <b>Decoding Errors</b>                         | Number of decoding errors.                                                   |
| <b>Packets received in out of state</b>        | Number of packets received in out of state.                                  |
| <b>Packets received</b>                        | Number of packets received.                                                  |
| <b>Packets freed by ALG</b>                    | Number of packets freed by ALG.                                              |
| <b>Gate fail errors</b>                        | Number of gate fail errors.                                                  |
| <b>Lookup packets</b>                          | Number of lookup packets.                                                    |
| <b>Announce packets</b>                        | Number of announce packets.                                                  |
| <b>Delete packets</b>                          | Number of delete packets.                                                    |
| <b>Number of packets received</b>              | Number of packets received.                                                  |
| <b>Number of Invalid packets</b>               | Number of invalid packets.                                                   |
| <b>Total number of sessions</b>                | Total number of sessions.                                                    |

Table 54: show services alg statistics Output Fields (continued)

| Field Name                | Field Description          |
|---------------------------|----------------------------|
| Number of active sessions | Number of active sessions. |

## Sample Output

### show services alg statistics application-protocol

While the statistics are the same for dce-rpc and dce-rpc-portmap, both rpc and rpc-portmap have the same output too.

```
user@router> show services alg statistics application-protocol dce-rpc
Interface name: ms-1/1/0
```

```
DCE-RPC ALG statistics:
 Packets with wrong header : 0
 Non epm 3.0 packets : 0
 Packets with type mismatch: 0
 Packets with id mismatch : 0
 Packets with call mismatch: 0
 Packets fragmented : 0
 Packets queued : 0
 Packets dropped : 0
 Packets released : 0
```

```
user@router> show services alg statistics application-protocol dns
Interface name: ms-2/0/0
```

```
DNS ALG statistics:
 Invalid packets received : 0
 Reply packets received : 3509
 Oversized packets received : 0
```

```
user@router> show services alg statistics application-protocol ftp
Interface name: ms-1/1/0
```

```
FTP ALG statistics:
 Packets dropped : 0
 ALG parser errors : 0
 Packets translated : 0
```

```
user@router> show services alg conversations application-protocol h323
Interface name: ms-1/0/0
```

```
H323 ALG statistics:
 H323 total calls: 1
 H323 active calls: 1
 H323 gate install failed: 0
 H323 pinhole opened too late: 0
 H323 pinhole hit dropped: 0
 H323 gate timeout failed: 0
 H323 packets dropped: 0
 H323 get virtual ctx failed: 0
 H323 obj alloc failed: 0
 H323 group alloc failed: 0
 H323 ce alloc failed: 0
 H323 Q931 decode error: 0
 H323 H245 decode error: 0
 H323 Q931 process error: 0
 H323 H245 process error: 0

```

## show services cos statistics

**Syntax** show services cos statistics  
 <brief | detail | extensive>  
 <diffserv | forwarding-class>  
 <interface *interface-name*>  
 <service-set *service-set-name*>  
 <summary>

**Release Information** Command introduced in Junos OS Release 8.1.

**Description** Display the mapping of class-of-service (CoS) code point aliases to corresponding bit patterns and the mapping of forwarding class names to queue numbers as configured in CoS services for the Multiservices PIC, MS-MIC, or MS-MPC.

**Options** **none**—Display all services CoS statistics.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**diffserv | forwarding-class**—(Optional) Display only the selected information, either DiffServ codepoints or forwarding classes.

**interface *interface-name***—(Optional) Display statistics for the specified interface only.

**service-set *service-set-name***—(Optional) Display statistics for the specified service set only.

**summary**—(Optional) Display summary of statistics on a per-interface basis.

**Required Privilege Level** view

**List of Sample Output** [show services cos statistics on page 1473](#)  
[show services cos statistics brief on page 1474](#)  
[show services cos statistics detail on page 1474](#)  
[show services cos statistics extensive on page 1474](#)

**Output Fields** [Table 55 on page 1472](#) describes the output fields for the **show services cos statistics** command. Output fields are listed in the approximate order in which they appear.

*Table 55: show services cos statistics Output Fields*

| Field Name  | Field Description                | Level of Output |
|-------------|----------------------------------|-----------------|
| Interface   | Name of interface.               | All levels      |
| Service set | Name of service set.             | All levels      |
| DSCP        | DiffServ code point bit pattern. | All levels      |

Table 55: show services cos statistics Output Fields (continued)

| Field Name              | Field Description              | Level of Output |
|-------------------------|--------------------------------|-----------------|
| <b>Packets in</b>       | Number of packets received.    | All levels      |
| <b>Packets out</b>      | Number of packets transmitted. | All levels      |
| <b>Forwarding class</b> | Forwarding class queue number. | All levels      |

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                  |

*Table 56: show services crtp Output Fields*

| Field Name                                 | Field Description                                                                                                                                                                                                                             |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b>                           | Name of the physical interface.                                                                                                                                                                                                               |
| <b>Port minimum</b><br><b>Port maximum</b> | Compression is applied to UDP packets with even ports in the specified range.                                                                                                                                                                 |
| <b>Maximum UDP compressed sessions</b>     | Maximum value of a context identifier in the space of context identifiers allocated for UDP.                                                                                                                                                  |
| <b>CRTP maximum period</b>                 | Maximum interval between full headers. Suggested value is 256.                                                                                                                                                                                |
| <b>CRTP maximum time</b>                   | Maximum time interval between full headers. Suggested value is 5 seconds.                                                                                                                                                                     |
| <b>Compression ratio</b>                   | Ratio of received packet size to compressed packet size, in percentage. For example, if the packet size is 100 bytes when it is received, and is 40 bytes after compression, the compression ratio is $100 \div 40 / 100 \times 100 = 60\%$ . |

Table 56: show services crtp Output Fields (continued)

| Field Name                  | Field Description                                                                                                                                                                                                                               |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Decompression ratio</b>  | Ratio of received packet size to decompressed packet size, in percentage. For example, if the packet size is 40 bytes when it is received, and is 100 bytes after compression, the decompression ratio is $100 \div 40/100 \times 100 = 60\%$ . |
| <b>Discards</b>             | Number of frames that the incoming packet match code discarded because they were not recognized.                                                                                                                                                |
| <b>Sessions</b>             | Total number of active CRTP sessions.                                                                                                                                                                                                           |
| <b>IP bytes</b>             | Number of IP bytes sent and received.                                                                                                                                                                                                           |
| <b>Compressed bytes</b>     | Number of compressed IP header bytes sent and received.                                                                                                                                                                                         |
| <b>CRTP packets</b>         | Number of CRTP packets sent and received.                                                                                                                                                                                                       |
| <b>CUDP/CNTCP packets</b>   | Number of compressed UDP packets and compressed non-TCP packets sent and received.                                                                                                                                                              |
| <b>Full header packets</b>  | Number of full header packets sent and received. Full header packets communicate the uncompressed IP header plus any following headers and data to establish the uncompressed header state in the decompressor for a particular context.        |
| <b>Context state packet</b> | Number of context state packets sent and received. Context state packets are sent from the decompressor to the compressor to communicate a list of context IDs for which synchronization is lost or might be lost.                              |
| <b>IP packets</b>           | Number of IP packets sent and received.                                                                                                                                                                                                         |
| <b>Compressed packets</b>   | Number of compressed packets sent and received.                                                                                                                                                                                                 |

## Sample Output

### show services crtp extensive

```

user@host> show services crtp extensive
Interface: lsq-1/1/0.1
 Port minimum: 2000, Port maximum: 64009
 Maximum UDP compressed sessions: 256
 CRTP maximum period: 256, CRTP maximum time: 5
 Compression ratio: 0, Decompression ratio: 0, Discards: 0
 CRTP stats
 Receive Transmit
 Sessions 1 1
 IP bytes 60 60
 Compressed bytes 61 60
 CRTP packets 0 0
 CUDP/CNTCP packets 0 0
 Full header packets 1 1
 Context state packets 0 0

```

|                    |   |   |
|--------------------|---|---|

*Table 57: show services crtp flows Output Fields*

| Field Name  | Field Description                                                                                                                                                                                 |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface   | Name of the physical interface.                                                                                                                                                                   |
| Flow        | Received or transmitted flow.                                                                                                                                                                     |
| Source      | IP source address.                                                                                                                                                                                |
| Destination | IP destination address.                                                                                                                                                                           |
| SSRC ID     | Synchronization source (SSRC) identifier. One of the fields in the RTP header used to select the context. The SSRC identifier is a randomly chosen value unique within a particular CRTP session. |
| Ctx ID      | Session context ID. Indicates the session context in which to interpret the packet. The decompressor can use the context ID to index its table of stored session contexts directly.               |

## Sample Output

### show services crtp flows

```
user@host> show services crtp flows
```

```
Interface: lsq-1/1/0.1
Flow Source Destination SSRC ID Ctx ID
Receive 192.0.2.3:28004 198.51.100.3:26000 123 0
Transmit 198.51.100.3:26000 192.0.2.3:28004 123 2
```

## show services ha detail

| Connection      | Status of the peer connection. <ul style="list-style-type: none"> <li>Up</li> <li>Down</li> </ul>                                                                                                                                                   |
| Synchronization | Synchronization state of peers. <ul style="list-style-type: none"> <li>Off—Peers are not currently engaged in synchronization.</li> <li>Cold—Peers are in a pre-synchronization state.</li> <li>Hot—Peers are ready for synchronization.</li> </ul> |
| Peers           |                                                                                                                                                                                                                                                     |

*Table 59: show services ha statistics Output Fields (continued)*

| Field Name                       | Field Description                                                                                                          |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Local                            | Local peer IP address.                                                                                                     |
| Port                             | Local peer port number.                                                                                                    |
| Remote                           | Remote peer IP address.                                                                                                    |
| Port                             | Remote peer port number.                                                                                                   |
| <b>Connection Status</b>         |                                                                                                                            |
| TCP connection establish         | Number of times a TCP connection is established.                                                                           |
| TCP connection teardown          | Number of times a TCP connection is torn down.                                                                             |
| UDP address exchange sent        | Number of times a UDP address is sent.                                                                                     |
| Stateful sync start sent         | Number of stateful sync start messages sent by the backup PIC, indicating the start of the cold sync phase.                |
| Stateful sync start received     | Number of stateful sync start messages received by active PIC, indicating the start of the cold sync phase.                |
| Cold sync completed count        | Number of times the PIC has successfully completed the cold sync phase.                                                    |
| <b>Session Add Statistics</b>    |                                                                                                                            |
| Sent                             | Number of session add statistics sent by the active PIC.                                                                   |
| Received                         | Number of session add statistics received by the backup PIC.                                                               |
| Completed                        | Number of session adds completed on the active and backup PICs.                                                            |
| rate                             | Number of sessions currently added per second.                                                                             |
| Nack sent                        | Number of times that a session add failed on the backup PIC, resulting in the sending of a Nack message to the active PIC. |
| Nack received                    | Number of Nack messages received from backup PIC due to session add failure.                                               |
| Add pending                      | Number of sessions eligible for synchronization, but not yet synchronized.                                                 |
| <b>Session Delete Statistics</b> |                                                                                                                            |
| Sent                             | Number of session deletes sent by the active PIC.                                                                          |
| Received                         | Number of session deletes received by the backup PIC.                                                                      |
| Completed                        | Number of session deletes completed on the active and backup PICs.                                                         |

**Table 59: show services ha statistics Output Fields (continued)**

| Field Name                      | Field Description                                                                                                                                                                                                       |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rate                            | Number of sessions currently deleted per second.                                                                                                                                                                        |
| Nack sent                       | Number of times that a session add failed on the backup PIC, resulting in the sending of a Nack message to the active PIC.                                                                                              |
| Nack received                   | Number of Nack messages received from backup PIC due to session add failure.                                                                                                                                            |
| Session not found               | Number of sessions not found when session delete was attempted.                                                                                                                                                         |
| <b>Session Error Statistics</b> |                                                                                                                                                                                                                         |
| Session attach failures         | Number of high-availability extension creation failures on the active PIC.                                                                                                                                              |
| Session detach failures         | Number of high-availability extension deletion failures on the active PIC.                                                                                                                                              |
| Session extension get failures  | Number of times that the high-availability extension is not available when requested.                                                                                                                                   |
| Session nullify                 | Number of times the high-availability session creation failed on the active PIC.                                                                                                                                        |
| Lookup fail                     | Number of times session lookup failed because the session has already been released by the infrastructure.                                                                                                              |
| Initiate fail                   | Number of times session creation failed on the backup PIC.                                                                                                                                                              |
| Activate fail                   | Number of times session activation failed on the backup PIC.                                                                                                                                                            |
| Illegal flow type               | Number of times an illegal flow type occurred on the active and backup PICs.                                                                                                                                            |
| Illegal service set             | Number of times service set extraction failed on backup and active PICs.                                                                                                                                                |
| Unsupported protocol            | Number of times that a session was not backed up because the protocol was neither TCP or UDP.                                                                                                                           |
| Send overflow                   | Number of times buffer overflowed when the high-availability session was created on the active PIC.                                                                                                                     |
| Send discard                    | Number of sessions that not synchronized to the backup, even though they were eligible for synchronization. This occurs whe at least one plugin in the service set indicates that a session should not be synchronized. |
| Spurious                        | Number of packets received on the backup PIC for which there are no existing sessions                                                                                                                                   |
| Process incoming failed         | Number of times JMUX header processing failed.                                                                                                                                                                          |
| Session ignored                 | Number of sessions that were eligible for synchronization, but are ignored because stateful sync is not supported for them, such as ALG sessions                                                                        |
| <b>JMUX Error Statistics</b>    | Synchronization statistics related to the JMUX library.                                                                                                                                                                 |

**Table 59: show services ha statistics Output Fields (continued)**

| Field Name            | Field Description                                                                                      |
|-----------------------|--------------------------------------------------------------------------------------------------------|
| JMUX begin fail       | Number of times that JMUX key verification or header creation failed.                                  |
| JMUX commit fail      | Number of times addition of JMUX data failed.                                                          |
| JMUX flush fail       | Number of times a send of JMUX data failed.                                                            |
| Invalid plugin header | Number of times stateful sync messages were rejected due to an invalid plugin header (internal error). |
| Invalid plugin name   | Number of times stateful sync messages were rejected due to an invalid plugin name (internal error).   |
| Invalid plugin length | Number of times stateful sync messages were rejected due to invalid plugin length (internal error).    |
| Plugin receive error  | Number of times installation of plugin information failed on the backup.                               |
| Plugin send error     | Number of times the plugin failed to pack the extension.                                               |
| IDL Error Statistics  | Statistics concerning encode or decode errors at the backup.                                           |
| IDL encode fail       | Number of times IDL encoding failed on the active and backup PICs.                                     |
| IDL decode fail       | Number of times IDL decoding failed on the active and backup PICs.                                     |

## Sample Output

## show services ids

**Syntax** show services ids (destination-table | pair-table | source-table)  
 <brief | extensive | terse>  
 <destination-prefix *destination-prefix-name*>  
 <interface *interface-name*>  
 <limit *number*>  
 <order (anomalies | bytes | flows | packets)>  
 <service-set *service-set-name*>  
 <source-prefix *source-prefix-name*>  
 <threshold *number*>

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** Display information about intrusion detection service (IDS) events. All events gathered by IDS are reported as anomalies. For example, events such as **create forward or watch flow**, **FTP passive**, and **FTP active** are genuinely allowed by the stateful firewall but are logged as anomalies to track the rates and number for these events.

**Options** **destination-table**—Display information for an address under possible attack.

**pair-table**—Display information for a particular suspected attack source and destination address pair.

**source-table**—Display information for an address that is a suspected attacker.

**brief | extensive | terse**—(Optional) Display the specified level of output.

**destination-prefix *destination-prefix-name***—(Optional) Display information for a particular destination prefix.

**interface *interface-name***—(Optional) On M Series and T Series routers, the *interface-name* can be *sp-fpc/pic/port* or *rspnumber*.

**limit *number***—(Optional) Maximum number of entries to display. By default, all tables display the top 32 entries sorted by the number of events for the criteria chosen. To display additional entries, configure the limit option to set up to 256 entries.

**order**—(Optional) Display events according to one of the following table-ordering criteria. The default is anomalies.

- **anomalies**—Display information for particular anomalies.
- **bytes**—Order output by number of bytes received.
- **flows**—Order output by number of flows.
- **packets**—Order output by number of packets received.

**service-set *service-set-name***—(Optional) Display information about a particular service set.

**source-prefix *source-prefix-name***—(Optional) Display information about a particular source prefix.

**threshold *number***—(Optional) Limit the display to events with this number of anomalies, bytes, flows, or packets, whichever criterion you specify for order. For example, to display all events with more than 100 flows, specify order flows and threshold 100.

**Required Privilege Level** view

**List of Sample Output** [show services ids destination-table on page 1491](#)  
[show services ids destination-table extensive on page 1491](#)  
[show services ids destination-table extensive order anomalies on page 1492](#)  
[show services ids pair-table extensive on page 1492](#)  
[show services ids pair-table extensive limit on page 1492](#)  
[show services ids source-table extensive on page 1493](#)  
[show services ids source-table extensive limit on page 1493](#)

**Output Fields** [Table 60 on page 1488](#) lists the output fields for the **show services ids** command. Output fields are listed in the approximate order in which they appear.

*Table 60: show services ids Output Fields*

| Field Name            | Field Description                                                                                                                                                                                                                                    | Output Level |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
| <b>Interface</b>      | Name of an adaptive services interface.                                                                                                                                                                                                              | All levels   |
| <b>Service set</b>    | Name of a service set. Individual empty service sets are not displayed, but if no service set has any flows, a flow table header is printed for each service set.                                                                                    | All levels   |
| <b>Sorting order</b>  | Primary mode to display information: <b>Anomalies, Bytes, Flows, or Packets</b> .                                                                                                                                                                    | All levels   |
| <b>Source address</b> | Name of the source address.                                                                                                                                                                                                                          | All levels   |
| <b>Dest address</b>   | Name of the destination address.                                                                                                                                                                                                                     | All levels   |
| <b>Time</b>           | Total time the information has been in the table.                                                                                                                                                                                                    | All levels   |
| <b>Flags</b>          | <b>Flags</b> can be <b>Forced</b> , <b>F</b> (terse output only), <b>SYNcookie</b> , <b>S</b> (terse output only), <b>Forced+SYNcookie</b> , and <b>F+S</b> (terse output only). The <b>SYNcookie</b> flag is visible only in the destination table. | All levels   |
| <b>Application</b>    | Configured application, such as <b>FTP</b> or <b>Telnet</b> .                                                                                                                                                                                        | All levels   |
| <b>Bytes</b>          | Total number of bytes sent from the source to the destination address, in thousands ( <b>k</b> ) or millions ( <b>m</b> ).                                                                                                                           | All levels   |
| <b>Packets</b>        | Total number of packets sent from the source to the destination address, in thousands ( <b>k</b> ) or millions ( <b>m</b> ).                                                                                                                         | All levels   |

Table 60: show services ids Output Fields (continued)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Output Level     |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Flows</b>               | Total number of flows of packets sent from the source to the destination address, in thousands ( <b>k</b> ) or millions ( <b>m</b> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | All levels       |
| <b>Anomalies</b>           | Total number of packets in the anomaly table, in thousands ( <b>k</b> ) or millions ( <b>m</b> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | All levels       |
| <b>Anomaly description</b> | <p>One or more of the following types of anomalies. For more information, see the detailed descriptions in the stateful firewall section of the <a href="#">System Log Explorer</a>.</p> <ul style="list-style-type: none"> <li>• First packet of TCP session not SYN</li> <li>• ICMP echo request dropped, because sequence number duplicated</li> <li>• ICMP echo reply dropped. No matching sequence number</li> <li>• ICMP echo request dropped. Too many echo requests without echo reply</li> <li>• ICMP header length check failed</li> <li>• ICMP packet length greater than 64K</li> <li>• IP fragment assembly timeout</li> <li>• IP fragment length error</li> <li>• IP fragment overlap</li> <li>• IP packet length greater than 64K</li> <li>• IP packet too short</li> <li>• IP packet with broadcast destination address</li> <li>• IP packet with checksum error</li> <li>• IP packet with incorrect length</li> <li>• IP packet with TTL equal to 0</li> </ul> | <b>extensive</b> |

Table 60: show services ids Output Fields (continued)

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Output Level |

| Count                           | Number of times that a particular anomaly occurred, in thousands (k) or millions (M).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | extensive    |
| Rate (eps)                      | Anomaly events per second. The IDS subsystem attempts to maintain a weighted average of rates, which might not reflect the exact incoming rate of attack at low rates. However, at high rates exceeding 160 events per second, the rates generally match.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | extensive    |
| Elapsed                         | Time since the same type of event last occurred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | extensive    |

This number is not necessarily the sum of all entries displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels   |

Table 60: `show services ids` Output Fields (continued)

| Field Name                                                   | Field Description                                                                                                     | Output Level |
|--------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|--------------|
| Total failed IDS table entry insertions                      | Number of IDS entries not allowed into the table because the table was full                                           | All levels   |
| Total number of events (closed flows and anomalies detected) | Total number of events since the system was started or since the <code>show ids services</code> command was executed. | All levels   |

## Sample Output

### `show services ids destination-table`

```

user@host> show services ids destination-table
Interface: sp-1/3/0, Service set: null-sfw
Sorting order: Packets
Source address Dest address Time Flags Application

any -> 10.58.255.146 36m12s SYN cookie
Bytes: 35.0 m, Packets: 822.0 k, Flows: 274.0 k, Anomalies: 2251.0 k

Total IDS table entries: 87
Total failed IDS table entry insertions 0
Total number of events (closed flows and anomalies detected): 2606018

```

### `show services ids destination-table extensive`

```

user@host> show services ids destination-table extensive
Interface: sp-1/3/0, Service set: null-sfw
Sorting order: Packets
Source address Dest address Time Flags Application

any -> 10.58.255.146 35m52s SYN cookie
Bytes: 34.0 m, Packets: 798.0 k, Flows: 266.0 k, Anomalies: 2251.0 k
Anomalies
First packet of TCP session not SYN 160.0 k 0 14s
TCP source or destination port zero 634.0 k 154.6 3m37s
UDP source or destination port zero 633.0 k 170.0 3m37s
ICMP header length check failed 2875 0.9 3m37s
IP fragment assembly timeout 820.0 k 12.8 3m18s
UDP header length check failed 385 0.5 3m53s
TCP header length check failed 383 0.5 3m53s

Total IDS table entries:
87
Total failed IDS table entry insertions
0
Total number of events (closed flows and anomalies detected):
2598063

```

**show services ids destination-table extensive order anomalies**

```

user@host> show services ids destination-table extensive order anomalies
Interface: sp-0/2/0, Service set: ssl
IDS sorting order: Anomalies
Source address Dest address Time Flags Application
192.0.2.1 -> 198.51.100.1 1m28s junos-ftp
Bytes: 1065, Packets: 18, Flows: 1, Anomalies: 10
Anomaly description Count Rate(eps) Elapsed
creating forward or watch flow 1 15.6 1m28s
Number of open sessions exceeds IDS limit 9 0.8 18s

Total IDS table entries: 3
Total failed IDS table entry insertions 0
Total number of events (closed flows and anomalies): 11

```

**show services ids pair-table extensive**

```

user@host> show services ids pair-table extensive
Interface: sp-3/2/0, Service set: ss_all_limits
IDS sorting order: Packets
Source address Dest address Time Flags Application
198.51.100.4 198.51.100.4 2m20s junos-ftp

Bytes: 5.7k, Packets: 102.0, Flows: 41.0, Anomalies: 462.0
Anomaly description Count Rate Elapsed
creating forward or watch flow 41.0 8.8 2m17s

Packet rate exceeds IDS src limit 21.0 7.1 2m17s

Session creation rate exceeds IDS src limit 359.0 99.7 2m16s

TCP SYN flood attack 41.0 1.9 1m30s

Total IDS table entries: 3
Total failed IDS table entry insertions 0
Total number of events (closed flows and anomalies): 462

```

**show services ids pair-table extensive limit**

```

| <b>Output Fields</b>            | <a href="#">Table 61 on page 1495</a> lists the output fields for the <code>show services inline nat pool</code> command. Output fields are listed in the order in which they appear. |

*Table 61: show services inline nat pool Output Fields*

| Field Name              | Field Description                                                          |
|-------------------------|----------------------------------------------------------------------------|
| <b>Interface</b>        | Name of an <b>si</b> interface hosted on a Trio-based line card.           |
| <b>NAT pool</b>         | Name of the pool used for address translations.                            |
| <b>Translation type</b> | Translation type specified in the applicable NAT rule for the service set. |
| <b>Address range</b>    | Starting and ending public NAT addresses available for translation.        |
| <b>NATed packets</b>    | Number of packets translated for the specified pool.                       |
| <b>un-NATed packets</b> | Number of received packets that were not translated.                       |
| <b>deNATed packets</b>  | Number of packets that were not translated for the specified service PIC.  |
| <b>Errors</b>           | Number of packets with translation errors.                                 |

## Sample Output

### show services inline nat pool

```

user@host> show services inline nat pool p1
Interface: si-5/0/0, Service set: ss-inat
NAT pool: p1, Translation type: BASIC NAT44
Address range: 192.0.2.0-192.0.2.255
NATed packets: 0, Un-NATed packets: 0, Errors: 0

```

### show services inline nat pool (Network Prefix Translation for IPv6)

```
user@host> show services inline nat pool ss_nptv6_pool1
```

```
Interface: si-4/0/0, Service set: ss_nptv6
NAT pool: ss_nptv6_pool1, Translation type: NPTV6
Address range: 2001:db8:3456::/48
NATed packets: 0, deNATed packets: 0, Errors: 0
```

## show services inline nat statistics

|                                 |                                                                                                                                                                                                                           |

*Table 63: show services inline software statistics Output Fields*

| Field Name                                       | Field Description                                                    |
|--------------------------------------------------|----------------------------------------------------------------------|
| Service PIC Name                                 | Name of the service PIC for which statistics are displayed.          |
| Control Plane Statistics                         | Statistics on the control plane.                                     |
| ICMPv4 echo requests to software concentrator    | Number of ICMPv4 echo received by the software concentrator.         |
| ICMPv4 echo responses from software concentrator | Number of ICMPv4 echo responses sent from the software concentrator. |

Table 63: show services inline software statistics Output Fields (continued)

| Field Name                                                     | Field Description                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dropped ICMPv4 packets to software concentrator                | Number of ICMP packets (except ICMP request) received by the software concentrator. All these packets are dropped in by the packet forwarding engine Ukernel.                                                                                                                                     |
| Trace route UDP packets to software concentrator               | Number of UDP trace route packets (port numbers 33434 through 33534) received by the software concentrator.                                                                                                                                                                                       |
| ICMPv4 Port unreachable errors sent from software concentrator | Number of ICMP port unreachable errors sent by the software concentrator after receiving the UDP trace route packets.                                                                                                                                                                             |
| Other dropped IPv4 packets to software concentrator            | Number of non-ICMP packets that were received and dropped because of fragmentation during encapsulation or decapsulation.                                                                                                                                                                         |
| Data Plane Statistics                                          | Statistics of the data plane.                                                                                                                                                                                                                                                                     |
| 6rd decaps                                                     | Number of 6rd decapsulated packets and bytes in the data plane. Decapsulation includes removing the outer IPv4 header and routing the inner IPv6 packet.                                                                                                                                          |
| 6rd encaps                                                     | Number of 6rd encapsulated (IPv4) packets and bytes in the data plane.                                                                                                                                                                                                                            |
| 6rd decap errors                                               | Number of all the packets and bytes that are not IPv4-IPv6, IPv4-UDP, or IPV4-ICMP packets.                                                                                                                                                                                                       |
| 6rd decap fragment errors                                      | Number of IPv4 fragmented packets and bytes.                                                                                                                                                                                                                                                      |
| 6rd decap spoof attacks                                        | Number of spoof attack packets and bytes, which includes packets for which the 6rd derived IPv4 address does not match with the source IPv4 address and packets for which the source IPv6 prefix does not match the 6rd IPv6 prefix.                                                              |
| 6rd encaps v4 mtu errors                                       | Count of packets and bytes with IPv4 encapsulation MTU errors. For downlink packets after encapsulating with an IPv4 header, if the packet length is more than Tunnel MTU then it is dropped as v4 MTU errors. For these packet drops, an ICMPv6 packet too big error is sent back to the sender. |

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                   |

Table 64: show services ipsec-vpn certificates Output Fields

| Field Name                     | Field Description                                                                                               | Level of Output   |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|-------------------|
| <b>Service set</b>             | Name of the IPsec service set.                                                                                  | All levels        |
| <b>Total entries</b>           | Number of certificate cache entries.                                                                            | All levels        |
| <b>Certificate cache entry</b> | Identification number of the certificate cache entry.                                                           | All levels        |
| <b>Flags</b>                   | Information about the digital certificate, including whether the certificate is a root certificate and trusted. | none <b>brief</b> |
| <b>Issued to</b>               | Device that was issued the digital certificate.                                                                 | none <b>brief</b> |
| <b>Issued by</b>               | Authority that issued the digital certificate.                                                                  | none <b>brief</b> |
| <b>Certificate version</b>     | Revision number of the digital certificate.                                                                     | <b>detail</b>     |
| <b>Serial number</b>           | Unique serial number of the digital certificate.                                                                | <b>detail</b>     |

Table 64: `show services ipsec-vpn certificates` Output Fields (continued)

| Field Name                  | Field Description                                                                                                                                                                                                                                                              | Level of Output   |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <b>Alternate subject</b>    | Domain name or IP address of the device related to the digital certificate.                                                                                                                                                                                                    | All levels        |
| <b>Validity</b>             | Time period when the digital certificate is valid. Values are: <ul style="list-style-type: none"> <li>• <b>Not before</b>—Start time when the digital certificate becomes valid.</li> <li>• <b>Not after</b>—End time when the digital certificate becomes invalid.</li> </ul> | none <b>brief</b> |
| <b>Public key algorithm</b> | Specifies the encryption algorithm used with the private key, such as <b>rsaEncryption (1024 bits)</b> .                                                                                                                                                                       | <b>detail</b>     |
| <b>Signature algorithm</b>  | Encryption algorithm that the CA used to sign the digital certificate, such as <b>sha1WithRSAEncryption</b> .                                                                                                                                                                  | <b>detail</b>     |
| <b>Fingerprint</b>          | Secure Hash Algorithm (SHA1) and Message Digest 5 (MD5) hashes used to identify the digital certificate.                                                                                                                                                                       | <b>detail</b>     |
| <b>Distribution CRL</b>     | Distinguished name information and the URL for the certificate revocation list (CRL) server.                                                                                                                                                                                   | <b>detail</b>     |
| <b>Use for key</b>          | Use of the public key, such as <b>Certificate signing</b> , <b>CRL signing</b> , <b>Digital signature</b> , or <b>Key encipherment</b> .                                                                                                                                       | <b>detail</b>     |

## Sample Output

### `show services ipsec-vpn certificates`

```

user@host> show services ipsec-vpn certificates
Service set: serviceset-dynamic-BiEspsha3des, Total entries: 3
Certificate cache entry: 3
 Flags: Non-root Trusted
 Issued to: router3.example.com, Issued by: juniper
 Alternate subject: router3.example.com
 Validity:
 Not before: 2005 Nov 21st, 23:33:58 GMT
 Not after: 2008 Nov 22nd, 00:03:58 GMT

Certificate cache entry: 2
 Flags: Non-root Trusted
 Issued to: router2.example.com, Issued by: juniper
 Alternate subject: router2.example.com
 Validity:
 Not before: 2005 Nov 21st, 23:28:22 GMT
 Not after: 2008 Nov 21st, 23:58:22 GMT

Certificate cache entry: 1
 Flags: Root Trusted
 Issued to: juniper, Issued by: juniper
 Validity:
 Not before: 2005 Oct 18th, 23:54:22 GMT
 Not after: 2025 Oct 19th, 00:24:22 GMT

```

## show services ipsec-vpn ike security-associations

|                                 |                                                                                                                                                                                                                                                                                    |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | show services ipsec-vpn ike security-associations<br><brief   detail><br><peer-address>                                                                                                                                                                                            |
| <b>Release Information</b>      | Command introduced before Junos OS Release 7.4.<br>Statistics for Internet Key Exchange (IKE) security associations for each services PIC introduced in Junos OS Release 12.1.                                                                                                     |
| <b>Description</b>              | (Adaptive services interface only) Display information for Internet Key Exchange (IKE) security associations. If no security association is specified, the information for all security associations is displayed.                                                                 |
| <b>Options</b>                  | <b>none</b> —(same as brief) Display standard information for all IPsec security associations.<br><b>brief   detail</b> —(Optional) Display the specified level of output.<br><b>peer-address</b> —(Optional) Display information about a particular security association address. |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                               |
| <b>List of Sample Output</b>    | <a href="#">show services ipsec-vpn ike security-associations on page 1509</a><br><a href="#">show services ipsec-vpn ike security-associations detail on page 1510</a><br><a href="#">show services ipsec-vpn ike security-associations (on ACX500 Routers) on page 1511</a>      |
| <b>Output Fields</b>            | <a href="#">Table 65 on page 1507</a> lists the output fields for the <b>show services ipsec-vpn ike security-associations</b> command. Output fields are listed in the approximate order in which they appear.                                                                    |

*Table 65: show services ipsec-vpn ike security-associations Output Fields*

| Field Name              | Field Description                                                                                                                                                                                                                               | Level of Output |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>IKE peer</b>         | Remote end of the IKE negotiation.                                                                                                                                                                                                              | <b>detail</b>   |
| <b>Role</b>             | Part played in the IKE session. The router triggering the IKE negotiation is the initiator, and the router accepting the first IKE exchange packets is the responder.                                                                           | <b>detail</b>   |
| <b>Remote Address</b>   | Responder's address.                                                                                                                                                                                                                            | none specified  |
| <b>State</b>            | State of the IKE security association: <ul style="list-style-type: none"> <li>• <b>Matured</b>—IKE security association is established.</li> <li>• <b>Not matured</b>—The IKE security association is in the process of negotiation.</li> </ul> | none specified  |
| <b>Initiator cookie</b> | When the IKE negotiation is triggered, a random number is sent to the remote node.                                                                                                                                                              | All levels      |

Table 65: show services ipsec-vpn ike security-associations Output Fields (continued)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Responder cookie</b>      | <p>The remote node generates its own random number and sends it back to the initiator as a verification that the packets were received.</p> <p>Of the numerous security services available, protection against denial of service (DoS) is one of the most difficult to address. A “cookie” or anticlogging token (ACT) is aimed at protecting the computing resources from attack without spending excessive CPU resources to determine the cookie's authenticity. An exchange prior to CPU-intensive public key operations can thwart some DoS attempts (such as simple flooding with invalid IP source addresses).</p>                                                                                                                                                                              | All levels      |
| <b>Exchange type</b>         | <p>Specifies the number of messages in an IKE exchange, and the payload types that are contained in each message. Each exchange type provides a particular set of security services, such as anonymity of the participants, perfect forward secrecy of the keying material, and authentication of the participants. Junos OS supports two types of exchanges:</p> <ul style="list-style-type: none"> <li>• <b>Main</b>—The exchange is done with six messages. <b>Main</b> encrypts the payload, protecting the identity of the neighbor.</li> <li>• <b>Aggressive</b>—The exchange is done with three messages. <b>Aggressive</b> does not encrypt the payload, leaving the identity of the neighbor unprotected.</li> <li>• <b>IKEv2</b>—The exchange is negotiated using IKE version 2.</li> </ul> | All levels      |
| <b>PIC</b>                   | The services PIC for which the IKE security associations are displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | All levels      |
| <b>Authentication method</b> | <p>Authentication method that determines which payloads are exchanged and when they are exchanged. Value can be ECDSA-signatures (256 bit key), ECDSA-signatures (384 bit key), Pre-shared-keys, or RSA-signatures.</p> <p><b>NOTE:</b> In Junos FIPS mode, ECDSA is not supported in Junos OS Release 17.3R1. Starting in Junos OS Release 17.4R1, ECDSA is supported in Junos FIPS mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                        | detail          |
| <b>Local</b>                 | Prefix and port number of the local end.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | detail          |

| <b>Output Fields</b>            | Table 66 on page 1512 lists the output fields for the <b>show services ipsec-vpn ipsec security-associations</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                   |

Table 66: show services ipsec-vpn ipsec security-associations Output Fields

| Field Name                    | Field Description                                                                                                                               | Level of Output  |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Service set</b>            | Name of the service set for which the IPsec security associations are defined. If appropriate, includes the outside service interface VRF name. | All levels       |
| <b>Rule</b>                   | Name of the rule set applied to the security association.                                                                                       | detail extensive |
| <b>Term</b>                   | Name of the IPsec term applied to the security association.                                                                                     | detail extensive |
| <b>Tunnel index</b>           | Numeric identifier of the specific IPsec tunnel for the security association.                                                                   | detail extensive |
| <b>Local gateway</b>          | Gateway address of the local system.                                                                                                            | All levels       |
| <b>Remote gateway</b>         | Gateway address of the remote system.                                                                                                           | All levels       |
| <b>IPsec inside interface</b> | Name of the logical interface hosting the IPsec tunnels.                                                                                        | All levels       |

Table 66: `show services ipsec-vpn ipsec security-associations` Output Fields (continued)

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Tunnel MTU</b>             | MTU of the IPsec tunnel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | All levels      |
| <b>Total uptime</b>           | Total amount of time that an IPsec tunnel has been up across security association rekeys.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail</b>   |
| <b>Local identity</b>         | <p>Protocol, address or prefix, and port number of the local entity of the IPsec association. The format is <b>id-type-name (proto-name:port-number,[0..id-data-len] = iddata-presentation)</b>. The protocol is always displayed as any because it is not user-configurable in the IPsec rule. Similarly, the port number field in the output is always displayed as 0 because it is not user-configurable in the IPsec rule. The value of the <b>id-data-len</b> parameter can be one of the following, depending on the address configured in the IPsec rule:</p> <ul style="list-style-type: none"> <li>For an IPv4 address, the length is 4 and the value displayed is 3.</li> <li>For a subnet mask of an IPv4 address, the length is 8 and the value displayed is 7.</li> <li>For a range of IPv4 addresses, the length is 8 and the value displayed is 7.</li> <li>For an IPv6 address prefix, the length is 16 and the value displayed is 15.</li> <li>For a subnet mask of an IPv6 address prefix, the length is 32 and the value displayed is 31.</li> <li>For a range of IPv6 address prefixes, the length is 32 and the value displayed is 31.</li> </ul> <p>The value of the <b>id-data-presentation</b> field denotes the IPv4 address or IPv6 prefix details. If the fully qualified domain name (FQDN) is specified instead of the address for the local peer of the IPsec association, it is displayed instead of the address details.</p>   | All levels      |
| <b>Remote identity</b>        | <p>Protocol, address or prefix, and port number of the remote entity of the IPsec association. The format is <b>id-type-name (proto-name:port-number,[0..id-data-len] = iddata-presentation)</b>. The protocol is always displayed as any because it is not user-configurable in the IPsec rule. Similarly, the port number field in the output is always displayed as 0 because it is not user-configurable in the IPsec rule. The value of the <b>id-data-len</b> parameter can be one of the following, depending on the address configured in the IPsec rule:</p> <ul style="list-style-type: none"> <li>For an IPv4 address, the length is 4 and the value displayed is 3.</li> <li>For a subnet mask of an IPv4 address, the length is 8 and the value displayed is 7.</li> <li>For a range of IPv4 addresses, the length is 8 and the value displayed is 7.</li> <li>For an IPv6 address prefix, the length is 16 and the value displayed is 15.</li> <li>For a subnet mask of an IPv6 address prefix, the length is 32 and the value displayed is 31.</li> <li>For a range of IPv6 address prefixes, the length is 32 and the value displayed is 31.</li> </ul> <p>The value of the <b>id-data-presentation</b> field denotes the IPv4 address or IPv6 prefix details. If the fully qualified domain name (FQDN) is specified instead of the address for the remote peer of the IPsec association, it is displayed instead of the address details.</p> | All levels      |
| <b>Primary remote gateway</b> | IP address of the configured primary remote peer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | All levels      |

Table 66: show services ipsec-vpn ipsec security-associations Output Fields (continued)

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                                                                                         | Level of Output  |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Backup remote gateway</b> | IP address of the configured backup remote peer.                                                                                                                                                                                                                                                                                                                                          | All levels       |
| <b>State</b>                 | State of the primary or backup interface: <b>Active</b> , <b>Offline</b> , or <b>Standby</b> . Both ES PICs are initialized to <b>Offline</b> . For primary and backup peers, <b>State</b> can be <b>Active</b> or <b>Standby</b> . If both peers are in a state of <b>Standby</b> , no connection exists yet between the two peers.                                                      | All levels       |
| <b>Failover counter</b>      | Number of times a PIC switched between primary and backup interfaces, or the number of times the tunnel switched between the primary and remote peers since the software has been activated.                                                                                                                                                                                              | All levels       |
| <b>Direction</b>             | Direction of the security association: <b>inbound</b> or <b>outbound</b> .                                                                                                                                                                                                                                                                                                                | All levels       |
| <b>SPI</b>                   | Value of the security parameter index.                                                                                                                                                                                                                                                                                                                                                    | All levels       |
| <b>AUX-SPI</b>               | Value of the auxiliary security parameter index. <ul style="list-style-type: none"> <li>When the value of <b>Protocol</b> is <b>AH</b> or <b>ESP</b>, <b>AUX-SPI</b> is always 0.</li> <li>When the value of <b>Protocol</b> is <b>AH+ESP</b>, <b>AUX-SPI</b> is always a positive integer.</li> </ul>                                                                                    | All levels       |
| <b>Mode</b>                  | Mode of the security association: <ul style="list-style-type: none"> <li><b>transport</b>—Protects single host-to-host protections.</li> <li><b>tunnel</b>—Protects connections between security gateways.</li> </ul>                                                                                                                                                                     | detail extensive |
| <b>Type</b>                  | Type of security association: <ul style="list-style-type: none"> <li><b>manual</b>—Security parameters require no negotiation. They are static, and are configured by the user.</li> <li><b>dynamic</b>—Security parameters are negotiated by the IKE protocol. Dynamic security associations are not supported in transport mode.</li> </ul>                                             | detail extensive |
| <b>State</b>                 | Status of the security association: <ul style="list-style-type: none"> <li><b>Installed</b>—The security association is installed in the security association database. (For transport mode security associations, the value of State must always be Installed.)</li> <li><b>Not installed</b>—The security association is not installed in the security association database.</li> </ul> | detail extensive |
| <b>Protocol</b>              | Protocol supported: <ul style="list-style-type: none"> <li><b>transport</b> mode supports Encapsulation Security Protocol (<b>ESP</b>) or Authentication Header (<b>AH</b>).</li> <li><b>tunnel</b> mode supports <b>ESP</b> or <b>AH+ESP</b>.</li> </ul>                                                                                                                                 | All levels       |
| <b>Authentication</b>        | Type of authentication used: <b>hmac-md5-96</b> , <b>hmac-sha1-96</b> , or <b>none</b> .                                                                                                                                                                                                                                                                                                  | detail extensive |

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Level of Output  |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| Encryption                     | Type of encryption algorithm used: can be <b>3des-cbc</b> , <b>aes-cbc (128 bits)</b> , <b>aes-cbc (192 bits)</b> , <b>aes-cbc (256 bits)</b> , <b>aes-gcm (128 bits)</b> , <b>aes-gcm(192 bits)</b> , <b>aes-gcm (256 bits)</b> , <b>des-cbc</b> , or <b>None</b> .<br><br><b>NOTE:</b> In Junos FIPS mode, AES-GCM is not supported in Junos OS Release 17.3R1. Starting in Junos OS Release 17.4R1, AES-GCM is supported in Junos FIPS mode.                                                                                                                                                                                                                                                                              | detail           |
| Soft lifetime<br>Hard lifetime | Each lifetime of a security association has two display options, hard and soft, one of which must be present for a dynamic security association. The hard lifetime specifies the lifetime of the SA. The soft lifetime, which is derived from the hard lifetime, informs the IPsec key management system that the SA is about to expire. This information allows the key management system to negotiate a new SA before the hard lifetime expires.<br><br><ul style="list-style-type: none"> <li><b>Expires in seconds seconds</b>—Number of seconds left until the security association expires.</li> <li><b>Expires in kilobytes kilobytes</b>—Number of kilobytes left until the security association expires.</li> </ul> | detail extensive |
| Anti-replay service            | State of the service that prevents packets from being replayed: <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | detail extensive |
| SA lifetime                    | Configured hard lifetime (total lifetime), in seconds, for the security association.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | detail           |
| Replay window size             | Configured size, in packets, of the antireplay service window: <b>32</b> or <b>64</b> . The antireplay window size protects the receiver against replay attacks by rejecting old or duplicate packets. If the replay window size is <b>0</b> , antireplay service is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                               | detail           |
| disable-natt                   | Configure to disable NAT-T functionality. By default the NAT-T is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels.      |
| nat-keepalive                  | Specify the interval at which NAT keepalive packets can be sent so that NAT translation continues.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | All levels.      |

## Sample Output

### show services ipsec-vpn ipsec security associations extensive

```

| <b>Errors</b>         | <ul style="list-style-type: none"> <li>• <b>AH authentication failures</b>—Number of authentication header (AH) failures. An AH failure occurs when there is a mismatch of the authentication header in a packet transmitted across an IPsec tunnel.</li> <li>• <b>ESP authentication failures</b>—Number of Encapsulation Security Payload (ESP) failures. An ESP failure occurs when there is an authentication mismatch in ESP packets.</li> <li>• <b>ESP Decryption failures</b>—Number of ESP decryption failures.</li> <li>• <b>Bad headers</b>—Number of invalid headers detected.</li> <li>• <b>Bad trailers</b>—Number of invalid trailers detected.</li> <li>• <b>Replay before window drops</b>—Number of replay errors. A replay error is generated when a duplicate packet is received within the replay window.</li> <li>• <b>Replayed pkts</b>—Number of packets replayed.</li> <li>• <b>IP integrity errors</b>—Number of IP integrity errors.</li> <li>• <b>Exceeds tunnel MTU</b>—Number of times the tunnel maximum transmission unit (MTU) value was exceeded.</li> <li>• <b>Rule lookup failures</b>—Number of rule lookup failures.</li> <li>• <b>No SA errors</b>—Number of errors resulting from a missing security association (SA).</li> <li>• <b>Flow errors</b>—Number of flow errors.</li> <li>• <b>Misc errors</b>—Number of miscellaneous errors.</li> </ul> | All levels      |

## Sample Output

### show services ipsec-vpn ipsec statistics detail

```
user@host> show services ipsec-vpn ipsec statistics
PIC: sp-0/2/0, Service set: ss0

ESP Statistics:
 Encrypted bytes: 0
 Decrypted bytes: 0
 Encrypted packets: 0
 Decrypted packets: 0
AH Statistics:
 Input bytes: 168
 Output bytes: 168
 Input packets: 2
 Output packets: 2
Errors:
 AH authentication failures: 0
 ESP authentication failures: 0
 ESP decryption failures: 0
 Bad headers: 0, Bad trailers: 0
 Replay before window drops: 0, Replayed pkts: 0
 IP integrity errors: 0, Exceeds tunnel MTU: 0
 Rule lookup failures: 0, No SA errors: 0
 Flow errors: 0, Misc errors: 0
```

### show services ipsec-vpn ipsec statistics remote-gw

```
user@host> show services ipsec-vpn ipsec statistics remote-gw 192.0.2.1
PIC: sp-3/1/0, Service set: service-set-2
Local gateway: 198.51.100.1, Remote gateway: 192.0.2.1, Tunnel index: 2
ESP Statistics:
 Encrypted bytes: 0
 Decrypted bytes: 0
 Encrypted packets: 0
 Decrypted packets: 0
AH Statistics:
 Input bytes: 0
 Output bytes: 0
 Input packets: 0
 Output packets: 0
Errors:
 AH authentication failures: 0
 ESP authentication failures: 0
 ESP decryption failures: 0
 Bad headers: 0, Bad trailers: 0
 Replay before window drops: 0, Replayed pkts: 0
 IP integrity errors: 0, Exceeds tunnel MTU: 0
 Rule lookup failures: 0, No SA errors: 0
 Flow errors: 0, Misc errors: 0
```

### show services ipsec-vpn ipsec statistics (on ACX500)

```
user@host> show services ipsec-vpn ipsec statistics

PIC: ms-0/2/0, Service set: SS_1

ESP Statistics:
```

```
Encrypted bytes: 4121664
Decrypted bytes: 151584
Encrypted packets: 64162
Decrypted packets: 1579
AH Statistics:
 Input bytes: 0
 Output bytes: 0
 Input packets: 0
 Output packets: 0
Errors:
 AH authentication failures: 0
 ESP authentication failures: 0
 ESP decryption failures: 0
 Bad headers: 0, Bad trailers: 0
 Replay before window drops: 0, Replayed pkts: 0
 IP integrity errors: 0, Exceeds tunnel MTU: 0
 Rule lookup failures: 3, No SA errors: 0
 Flow errors: 0, Misc errors: 0
```

PIC: ms-0/2/0, Service set: SS\_2

```
ESP Statistics:
 Encrypted bytes: 576
 Decrypted bytes: 576
 Encrypted packets: 6
 Decrypted packets: 6
AH Statistics:
 Input bytes: 0
 Output bytes: 0
 Input packets: 0
 Output packets: 0
Errors:
 AH authentication failures: 0
 ESP authentication failures: 0
 ESP decryption failures: 0
 Bad headers: 0, Bad trailers: 0
 Replay before window drops: 0, Replayed pkts: 0
 IP integrity errors: 0, Exceeds tunnel MTU: 0
 Rule lookup failures: 0, No SA errors: 0
 Flow errors: 0, Misc errors: 0
```

| <b>Output Fields</b>            | Table 68 on page 1522 lists the output fields for the <b>show services link-services cpu-usage</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                      |

Table 68: show services link-services cpu-usage Output Fields

| Field Name              | Field Description                                                                                                                                                         | Level of Output |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Role</b>             | CPU functional category.                                                                                                                                                  | <b>brief</b>    |
| <b>1 Second Average</b> | Percentage of usage during 1-second duration.                                                                                                                             | All levels      |
| <b>5 Second Average</b> | Percentage of usage during 5-second duration.                                                                                                                             | All levels      |
| <b>QoS</b>              | Quality of service (QoS) CPU, which takes care of queuing and scheduling of incoming IP packets on a per-bundle basis. It schedules packets with higher QoS values first. | All levels      |
| <b>Sequencer</b>        | Assigns sequence numbers to outgoing MLPPP fragments and interleaves link fragmentation and interleaving (LFI) traffic.                                                   | All levels      |
| <b>Load Balancer</b>    | Distributes load across different fragmenter CPUs.                                                                                                                        | All levels      |
| <b>Fragmenter</b>       | Main LSQ CPU; fragments IP packets into MLPPP fragments and also reassembles MLPPP fragments into IP packets.                                                             | All levels      |

*Table 68: show services link-services cpu-usage Output Fields (continued)*

| Field Name                         | Field Description                                                                                   | Level of Output |
|------------------------------------|-----------------------------------------------------------------------------------------------------|-----------------|
| <b>Total</b>                       | Sum of all CPU functions.                                                                           | <b>brief</b>    |
| <b>Idle</b>                        | Counts idle cycles when the CPU does not have any work.                                             | <b>detail</b>   |
| <b>Timer</b>                       | Takes care of periodic events driven by a timer, such as timeouts.                                  | <b>detail</b>   |
| <b>System</b>                      | System housekeeping thread.                                                                         | <b>detail</b>   |
| <b>Input (QoS)</b>                 | Acquires and queues incoming IP frames from hardware interfaces.                                    | <b>detail</b>   |
| <b>Output (QoS)</b>                | Sends scheduled frames to the next processing CPU.                                                  | <b>detail</b>   |
| <b>Output Frags (QoS)</b>          | Sends outstanding frames to the fragmenter CPU.                                                     | <b>detail</b>   |
| <b>Bypass (QoS)</b>                | Sends outstanding frames for LFI.                                                                   | <b>detail</b>   |
| <b>Free frame (QoS)</b>            | Frees dropped frames.                                                                               | <b>detail</b>   |
| <b>CPUnumber</b>                   | Identifier number of specific CPU.                                                                  | <b>detail</b>   |
| <b>Drop (Fragmenter)</b>           | Drops frames that have been marked by the QoS CPU.                                                  | <b>detail</b>   |
| <b>Frag (Fragmenter)</b>           | Fragments IP frames into MLPPP fragments.                                                           | <b>detail</b>   |
| <b>Reass (Fragmenter)</b>          | Reassembles MLPPP fragments into IP frames.                                                         | <b>detail</b>   |
| <b>Freeback (Fragmenter)</b>       | Handles freeback of credits from other CPUs (MultiServices PICs only).                              | <b>detail</b>   |
| <b>Input LFI (Sequencer)</b>       | Receives LFI traffic from QoS CPU and transmits it with strict priority over MLPPP.                 | <b>detail</b>   |
| <b>Input Frag (Sequencer)</b>      | Receives MLPPP fragments from fragmenter CPUs, assigns sequence numbers, and appends MLPPP headers. | <b>detail</b>   |
| <b>Output Frag (Sequencer)</b>     | Load-balances and transmits fragments across links.                                                 | <b>detail</b>   |
| <b>Retry (Sequencer)</b>           | Retries transmission if hardware was busy in the previous attempt.                                  | <b>detail</b>   |
| <b>Input Alloc (Load Balancer)</b> | Acquires frames from hardware interfaces and validates them.                                        | <b>detail</b>   |
| <b>Input (Load Balancer)</b>       | Performs error and sanity checks and check frames for PortMapping.                                  | <b>detail</b>   |

Table 68: show services link-services cpu-usage Output Fields (continued)

| Field Name                      | Field Description                            | Level of Output |
|---------------------------------|----------------------------------------------|-----------------|
| <b>Output</b> (Load Balancer)   | Sends frame to next processing CPU.          | <b>detail</b>   |
| <b>Freeback</b> (Load Balancer) | Handles freeback of credits from other CPUs. | <b>detail</b>   |

| <b>Output Fields</b>            | <p><a href="#">Table 70 on page 1530</a> lists the output fields for the <b>show services l2tp radius</b> command. Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                |

*Table 70: show services l2tp radius Output Fields*

| Field Name | Field Description                                           |
|------------|-------------------------------------------------------------|
| IP Address | IP address of the server.                                   |
| State      | ( <b>servers</b> keyword only) Present state of the server. |

Table 70: show services l2tp radius Output Fields (continued)

| Field Name          | Field Description                                                                                                                                                                                                                          |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UDP Port            | Number of the UDP port used to send authentication or accounting messages to the server.                                                                                                                                                   |
| Retry Count         | ( <b>servers</b> keyword only) Number of times the RADIUS client resends a packet if no ACK is received.                                                                                                                                   |
| Timeout             | ( <b>servers</b> keyword only) Length of time the client waits for an ACK before retransmission.                                                                                                                                           |
| Pending Requests    | ( <b>servers</b> keyword only) Number of client pending authentication or accounting requests.                                                                                                                                             |
| Maximum Sessions    | ( <b>servers</b> keyword only) Maximum number of pending requests on each RADIUS client before the server moves to the next RADIUS client, which is 200 times the maximum number of clients that can be created on a server (which is 12). |
| Dead Time           | ( <b>servers</b> keyword only) Interval to wait before retrying a server after it fails to send a response to an authentication or accounting request.                                                                                     |
| Secret Type         | ( <b>servers</b> keyword only) Secret type configured on the RADIUS server.                                                                                                                                                                |
| Profile             | ( <b>servers</b> keyword only) Name of profile configured for the RADIUS server.                                                                                                                                                           |
| Access requests     | ( <b>statistics</b> keyword only) Number of access requests sent to the server.                                                                                                                                                            |
| Rollover requests   | ( <b>statistics</b> keyword only) Number of requests coming into the server as a result of the previous server timing out.                                                                                                                 |
| Retransmissions     | ( <b>statistics</b> keyword only) Number of retransmissions.                                                                                                                                                                               |
| Access accepts      | ( <b>statistics</b> keyword only) Number of access accept messages received from the server.                                                                                                                                               |
| Access rejects      | ( <b>statistics</b> keyword only) Number of access reject messages received from the server.                                                                                                                                               |
| Access challenges   | ( <b>statistics</b> keyword only) Number of access challenges received from the server.                                                                                                                                                    |
| Malformed responses | ( <b>statistics</b> keyword only) Number of responses with attributes having an invalid length or unexpected attributes (such as two attributes when the response is required to have at most one).                                        |
| Bad authenticators  | ( <b>statistics</b> keyword only) Number of responses in which the authenticator is incorrect for the matching request. This can occur if the RADIUS secrets for the client and server do not match.                                       |
| Requests pending    | ( <b>statistics</b> keyword only) Number of requests waiting for a response.                                                                                                                                                               |
| Request timeouts    | ( <b>statistics</b> keyword only) Number of requests that timed out.                                                                                                                                                                       |
| Unknown responses   | ( <b>statistics</b> keyword only) Number of unknown responses. The RADIUS response type in the header is invalid or unsupported.                                                                                                           |

Table 70: show services l2tp radius Output Fields (continued)

| Field Name             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Packets dropped</b> | ( <b>statistics</b> keyword only) Number of packets dropped because they are too short or because the router receives a response for which there is no corresponding request. For example, if the router sends a request that times out, the router removes the request from the list and sends a new request. If the server is slow and sends a response to the first request after the router removes the request, the packet is dropped. |

## Sample Output

### show services l2tp radius servers

```

user@host> show services l2tp radius servers

## show services l2tp session

---

**Syntax**    `show services l2tp session`  
              `<brief | detail | extensive>`  
              `<interface interface-name>`  
              `<local-gateway gateway-address>`  
              `<local-gateway-name gateway-name>`  
              `<local-session-id session-id>`  
              `<local-tunnel-id tunnel-id>`  
              `<peer-gateway gateway-address>`  
              `<peer-gateway-name gateway-name>`  
              `<statistics>`  
              `<tunnel-group group-name>`  
              `<user username>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Support for LAC on MX Series routers introduced in Junos OS Release 10.4.  
                              Support for LNS on MX Series routers introduced in Junos OS Release 11.4.

**Description**    (M10i and M7i routers only) Display information about active L2TP sessions for LNS.  
  
                      (MX Series routers only) Display information about active L2TP sessions for LAC and LNS.

**Options**    **none**—Display standard information about all active L2TP sessions.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**interface *interface-name***—(Optional) Display L2TP session information for only the specified adaptive services or inline services interface. The interface type depends on the line card as follows:

- **si-*fpc/pic/port***—MPCs on MX Series routers only. This option is not available for L2TP on M Series routers.
- **sp-*fpc/pic/port***—AS or Multiservices PICs on M7i, M10i, and M120 routers only. This option is not available for L2TP on MX Series routers.

**local-gateway *gateway-address***—(Optional) Display L2TP session information for only the specified local gateway address.

**local-gateway-name *gateway-name***—(Optional) Display L2TP session information for only the specified local gateway name.

**local-session-id *session-id***—(Optional) Display L2TP session information for only the specified local session identifier.

**local-tunnel-id *tunnel-id***—(Optional) Display L2TP session information for only the specified local tunnel identifier.

**peer-gateway *gateway-address***—(Optional) Display L2TP session information for only the specified peer gateway address.

**peer-gateway-name *gateway-name***—(Optional) Display L2TP session information for only the specified peer gateway name.

**statistics**—(Optional) Display the number of control packets and bytes transmitted and received for the session. You cannot include this option with any of the level options, **brief**, **detail**, or **extensive**.

**tunnel-group *group-name***—(Optional) Display L2TP session information for only the specified tunnel group. To display information about L2TP CPU and memory usage, you can include the tunnel group name in the **show services service-sets memory-usage *group-name*** and **show services service-sets cpu-usage *group-name*** commands. This option is not available for L2TP LAC on MX Series routers.

**user *username***—(M Series routers only) (Optional) Display L2TP session information for only the specified username.

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Level of Output  |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Session local ID</b>    | Identifier of the local endpoint of the L2TP session, as assigned by the LNS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels       |
| <b>Session remote ID</b>   | Identifier of the remote endpoint of the L2TP session, as assigned by the L2TP access concentrator (LAC).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | All levels       |
| <b>State</b>               | State of the L2TP session: <ul style="list-style-type: none"> <li>• <b>Established</b>—Session is operating. This is the only state supported for the LAC.</li> <li>• <b>closed</b>—Session is being closed.</li> <li>• <b>destroyed</b>—Session is being destroyed.</li> <li>• <b>clean-up</b>—Session is being cleaned up.</li> <li>• <b>lns-ic-accept-new</b>—New session is being accepted.</li> <li>• <b>lns-ic-idle</b>—Session has been created and is idle.</li> <li>• <b>lns-ic-reject-new</b>—New session is being rejected.</li> <li>• <b>lns-ic-wait-connect</b>—Session is waiting for the peer's incoming call connected (ICCN) message.</li> </ul> | All levels       |
| <b>Bundle ID</b>           | (LNS only) Bundle identifier. Indicates the session is part of a multilink bundle. Sessions that have a blank <b>Bundle</b> field are not participating in the Multilink Protocol. Sessions in a multilink bundle might belong to different L2TP tunnels. For L2TP output organized by bundle ID, issue the <b>show services l2tp multilink extensive</b> command.                                                                                                                                                                                                                                                                                                | All levels       |
| <b>Mode</b>                | (LNS) Mode of the interface representing the session: <b>shared</b> or <b>exclusive</b> .<br><br>(LAC) Mode of the interface representing the session: <b>shared</b> or <b>dedicated</b> . Only <b>dedicated</b> is currently supported for the LAC.                                                                                                                                                                                                                                                                                                                                                                                                              | <b>extensive</b> |
| <b>Local IP</b>            | IP address of local endpoint of the Point-to-Point Protocol (PPP) session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>extensive</b> |
| <b>Remote IP</b>           | IP address of remote endpoint of the PPP session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>extensive</b> |
| <b>Username</b>            | (LNS only) Name of the user logged in to the session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | All levels       |
| <b>Assigned IP address</b> | (LNS only) IP address assigned to remote client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>extensive</b> |
| <b>Local name</b>          | For LNS, name of the LNS instance in which the session was created. For LAC, name of the LAC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>extensive</b> |

Table 71: show services l2tp session Output Fields (continued)

| Field Name                            | Field Description                                                                                                                    | Level of Output  |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>LCP renegotiation</b>              | (LNS only) Whether Link Control Protocol (LCP) renegotiation is configured: <b>On</b> or <b>Off</b> .                                | <b>extensive</b> |
| <b>Authentication</b>                 | Type of authentication algorithm used: Challenge Handshake Authentication Protocol (CHAP) or Password Authentication Protocol (PAP). | <b>extensive</b> |
| <b>Interface ID</b>                   | (LNS only) Identifier used to look up the logical interface for this session.                                                        | <b>extensive</b> |
| <b>Interface unit</b>                 | Logical interface for this session.                                                                                                  | All levels       |
| <b>Call serial number</b>             | Unique serial number assigned to the call.                                                                                           | <b>extensive</b> |
| <b>Policer bandwidth</b>              | Maximum policer bandwidth configured for this session.                                                                               | <b>extensive</b> |
| <b>Policer burst size</b>             | Maximum policer burst size configured for this session.                                                                              | <b>extensive</b> |
| <b>Firewall filter</b>                | Configured firewall filter name.                                                                                                     | <b>extensive</b> |
| <b>Session encapsulation overhead</b> | Overhead allowance configured for this session, in bytes.                                                                            | <b>extensive</b> |
| <b>Session cell overhead</b>          | Cell overhead activation ( <b>On</b> or <b>Off</b> ).                                                                                | <b>extensive</b> |
| <b>Create time</b>                    | Date and time when the call was created.                                                                                             | <b>extensive</b> |
| <b>Up time</b>                        | Length of time elapsed since the call became active, in hours, minutes, and seconds.                                                 | <b>extensive</b> |
| <b>Idle time</b>                      | Length of time elapsed since the call became idle, in hours, minutes, and seconds.                                                   | <b>extensive</b> |

Table 71: show services l2tp session Output Fields (continued)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output  |

| <b>Output Fields</b>            | Table 72 on page 1543 lists the output fields for the <b>show services l2tp summary</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                              |

*Table 72: show services l2tp summary Output Fields*

| Field Name                  | Field Description                                                                                                                         |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Administrative state</b> | Administrative state of the tunnel is drain. In this state you cannot configure new sessions, destinations, or tunnels at the LAC or LNS. |

Table 72: show services l2tp summary Output Fields (continued)

| Field Name                                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Failover within a preference level</b> | State of this tunnel selection method on the LAC. When enabled, tunnel selection fails over within a preference level. When disabled, tunnel selection drops to the next lower preference level. Not displayed for LNS on M Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Weighted load balancing</b>            | State of this tunnel selection method on the LAC. When enabled, the maximum session limit of a tunnel determines its weight within a preference level. Tunnel selection proceeds from greatest to least weight. When disabled, selection defaults to a round robin method. Not displayed for LNS on M Series routers.                                                                                                                                                                                                                                                                                                                                                   |
| <b>Destination equal load balancing</b>   | State of this tunnel selection method on the LAC. When enabled, the LAC selects tunnels based on the session count for destinations and the tunnel session count. Not displayed for LNS on M Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Tunnel authentication challenge</b>    | State of tunnel authentication, indicating whether the LAC and LNS exchange an authentication challenge and response during the establishment of the tunnel. The state is <b>Enabled</b> when a secret is configured in the tunnel profile or on the RADIUS server in the Tunnel-Password attribute [69]. The state is <b>Disabled</b> when the secret is not present. Not displayed for LNS on M Series routers.                                                                                                                                                                                                                                                       |
| <b>Calling number avp</b>                 | When the state is <b>Enabled</b> , the LAC includes the value of the Calling Number AVP 22 in ICRQ packets sent to the LNS. When the state is <b>Disabled</b> , the attribute is not sent to the LNS. Not displayed for LNS on M Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Failover Protocol</b>                  | When the state is enabled, the LAC operates in the default <i>failover-protocol-fall-back-to-silent-failover</i> manner. When the state is disabled, the <b>disable-failover-protocol</b> statement has been issued and the LAC operates only in silent failover mode. Not displayed for LNS on M Series routers.                                                                                                                                                                                                                                                                                                                                                       |
| <b>Tx connect speed method</b>            | <p>The connection speed method configured to send the speed values in the L2TP Tx Connect Speed (AVP 24) and L2TP Rx Connect Speed (AVP 38). Possible values are:</p> <ul style="list-style-type: none"> <li>• <b>actual</b><br/>This is the default value in Junos OS Releases 15.1, 16.1, 16.2, and 17.1. It is deprecated in Junos Releases 17.2 and higher.</li> <li>• <b>ancp</b></li> <li>• <b>none</b></li> <li>• <b>pppoe-ia-tag</b></li> <li>• <b>service-profile</b></li> <li>• <b>static</b><br/>This is the default value in Junos Releases 13.3, 14.1, 14.2, 17.2 and higher. | <b>Rx speed avp when equal</b>            | Indicates if the Rx connect speed when equal configuration is <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 72: show services l2tp summary Output Fields (continued)

| Field Name                                            | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Tunnel assignment id</b>                           | <p>Format of the tunnel name.</p> <p>Format of the tunnel name, based on RADIUS attributes returned from the AAA server:</p> <ul style="list-style-type: none"> <li>• <b>authentication-id</b>—Name consists of only Tunnel Assignment-Id [82]. This is the default value.</li> <li>• <b>client-server-id</b>—Name is a combination of Tunnel-Client-Auth-Id [90], Tunnel-Server-Endpoint [67], and Tunnel-Assignment-Id [82]. This format is available only on MX Series routers.</li> </ul>                                                                            |
| <b>Tunnel Tx Address Change</b>                       | <p>Action taken by LAC when it receives a request from a peer to change the destination IP address, UDP port, or both:</p> <ul style="list-style-type: none"> <li>• <b>accept</b>—Accepts change requests for the IP address or UDP port. This is the default action.</li> <li>• <b>ignore</b>—Ignores all change requests.</li> <li>• <b>ignore-ip-address</b>—Ignores change requests for the IP address but accepts them for the UDP port.</li> <li>• <b>ignore-udp-port</b>—Ignores change requests for the UDP port but accepts them for the IP address.</li> </ul> |
| <b>Min Retransmission Timeout for control packets</b> | Minimum number of seconds that the local peer waits for the initial response after transmitting an L2TP control packet. If no response has been received by the time the period expires, the local peer retransmits the packet.                                                                                                                                                                                                                                                                                                                                          |
| <b>Min Retransmission Timeout for control packets</b> | Minimum number of seconds that the local peer waits for the initial response after transmitting an L2TP control packet. If no response has been received by the time the period expires, the local peer retransmits the packet.                                                                                                                                                                                                                                                                                                                                          |
| <b>Max Retransmissions for Established Tunnel</b>     | Maximum number of times control messages are retransmitted for established tunnels.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Max Retransmissions for Not Established Tunnel</b> | Maximum number of times control messages are retransmitted for tunnels that are not established.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Tunnel Idle Timeout</b>                            | Period that a tunnel can be inactive—that is, carrying no traffic—before it times out and is torn down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Destruct Timeout</b>                               | Period that the router attempts to maintain dynamic destinations, tunnels, and sessions after they have been destroyed.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Reassembly Service Set</b>                         | Indicates active IP reassembly configured for the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Destination Lockout Timeout</b>                    | Timeout period for which all future destinations are locked out, meaning that they are not considered for selection when a new tunnel is created.                                                                                                                                                                                                                                                                                                                                                                                                                        |

Table 72: show services l2tp summary Output Fields (continued)

| Field Name                            | Field Description                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Access Line Information</b>        | <p>State of LAC global configuration for forwarding subscriber line information to the LNS, <b>Enabled</b> or <b>Disabled</b>.</p> <p>Indicates active IP reassembly configured for the interface.</p> <p>Starting in Junos OS Release 17.4R1, this information can also be displayed on the LNS for information it receives from the LAC.</p> |
| <b>IPv6 Services for LAC Sessions</b> | State of LAC IPv6 service configuration for creating the IPv6 (inet6) address family for LAC subscribers, allowing the application of IPv6 firewall filters, <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                               |
| <b>Speed Updates</b>                  | <p>State of LAC global configuration for including connection speed updates when it forwards subscriber line information to the LNS, <b>Enabled</b> or <b>Disabled</b>.</p> <p>Starting in Junos OS Release 17.4R1, this information can also be displayed on the LNS for updates it receives from the LAC.</p>                                |
| <b>Destinations</b>                   | Number of L2TP destinations for the LAC. Not displayed for LNS on M Series routers.                                                                                                                                                                                                                                                            |
| <b>Tunnels</b>                        | Number of L2TP tunnels established on the router.                                                                                                                                                                                                                                                                                              |
| <b>Sessions</b>                       | Number of L2TP sessions established on the router.                                                                                                                                                                                                                                                                                             |
| <b>Switched sessions</b>              | Number of L2TP tunnel-switched sessions established on the router.                                                                                                                                                                                                                                                                             |
| <b>Control</b>                        | Count of L2TP control packets and bytes sent and received.                                                                                                                                                                                                                                                                                     |
| <b>Data</b>                           | Count of L2TP data packets and bytes sent and received.                                                                                                                                                                                                                                                                                        |
| <b>Errors</b>                         | Count of L2TP error packets and bytes sent and received.                                                                                                                                                                                                                                                                                       |

## Sample Output

### show services l2tp summary (LAC on M Series routers)

```

user@host> show services l2tp summary
Administrative state is Drain
Failover within a preference level is Disabled
Weighted load balancing is Enabled
Destination equal load balancing is Disabled
Tunnel authentication challenge is Enabled
Calling number avp is Enabled
Failover Protocol is Disabled
Tunnel assignment id format is authentication-id
Destinations: 1 Tunnels: 1, Sessions: 1
 Tx packets Rx packets Memory (bytes)
Control 260 144 11513856

```

|        |      |       |      |
|--------|------|-------|------|
| Data   | 7.5k | 16.9k | 8.3k |
| Errors | 0    | 0     |      |

### show services l2tp summary (LAC on MX Series routers)

```

user@host> show services l2tp summary
Administrative state is Drain
 Failover within a preference level is Disabled
 Weighted load balancing is Disabled
 Destination equal load balancing is Enabled
 Tunnel authentication challenge is Enabled
 Calling number avp is Enabled
 Failover Protocol is Disabled
 Tx Connect speed method is static
 Rx speed avp when equal is enabled
 Tunnel Tx Address Change is Accept
 Min Retransmissions Timeout for control packets is 2 seconds
 Max Retransmissions for Established Tunnel is 7
 Max Retransmissions for Not Established Tunnel is 5
 Tunnel Idle Timeout is 60 seconds
 Destruct Timeout is 300 seconds
 Destination Lockout Timeout is 300 seconds
 Reassembly Service Set is ssnr3
 Access Line Information is Enabled, Speed Updates is Enabled
 IPv6 Services For LAC Sessions is Enabled
 Destinations: 0, Tunnels: 0, Sessions: 0, Switched sessions: 0

```

### show services l2tp summary (LNS on MX Series routers)

```

user@host show services l2tp summary
Administrative state is Drain
 Failover within a preference level is Disabled
 Weighted load balancing is Disabled
 Destination equal load balancing is Disabled
 Tunnel authentication challenge is Enabled
 Calling number avp is Enabled
 Failover Protocol is Enabled
 Tx Connect speed method is static
 reassembly Service Set is ssnr3
 Destinations: 4, Tunnels: 19, Sessions: 65, Switched sessions: 2
 Access Line Information is Enabled, Speed Updates is Enabled

```

### show services l2tp summary (LNS on M Series routers)

```

user@host> show services l2tp summary
Tunnels: 2, Sessions: 2, Errors: 0
 Tx packets Rx packets Memory (bytes)
Control 6k 9k 688k
Data 70k 70k 3054

```

### show services l2tp summary statistics (MX Series routers)

```

user@host>show services l2tp summary statistics
Administrative state is Drain
 Failover within a preference level is Disabled
 Weighted load balancing is Disabled
 Destination equal load balancing is Disabled
 Tunnel authentication challenge is Enabled
 Calling number avp is Enabled
 Failover Protocol is Enabled

```

Tx Connect speed method is advisory

## show services l2tp tunnel

**Syntax** show services l2tp tunnel  
 <brief | detail | extensive>  
 <interface *sp-fpc/pic/port*>  
 <local-gateway *gateway-address*>  
 <local-gateway-name *gateway-name*>  
 <local-tunnel-id *tunnel-id*>  
 <peer-gateway *gateway-address*>  
 <peer-gateway-name *gateway-name*>  
 <statistics>  
 <tunnel-group *group-name*>

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** (M10i and M7i routers only) Display information about active Layer 2 Tunneling Protocol (L2TP) tunnels for LNS.

(MX Series routers only) Display information about L2TP tunnels for LAC and LNS; the tunnels may or may not have active sessions.

**Options** **none**—Display standard information about all active L2TP tunnels.

**brief | detail | extensive**—(Default) Display the specified level of output.

**interface *sp-fpc/pic/port***—(Optional) Display L2TP tunnel information for only the specified adaptive services interface. This option is not available for L2TP on MX Series routers.

**local-gateway *gateway-address***—(Optional) Display L2TP tunnel information for only the specified local gateway address.

**local-gateway-name *gateway-name***—(Optional) Display L2TP tunnel information for only the specified local gateway name.

**local-tunnel-id *tunnel-id***—(Optional) Display L2TP tunnel information for only the specified local tunnel identifier.

**peer-gateway *gateway-address***—(Optional) Display L2TP tunnel information for only the specified peer gateway address.

**peer-gateway-name *gateway-name***—(Optional) Display L2TP tunnel information for only the specified peer gateway name.

**statistics**—(Optional) Display the number of control packets and bytes transmitted and received for the tunnel. The statistics for a tunnel are retained until the tunnel is disconnected, rather than until the last session in the tunnel is cleared. Retaining the statistics enables them to increment in the event a new session subsequently uses the tunnel. You cannot include this option with any of the level options, **brief**, **detail**, or **extensive**.

**tunnel-group *group-name***—(Optional) Display L2TP tunnel information for only the specified tunnel group.

| <b>Tunnel Logical System</b>           | Logical system in which the L2TP tunnel is brought up.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Tunnel Routing Instance</b>         | Routing instance in which the L2TP tunnel is brought up.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Max sessions</b>                    | Maximum number of sessions that can be established on this tunnel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Window size</b>                     | Number of control messages that can be sent without receipt of an acknowledgment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Hello interval</b>                  | Interval between the transmission of hello messages, in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Table 73: show services l2tp tunnel Output Fields (continued)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Create time</b>      | Date and time when the tunnel was created. While the LNS and LAC are connected, this value should correspond to the router's uptime. If connection to the LAC is severed, the State changes to <b>Unknown</b> and the <b>Create time</b> value resets.                                                                                                                                                                                                                                                                                                                                                  |
| <b>Up time</b>          | Amount of time elapsed since the tunnel became active, in hours, minutes, and seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Idle time</b>        | Amount of time elapsed since the tunnel became idle, in hours, minutes, and seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Sample Output

### show services l2tp tunnel (LAC)

```
user@host> show services l2tp tunnel
Local ID Remote ID Remote IP Sessions State
17185 1 203.0.113.101:1701 1 Established
```

### show services l2tp tunnel detail (LAC)

```
user@host> show services l2tp tunnel detail
Tunnel local ID: 31889, Tunnel remote ID: 1
Remote IP: 203.0.113.101:1701
Sessions: 1, State: Established
Tunnel Name: 1/tunnel-to-LNS-1
Local IP: 192.0.2.2:1701
Local name: ce-lac, Remote name: ce-lns
Effective Peer Resync Mechanism: silent failover
```

### show services l2tp tunnel detail (LAC on MX Series Routers)

```
user@host> show services l2tp tunnel detail
Tunnel local ID: 17301, Tunnel remote ID: 1
Remote IP: 203.0.113.101:1701
Sessions: 1, State: Established
Tunnel Name: 2/tunnel-to-LNS-2
Local IP: 192.0.2.2:1701
Local name: ce-lac, Remote name: ce-lns
Effective Peer Resync Mechanism: silent failover
Tunnel Logical System: default, Tunnel Routing Instance: default
```

**show services l2tp tunnel detail (LNS on MX Series Routers)**

```

user@host> show services l2tp tunnel detail
Tunnel local ID: 17301, Tunnel remote ID: 1
Remote IP: 198.51.100.15:1701
Sessions: 1, State: Established
Tunnel Name: 2/2
Local IP: 198.51.100.5:1701
Local name: ce-bras-mx240-e, Remote name: testlac2
Effective Peer Resync Mechanism: silent failover
Tunnel Logical System: default, Tunnel Routing Instance: vrf1

```

**show services l2tp tunnel extensive (LAC)**

```

user@host> show services l2tp tunnel extensive
Tunnel local ID: 17185, Tunnel remote ID: 1
Remote IP: 203.0.113.101:1701
Sessions: 1, State: Established
Tunnel Name: 2/tunnel-to-LNS-2
Local IP: 192.0.2.22:1701
Local name: ce-lac, Remote name: ce-lns
Effective Peer Resync Mechanism: failover protocol
Max sessions: 32000, Window size: 4, Hello interval: 60
Create time: Tue Nov 9 15:23:29 2010, Up time: 00:00:26
Idle time: 00:00:00

```

**show services l2tp tunnel extensive (LNS on M Series Routers)**

```

| <b>Output Fields</b>            | <a href="#">Table 76 on page 1561</a> lists the output fields for the <b>show services nat deterministic-nat nat-port-block</b> command. Output fields are listed in the approximate order in which they appear. |

*Table 76: show services nat deterministic-nat nat-port-block Output Fields*

| Field Name            | Field Description                                                                                                                                                           |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b>      | Name of a service interface.                                                                                                                                                |
| <b>Service set</b>    | Name of a service set. Individual empty service sets are not displayed, but if none of the service sets has any flows, a flow table header is printed for each service set. |
| <b>Internal Host</b>  | Private IP address of a subscriber on the access network.                                                                                                                   |
| <b>NAT IP address</b> | NAT public IP address                                                                                                                                                       |
| <b>NAT Port Start</b> | Lowest port number in range of assigned ports.                                                                                                                              |
| <b>NAT Port End</b>   | Highest port number in range of assigned ports.                                                                                                                             |

## Sample Output

### run show services nat deterministic-nat nat-port-block

```

user@host> show services nat deterministic-nat nat-port-block 192.0.2.1
Service set: ss1
Interface: sp-2/0/0
NAT pool: pool1
Internal Host: 192.0.2.1, NAT IP Address: 203.0.113.1, NAT Port Start: 1024, NAT
Port End: 1279

```

## show services nat ipv6-multicast-interfaces

|                                 |                                                                                                                                                                                                           |

| <b>Description</b>         | Display information about Network Address Translation (NAT) address, port, and port control protocol (PCP) mappings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>             | <b>none</b> —Display standard information about all NAT pools.<br><br><b>brief   detail   summary</b> —(Optional) Display the specified level of output.<br><br><b>nptv6</b> —(Optional) Display information about the network prefix translation for IPv6 traffic.<br><br><b>ipv6-address</b> —(Optional) Display the network prefix translation details for the specified IPv6 address.<br><br><b>external</b> —(Optional) Display the external to internal address mapping for a given external address if the mapping exists for stateless network IPv6 prefix translation.<br><br><b>internal</b> —(Optional) Display the internal to external address mapping for a given internal address if the mapping exists for stateless network IPv6 prefix translation.<br><br><b>pool-name</b> —(Optional) Display detailed information about a specific NAT pool. Used only with detail level output.<br><br><b>address-pooling-paired</b> —(Optional) Display only information about address-pooling paired mappings.<br><br><b>endpoint-independent</b> —(Optional) Display only information about endpoint-independent mappings.<br><br><b>pcg</b> —(Optional) Display only information about port control protocol mappings. |

**NOTE:** PCP requests with the prefer-failure option request a particular external IP address and port. When the request cannot be fulfilled, the mapping is not created. In this case, the subscriber does not have a mapped IP address. Such a subscriber is counted in the summary of the number or address mappings, but is not displayed in the list of address mappings, as shown in the following examples:

```
user@host# show services nat mappings summary
Service Interface: sp-2/0/0
Total number of address mappings: 1
Total number of endpoint independent port mappings: 0
Total number of endpoint independent filters: 0

user@host# show services nat mappings address-pooling-paired
[edit]
```

This is expected behavior because unfulfilled address mappings (IP of 0.0.0.0) are not displayed in the output of the second CLI command. These address mappings will time out based on configured or default values.

- [show services nat mappings nptv6 external on page 1568](#)

**Output Fields** [Table 78 on page 1565](#) lists the output fields for the **show services nat mappings** command. Output fields are listed in the approximate order in which they appear.

*Table 78: show services nat mappings Output Fields*

| Field Name  | Field Description                                                                                                                                                           | Level of Output |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Interface   | Name of a service interface.                                                                                                                                                | All levels      |
| Service set | Name of a service set. Individual empty service sets are not displayed, but if none of the service sets has any flows, a flow table header is printed for each service set. | All levels      |
| NAT pool    | Name of the NAT pool.                                                                                                                                                       | All levels      |

Table 78: show services nat mappings Output Fields (continued)

| Field Name                                          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Level of Output |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Address Mapping<br>or<br>Mapping                    | Mapping performed by NAT to conceal the network address.                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels      |
| No. of port mappings                                | Number of port mappings.                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels      |
| Port mapping                                        | Port mapping performed by NAT.                                                                                                                                                                                                                                                                                                                                                                                                                                           | detail          |
| Flow Count                                          | Number of flows.                                                                                                                                                                                                                                                                                                                                                                                                                                                         | detail          |
| Total number of address mappings                    | Total number of address mappings, by service interface.                                                                                                                                                                                                                                                                                                                                                                                                                  | summary         |
| Total number of endpoint independent port mappings: | Total number of port mappings by service interface.                                                                                                                                                                                                                                                                                                                                                                                                                      | summary         |
| Total number of endpoint independent filters        | Total number of independent filters that filter out only packets that are not destined to the internal address and port, regardless of the external IP address and port source, by service interface.                                                                                                                                                                                                                                                                    | summary         |
| Mapping State                                       | NAT mapping state. The following states are possible: <ul style="list-style-type: none"> <li>• <b>ACTIVE</b>—Indicates that the entry is active and in use.</li> <li>• <b>TIMEOUT</b>—Indicates that the mapping is not in use. After the <b>mapping-timeout</b>, configured at the <b>[edit services nat pool pool-name]</b> hierarchy level, lapses, the mapping is deleted. This field also displays the number of seconds after which the timeout occurs.</li> </ul> |                 |
| Ports In Use                                        | The number of ports used for a specific address-pooling paired mapping.                                                                                                                                                                                                                                                                                                                                                                                                  |                 |
| PCP Lifetime                                        | Elapsed PCP lifetime in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                         |                 |
| PCP Client                                          | Address of the PCP client sending the PCP request.                                                                                                                                                                                                                                                                                                                                                                                                                       |                 |
| Session Count                                       | Number of sessions currently using the mapping.                                                                                                                                                                                                                                                                                                                                                                                                                          |                 |

## Sample Output

### show services nat mappings brief

```

user@host> show services nat mappings brief
Interface: sp-2/3/0, Service set: s1

NAT pool: p1

```

```
Address Mapping: 2.1.20.10 ---> 34.34.34.34
No. of port mappings: 1
```

### show services nat mapping detail

```
user@host> show services nat mapping detail
Interface: sp-2/3/0, Service set: s1

NAT pool: p1
Address Mapping: 2.1.20.10 ---> 34.34.34.34, No. of port mappings: 1
Port mapping: 49604 --> 1024, Flow Count: 2
```

### show services nat mappings pool-name

```
user@host> show services nat mappings pool-name p1
Interface: sp-2/3/0, Service set: s1

NAT pool: p1
Address Mapping: 2.1.20.10 ---> 34.34.34.34
No. of port mappings: 1
```

### show services nat mappings summary

```
user@host> show services nat mapping summary

Service Interface: sp-1/0/0
Total number of address mappings: 790
Total number of endpoint independent port mappings: 1580
Total number of endpoint independent filters: 1580

Service Interface: sp-1/1/0
Total number of address mappings: 914
Total number of endpoint independent port mappings: 1828
Total number of endpoint independent filters: 1828

Service Interface: sp-4/0/0
Total number of address mappings: 688
Total number of endpoint independent port mappings: 1376
Total number of endpoint independent filters: 1376

Service Interface: sp-4/1/0
Total number of address mappings: 648
Total number of endpoint independent port mappings: 1296
Total number of endpoint independent filters: 1296
```

### show services nat mappings address-pooling-paired

```
user@host> show services nat mappings address-pooling-paired
Interface: sp-3/0/0, Service set: NAPT44-SS1
NAT pool: napt44-SS1-p1
Mapping : 29.32.38.255 --> 192.168.75.23
Ports In Use : 9
Session Count : 1
Mapping State : Active
```

### show services nat mappings address-pooling-paired (mapping of active B4 for a subscriber)

```
user@host> show services nat mappings address-pooling-paired
```

```
Interface: sp-0/0/0, Service set: sset_1

NAT pool: nat_pool1

Mapping : 2001:: --> 33.33.33.2
Ports In Use : 1
Session Count: 9
Mapping State: Timeout
```

#### show services nat mappings endpoint-independent

```
user@host> show services nat mappings endpoint-independent
Interface: sp-3/0/0, Service set: NAPT44-SS1
NAT pool: napt44-SS1-p1
Mapping : 29.32.38.255:10000 --> 192.168.75.23:1024
Session Count: 1
Mapping State: Active
```

#### show services nat mappings pcnp

```
user@host> show services nat mappings pcnp
PCP Client : 172.16.0.1 PCP Lifetime : 45
Mapping : 29.32.38.255:10000 --> 192.168.75.23:1024
Session Count : 1
Mapping State : Active
```

#### show services nat mappings nptv6 internal

```
user@host> show services nat mappings nptv6 internal 1111:2222:3333:aaaa:bbbb::1

Interface Service-set NAT-Pool Address Mapping
si-0/1/0 ss_nptv6 ss_nptv6_pool 1111:2222:3333:aaaa:bbbb::1 ->
aaaa:bbbb:cccc:dddd:bbbb::1
```

#### show services nat mappings nptv6 external

```
user@host> show services nat mappings nptv6 external aaaa:bbbb:cccc:dddd:bbbb::1

Interface Service-set NAT-Pool Address Mapping
si-0/1/0 ss_nptv6 ss_nptv6_pool 1111:2222:3333:aaaa:bbbb::1
-> aaaa:bbbb:cccc:dddd:bbbb::1
```

## show services nat pool

**Syntax**    `show services nat pool`  
               `<brief | detail>`  
               `<pool-name>`  
               `pgcp <ports-per-session | remotely-controlled>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                               `pgcp` option added in Junos OS Release 8.5.

**Description**    Display information about Network Address Translation (NAT) pools.

**NOTE:** On MS-MPCs and MS-MICs, if the line cards receive a packet immediately after the active port block timeout interval has expired, a new port block is allocated and the old port block is released thereafter (if no more ports are being used from that block). In such a scenario, you might notice that the Max number of port blocks used field displays a higher value than the value shown for the Unique pool users field in the output of the `show services nat pool detail` command. This behavior is expected with port block allocation.

With MS-MPCs and MS-MICs, in the output of the `show services nat pool detail` command, the Max ports used and the Ports in use fields display values that indicate a higher number than the number of active subscribers on the member interfaces of an ams interface. This behavior of an increased value displayed for the number of ports allocated and maximum number of ports used is expected after you perform a Graceful Routing Engine switchover (GRES) and a restart of the MPC.

With MS-MPCs and MS-MICs on MX Series routers with AMS interfaces, it is observed that the subscriber and port count details are displayed only after a long time in the output of the `show services nat pool detail` command. This behavior is expected with NAT pool counters and occurs, regardless of port block allocation being configured.

**Options**    **none**—Display standard information about all NAT pools.

**brief | detail**—(Optional) Display the specified level of output.

**pool-name**—(Optional) Display information about the specified NAT pool.

**pgcp**—(Optional) Display information about a NAT pool that is exclusive to the BGF.

**ports-per-session**—(Optional) Display the number of ports allocated per session from the NAT pool.

**remotely-controlled**—(Optional) Display if the NAT pool is explicitly specified by the gateway controller.

**Required Privilege Level** view

**List of Sample Output** [show services nat pool brief on page 1572](#)  
[show services nat pool detail on page 1572](#)  
[show services nat pool \(Secured Port Block Allocation\) on page 1573](#)  
[show services nat pool detail \(Deterministic Port Block Allocation\) on page 1573](#)  
[show services nat pool \(Deterministic Port Block Allocation\) on page 1573](#)  
[show services nat pool detail \(Port Block Allocation\) on page 1574](#)

**Output Fields** [Table 79 on page 1570](#) lists the output fields for the **show services nat pool** command. Output fields are listed in the approximate order in which they appear.

*Table 79: show services nat pool Output Fields*

| Field Name                        | Field Description                                                                                                                                                           | Level of Output |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Interface</b>                  | Name of an adaptive services interface.                                                                                                                                     | All levels      |
| <b>Service set</b>                | Name of a service set. Individual empty service sets are not displayed, but if none of the service sets has any flows, a flow table header is printed for each service set. | All levels      |
| <b>NAT pool</b>                   | Name of the Network Address Translation pool.                                                                                                                               | All levels      |
| <b>Type or Translation type</b>   | Address translation type: <b>basic-nat-pt</b> , Y, Y, Y, Y, Y, Y, Y, Y, Y, Y, Y.                                                                                            | All levels      |
| <b>Address or Address range</b>   | IPv4 address range of the pool.                                                                                                                                             | All levels      |
| <b>Port or Port range</b>         | Port range of the pool. Applicable only for dynamic NAT pools. Not displayed for static NAT pools.                                                                          | All levels      |
| <b>Ports used or Ports in use</b> | Number of ports allocated in this pool with this name. Applicable only for dynamic NAT pools. Not displayed for static NAT pools.                                           | All levels      |
| <b>Port block type</b>            | Type of port block allocation: secured or deterministic                                                                                                                     | All levels      |
| <b>Available addresses</b>        | Number of free addresses in the NAT pool.                                                                                                                                   | <b>detail</b>   |
| <b>Configured port range</b>      | The range of ports configured to be used for NAT pool.                                                                                                                      | <b>detail</b>   |
| <b>Out of port errors</b>         | Number of port allocation errors. Applicable only for dynamic NAT pools. Not displayed for static NAT pools.                                                                | <b>detail</b>   |
| <b>Parity port errors</b>         | Number of port allocations that failed because a port number of the desired parity was not available.                                                                       | <b>detail</b>   |

Table 79: *show services nat pool Output Fields (continued)*

| Field Name                                      | Field Description                                                                                                                                                                                                                                           | Level of Output       |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| <b>Preserve Range errors</b>                    | Number of port allocations that failed because a port in the desired range was not available.                                                                                                                                                               | <b>detail</b>         |
| <b>Max ports used</b>                           | Maximum number of ports used. Applicable only for dynamic NAT pools. Not displayed for static NAT pools.                                                                                                                                                    | <b>detail</b>         |
| <b>Addresses in use</b>                         | Number of addresses in use for dynamic source address NAT pools.                                                                                                                                                                                            | <b>detail</b>         |
| <b>AP-P port allocation errors</b>              | When address pooling paired (AP-P) is configured, a private IP is paired to a public IP. This is a counter of translation errors where there are free ports available in the NAT pool, but none for the NAT IP to which the private IP is paired.           | <b>detail</b>         |
| <b>AP-P port limit allocation errors</b>        | When AP-P is configured, this is a counter of out-of-port errors that are due to a configured limit for the number of allocated ports in the <b>limit-ports-per-address</b> statement at the <b>[edit services nat pool nat-pool-name]</b> hierarchy level. | <b>detail</b>         |
| <b>Memory allocation errors</b>                 | Number of memory allocation failures.                                                                                                                                                                                                                       | <b>detail</b>         |
| <b>EIF Inbound session count</b>                | Current number of EIF inbound sessions.                                                                                                                                                                                                                     | <b>detail</b>         |
| <b>EIF Inbound session Limit exceeded drops</b> | Number of inbound connections that were dropped because the EIF limit was exceeded.                                                                                                                                                                         | <b>detail</b>         |
| <b>Port block size</b>                          | Number of ports in a port block.                                                                                                                                                                                                                            | <b>none<br/>brief</b> |
| <b>Max port blocks per address</b>              | Maximum number of port blocks per private address.                                                                                                                                                                                                          | <b>none<br/>brief</b> |
| <b>Active block timeout</b>                     | Activity timeout of port block.                                                                                                                                                                                                                             | <b>none<br/>brief</b> |
| <b>Effective port range</b>                     | Effective range of port numbers.                                                                                                                                                                                                                            | <b>none<br/>brief</b> |
| <b>Effective number of port blocks</b>          | Effective number of port blocks.                                                                                                                                                                                                                            | <b>none<br/>brief</b> |
| <b>Effective number of ports</b>                | Effective number of ports.                                                                                                                                                                                                                                  | <b>none<br/>brief</b> |
| <b>Port block efficiency</b>                    | Port block efficiency.                                                                                                                                                                                                                                      | <b>none<br/>brief</b> |
| <b>Port blocks limit exceeded errors</b>        | The total number of times when a request for more than the allowed port blocks allocated for a user arrives from a user.                                                                                                                                    | <b>All levels</b>     |

Table 79: show services nat pool Output Fields (continued)

| Field Name                                    | Field Description                                                                                                                                                                                                                                                                                             | Level of Output |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Preserve range enabled</b>                 | Whether the capability to preserve the privileged port range after translation is enabled. One of the following is displayed: <ul style="list-style-type: none"> <li><b>Is active</b>—Preservation of port range is enabled.</li> <li><b>Not active</b>—Preservation of port range is not enabled.</li> </ul> | <b>detail</b>   |
| <b>AP-P out of port errors</b>                | When AP-P is configured, a private IP is paired to a public IP. This is a counter of translation errors where there are free ports available in the NAT pool, but none for the NAT IP to which the private IP is paired.                                                                                      | <b>detail</b>   |
| <b>MAX number of port blocks used</b>         | The maximum number of port blocks used.                                                                                                                                                                                                                                                                       | All levels      |
| <b>Current number of port blocks in use</b>   | Current count of the port blocks that are being used.                                                                                                                                                                                                                                                         | <b>detail</b>   |
| <b>Port block allocation errors</b>           | The consolidated number of port block allocation errors.                                                                                                                                                                                                                                                      | All levels      |
| <b>Port block memory allocation errors</b>    | The number of memory allocation errors for port blocks.                                                                                                                                                                                                                                                       | All levels      |
| <b>DetNat subscriber exceeded port limits</b> | The number of times a subscriber exceeded its port limits for a NAT pool that uses deterministic port block allocation.                                                                                                                                                                                       | All levels      |
| <b>Unique pool users</b>                      | The number of different users of the NAT pools.                                                                                                                                                                                                                                                               | All levels      |
| <b>Current EIF Inbound flows count</b>        | Current count of EIF inbound flows, including all EIF flows per pool.                                                                                                                                                                                                                                         | <b>detail</b>   |
| <b>EIF flow limit exceeded drops</b>          | Current number of flow drops due to exceeded flow limit. This number is per pool, not per EIF mapping.                                                                                                                                                                                                        | <b>detail</b>   |

## Sample Output

### show services nat pool brief

```
user@host> show services nat pool brief
```

```
Interface: ms-1/0/0, Service set: s1
NAT pool Type Address Port Ports used
dest-pool DNAT-44 10.10.10.2-10.10.10.2
napt-pool NAPT-44 50.50.50.1-50.50.50.254 1024-63487 0
source-dynamic-pool DYNAMIC NAT44 40.40.40.1-40.40.40.254
source-static-pool BASIC NAT44 30.30.30.1-30.30.30.254
```

### show services nat pool detail

```
user@host> show services nat pool detail
```

```

Interface: ms-4/0/0, Service set: ss1
NAT pool: srcpool, Translation type: NAPT-44
Address range: 100.0.0.1-100.0.0.254
Available addresses: 254
Configured port range: 1024-65535
Port range: 1024-65535, Ports in use: 0, Out of port errors: 0
Parity port errors: 0, Preserve Range errors: 0
Max ports used: 0
AP-P port allocation errors: 0, AP-P port limit allocation errors: 0
Memory allocation errors: 0
EIF Inbound session count: 0
EIF Inbound session Limit exceeded drops: 0

```

### show services nat pool (Secured Port Block Allocation)

```

user@host> show services nat pool
Interface: sp-2/0/0, Service set: in
NAT pool Type Address Port Ports used
mypool dynamic 3.3.3.3-3.3.3.10 512-65535 0
 3.3.3.15-3.3.3.20
 3.3.3.25-3.3.3.30
 3.3.3.95-3.3.3.200
Port block size: 64, Max port blocks per address: 1, Active block timeout: 86400,
Effective port range: 1024-65471,
Effective number of port blocks: 126882, Effective number of ports: 8120448, Port
block efficiency: nan

Interface: sp-2/1/0, Service set: in1
NAT pool Type Address Port Ports used
mypool1 dynamic 9.9.9.1-9.9.9.254 512-65535 0
Port block size: 64, Max port blocks per address: 1, Active block timeout: 86400,
Effective port range: 1024-65471,
Effective number of port blocks: 255778, Effective number of ports: 16369792,
Port block efficiency: nan

```

### show services nat pool detail (Deterministic Port Block Allocation)

```

user@host> show services nat pool detail
Interface: sp-2/0/0, Service set: ss1
NAT pool: napt_pool, Translation type: dynamic
Address range: 5.5.5.1-5.5.5.254
Configured port range: 1-60000, Preserve range enabled: Is active
Port range: 2000-2002, Ports in use: 2, Out of port errors: 0, Max ports used:
2
AP-P out of port errors: 188
Max number of port blocks used: 1, Current number of port blocks in use: 1,
Port block allocation errors: 0,
Port block memory allocation errors: 0
DetNAT subscriber exceeded port limits: 1
Unique pool users: 1

```

### show services nat pool (Deterministic Port Block Allocation)

```

user@host> show services nat pool

Interface: sp-2/0/0, Service set: ss2
NAT pool Type Address Port Ports Used
pba dynamic 33.33.33.1-33.33.33.128 512-65535 6604
Port block type: Deterministic port block, Port block size: 200

```

### show services nat pool detail (Port Block Allocation)

```
user@host> show services nat pool detail
```

```
Interface: sp-2/0/0, Service set: s
NAT pool: napt_pool, Translation type: dynamic
Address range: 44.1.1.1-44.1.1.1
Configured port range: 1-60000
Port range: 1024-65535, Ports in use: 0, Out of port errors: 0,
Max ports used: 0
AP-P out-of-port errors: 0
Current EIF Inbound flows count: 0
EIF flow limit exceeded drops: 0
```

## show services pcsp statistics

**Syntax** `show services pcsp statistics`

**Release Information** Command introduced in Junos OS Release 13.2

**Description** Display information PCP mappings.

**Required Privilege Level** view

**List of Sample Output** [show services pcsp statistics pcsp on page 1576](#)

**Output Fields** [Table 80 on page 1575](#) lists the output fields for the **show services pcsp statistics** command. Output fields are listed in the approximate order in which they appear.

*Table 80: show services pcsp statistics Output Fields*

| Field Name                    | Field Description                                                                              |
|-------------------------------|------------------------------------------------------------------------------------------------|
| Services PIC Name             | Name of a service interface.                                                                   |
| Protocol Statistics           | Overall PCP statistics, consisting of: operational, option, and results statistics.            |
| Operational Statistics        | Operational statistics group.                                                                  |
| Map request received          | Total PCP MAP requests received from PCP clients.                                              |
| Peer request received         | Number of peer requests received.                                                              |
| Option Statistics             | Number of requests using available options.                                                    |
| Unprocessed requests received | Number of requests received with no option specified.                                          |
| Third party requests received | Number of third-party requests received.                                                       |
| Prefer fail option received   | Number of prefer fail requests received.                                                       |
| Filter option received        | Number of filter option requests received.                                                     |
| Other options counters        | Number of packets received with options other than <b>prefer-fail</b> and <b>third-party</b> . |
| Other optional received       |                                                                                                |
| Results Statistics            | Information about the results of PCP requests.                                                 |
| PCP success                   | Number of PCP MAP requests successfully processed by the server.                               |
| PCP unsupported version       | Number of PCP packets received with version other than 1.                                      |

Table 80: show services pcp statistics Output Fields (continued)

| Field Name                       | Field Description                                                                                                          |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Not authorized                   | Number of unauthorized MAP delete requests.                                                                                |
| Bad requests                     | Number of requests with invalid PCP packets.                                                                               |
| Unsupported opcode               | Number of packets that have an unsupported opcode.                                                                         |
| Unsupported option               | Number of packets that have an unsupported option.                                                                         |
| Bad option                       | Number of packet that have a malformed option.                                                                             |
| Network failure                  | Number of times a mapping could not be provided due to a network failure.                                                  |
| Out of resources                 | Number of times a mapping could not be provided because the PCP server ran out of pool resources.                          |
| Unsupported protocol             | Number of requests for which the protocol was neither TCP nor UDP.                                                         |
| User exceeded quota              | Number of requests for which the PCP client requested more than the configured number of ports.                            |
| Cannot provide external          | Number of requests for which the PCP server cannot provide the external address or port requested by the client.           |
| Address mismatch                 | Number of requests for which the PCP client IP address and the layer-3 source IP do not match.                             |
| Excessive number of remote peers | This counter is not currently used.                                                                                        |
| Processing error                 | Number of requests with malformed PCP packets information, such as an invalid IP address in a <b>third-party</b> request . |
| Other result counters            | Not currently used.                                                                                                        |

## Sample Output

### show services pcp statistics pcp

|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Transition Events Ignored | <p>Number of transition events ignored in each of the following categories:</p> <ul style="list-style-type: none"> <li>• Acquire mastership auto</li> <li>• Acquire mastership manual</li> <li>• Release mastership auto</li> <li>• Release mastership manual</li> </ul> <p>In a high-availability or redundancy pair of SDGs, in which one SDG is the master and the other is the standby, when perform a double failover of the SDGs, the second failover event is not ignored, which is the expected behavior. The event is not disregarded because it arrives as a critical redundancy-event based on the redundancy-policy. However, because the SDG is already be in Standby state, the finite state machine transitions to the Standby-Warned state until it recovers. Therefore, the event is honored and not ignored. Although there was no mastership transition, it is because of a valid reason that the SDG is already in Standby state. The redundancy-event is associated with to a mastership release policy based on the configuration and the Release mastership field under the Transition Events Ignored column displays a number that corresponds to the redundancy event.</p> <p>The services redundancy daemon (SRD) finite state machine quickly recovers (transitions from Standby-Warned to Standby) during restart-routing because the rpd restart-handling and recovery are fast and the following critical event is not ignored. However, disabling or deactivating the interface results in the FSM remaining in Standby-Warned until the interface is up. Any critical events during the time when the interface is down are ignored because the state is already Standby-Warned and does not transition to a different state. In summary, the following is the manner in which critical events are analyzed during state transitions:</p> <ul style="list-style-type: none"> <li>• Standby -&gt; Standby Warned = Critical Event Not ignored [valid state transition]</li> <li>• Standby Warned -&gt; Standby Warned = Critical Event Ignored [no state transition]</li> </ul> | extensive       |
| Monitored Events Received | <p>Number of monitored events received in each of the following categories:</p> <ul style="list-style-type: none"> <li>• Link-down</li> <li>• Routing restart/abort</li> <li>• Route update error</li> <li>• Peer mastership-acquire</li> <li>• Peer mastership-release</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | extensive       |

## show services service-sets cpu-usage

**Syntax** `show services service-sets cpu-usage`  
`<interface interface-name>`  
`<service-set service-set-name>`

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** Display service set CPU usage as a percentage. The command is supported only on Adaptive Services PICs (SP PICs).

**Options** **none**—Display CPU usage for all adaptive services interfaces and service sets.

**interface *interface-name***—(Optional) Display CPU usage for a particular interface. On M Series and T Series routers, the *interface-name* parameter can have the value *sp-fpc/pic/port* or *rspnumber*.

**service-set *service-set-name***—(Optional) Display CPU usage for a particular service set. For the Layer 2 Tunneling Protocol (L2TP), you can use a tunnel group to represent a service set.

**Required Privilege Level** view

**List of Sample Output** [show services service-sets cpu-usage on page 1587](#)

**Output Fields** [Table 82 on page 1586](#) lists the output fields for the **show services service-sets cpu-usage** command. Output fields are listed in the approximate order in which they appear.

*Table 82: show services service-sets cpu-usage Output Fields*

| Field Name                           | Field Description                                                                                                                                                                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b>                     | Name of an adaptive services interface                                                                                                                                                                                                                             |
| <b>Service set (system category)</b> | Name of the CPU usage category: <ul style="list-style-type: none"> <li>• idp_recommended—Name of the service sets (displays all the service sets attached to the service PICs)</li> <li>• Idle</li> <li>• System</li> <li>• Receive</li> <li>• Transmit</li> </ul> |
| <b>CPU utilization %</b>             | Percentage of the CPU resources being used                                                                                                                                                                                                                         |

## Sample Output

`show services service-sets cpu-usage`

```
user@host> show services service-sets cpu-usage
```

| Interface | Service set (system category) | CPU utilization % |
|-----------|-------------------------------|-------------------|
| sp-4/1/0  | idp_recommended               | 18.20 %           |
| sp-4/1/0  | Idle                          | 44.69 %           |
| sp-4/1/0  | System                        | 7.01 %            |
| sp-4/1/0  | Receive                       | 15.10 %           |
| sp-4/1/0  | Transmit                      | 15.00 %           |

## show services service-sets memory-usage

**Syntax** show services service-sets memory-usage  
 <interface *interface-name*>  
 <service-set *service-set-name*>  
 <zone>

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** Display service set memory usage.

**Options** none—Display service set memory usage.

**interface *interface-name***—(Optional) Display memory usage for a particular interface. On M Series and T Series routers, the *interface-name* can be *sp-fpc/pic/port*, or *rspnumber*.

**NOTE:** This command is not supported on Multilink Protocol–based services PICs.

The interface option is not supported on Multiservice PICs.

**service-set *service-set-name***—(Optional) Display memory usage for a particular service set. For Layer 2 Tunneling Protocol (L2TP), you can use a tunnel group to represent a service set.

**zone**—(Optional) Display the memory usage zone of the adaptive services interface or an individual service set.

**Required Privilege Level** view

**List of Sample Output** [show services service-sets memory-usage on page 1589](#)  
[show services service-sets memory-usage zone on page 1589](#)  
[show services service-sets memory-usage interface on page 1589](#)

**Output Fields** [Table 83 on page 1588](#) lists the output fields for the **show services service-sets memory-usage** command. Output fields are listed in the approximate order in which they appear.

*Table 83: show services service-sets memory-usage Output Fields*

| Field Name  | Field Description                      |
|-------------|----------------------------------------|
| Interface   | Name of an adaptive services interface |
| Service set | Name of a service set                  |

*Table 83: show services service-sets memory-usage Output Fields (continued)*

| Field Name         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Bytes Used</b>  | Number of bytes of memory being used                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Memory zone</b> | <p>Memory zone in which the adaptive services interface is currently operating:</p> <ul style="list-style-type: none"> <li>• <b>Green</b>—All new flows are allowed.</li> <li>• <b>Yellow</b>—Unused memory is reclaimed. All new flows are allowed.</li> <li>• <b>Orange</b>—New flows are allowed only for service sets that are using less than their equal share of memory.</li> <li>• <b>Red</b>—No new flows are allowed.</li> </ul> |

## Sample Output

### show services service-sets memory-usage

```

user@host> show services service-sets memory-usage
Interface Service set Bytes Used
ms-4/0/0 N/A 14817036
ms-4/1/0 N/A 14691700

```

### show services service-sets memory-usage zone

```

user@host> show services service-sets memory-usage zone
Interface Memory zone

```

### show services service-sets memory-usage interface

```

user@host> show services service-sets memory-usage interface ms-4/1/0
Interface Service Set Bytes Used
ms-4/1/0 N/A 14691700

```

## show services service-set statistics ids drops

**Syntax** `show services service-set statistics ids drops`  
`<interface interface-name>`  
`<service-set service-set-name>`

**Release Information** Command introduced in Junos OS Release 17.1 on MX Series.

**Description** Display statistics for packet drops resulting from header-integrity, suspicious packet pattern, and session-limit checks performed by an MS-MPC or MS-MIC.

**Options** **none**—Display statistics for all configured service interfaces and service sets.  
**interface *interface-name***—(Optional) Display statistics for the specified services interface.  
**service-set *service-set-name*** —(Optional) Display statistics for the specified service set.

**Required Privilege Level** view

| Field Name | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <p>Number of IPv4 errors for the following categories:</p> <ul style="list-style-type: none"> <li>• <b>IP packet length inconsistencies</b>—IP packet length did not match the Layer 2 reported length.</li> <li>• <b>Minimum IP header length check failures</b>—Minimum IP header length is 20 bytes. The received packet contained less than 20 bytes.</li> <li>• <b>Reassembled packet exceeds maximum IP length</b>—After fragment reassembly, the reassembled IP packet length exceeded 65,535.</li> <li>• <b>Illegal source address 0</b>—Source address is not a valid address. Invalid addresses are loopback, broadcast, multicast, and reserved addresses. Source address 0, however, is allowed to support BOOTP and the destination address 0xffffffff.</li> <li>• <b>Illegal destination address</b>—Destination address was not a valid address. The address is reserved.</li> <li>• <b>TTL zero errors</b>—Received packet had a time-to-live (TTL) value of 0.</li> <li>• <b>Illegal IP protocol number 0 or 255</b>—IP protocol is 0 or 255.</li> <li>• <b>Land attack</b>—IP source address is the same as the destination address.</li> <li>• <b>Non-IP packets</b>—Packet did not conform to the IP standard.</li> <li>• <b>IP option</b>—Packet had a non-allowed IP option.</li> <li>• <b>Non-IPv4 packets</b>—Packet was not of the IPv4 type.</li> <li>• <b>Non-IPv6 packets</b>—Packet was not of the IPv6 type.</li> <li>• <b>Bad checksum</b>—Packet had an invalid IP checksum.</li> <li>• <b>Illegal IP fragment length</b>—Illegal fragment length. All fragments (other than the last fragment) must have a length that is a multiple of 8 bytes.</li> <li>• <b>IP fragment overlap</b>—Fragments had overlapping fragment offsets.</li> <li>• <b>IP fragment limit exceeded</b>—Configured number of allowed fragments for a packet was exceeded.</li> <li>• <b>IP fragment reassembly timeout</b>—Some of the fragments for an IP packet were not received in time, and the reassembly handler dropped partial fragments. Whenever a fragment is received, it is maintained in a chain until all other fragments are received. If other fragments do not arrive within the configured value of reassembly-timeout, this packet is dropped and the value of the counter shown in this field is incremented. If other fragments arrive in time but the total number of fragments is more than the configured value of fragment-limit, all the fragments (of this packet) are dropped and the value of the counter shown in this field is incremented.</li> <li>• <b>IPv4 bad options</b>—Packet IP header contained IPv4 option that is not allowed.</li> <li>• <b>IPv6 bad extension headers</b>—Packet contained IPv6 extension header type that is not allowed.</li> <li>• <b>session-limit exceeded for source</b>—Number of concurrent sessions from an individual source address or subnet exceeded limit.</li> <li>• <b>session-limit exceeded for destination</b>—Number of concurrent sessions to an individual destination address or subnet exceeded</li> </ul> |

## Sample Output

### show services service-set statistics ids drops

```

user@host> show services service-set statistics ids drops
Interface: ms-1/0/0
Service set: sset1
Errors:
 IP: 0, TCP: 0
 UDP: 0, ICMP: 0
IP errors:
 IP packet length inconsistencies: 0
 Illegal source address: 0
 Illegal destination address: 0
 TTL zero errors: 0, Illegal IP protocol number (0 or 255): 0
 Land attack: 0
 Non-IPv4 packets: 0
 Non-IPv6 packets: 0
 Bad checksum: 0
 Illegal IP fragment length: 0
 IP fragment overlap: 0
 IP fragment reassembly timeout: 0
 IP fragment limit exceeded: 0
 IPv4 bad options: 0
 IPv6 bad extension headers: 0
 session-limit exceeded for source: 0
 session-limit exceeded for destination: 0
 connections/second limit exceeded for source: 0
 connections/second limit exceeded for destination: 0
 packets/second limit exceeded for source: 0
 packet/second limit exceeded for destination: 0
 Unknown: 0
TCP errors:
 TCP header length inconsistencies: 0
 Source or destination port number is zero: 0
 Illegal sequence number and flags combinations: 0
 TCP winnuk: 0
 TCP SYN Fragment: 0
 TCP connection closed due to SYN defense: 0
 TCP session-limit exceeded for source: 0
 TCP session-limit exceeded for destination: 0
 TCP connections/second limit exceeded for source: 0
 TCP connections/second limit exceeded for destination: 0
 TCP packets/second limit exceeded for source: 0
 TCP packet/second limit exceeded for destination: 0
UDP errors:
 IP data length less than minimum UDP header length (8 bytes): 0
 Source or destination port number is zero: 0
 UDP session-limit exceeded for source: 0
 UDP session-limit exceeded for destination: 0
 UDP connections/second limit exceeded for source: 0
 UDP connections/second limit exceeded for destination: 0
 UDP packets/second limit exceeded for source: 0
 UDP packet/second limit exceeded for destination: 0
ICMP errors:
 IP data length less than minimum ICMP header length (8 bytes): 0
 ICMP error length inconsistencies: 0
 ICMP fragments: 0
 ICMP session-limit exceeded for source: 0
 ICMP session-limit exceeded for destination: 0

```

```
ICMP connections/second limit exceeded for source: 0
ICMP connections/second limit exceeded for destination: 0
ICMP packets/second limit exceeded for source: 0
ICMP packet/second limit exceeded for destination: 0
```

Packets dropped due to high pps: 0
```

## show services service-sets statistics integrity-drops

**Syntax** show services service-sets statistics integrity-drops  
 <interface *interface-name*>  
 <service-set *service-set-name*>

**Release Information** Command introduced in Junos OS Release 13.1

**Description** Display integrity-drops statistics for one adaptive services interface, for all adaptive services interfaces, or for one service-set. You can configure use the output of this command to verify the packet header for anomalies in IP, TCP, UDP, and IGMP information and to examine any anomalies and errors.

**Options** **none**—Display integrity-drops statistics for all configured adaptive service interfaces/ service-set.

**service-set *service-set-name*** —(Optional) Display integrity-drops statistics for the specified service-set

**interface *interface-name***—(Optional) Display integrity-drops statistics for the specified adaptive services interface.

**Required Privilege Level** view

| Field Name | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Errors  | <p>IPv4 errors:</p> <ul style="list-style-type: none"> <li>• <b>IP packet length inconsistencies</b>—IP packet length does not match the Layer 2 reported length.</li> <li>• <b>Minimum IP header length check failures</b>—Minimum IP header length is 20 bytes. The received packet contains less than 20 bytes.</li> <li>• <b>Reassembled packet exceeds maximum IP length</b>—After fragment reassembly, the reassembled IP packet length exceeds 65,535.</li> <li>• <b>Illegal source address 0</b>—Source address is not a valid address. Invalid addresses are, loopback, broadcast, multicast, and reserved addresses. Source address 0, however, is allowed to support BOOTP and the destination address 0xffffffff.</li> <li>• <b>Illegal destination address</b> —Destination address is not a valid address. The address is reserved.</li> <li>• <b>TTL zero errors</b>—Received packet had a time-to-live (TTL) value of 0.</li> <li>• <b>Illegal IP protocol number 0 or 255</b>—IP protocol is 0 or 255.</li> <li>• <b>Land attack</b>—IP source address is the same as the destination address.</li> <li>• <b>Non-IP packets</b>—Packet did not conform to the IP standard.</li> <li>• <b>IP option</b>—Packet dropped because of a nonallowed IP option.</li> <li>• <b>Non-IPv4 packets</b>—Packet was not of the IPv4 type.</li> <li>• <b>Non-IPv6 packets</b>—Packet was not of the IPv6 type.</li> <li>• <b>Bad checksum</b>—Packet had an invalid IP checksum.</li> <li>• <b>Illegal IP fragment length</b>—Illegal fragment length. All fragments (other than the last fragment) must have a length that is a multiple of 8 bytes.</li> <li>• <b>IP fragment overlap</b>—Fragments have overlapping fragment offsets.</li> <li>• <b>IP fragment limit exceeded:</b> —Fragments dropped because the configured number of allowed fragments for a packet was exceeded.</li> <li>• <b>IP fragment reassembly timeout</b>—Some of the fragments for an IP packet were not received in time, and the reassembly handler dropped partial fragments. Whenever a fragment is received, it is maintained in a chain until all other fragments are received. If other fragments do not arrive within the configured value of reassembly-timeout, this packet is dropped and the value of the counter shown in this field is incremented. If other fragments arrive in time but the total number of fragments is more than the configured value of fragment-limit, all the fragments (of this packet) are dropped and the value of the counter shown in this field is incremented.</li> <li>• <b>Unknown:</b> —Unknown fragments.</li> </ul> |

*Table 86: show services service-sets integrity-drops Output Fields (continued)*

| Field Name  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TCP Errors  | <p>TCP protocol errors:</p> <ul style="list-style-type: none"> <li>• <b>TCP header length inconsistencies</b>—Minimum TCP header length is 20 bytes, and the IP packet received does not contain at least 20 bytes.</li> <li>• <b>Source or destination port number is zero</b>—TCP source or destination port is zero.</li> <li>• <b>Illegal sequence number, flags combination</b>—Dropped because of TCP errors, such as an illegal sequence number, which causes an illogical combination of flags to be set.</li> </ul> |
| UDP Errors  | <p>UDP protocol errors:</p> <ul style="list-style-type: none"> <li>• <b>IP data length less than minimum UDP header length (8 bytes)</b>—Minimum UDP header length is 8 bytes. The received IP packets contain less than 8 bytes.</li> <li>• <b>Source or destination port is zero</b>—UDP source or destination port is 0.</li> </ul>                                                                                                                                                                                       |
| ICMP Errors | <p>ICMP protocol errors:</p> <ul style="list-style-type: none"> <li>• <b>IP data length less than minimum ICMP header length (8 bytes)</b>—ICMP header length is 8 bytes. This counter is incremented when received IP packets contain less than 8 bytes.</li> <li>• <b>ICMP error length inconsistencies</b>—Minimum length of an ICMP error packet is 48 bytes, and the maximum length is 576 bytes. This counter is incremented when the received ICMP error falls outside this range.</li> </ul>                         |

## Sample Output

### show services service-sets statistics integrity-drops

```

user@host> show services service-sets statistics integrity-drops
Interface: ms-1/0/0
Service set: sset1
Errors:
 IP: 0, TCP: 0
 UDP: 0, ICMP: 0
IP errors:
 IP packet length inconsistencies: 0
 Illegal source address: 0
 Illegal destination address: 0
 TTL zero errors: 0, Illegal IP protocol number (0 or 255): 0
 Land attack: 0
 Non-IPv4 packets: 0
 Non-IPv6 packets: 0
 Bad checksum: 0
 Illegal IP fragment length: 0
 IP fragment overlap: 0
 IP fragment limit exceeded: 0
 IP fragment reassembly timeout: 0
 Unknown: 0
TCP errors:

```

```
TCP header length inconsistencies: 0
Source or destination port number is zero: 0
Illegal sequence number and flags combinations: 0
UDP errors:
 IP data length less than minimum UDP header length (8 bytes): 0
 Source or destination port number is zero: 0
ICMP errors:
 IP data length less than minimum ICMP header length (8 bytes): 0
 ICMP error length inconsistencies: 0
```

## show services service-sets statistics packet-drops

|                                 |                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Output Fields</b>            | <a href="#">Table 84 on page 1590</a> lists the output fields for the <b>show services service-sets packet-drops</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                   |

*Table 87: show services service-sets packet-drops Output Fields*

| Field Name                | Field Description                                                                 |
|---------------------------|-----------------------------------------------------------------------------------|
| <i>Interface</i>          | Name of an adaptive services interface.                                           |
| <i>Service set</i>        | Name of a service set.                                                            |
| <i>CPU limit Drops</i>    | Number of packets dropped because the service set exceeded the average CPU limit. |
| <i>Memory limit Drops</i> | Number of packets dropped because the service set exceeded the memory limit.      |
| <i>Flow limit Drops</i>   | Number of packets dropped because the service set exceeded the flow limit.        |

## Sample Output

**show services service-sets statistics packet-drops interface**

```
user@host> show services service-sets statistics packet-drops interface sp-1/0/0
```

| Interface | Service Set | Cpu limit<br>Drops | Memory limit<br>Drops | Flow limit<br>Drops |
|-----------|-------------|--------------------|-----------------------|---------------------|
| sp-1/0/0  | sset1       | 0                  | 0                     | 0                   |

## show services service-sets statistics syslog

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## show services service-sets statistics tcp-mss

|                                 |                                                                                                                                                                                                                                                                                                                         |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | show services service-sets statistics tcp-mss<br><interface <i>interface-name</i> >                                                                                                                                                                                                                                     |
| <b>Release Information</b>      | Command introduced in Junos OS Release 9.5.                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | (M Series and T Series routers only) Display TCP maximum segment size (MSS) statistics for service sets.                                                                                                                                                                                                                |
| <b>Options</b>                  | <p><b>none</b>—Display service set TCP MSS information for all adaptive services interfaces.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Display TCP MSS statistics for a particular interface. The <i>interface-name</i> can be <i>ms-fpc/pic/port</i>, <i>sp-fpc/pic/port</i>, or <i>rsp number</i>.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                    |
| <b>List of Sample Output</b>    | <a href="#">show services service-sets statistics tcp-mss on page 1615</a>                                                                                                                                                                                                                                              |
| <b>Output Fields</b>            | <a href="#">Table 89 on page 1615</a> lists the output fields for the <b>show services service-sets statistics tcp-mss</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                             |

Table 89: show services service-sets statistics tcp-mss Output Fields

| Field Name   | Field Description                                                                                                    |
|--------------|----------------------------------------------------------------------------------------------------------------------|
| Interface    | Name of the adaptive services interface.                                                                             |
| Service Set  | Name of the configured service set.                                                                                  |
| SYN Received | Number of TCP SYN packets received.                                                                                  |
| SYN Modified | Number of TCP SYN packets with the MSS value modified to match the MSS value specified in the TCP MSS configuration. |

## Sample Output

### show services service-sets statistics tcp-mss

```

user@host> show services service-sets statistics tcp-mss
Interface Service Set SYN Received SYN Modified
sp-1/2/0 asq_ipsec_svc_0 500 220

```

*Table 90: show services service-sets summary Output Fields*

| Field Name                     | Field Description                                                                                                                                                                                                                          |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b>               | Name of an adaptive services interface                                                                                                                                                                                                     |
| <b>Service type</b>            | Type of adaptive service, such as stateful firewall (SFW), Network Address Translation (NAT), intrusion detection service (IDS), Layer 2 Tunneling Protocol (L2TP), Compressed Real-Time Transport Protocol (CRTP), or IP Security (IPsec) |
| <b>Service sets configured</b> | Total number of service sets configured on the PIC that use internal service set IDs and do not consume external service sets, including CRTP and L2TP                                                                                     |
| <b>Bytes used</b>              | Bytes used by a particular service or all services                                                                                                                                                                                         |
| <b>Policy bytes used</b>       | Policy bytes used by a particular service or all services                                                                                                                                                                                  |
| <b>CPU utilization</b>         | Percentage of the CPU resources being used                                                                                                                                                                                                 |

## Sample Output

### show services service-sets summary

```
user@host> show services service-sets summary
```

| Interface | Service sets<br>configured | Bytes used         | Policy bytes used | CPU<br>utilization |
|-----------|----------------------------|--------------------|-------------------|--------------------|
| ms-4/0/0  | 1                          | 14821556 ( 4.53 %) | 855124 ( 0.40 %)  | N/A                |
| ms-4/1/0  | 1                          | 14691700 ( 4.49 %) | 855068 ( 0.40 %)  | N/A                |

### show services service-sets summary interface

```
user@host> show services service-sets summary interface sp-1/3/0
```

Interface: sp-1/3/0

| Service type | Service sets<br>configured | Bytes used       | CPU<br>utilization |
|--------------|----------------------------|------------------|--------------------|
| SFW/NAT/IDS  | 1                          | 54 ( 0.00 %)     | N/A                |
| L2TP         | 1                          | 58 ( 0.00 %)     | N/A                |
| CRTP         | 1                          | 58 ( 0.00 %)     | N/A                |
| System       | 0                          | 920831 ( 0.44 %) | N/A                |
| Idle         | 0                          | 0 ( 0.00 %)      | N/A                |
| Total        | 3                          | 921001 ( 0.44 %) | N/A                |

## show services sessions

---

**Syntax**    show services sessions  
              <brief | extensive | terse>  
              <application-protocol *protocol*>  
              <count>  
              <destination-port *destination-port*>  
              <destination-prefix *destination-prefix*>  
              <interface *interface-name*>  
              <limit *number*>  
              <protocol *protocol*>  
              <service-set *service-set*>  
              <source-port *source-port*>  
              <source-prefix *source-prefix*>  
              <utilization>

**Release Information**    Command introduced in Junos OS Release 10.4.

**Description**    Display session information.

**NOTE:** On MX Series routers (with interchassis redundancy configured), the idle timeout for every flow is displayed in the **show services session extensive** and **show services flows extensive** commands.

**Options**    **none**—Display standard information about all sessions.

**brief | extensive | terse**—(Optional) Display the specified level of output.

**application-protocol *protocol***—(Optional) Display information about one of the following application protocols:

- **bootp**—Bootstrap protocols
- **dce-rpc**—Distributed Computing Environment-Remote Procedure Call protocols
- **dce-rpc-portmap**—Distributed Computing Environment-Remote Procedure Call protocols portmap service
- **dns**—Domain Name System protocol
- **exec**—Remote Execution Protocol
- **ftp**—File Transfer Protocol
- **h323**—H.323
- **icmp**—ICMP
- **icmpv6**—ICMPv6
- **iiop**—Internet Inter-ORB Protocol

- **ike-esp-nat**—IKE ALG
- **ip**—IP
- **login**—LOGIN
- **netbios**—NETBIOS
- **netshow**—NETSHOW
- **pptp**—Point-to-Point Tunneling Protocol
- **realaudio**—RealAudio
- **rpc**—Remote Procedure Call protocol
- **rpc-portmap**—Remote Procedure Call protocol portmap service
- **rtsp**—Real-Time Streaming Protocol
- **rsh**—Remote Shell
- **sip**—Session Initiation Protocol
- **shell**—Shell
- **snmp**—SNMP
- **sql**—SQLNet
- **talk**—Talk Program
- **tftp**—Trivial File Transfer Protocol
- **traceroute**—Traceroute
- **winframe**—WinFrame

**NOTE:** You can use the **none** option with the **show services sessions count application-protocol** command to display information about sessions other than ALG sessions.

**count**—(Optional) Display a count of the matching entries.

**destination-port *destination-port***—(Optional) Display information for the specified destination port. The range of values is from 0 to 65,535.

**destination-prefix *destination-prefix***—(Optional) Display information for the specified destination prefix.

**interface *interface-name***—(Optional) Display information about the specified interface. On M Series and T Series routers, *interface-name* can be **ms-fpc/pic/port** or **rspnumber**. On J Series routers, *interface-name* is **ms-pim/0/port**.

**limit *number***—(Optional) Maximum number of entries to display.

**protocol *protocol***—(Optional) Display information about one of the following IP types:

- ***number***—Numeric protocol value from 0 to 255
- ***ah***—IPsec Authentication Header protocol
- ***egp***—An exterior gateway protocol
- ***esp***—IPsec Encapsulating Security Payload protocol
- ***gre***—A generic routing encapsulation protocol
- ***icmp***—Internet Control Message Protocol
- ***icmp6***—Internet Control Message Protocol version 6

**Output Fields** Table 91 on page 1621 lists the output fields for the **show services sessions** command. Output fields are listed in the approximate order in which they appear.

*Table 91: show services sessions Output Fields*

| Field Name            | Field Description                                                                                                                                                                                                                                                                                                                      | Level of Output                             |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------|
| <b>Interface</b>      | Name of the interface.                                                                                                                                                                                                                                                                                                                 | <b>application-protocol</b>                 |
| <b>Session</b>        | Session ID that uniquely identifies the session.                                                                                                                                                                                                                                                                                       | All levels                                  |
| <b>ALG</b>            | Name of the application.                                                                                                                                                                                                                                                                                                               | <b>terse</b>                                |
| <b>Flags</b>          | Session flag for the ALG: <ul style="list-style-type: none"> <li>• <b>0x1</b>—Found an existing session.</li> <li>• <b>0x2</b>—Reached session or flow limit.</li> <li>• <b>0x3</b>—No memory available for new sessions.</li> <li>• <b>0x4</b>—No free session ID available.</li> <li>• <b>0x0000</b>—No session ID found.</li> </ul> | All levels                                  |
| <b>IP Action</b>      | Flag indicating whether IP action has been set for the session.                                                                                                                                                                                                                                                                        | All levels                                  |
| <b>Offload</b>        | Flag indicating whether the session has been offloaded to the Packet Forwarding Engine.                                                                                                                                                                                                                                                | All levels                                  |
| <b>Asymmetric</b>     | Flag indicating whether the session is uni-directional.                                                                                                                                                                                                                                                                                | <b>terse</b><br><b>application-protocol</b> |
| <b>Service set</b>    | Name of a service set. Individual empty service sets are not displayed.                                                                                                                                                                                                                                                                | <b>count</b>                                |
| <b>Sessions Count</b> | Number of sessions.                                                                                                                                                                                                                                                                                                                    | <b>count</b>                                |

## Sample Output

### show services sessions

```

user@host> show services sessions
ms-2/0/0
Session: 293, ALG: 16, Flags: 0x0040, IP Action: no, Offload: no
UDP 10.10.10.2:43677 -> 10.20.20.1:53 Forward I 1
UDP 10.20.20.1:53 -> 192.0.2.1:43677 Forward 0 1
Session: 53, ALG: 16, Flags: 0x0040, IP Action: no, Offload: no
UDP 10.10.10.2:37494 -> 10.20.20.1:53 Forward I 1
UDP 10.20.20.1:53 -> 10.11.11.11:37494 Forward 0 1
Session: 66, ALG: 16, Flags: 0x0040, IP Action: no, Offload: no
UDP 10.10.10.2:48161 -> 10.20.20.1:53 Forward I 1
UDP 10.20.20.1:53 -> 10.11.11.11:48161 Forward 0 1
Session: 17, ALG: 16, Flags: 0x0040, IP Action: no, Offload: no
UDP 10.10.10.2:38908 -> 10.20.20.1:53 Forward I 1

```

```

UDP 10.20.20.1:53 -> 10.11.11.11:38908 Forward 0 1
Session: 42, ALG: 16, Flags: 0x0040, IP Action: no, Offload: no
UDP 10.10.10.2:58189 -> 10.20.20.1:53 Forward I 1
UDP 10.20.20.1:53 -> 10.11.11.11:58189 Forward 0 1

```

### show services sessions brief

The output for the **show services flows brief** command is identical to that for the **show services sessions** command. For sample output, see [show services sessions on page 1621](#).

### show services sessions extensive

```

user@host> show services sessions extensive
ms-0/1/0
Session: 2, ALG: 0, Flags: 0x0080, IP Action: no, Offload: no
NAT Pugin Data:
 NAT Action: Translation Type - DYNAMIC NAT44
 NAT source 192.0.21.2 -> 10.10.10.127
TCP 192.0.2.2:52145 -> 198.51.100.2:23 Forward I
 22
 Byte count: 1483
 Flow role: Unknown, Timeout: 0
TCP 198.51.100.2:23 -> 10.10.10.127:52145 Forward 0
 18
 Byte count: 2712
 Flow role: Unknown, Timeout: 0

```

### show services sessions terse

```

user@router> show services sessions terse
ms-1/1/0
Session: 1, ALG: ftp, Flags: 0x2000, IP Action: no, Offload: no, Asymmetric: no
TCP 10.2.2.2:52138 -> 10.1.1.2:21 Forward I 33
TCP 10.1.1.2:21 -> 10.2.2.2:52138 Forward 0 31

```

### show services sessions application-protocol

This command has the same output for the rpc, dce-rpc, rpc-portmap and dce-rpc-portmap ALGs.

```

user@router> show services sessions application-protocol dce-rpc
Interface name: ms-1/1/0
Session: 8, ALG: portmapper, Flags: 0x1800, IP Action: no, Offload: no
UDP 192.168.203.198:1019 ->192.168.203.194:2049 Forward I 4
UDP 192.168.203.194:2049 ->192.168.203.198:1019 Forward 0 4
Session: 7, ALG: portmapper, Flags: 0x1800, IP Action: no, Offload: no
UDP 192.168.203.198:954 ->192.168.203.194:613 Forward I 1
UDP 192.168.203.194:613 ->192.168.203.198:954 Forward 0 1
Session: 6, ALG: portmapper, Flags: 0x1800, IP Action: no, Offload: no
UDP 192.168.203.198:53836 ->192.168.203.194:613 Forward I 1
UDP 192.168.203.194:613 ->192.168.203.198:53836 Forward 0 1
Session: 5, ALG: portmapper, Flags: 0x1000, IP Action: no, Offload: no
UDP 192.168.203.198:59813 ->192.168.203.194:111 Forward I 1
UDP 192.168.203.194:111 ->192.168.203.198:59813 Forward 0 1
Session: 4, ALG: portmapper, Flags: 0x1800, IP Action: no, Offload: no
UDP 192.168.203.198:36595 ->192.168.203.194:2049 Forward I 1
UDP 192.168.203.194:2049 ->192.168.203.198:36595 Forward 0 1

```

```

Session: 3, ALG: portmapper, Flags: 0x1000, IP Action: no, Offload: no
UDP 192.168.203.198:56050 ->192.168.203.194:111 Forward I 1
UDP 192.168.203.194:111 ->192.168.203.198:56050 Forward 0 1

user@router> show services sessions application-protocol dns

TCP 10.1.1.2:21 -> 10.2.2.2:52138 Forward 0 31

```

## show services sessions (Aggregated Multiservices)

---

**Syntax**    show services sessions  
              <brief | extensive | terse>  
              <application-protocol *protocol*>  
              <count>  
              <destination-port *destination-port*>  
              <destination-prefix *destination-prefix*>  
              <interface *interface-name*>  
              <limit *number*>  
              <protocol *protocol*>  
              <service-set *service-set*>  
              <source-port *source-port*>  
              <source-prefix *source-prefix*>

**Release Information**    Statement introduced in Junos OS Release 16.1 on MX Series.

**Description**    Display the session information for each service set in each member interface of the AMS interface.

**Options**    **none**—Display standard information about all sessions.

**brief | extensive | terse**—(Optional) Display the specified level of output.

**application-protocol**—(Optional) Display information about one of the following application protocols:

- **ftp**—File Transfer Protocol
- **icmp**—Internet Control Message Protocol
- **pptp**—Point-to-Point Tunneling Protocol
- **rtsp**—Real-Time Streaming Protocol
- **sqlnet**—SQL \*Net
- **tcp**—Transmission Control Protocol
- **traceroute**—Traceroute
- **tftp**—Trivial File Transfer Protocol
- **udp**—User Datagram Protocol

**count**—(Optional) Display a count of the matching entries.

**destination-port *destination-port***—(Optional) Display information for a particular destination port. The range of values is from 0 through 65,535.

**destination-prefix *destination-prefix***—(Optional) Display information for a particular destination prefix.

**interface *interface-name***—(Optional) Display information about a particular interface.  
 On M Series and T Series routers, *interface-name* can be **ms-fpc/pic/port** or **rspnumber**.  
 On J Series routers, *interface-name* is **ms-pim/0/port**.

**limit *number***—(Optional) Maximum number of entries to display.

**protocol *protocol***—(Optional) Display information about one of the following IP types:

- ***number***—Numeric protocol value from 0 through 255
- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **icmp6**—Internet Control Message Protocol version 6
- **igmp**—Internet Group Management Protocol
- **ipip**—IP-over-IP encapsulation protocol
- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Transmission Protocol
- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

**service-set *service-set***—(Optional) Display information for a particular service set.

**source-port *source-port***—(Optional) Display information for a particular source port.  
 The range of values is from 0 through 65,535.

**source-prefix *source-prefix***—(Optional) Display information for a particular source prefix.

**Required Privilege  
Level**

**List of Sample Output**

[show services sessions brief on page 1629](#)  
[show services sessions interface mams-5/0/0 extensive on page 1629](#)  
[show services sessions terse on page 1631](#)  
[show services sessions count on page 1632](#)

**Output Fields**

[Table 91 on page 1621](#) lists the output fields for the **show services sessions** command.  
 Output fields are listed in the approximate order in which they appear.

Table 92: show services sessions Output Fields

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b>         | Name of the member interface ( <b>mams-</b> ) and the aggregated multiservices interface ( <b>ams</b> ) to which it belongs.                                                                                                                                                                                                                                                                                                                     |
| <b>Session ID</b>        | Session ID that uniquely identifies the session.                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>ALG</b>               | Name of the application.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Flags</b>             | Session flag for the ALG: <ul style="list-style-type: none"> <li>• <b>0x1</b>—Found an existing session.</li> <li>• <b>0x2</b>—Reached session or flow limit.</li> <li>• <b>0x3</b>—No memory available for new sessions.</li> <li>• <b>0x4</b>—No free session ID available.</li> </ul>                                                                                                                                                         |
| <b>IP Action</b>         | Flag indicating whether IP action has been set for the session.                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Offload</b>           | Flag indicating whether the session has been offloaded to the Packet Forwarding Engine.                                                                                                                                                                                                                                                                                                                                                          |
| <b>Asymmetric</b>        | Flag indicating whether the session is unidirectional.                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Service set</b>       | Name of a service set. Individual empty service sets are not displayed.                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Sessions Count</b>    | Number of sessions.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Flow or Flow Prot</b> | Protocol used for this session.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Source</b>            | Source prefix of the flow in the format <b>source-prefix:port</b> . For ICMP flows, port information is not displayed.                                                                                                                                                                                                                                                                                                                           |
| <b>Dest</b>              | Destination prefix of the flow. For ICMP flows, port information is not displayed.                                                                                                                                                                                                                                                                                                                                                               |
| <b>State</b>             | Status of the flow: <ul style="list-style-type: none"> <li>• <b>Drop</b>—Drop all packets in the flow without response.</li> <li>• <b>Forward</b>—Forward the packet in the flow without looking at it.</li> <li>• <b>Reject</b>—Drop all packets in the flow with response.</li> <li>• <b>Watch</b>—Inspect packets in the flow.</li> <li>• <b>Bypass</b>—Bypass packets in the flow.</li> <li>• <b>Unknown</b>—Unknown flow status.</li> </ul> |
| <b>Packet Direction</b>  | Direction of the flow: ingress ( <b>I</b> ), egress ( <b>O</b> ), or unknown.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Frm count</b>         | Number of frames in the flow.                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Sample Output

### show services sessions brief

```
user@host> show services sessions brief
mams-1/0/0 (ams0)

|                                 |                                                                                                                                                                                               |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>show services sessions analysis</code><br><code>&lt;interface <i>interface-name</i>&gt;</code>                                                                                          |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 17.1 on MX Series MS-MPC.                                                                                                                            |
| <b>Description</b>              | Display session statistics.                                                                                                                                                                   |
| <b>Options</b>                  | <b>none</b> —Display standard information about all session statistics.<br><br><b>interface <i>interface-name</i></b> —(Optional) Display information about the specified interface.          |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                          |
| <b>List of Sample Output</b>    | <a href="#">show services sessions analysis interface on page 1634</a>                                                                                                                        |
| <b>Output Fields</b>            | <a href="#">Table 93 on page 1633</a> lists the output fields for the <b>show services sessions analysis</b> command. Output fields are listed in the approximate order in which they appear. |

*Table 93: show services sessions analysis Output Fields*

| Field Name                      | Field Description                                                                             |
|---------------------------------|-----------------------------------------------------------------------------------------------|
| Services PIC Name               | FPC and PIC slots for the services PIC on which the sessions are running.                     |
| Session Analysis Statistics:    |                                                                                               |
| Total Sessions Active           | Total active sessions in the MS-PIC including TCP, UDP, ICMP and Softwires.                   |
| Total TCP Sessions Active       | Total active TCP sessions in the MS-PIC.                                                      |
| Total UDP Sessions Active       | Total active UDP session in the MS-PIC.                                                       |
| Total Other Sessions Active     | Total other active sessions in the MS-PIC including ICMP and softwires.                       |
| Total Predicted Sessions Active | Predicted sessions are created only by the ALG traffic using the L3/L4 information available. |
| Created Sessions per Second     | Session setup rate at the time of running the command.                                        |
| Deleted Sessions per Second     | Session deletion rate at the time of running the command.                                     |

**Table 93: show services sessions analysis Output Fields (continued)**

| Field Name                           | Field Description                                                                                                                      |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Peak Total Sessions Active           | Highest number of active sessions since the last PIC restart or since the last time session statistics are flushed.                    |
| Peak Total TCP Sessions Active       | Highest number of active TCP sessions since the last PIC restart or since the last time session stats are flushed.                     |
| Peak Total UDP Sessions Active       | Highest number of active UDP sessions since the last PIC restart or since the last time session statistics are flushed.                |
| Peak Total Other Sessions Active     | Highest number of other active sessions since the last PIC restart or since the last time session statistics are flushed.              |
| Peak Created Sessions per Second     | Maximum session setup rate observed since the last PIC restart or since the last time session statistics are flushed.                  |
| Peak Deleted Sessions per Second     | Maximum session deletion rate observed since the last PIC restart or from the last time session statistics are flushed.                |
| Packets received                     | Total number of packets received by the MS-PIC.                                                                                        |
| Packets transmitted                  | Total number of packets transmitted by the MS-PIC.                                                                                     |
| Slow path forward                    | Number of packets forwarded in the slow path (that is, after the successful rule match and session creation).                          |
| Slow path discard                    | Number of packets discarded before the session creation.                                                                               |
| Session Rate Data: Number of Samples | Number of samples used to calculate the session rate since the last PIC restart or since the last time session statistics are flushed. |
| Session Rate Distribution(sec)       |                                                                                                                                        |
| Session Operation :Creation          | Number of sampling intervals during which a number of sessions in the indicated range were created during the current sampling period. |
| Session Operation :Deletion          | Number of sampling intervals during which a number of sessions in the indicated range were deleted during the current sampling period. |
| Session Lifetime Distribution(sec):  | Number of TCP, UDP, and HTTP sessions whose length was in the indicated range in seconds.                                              |

## Sample Output

### show services sessions analysis interface

| sp-0/0/0  | dslite-svc-set1 | 2       | 0   |

## show services software flows

**Syntax** `show services software flows`  
 (`<interface interface-name> <service-set service-set-name>|`  
`count <interface interface-name> <service-set service-set-name>|`  
`ds-lite <B4 b4-address> <AFTR aftr-address>|`  
`v6rd <initiator initiator-ip-address><concentrator concentrator-ip-address>)`

**Release Information** Command introduced in Junos OS Release 10.2.

**Description** Display statistics information about the software flows.

**NOTE:** Starting with Junos OS Release 14.1R4, the IPv6 prefix length associated with a subscriber's basic broadband bridging device that is subject to a limited number of sessions (`dslite-ipv6-prefix-length` attribute) is taken into account while the session count is calculated and displayed in the output of the `show services software flows` command. Until Junos OS Release 14.1R3, only IPv4 flows were counted and IPv6 flows were not considered for the statistics about software flows

**Options** `interface interface-name`—(Optional) Display statistics information about the specified interface only.

`service-set service-set-name`—(Optional) Display statistics information about the specified service set only.

`count <interface interface-name> <service-set service-set-name>|`—(Optional) Display flow count information only, with optional filtering by interface and service set.

`ds-lite <B4 b4-address> <AFTR aftr-address>|`—(Optional) Display DS-Lite flow information, with optional filtering by B4 (software initiator) and AFTR (software concentrator).

`v6rd <initiator initiator-ip-address><concentrator concentrator-ip-address>|`—(Optional) Display v6rd flow information, with optional filtering by the software initiator and software concentrator.

**Required Privilege Level** view

**List of Sample Output** [show services software flows on page 1640](#)  
[show services software flows count on page 1641](#)  
[show services software flows ds-lite B4 on page 1641](#)  
[show services software flows ds-lite AFTR on page 1641](#)  
[services software flows ds-lite AFTR and B4 on page 1641](#)

**Output Fields** Table 95 on page 1640 lists the output fields for the **show services softwire flows** command. Output fields are listed in the approximate order in which they appear.

*Table 95: show services softwire flows Output Fields*

| Field Name  | Field Description                                                                                                                                                                                                                                                                                        |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface   | Name of the interface.                                                                                                                                                                                                                                                                                   |
| Service set | Name of the service set.                                                                                                                                                                                                                                                                                 |
| Flow        | Description of flow, including protocol input and output interface addresses.                                                                                                                                                                                                                            |
| State       | Flow state. Value is: <ul style="list-style-type: none"> <li>• Forward</li> </ul>                                                                                                                                                                                                                        |
| Dir         | Flow direction. Values are: <ul style="list-style-type: none"> <li>• I—inbound</li> <li>• O—outbound</li> </ul>                                                                                                                                                                                          |
| Frm count   | Number of frames transferred.                                                                                                                                                                                                                                                                            |
| NAT dest    | NAT translation of the decapsulated address.                                                                                                                                                                                                                                                             |
| Softwire    | For outbound flows, the address of the local softwire initiator (B4 for DS-Lite) is shown first, followed by the address of the softwire concentrator (AFTR for DS-Lite). For inbound flows, the address of the software concentrator is shown first, followed by the address of the softwire initiator. |

## show services software statistics

**Syntax** `show services software statistics`  
`<ds-lite>`  
`<ds-lite>`  
`<interface interface-name>`  
`<v6rd>`

**Release Information** Command introduced in Junos OS Release 10.4.

**Description** Display information about software services.

**Options** `ds-lite`—(Optional) Display only DS-Lite.

`interface interface-name` —(Optional) Name of the interface servicing the software. When you omit this option, data for all interfaces are shown.

`v6rd`—(Optional) Display only 6rd statistics.

**Required Privilege Level** view

**List of Sample Output** [show services software statistics on page 1645](#)  
[show services software statistics ds-lite on page 1646](#)

**Output Fields** [Table 96 on page 1642](#) lists the output fields for the **command-name** command. Output fields are listed in the approximate order in which they appear.

*Table 96: command-name Output Fields*

| Field Name                   | Field Description                                                                                                                                                                                                  | Level of Output             |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|
| Service PIC Name             | Name of service PIC for which statistics are shown.                                                                                                                                                                | statistics                  |
| Softwires Created            | Number of softwires created.                                                                                                                                                                                       | statistics                  |
| Softwires Created for EIF/HP | Number of softwires created for endpoint-independent filtering (EIF) or hairpinning (HP).                                                                                                                          | statistics for ds-lite only |
| Softwires Deleted            | Number of softwires deleted.                                                                                                                                                                                       | statistics                  |
| Softwires Flows Created      | Number of flows created.                                                                                                                                                                                           | statistics                  |
| Softwires Flows Deleted      | Number of flows deleted.                                                                                                                                                                                           | statistics                  |
| Slow Path Packets Processed  | Number of packets processed as initial packets in a software session. These packets require a rule lookup and setting up of flows; this processing of an initial packet in a flow is called <i>the slow path</i> . | statistics                  |

Table 96: command-name Output Fields (continued)

| Field Name                                     | Field Description                                                                                                                                        | Level of Output                       |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|
| <b>Slow Path Packets Processed for EIF/HP</b>  | Number of slow path EIF/HP packets processed.                                                                                                            | <b>statistics for ds-lite only</b>    |
| <b>Fast Path Packets Processed</b>             | Number of packets processed that are not <i>slow path</i> .                                                                                              | <b>statistics</b>                     |
| <b>Fast Path Encapsulated</b>                  | Number of packets encapsulated in the fast path.                                                                                                         | <b>statistics</b>                     |
| <b>Softwire EIF Accept</b>                     | Number of packets that matched an EIF entry that initiated the creation of a DS-Lite tunnel. The EIF entry was previously triggered by a DS-Lite packet. | <b>statistics for ds-lite only</b>    |
| <b>Rule Match Succeeded</b>                    | Number of packets that matched a softwire rule.                                                                                                          | <b>statistics</b>                     |
| <b>Rule Match Failed</b>                       | Number of packets that did not match any softwire rule.                                                                                                  | <b>statistics</b>                     |
| <b>IPv6 Packets Fragmented</b>                 | Number of packets fragmented by the services PIC.                                                                                                        | <b>statistics for ds-lite only</b>    |
| <b>IPv4 Client Fragments</b>                   | Number of IPv4 fragments received from the client end over the softwire tunnel destined to the server.                                                   | <b>statistics for ds-lite only</b>    |
| <b>IPv4 Server First Fragments</b>             | Number of IPv4 first fragments received from the server destined to go over the softwire tunnel to the client.                                           | <b>statistics for ds-lite only</b>    |
| <b>IPv4 Server More Fragments</b>              | Number of IPv4 other fragments (excluding first and last fragment) received from the server destined to go over the softwire tunnel to the client.       | <b>statistics for ds-lite only</b>    |
| <b>IPv4 Server Last Fragments</b>              | Number of IPv4 last fragments received from the server destined to go over the softwire tunnel to the client.                                            | <b>statistics for ds-lite only</b>    |
| <b>ICMPv4 Packets sent</b>                     | Number of ICMPv4 packets sent to the softwire concentrator.                                                                                              | <b>statistics</b>                     |
| <b>ICMPv4 Error Packets sent</b>               | Number of ICMPv4 error packets sent to the softwire concentrator.                                                                                        | <b>statistics</b>                     |
| <b>ICMPv6 Packets sent</b>                     | Number of ICMPv6 packets sent to the softwire concentrator.                                                                                              | <b>statistics</b>                     |
| <b>Dropped ICMPv6 packets destined to AFTR</b> | Number of ICMPv6 packets dropped instead of sending to the softwire concentrator.                                                                        | <b>statistics</b>                     |
| <b>Softwire Creation Failed</b>                | Number of softwire creation failures.                                                                                                                    | <b>statistics for ds-lite and 6rd</b> |

Table 96: command-name Output Fields (continued)

| Field Name                                      | Field Description                                                                                                                                    | Level of Output                    |
|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|
| <b>Softwire Creation Failed for EIF/HP</b>      | Number of softwire creation failures for EIF/HP.                                                                                                     | <b>statistics for ds-lite only</b> |
| <b>Flow Creation Failed</b>                     | Number of flow creation failures.                                                                                                                    | <b>statistics</b>                  |
| <b>Flow Creation Failed for EIF/HP</b>          | Number of flow creation failures for EIF/HP.                                                                                                         | <b>statistics for ds-lite only</b> |
| <b>Flow Creation Failed - Retry</b>             | Number of flow creations retried after failure.                                                                                                      | <b>statistics</b>                  |
| <b>Slow Path Failed</b>                         | Number of failures detected in the slow path.                                                                                                        | <b>statistics</b>                  |
| <b>Slow Path Failed - Retry</b>                 | Number of times processing of a packet was reprocessed in the slow path.                                                                             | <b>statistics</b>                  |
| <b>Packet not IPv4-in-IPv6</b>                  | Number of IPv4 packets not encapsulated in IPv6.                                                                                                     | <b>statistics for ds-lite only</b> |
| <b>IPv6 Fragmentation Error</b>                 | Number of IPv6 packets with fragmentation errors.                                                                                                    | <b>statistics</b>                  |
| <b>Slow Path Failed-IPv6 Next Header Offset</b> | Number of IPv6 header errors detected in slow path processing.                                                                                       | <b>statistics for ds-lite only</b> |
| <b>Decapsulated Packet not IPv4</b>             | Number of packets without IPv4 inner header.                                                                                                         | <b>statistics for ds-lite only</b> |
| <b>Decap Failed - IPv6 Next Header Offset</b>   | Decapsulation failure due to an unexpected inner header.                                                                                             | <b>statistics for ds-lite only</b> |
| <b>Decap Failed - IPv4 L3 Integrity</b>         | Decapsulation failure due to incorrect Layer 3 data, such as not an IP packet, bad source or destination address, checksum error, or protocol error. | <b>statistics for ds-lite only</b> |
| <b>Decap Failed - IPv4 L4 Integrity</b>         | Decapsulation failure due to incorrect Layer 4 data, such as errors in TCP, UDP, or TCP headers.                                                     | <b>statistics for ds-lite only</b> |
| <b>No Softwire ID</b>                           | Number of times a softwire ID was not found.                                                                                                         | <b>statistics</b>                  |
| <b>No Flow Extension</b>                        | Number of times flow extensions were not found.                                                                                                      | <b>statistics</b>                  |
| <b>ICMPv4 Dropped Packets</b>                   | Number of ICMPv4 packets dropped.                                                                                                                    | <b>statistics</b>                  |
| <b>Packet not IPv6-in-IPv4</b>                  | Number of IPv6 packets not encapsulated in IPv4.                                                                                                     | <b>statistics for v6rd only</b>    |

Table 96: command-name Output Fields (continued)

| Field Name                                             | Field Description                                                                                  | Level of Output                    |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------|------------------------------------|
| <b>Decapsulated<br/>Packet not IPv6</b>                | Number of packets without an IPv6 inner header.                                                    | <b>statistics for v6rd only</b>    |
| <b>Encapsulation<br/>Failed - No packet<br/>memory</b> | Failed to encapsulate IPv6 packets in IPv4 due to low memory.                                      | <b>statistics for v6rd only</b>    |
| <b>Flow limit exceeded</b>                             | Flow not created because configured maximum flows per software is exceeded.                        | <b>statistics</b>                  |
| <b>Session limit<br/>exceeded</b>                      | Flow not created because configured maximum DS-Lite software sessions per IPv6 prefix is exceeded. | <b>statistics for ds-lite only</b> |

## show services stateful-firewall conversations

---

**Syntax**    show services stateful-firewall conversations  
              <brief | extensive | terse>  
              <application-protocol *protocol*>  
              <destination-port *destination-port*>  
              <destination-prefix *destination-prefix*>  
              <interface *interface-name*>  
              <limit *number*>  
              <pgcp>  
              <protocol *protocol*>  
              <service-set *service-set*>  
              <source-port *source-port*>  
              <source-prefix *source-prefix*>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              **pgcp** option introduced in Junos OS Release 8.4.

**Description**            Display information about stateful firewall conversations.

**Options**                **none**—Display standard information about all stateful firewall conversations.

**brief | extensive | terse**—(Optional) Display the specified level of output.

**application-protocol *protocol***—(Optional) Display information about one of the following application protocols:

- **bootp**—Bootstrap protocol
- **dce-rpc**—Distributed Computing Environment-Remote Procedure Call protocols
- **dce-rpc-portmap**—Distributed Computing Environment-Remote Procedure Call protocols portmap service
- **dns**—Domain Name System protocol
- **exec**—Exec
- **ftp**—File Transfer Protocol
- **h323**—H.323 standards
- **icmp**—Internet Control Message Protocol
- **iiop**—Internet Inter-ORB Protocol
- **login**—Login
- **netbios**—NetBIOS
- **netshow**—NetShow
- **realaudio**—RealAudio
- **rpc**—Remote Procedure Call protocol

- **rpc-portmap**—Remote Procedure Call protocol portmap service
- **rtsp**—Real-Time Streaming Protocol
- **shell**—Shell
- **sip**—Session Initiation Protocol
- **snmp**—Simple Network Management Protocol
- **sqlnet**—SQLNet
- **tftp**—Trivial File Transfer Protocol
- **traceroute**—Traceroute
- **winframe**—WinFrame

**destination-port** *destination-port*—(Optional) Display information for a particular destination port. The range of values is 0 to 65535.

**destination-prefix** *destination-prefix*—(Optional) Display information for a particular destination prefix.

**interface** *interface-name*—(Optional) Display information about a particular interface. On M Series and T Series routers, the *interface-name* can be *sp-fpc/pic/port* or *rspnumber*.

**limit** *number*—(Optional) Maximum number of entries to display.

**pgcp** —(Optional) Display information about stateful firewall conversations for Packet Gateway Control Protocol (PGCP) flows.

**protocol** *protocol*—(Optional) Display information about one of the following IP types:

- **number**—Numeric protocol value from 0 to 255
- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **igmp**—Internet Group Management Protocol
- **ipip**—IP-within-IP Encapsulation Protocol
- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Protocol

- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

**service-set *service-set***—(Optional) Display information for the specific service set.

**source-port *source-port***—(Optional) Display information for a particular source port.  
The range of values is 0 to 65535.

**source-prefix *source-prefix***—(Optional) Display information for a particular source prefix.

**Required Privilege Level** view

**List of Sample Output** [show services stateful-firewall conversations on page 1651](#)  
[show services stateful-firewall conversations destination-port on page 1651](#)

**Output Fields** [Table 97 on page 1650](#) lists the output fields for the **show services stateful-firewall conversations** command. Output fields are listed in the approximate order in which they appear.

*Table 97: show services stateful-firewall conversations Output Fields*

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                            |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b>         | Name of an adaptive services interface.                                                                                                                                                                                                                                                                                                      |
| <b>Service set</b>       | Name of a service set. Individual empty service sets are not displayed, but if no service set has any flows, a flow table header is printed for each service set.                                                                                                                                                                            |
| <b>Conversation</b>      | Information about a group of related flows. <ul style="list-style-type: none"> <li>• <b>ALG Protocol</b>—Application-level gateway protocol.</li> <li>• <b>Number of initiators</b>—Number of flows that initiated a session.</li> <li>• <b>Number of responders</b>—Number of flows that responded in a session.</li> </ul>                 |
| <b>Flow or Flow Prot</b> | Protocol used for this flow.                                                                                                                                                                                                                                                                                                                 |
| <b>Source</b>            | Source prefix of the flow, in the format <i>source-prefix-port</i> .                                                                                                                                                                                                                                                                         |
| <b>Destination</b>       | Destination prefix of the flow.                                                                                                                                                                                                                                                                                                              |
| <b>State</b>             | Status of the flow: <ul style="list-style-type: none"> <li>• <b>Drop</b>—Drop all packets in the flow without response.</li> <li>• <b>Forward</b>—Forward the packet in the flow without looking at it.</li> <li>• <b>Reject</b>—Drop all packets in the flow with response.</li> <li>• <b>Watch</b>—Inspect packets in the flow.</li> </ul> |
| <b>Dir</b>               | Direction of the flow: input (I) or output (O).                                                                                                                                                                                                                                                                                              |

Table 97: show services stateful-firewall conversations Output Fields (continued)

| Field Name      | Field Description                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source NAT      | Original and translated source IPv4 or IPv6 addresses are displayed if Network Address Translation (NAT) is configured on this particular flow or conversation. |
| Frm Count       | Number of frames in the flow.                                                                                                                                   |
| Destin NAT      | Original and translated destination IPv4 or IPv6 addresses are displayed if NAT is configured on this particular flow or conversation.                          |
| Byte count      | Number of bytes forwarded in the flow.                                                                                                                          |
| TCP established | Whether a TCP connection was established: <b>Yes</b> or <b>No</b> .                                                                                             |
| TCP window size | Negotiated TCP connection window size, in bytes.                                                                                                                |
| TCP acknowledge | TCP acknowledgment sequence number.                                                                                                                             |
| TCP tickle      | Whether TCP inquiry mode is on ( <b>enabled</b> or <b>disabled</b> ) and the time remaining to send the next inquiry, in seconds.                               |
| Master flow     | Flow that initiated the conversation.                                                                                                                           |
| Timeout         | Lifetime of the flow, in seconds.                                                                                                                               |

| <b>Output Fields</b>            | <a href="#">Table 93 on page 1633</a> lists the output fields for the <b>show services stateful-firewall flow-analysis</b> command. Output fields are listed in the approximate order in which they appear. |

*Table 98: show services stateful-firewall flow-analysis Output Fields*

| Field Name                   | Field Description                                                                                                 |
|------------------------------|-------------------------------------------------------------------------------------------------------------------|
| Total Flows Active           | Total active flows in the MS-PIC including TCP, UDP, ICMP and Softwires.                                          |
| Total TCP Flows Active       | Total active TCP flows in the MS-PIC.                                                                             |
| Total UDP Flows Active       | Total active UDP flows in the MS-PIC.                                                                             |
| Total Other Flows Active     | Total other active flows in the MS-PIC including ICMP and softwires.                                              |
| Total Predicted Flows Active | Predicted flows are created only by the ALG traffic using the L3/L4 information available.                        |
| Created Flows per Second     | Flow setup rate at the time of running the command.                                                               |
| Deleted Flows per Second     | Flow deletion rate at the time of running the command.                                                            |
| Peak Total Flows Active      | The highest number of active flows since the last PIC restart or since the last time flow statistics are flushed. |
| Peak Total TCP Flows Active  | The highest number of active TCP flows since the last PIC restart or since the last time flow stats are flushed.  |

**Table 98: show services stateful-firewall flow-analysis Output Fields (continued)**

| Field Name                                                                    | Field Description                                                                                                                     |
|-------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Peak Total UDP Flows Active                                                   | The highest number of active UDP flows since the last PIC restart or since the last time flow statistics are flushed.                 |
| Peak Total Other Flows Active                                                 | The highest number of other active flows since the last PIC restart or since the last time flow statistics are flushed.               |
| Peak Created Flows per Second                                                 | The maximum flow setup rate observed since the last PIC restart or since the last time flow statistics are flushed.                   |
| Peak Deleted Flows per Second                                                 | The maximum flow deletion rate observed since the last PIC restart or from the last time flow statistics are flushed.                 |
| Average HTTP Flow Lifetime(ms)                                                | Average HTTP Flow Lifetime in millisecond.                                                                                            |
| Packets received                                                              | The total number of packets received by the MS-PIC.                                                                                   |
| Packets transmitted                                                           | The total number of packets transmitted by the MS-PIC.                                                                                |
| Slow path forward                                                             | The number of packets forwarded in the slow path (i.e. after the successful rule match and flow creation).                            |
| Slow path discard                                                             | The number of packets discarded before the flow creation.                                                                             |
| Flow Rate Data: Number of Samples                                             | The number of samples used to calculate the flow rate, since the last PIC restart or since the last time flow statistics are flushed. |
| Flow Rate Distribution(sec) Flow Operation :Creation Flow Operation :Deletion | Histogram of the samples used for flow rate calculation.                                                                              |
| Flow Lifetime Distribution(sec):                                              | Histogram of the samples used to calculate the flow life time in sec.                                                                 |

## show services stateful-firewall flows

**Syntax** show services stateful-firewall flows  
 <brief | extensive | summary | terse>  
 <application-protocol *protocol*>  
 <count>  
 <destination-port *destination-port*>  
 <destination-prefix *destination-prefix*>  
 <interface *interface-name*>  
 <limit *number*>  
 <protocol *protocol*>  
 <service-set *service-set*>  
 <source-port *source-port*>  
 <source-prefix *source-prefix*>

**Release Information** Command introduced before Junos OS Release 7.4.  
**pgcp** option introduced in Junos OS Release 8.4.  
**application-protocol** option introduced in Junos OS Release 10.4.

**Description** Display stateful firewall flow table entries. When the interface is used for software processing, the type of software concentrator (**DS-LITE** or **6rd**) is shown, and frame counts are provided.

**Options** **none**—Display standard information about all stateful firewall flows.

**brief | extensive | summary | terse**—(Optional) Display the specified level of output.

**application-protocol *application-protocol***—(Optional) Display information about one of the following application-level gateway (ALG) protocol types:

- **bootp**—Bootstrap protocol
- **dce-rpc**—Distributed Computing Environment (DCE) remote procedure call (RPC) protocol

**NOTE:** Use this option to select Microsoft Remote Procedure Call (MSRPC).

- **dce-rpc-portmap**—Distributed Computing Environment (DCE) remote procedure call (RPC) portmap protocol
- **dns**—Domain Name Service protocol
- **exec**—Remote execution protocol
- **ftp**—File Transfer Protocol
- **h323**—H.323 protocol
- **icmp**—Internet Control Message Protocol

- **iiop**—Internet Inter-ORB Protocol
- **ip**—Internet protocol
- **netbios**—NetBIOS protocol
- **netshow**—Netshow protocol
- **pptp**—Point-to-Point Tunneling Protocol
- **realaudio**—RealAudio protocol
- **rpc**—Remote Procedure Call protocol

**NOTE:** Use this option to select Sun Microsystems Remote Procedure Call protocol (SunRPC).

- **rpc-portmap**—Remote Procedure Call portmap protocol
- **rtsp**—Real-Time Streaming Protocol
- **sip**—Session Initiation Protocol
- **snmp**—Simple Network Management Protocol
- **talk**—Talk protocol
- **tftp**—Trivial File Transfer Protocol
- **traceroute**—Traceroute
- **winframe**—WinFrame

**count**—(Optional) Display a count of the matching entries.

**destination-port *destination-port***—(Optional) Display information for a particular destination port. The range of values is from 0 to 65535.

**destination-prefix *destination-prefix***—(Optional) Display information for a particular destination prefix.

**interface *interface-name***—(Optional) Display information about a particular interface. On M Series and T Series routers, *interface-name* can be **ms-fpc/pic/port** or **rspnumber**.

**limit *number***—(Optional) Maximum number of entries to display.

**protocol *protocol***—(Optional) Display information about one of the following IP types:

- ***number***—Numeric protocol value from 0 to 255
- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol

- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **igmp**—Internet Group Management Protocol
- **ipip**—IP-within-IP Encapsulation Protocol
- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Protocol
- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

**service-set** *service-set*—(Optional) Display information for a particular service set.

**source-port** *source-port*—(Optional) Display information for a particular source port.  
The range of values is from 0 to 65535.

**source-prefix** *source-prefix*—(Optional) Display information for a particular source prefix.

**Required Privilege Level**

|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b>   | Name of the interface.                                                                                                                                          |
| <b>Service set</b> | Name of a service set. Individual empty service sets are not displayed. If no service set has any flows, a flow table header is displayed for each service set. |

Table 99: show services stateful-firewall flows Output Fields (continued)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                            |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flow Count        | Number of flows in a session.                                                                                                                                                                                                                                                                                                                |
| Flow or Flow Prot | Protocol used for this flow.                                                                                                                                                                                                                                                                                                                 |
| Source            | Source prefix of the flow in the format <i>source-prefix:port</i> . For ICMP flows, port information is not displayed.                                                                                                                                                                                                                       |
| Dest              | Destination prefix of the flow. For ICMP flows, port information is not displayed.                                                                                                                                                                                                                                                           |
| State             | Status of the flow: <ul style="list-style-type: none"> <li>• <b>Drop</b>—Drop all packets in the flow without response.</li> <li>• <b>Forward</b>—Forward the packet in the flow without looking at it.</li> <li>• <b>Reject</b>—Drop all packets in the flow with response.</li> <li>• <b>Watch</b>—Inspect packets in the flow.</li> </ul> |
| Dir               | Direction of the flow: input (I) or output (O).                                                                                                                                                                                                                                                                                              |
| Frm count         | Number of frames in the flow.                                                                                                                                                                                                                                                                                                                |

## Sample Output

### show services stateful-firewall flows

On the MX Series router, both input (I) and output (O) flow entries appear, even if traffic only flows in one direction. This applies to both NAT and non-NAT cases.

```
user@host> show services stateful-firewall flows
Interface: ms-1/3/0, Service set: green
```

```
Flow
Prot Source Dest State Dir Frm count
TCP 10.58.255.178:23 -> 10.59.16.100:4000 Forward O
TCP 10.58.255.50:33005-> 10.58.255.178:23 Forward I 1
Source NAT 10.58.255.50:33005-> 10.59.16.100:4000
Destin NAT 10.58.255.178:23 -> 0.0.0.0:4000
```

### show services stateful-firewall flows (For Software Flows)

When a service set includes software processing, the following output format is used for the software flows:

```
user@host> show services stateful-firewall flows
Interface: sp-0/1/0, Service set: dslite-svc-set2
Flow
TCP 200.200.200.2:80 -> 44.44.44.1:1025 Forward O 219942
NAT dest 44.44.44.1:1025 -> 20.20.1.4:1025
Software 2001::2 -> 1001::1
TCP 20.20.1.2:1025 -> 200.200.200.2:80 Forward I 110244
NAT source 20.20.1.2:1025 -> 44.44.44.1:1024
Software 2001::2 -> 1001::1
TCP 200.200.200.2:80 -> 44.44.44.1:1024 Forward O 219140
```

```

 NAT dest 44.44.44.1:1024 -> 20.20.1.2:1025
 Software 2001::2 -> 1001::1
DS-LITE 2001::2 -> 1001::1 Forward I 988729
TCP 200.200.200.2:80 -> 44.44.44.1:1026 Forward O 218906
 NAT dest 44.44.44.1:1026 -> 20.20.1.3:1025
 Software 2001::2 -> 1001::1
TCP 20.20.1.3:1025 -> 200.200.200.2:80 Forward I 110303
 NAT source 20.20.1.3:1025 -> 44.44.44.1:1026
 Software 2001::2 -> 1001::1
TCP 20.20.1.4:1025 -> 200.200.200.2:80 Forward I 110944
 NAT source 20.20.1.4:1025 -> 44.44.44.1:1025
 Software 2001::2 -> 1001::1

```

### show services stateful-firewall flows brief

The output for the **show services stateful-firewall flows brief** command is identical to that for the **show services stateful-firewall flows** command. For sample output, see [show services stateful-firewall flows](#).

### show services stateful-firewall flows extensive

```

user@host> show services stateful-firewall flows extensive
Interface: ms-0/3/0, Service set: ss_nat
Flow
count
TCP 16.1.0.1:2330 -> 16.49.0.1:21 Forward I
8
 NAT source 16.1.0.1:2330 -> 16.41.0.1:2330
 NAT dest 16.49.0.1:21 -> 16.99.0.1:21

## show services stateful-firewall sip-call

**Syntax** show services stateful-firewall sip-call  
 <brief | extensive | terse>  
 <application-protocol *protocol*>  
 <destination-port *destination-port*>  
 <destination-prefix *destination-prefix*>  
 <interface *interface-name*>  
 <limit *number*>  
 <protocol *protocol*>  
 <service-set *service-set*>  
 <source-port *source-port*>  
 <source-prefix *source-prefix*>

**Release Information** Command introduced in Junos OS Release 7.4.

**Description** Display stateful firewall Session Initiation Protocol (SIP) call information.

**Options** **count**—(Optional) Display a count of the matching entries.

**brief**—(Optional) Display brief SIP call information.

**extensive**—(Optional) Display detailed SIP call information.

**terse**—(Optional) Display terse SIP call information.

**application-protocol**—(Optional) Display information about one of the following application protocols:

- **bootp**—(SIP only) Bootstrap protocol
- **dce-rpc**—(SIP only) Distributed Computing Environment-Remote Procedure Call protocols
- **dce-rpc-portmap**—(SIP only) Distributed Computing Environment-Remote Procedure Call protocols portmap service
- **dns**—(SIP only) Domain Name System protocol
- **exec**—(SIP only) Exec
- **ftp**—(SIP only) File Transfer Protocol
- **h323**—H.323 standards
- **icmp**—Internet Control Message Protocol
- **iiop**—Internet Inter-ORB Protocol
- **login**—Login
- **netbios**—NetBIOS
- **netshow**—NetShow
- **realaudio**—RealAudio

- **rpc**—Remote Procedure Call protocol
- **rpc-portmap**—Remote Procedure Call protocol portmap service
- **rtsp**—Real-Time Streaming Protocol
- **shell**—Shell
- **sip**—Session Initiation Protocol
- **snmp**—Simple Network Management Protocol
- **sqlnet**—SQLNet
- **tftp**—Trivial File Transfer Protocol
- **traceroute**—Traceroute
- **winframe**—WinFrame

**destination-port** *destination-port*—(Optional) Display information for a particular destination port. The range of values is from 0 to 65535.

**destination-prefix** *destination-prefix*—(Optional) Display information for a particular destination prefix.

**interface** *interface-name*—(Optional) Display information about a particular adaptive services interface. On M Series and T Series routers, *interface-name* can be *sp-fpc/pic/port* or *rspnumber*.

**limit** *number*—(Optional) Maximum number of entries to display.

**protocol**—(Optional) Display information about one of the following IP types:

- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **igmp**—Internet Group Management Protocol
- **ipip**—IP-within-IP Encapsulation Protocol
- **ipv6**—IPv6 within IP
- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Protocol

- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

**service-set *service-set***—(Optional) Display information for a particular service set.

**source-port *source-port***—(Optional) Display information for a particular source port.  
The range of values is from 0 to 65535.

**source-prefix *source-prefix***—(Optional) Display information for a particular source prefix.

## show services stateful-firewall sip-register

---

**Syntax**    show services stateful-firewall sip-register  
              <brief | extensive | terse>  
              <application-protocol *protocol*>  
              <destination-port *destination-port*>  
              <destination-prefix *destination-prefix*>  
              <interface *interface-name*>  
              <limit *number*>  
              <protocol *protocol*>  
              <service-set *service-set*>  
              <source-port *source-port*>  
              <source-prefix *source-prefix*>

**Release Information**    Command introduced in Junos OS Release 7.4.

**Description**    Display stateful firewall Session Initiation Protocol (SIP) register information.

**Options**    **count**—(Optional) Display a count of the matching entries.

**brief**—(Optional) Display brief SIP register information.

**extensive**—(Optional) Display detailed SIP register information.

**terse**—(Optional) Display terse SIP register information.

**application-protocol**—(Optional) Display information about one of the following application protocols:

- **bootp**—(SIP only) Bootstrap protocol
- **dce-rpc**—(SIP only) Distributed Computing Environment-Remote Procedure Call protocols
- **dce-rpc-portmap**—(SIP only) Distributed Computing Environment-Remote Procedure Call protocols portmap service
- **dns**—(SIP only) Domain Name System protocol
- **exec**—(SIP only) Exec
- **ftp**—(SIP only) File Transfer Protocol
- **h323**—H.323 standards
- **icmp**—Internet Control Message Protocol
- **iiop**—Internet Inter-ORB Protocol
- **login**—Login
- **netbios**—NetBIOS
- **netshow**—NetShow
- **realaudio**—RealAudio

- **rpc**—Remote Procedure Call protocol
- **rpc-portmap**—Remote Procedure Call protocol portmap service
- **rtsp**—Real-Time Streaming Protocol
- **shell**—Shell
- **sip**—Session Initiation Protocol
- **snmp**—Simple Network Management Protocol
- **sqlnet**—SQLNet
- **tftp**—Trivial File Transfer Protocol
- **traceroute**—Traceroute
- **winframe**—WinFrame

**destination-port** *destination-port*—(Optional) Display information for a particular destination port.

**destination-prefix** *destination-prefix*—(Optional) Display information for a particular destination prefix. The range of values is from 0 to 65535.

**interface** *interface-name*—(Optional) Display information about a particular interface. On M Series and T Series routers, the *interface-name* can be *sp-fpc/pic/port* or *rspnumber*.

**limit** *number*—(Optional) Maximum number of entries to display.

**protocol**—(Optional) Display information about one of the following IP types:

- **ah**—IPsec Authentication Header protocol
- **egp**—An exterior gateway protocol
- **esp**—IPsec Encapsulating Security Payload protocol
- **gre**—A generic routing encapsulation protocol
- **icmp**—Internet Control Message Protocol
- **igmp**—Internet Group Management Protocol
- **ipip**—IP-within-IP Encapsulation Protocol
- **ipv6**—IPv6 within IP
- **ospf**—Open Shortest Path First protocol
- **pim**—Protocol Independent Multicast protocol
- **rsvp**—Resource Reservation Protocol
- **sctp**—Stream Control Protocol

- **tcp**—Transmission Control Protocol
- **udp**—User Datagram Protocol

**service-set *service-set***—(Optional) Display information for a particular service set.

**source-port *source-port***—(Optional) Display information for a particular source port.  
The range of values is from 0 to 65535.

**source-prefix *source-prefix***—(Optional) Display information for a particular source prefix.

**Output Fields** [Table 101 on page 1670](#) lists the output fields for the **show services stateful-firewall sip-register** command. Output fields are listed in the approximate order in which they appear.

*Table 101: show services stateful-firewall sip-register Output Fields*

| Field Name                | Field Description                       |
|---------------------------|-----------------------------------------|
| <b>Interface</b>          | Name of an adaptive services interface. |
| <b>Service set</b>        | Name of a service set.                  |
| <b>SIP Register</b>       | Register information header.            |
| <b>Protocol</b>           | Protocol used for this flow.            |
| <b>Registered IP</b>      | Register IP address.                    |
| <b>Port</b>               | Register port number.                   |
| <b>Expiration timeout</b> | Configured lifetime, in seconds.        |
| <b>Timeout remaining</b>  | Lifetime remaining, in seconds.         |
| <b>From</b>               | Initiator address.                      |
| <b>To</b>                 | Responder address.                      |
| <b>Call ID</b>            | SIP call identification string.         |

|            | TCP protocol errors:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|            | <ul style="list-style-type: none"> <li>• <b>TCP header length inconsistencies</b>—Minimum TCP header length is 20 bytes, and the IP packet received does not contain at least 20 bytes.</li> <li>• <b>Source or destination port number is zero</b>—TCP source or destination port is zero.</li> <li>• <b>Illegal sequence number and flags combinations</b> — Dropped because of TCP errors, such as an illegal sequence number, which causes an illogical combination of flags to be set.</li> <li>• <b>SYN attack (multiple SYN messages seen for the same flow)</b>—Multiple SYN packets received for the same flow are treated as a SYN attack. The packets might be retransmitted SYN packets and therefore valid, but a large number is cause for concern.</li> <li>• <b>First packet not a SYN message</b>—First packets for a connection are not SYN packets. These packets might originate from previous connections or from someone performing an ACK/FIN scan.</li> <li>• <b>TCP port scan (TCP handshake, RST seen from server for SYN)</b>—In the case of a SYN defender, if an RST (reset) packet is received instead of a SYN/ACK message, someone is probably trying to scan the server. This behavior can result in false alarms if the RST packet is not combined with an intrusion detection service (IDS).</li> <li>• <b>Bad SYN cookie response</b>—SYN cookie generates a SYN/ACK message for all incoming SYN packets. If the ACK received for the SYN/ACK message does not match, this counter is incremented.</li> <li>• <b>TCP reconstructor sequence number error</b>—This counter is incremented in the following cases:<br/>The TCP seqno is 0 and all the TCP flags are also 0.<br/>The TCP seqno is 0 and FIN/PSH/URG TCP flags are set.</li> <li>• <b>TCP reconstructor retransmissions</b>—This counter is incremented for the retransmitted packets during connection 3-way handshake.</li> <li>• <b>TCP partially opened connection timeout (SYN)</b>—This counter is incremented when the SYN Defender is enabled and the 3-way handshake is not completed within the SYN DEFENDER TIMEOUT. The connection will be closed and resources will be released by sending RST to the responder.</li> <li>• <b>TCP partially opened connection timeout (SYN-ACK)</b>—This counter is incremented when the SYN Defender is enabled and the 3-way handshake is not completed within the SYN DEFENDER TIMEOUT. The connection will be closed and resources will be released by sending RST to the responder.</li> <li>• <b>TCP partially closed connection reuse</b>—Not supported.</li> <li>• <b>TCP 3-way error - client sent SYN+ACK</b>—A SYN/ACK should be sent by the server on receiving a SYN. This counter is incremented when the first message received from the initiator is SYN+ACK.</li> <li>• <b>TCP 3-way error - server sent ACK</b>—ACK should be sent by the client on receiving a SYN/ACK from the server. This counter is incremented when the ACK is received from the Server instead of from the Client.</li> <li>• <b>TCP 3-way error - SYN seq number retransmission mismatch</b>—This counter is incremented when the SYN is received again with a different sequence number from the first SYN sequence number.</li> <li>• <b>TCP 3-way error - RST seq number mismatch</b>—A reset could be received from either side. The server could send a RST on receiving a SYN or the client could send a RST on receiving SYN/ACK. This counter is incremented when the</li> </ul> |

## Sample Output

### show services stateful-firewall statistics extensive

```

user@host> show services stateful-firewall statistics extensive
Interface: ms-1/3/0
Service set: interface-svc-set
New flows:
 Rule Accepts: 907, Rule Discards: 0, Rule Rejects: 0
Existing flow types packet counters:
 Accepts: 3535, Drop: 0, Rejects: 0
Hairpinning counters:
 Slow Path Hairpinned Packets: 0, Fast Path Hairpinned Packets: 0
Drops:
 IP option: 0, TCP SYN defense: 0
 NAT ports exhausted: 0, Sessions dropped due to subscriber flow limit: 0
Errors:
 IP: 0, TCP: 0
 UDP: 0, ICMP: 0
 Non-IP packets: 0, ALG: 0
IP errors:
 IP packet length inconsistencies: 0
 Minimum IP header length check failures: 0
 Reassembled packet exceeds maximum IP length: 0
 Illegal source address: 0
 Illegal destination address: 0
 TTL zero errors: 0, Illegal IP protocol number (0 or 255): 0
 Land attack: 0
 Non-IPv4 packets: 0, Bad checksum: 0
 Illegal IP fragment length: 0
 IP fragment overlap: 0
 IP fragment reassembly timeout: 0
 IP fragment limit exceeded: 0
 Unknown: 0
TCP errors:
 TCP header length inconsistencies: 0
 Source or destination port number is zero: 0
 Illegal sequence number and flags combination: 0
 SYN attack (multiple SYN messages seen for the same flow): 0
 First packet not a SYN message: 0
 TCP port scan (TCP handshake, RST seen from server for SYN): 0
 Bad SYN cookie response: 0
 TCP reconstructor sequence number error: 0
 TCP reconstructor retransmissions: 0
 TCP partially opened connection timeout (SYN): 0
 TCP partially opened connection timeout (SYN-ACK): 0
 TCP partially closed connection reuse: 0
 TCP 3-way error - client sent SYN+ACK: 0
 TCP 3-way error - server sent ACK: 0
 TCP 3-way error - SYN seq number retransmission mismatch: 0
 TCP 3-way error - RST seq number mismatch: 0
 TCP 3-way error - FIN received: 0
 TCP 3-way error - invalid flags (PSH, URG, ECE, CWR): 0
 TCP 3-way error - SYN recvd but no client flows: 0
 TCP 3-way error - first packet SYN+ACK: 0
 TCP 3-way error - first packet FIN+ACK: 0
 TCP 3-way error - first packet FIN: 0

## show services stateful-firewall statistics application-protocol sip

**Syntax** show services stateful-firewall application-protocol sip

**Release Information** Command introduced in Junos OS Release 7.4.

**Description** Display stateful firewall Session Initiation Protocol (SIP) statistics.

**Options** This command has no options.

**Required Privilege Level** view

**List of Sample Output** [show services stateful-firewall statistics application-protocol-sip on page 1682](#)

**Output Fields** [Table 103 on page 1681](#) lists the output fields for the **show services stateful-firewall statistics application-protocol-sip** command. Output fields are listed in the approximate order in which they appear.

*Table 103: show services stateful-firewall statistics application-protocol-sip Output Fields*

| Field Name                    | Field Description                                                                                           |
|-------------------------------|-------------------------------------------------------------------------------------------------------------|
| Interface                     | Name of an adaptive services interface.                                                                     |
| Service set                   | Name of the service set flow.                                                                               |
| ALG                           | Name of the application-layer gateway.                                                                      |
| Active SIP call count         | Number of active SIP calls.                                                                                 |
| Active SIP registration count | Number of active SIP registrations.                                                                         |
| REGISTER                      | Number of new, invalid, and retransmitted register requests sent to the SIP registrar.                      |
| INVITE                        | Number of new, invalid, and retransmitted invite messages sent by user agent clients.                       |
| ReINVITE                      | Number of new, invalid, and retransmitted reinvite messages sent by user agent clients.                     |
| ACK                           | Number of new, invalid, and retransmitted ACK messages received (in response to a SIP Call Invite message). |
| BYE                           | Number of new, invalid, and retransmitted requests to terminate SIP dialogues.                              |
| CANCEL                        | Number of new, invalid, and retransmitted SIP request cancellations.                                        |
| SUBSCRIBE                     | Number of new, invalid, and retransmitted SIP requests to subscribe for event notifications.                |

*Table 103: show services stateful-firewall statistics application-protocol-sip Output Fields (continued)*

| Field Name                         | Field Description                                                                                                                                                   |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>NOTIFY</b>                      | Number of new, invalid, and retransmitted event notifications in SIP dialogues.                                                                                     |
| <b>OPTIONS</b>                     | Number of new, invalid, and retransmitted requests to query SIP capabilities.                                                                                       |
| <b>INFO</b>                        | Number of new, invalid, and retransmitted requests carrying application-level information.                                                                          |
| <b>UPDATE</b>                      | Number of new, invalid, and retransmitted SIP dialogue updates.                                                                                                     |
| <b>REFER</b>                       | Number of new, invalid, and retransmitted requests to the recipient to contact a third party.                                                                       |
| <b>Provisional responses</b>       | Number of new, invalid, and retransmitted responses from the user agent server to indicate the progress of a SIP transaction.                                       |
| <b>OK responses to INVITES</b>     | OK responses sent from the user agent clients to user agent servers in response to Invite messages. The server can then return an ACK message.                      |
| <b>OK responses to non-INVITES</b> | OK responses to SIP messages other than an Invite message.                                                                                                          |
| <b>Redirection responses</b>       | Responses from the user agent server to a user agent client requesting the client to contact a different SIP uniform resource identifier (URI).                     |
| <b>Request failure responses</b>   | Responses that indicate a definite failure from a particular server. The client must not retry the same request without modification after receiving this response. |
| <b>Server failure responses</b>    | Responses that indicate a server failure.                                                                                                                           |
| <b>Global failure responses</b>    | Responses that indicate a server has definitive information about a particular user, not just the particular instance indicated in the Request URI.                 |
| <b>Invalid responses</b>           | Responses that are invalid.                                                                                                                                         |
| <b>Response (all) retransmits</b>  | Retransmissions of all responses.                                                                                                                                   |
| <b>Parser</b>                      | Syntax errors, content errors, and unknown methods counted by the message parser.                                                                                   |

## Sample Output

## show services subscriber analysis

|                                 |                                                                                                                                                                                                  |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>show services subscriber analysis</code><br><code>&lt;interface <i>interface-name</i>&gt;</code>                                                                                           |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 17.1 on MX Series MS-MPC.                                                                                                                               |
| <b>Description</b>              | Display information about the number of active subscribers on the services PIC.                                                                                                                  |
| <b>Options</b>                  | <b>none</b> —Display standard information about all active subscribers on the PIC.<br><b>interface <i>interface-name</i></b> —(Optional) Display information about the specified interface.      |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                             |
| <b>List of Sample Output</b>    | <a href="#">show services subscriber analysis interface on page 1688</a>                                                                                                                         |
| <b>Output Fields</b>            | <a href="#">Table 104 on page 1684</a> lists the output fields for the <b>show services subscriber analysis</b> command. Output fields are listed in the approximate order in which they appear. |

*Table 105: show services subscriber analysis Output Fields*

| Field Name                          | Field Description                                                                                                                         |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Services PIC Name                   | Name of an adaptive services interface.                                                                                                   |
| Subscriber Analysis Statistics:     |                                                                                                                                           |
| Total Subscribers Active            | Total number of subscribers currently active on the service PIC.                                                                          |
| Created Subscribers per Second      | Rate at which subscribers are currently being created on the service PIC.                                                                 |
| Deleted Subscribers per Second      | Rate at which subscribers are currently being deleted on the service PIC.                                                                 |
| Peak Total Subscribers Active       | Highest number of subscribers that were active during the lifetime of the service PIC.                                                    |
| Peak Created Subscribers per Second | Highest rate at which subscribers were being created during the lifetime of the service PIC.                                              |
| Peak Deleted Subscribers per Second | Highest rate at which subscribers were being deleted during the lifetime of the service PIC.                                              |
| Number of Samples                   | Number of samples during the current sampling period lifetime.                                                                            |
| Subscriber Rate Distribution(sec)   |                                                                                                                                           |
| Subscriber Operation: Creation      | Number of sampling intervals during which a number of subscribers in the indicated range were created during the current sampling period. |

Table 105: show services subscriber analysis Output Fields (continued)

| Field Name                     | Field Description                                                                                                                         |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Subscriber Operation: Deletion | Number of sampling intervals during which a number of subscribers in the indicated range were deleted during the current sampling period. |

| Output Fields            | <a href="#">Table 106 on page 1691</a> lists the output fields for the <b>show services traffic-load-balance statistics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Table 106: show services traffic-load-balance statistics Output Fields

| Field Name                                   | Field Description                                                                                                                                                                                                     | Level of Output   |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| <b>Traffic load balance instance name</b>    | Name of the traffic load balancer (TLB) instance that contains the load-distribution-related configuration settings.                                                                                                  | All levels        |
| <b>Multi services interface name</b>         | Name of the aggregated multiservices (AMS) interface used for the TLB instance to provide one-to-one redundancy for server health monitoring.                                                                         | All levels        |
| <b>Interface state</b>                       | Inter-process communications (IPC) status between the TLB daemon (traffic-dird) and the health checking daemon (net-monitor). <ul style="list-style-type: none"> <li>DOWN</li> <li>UP</li> </ul>                      | All levels        |
| <b>Interface type</b>                        | Logical interface type.                                                                                                                                                                                               | All levels        |
| <b>Route hold timer</b>                      | Time that the programmed VIP routes are kept intact after connectivity between traffic-dird and net-monitor daemons is lost. If connectivity is not reestablished within this time, all the VIP routes are withdrawn. | All levels        |
| <b>Traffic load balance virtual svc name</b> | Name of the virtual service for the TLB instance. The virtual service provides an address that is associated with the group of servers to which traffic is directed.                                                  | none<br>extensive |
| <b>Virtual service</b>                       | Name of the virtual service for the TLB instance. The virtual service provides an address that is associated with the group of servers to which traffic is directed.                                                  | summary           |
| <b>Routing instance name</b>                 | Name of the routing instance used for the virtual service.                                                                                                                                                            | none<br>extensive |
| <b>IP address</b>                            | IP address of the virtual service.                                                                                                                                                                                    | none<br>extensive |
| <b>Address</b>                               | IP address of the virtual service.                                                                                                                                                                                    | summary           |
| <b>Sts</b>                                   | Operational state of the virtual service.                                                                                                                                                                             | summary           |
| <b>Packet Sent</b>                           | Number of packets originating from the clients that the TLB instance virtual service processes for load balancing to next-hop servers.                                                                                | summary           |
| <b>Byte Sent</b>                             | Number of bytes originating from the clients that the TLB instance virtual service processes for load balancing to next-hop servers.                                                                                  | summary           |
| <b>Packet Recv</b>                           | Number of packets returning from the next-hop servers that the TLB instance virtual service processes and forwards to the clients.                                                                                    | summary           |
| <b>Byte Recv</b>                             | Number of bytes returning from the next-hop servers that the TLB instance virtual service processes and forwards to the clients.                                                                                      | summary           |

Table 106: show services traffic-load-balance statistics Output Fields (continued)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                | Level of Output   |

| Traffic load balance group name        | Server group name used for the virtual service.                                                                                                                                                                                                                                                                                                                  | none<br>extensive |
| Health check interface subunit         | Number of the subunit of the multiservice interface used for health checking.                                                                                                                                                                                                                                                                                    | none<br>extensive |
| Traffic load balance group down count  | Number of times the status of the TLB server group was down.                                                                                                                                                                                                                                                                                                     | extensive         |
| Protocol                               | Virtual service protocol, either tcp or udp. In translated mode, packets destined to the virtual service IP address+port number+protocol are load balanced and then replaced by the real service IP address and server listening port number.                                                                                                                    | none<br>extensive |
| Port Number                            | Virtual service port number. In translated mode, packets destined to the virtual service IP address+port number+protocol are load balanced and then replaced by the real service IP address and server listening port number.                                                                                                                                    | none<br>extensive |
| Server Listening Port Number           | Real service port number that replaces the virtual service port number. In translated mode, packets destined to the virtual service IP address+port number+protocol are load balanced and then replaced by the real service IP address and server listening port number.                                                                                         | none<br>extensive |
| Demux Nexthop index                    | Index number of the demultiplexing next hop for the virtual service. Index number is unique for a VIP, routing-instance, and protocol combination. The demultiplexing next hop is responsible for port-based demultiplexing of traffic to the load-balancing next hop for session distribution.                                                                  | none<br>extensive |
| DFW client-id                          | Client connection identifier assigned to the TLB daemon (traffic-dird) by the firewall daemon (dfwd) when the daemons are successfully connected.                                                                                                                                                                                                                | extensive         |
| Traffic load balance group warmup time | Time, in seconds, that passes after the traffic-dird daemon comes up until the traffic-dird programs the distribution table on the Packet Forwarding Engine.                                                                                                                                                                                                     | extensive         |
| Traffic load balance group auto-rejoin | Indicates whether the option that allows a server to rejoin the group automatically when it comes up is enabled or not.                                                                                                                                                                                                                                          | extensive         |
| Route metric                           | Routing metric assigned to the virtual service. A lower metric makes a route more preferred.                                                                                                                                                                                                                                                                     | extensive         |

Table 106: show services traffic-load-balance statistics Output Fields (continued)

| Field Name                       | Field Description                                                                                                                                                           | Level of Output   |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| Virtual service down count       | Number of times the status of the virtual service was down.                                                                                                                 | extensive         |
| Traffic load balance hash method | Hash key parameter used for load balancing. Hash keys supported in the ingress direction are protocol, source IP address, and destination IP address.                       | extensive         |
| Nexthop index                    | Index number of the next-hop for the virtual service. A group of servers function as a pool for next-hop session distribution.                                              | none<br>extensive |
| Up time                          | Period of time for which the virtual service is up, in the format <i>number-of-days hh:mm:ss</i> .                                                                          | none<br>extensive |
| Real Server Up count             | Starting in Junos OS Release 16.1R6 and 18.2R1, number of real servers that are up for the specified virtual service or server group.                                       | none              |
| Real Server Down count           | Starting in Junos OS Release 16.1R6 and 18.2R1, number of real servers that are down for the specified virtual service or server group.                                     | none              |
| Total packet sent count          | Number of packets originating from the clients that the TLB instance virtual service processes for load balancing to next-hop servers.                                      | none<br>extensive |
| Total byte sent count            | Number of bytes originating from the clients that the TLB instance virtual service processes for load balancing to next-hop servers.                                        | none<br>extensive |
| Total packet received count      | Number of packets returning from the next-hop servers that the TLB instance virtual service processes and forwards to the clients.                                          | none<br>extensive |
| Total byte received count        | Number of bytes returning from the next-hop servers that the TLB instance virtual service processes and forwards to the clients.                                            | none<br>extensive |
| Network monitoring profile count | Number of network monitoring profiles that are used to monitor the health of servers used in TLB session distribution.                                                      | extensive         |
| Active real service count        | Number of real services that are functional and active.                                                                                                                     | extensive         |
| Total real service count         | Total number of real services in different states.                                                                                                                          | extensive         |
| Network monitoring profile index | Unique index number associated with the network monitoring profile. Network monitoring profiles are used to monitor the health of servers used in TLB session distribution. | extensive         |

Table 106: show services traffic-load-balance statistics Output Fields (continued)

| Field Name                                | Field Description                                                                                                                                                                                                             | Level of Output  |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Network monitoring profile name</b>    | Name configured for the network monitoring profile.                                                                                                                                                                           | <b>extensive</b> |
| <b>Probe type</b>                         | Probe type used to examine the health of servers. TLB supports ICMP, TCP, and HTTP health check probes to monitor the health of servers in a group.                                                                           | <b>extensive</b> |
| <b>Probe interval</b>                     | Frequency, in number of seconds, at which health check probes are sent.                                                                                                                                                       | <b>extensive</b> |
| <b>Probe failure retry count</b>          | Number of failure retries, after which the real service is tagged as down.                                                                                                                                                    | <b>extensive</b> |
| <b>Probe recovery retry count</b>         | Number of successful retries after which the real service is tagged as up.                                                                                                                                                    | <b>extensive</b> |
| <b>Real service</b>                       | Name of the TLB server (also referred to as real service). The name is the identifier for a server to which sessions can be distributed using the server distribution table in conjunction with the session distribution API. | none             |
| <b>Address</b>                            | IP address of the configured real service.                                                                                                                                                                                    | none             |
| <b>Sts</b>                                | Operational state of the TLB server.                                                                                                                                                                                          | none             |
| <b>Packet Sent</b>                        | Number of packets originating from the clients that the TLB instance virtual service sends to the real service.                                                                                                               | none             |
| <b>Byte Sent</b>                          | Number of bytes originating from the clients that the TLB instance virtual service sends to the real service next-hop server.                                                                                                 | none             |
| <b>Packet Recv</b>                        | Number of packets returning from the real service next-hop server that the TLB instance virtual service processes and forwards to the clients.                                                                                | none             |
| <b>Byte Recv</b>                          | Number of bytes returning from the real service next-hop server that the TLB instance virtual service processes and forwards to the clients.                                                                                  | none             |
| <b>Traffic load balance real svc name</b> | Name of the real service used for traffic load-balancing.                                                                                                                                                                     | <b>extensive</b> |
| <b>Routing instance name</b>              | Name of the routing instance on which the real service is configured.                                                                                                                                                         | <b>extensive</b> |
| <b>IP address</b>                         | IP address of the configured real service.                                                                                                                                                                                    | <b>extensive</b> |
| <b>Traffic load balance group name</b>    | Name of the server group for real service.                                                                                                                                                                                    | <b>extensive</b> |
| <b>Admin state</b>                        | Administrative state of the real service, such as <b>Up</b> or <b>Down</b> .                                                                                                                                                  | <b>extensive</b> |

Table 106: show services traffic-load-balance statistics Output Fields (continued)

| Field Name                                 | Field Description                                                                                                                                                                                                                                                                                  | Level of Output  |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Oper state</b>                          | Operational state of the real service, such as <b>Up</b> or <b>Down</b> .                                                                                                                                                                                                                          | <b>extensive</b> |
| <b>Network monitoring probe up count</b>   | Number of probes for which the status of the server whose health is checked is observed to be up. If a server group is configured for dual health check, a real service is declared to be UP only if both health-check probes are simultaneously UP; otherwise a real service declared to be DOWN. | <b>extensive</b> |
| <b>Network monitoring probe down count</b> | Number of probes for which the status of the server whose health is checked is observed to be down.                                                                                                                                                                                                | <b>extensive</b> |
| <b>Total rejoin event count</b>            | Number of events that caused a server that was previously down and later operational to rejoin a group of real services for load-balancing.                                                                                                                                                        | <b>extensive</b> |
| <b>Total up event count</b>                | Number of TLB events that identified a virtual service or real service to be up.                                                                                                                                                                                                                   | <b>extensive</b> |
| <b>Total down event count</b>              | Number of TLB events that identified a virtual service or real service to be down.                                                                                                                                                                                                                 | <b>extensive</b> |
| <b>Real Service packet sent count</b>      | Number of packets originating from the clients that the TLB instance virtual service sends to the real service.                                                                                                                                                                                    | <b>extensive</b> |
| <b>Real Service byte sent count</b>        | Number of bytes originating from the clients that the TLB instance virtual service sends to the real service next-hop server.                                                                                                                                                                      | <b>extensive</b> |
| <b>Real Service packet received count</b>  | Number of packets returning from the real service next-hop server that the TLB instance virtual service processes and forwards to the clients.                                                                                                                                                     | <b>extensive</b> |
| <b>Real Service byte received count</b>    | Number of bytes returning from the real service next-hop server that the TLB instance virtual service processes and forwards to the clients.                                                                                                                                                       | <b>extensive</b> |
| <b>Total probe sent</b>                    | Number of health-monitoring probes sent from the TLB health check daemon.                                                                                                                                                                                                                          | <b>extensive</b> |
| <b>Total probe success</b>                 | Number of health-monitoring probes sent from the TLB health check daemon that were successful.                                                                                                                                                                                                     | <b>extensive</b> |
| <b>Total probe fail</b>                    | Number of health-monitoring probes attempted to be sent from the TLB health check daemon that failed.                                                                                                                                                                                              | <b>extensive</b> |
| <b>Total probe sent fail</b>               | Number of health-monitoring probes attempted to be sent from the TLB health check daemon that were unsuccessfully initiated.                                                                                                                                                                       | <b>extensive</b> |
| <b>Probe state</b>                         | Status of the health-check probe, such as <b>Up</b> or <b>Down</b> .                                                                                                                                                                                                                               | <b>extensive</b> |
| <b>Probe sent</b>                          | Number of health-check probe requests transmitted from the TLB health check daemon.                                                                                                                                                                                                                | <b>extensive</b> |

Table 106: show services traffic-load-balance statistics Output Fields (continued)

| Field Name                       | Field Description                                                                                                        | Level of Output  |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Probe success</b>             | Number of successful health-check probe requests transmitted from the TLB health check daemon.                           | <b>extensive</b> |
| <b>Probe fail</b>                | Number of failed health-check probe requests transmitted from the TLB health check daemon.                               | <b>extensive</b> |
| <b>Probe sent failed</b>         | Number of times the TLB health check daemon was unable to initiate transmission of a extensive health-check probe.       | <b>extensive</b> |
| <b>Probe consecutive success</b> | Number of health-check probe requests transmitted from the TLB health check daemon that were consecutively successful.   | <b>extensive</b> |
| <b>Probe consecutive fail</b>    | Number of health-check probe requests transmitted from the TLB health check daemon that failed for two successive times. | <b>extensive</b> |

## show services url-filter dns-resolution profile

**Syntax** `show services url-filter dns-resolution profile profile-name <template template-name>  
<fpc-slot fpc-slot pic-slot pic-slot>`

**Release Information** Command introduced in Junos OS Release 17.2.

**Description** Display URL filter domain name system (DNS) resolution information.

URL filtering resolves the blacklisted domains. The total number of domains are divided into chunks of 50 domains per chunk. The **filter term** in the command output is the name of a chunk.

**NOTE:** Starting in Junos OS Release 18.3R1, the `show services url-filter dns-resolution profile` command is deprecated and has been replaced by the `show services web-filter dns-resolution profile` command.

**Options** `fpc-slot fpc-slot pic-slot pic-slot`—(Optional) Specify the FPC and PIC for which you want URL filter information displayed.

`profile profile-name`—Specify the profile for which you want URL filter information displayed.

`template template-name`—(Optional) Specify the template for which you want URL filter information displayed.

## Sample Output

### show services url-filter dns-resolution profile

```
user@host> show services url-filter dns-resolution profile p1
URL filtering DNS resolution:
Profile: p1
Template: t1
```

```
1). Filter Term: URLF_t1_0004
```

```
IPv4 Address Count: 20
IPv6 Address Count: 20
```

```
1). Domain Name: www.facebook.com
```

```
IPv4 Records:
31.13.77.36
31.13.76.68
```

```
IPv6 Records:
2a03:2880:f122:83:face:b00c:0:25de
2a03:2880:f111:83:face:b00c:0:25de
```

```
2). Domain Name: www.youtube.com
```

```
IPv4 Records:
216.58.193.78
216.58.194.206
```

```
IPv6 Records:
2607:f8b0:400a:800::200e
2607:f8b0:4005:809::200e
```

```
3). Domain Name: www.netflix.com
```

## show services url-filter dns-resolution-statistics profile template

**Syntax** `show services url-filter dns-resolution-statistics profile profile-name template template-name (extensive | summary)`

**Release Information** Command introduced in Junos OS Release 17.2.

**Description** Display URL filter domain name system (DNS) resolution statistics.

**NOTE:** Starting in Junos OS Release 18.3R1, the `show services url-filter dns-resolution-statistics profile template` command is deprecated and has been replaced by the `show services web-filter dns-resolution-statistics profile template` command.

**Options** (extensive | summary)—Specify the level of detail of information you want displayed.

**profile *profile-name***—Specify the profile for which you want URL filter information displayed.

**template *template-name***—Specify the template for which you want URL filter information displayed.

**Required Privilege Level** view

## show services url-filter statistics profile template

**Syntax** `show services url-filter statistics profile profile-name template template-name <fpc-slot fpc-slot pic-slot pic-slot>`

**Release Information** Command introduced in Junos Os Release 17.2.

**Description** Display URL filter statistics.

**NOTE:** Starting in Junos OS Release 18.3R1, the `show services url-filter statistics profile template` command is deprecated and has been replaced by the `show services web-filter statistics profile` command.

**Required Privilege Level** view

**Related Documentation**

- [show services url-filter dns-resolution profile on page 1701](#)
- [show services url-filter dns-resolution-statistics profile template on page 1704](#)
- [Configuring URL Filtering on page 49](#)

**List of Sample Output** [show services url-filter statistics profile template on page 1710](#)

**Output Fields** [Table 109 on page 1709](#) lists the output fields for the `show services url-filter statistics profile template` command. Output fields are listed in the approximate order in which they appear.

*Table 109: show services url-filter statistics profile template Output Fields*

| Field Name           | Field Description                                                                       |
|----------------------|-----------------------------------------------------------------------------------------|
| Accept               | Action counters for accepted packets.                                                   |
| Custom page          | Action counters for custom page sent to recipient.                                      |
| Http scode           | Action counters for HTTP status code response.                                          |
| Redirect url         | Action counters for redirect URL response.                                              |
| TCP reset            | Action counters for TCP reset. Connection is closed.                                    |
| Bypass session count | Number of sessions not blocked by URL filtering because the match criteria was not met. |

*Table 109: show services url-filter statistics profile template Output Fields (continued)*

| Field Name                      | Field Description                                                                                                                                                                                                                                              |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IPV4 Disable IP Blocking</b> | Action counters for IPv4 packets that were accepted because filtering is disabled for HTTP traffic that contains an embedded IP address belonging to a blacklisted domain name in the URL filter database.                                                     |
| <b>IPV6 Disable IP Blocking</b> | Action counters for IPv6 packets that were accepted because filtering is disabled for HTTP traffic that contains an embedded IP address belonging to a blacklisted domain name in the URL filter database.                                                     |
| <b>session count</b>            | The session of activity that a user with a unique IP address spends on a website during a specified period of time. A session, in this case, would be the packets going to the service PIC from the Packet Forwarding Engine and then back to the service PIC. |
| <b>uplink packet count</b>      | Number of packets going from the Packet Forwarding Engine to the service PIC.                                                                                                                                                                                  |
| <b>uplink bytes</b>             | Number of bytes passing uplink.                                                                                                                                                                                                                                |
| <b>downlink packet count</b>    | Number of packets going from the service PIC to the service Packet Forwarding Engine.                                                                                                                                                                          |
| <b>downlink bytes</b>           | Number of bytes passing downlink.                                                                                                                                                                                                                              |

Table 112: show services web-filter statistics profile Output Fields

| Field Name   | Field Description                                                                                                                                    |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| UDP Counters | Number of UDP DNS requests, responses, and log only responses for DNS request filtering for queries of types A, AAAA, MX, CNAME, SRV, TXT, and MISC. |
| TCP Counters | Number of TCP DNS requests, responses, and log only responses for DNS request filtering for queries of types A, AAAA, MX, CNAME, SRV, TXT, and MISC. |

Table 112: show services web-filter statistics profile Output Fields (continued)

| Field Name                      | Field Description                                                                                                                                                                                                                                                                |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Accept</b>                   | Action counters for accepted packets for URL filtering.                                                                                                                                                                                                                          |
| <b>Custom page</b>              | Action counters for custom page sent to recipient for URL filtering.                                                                                                                                                                                                             |
| <b>Http scode</b>               | Action counters for HTTP status code response for URL filtering.                                                                                                                                                                                                                 |
| <b>Redirect url</b>             | Action counters for redirect URL response for URL filtering.                                                                                                                                                                                                                     |
| <b>TCP reset</b>                | Action counters for TCP reset for URL filtering. Connection is closed.                                                                                                                                                                                                           |
| <b>Bypass session count</b>     | Number of sessions not blocked by URL filtering because the match criteria was not met for URL filtering.                                                                                                                                                                        |
| <b>IPV4 Disable IP Blocking</b> | Action counters for IPv4 packets that were accepted because filtering is disabled for HTTP traffic that contains an embedded IP address belonging to a blacklisted domain name in the URL filter database.                                                                       |
| <b>IPV6 Disable IP Blocking</b> | Action counters for IPv6 packets that were accepted because filtering is disabled for HTTP traffic that contains an embedded IP address belonging to a blacklisted domain name in the URL filter database.                                                                       |
| <b>session count</b>            | The session of activity that a user with a unique IP address spends on a website during a specified period of time for URL filtering. A session, in this case, would be the packets going to the service PIC from the Packet Forwarding Engine and then back to the service PIC. |
| <b>uplink packet count</b>      | Number of packets going from the Packet Forwarding Engine to the service PIC for URL filtering.                                                                                                                                                                                  |
| <b>uplink bytes</b>             | Number of bytes passing uplink for URL filtering.                                                                                                                                                                                                                                |
| <b>downlink packet count</b>    | Number of packets going from the service PIC to the service Packet Forwarding Engine for URL filtering.                                                                                                                                                                          |
| <b>downlink bytes</b>           | Number of bytes passing downlink for URL filtering.                                                                                                                                                                                                                              |
| <b>UDP DNS</b>                  | Number of UDP DNS requests, responses, and log only responses for DNS request filtering for queries of types A, AAAA, MX, CNAME, SRV, TXT, and MISC.                                                                                                                             |
| <b>TCP DNS</b>                  | Number of TCP DNS requests, responses, and log only responses for DNS request filtering for queries of types A, AAAA, MX, CNAME, SRV, TXT, and MISC.                                                                                                                             |

## Sample Output

### show services web-filter statistics profile dns-filter-template

```

user@host> show services web-filter statistics profile pdns dns-filter-template tdns
 Query Requests Responses Log
 Type only
