#### YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

#### END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <https://support.juniper.net/support/eula/>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

# Table of Contents

	About the Documentation . . . . .	xxxi
	Documentation and Release Notes . . . . .	xxxi
	Using the Examples in This Manual . . . . .	xxxi
	Merging a Full Example . . . . .	xxxiv
	Merging a Snippet . . . . .	xxxiv
	Documentation Conventions . . . . .	xxxv
	Documentation Feedback . . . . .	xxxvii

<b>Part 1</b>	<b>Overview</b>	
<b>Chapter 1</b>	<b>Chassis-Level Configuration Overview . . . . .</b>	<b>3</b>
	Chassis-Level Features Overview . . . . .	3
<b>Chapter 2</b>	<b>MX Series MPCs Overview . . . . .</b>	<b>5</b>
	16-Port 10-Gigabit Ethernet MPC on MX Series Routers (16x10GE 3D MPC)	
	Overview . . . . .	6
	MPC1 on MX Series Routers Overview . . . . .	7
	Understanding Interface Naming Conventions for MPC1 . . . . .	8
	MPC2 on MX Series Routers Overview . . . . .	12
	Understanding Interface Naming Conventions for MPC2 . . . . .	14
	Tunnel Interfaces on MX Series Routers with MPC1 and MPC2 . . . . .	20
	Packet Forwarding Engine Mapping and Tunnel Bandwidth for MPC1E and MPC1E-Q . . . . .	21
	Packet Forwarding Engine Mapping and Tunnel Bandwidth for MPC2E, MPC2E-Q, and MPC2E-EQ . . . . .	21
	Understanding Interface Naming Conventions for MIC-MACSEC-20GE . . . . .	22
	MPC3E on MX Series Routers Overview . . . . .	23
	MPC4E on MX Series Routers Overview . . . . .	27
	MPC5E on MX Series Routers Overview . . . . .	29
	MPC6E on MX Series Routers Overview . . . . .	31
	MPC7E (Multi-Rate) on MX Series Routers Overview . . . . .	33
	MPC7E-MRATE Gigabit Ethernet Interface Naming Convention . . . . .	33
	MPC7E-MRATE MPC Rate-Selectability Overview . . . . .	34
	MPC7E 10G on MX Series Routers Overview . . . . .	35
	MPC8E on MX Series Routers Overview . . . . .	37
	Upgrading MPC8E to Provide Increased Bandwidth . . . . .	38
	MPC9E on MX Series Routers Overview . . . . .	39

Tunnel Interfaces on MX Series Routers with MPC7E-10G, MPC7E-MRATE, MX2K-MPC8E, and MX2K-MPC9E . . . . .	41
Packet Forwarding Engine Mapping and Tunnel Bandwidth for MPC7E-MRATE . . . . .	41
Packet Forwarding Engine Mapping and Tunnel Bandwidth for MPC7E-10G . . . . .	41
Packet Forwarding Engine Mapping and Tunnel Bandwidth for MX2K-MPC8E . . . . .	42
Packet Forwarding Engine Mapping and Tunnel Bandwidth for MX2K-MPC9E . . . . .	42
MX10003 MPC on MX10003 Router Overview . . . . .	43
JNP10K-LC2101 MPC on MX10008 Routers Overview . . . . .	44
Downgrading JNP10K-LC2101 to Provide Decreased Bandwidth . . . . .	44
MX204 Router Overview . . . . .	45
Flexible Queuing Mode Overview . . . . .	45
Upgrading non-HQoS MPCs to Support Flexible Queuing . . . . .	46
Disabling Flexible Queuing for non-HQoS MPCs to Optimize Power Utilization . . . . .	47
Understanding the Hyper Mode Feature on Enhanced MPCs for MX Series Routers and EX9200 Switches . . . . .	48
Configuring Hyper Mode on Enhanced MPCs to Speed Up Packet Processing . . . . .	50
Unsupported Features and CLI Commands When Hyper Mode Is Enabled . . . . .	51
License Modes for Enhanced MPCs Overview . . . . .	54
Configuring the License Mode for Specific Enhanced MPCs on MX Series Routers . . . . .	55
Example: Configuring the License Mode for MPC5E . . . . .	56
Configuring the Number of Active Ports on 16-Port MPCs of MX Series Routers . . . . .	61
Configuring Tunnel Interfaces on an MX Series Router with a 16x10GE 3D MPC . . . . .	62
Configuring Tunnel Interfaces on MX Series Routers with the MPC3E . . . . .	63
Example: Configuring Tunnel Interfaces on the MPC3E . . . . .	64
Configuring Tunnel Interfaces on MX Series Routers with MPC4E . . . . .	66
Configuring Tunnel Interfaces on MX Series Routers with MPC7E-MRATE/MPC7E-10G . . . . .	67
Configuring Tunnel Interfaces on MX Series Routers with MX2K-MPC8E . . . . .	68
Configuring Tunnel Interfaces on MX Series Routers with MX2K-MPC9E . . . . .	69
Remote Port Identification using LEDs for Cabling Assistance . . . . .	70
MPC and MIC Lane LED Scheme Overview . . . . .	71
MX204 LED Scheme Overview . . . . .	74
Guidelines for Identifying Active PICs on MPC5E (MPC5E-40G10G) . . . . .	75

<b>Chapter 3</b>	<b>Line Card Interoperability Overview . . . . .</b>	<b>79</b>
	Interoperability of Type 3 FPCs and Type 4 FPCs with Type 5 FPCs . . . . .	79
	Interoperability Between MPC4E (MPC4E-3D-2CGE-8XGE) and 100-Gigabit Ethernet PICs on Type 4 FPC . . . . .	80
	Configuring 100-Gigabit Ethernet MICs to Interoperate with Type 4 100-Gigabit Ethernet PICs (PD-1CE-CFP-FPC4) Using SA Multicast Mode . . . . .	80
	Configuring MPC4E (MPC4E-3D-2CGE-8XGE) to Interoperate with 100-Gigabit Ethernet PICs on Type 4 FPC Using SA Multicast Mode . . . . .	83
	Configuring SA Multicast Bit Steering Mode on MPC4E . . . . .	83
	Configuring Two 50-Gigabit Ethernet Physical Interfaces on the Ethernet PIC as One Aggregated Ethernet Interface . . . . .	84
	Interoperability Between MPC7E-MRATE and 100-Gigabit Ethernet PICs on Type 4 FPC . . . . .	85
	Configuring MPC7E-MRATE to Interoperate with 100-Gigabit Ethernet PICs on Type 4 FPC Using SA Multicast Mode . . . . .	86
	Configuring SA Multicast Bit Steering Mode on MPC7E . . . . .	86
	Configuring Two 50-Gigabit Ethernet Physical Interfaces on the Ethernet PIC as One Aggregated Ethernet Interface . . . . .	87
	Interoperability Between MPC8E (MX2K-MPC8E) and 100-Gigabit Ethernet PICs on Type 4 FPC . . . . .	88
	Configuring MPC8E to Interoperate with 100-Gigabit Ethernet PICs on Type 4 FPC Using SA Multicast Mode . . . . .	89
	Configuring SA Multicast Bit Steering Mode on MPC8E . . . . .	89
	Configuring Two 50-Gigabit Ethernet Physical Interfaces on the Ethernet PIC as One Aggregated Ethernet Interface . . . . .	90
	Interoperability Between MPC9E (MX2K-MPC9E) and 100-Gigabit Ethernet PICs on Type 4 FPC . . . . .	91
	Configuring MPC9E to Interoperate with 100-Gigabit Ethernet PICs on Type 4 FPC Using SA Multicast Mode . . . . .	92
	Configuring SA Multicast Bit Steering Mode on MPC9E . . . . .	92
	Configuring Two 50-Gigabit Ethernet Physical Interfaces on the Ethernet PIC as One Aggregated Ethernet Interface . . . . .	93
<b>Chapter 4</b>	<b>Configuring Power Management . . . . .</b>	<b>95</b>
	T4000 Power Management Overview . . . . .	95
	Understanding Power Management on the PTX5000 . . . . .	98
	Power Priority of FPCs . . . . .	98
	How an FPC's Power Priority Is Determined . . . . .	99
	FPC Priority and FPC Power Allocation . . . . .	99
	FPC Priority and Changes in the Power Budget . . . . .	99
	Power Zones . . . . .	100
	Power Supply Redundancy . . . . .	100
	Managing Power Allocated to PTX5000 FPCs on the Basis of Chassis Ambient Temperature Configuration . . . . .	101
	Understanding How Dynamic Power Management Enables Better Utilization of Power . . . . .	103

	Understanding How Configuring Ambient Temperature Helps Optimize Power Utilization . . . . .	104
	Monitoring the Power Consumption of PTX5000 FPCs by Configuring the Ambient Temperature . . . . .	105
	Redistributing the Available Power by Configuring Power-On Sequence . . . . .	108
	Configuring Power-On Sequence to Redistribute the Available Power . . . . .	109
	Configuring the Six-Input DC Power Supply on T Series Routers . . . . .	110
	Configuring the Six-Input DC Power Supply on an LCC Router in a Routing Matrix . . . . .	111
	Configuring the Six-Input DC Power Supply on T640 and T1600 Routers . . . . .	111
	Configuring the Six-Input DC Power Supply on T4000 Routers . . . . .	112
<b>Chapter 5</b>	<b>Fabric Management Overview . . . . .</b>	<b>115</b>
	Understanding Fabric Fault Handling on T4000 Router . . . . .	116
	Fabric Fault Handling Overview on PTX5000 Packet Transport Router . . . . .	119
	SIB-Level Faults . . . . .	121
	Types of Faults That Occur on a SIB . . . . .	121
	Handling SIB-Level Faults . . . . .	122
	FPC-Level Faults . . . . .	122
	Types of Faults That Occur on an FPC . . . . .	122
	Handling FPC-Level Faults . . . . .	123
	Fabric Plane Management on AS MLC Modular Carrier Card Overview . . . . .	124
	Fabric Plane Management on MPC4E Overview . . . . .	127
	Fabric Plane Management on JNP10K-LC2101 Overview . . . . .	128
	Example: Configuring Fabric Redundancy Mode on MPC4E . . . . .	129
	Signaling Neighboring Routers of Fabric Down on T640 and T1600 Routers . . . . .	131
	Fabric Resiliency and Degradation . . . . .	132
	Packet Forwarding Engine Errors and Recovery on PTX Series Routers . . . . .	133
	Packet Forwarding Engine Errors and Recovery on T640, T1600 or TX Matrix Routers . . . . .	133
	Detection and Recovery of Fabric-Related Failures Caused by Loss of Connectivity on MX Series Routers . . . . .	135
	Fabric-Failure Detection Methods on MX Series Routers . . . . .	136
	MX Series Routers Fabric Resiliency . . . . .	138
	Fabric Connectivity Restoration . . . . .	138
	Line Cards with Degraded Fabric . . . . .	139
	Connectivity Loss Towards a Single Destination Only . . . . .	139
	Redundancy Fabric Mode on Active Control Boards . . . . .	140
	Detection and Corrective Actions of Line Cards with Degraded Fabric on MX Series Routers . . . . .	140
	Managing Bandwidth Degradation . . . . .	143
	Disabling Line Card Restart to Limit Recovery Actions from Degraded Fabric Conditions . . . . .	144
	Disabling an FPC with Degraded Fabric Bandwidth . . . . .	144
	Configuring Redundancy Fabric Mode for Active Control Boards on MX Series Routers . . . . .	145
	Understanding Fabric Grant Bypass . . . . .	146
	Disabling Fabric Grant Bypass to Control Congestion and Improve Performance . . . . .	147

	Re-Enabling Fabric Grant Bypass . . . . .	148
	Understanding the Smooth Upgrade Process . . . . .	150
	Before you Begin the Smooth Upgrade Process . . . . .	151
	Performing a Smooth Upgrade to Enhanced Switch Fabric Board (SFB2) with Minimal Impact on Traffic . . . . .	160
	Understanding Fabric Fault Handling on Enhanced Switch Fabric Board (SFB2) . . . . .	170
	Fabric Management on MPC7E Overview . . . . .	171
	Fabric Hardening . . . . .	172
	Limiting Traffic Disruption by Detecting Packet Forwarding Engine Destinations That Are Unreachable over the Fabric . . . . .	172
<b>Chapter 6</b>	<b>Configuring Rate Selectability . . . . .</b>	<b>175</b>
	Understanding Rate Selectability . . . . .	176
	Rate Selectability on MPC7E-MRATE . . . . .	177
	Rate Selectability on MIC-MRATE . . . . .	177
	Rate Selectability on JNP10K-LC2101 . . . . .	178
	Rate Selectability on MIC-MACSEC-20GE . . . . .	178
	Guidelines for Configuring Rate Selectability . . . . .	179
	Guidelines for Configuring Rate Selectability for JNP10K-LC2101 . . . . .	180
	Understanding Interface Naming Convention for MPC7E-MRATE . . . . .	180
	Understanding Interface Naming Conventions for MIC-MRATE . . . . .	182
	Understanding Interface Naming Conventions for MX10003 MPC . . . . .	185
	Understanding Interface Naming Conventions for JNP10K-LC2101 . . . . .	187
	Supported Active Physical Ports for Configuring Rate Selectability to Prevent Oversubscription . . . . .	189
	Supported Active Physical Ports for Configuring Rate Selectability to Prevent Oversubscription on MX10003 MPC . . . . .	192
	Supported Active Physical Rate-Selectable Ports to Prevent Oversubscription on MX204 Router . . . . .	193
	Invalid Port Configuration . . . . .	194
	Configuring Active Ports on MX204 Router with Rate Selectability . . . . .	194
	Configuring Rate Selectability on MIC-MRATE to Enable Different Port Speeds . . . . .	196
	Configuring Rate Selectability on MIC-MRATE at MIC Level . . . . .	197
	Configuring Rate Selectability on MIC-MRATE at Port Level . . . . .	199
	Configuring Rate Selectability on MPC7E (Multi-Rate) to Enable Different Port Speeds . . . . .	201
	Configuring Rate Selectability at PIC Level . . . . .	201
	Configuring Rate Selectability at Port Level . . . . .	203
	MX10003 MPC Rate-Selectability Overview . . . . .	205
	Invalid Port Configuration . . . . .	209
	MX204 Router Rate-Selectability Overview . . . . .	210
	User-Configurable Rate Selectability of MX204 Routers . . . . .	213
	Maximum number of 10/40/100GE ports Configurable at PIC and Port Mode . . . . .	214
	Port Configuration - PIC Level . . . . .	214

	Configuring Rate Selectability on MX10003 MPC to Enable Different Port Speeds . . . . .	216
	Configuring Rate Selectability on MX10003 MPC at MIC/PIC Level . . . . .	217
	Configuring Rate Selectability on MX10003 MPC at Port Level . . . . .	218
	Configuring Rate Selectability on MX204 to Enable Different Port Speeds . . . . .	220
	Configuring Rate Selectability on MX204 at PIC Level . . . . .	220
	Configuring Rate Selectability on MX204 at Port Level . . . . .	222
	Configuring Rate Selectability on JNP10K-2101 MPC to Enable Different Port Speeds . . . . .	223
	Configuring Rate Selectability on JNP10K-2101 MPC at PIC Level . . . . .	224
	Configuring Rate Selectability on JNP10K-LC2101 MPC at Port Level . . . . .	225
<b>Chapter 7</b>	<b>Port Mirroring Instances Configuration Overview . . . . .</b>	<b>227</b>
	Understanding Port-Mirroring Instances on Different Routers . . . . .	227
	Configuring Port-Mirroring Instances on M320 Routers . . . . .	228
	Configuring Port-Mirroring Instances on M120 Routers . . . . .	228
	Configuring Port-Mirroring Instances on MX Series 5G Universal Routing Platforms . . . . .	229
	Configuring Port-Mirroring Instances at the DPC Level . . . . .	229
	Configuring Port-Mirroring Instances at the PIC Level . . . . .	230
<b>Chapter 8</b>	<b>Configuring Clocking and Synchronization . . . . .</b>	<b>231</b>
	Centralized Clocking Overview . . . . .	232
	Stratum 3 Clock Module . . . . .	233
	BITS and GPS Support . . . . .	233
	External Clock Interface Input . . . . .	234
	External Clock Interface Input for BITS . . . . .	234
	External Clock Interface Input for GPS . . . . .	234
	External Clock Interface Output . . . . .	236
	Redundancy . . . . .	236
	Ethernet Synchronization Message Channel Overview . . . . .	238
	Getting Started Configuring Clock Synchronization on PTX Series Routers . . . . .	240
	Interface and Router Clock Sources Overview . . . . .	240
	Interface and Router Clock Sources Description . . . . .	240
	Configuring an External Synchronization Interface . . . . .	241
	Synchronous Ethernet Overview . . . . .	242
	Understanding Synchronous Ethernet . . . . .	242
	Supported Platforms . . . . .	243
	Understanding Synchronous Ethernet on the ACX Series Universal Metro Routers . . . . .	247
	Understanding Clock Synchronization . . . . .	247
	Understanding Ingress Monitoring on MX Series Routers . . . . .	247
	Understanding Distributed Clocking Mode on MX Series Routers . . . . .	248
	Centralized Clocking Mode Overview . . . . .	248
	Synchronous Ethernet on 10-Gigabit Ethernet MIC Overview . . . . .	252

Precision Time Protocol Overview . . . . .	256
G.8275.1 Telecom Profile . . . . .	258
Types of Clocks Supported in the G.8275.1 Profile . . . . .	259
Alternate BMCA . . . . .	259
PTP over Link Aggregation Group . . . . .	259
Configuring G.8275.1 Profile . . . . .	260
Understanding Clock Synchronization . . . . .	263
Clock Selection . . . . .	264
Network Option . . . . .	266
Clock Mode . . . . .	267
Quality Mode . . . . .	267
Selection Mode . . . . .	267
Hold Interval . . . . .	268
Switchover Mode . . . . .	268
Clock Source . . . . .	269
ESMC Packet Transmit . . . . .	272
Global Wait To Restore . . . . .	272
Maximum Transmit Quality Level . . . . .	272
Interfaces with Upstream Clock Source . . . . .	272
E1 Interface Options . . . . .	273
Pulse Per Second . . . . .	274
Signal Type . . . . .	274
T1 Interface Options . . . . .	274
External Output Interface . . . . .	275
Holdover Mode . . . . .	275
Minimum Quality . . . . .	275
Source Mode . . . . .	276
Transmit Quality Level . . . . .	276
Wander Filter . . . . .	276
Clock Synchronization Ports . . . . .	276
MIC-Level Framing Mode . . . . .	278
Understanding ESMC Quality Level Mapping . . . . .	280
Synchronous Ethernet Mode . . . . .	281
Precision Time Protocol Mode . . . . .	281
Hybrid Mode . . . . .	283
Feature Mode Changes . . . . .	283
PTP Trace Overview . . . . .	284
PTP Ring Topology . . . . .	285
Path Trace Mechanism Overview . . . . .	285
Steady State . . . . .	286
Failure Handling . . . . .	287
PTP Ring Topology Without Path Trace Mechanism . . . . .	287
Understanding Hybrid Mode . . . . .	288
Hybrid Mode Overview . . . . .	288
Supporting Platforms . . . . .	290

Line Card Redundancy Overview . . . . .	291
Configuring Junos OS to Support an External Clock Synchronization Interface for M Series, MX Series, and T Series Routers . . . . .	292
Configuring Clock Synchronization Interface on MX Series Routers . . . . .	293
Configuring Clock Synchronization Options . . . . .	294
Display the External Clock Synchronization Configuration for SCB . . . . .	301
Display the External Clock Synchronization Configuration for SCBE . . . . .	302
Display the External Clock Synchronization Configuration for SCBE2 . . . . .	303
Displaying the External Clock Synchronization Configuration for MX2020 Control Board . . . . .	305
Clock Sources for PTX Series Packet Transport Routers . . . . .	306
Synchronizing Internal Stratum 3 Clock to External Clock Sources on PTX Series Routers . . . . .	308
Configuring a Recovered Clock for an FPC . . . . .	308
Configuring External Clock Synchronization Options . . . . .	308
Example: Configuring Synchronous Ethernet on MX Series Routers . . . . .	311
Example: Configuring Framing Mode for Synchronous Ethernet on MX Series Routers with 10-Gigabit Ethernet MIC . . . . .	316
Configuring Precision Time Protocol . . . . .	319
Configuring Precision Time Protocol and its Options . . . . .	319
Configuring PTP Options . . . . .	319
Configuring Slave Clock Options . . . . .	320
Configuring Master Clock Options . . . . .	323
Example: Configuring Precision Time Protocol . . . . .	325
Configuring Hybrid Mode and ESMC Quality Level Mapping . . . . .	329
Configuring the Router in Hybrid Mode . . . . .	330
Configuring Hybrid Mode with Mapping of the PTP Clock Class to the ESMC Quality Level . . . . .	331
Configuring Hybrid Mode with a User-Defined Mapping of the PTP Clock Class to the ESMC Quality Level . . . . .	332
Example: Configuring Hybrid Mode and ESMC Quality Level Mapping . . . . .	333
Example: Configuring Centralized Clocking on the Enhanced MX Switch Control Board . . . . .	340
Example: Configuring Centralized Clocking on an MX2020 . . . . .	349
<b>Chapter 9</b>	
<b>Configuring Network Services Mode . . . . .</b>	<b>361</b>
Network Services Mode Overview . . . . .	361
Network Services on SCBE2 . . . . .	363
Restrictions on Junos OS Ethernet Network Services Mode and Enhanced Ethernet Network Services Mode Features for MX Series Routers . . . . .	365
Configuring Junos OS to Run a Specific Network Services Mode in MX Series Routers . . . . .	366
Configuring Enhanced LAN Mode for a Virtual Chassis . . . . .	366
Limiting the Maximum Number of Logical Interfaces on MX Series Routers With MS-DPCs in Enhanced IP Network Services Mode . . . . .	368

<b>Part 2</b>	<b>Configuring Chassis-Level Features</b>	
<b>Chapter 10</b>	<b>Configuring TX Matrix Chassis-Level Features</b>	<b>373</b>
	TX Matrix Router and T640 Router Configuration Overview	373
	TX Matrix Router and T640 Router-Based Routing Matrix Overview	373
	Running Different Junos OS Releases on the TX Matrix Router and T640 Routers	374
	TX Matrix Router Software Upgrades and Reinstallation	375
	TX Matrix Router Rebooting Process	375
	Committing Configurations on the TX Matrix Router	375
	TX Matrix and T640 Router Configuration Groups	376
	Routing Matrix System Log Messages	376
	TX Matrix Router Chassis and Interface Names	376
	Using the Junos OS to Configure a T640 Router Within a Routing Matrix	378
	Configuring Junos OS to Upgrade and Downgrade Switch Interface Boards on a TX Matrix Router	379
	Configuring Junos OS to Upgrade Switch Interface Boards on a TX Matrix Router	379
	Configuring Junos OS to Downgrade Switch Interface Boards on a TX Matrix Router	380
	Configuring Junos OS to Enable the TX Matrix Router to Generate an Alarm If a T640 Router Stays Offline	380
	FIB Localization Overview	381
	Configuring FIB Localization	382
	FIB Localization Overview	382
	Example: Configuring Packet Forwarding Engine FIB Localization	383
	Configuration Statements	388
	fib-local	388
	fib-remote	389
	no-route-localize	389
	route-localization	390
	Example: Configuring Packet Forwarding Engine FIB Localization	390
<b>Chapter 11</b>	<b>Configuring TX Matrix Plus Chassis-Level Features</b>	<b>397</b>
	TX Matrix Plus Router Configuration Overview	397
	TX Matrix Plus Router and Router-Based Routing Matrix Overview	398
	Running Different Junos OS Releases on the TX Matrix Plus Router and T1600 or T4000 Routers	399
	TX Matrix Plus Router Software Upgrades and Reinstallation	399
	TX Matrix Plus Router Rebooting Process	399
	TX Matrix Plus Router Routing Engine Rebooting Sequence	399
	TX Matrix Plus Router Management Ethernet Interfaces	399
	TX Matrix Plus Router Internal Ethernet Interfaces	400
	Routing Matrix-Based T1600 or T4000 Router Internal Ethernet Interfaces	400
	Committing Configurations on the TX Matrix Plus Router	400
	Routing Matrix Configuration Groups	401

Routing Matrix System Log Messages .....	401
TX Matrix Plus Router Chassis and Interface Names .....	402
Using the Junos OS to Configure a T1600 or T4000 Router Within a Routing Matrix .....	405
Configuring Junos OS to Enable the TX Matrix Plus Router to Generate an Alarm If a T1600 or T4000 Router Stays Offline .....	406
Configuring Junos OS to Upgrade the T1600 Router Chassis to LCC0 of a TX Matrix Plus Routing Platform .....	407
Preparing the Configuration File and Upgrading Junos OS on the T1600 Router and SFC .....	408
Configuring Junos OS for Upgrading SIBs on the T1600 Router and Connecting It to the SFC .....	408
Upgrading CBs and Routing Engines of the T1600 Router for Control Plane Connectivity .....	410
Changing the Management Ethernet Interface Name for the T1600 Router .....	410
Transferring Control of the T1600 Router (LCC0) to the SFC .....	410
Adding a New T1600 Router to the TX Matrix Plus Routing Platform .....	411
Downgrading a T1600 Router from the LCC of a TX Matrix Routing Platform to a Standalone T1600 Router .....	411
Configuring Junos OS to Upgrade the T1600 Router Chassis to LCC 0 of a TX Matrix Plus Router with 3D SIBs .....	412
Preparing the Configuration File and Upgrading Junos OS on the T1600 Router and the SFC .....	413
Configuring Junos OS for Upgrading the SIBs on the T1600 Router and Connecting It to the SFC .....	413
Upgrading the Control Boards, Routing Engines, PEMs, and Rear Fan Tray of the T1600 Router for Control Plane Connectivity .....	413
Preparing the SFC and the LCC for the Upgrade .....	413
Upgrading the SIBs .....	415
Training the Switching Plane Links .....	416
Activating and Verifying the Switching Planes .....	417
Transferring Control of the T1600 Router (LCC 0) to the SFC .....	418
Adding a New T1600 Router to the TX Matrix Plus Routing Matrix .....	419
Configuring Junos OS to Upgrade a T4000 Router to LCC 0 of a TX Matrix Plus Router with 3D SIBs .....	419
Preparing the Configuration File and Upgrading Junos OS on the T4000 Router and the SFC .....	420
Configuring Junos OS for Upgrading the SIBs on the T4000 Router and Connecting the Router to the SFC .....	420
Upgrading the Control Boards, Routing Engines, PEMs, and Rear Fan Tray of the T4000 Router for Control Plane Connectivity .....	421
Preparing the SFC and the LCC for the Upgrade .....	421
Upgrading the SIBs .....	422
Training the Switching Plane Links .....	423
Activating and Verifying the Switching Plane .....	425
Transferring Control of the T4000 Router (LCC 0) to the SFC .....	425
Adding a New T4000 Router to the TX Matrix Plus Routing Matrix .....	426

	Configuring Junos OS to Upgrade the T640 Router Chassis to LCC 0 of a TX Matrix Plus Router with 3D SIBs . . . . .	427
<b>Chapter 12</b>	<b>Configuring M Series Chassis-Level Features . . . . .</b>	<b>429</b>
	Configuring the Junos OS to Enable MTU Path Check for a Routing Instance on M Series Routers . . . . .	429
	Enabling MTU Check for a Routing Instance . . . . .	430
	Assigning an IP Address to an Interface in the Routing Instance . . . . .	430
	Configuring the Junos OS to Enable an M160 Router to Operate in Packet Scheduling Mode . . . . .	431
	Configuring the Junos OS to Make an SFM Stay Offline . . . . .	431
	Configuring the Junos OS to Support FPC to FEB Connectivity on M120 Routers . . . . .	432
	Configuring the Junos OS to Support Eight Queues on IQ Interfaces for T Series and M320 Routers . . . . .	434
	Configuring the Junos OS to Support Entry-Level Configuration on an M320 Router with a Minimum Number of SIBs and PIMs . . . . .	435
<b>Chapter 13</b>	<b>Configuring MX Series Chassis-Level Features . . . . .</b>	<b>437</b>
	Configuring the Junos OS to Enable Session Offloading on MX Series 5G Universal Routing Platforms with MS-DPCs . . . . .	437
	Configuring Voltage Level Monitoring of FPCs . . . . .	438
	Enabling Voltage Failure Errors on the FPC . . . . .	438
	Disabling Voltage Failure Errors on the FPC . . . . .	438
	Accounting of the Layer 2 Overhead Attribute in Interface Statistics . . . . .	439
	Guidelines for Configuring the Computation of Layer 2 Overhead in Interface Statistics . . . . .	440
	Configuring Layer 2 Overhead Accounting in Interface Statistics . . . . .	441
	Enabling the Accounting of Layer 2 Overhead in Interface Statistics at the PIC Level . . . . .	442
	Verifying the Accounting of Layer 2 Overhead in Interface Statistics . . . . .	443
<b>Chapter 14</b>	<b>Configuring T Series Chassis-Level Features . . . . .</b>	<b>447</b>
	Configuring OSS Mapping to Represent a T4000 Chassis as a T1600 or a T640 Chassis . . . . .	447
	Configuring T4000 Chassis as a T1600 Chassis . . . . .	447
	Configuring T4000 Chassis as a T640 Chassis . . . . .	447
	Disabling the OSS Mapping Feature . . . . .	448
	Example: Configuring a T4000 Chassis to Represent a T640 Chassis . . . . .	449
<b>Chapter 15</b>	<b>Configuring PTX Series Chassis-Level Features . . . . .</b>	<b>453</b>
	Configuring Port Speed . . . . .	453
	License Modes for PTX Series Routers . . . . .	454
	Configuring FPC Error Levels and Actions . . . . .	455
	Managing FPC Errors . . . . .	456
	Modifying Severity of an Error . . . . .	457
	Disabling an Error . . . . .	457

<b>Chapter 16</b>	<b>Configuring PIC-Specific Features . . . . .</b>	<b>459</b>
	Configuring the Junos OS to Make a Flexible PIC Concentrator Stay Offline . . .	459
	Configuring the Junos OS to Enable SONET/SDH Framing for SONET/SDH PICs . . . . .	461
	Configuring Junos OS to Enable SONET/SDH Framing for ATM MICs . . . . .	464
	Configuring the Junos OS to Use ATM Cell-Relay Accumulation Mode on an ATM1 PIC . . . . .	466
	Configuring the Junos OS to Support the Sparse DLCI Mode on Channelized STM1 or Channelized DS3 PICs . . . . .	466
	Configuring the Junos OS to Enable a SONET PIC to Operate in Channelized (Multiplexed) Mode . . . . .	467
	Configuring the Junos OS to Support Channel Groups and Time Slots for Channelized E1 PICs . . . . .	468
	Ranges for Channelized E1 Interfaces Configuration . . . . .	470
	Configuring the Junos OS to Support ILMI for Cell Relay Encapsulation on an ATM2 IQ PIC . . . . .	471
	Configuring the Junos OS to Enable Larger Delay Buffers for T1, E1, and DS0 Interfaces Configured on Channelized IQ PICs . . . . .	471
	Maximum Delay Buffer with q-pic-large-buffer Statement Enabled . . . . .	472
	Configuring a Policer Overhead . . . . .	473
	Configuring Mixed-Rate Mode Operation . . . . .	474
	Configuring Port Speed on Multi-Rate MICs . . . . .	475
<b>Chapter 17</b>	<b>Configuring Resynchronization of FPC Sequence Numbers when a new FPC is Brought Online . . . . .</b>	<b>479</b>
	Configuring the Junos OS to Resynchronize FPC Sequence Numbers with Active FPCs when an FPC Comes Online . . . . .	479
<b>Chapter 18</b>	<b>Configuring Chassis Settings to Support Aggregated Devices . . . . .</b>	<b>481</b>
	Configuring Junos OS for Supporting Aggregated Devices . . . . .	481
	Configuring Virtual Links for Aggregated Devices . . . . .	481
	Configuring LACP Link Protection at the Chassis Level . . . . .	482
	Enabling LACP Link Protection . . . . .	483
	Configuring System Priority . . . . .	483
	Configuring the Maximum Links Limit . . . . .	484
	Configuring PPM on Junos Fusion . . . . .	484
<b>Chapter 19</b>	<b>Configuring Chassis Settings to Support Load Balancing . . . . .</b>	<b>487</b>
	Configuring ECMP Next Hops for RSVP and LDP LSPs for Load Balancing . . .	487
	Configuring PIC-Level Symmetrical Hashing for Load Balancing on 802.3ad LAGs for MX Series Routers . . . . .	489
	Examples: Configuring PIC-Level Symmetrical Hashing for Load Balancing on 802.3ad LAGs on MX Series Routers . . . . .	491
	Configuring Symmetrical Hashing for family multiservice on Both Routers . . . . .	492
	Configuring Symmetrical Hashing for family inet on Both Routers . . . . .	492
	Configuring Symmetrical Hashing for family inet and family multiservice on the Two Routers . . . . .	493

<b>Chapter 20</b>	<b>Configuring Chassis Settings to Support Channelized Interfaces . . . . .</b>	<b>495</b>
	Configuring the Junos OS to Support Channelized DS3-to-DS0 Naming for	
	Channel Groups and Time Slots . . . . .	495
	Ranges for Channelized DS3-to-DS0 Configuration . . . . .	496
	Configuring the Junos OS to Support Channelized STM1 Interface Virtual Tributary	
	Mapping . . . . .	497
	Configuring the Junos OS to Enable Channelization on DS3/E3 MIC . . . . .	497
<b>Chapter 21</b>	<b>Configuring Chassis Settings to Support ATM Devices . . . . .</b>	<b>501</b>
	Configuring the Junos OS to Enable ATM2 Intelligent Queuing Layer 2 Circuit	
	Transport Mode . . . . .	501
	Configuring the Junos OS to Enable Idle Cell Format and Payload Patterns for	
	ATM Devices . . . . .	502
<b>Chapter 22</b>	<b>Configuring Chassis Settings for Routing Engines and Packet Forwarding</b>	
	<b>Engines . . . . .</b>	<b>505</b>
	Configuring the Junos OS to Support Redundancy on Routers Having Multiple	
	Routing Engines or Switching Boards . . . . .	505
	Configuring the Junos OS to Allocate More Memory for Routing Tables, Firewall	
	Filters, and Layer 3 VPN Labels . . . . .	506
	Configuring the Junos OS to Enable a Routing Engine to Reboot on Hard Disk	
	Errors . . . . .	509
	Associating Sampling Instances for Active Flow Monitoring with a Specific FPC,	
	MPC, or DPC . . . . .	509
	Configuring a Policer Overhead . . . . .	510
	Configuring Sanity Polling . . . . .	511
	Configuring Slow Packet Forwarding Engine Alarm . . . . .	514
	Enabling Slow Packet Forwarding Engine Alarm . . . . .	514
	Disabling Slow Packet Forwarding Engine Alarm . . . . .	514
	Verifying That the Alarm Output and System Log Messages are	
	Updated . . . . .	515
<b>Chapter 23</b>	<b>Configuring Chassis Settings for the Craft Interface . . . . .</b>	<b>517</b>
	Configuring the Junos OS to Disable the Physical Operation of the Craft	
	Interface . . . . .	517
<b>Chapter 24</b>	<b>Configuring Chassis Settings for Alarms . . . . .</b>	<b>519</b>
	User-Defined Alarm Relay Overview . . . . .	519
	Alarm Contact Port . . . . .	519
	Alarm Input . . . . .	520
	Alarm Output . . . . .	520
	Configuring Chassis Alarm Relays . . . . .	520
	Configuring Chassis Alarm Input . . . . .	521
	Configuring Chassis Alarm Output . . . . .	522
	Chassis Alarms . . . . .	523
	Chassis Conditions That Trigger Alarms . . . . .	530
	Chassis Component Alarm Conditions on M5 and M10 Routers . . . . .	531
	Chassis Component Alarm Conditions on M7i and M10i Routers . . . . .	533
	Chassis Component Alarm Conditions on M20 Routers . . . . .	537
	Chassis Component Alarm Conditions on M40 Routers . . . . .	541

	Chassis Component Alarm Conditions on M40e and M160 Routers . . . . .	546
	Chassis Component Alarm Conditions on M120 Routers . . . . .	551
	Chassis Component Alarm Conditions on M320 Routers . . . . .	556
	Chassis Component Alarm Conditions on MX Series 5G Universal Routing Platforms . . . . .	561
	Backup Routing Engine Alarms . . . . .	567
	Chassis Component Alarm Conditions for Guest Network Functions (GNFs) . . . . .	569
	System Alarms . . . . .	570
	System Utilization Alarms . . . . .	570
	Configuring Junos OS to Determine Conditions That Trigger Alarms on Different Interface Types . . . . .	571
	System-Wide Alarms and Alarms for Each Interface Type . . . . .	571
	Configuring Junos OS to Determine Conditions That Trigger Alarms on Different Interface Types . . . . .	573
	Silencing External Devices Connected to Alarm Relay Contacts . . . . .	574
<b>Chapter 25</b>	<b>Examples . . . . .</b>	<b>575</b>
	Example: Configuring Tunnel Interfaces on a Gigabit Ethernet 40-Port DPC . . .	575
	Example: Configuring Tunnel Interfaces on a 10-Gigabit Ethernet 4-Port DPC . .	576
	Example: Configuring FPC Error Detection and Self-Healing on T Series Core Routers . . . . .	576
<b>Part 3</b>	<b>Configuration Statements and Administrative Commands</b>

# About the Documentation

- Documentation and Release Notes on page xxxiii
- Using the Examples in This Manual on page xxxiii
- Documentation Conventions on page xxxv
- Documentation Feedback on page xxxvii
- Requesting Technical Support on page xxxvii

## Documentation and Release Notes

---

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at <https://www.juniper.net/documentation/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <https://www.juniper.net/books>.

## Using the Examples in This Manual

---

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

## Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xml;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

## Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {
  file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the **load** command, see [CLI Explorer](#).

## Documentation Conventions

Table 1 on page xxxv defines notice icons used in this guide.

*Table 1: Notice Icons*

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.
	Tip	Indicates helpful information.
	Best practice	Alerts you to a recommended use or implementation.

Table 2 on page xxxvi defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
<b>Bold text like this</b>	Represents text that you type.	To enter configuration mode, type the <b>configure</b> command:  user@host> <b>configure</b>
Fixed-width text like this	Represents output that appears on the terminal screen.	user@host> <b>show chassis alarms</b>  No alarms currently active
<i>Italic text like this</i>	<ul style="list-style-type: none"> <li>Introduces or emphasizes important new terms.</li> <li>Identifies guide names.</li> <li>Identifies RFC and Internet draft titles.</li> </ul>	<ul style="list-style-type: none"> <li>A policy <i>term</i> is a named structure that defines match conditions and actions.</li> <li><i>Junos OS CLI User Guide</i></li> <li>RFC 1997, <i>BGP Communities Attribute</i></li> </ul>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name:  [edit] root@# <b>set system domain-name</b> <i>domain-name</i>
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"> <li>To configure a stub area, include the <b>stub</b> statement at the [edit protocols ospf area area-id] hierarchy level.</li> <li>The console port is labeled <b>CONSOLE</b>.</li> </ul>
< > (angle brackets)	Encloses optional keywords or variables.	<b>stub</b> <default-metric <i>metric</i> >;
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	<b>broadcast</b>   <b>multicast</b>  ( <i>string1</i>   <i>string2</i>   <i>string3</i> )
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	<b>rsvp { # Required for dynamic MPLS only</b>
[ ] (square brackets)	Encloses a variable for which you can substitute one or more values.	<b>community name members</b> [ <i>community-ids</i> ]
Indentation and braces ( { } )	Identifies a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	

Table 2: Text and Syntax Conventions (continued)

Convention	Description	Examples
<b>GUI Conventions</b>		
<b>Bold text like this</b>	Represents graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"> <li>In the Logical Interfaces box, select <b>All Interfaces</b>.</li> <li>To cancel the configuration, click <b>Cancel</b>.</li> </ul>
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select <b>Protocols&gt;Ospf</b> .

## Documentation Feedback

We encourage you to provide feedback so that we can improve our documentation. You can use either of the following methods:

- Online feedback system—Click TechLibrary Feedback, on the lower right of any page on the [Juniper Networks TechLibrary](#) site, and do one of the following:

- Click the thumbs-up icon if the information on the page was helpful to you.
- Click the thumbs-down icon if the information on the page was not helpful to you or if you have suggestions for improvement, and use the pop-up form to provide feedback.
- E-mail—Send your comments to [techpubs-comments@juniper.net](mailto:techpubs-comments@juniper.net). Include the document or topic name, URL or page number, and software version (if applicable).

## Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or Partner Support Service support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <https://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <https://www.juniper.net/support/warranty/>.

- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

## Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <https://www.juniper.net/customers/support/>
- Search for known bugs: <https://prsearch.juniper.net/>
- Find product documentation: <https://www.juniper.net/documentation/>
- Find solutions and answer questions using our Knowledge Base: <https://kb.juniper.net/>
- Download the latest versions of software and review release notes: <https://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications: <https://kb.juniper.net/InfoCenter/>
- Join and participate in the Juniper Networks Community Forum: <https://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <https://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://entitlementsearch.juniper.net/entitlementsearch/>

## Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <https://www.juniper.net/cm/>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <https://www.juniper.net/support/requesting-support.html>.

## Chassis-Level Features Overview

---

The Junos Software enables you to configure several properties of the router and many PIC-level features at the **[edit chassis]** hierarchy level. Some of the features are specific to M Series, MX Series, J Series, or T Series routers, while some others are common across all routers.

To configure router chassis properties, you can include the configuration statements available at the **[edit chassis]** hierarchy level.

**NOTE:** Statements at the **[edit chassis redundancy]** hierarchy level are described in the *JUNOS High Availability Configuration Guide*.

**NOTE:** The configuration statements at the **[edit chassis lcc]** hierarchy level apply only to a routing matrix based on a TX Matrix router or a TX Matrix Plus router. For information about a routing matrix composed of a TX Matrix router and T640 routers, see “[TX Matrix Router and T640 Router Configuration Overview](#)” on [page 373](#) and the *TX Matrix Router Hardware Guide*. For information about a routing matrix composed of a TX Matrix Plus router and T1600 or T4000 routers, see “[TX Matrix Plus Router Configuration Overview](#)” on [page 397](#) and the *TX Matrix Plus Router Hardware Guide*.

**NOTE:** The sanity-poll configuration statements at the **[edit chassis fpc slot-number]** hierarchy level apply only to T Series routers. You can also configure sanity-poll for routing matrix based on a TX Matrix router or TX Matrix Plus router at the hierarchy level **[edit chassis lcc number fpc number]**.

## **16-Port 10-Gigabit Ethernet MPC on MX Series Routers (16x10GE 3D MPC) Overview**

In Junos OS Release 10.1 and later, MX960, MX480, and MX240 routers support the 16-port 10-Gigabit Ethernet MPC (16x10GE 3D MPC) with model numbers MPC-3D-16XGE-SFPP-R-B and MPC-3D-16XGE-SFPP. This MPC provides scalability in bandwidth, subscribers, and services capabilities of the routers.

The following are some of the key features of the 16x10GE 3D MPC:

- Contains 16 built-in 10-Gigabit Ethernet ports in groups of four each. It does not contain separate slots for Modular Interface Cards (MICs).
- Supports LAN-PHY mode with the following throughput:
  - 120 Gbps on Junos release 11.3 and earlier (SCB)
  - 160 Gbps on Junos release 11.4 and later (SCBE)
  - 160 Gbps on Junos release 13.3 and later (SCBE2)

**NOTE:** The 16x10GE 3D MPC does not support WAN-PHY mode.

---

- Supports small form-factor pluggable transceivers of the SFP+ standard. For a list of supported SFPs, see the [MX Series Interface Module Reference](#).
- Supports an effective line rate of twelve 10-Gigabit Ethernet ports. If all sixteen 10-Gigabit Ethernet ports are used, the line card is oversubscribed in the ratio of 4:3.

- Supports intelligent oversubscription services.
- Supports one full-duplex 10-Gigabit Ethernet tunnel interface for each Packet Forwarding Engine.

For information about the supported and unsupported Junos OS features for this MPC, see “Protocols and Applications Supported by MX Series MPCs” in the [MX Series Interface Module Reference](#).

## MPC1 on MX Series Routers Overview

In Junos OS Release 10.2 and later, MX960, MX480, MX240, MX2008, MX2010, and MX2020 routers support the Modular Port Concentrator (MPC) MPC1. This MPC provides scalability in bandwidth, subscribers, and services capabilities of the routers.

The MPC interoperates with existing MX Series line cards, including Dense Port Concentrators (DPCs) and Modular Port Concentrators (MPCs).

Starting in JunosOS Release 18.3R1, on MX240, MX480, and MX960 routers, the MIC-MACSEC-20GE with SFP/SFP+ ports are supported on MPC1 line card.

The MIC-MACSEC-20GE includes MACSEC-enabled ports with 256-bit encryption (GCM-AES-256 and GCM-AES-XPB-256). For more information, refer to “[Understanding Interface Naming Conventions for MIC-MACSEC-20GE](#)” on page 22.

MPC Name	MPC Model Number	First Junos OS Release on MX240, MX480, and MX960 Routers	First Junos OS Release on MX2008 Routers	First Junos OS Release on MX2010 Routers	First Junos OS Release on MX2020 Routers
<i>MPC1</i>	MX-MPC1-3D	10.2	15.1F7	12.3	12.3
<i>MPC1E</i>	MX-MPC1E-3D	11.2R4	15.1F7	12.3	12.3
<i>MPC1 Q</i>	MX-MPC1-3D-Q	10.2	15.1F7	12.3	12.3
<i>MPC1E Q</i>	MX-MPC1E-3D-Q	11.2R4	15.1F7	12.3	12.3

The following are some of the key features of the MPC:

- Contains two slots for Modular Interface Cards (MICs) labeled PIC0/1 and PIC2/3 .
- Supports LAN-PHY mode with the throughput of 10.31 Gbps and WAN-PHY mode with the throughput of 9.95 Gbps
- Supports small form-factor pluggable plus (SFP+) transceivers. For a list of supported transceivers, see the [MX Series Interface Module Reference](#).
- Supports intelligent oversubscription services.
- Supports one full-duplex, 16-Gigabit Ethernet tunnel interface for each Packet Forwarding Engine.

For information about the supported and unsupported Junos OS features for this MPC, see "Protocols and Applications Supported by MX Series MPCs" in the [MX Series Interface Module Reference](#).

## Understanding Interface Naming Conventions for MPC1

MPC1 facilitates configuration compatibility and enables you to replace an MX DPC with an MPC1 or MPC2 without requiring configuration change. The chassis daemon process (chassisd) creates physical interfaces for the tunnels only if it finds an associated tunnel bandwidth configuration.

The naming convention for virtual tunnels, for example is as follows:

*vt-mpc-slot/pic-slot/port-number.*

On MPC1, the PIC slot could be 0 or 1. Both the PIC slots are associated with the Packet Forwarding Engine PFE 0. [Table 3 on page 9](#) summarizes the MIC/PIC mapping for MPC1E and MPC1EQ.

## MPC2 on MX Series Routers Overview

In Junos OS Release 10.2 and later, MX240, MX480, MX960, MX2008, MX2010, and MX2020 routers support a new Modular Port Concentrator (MPC), MPC2. This MPC is a fixed-port MPC. On MX2020 and MX2010 routers, MPC2 is housed in an adapter card (ADC). MPC2 is available in the following models: MX-MPC2-3D(MPC2),

MX-MPC2-3D-Q(MPC2 Q), and MX-MPC2-3D-EQ(MPC2 EQ). This MPC provides scalability in bandwidth, subscribers, and services capabilities of the routers.

Starting in JunosOS Release 18.3R1, on MX240, MX480, and MX960 routers, the MIC-MACSEC-20GE with SFP/SFP+ ports are supported on MPC2 and MPC2E line cards.

The MIC-MACSEC-20GE includes MACSEC-enabled ports with 256-bit encryption (GCM-AES-256 and GCM-AES-XPN-256). For more information, refer to [“Understanding Interface Naming Conventions for MIC-MACSEC-20GE” on page 22](#).

MPC Name	MPC Model Number	First Junos OS Release on MX240, MX480, and MX960 Routers	First Junos OS Release on MX2008 Routers	First Junos OS Release on MX2010 Routers	First Junos OS Release on MX2020 Routers
<i>MPC2</i>	MX-MPC2-3D	10.1	15.1F7	12.3	12.3
<i>MPC2E</i>	MX-MPC2E-3D	11.2R4	15.1F7	12.3	12.3

<i>MPC2E Q</i>	MX-MPC2E-3D-Q	11.2R4	15.1F7	12.3	12.3
<i>MPC2 EQ</i>	MX-MPC2-3D-EQ	10.1	15.1F7	12.3	12.3
<i>MPC2E EQ</i>	MX-MPC2E-3D-EQ	11.2R4	15.1F7	12.3	12.3
<i>MPC2E P</i>	MX-MPC2E-3D-P	12.2	15.1F7	12.3	12.3
<i>MPC2E NG</i>	MX-MPC2E-3D-NG	14.1R4, 14.2R3 and Junos Continuity	15.1F7	14.1R4, 14.2R3 and Junos Continuity	14.1R4, 14.2R3 and Junos Continuity
		15.1		15.1	15.1
<i>MPC2E NG Q</i>	MX-MPC2E-3D-NG-Q	14.1R4, 14.2R3 and Junos Continuity	15.1F7	14.1R4, 14.2R3 and Junos Continuity	14.1R4, 14.2R3 and Junos Continuity
		15.1		15.1	15.1

The following are some of the key features of the MPC:

- Contains two slots for Modular Interface Cards (MICs) labelled PIC0/1 and PIC2/3 .
- Supports line-rate throughput of up to 80 Gbps
- Supports LAN-PHY mode with the throughput of 10.3125 Gbps and WAN-PHY mode with the throughput of 9.953 Gbps
- Supports small form-factor pluggable plus (SFP+) transceivers. For a list of supported transceivers, see the [MX Series Interface Module Reference](#).
- Supports intelligent oversubscription services.

For information about the supported and unsupported Junos OS features for this MPC, see *Protocols and Applications Supported on MPCs for MX Series Routers*.

**Release History Table**

Release	Description
18.3R1	Starting in JunosOS Release 18.3R1, on MX240, MX480, and MX960 routers, the MIC-MACSEC-20GE with SFP/SFP+ ports are supported on MPC2 and MPC2E line cards.

**Related Documentation** • [MPC2 on MX Series Routers Overview on page 12](#)

## Tunnel Interfaces on MX Series Routers with MPC1 and MPC2

MPC1 and MPC2 on the MX series routers support the following tunnel interfaces:

- gr-x/y/z—for GRE tunnels over IP
- ip-x/y/z—for IP over IP tunnels
- mt-x/y/z—for multicast tunnels
- pe-x/y/z—for PIM encapsulator interface
- pd-x/y/z—for PIM decapsulator interface
- lt-x/y/z—for logical tunnel interface connecting logical routers
- vt-x/y/z—for VPN tunnel interface for looping back packets from core into the PE and doing additional lookup

**NOTE:** x maps to the FPC slot, y maps to PIC slot and z maps to the port.

The following MPCs provide tunnel support parity, replacing traditional tunnel and services PICs with tunnels that were supported on a virtual port on the MX Series Packet Forwarding Engine.

- MX-MPC1-3D (MPC1)
- MX-MPC1-3D-Q (MPC1Q)
- MX-MPC2-3D (MPC2)
- MX-MPC2-3D-Q (MPC2 Q)
- MX-MPC2-3D-EQ (MPC2 EQ)

MX Series routers support a virtual PIC and a virtual port, visible for tunnel configuration, and eliminating the need for a tunnel PIC. Traditional tunnel PIC features are supported, including:

- GRE keys
- GRE clear-dont-fragment-bit

On MPC1 and MPC2 there are no tunnel PICs. Instead the MX router reserves some bandwidth for tunneling. In the presence of tunnel traffic, all WAN ports are affected in case of oversubscription.

You create tunnel interfaces on MX Series routers by including the following statements at the [edit chassis] hierarchy level on a particular PIC. For example

```
[edit chassis]
fpc 0 {
  pic 0 {
    tunnel-services {
```

```

        bandwidth 1g;
    }
}
fpc 0 {
pic 1 {
    tunnel-services {
        bandwidth 1g;
    }
}
}
}

```

This configuration enables tunnel services with a bandwidth of 1Gbps on FPC 0 and PIC 0. With this configuration, the tunnel interfaces created are:

- vt-0/0/0, ip-0/0/0, and so on for PIC 0
- vt-0/1/0, ip-0/1/0 and so on for PIC 1

MPC1 and MPC2 support bandwidth of 1 Gbps and 10 Gbps. The tunnel interfaces with their associated configurations work when an MX-DPC is replaced by an MPC. The router creates tunnel devices based on the tunnel services configuration. Although the same Packet Forwarding Engine supports vt-0/0/0 and vt-0/1/0, two devices must be created to be compatible with the above configuration. The MPCs allows you to configure four tunnel MICs per MPC (to support vt-0/0/0, vt-0/1/0, vt-0/2/0, vt-0/3/0), although in reality there are only two physical MICs. This is achieved by creating logical MICs on the MPCs.

### Packet Forwarding Engine Mapping and Tunnel Bandwidth for MPC1E and MPC1E-Q

The tunnel bandwidth for MPC1E and MPC1E-Q is 1Gbps or 10Gbps . However, if you do not specify the bandwidth in the configuration, it is set to 16Gbps.

[Table 5 on page 21](#) shows the mapping between the tunnel bandwidth and the Packet Forwarding Engines for MPC1E and MPC1E-Q .

**Table 5: Packet Forwarding Engine Mapping and Tunnel Bandwidth for MPC1E and MPC1E-Q**

Tunnel PIC	Maximum Bandwidth per Tunnel PIC	PFE Mapping	Maximum Tunnel Bandwidth per PFE	Maximum PFE Bandwidth
PIC0	16Gbps	PFE0	16Gbps	40Gbps
PIC1	16Gbps			
PIC2	16Gbps			
PIC3	16Gbps			

### Packet Forwarding Engine Mapping and Tunnel Bandwidth for MPC2E, MPC2E-Q, and MPC2E-EQ

The tunnel bandwidth for MPC2E, MPC2E-Q, and MPC2E-EQ is 1Gbps or 10Gbps . However, if you do not specify the bandwidth in the configuration, it is set to 16Gbps.

Table 6 on page 22 shows the mapping between the tunnel bandwidth and the Packet Forwarding Engines for MPC2E, MPC2E-Q, and MPC2E-EQ.

**Table 6: Packet Forwarding Engine Mapping and Tunnel Bandwidth for MPC2, /MPC2E-Q, and MPC2E-EQ**

Tunnel PIC	Maximum Bandwidth per Tunnel PIC	PFE Mapping	Maximum Tunnel Bandwidth per PFE	Maximum PFE Bandwidth
PIC0	16Gbps	PFE0	16Gbps	40Gbps
PIC1	16Gbps			
PIC2	16Gbps	PFE1	16Gbps	40Gbps
PIC3	16Gbps

## Understanding Interface Naming Conventions for MIC-MACSEC-20GE

By default, MIC-MACSEC-20GE operates in 1-Gigabit Ethernet mode. In this mode, the ports in the MIC are created as “ge” interfaces distributed across PIC0 and PIC1.

In 10-Gigabit Ethernet mode, the ports in the MIC will be created as “xe” interfaces one each on PIC 0 and PIC 1. In this mode, the 10G ports physically maps to the front panel port 8 and 9 on the second PIC of the MIC (that is marked on the front panel of the MIC).

**NOTE:** In the 10G mode, only the marked ports are operational and other physical ports are disabled.

**Table 7: Interface Naming Convention for MIC-MACSEC-20GE**

PIC	1-Gigabit Ethernet Interface	10-Gigabit Ethernet Interface
PIC 0	<b>ge-x/0/[0-9]</b>	<b>xe-x/0/0</b>
PIC 1	<b>ge-x/1/[0-9]</b>	<b>xe-x/1/0</b>
PIC 2	<b>ge-x/2/[0-9]</b>	<b>xe-x/2/0</b>
PIC 3	<b>ge-x/3/[0-9]</b>	<b>xe-x/3/0</b>

You should use the **pic-mode 10G** configuration command to set the PIC to operate in 10G mode. Both the PICs on a MIC must be configured in the same pic-mode, otherwise the configuration does not take effect. A chassis alarm is raised indicating a mis-configuration. Any mis-configuration will cause the PICs to assume default pic-mode, that is, to be in 20x1GE where all ports are in 1GE port speed.

**NOTE:** The 10-Gbps-capable ports (ports 8 and 9) of the 2x10GE/20x1GE MIC-MACSEC-20GE may show the link status as up while the peer side is down. In this case, it is recommended to disable auto-negotiation and set the speed to 1-Gbps on the peer side to bring the link up on the peer side.

The MIC-MACSEC-20GE MIC also provides 128-bit and 256-bit MACsec encryption on all the twenty 1GE and on the two 10GE ports in the following hardware configuration:

- Installed directly on the MX80 and MX104 routers
- Installed on MPC1, MPC2, MPC3, MPC2E, MPC3E, MPC2E-NG, and MPC3E-NG line cards on the MX240, MX480, and MX960 routers

By default, 128-bit MACsec encryption is supported.

The twenty 1-Gigabit Ethernet SFP ports distributes the ports across PIC0 and PIC1, that are logical PICs on the physical MIC. The two 10-Gigabit Ethernet SFP+ ports are physically located on PIC1. But, the 10-Gigabit interfaces are created by distributing the ports in either of the PICs.

**NOTE:**

- When the pic-mode is changed from 1-Gbps to 10-Gbps or vice versa, the Flexible PIC Concentrator (FPC) in MX240, MX480, MX960 routers and the Forwarding Engine Board (FEB) in MX80, MX104 routers undergoes an automatic bounce or a reboot.
- When the MIC-MACSEC-20GE is operating in the 10-Gbps mode, all the other 1-Gbps ports are disabled.

## MPC3E on MX Series Routers Overview

MX960, MX480, MX240, and MX2020 routers support the MPC3E (MX-MPC3E-3D) with two MIC slots. The MPC provides the connection between the customer's Ethernet interfaces and the routing fabric of the MX Series chassis.

The MPC3E supports these MICs as field-replaceable units (FRUs):

- *100-Gigabit Ethernet MIC with CFP* (model number MIC3-3D-1X100GE-CFP)
- *100-Gigabit Ethernet MIC with CXP* (model number MIC3-3D-1X100GE-CXP)
- *10-Gigabit Ethernet MIC with SFP+ (10 Ports)* (model number MIC3-3D-10XGE-SFPP)
- *2-port 40-Gigabit Ethernet MIC with QSFP+* (model number MIC3-3D-2X40GE-QSFPP)
- *20-port Enhanced Gigabit Ethernet MIC with SFP (E)* (model number MIC-3D-20GE-SFP-E)

The MPC3E also supports these legacy MICs:

- *20-port Gigabit Ethernet MIC with SFP* (model number MIC-3D-20GE-SFP)
- *2-port 10-Gigabit Ethernet MICs with XFP* (model number MIC-3D-2XGE-XFP)
- *20-port Gigabit Ethernet MIC with SFP/SFP+* (model number MIC-MACSEC-20GE)

Starting in JunosOS Release 18.3R1, on MX240, MX480, and MX960 routers, the MIC-MACSEC-20GE with SFP/SFP+ ports are supported on MPC3 and MPC3E line cards.

The MIC-MACSEC-20GE includes MACSEC-enabled ports with 256-bit encryption (GCM-AES-256 and GCM-AES-XPN-256). For more information, refer to [“Understanding Interface Naming Conventions for MIC-MACSEC-20GE” on page 22](#).

The MPC3E requires the Enhanced MX Switch Control Board (SCBE) for fabric redundancy. You can also continue to use existing SCBs without fabric redundancy. The MPC interoperates with existing MX Series line cards, including Dense Port Concentrators (DPCs) and Modular Port Concentrators (MPCs).

You can also configure the 100-Gigabit Ethernet MIC (MIC3-3D-1X100GE-CFP) to interoperate with routers using the 100-Gigabit Ethernet PIC (Type 4 1X100GE PIC for STFPC4 FPC) by using the **forwarding-mode** statement with the **sa-multicast** option at the **[edit chassis fpc slot pic slot]** hierarchy level. For more information, see [“Configuring 100-Gigabit Ethernet MICs to Interoperate with Type 4 100-Gigabit Ethernet PICs \(PD-ICE-CFP-FPC4\) Using SA Multicast Mode” on page 80](#).

The MPC3E is based on a new Juniper Networks chipset for increased scalability for bandwidth, subscribers, and service capabilities of the routers.

The MPC3E supports these key features:

- 100-Gigabit Ethernet interfaces
- Two separate slots for MICs
- The following MICs:
  - MIC3-3D-1X100GE-CFP
  - MIC3-3D-1X100GE-CXP
  - MIC3-3D-10XGE-SFPP
  - MIC3-3D-2X40GE-QSFPP

- MIC-3D-20GE-SFP
- MIC-3D-20GE-SFP-E
- MIC-3D-2XGE-XFP
- MIC-3D-8OC3OC12-4OC48
- MIC-3D-4OC3OC12-1OC48
- MIC-3D-1OC192-XFP
- MIC-3D-8DS3-E3
- Up to 100 Gbps per MIC slot
- Up to 200 Gbps aggregate WAN bandwidth connectivity for the two MIC slots; the line card is oversubscribed in the ratio of 1.5:1.
- Up to four full-duplex tunnel interfaces on the line card
- Intelligent oversubscription services
- Configuration of Virtual Chassis ports in an MX Series Virtual Chassis member router

The MPC3E supports all MX Series Virtual Chassis features, including Layer 2 and IEEE 802.3ad link aggregation features. An MX Series Virtual Chassis configuration does not currently support the Spanning Tree Protocol (STP).

**NOTE:** On the MX960 router, FPC slot 0 and slot 11 are not NEBS compliant beyond 104°F (40°C) with MPC3E-3D-NG and MPC3E-3D-NG-Q. This is a cooling restriction.

For more information about supported Junos OS features on the MPC3E, see *Protocols and Applications Supported by the MPC3E on MX Series Routers* in the [MX Series Interface Module Reference](#).

The MPC3E supports feature parity with the following software features:

- Basic Layer 2 features and virtual private LAN service (VPLS) functionality
- Layer 3 routing protocols
- MPLS
- Multicast forwarding
- Firewall filters and policers
- Intelligent hierarchical policers
- Per unit scheduling
- Class-of-service (CoS) support
- Synchronous Ethernet
- Tunnel support

- Interoperability with existing DPCs and MPCs
- Unified in-service software upgrade (ISSU)

For information about the supported and unsupported Junos OS features for this MPC, see *Protocols and Applications Supported by the MPC3E on MX Series Routers* in the [MX Series Interface Module Reference](#).

Starting from Junos OS Release 13.3R1, the following encapsulations are supported on the MIC-3D-8OC3OC12-4OC48, MIC-3D-4OC3OC12-1OC48, MIC-3D-1OC192-XFP, and the MIC-3D-8DS3-E3 on MPC3E:

- Cisco High-Level Data Link Control (Cisco HDLC)
- Flexible Frame Relay
- Frame Relay
- Frame Relay for CCC
- Frame Relay for TCC
- MPLS fast reroute
- MPLS circuit cross-connect (CCC)
- MPLS translational cross-connect (TCC)
- Point-to-Point Protocol (PPP) (default encapsulation)
- PPP for CCC
- PPP for TCC
- PPP over Frame Relay

Note that the aggregated SONET is supported only for Cisco HDLC and PPP encapsulations.

#### Release History Table

## MPC4E on MX Series Routers Overview

In Junos OS Release 12.3R2 and later, MX2020, MX2010, MX960, MX480, and MX240 routers support a new MPC, MPC4E. MPC4E is a fixed-configuration MPC that provides scalability in bandwidth and services capability of the routers. MPC4E is available in two models—MPC4E-3D-32XGE-SFP and MPC4E-3D-2CGE-8XGE.

Type of MPC4E	Ports	Interfaces	Optical Transceiver Support	Initial Release
MPC4E-3D-32XGE-SFP	32 built-in 10-Gigabit Ethernet ports	10-Gigabit Ethernet interfaces	10GBASE-LR, 10GBASE-SR, 10GBASE-ER, 10GBASE-ZR	12.3R2
MPC4E-3D-2CGE-8XGE	2 built-in 100-Gigabit Ethernet ports and 8 built-in 10-Gigabit Ethernet ports	10-Gigabit Ethernet and 100-Gigabit Ethernet interfaces	100GBASE-LR4, 100GBASE-SR10, 10GBASE-LR, 10GBASE-SR, 10GBASE-ER, 10GBASE-ZR	12.3R2

**NOTE:** Both models of MPC4E are supported on the MX2020, MX2010, MX960, MX480, and MX240 routers with both normal-capacity and high-capacity power supplies and fan trays.

MPC4E does not support legacy SCBs. It interoperates with existing MX Series line cards, including Dense Port Concentrators (DPCs) and Modular Port Concentrators (MPCs).

MPC4E is a fixed-configuration MPC and does not contain separate slots for Modular Interface Cards (MICs). It contains two Packet Forwarding Engines (PFEs)—PFE0 hosts PIC0 and PIC1 while PFE1 hosts PIC2 and PIC3.

You can also configure the MPC4E to interoperate with routers that use the 100-Gigabit Ethernet PIC (Type 4 PIC on Type 4 FPC) by using the **forwarding-mode** statement with the **sa-multicast** option at the **[edit chassis fpc slot pic slot]** hierarchy level. For more information, see [“Configuring MPC4E \(MPC4E-3D-2CGE-8XGE\) to Interoperate with 100-Gigabit Ethernet PICs on Type 4 FPC Using SA Multicast Mode”](#) on page 83.

MPC4E supports:

- Forwarding capability of up to 130 Gbps per Packet Forwarding Engine.
- Small form-factor pluggable (SFP) and C form-factor pluggable (CFP) transceivers for connectivity.
- Up to 260 Gbps of full-duplex traffic.
- Intelligent oversubscription services.
- WAN-PHY mode on 10-Gigabit Ethernet interfaces on a per-port basis.
- Up to four full-duplex tunnel interfaces on each MPC4E.

**NOTE:** By default on MX480 routers, only 5 out of the 6 line-card slots can be populated with MPC4Es. By default on MX960 routers, only 10 out of the 11 line-card slots can be populated with MPC4Es. This is a power restriction of default operating mode which supports operation at 55°C ambient temperature. You can insert other line-cards in the remaining slots as long as the power budget is not exceeded. However, if ambient-temperature is configured to 25°C or 40°C, all the 6 slots of an MX480 can be populated with MPC4E, and all the 11 slots of an MX960 can be populated with MPC4E. For more information about power requirements, see *Power Requirements for an MX480 Router*, and *Power Requirements for an MX960 Router*.

Also, on the MX960 router, FPC slot 0 and FPC slot 11 are not NEBS compliant beyond 104°F (40°C). This is a cooling restriction.

---

For more information about the supported and unsupported Junos OS software features for this MPC, see *Protocols and Applications Supported on the MPC4E for MX Series Routers* in the *MX Series Line Card Guide*.

## MPC5E on MX Series Routers Overview

In Junos OS Release 13.3R2 and later, MX2020, MX2010, MX960, MX480, and MX240 routers support a new MPC, MPC5E. MPC5E is a fixed-port MPC. On MX2020 and MX2010 routers, MPC5E is housed in an adapter card (ADC). MPC5E is available in the following models:

Type of MPC5E	Ports	Interfaces	Optical Transceiver Support	Initial Release
MPC5E-40G10G	6 built-in 40-Gigabit Ethernet ports and 24 built-in 10-Gigabit Ethernet ports	40-Gigabit Ethernet and 10-Gigabit Ethernet interfaces	40GBASE-SR4, 40GBASE-LR4, 10GBASE-LR, 10GBASE-SR, 10GBASE-ER, 10GBASE-ZR	13.3R2
MPC5EQ-40G10G	6 built-in 40-Gigabit Ethernet ports and 24 built-in 10-Gigabit Ethernet ports	40-Gigabit Ethernet and 10-Gigabit Ethernet interfaces	40GBASE-SR4, 40GBASE-LR4, 10GBASE-LR, 10GBASE-SR, 10GBASE-ER, 10GBASE-ZR	13.3R2
MPC5E-100G10G	2 built-in 100-Gigabit Ethernet ports and 4 built-in 10-Gigabit Ethernet ports	100-Gigabit Ethernet and 10-Gigabit Ethernet interfaces	100GBASE-SR10, 100GBASE-LR4, 100GBASE-ER4, 10GBASE-LR, 10GBASE-SR, 10GBASE-ER, 10GBASE-ZR	13.3R3
MPC5EQ-100G10G	2 built-in 100-Gigabit Ethernet ports and 4 built-in 10-Gigabit Ethernet ports	100-Gigabit Ethernet and 10-Gigabit Ethernet interfaces	100GBASE-SR10, 100GBASE-LR4, 100GBASE-ER4, 10GBASE-LR, 10GBASE-SR, 10GBASE-ER, 10GBASE-ZR	13.3R3

MPC5E supports the enhanced Switch Control Board (MX-SCBE) and MX-SCBE2 on MX240, MX480, and MX960 routers. MPC5E does not support the legacy SCB (MX-SCB). MPC5E supports the Switch Fabric Board (SFB) on MX2010 and MX2020 routers.

On MX240, MX480, and MX960 routers, the number of MPC5Es that can be supported depends on the power entry module (PEM) type. There are no such restrictions for MX2010 and MX2020 routers.

**NOTE:** On MX960 routers, all the MPC slots work with chassis temperature of up to 40°C (104°F). However, when the chassis temperature exceeds 40°C (104°F), slots 0 and 11 can only work with MPC1, MPC2, and the 16x10GE MPC.

MPC5E interoperates with existing MPCs but does not interoperate with existing DPCs, except the Multiservices DPC (MS-DPC). MX series routers do not support tunnel services PICs. MPC5E provides support for inline tunnel interfaces and supports the following tunnel types:

- Generic Routing Encapsulation (GRE) Tunnels
- Multicast Tunnels (MT)

- IP-IP Tunnels
- Protocol Independent Multicast (PIM) E tunnels
- Virtual loopback Tunneling (VT)
- Logical Tunnelling (LT)

**NOTE:** On MX240, MX480, and MX960 routers, MPC5E powers on only if the **network-services** mode on the router is configured to either **enhanced-ip** or **enhanced-ethernet**. On the MX2010 and MX2020 routers, **enhanced-ip** is the only **network-services** mode supported.

MPC5E supports:

- Forwarding capability of up to 130 Gbps per Packet Forwarding Engine
- [“Flexible Queuing Mode” on page 45](#) using an add-on license
- Intelligent oversubscription services
- Optical Channel Transport Network services
- Quad small form-factor pluggable plus transceivers (QSFP+) and small form-factor pluggable transceivers (SFP) for connectivity
- Up to 240 Gbps of full-duplex traffic
- WAN-PHY mode on 10-Gigabit Ethernet interfaces on a per-port basis

For more information about the supported and unsupported Junos OS software features for this MPC, see *Protocols and Applications Supported by the MPC5E for MX Series Routers* in the [MX Series Interface Module Reference](#).

## MPC6E on MX Series Routers Overview

In Junos OS Release 13.3R2 and later, MX2020 and MX2010 routers support a new MPC, MPC6E (model number: MX2K-MPC6E). MPC6E is a 100-Gigabit Ethernet MPC that provides increased port density and performance to MX Series routers in broadband access networks for services such as Layer 3 peering, VPLS and Layer 3 aggregation, and video distribution.

MPC6E supports two MIC slots and each MIC slot supports a single MIC. The MPC can have any of the following MICs:

- 4-port 100-Gigabit Ethernet MIC with CXP
- 2-port 100-Gigabit Ethernet MIC with CFP2
- 24-port 10-Gigabit Ethernet MIC with SFPP (non-OTN)
- 24-port 10-Gigabit Ethernet MIC with SFPP OTN

Based on the MICs used, the following MPC6E models are supported:

Type of MPC6E	Ports	Interfaces	Initial Release
MX2K-MIC6-24XE	24 built-in 10-Gigabit Ethernet ports	10-Gigabit Ethernet interfaces	13.3R2
MX2K-MIC6-4CE-CXP	4 built-in 100-Gigabit Ethernet ports	100-Gigabit Ethernet interfaces	13.3R2
MX2K-MIC6-24XE-OTN	24 built-in 10-Gigabit Ethernet ports with OTN	10-Gigabit Ethernet interfaces	13.3R3
MX2K-MIC6-2CE-CFP2	2 built-in 100-Gigabit Ethernet ports with OTN	100-Gigabit Ethernet interfaces	13.3R3

MPC6E supports:

- Two Packet Forwarding Engines for each MIC slot.
- Forwarding capability of up to 130 Gbps per Packet Forwarding Engine.
- Two separate slots for MICs (MIC6-10G and MIC6-100G).
- Up to 520 Gbps of full-duplex traffic for the two MIC slots.
- Intelligent oversubscription services.
- WAN-PHY mode on 10-Gigabit Ethernet interfaces on a per-port basis.

MPC6E supports the following software features:

- Basic Layer 2 features and virtual private LAN service (VPLS) functionality, except for Operation, Administration, and Maintenance (OAM)
- Layer 3 routing protocols
- MPLS
- Multicast forwarding
- Firewall filters and policers
- Class of service (CoS)
- Tunnel service
- Interoperability with existing MPCs
- Internet Group Management Protocol (IGMP) snooping with bridging, integrated routing and bridging (IRB), or VPLS
- Intelligent hierarchical policers
- Layer 2 trunk port
- MPLS fast reroute (FRR) VPLS instance prioritization
- Synchronous Ethernet

The following features are not supported on MPC6E:

- Fine-grained queuing and input queuing
- Active flow monitoring and services
- Virtual Chassis support

For more information about the supported and unsupported Junos OS software features for this MPC, see *Protocols and Applications Supported by the MPC6E for MX2000 Routers* in the *Interface Reference Module Guide*.

#### Release History Table

Release	Description
13.3R2	In Junos OS Release 13.3R2 and later, MX2020 and MX2010 routers support a new MPC, MPC6E (model number: MX2K-MPC6E).

## MPC7E (Multi-Rate) on MX Series Routers Overview

In Junos OS Release 15.1F4 and later, MX2020, MX2010, MX960, MX480, and MX240 routers support the rate-selectable MPC MPC7E (Multi-Rate) (model number: MPC7E-MRATE). The MPC7E-MRATE MPC is a fixed-configuration MPC that provides scalability in bandwidth and services capability of the routers.

The main features of the MPC7E-MRATE MPC are the following:

- Line-rate throughput of up to 480 Gbps on MX240, MX480, and MX960 routers.
- Line-rate throughput of up to 400 Gbps on the MX2000 line of routers.
- Twelve ports that can each be configured as a 40-Gigabit Ethernet port or as four 10-Gigabit Ethernet ports by using a breakout cable. The ports support quad small-form factor pluggable plus (QSFP+) transceivers.
- Four ports—0/2, 0/5, 1/2, and 1/5—out of the twelve ports can be configured as 100-Gigabit Ethernet ports.
- By default, the ports are configured as 10-Gigabit Ethernet ports.
- You can configure different combinations of port speeds as long as the aggregate capacity per group of six ports labeled 0/0 through 0/5 does not exceed 240 Gbps. Similarly, aggregate capacity per group of the other six ports labeled 1/0 through 1/5 must not exceed 240 Gbps.

For information about the supported and unsupported Junos OS features for this MPC, see *Protocols and Applications Supported by the MPC7E for MX Series Routers* in the *MX Series Line Card Guide*.

## MPC7E-MRATE Gigabit Ethernet Interface Naming Convention

The MPC7E-MRATE MPC is a fixed-configuration MPC and does not contain separate slots for Modular Interface Cards (MICs). It contains two PICs, PIC 0 and PIC 1. Each PIC has six physical quad small form-factor pluggable plus (QSFP+) ports that support 100-Gbps, 10-Gbps, or 40-Gbps port speeds. You use the 4x duplex LC breakout cables and fiber-optic 40-gigabit and 100-gigabit QSFP+ transceivers to achieve these speeds.

**TIP:** You can issue the `show chassis pic fpc-slot fpc-slot-number pic-slot pic-slot-number` command to view the supported speeds on each port.

Each of the six ports of PIC 0 and PIC 1 supports 10-Gigabit and 40-Gigabit Ethernet interfaces. However, only ports 2 and 5 on both the PICs support 100-Gigabit Ethernet interfaces. The 40 and 100 Gigabit Ethernet interfaces configured on the MPC7E-MRATE MPC follow the naming convention `et-fpc-slot/pic-slot/port-number`. For example, `et-0/0/2` indicate a 40-Gigabit or 100-Gigabit Ethernet interface configured on port 2 of PIC 0 of the MPC7E-MRATE MPC that is installed in the FPC slot 0.

You can configure four 10-Gigabit Ethernet interfaces on each port. Therefore, the 10 Gigabit Ethernet interfaces configured on the MPC7E-MRATE MPC follow the naming convention *xe-fpc-slot/pic-slot/port-number:channel-number*. Channel numbers 0 to 3 are used to indicate the four logical ports that are enabled by the use of the 4x duplex LC breakout cables. Therefore, the four 10-Gigabit Ethernet interfaces that are configured on port 2 of PIC 0 of an MPC7E-MRATE MPC that is installed in the FPC slot 0 is as follows:

- **xe-0/0/2:0**
- **xe-0/0/2:1**
- **xe-0/0/2:2**
- **xe-0/0/2:3**

### MPC7E-MRATE MPC Rate-Selectability Overview

You can choose to configure all supported ports of the PIC to operate at the same speed or configure all the ports at different supported speeds. For example, you can choose to configure:

- All the ports of the PIC at 10-Gbps speed.
- All the ports of the PIC at 40-Gbps speed.
- Ports 2 and 5 of the PIC at 100-Gbps speed.
- Ports 0, 1, 3, 4 of the PIC at 10-gigabit or 40-gigabit speed and ports 2 and 5 at 100-gigabit speed.

To configure all ports to operate at the same speed, you configure rate selectability at the *PIC level*. When you configure rate selectability at the PIC level, all the ports of the PIC that support the configured speed operate at that speed. Additionally, you can configure the number of active ports that operate at the configured speed. That is, for example, if you want only two ports of the PIC to operate at 40-gigabit speed, you can configure the PIC to operate at 40-gigabit speed and enable the two ports that you want to operate at that speed. The remaining four ports of the PIC are automatically disabled. Configuring rate selectability at the PIC level helps you configure the operating speed of the PIC easily.

To configure different ports of the PIC to operate at different supported speeds, you configure rate selectability at the *port level*. You configure each port of the PIC to operate at a specific supported speed. Only the ports that are configured are enabled, while the other ports are automatically disabled. Configuring rate selectability at the PIC level provides you the flexibility of operating the ports of the PIC at different supported speeds. For example, you can configure four 10-Gigabit Ethernet interfaces on port 0, one 40-Gigabit Ethernet interface on port 1, and one 100-Gigabit Ethernet interface on port 2.

**NOTE:**

- Ensure that you connect optics to the ports according to the speeds that you configure. That is, you have to use 4x duplex LC breakout cables to configure 10-Gigabit Ethernet interfaces, fiber-optic 40-gigabit QSFP+ transceivers to configure 40-Gigabit Ethernet interfaces, and fiber-optic 100-gigabit QSFP28 transceivers to configure 100-Gigabit Ethernet interfaces.
- If rate selectability is not configured, each port of the MPC7E-MRATE MPC operates as four 10-Gigabit Ethernet interfaces.

For more information about how to configure rate selectability, see [“Configuring Rate Selectability on MPC7E \(Multi-Rate\) to Enable Different Port Speeds” on page 201](#).

## MPC7E 10G on MX Series Routers Overview

Starting with Junos OS Release 15.1F5, MX2020, MX2010, MX960, MX480, and MX240 routers support the Modular Port Concentrator (MPC) MPC7E 10G (MPC7E-10G). This is a fixed-configuration MPC with forty 10-Gbps Ethernet ports. To use the MPC7E 10G MPC on Junos OS Release 15.1F5, you must download and install the Junos Continuity software package for Junos OS Release 15.1F5.

**NOTE:**

- On MX2000 line of routers, MPC7E 10G is plugged into an adapter card. Therefore, to use the MPC7E 10G MPC on MX2000 line of routers, the adapter card must be installed on the routers.
- To operate MPC7E 10G on MX240, MX480, and MX960 routers, the routers must be equipped with high-capacity power supply, high-capacity fan tray, and Enhanced Switch Control Board SCBE2.

The main features of the MPC7E-MRATE MPC are the following:

- Line-rate throughput of up to 400 Gbps on MX240, MX480, MX960, MX2010, and MX2020 routers.
- Forty 10-Gigabit Ethernet ports. The ports support small-form factor pluggable plus (SFP+) transceivers.
- Support maximum transmission units (MTUs) from 256 bytes through 16,000 bytes.
- Supports [Hyper mode](#) to speed up packet processing.
- Supports [Flexible queuing](#) using an add-on license to support 32,000 queues per line card, including queues on both ingress and egress interfaces. You can use an additional license to support up to 512,000 queues.

**NOTE:** On MX240, MX480, and MX960 routers, MPC7E 10G powers on only if the **network-services** mode on the router is configured as either **enhanced-ip** or **enhanced-ethernet**. On MX2000 routers, no additional configuration is required because by default the router operates in **enhanced-ip** mode.

---

For information about the supported and unsupported Junos OS features for this MPC, see *Protocols and Applications Supported by the MPC7E for MX Series Routers* in the *MX Series Line Card Guide*.

- *Interface Naming Overview*

## MPC8E on MX Series Routers Overview

In Junos OS Release 15.1F5 and later, MX2020 and MX2010 routers support *MPC8E* (model number: MX2K-MPC8E), a new Modular Port Concentrator (MPC) with two Modular Interface Card (MIC) slots that provide a maximum bandwidth of 960 Gbps. Each MIC slot on MPC8E supports a 12-port rate selectable MIC (MIC-MRATE). MPC8E has four Packet Forwarding Engines, each providing a maximum bandwidth of 240 Gbps.

**NOTE:** To use the MPC8E MPC on Junos OS Release 15.1F5, you must download and install the Junos Continuity software package for Junos OS Release 15.1F5.

MPC8E plugs into the chassis and provides the fabric interface. The MX2000 line of routers can support eight Switch Fabric Boards (SFBs) and eight Enhanced Switch Fabric Boards (SFB2s) but not both at the same time. However, during an upgrade from SFB to SFB2, the MX2000 line of routers support both SFB and SFB2 at the same time for the duration of the upgrade.

Starting in Junos OS Release 17.4R1, MIC-MACSEC-MRATE with MACsec is supported on MPC8E to extend MACsec capabilities on MX2000 line of routers (MX2020, MX2010, MX2008). The MACsec feature increases the Data Center (DC) security and also for DC to DC secured connectivity. MIC-MACSEC-MRATE MIC enable 40G and 100G MACsec capability to the MPC8E. Each MPC supports two MIC-MACSEC-MRATE MICs. On an MPC8E, each MIC supports 48 10-Gigabit Ethernet, 12 40-Gigabit Ethernet, or 4 100-Gigabit Ethernet MACsec-capable interfaces, or a combination.

**NOTE:** Compared to other MICs, MIC-MACSEC-MRATE takes longer time (around 4 minutes) to boot as it is required to bring up two MICs in serial.

MPC8E supports:

- Line-rate throughput of up to 960 Gbps on the MX2000 line of routers.
- MIC-MRATE MICs with QSFP+ transceivers that support rate selectability at the port level and at the MIC level.
- Configuration of 4 ports out of the 12 MIC-MRATE ports as 100-Gigabit Ethernet ports.
- Configuration of PIC-based tunnel interfaces from the Junos OS CLI.
- Maximum transmission unit (MTU) size of 16,000 bytes for transit traffic.

MPC8E supports the following software features:

- [Dynamic power management](#) for effective utilization of available power.
- [Inline flow monitoring](#) for higher scalability and performance.

- **Flexible queuing** using an add-on license to support 32,000 queues per line card, including queues on both ingress and egress interfaces. You can use an additional license to support up to 512,000 queues per slot or 1,000,000 queues per slot.
- **Hyper mode** to speed up packet processing.
- MACsec MIC MRATE support for MX2000 line of routers. See [Understanding Media Access Control Security \(MACsec\) on MX Series Routers](#) for more details.

For more information about the supported and unsupported Junos OS features on MPC8E, see *Protocols and Applications Supported by the MPC8E and MPC9E on the MX2010 and MX2020 Routers* in the [MX Series Interface Module Reference](#).

## Upgrading MPC8E to Provide Increased Bandwidth

In Junos OS Release 16.1R1 and later, you can upgrade MPC8E to provide an increased bandwidth of 1600 Gbps (1.6 Tbps) by using an add-on license. After you purchase the license and perform the upgrade, MPC8E provides a bandwidth of 1.6 Tbps, which is equivalent to the bandwidth that MPC9E provides. However, the MPC continues to be identified as MPC8E.

**NOTE:** After you upgrade MPC8E to provide a bandwidth of 1.6 Tbps, the power consumption by MPC8E increases and is equivalent to the power that MPC9E consumes. See *MPC8E* for more information.

After you purchase the add-on license, you upgrade the bandwidth by using the **set chassis fpc slot bandwidth 1.6T** command. You can disable this feature by using the **delete chassis fpc slot bandwidth 1.6T** command.

**NOTE:** When you modify the bandwidth of MPC8E and commit the configuration, the MPC automatically reboots. For instance, if you upgrade MPC8E to provide a bandwidth of 1.6 Tbps and commit the configuration, the MPC automatically reboots. Also, if you disable the feature on MPC8E (to provide a bandwidth of 960 Gbps) and commit the configuration, the MPC automatically reboots.

Release History Table

Release	Description
17.4R1	Starting in Junos OS Release 17.4R1, MIC-MACSEC-MRATE with MACsec is supported on MPC8E to extend MACsec capabilities on MX2000 line of routers (MX2020, MX2010, MX2008).

## MPC9E on MX Series Routers Overview

In Junos OS Release 15.1F5 and later, the MX2000 line of routers support a new modular MPC, MPC9E (MX2K-MPC9E). MPC9E has two Modular Interface Card (MIC) slots. MPC9E has four Packet Forwarding Engines, each with forwarding capacity of up to 400 Gbps. MPC9E supports only the 12-port, rate-selectable MIC (MIC-MRATE).

**NOTE:** To use the MPC9E MPC on Junos OS Release 15.1F5, you must download and install the Junos Continuity software package for Junos OS Release 15.1F5.

Starting in Junos OS Release 17.4R1, MIC-MACSEC-MRATE with MACsec is supported on MPC9E to extend MACsec capabilities on MX2000 line of routers (MX2020, MX2010, MX2008). The MACsec feature increases the Data Center (DC) security and also for DC to DC secured connectivity. Each MPC supports two MIC-MACSEC-MRATE MICs. On an MPC9E, each MIC supports 48 10-Gigabit Ethernet, 12 40-Gigabit Ethernet, or 8 100-Gigabit Ethernet MACsec-capable interfaces, or a combination.

**NOTE:** Compared to other MICs, MIC-MACSEC-MRATE MIC takes longer time (around 4 minutes) to boot as it is required to bring up two MICs in serial.

MPC9E plugs into the chassis and provides the fabric interface. MX2000 line of routers can support eight Switch Fabric Boards (SFB) and eight Enhanced Switch Fabric Boards (SFB2) but not both at the same time. However, during an upgrade from SFB to SFB2, the MX2000 line of routers support both SFB and SFB2 at the same time for the duration of the upgrade.

- Line-rate throughput of up to 1.6 Tbps on the MX2000 line of routers.
- MIC-MRATE MICs with QSFP+ transceivers that support rate selectability at the port level and at the MIC level.
- Configuration of 8 ports out of the 12 MIC-MRATE ports as 100-Gigabit Ethernet ports.

- Configuration of PIC-based tunnel interfaces from the Junos OS CLI.
- Maximum transmission unit (MTU) size of 16,000 bytes for transit traffic.

MPC9E supports the following software features:

- [Dynamic power management](#) for effective utilization of available power.
- [Inline flow monitoring](#) for higher scalability and performance.
- [Flexible queuing](#) using an add-on license to support 32,000 queues per line card, including queues on both ingress and egress interfaces. You can use an additional license to support up to 512,000 queues per slot or 1,000,000 queues per slot.
- [Hyper mode](#) to speed up packet processing.
- MACsec MIC MRATE support for MX2000 line of routers. See [Understanding Media Access Control Security \(MACsec\) on MX Series Routers](#) for more details.

For more information about the supported and unsupported Junos OS features for this MPC, see *Protocols and Applications Supported by the MPC8E and MPC9E on the MX2010 and MX2020 Routers* in the [MX Series Interface Module Reference](#).

#### Release History Table

Release	Description
17.4R1	Starting in Junos OS Release 17.4R1, MIC-MACSEC-MRATE with MACsec is supported on MPC9E to extend MACsec capabilities on MX2000 line of routers (MX2020, MX2010, MX2008).

## Tunnel Interfaces on MX Series Routers with MPC7E-10G, MPC7E-MRATE, MX2K-MPC8E, and MX2K-MPC9E

MPC7E-10G, MPC7E-MRATE, MX2K-MPC8E, and MX2K-MPC9E support a total of four inline tunnel interfaces per MPC, one per PIC. You can create a set of tunnel interfaces per PIC slot up to a maximum of four slots (from 0 through 3) on MX Series routers with these MPCs. These PICs are referred to as pseudo tunnel PICs. You create tunnel interfaces on MX Series routers with MPC7E-10G, MPC7E-MRATE, MX2K-MPC8E, and MX2K-MPC9E by including the following statements at the **[edit chassis]** hierarchy level:

```
[edit chassis]
fpc slot-number {
  pic number {
    tunnel-services {
      bandwidth ;
    }
  }
}
```

### Packet Forwarding Engine Mapping and Tunnel Bandwidth for MPC7E-MRATE

The tunnel bandwidth for MPC7E-MRATE is 1–120Gbps with an increment of 1Gbps. However, if you do not specify the bandwidth in the configuration, it is set to 120Gbps.

[Table 6 on page 22](#) shows the mapping between the tunnel bandwidth and the Packet Forwarding Engines for MPC7-MRATE.

**Table 8: Packet Forwarding Engine Mapping and Tunnel Bandwidth for MPC7E-MRATE**

Pseudo Tunnel PIC	Maximum Bandwidth per Tunnel PIC	PFE Mapping	Maximum Tunnel Bandwidth per PFE	Maximum PFE Bandwidth
PIC0	120Gbps	PFE0	120Gbps	240Gbps
PIC1	120Gbps			
PIC2	120Gbps	PFE1	120Gbps	240Gbps
PIC3	120Gbps			

### Packet Forwarding Engine Mapping and Tunnel Bandwidth for MPC7E-10G

The tunnel bandwidth for MPC7E-10G is 1–120Gbps with an increment of 1Gbps. However, if you do not specify the bandwidth in the configuration, it is set to 120Gbps.

[Table 9 on page 42](#) shows the mapping between the tunnel bandwidth and the Packet Forwarding Engines for MPC7E-10G.

**Table 9: Packet Forwarding Engine Mapping and Tunnel Bandwidth for MPC7E-10G**

Pseudo Tunnel PIC	Maximum Bandwidth per Tunnel PIC	PFE Mapping	Maximum Tunnel Bandwidth per PFE	Maximum PFE Bandwidth
PIC0	120Gbps	PFE0	120Gbps	200Gbps
PIC1	120Gbps			
PIC2	120Gbps	PFE1	120Gbps	200Gbps
PIC3	120Gbps			

### Packet Forwarding Engine Mapping and Tunnel Bandwidth for MX2K-MPC8E

The tunnel bandwidth for MX2K-MPC8E is 1– 120Gbps with an increment of 1Gbps. However, if you do not specify the bandwidth in the configuration, it is set to 120Gbps.

[Table 10 on page 42](#) shows the mapping between the tunnel bandwidth and the Packet Forwarding Engines for MX2K-MPC8E.

**Table 10: Packet Forwarding Engine Mapping and Tunnel Bandwidth for MX2K-MPC8E**

Pseudo Tunnel PIC	Maximum Bandwidth per Tunnel PIC	Packet Forwarding Engine Mapping	Maximum Tunnel Bandwidth per PFE	Maximum PFE Bandwidth
PIC0	120Gbps	PFE0	120Gbps	240Gbps
PIC1	120Gbps	PFE1	120Gbps	240Gbps
PIC2	120Gbps	PFE2	120Gbps	240Gbps
PIC3	120Gbps	PFE3	120Gbps	240Gbps

### Packet Forwarding Engine Mapping and Tunnel Bandwidth for MX2K-MPC9E

The tunnel bandwidth for MX2K-MPC9E is 1– 200Gbps with an increment of 1Gbps. However, if you do not specify the bandwidth in the configuration, it is set to 200Gbps.

[Table 11 on page 42](#) shows the mapping between the tunnel bandwidth and the Packet Forwarding Engines for MX2K-MPC9E.

**Table 11: Packet Forwarding Engine Mapping and Tunnel Bandwidth for MX2K-MPC9E**

Pseudo Tunnel PIC	Maximum Bandwidth per Tunnel PIC	Packet Forwarding Engine Mapping	Maximum Tunnel Bandwidth per PFE	Maximum PFE Bandwidth
PIC0	200Gbps	PFE0	200Gbps	400Gbps
PIC1	200Gbps	PFE1	200Gbps	400Gbps
PIC2	200Gbps	PFE2	200Gbps	400Gbps

Table 11: Packet Forwarding Engine Mapping and Tunnel Bandwidth for MX2K-MPC9E (continued)

Pseudo Tunnel PIC	Maximum Bandwidth per Tunnel PIC	Packet Forwarding Engine Mapping	Maximum Tunnel Bandwidth per PFE	Maximum PFE Bandwidth
PIC3	200Gbps	PFE3	200Gbps	400Gbps

  - [bandwidth on page 606](#)

## MX10003 MPC on MX10003 Router Overview

In Junos OS Release 17.3R1 and later, the MX10003 router supports a new Modular Port Concentrator (MPC), MX10003 MPC. Each MPC supports a Multi-Rate 12xQSFP28 Ethernet Modular Interface Card (MIC) (model numbers: JNP-MIC1 (in Junos OS Release 17.3R1) and JNP-MIC1-MACSEC (in Junos OS Release 17.3R2)) and the fixed-port PIC (6xQSFP). The router provides two dedicated line-card slots for MPCs. MPCs install into the line-card slots. The fixed-port PIC is mapped to PIC 0, and each Packet Forwarding Engine is mapped to two ports in PIC 0. The Multi-Rate 12xQSFP28 Ethernet MIC is mapped to PIC 1, and each Packet Forwarding Engine is mapped to four ports in PIC 1. On the MIC all 12 ports are active and are capable of running in 40-Gigabit Ethernet, 100-Gigabit Ethernet, and 4x10-Gigabit Ethernet mode.

The MX10003 MPC supports:

- Line-rate throughput of up to 1.2 Tbps on the MX10003 routers.
- MICs with QSFP+/QSFP28 transceivers that are rate-selectable at the port level and at the MIC level.
- Configuration of all 12 ports of the MIC as 100-Gigabit Ethernet ports.
- Configuration of PIC-based tunnel interfaces from the Junos OS CLI.
- Maximum transmission unit (MTU) size of 16,000 bytes for transit traffic.

The MX10003 MPC supports the following software features:

- [Dynamic power management](#) for effective utilization of available power.
- [Inline flow monitoring](#) for higher scalability and performance.
- [Hyper mode](#) to speed up packet processing.

- Related Documentation**
- [MX10003 MPC Rate-Selectability Overview on page 205](#)
  - [Supported Active Physical Ports for Configuring Rate Selectability to Prevent Oversubscription on MX10003 MPC on page 192](#)

## JNP10K-LC2101 MPC on MX10008 Routers Overview

---

In Junos OS Release 18.2R1 and later, MX10008 routers support a new MPC, JNP10K-LC2101. JNP10K-LC2101 is a fixed-configuration MPC that provides increased port density and performance to the MX10008 routers. JNP10K-LC2101 does not contain separate slots for Modular Interface Cards (MICs) and has six Packet Forwarding Engines.

MX10008 routers support eight JNP10K-LC2101 MPCs. By default, each JNP10K-LC2101 MPC provides a maximum bandwidth of 2.4Tbps. JNP10K-LC2101 has six Packet Forwarding Engines, each providing a maximum bandwidth of up to 400 Gbps, which cannot be oversubscribed. JNP10K-LC2101 MPC plugs into the chassis and provides the fabric interface. The MX10008 router supports six Switch Fabric Boards (SFBs).

The MX10008 router supports only **enhanced-ip** and **enhanced-ethernet** network services mode. The default network services mode is **enhanced-ip**.

JNP10K-LC2101 supports:

- Multi-rate ports. The ports on the JNP10K-LC2101 MPC support multiple port speeds such as 10Gbps, 40 Gbps, and 100 Gbps. Hence, they are known as multi-rate ports. All ports support all port speeds. To view the port speed information for each port, use the **show chassis pic fpc-slot *fpc-slot-number* pic-slot *pic-slot-number*** command.
- PIC-based tunnel configuration
- Maximum Transmission Unit (MTU) size of 16000 bytes for transit traffic.
- [Dynamic Power Management](#) for effective utilization of available power.
- [Flexible queuing](#) supports 128,000 queues per line card, including queues on both ingress and egress interfaces. You can use an additional license to support up to 256,000 queues or 1,500,000 queues per slot.

For more information about the supported and unsupported Junos OS features on JNP10K-LC2101, see *Protocols and Applications Supported by the JNP10K-LC2101 on the MX10008 Routers* in the [MX Series Interface Module Reference](#).

## Downgrading JNP10K-LC2101 to Provide Decreased Bandwidth

You can downgrade the JNP10K-LC2101 MPC to provide a decreased bandwidth of 1.44Tbps. After you perform the downgrade, JNP10K-LC2101 provides a bandwidth of 1.44Tbps. Each of the six Packet Forwarding Engines now provide a maximum bandwidth of up to 240 Gbps, which cannot be oversubscribed.

You can downgrade the bandwidth by using the **set chassis fpc slot bandwidth 1.44T** command. You can disable this feature by using the **delete chassis fpc slot bandwidth 1.44T** command.

**NOTE:** When you modify the bandwidth of JNP10K-LC2101 and commit the configuration, the MPC automatically reboots. For instance, if you downgrade JNP10K-LC2101 to provide a bandwidth of 1.44 Tbps and commit the configuration, the MPC automatically reboots. Also, if you disable the feature on JNP10K-LC2101 (to provide a bandwidth of 2.4Tbps) and commit the configuration, the MPC automatically reboots.

## MX204 Router Overview

Starting with Release 17.4R1, Junos OS supports the MX204 Universal Routing Platform (model number: JNP204 [MX204]). The MX204 chassis is a monolithic system— that is, it does not have separate Switch Processor Mezzanine Boards and line cards. All the router components including Packet Forwarding Engines and WAN interfaces are managed by the CPU subsystem (consisting of an eight-core Broadwell CPU). The MX204 delivers a throughput of up to 400 Gbps.

The MX204 router is a fixed-configuration router, and supports one fixed Routing Engine. It contains a total of twelve fixed ports, in two groups of four and eight, respectively. The set of four ports (referred to as the PIC 0 ports) are rate selectable and can be configured at 10-Gbps (by using a breakout cable), 40-Gbps, or 100-Gbps speed. However, not all the ports support all the three speeds. The set of eight ports (referred to as PIC 1 ports) operate at a fixed speed of 10-Gbps. The four rate-selectable ports support QSFP28 and QSFP+ transceivers, whereas the eight 10-Gigabit Ethernet ports support SFP+ transceivers.

See “MX204 Router Rate-Selectability Overview” on page 210 and “Supported Active Physical Rate-Selectable Ports to Prevent Oversubscription on MX204 Router” on page 193 for more details.

**Related Documentation**

- [MX204 LED Scheme Overview on page 74](#)

## Flexible Queuing Mode Overview

The queuing component on non-HQoS MPCs is disabled by default to save power. When flexible queuing is enabled on a non-HQoS MPC, the MPC is restarted with the queuing component enabled. The MPC is powered on only if the PEM has sufficient power to bring

up the MPC with the queuing component enabled. The MPC remains offline if the required power is not available.

You can enable flexible queuing on the non-HQoS MPCs by including the [flexible-queuing-mode](#) statement at the `[edit chassis fpc]` hierarchy level. When queuing is configured, the power consumed by the queuing components at the configured ambient temperature is considered when power is allocated for the MPC.

**NOTE:** The following MICs are supported on non-HQoS MPCs only when flexible queuing is enabled:

- MIC-3D-8CHOC3-4CHOC12
- MIC-3D-4CHOC3-2CHOC12
- MIC-4COC3-2COC12-G
- MIC-2COC3-1COC12-G

[Table 12 on page 46](#) lists the MPCs that support flexible queueing and the supported Junos OS release for these MPCs.

**Table 12: MPCs and the Junos OS Release that Support Flexible Queueing**

MPCs	First Supported Junos OS Release
MPC2E-3D-NG	15.1R1
MPC3E-3D-NG	15.1R1
MPC5E	14.1R1
MPC7E-MRATE	15.1F4
MPC7E-10G	15.1F5
MPC8E	
MPC9E	

**Related Documentation**

- [MPC5E on MX Series Routers Overview on page 29](#)
- [MPC3E on MX Series Routers Overview on page 23](#)

## Upgrading non-HQoS MPCs to Support Flexible Queueing

You can enable flexible queuing on a non-HQoS MPC to support a maximum of up to 32,000 queues per port and per card, including queues on both ingress and egress interfaces.

This topic describes how to enable flexible queuing on a non-HQoS MPC.

To configure flexible queuing on non-HQoS MPCs:

1. Run the **set chassis fpc slot-number flexible-queuing-mode** configuration mode command.

For example, to configure flexible queuing on an MPC in slot 2:

```
[edit]
user@router# set chassis fpc 2 flexible-queuing-mode
```

**NOTE:** When flexible queuing is enabled, the MPC is restarted with the queuing component enabled. The MPC comes online only if the power entry module (PEM) has sufficient power to bring up the MPC with the queuing component enabled. The MPC remains offline if the required power is not available in the PEM.

2. Review your configuration and issue the **commit** command.

```
[edit]
user@router# commit
[edit]
'chassis fpc'
  WARNING: FPC configuration for flexible-queuing is changed. FPC would
  undergo reboot to enable flexible-queuing. FPC would come online only if power
  available is sufficient to enable queuing components.
commit complete
```

**Related Documentation**

- [flexible-queuing-mode on page 652](#)

## Disabling Flexible Queuing for non-HQoS MPCs to Optimize Power Utilization

You can optimize power utilization by disabling flexible queuing on a non-HQoS MPC.

This topic describes how to disable flexible queuing on a non-HQoS MPC.

1. Run the **delete chassis fpc slot-number flexible-queuing-mode** command at the **[edit chassis]** hierarchy level.

For example, to disable flexible queuing on an MPC in slot 2:

```
[edit]
user@router# delete chassis fpc 2 flexible-queuing-mode
```

2. Review your configuration and issue the **commit** command.

```
[edit]
user@router# commit
commit complete

[edit]
user@router#
```

## Understanding the Hyper Mode Feature on Enhanced MPCs for MX Series Routers and EX9200 Switches

Starting with Junos OS Release 15.1, enhanced MPCs can be configured to support increased packet processing rates. Enhanced MPCs include these models: MPC3E, MPC4E, MPC5E, MPC6E, MPC7E-MRATE, MPC7E-10G, MX2K-MPC8E, and MX2K-MPC9E.

Starting with Junos OS Release 18.2R1, MPC JNP10K-LC2101 can be configured to support increased packet processing rates. A higher rate of processing of data packets results in the optimization of the lifetime of a data packet. Optimization of the data packet lifetime enables the network device (a router or a switch) to provide better performance and throughput.

To enable the device to support increased packet processing rates, you must configure the hyper mode feature. After configuring the hyper mode feature, you must reboot the device for the changes to take effect.

When you configure the hyper mode feature on the device, the configured mode changes from normal mode to hyper mode. However, because the configuration does not take effect until you reboot the device the current mode of the device remains as normal mode. The current mode changes from normal mode to hyper mode after you reboot the device. If the hyper mode feature is not configured, the device processes data packets in normal mode.

**NOTE:** You can enable the hyper mode feature only if the network-service mode on the device is configured as either **enhanced-ip** or **enhanced-ethernet**.

[Table 13 on page 48](#) displays the values of the current and configured mode based on the hyper mode configuration and system reboot.

**Table 13: Current Mode and Configured Mode Values Based on Hyper mode Configuration**

Action	Current Mode	Configured Mode
Hyper mode is configured but the device is not rebooted.	Normal mode	Hyper mode
Hyper mode is configured and device is rebooted.	Hyper mode	Hyper mode
Hyper mode configuration is removed and device is not rebooted.	Hyper mode	Normal mode

**Table 13: Current Mode and Configured Mode Values Based on Hyper mode Configuration (continued)**

Action	Current Mode	Configured Mode
Hyper mode configuration is removed and device is rebooted.	Normal mode	Normal mode

When you configure hyper mode, the following features are not supported:

- Creation of Virtual Chassis
- Forwarding class accounting (enhanced mode)
- Interoperability with legacy DPCs, including MS-DPCs. The MPC in hyper mode accepts and transmits data packets only from other existing MPCs.
- Interoperability with non-Ethernet MICs and non-Ethernet Interfaces such as channelized interfaces, multilink interfaces, and SONET interfaces.
- Junos Fusion
- Node Virtualization
- Padding of Ethernet frames with VLAN.
- Provider Backbone Bridging (PBB) and Ethernet VPN (EVPN)
- Sending Internet Control Message Protocol (ICMP) redirect messages. ICMP redirects are disabled by default and cannot be re-enabled in hyper mode.
- Termination or tunneling of all subscriber-based services.

After you configure the hyper mode feature and reboot the device, existing MPCs that do not support the hyper mode feature, such as MPC1, MPC2, and MPC3, power on in normal mode. Also, when you have installed MICs and PICs on MPCs that are in normal mode when the hyper mode feature is enabled, those MICs and PICs do not power on. Following is a list of the MICs and PICs that do not power on:

- *Channelized E1/T1 Circuit Emulation MIC*
- *Channelized E1/T1 Circuit Emulation MIC (H)*
- *Channelized OC3/STM1 (Multi-Rate) Circuit Emulation MIC with SFP*
- *Channelized OC3/STM1 (Multi-Rate) Circuit Emulation MIC with SFP (H)*
- *Channelized SONET/SDH OC3/STM1 (Multi-Rate) MICs with SFP*
- *DS3/E3 MIC*
- *SONET/SDH OC3/STM1 (Multi-Rate) MICs with SFP*
- *SONET/SDH OC192/STM64 MIC with XFP*
- *Channelized OC48/STM16 Enhanced IQ (IQE) PIC with SFP*

## Release History Table

Release	Description
18.2R1	Starting with Junos OS Release 18.2R1, MPC JNP10K-LC2101 can be configured to support increased packet processing rates.
15.1	Starting with Junos OS Release 15.1, enhanced MPCs can be configured to support increased packet processing rates.

## Related Documentation

## Configuring Hyper Mode on Enhanced MPCs to Speed Up Packet Processing

Starting with Junos OS Release 15.1, enhanced MPCs can be configured to support increased packet processing rates. Enhanced MPCs include these models: MPC3E, MPC4E, MPC5E, MPC6E, MPC7E-MRATE, MPC7E-10G, MX2K-MPC8E, and MX2K-MPC9E.

Starting with Junos OS Release 18.2R1, JNP10K-LC2101 MPC can be configured to support increased packet processing rates. A higher rate of processing of data packets results in the optimization of the lifetime of a data packet. Optimization of the data packet lifetime enables the network device (a router or a switch) to provide better performance and throughput.

To configure the device to support increased packet processing rates, you must configure the hyper mode feature. After configuring the hyper mode feature, you must reboot the device for the changes to take effect. If the hyper mode feature is not configured, the device processes data packets in normal mode.

**NOTE:** You can enable the hyper mode feature only if the network-service mode on the device is configured as either enhanced-ip or enhanced-ethernet.

To configure hyper mode on enhanced MPCs to speed up packet processing:

1. Configure hyper mode by including the **forwarding-options hyper-mode** statement at the [edit] hierarchy level.

```
[edit]
user@host# set forwarding-options hyper-mode
```

2. After configuring hyper mode, commit the configuration.

```
[edit]
```

```
user@host# commit
```

**NOTE:** After configuring hyper mode and committing the configuration, the configured mode changes to hyper-mode but the current mode remains as normal mode. The device displays the following warning message after you commit the configuration:

```
[edit forwarding-options]
```

```
'hyper-mode'
```

**WARNING:** forwarding-options hyper-mode configuration changed. A system reboot is mandatory. Please reboot the system NOW. Continuing without a reboot might result in unexpected system behavior. commit complete

3. Reboot the device for the configuration to take effect.

```
user@host> request system reboot
```

Release History Table

Release	Description
18.2R1	Starting with Junos OS Release 18.2R1, JNP10K-LC2101 MPC can be configured to support increased packet processing rates.
15.1	Starting with Junos OS Release 15.1, enhanced MPCs can be configured to support increased packet processing rates.

## License Modes for Enhanced MPCs Overview

Enhanced MPCs are available in three license variants. Before Junos OS Release 16.1, there were two variants: infrastructure routing (IR) and routing (R). Starting in Junos OS Release 16.1, there is also a base variant, making a total of three license variants. All variants support an identical feature set, but with a few scale differences. [Table 15 on page 54](#) describes the three license variants.

**Table 15: License Variants for MPCs**

License	How to Identify	Description
base	No special suffix in the license name.	<ul style="list-style-type: none"> <li>All Layer 2, Layer 2.5, and Layer 3 features.</li> <li>Up to 32 Layer 3 routing instances of the virtual routing and forwarding (VRF) instance. The VRF support includes Layer 3 VPN (L3VPN).</li> <li>Up to 2 million routes in the forwarding information base (FIB), provided there is hardware support. (FIB is also known as forwarding table.)</li> <li>Up to 6 million routes in the routing information base (RIB), also known as routing table.</li> </ul>
IR	-IR suffix in the license name.	<ul style="list-style-type: none"> <li>All Layer 2, Layer 2.5, and Layer 3 features.</li> <li>Up to 32 Layer 3 routing instances of the virtual routing and forwarding (VRF) instance. The VRF support includes Layer 3 VPN (L3VPN).</li> </ul>
R	-R suffix in the license name.	Full-scale Layer 2, Layer 2.5, and Layer 3 features. Scale is determined by the hardware capabilities.

Suppose you have purchased two MPC4Es: one with IR license and one with R license. After the MPCs are installed on a router, both MPCs appear identical. To distinguish between an MPC with an IR license and an MPC with an R license after the MPC is installed on the router, you must configure the license mode based on the license purchased. For instance, if you have purchased an MPC with the IR license, you must configure the license mode for that MPC as IR. The license mode settings are set specific to each MPC slot. If the MPC is installed in a different slot, or moved to another device, the license mode settings must be reconfigured on the new slot or device. Also, the license mode settings previously configured must be deleted.

**NOTE:** The license mode settings are used only to provide information. You cannot set or alter the license of the MPC by configuring the license mode.

To view the current license mode settings on an MPC, from the configuration mode, use the **show chassis fpc** command. To view the current license mode settings on an MPC, from the operational mode, use the **show chassis hardware extensive** command. To delete the existing license mode settings on an MPC, use the **delete chassis fpc** command.

## Configuring the License Mode for Specific Enhanced MPCs on MX Series Routers

Starting with Junos OS Release 14.2, you can set the license mode for enhanced MPCs such as MPC4E, MPC5E, and MPC6. Configuring the license mode enables you to distinguish between an MPC with an IR license and an MPC with an R license after the MPC is installed on the router. An MPC with an R license supports all the Layer 2, Layer 2.5, and Layer 3 features. An MPC with an IR license offers partial support for these features. For more information about the license variants, see [“License Modes for Enhanced MPCs Overview” on page 54](#)

**NOTE:** The license mode settings are used only to provide information. You cannot set or alter the license of the MPC when you configure the license mode.

Before you configure the license mode of the MPC, verify the license of the MPC. You will need this information to configure the license mode.

Do not try to set the license mode while the card is rebooting or the following error message will appear: **Card not online or TRIO/DPC based.**

To configure the license mode for MPCs on MX Series routers:

1. Configure the license mode for the MPC in a specified MPC slot.

If the MPC has an IR license, configure the license mode as IR. If the MPC has an R license, configure the license mode of the MPC as R.

```
[edit]
user@host# set chassis fpc slot-number ir-mode ir-mode
```

2. In configuration mode, verify the configuration, for example:

```
[edit]
user@host# show chassis
fpc 1 {
  ir-mode IR;
}
```

- After verifying the license mode, commit the changes by using the **commit** statement.

```
[edit]
user@host# commit
```

#### Release History Table

Release	Description
14.2	Starting with Junos OS Release 14.2, you can set the license mode for enhanced MPCs such as MPC4E, MPC5E, and MPC6.

#### Related Documentation

### Example: Configuring the License Mode for MPC5E

This example describes how to configure the license mode for MPC5E on the MX480 router. It also describes how to remove the license mode settings and reconfigure the license mode settings on a new slot.

- [Requirements on page 56](#)
- [Overview on page 56](#)
- [Configuration on page 57](#)
- [Verification on page 59](#)

#### Requirements

This example uses the following hardware and software components:

- Junos OS Release 14.2 or later for MX Series routers
- A single MX480 router with MPC5E with R license

#### Overview

Configuring the license mode for an MPC enables you to distinguish between an MPC with an IR license and an MPC with an R license after the MPC is installed on the router.

**NOTE:** The license mode settings are used only to provide information. You cannot set or alter the license of the MPC when you configure the license mode.

The license mode settings are set specific to each MPC slot. If the MPC is installed in a different slot, or moved to another device, the license mode settings must be reconfigured on the new slot or device. Also, the license mode settings configured previously must be

removed. You can view the license mode settings from both configuration mode and operational mode.

### Topology

In this example, an MPC5E is installed in slot 4 of an MX480 router and has an R license. The R license indicates that all Layer 2, Layer 2.5, and Layer 3 features are supported on the MPC. You first configure the license mode of the MPC5E in slot 4 to R. After configuring the license mode, you can verify the license mode settings. You then install the MPC5E in slot 2 of the same router. License mode settings are set specific to each MPC slot. Therefore, the license mode setting must be reconfigured. After you move the MPC5E, delete the license mode setting on slot 4 and then reconfigure the license mode setting on slot 2.

## Configuration

To configure the license mode for the MPC5E according to the topology specified in the overview section, perform these tasks:

- [Configuring the License Mode for MPC5E in Slot 4 on page 57](#)
- [Deleting the License Mode for MPC5E in Slot 4 on page 58](#)
- [Configuring the License Mode for MPC5E in Slot 2 on page 58](#)

### Configuring the License Mode for MPC5E in Slot 4

#### Step-by-Step Procedure

To configure the license mode for the MPC5E in slot 4:

1. Configure the license mode R for the MPC5E in slot 4:

```
[edit]
user@host# set chassis fpc 4 ir-mode R
```

2. In configuration mode, verify the configuration.

```
user@host# show chassis fpc 4
pic 0 {
  power off;
}
pic 1 {
  power off;
}
ir-mode R;
```

3. After verifying the license mode, commit the changes by using the **commit** statement.

```
[edit]
user@host# commit
```

### Deleting the License Mode for MPC5E in Slot 4

---

#### Step-by-Step Procedure

To delete the license mode R for the MPC5E in slot 4:

1. Delete the license mode for the MPC5E.

```
[edit]
user@host# delete chassis fpc 4 ir-mode R
```

2. In configuration mode, verify the configuration.

```
user@host# show chassis fpc 4
pic 0 {
  power off;
}
pic 1 {
  power off;
}
```

3. After verifying the license mode, commit the changes by using the **commit** statement.

```
[edit]
user@host# commit
```

### Configuring the License Mode for MPC5E in Slot 2

---

#### Step-by-Step Procedure

To configure the license mode for the MPC5E in slot 2:

1. Configure the license mode R for the MPC5E.

```
[edit]
user@host# set chassis fpc 2 ir-mode R
```

2. In configuration mode, verify the configuration.

```
user@host# show chassis fpc 2
pic 0 {
  power off;
}
pic 1 {
  power off;
}
ir-mode R;
```

3. After verifying the license mode, commit the changes by using the **commit** statement.

```
[edit]
```

```
user@host# commit
```

## Verification

To confirm that you have accurately configured the license mode settings on MPC5E, perform these tasks:

- [Verifying That License Mode Is Configured for MPC5E in Slot 4 on page 59](#)
- [Verifying That the Configured License Mode Is Deleted on page 59](#)
- [Verifying That the License Mode Is Configured for MPC5E in Slot 2 on page 60](#)

### Verifying That License Mode Is Configured for MPC5E in Slot 4

**Purpose** To verify that license mode R is configured for the MPC5E in slot 4.

**Action** From operational mode, enter the **show chassis hardware extensive** command.

```
user@host> show chassis hardware extensive
```

```

## Configuring the Number of Active Ports on 16-Port MPCs of MX Series Routers

You can disable a sub-set of the physical ports available on the Packet Forwarding Engines of the 16x10GE 3D MPC, and for PICs installed in MPC3, MPC4, MPC5, and MPC6.

Two of the most common reasons for disabling ports are explained below.

- **Ensure guaranteed bandwidth by preventing oversubscription**—The 16x10GE 3D MPC supports one 10-Gigabit Ethernet tunnel interface for each Packet Forwarding Engine. The effective line-rate bandwidth of the MPC is 12 ports because of an oversubscription ratio of 4:3. Therefore, configuring a tunnel interface might further result in the Packet Forwarding Engines being oversubscribed. To prevent such oversubscription and to ensure a guaranteed bandwidth, include the **number-of-ports** configuration statement to disable one or two ports per Packet Forwarding Engine.
- **Enable Switch Control Board (SCB) redundancy**—For maximum bandwidth capabilities (12-port line-rate bandwidth), the 16x10GE 3D MPC uses all the available SCBs (three SCBs for an MX960 router, two SCBs for an MX480 or MX240 router) actively in the chassis.

If SCB redundancy (2+1 SCBs on an MX960 router or 1+1 SCB on an MX480 or MX240 router) is required, ports on the line card can be disabled by setting the number of usable ports per line card to 8. In such a case, the third and fourth ports (ports 0/2-3, 1/2-3, 2/2-3, 3/2-3) on every Packet Forwarding Engine are disabled.

To configure the number of active ports on the 16x10GE 3D MPC, include the **number-of-ports active-ports** configuration statement at the **[edit chassis fpc slot-number]** hierarchy level:

```
[edit chassis fpc slot-number]
number-of-ports (8 | 12);
```

To configure the number of active ports on a PIC in an MPC3, MPC4, MPC5, or MPC6, include the **number-of-ports active-ports** configuration statement at the **[edit chassis fpc slot-number pic pic-number]** hierarchy level:

```
[edit chassis fpc slot-number pic pic-number]
number-of-ports (8 | 12);
```

Specify either 8 or 12 ports using this statement. When eight active ports are configured, two ports per Packet Forwarding Engine are disabled, and the LEDs on the MPC are set

to **yellow**. When you specify 12 active ports, one port per Packet Forwarding Engine is disabled and the corresponding LED is set to **yellow**. When you do not include this statement in the configuration, all 16 default ports on the MPC are active.

NOTE:

- Committing the configuration after including the `number-of-ports active-ports` configuration statement brings down the Ethernet interfaces for all the ports on the MPC before the ports configuration becomes active.
- A minimum of one high-capacity fan tray is necessary for meeting the cooling requirements of the MPC. The Junos OS generates a chassis yellow alarm recommending fan tray upgrade for optimal performance, if the MX router chassis contains an old fan tray.

For more information about the 16x10GE 3D MPC, see the [MX Series Interface Module Reference](#).

## Configuring Tunnel Interfaces on an MX Series Router with a 16x10GE 3D MPC

MX960, MX480, and M240 routers support the 16-port 10-Gigabit Ethernet MPC (16x10GE 3D MPC) fixed configuration Field Replaceable Unit (FRU). Each Packet Forwarding Engine on a 16x10GE MPC can support a full-duplex 10Gbps tunnel without losing line-rate capacity. For example, a full-duplex 10Gbps tunnel can be hosted on a 10-Gigabit-Ethernet port, while two other 10-Gigabit-Ethernet ports on the same PFE can concurrently forward line-rate traffic.

To configure an MPC and its corresponding Packet Forwarding Engine to use tunneling services, include the `tunnel-services` statement at the `[edit chassis fpc slot-number pic pic-number]` hierarchy level. The Junos OS creates tunnel interfaces `gr-fpc/pic/port.0`, `vt-fpc/pic/port.0`, and so on. You also configure the amount of bandwidth reserved for tunnel services.

```
[edit chassis]
fpc slot-number {
  pic number {
    tunnel-services {
      bandwidth 10g;
    }
  }
}
```

```
}
```

**fpc slot-number** is the slot number of the MPC. If two SCBs are installed, the range is 0 through 11. If three SCBs are installed, the range is 0 through 5 and 7 through 11.

**pic number** is the number of the Packet Forwarding Engine on the MPC. The range is 0 through 3.

**bandwidth 10g** is the amount of bandwidth to reserve for tunnel traffic on each Packet Forwarding Engine.

In the following example, you create tunnel interfaces on Packet Forwarding Engine 0 of MPC 4 with 10 Gbps of bandwidth reserved for tunnel traffic. With this configuration, the tunnel interfaces created are **gr-4/0/0**, **pe-4/0/0**, **pd-4/0/0**, **vt-4/0/0**, and so on.

```
[edit chassis]
fpc 4 pic 0 {
  tunnel-services {
    bandwidth 10g;
  }
}
```

#### Related Documentation

- [16-Port 10-Gigabit Ethernet MPC on MX Series Routers \(16x10GE 3D MPC\) Overview on page 6](#)
- [Configuring Junos OS to Run a Specific Network Services Mode in MX Series Routers on page 366](#)

## Configuring Tunnel Interfaces on MX Series Routers with the MPC3E

Because the MX Series routers do not support Tunnel Services PICs, you create tunnel interfaces on MX Series routers by including the following statements at the **[edit chassis]** hierarchy level:

```
[edit chassis]
fpc slot-number {
  pic number {
    tunnel-services {
      bandwidth (1g | 10g | 20g | 40g);
    }
  }
}
```

**fpc slot-number** is the slot number of the DPC, MPC, or MIC. On the MX80 router, the range is 0 through 1. On other MX series routers, if two SCBs are installed, the range is 0 through 11. If three SCBs are installed, the range is 0 through 5 and 7 through 11.

The **pic number** On MX80 routers, if the FPC is 0, the PIC number can only be 0. If the FPC is 1, the PIC range is 0 through 3. For all other MX series routers, the range is 0 through 3.

**bandwidth (1g | 10g | 20g | 40g)** is the amount of bandwidth to reserve for tunnel traffic on each Packet Forwarding Engine.

**NOTE:** When you use MPCs and MICs, tunnel interfaces are soft interfaces and allow as much traffic as the forwarding-path allows, so it is advantageous to setup tunnel services without artificially limiting traffic by use of the **bandwidth** option. However, you *must* specify **bandwidth** when configuring tunnel services for MX Series routers with DPCs or FPCs.

**1g** indicates that 1 gigabit per second of bandwidth is reserved for tunnel traffic.

**10g** indicates that 10 gigabits per second of bandwidth is reserved for tunnel traffic.

**20g** indicates that 20 gigabits per second of bandwidth is reserved for tunnel traffic.

**40g** indicates that 40 gigabits per second of bandwidth is reserved for tunnel traffic.

If you specify a bandwidth that is not compatible, tunnel services are not activated. For example, you cannot specify a bandwidth of 1 Gbps for a Packet Forwarding Engine on a 10-Gigabit Ethernet 4-port DPC.

To verify that the tunnel interfaces have been created, issue the **show interfaces terse** operational mode command. For more information, see the [CLI Explorer](#). The bandwidth that you specify determines the port number of the tunnel interfaces that are created. When you specify a bandwidth of **1g**, the port number is always 10. When you specify any other bandwidth, the port number is always 0.

#### Requirements for Configuration of Tunnel Interfaces on the MPC3E

This example requires MX Series routers with the MPC3E.

## Ethernet Tunnel Configuration Overview

MX Series routers do not support Tunnel Services PICs. However, you can create one set of tunnel interfaces per pic slot up to a maximum of 4 slots from 0-3 on MX Series routers with the MPC3E.

To configure the tunnels, include the **tunnel-services** statement and an optional bandwidth of (1g | 10g | 20g | 30g | 40g) at the **[edit chassis]** hierarchy level.

**NOTE:** When no tunnel bandwidth is specified, the tunnel interface can have a maximum bandwidth of up to 60Gbps.

**NOTE:** A MIC need not be plugged in to the MPC3E to configure a tunnel interface.

## Configuring a 20-Gigabit Ethernet Tunnel

**Step-by-Step Procedure** In the following example, you create tunnel interfaces on PIC-slot 1 of MPC 0 with 20 gigabit per second of bandwidth reserved for tunnel traffic. With this configuration, the tunnel interfaces created are **gr-0/1/0**, **pe-0/1/0**, **pd-0/1/0**, **vt-0/1/0**, and so on.

1. To create a 20 gigabit per second tunnel interface, use the following configuration:

```
[edit chassis]
fpc 0 pic 1 {
  tunnel-services {
    bandwidth 20g;
  }
}
```

## Configuring a Tunnel With Unspecified Bandwidth

**Step-by-Step Procedure** In the following example, you create a tunnel interface on PIC-slot 3 of MPC 0 with no bandwidth specified. The tunnel traffic can carry up to a maximum of 60Gbps depending on other traffic through the packet forwarding engine. With this configuration, the tunnel interfaces created are **gr-0/3/0**, **pe-0/3/0**, **pd-0/3/0**, **vt-0/3/0**, and so on.

1. To create a tunnel interface with no bandwidth specification, use the following configuration:

```
[edit chassis]
fpc 0 pic 3 {
  tunnel-services;
}
```

## Configuring Tunnel Interfaces on MX Series Routers with MPC4E

MX Series routers do not support Tunnel Services PICs. However, you can create a set of tunnel interfaces per PIC slot up to a maximum of four slots from 0 through 3 on MX Series routers with MPC4E.

To configure the tunnel interfaces, include the **tunnel-services** statement and an optional bandwidth of (**1g | 10g | 20g | 30g | 40g**) at the **[edit chassis]** hierarchy level. When no tunnel bandwidth is specified, the tunnel interface can have a maximum bandwidth of up to 60 Gbps.

To verify that the tunnel interfaces have been created, issue the **show interfaces terse** operational mode command. For more information, see the [CLI Explorer](#). The bandwidth that you specify determines the port number of the tunnel interfaces that are created. When you specify a bandwidth of **1g**, the port number is always 10. When you specify any other bandwidth, the port number is always 0.

In the following example, you create tunnel interfaces on **PIC 1** of **MPC 4** with 40 Gbps of bandwidth reserved for tunnel traffic. **fpc slot-number** is the slot number of the MPC. In this configuration, the tunnel interfaces created are gr-4/1/1, pe-4/1/1, pd-4/1/1, vt-4/1/1, and so on.

1. To create a 40-Gbps tunnel interface, use the following configuration:

```
[edit chassis]
fpc 4 pic 1 {
  tunnel-services {
    bandwidth 40g;
  }
}
```

- Related Documentation**

  - [tunnel-services \(Chassis\) on page 817](#)
  - *Tunnel Interface Configuration on MX Series Routers Overview*

## Configuring Tunnel Interfaces on MX Series Routers with MPC7E-MRATE/MPC7E-10G

MPCs support a total of four inline tunnels per MPC, one per PIC. You can create a set of tunnel interfaces per PIC slot up to a maximum of four slots from 0 through 3

To configure the tunnel interfaces, include the **tunnel-services** statement and an optional bandwidth of 1 Gbps through 120 Gbps at the **[edit chassis fpc fpc-slot pic number]** hierarchy level. If you do not specify the tunnel bandwidth then, the tunnel interface can have a maximum bandwidth of up to 120 Gbps.

```
[edit chassis]
fpc slot-number {
  pic number {
    tunnel-services {
      bandwidth ;
    }
  }
}
```

To verify that the tunnel interfaces have been created, issue the **show interfaces terse** operational mode command. For more information, see the [CLI Explorer](#).

In the following example, you create tunnel interfaces on PIC 1 of MPC 5 with 40 Gbps of bandwidth reserved for tunnel traffic. **fpc slot-number** is the slot number of the MPC. In this configuration, the tunnel interfaces created are gr-5/1/1, pe-5/1/1, pd-5/1/1, vt-5/1/1, and so on.

To create a 40-Gbps tunnel interface, use the following configuration:

```
[edit chassis]
fpc 5 {
  pic 1 {
    tunnel-services {
      bandwidth 40g;
    }
  }
}
```

## Configuring Tunnel Interfaces on MX Series Routers with MX2K-MPC8E

MX2K-MPC8E support a total of four inline tunnels per MPC, one per PIC. You can create a set of tunnel interfaces per PIC slot up to a maximum of four slots from 0 through 3.

To configure the tunnel interfaces, include the **tunnel-services** statement and an optional bandwidth of 1–120Gbps at the **[edit chassis fpc fpc-slot pic number ]** hierarchy level. If you do not specify the tunnel bandwidth then, the tunnel interface can have a maximum bandwidth of up to 120 Gbps.

```
[edit chassis]
fpc slot-number {
  pic number {
    tunnel-services {
      bandwidth;
    }
  }
}
```

To verify that the tunnel interfaces have been created, issue the **show interfaces terse** operational mode command. For more information, see the [CLI Explorer](#).

In the following example, you create tunnel interfaces on PIC 1 of MPC 5 with 40 Gbps of bandwidth reserved for tunnel traffic. **fpc slot-number** is the slot number of the MPC. In this configuration, the tunnel interfaces created are gr-5/1/1, pe-5/1/1, pd-5/1/1, vt-5/1/1, and so on.

To create a 40-Gbps tunnel interface, use the following configuration:

```
[edit chassis]
fpc 5 {
  pic 1 {
    tunnel-services {
      bandwidth 40g;
    }
  }
}
```

## Remote Port Identification using LEDs for Cabling Assistance

With new and higher-density Modular Interface Cards (MICs) and Modular Port Concentrators (MPCs), cabling is complex and can result in wiring mistakes. Remote port identification reduces the complexity by providing an easy way of identifying the ports that must be connected to the cables. Starting in Junos OS Release 16.1, the remote port identification feature is supported on MPC7E-10G, MPC7E-MRATE, MX2K-MPC8E, and MX2K-MPC9E.

Starting in Junos OS Release 18.2, the remote port identification feature is supported on JNP10K-LC2101 on MX10008 routers.

LEDs, used to display the status of the port, can be configured to blink for a small duration of time to identify the port and provide cabling assistance. Depending on the port identification required, you can configure the LED of a specific port, LEDs of all ports, LED of a specific type of port to blink. For instance, on MX2020 routers with MPC8E, you can identify the active ports that support port speeds of 100 Gbps by configuring the LEDs of the specific port to blink. Similarly, you can identify active ports that support port speeds of 10 Gbps and 40 Gbps. You can configure the LED of, for example, active port 9 on the MX2020 router with MPC9E and MIC-MRATE. You can also make the LEDs of all the ports blink, if required.

You can specify the duration of time that a LED blinks. The default duration is 5 minutes (300 seconds). You can also stop the LED from blinking before the duration expires, if required.

To enable port identification on the enhanced MPCs, you can make the LED corresponding to the ports to blink using the **request chassis port-led** command.

Release History Table

Release	Description
18.2	Starting in Junos OS Release 18.2, the remote port identification feature is supported on JNP10K-LC2101 on MX10008 routers.
16.1	Starting in Junos OS Release 16.1, the remote port identification feature is supported on MPC7E-10G, MPC7E-MRATE, MX2K-MPC8E, and MX2K-MPC9E.

## MPC and MIC Lane LED Scheme Overview

LEDs on the interface cards display the status of the ports. On some MICs and MPC that have multiple ports and supports multiple port speed, it is not feasible to have an individual LED display for each port on an interface card. Hence, a shared LED display is introduced—the lane LEDs.

The MX10003 MPC includes this new LED lane display. The Multi-Rate 12xQFSP28 MIC and the fixed-port PIC (6xQFSP) have separate lane LEDs.

The lane LEDs of the MIC are located on the MIC itself, whereas the lane LEDs of the PIC are located on the MPC.

The following interface cards support lane LEDs:

- *MX10003 MPC (Multi-Rate)*
- *MX10K-LC2101*
- *Multi-Rate Ethernet MIC*

You can select a port operating in a breakout mode for an individual lane display, either periodically or when the **request chassis port-led** command is executed. Similar to the port status LEDs, the lane LED supports 4 states defined by the color or the LED status—OFF, GREEN, AMBER, and RED.

Figure 1 on page 71 illustrates the port LED and lane LED displays on the MPC.

Figure 1: Port LED and Lane LED display on the MPC

Figure 2 on page 71 illustrates the port LED and lane LED displays for the MPC.

Figure 2: Port LED and Lane LED display on the JNP10K-LC2101 MPC

Figure 3 on page 72 illustrates the port LED and lane LED displays for the MIC.

Figure 3: Port LED and Lane LED display on the MIC

1—Lane display LEDs

2—Port LEDs

The following port LED display modes are defined:

- Normal—The port status LED represents port state or a breakout port state. By default, the port status display mode is Normal.
- Lane display—An array of lane status LEDs displays the status of each individual lane for the selected port. The lane display is ON when the software cycles through ports for lane status display. One port is selected at a time, and the display mode for that particular port switches to lane display mode. The other ports remain in normal display mode.
- Port location—The port location mode is ON when a remote operator initiates a port location command for a port or a group of ports. The **request chassis port-led** command temporarily overrides periodic software port selection for the lane display; all ports on an interface card that are not selected for port location switch to Normal mode, and selected ports switch to port location mode. If only one port is selected for port location, then the corresponding lane LEDs are applicable. However, if the selected port is in breakout mode, then all lane LEDs are applicable. If not in breakout mode, only lane 0 LED displays the port status. If more than one port is selected for port location, then the lane LEDs are disabled.

The following factors trigger a change in the port LED color:

- Change in the port state. For example, loss of signal (LOS) to no LOS, remote fault, or local fault
- Pluggable insertion or removal
- Change in configuration
- Activation or deactivation of port location feature
- Selection of breakout port for lane display

**NOTE:** Ports with all individual links in *Up* state are skipped and are not considered for lane display, thereby reducing the time needed to cycle through all the ports.

Table 16 on page 73 summarizes the state and color rules for the port LEDs. These rules help in determining the port LED color. When port location mode is activated, the port

LED state or color can be determined from the Port Location ON column. If the breakout port is selected for the lane status display, then port LED state or color can be determined from the Lane Display column.

**Table 16: Port LED State and Color Rules**

Pluggable Inserted	Breakout Configuration State	Explicitly Disabled	Port State	Normal	Port Location ON	Lane Display
Yes	No breakout	No	Up	Green	Blinking green	-
Yes	No breakout	No	Down; loss of signal (LOS) detected	Off	Blinking green	-
Yes	No breakout	No	Down; transceiver hardware failure	Red	Blinking red	-
Yes	No breakout	No	Down; any other fault other than LOS and transceiver hardware failure	Amber	Blinking amber	-
ANY	No breakout	Yes	Port disabled by CLI	Amber	Blinking amber	-
No	Any	No	Anything except disabled port; however, transceiver not present	Off	Blinking green	-
Yes	Breakout	No	All breakout ports are UP	Green	Blinking green	Blinking green
Yes	Breakout	No	All breakout ports are down with LOS	Off	Blinking green	Blinking green
Yes	Breakout	No	Hardware failure; transceiver initialization error at the port level (not individual lane)	Red	Blinking red	Blinking red
Yes	Breakout	Any	In all other cases the port LED color is amber	Amber	Blinking amber	Blinking amber

The following factors trigger a change in the lane LED color:

- A breakout port is selected for a lane display.
- Port location mode is activated for a port on a given interface card.

[Table 17 on page 73](#) summarizes the state and color rules for the lane LEDs.

**Table 17: Lane LED Color Rules**

Pluggable Inserted	Breakout Configuration State	Explicitly Disabled	Port State	Order	LED Color
Yes	Breakout	No	Up	1	Green

Table 17: Lane LED Color Rules (continued)

Pluggable Inserted	Breakout Configuration State	Explicitly Disabled	Port State	Order	LED Color
Yes	Breakout	No	Down; loss of signal (LOS) detected	2	Off
Yes	Breakout	No	Down; transceiver hardware failure	3	Red
Yes	Breakout	No	Down; fault other than LOS and transceiver hardware failure	4	Amber
Yes	Breakout	Yes	Breakout port is disabled in the CLI	5	Amber

## MX204 LED Scheme Overview

LEDs on the interface cards display the status of the ports. In MX204 router, there are four port LEDs per port. Each port provides an individual status LED with four states signaled by the color/LED state: OFF, GREEN, AMBER, RED.

The following port LED display modes are defined:

- Normal—Represents the normal working mode of the LED. By default, the port status display mode is Normal.
- Port location—The port location mode is ON when a remote operator initiates a port location command for a port or a group of ports.

The following factors trigger a change in the port LED color:

- Change in the port state. For example, loss of signal (LOS) to no LOS, remote fault, or local fault
- Pluggable insertion or removal
- Change in configuration
- Activation or deactivation of port location feature

[Table 16 on page 73](#) summarizes the state and color rules for the port LEDs. These rules help in determining the port LED color. When port location mode is activated, the port LED state or color can be determined from the Port Location ON column.

**NOTE:** In MX204 router, there are four port LEDs per port. On PIC 0, if the port operates at the speed of 40-Gbps or 100-Gbps, then the first LED of PIC 1 will be ON and the other three LEDs will be OFF. And, if the port operates at the speed of 10-Gbps, then all the LEDs will be ON.

**Table 18: Port LED State and Color Rules**

Pluggable Inserted	Explicitly Disabled	Port State	Normal	Port Location ON
Yes	No	Up	Green	Blinking green
Yes	No	Down; loss of signal (LOS) detected	Off	Blinking green
Yes	No	Down; transceiver hardware failure	Red	Blinking red
Yes	No	Down; any other fault other than LOS and transceiver hardware failure	Amber	Blinking amber
ANY	Yes	Port disabled by CLI	Amber	Blinking amber
No	No	Anything except disabled port; however, transceiver not present	Off	Blinking green

## Guidelines for Identifying Active PICs on MPC5E (MPC5E-40G10G)

MPC5E contains two Packet Forwarding Engines (PFEs) and 4 fixed port PICs. On MPC5E-100G10G, the **PFE0** hosts **PIC0** and **PIC1** while **PFE1** hosts **PIC2** and **PIC3**. All the PICs can be powered on and used.

On the MPC5E-40G10G, the **PFE0** hosts **PIC0** and **PIC2** while **PFE1** hosts **PIC1** and **PIC3**. Only a maximum of two PICs (**PIC0** or **PIC2** and **PIC1** or **PIC3**) can be powered on. The remaining PICs are required to be kept powered off.

This topic describes the guidelines to consider while identifying active PICs on the MPC5E (MPC5E-40G10G):

- By default, (i.e. without any CLI configuration), **PIC0 (12x10GE)** and **PIC1 (12x10GE)** are powered ON while **PIC2 (3x40GE)** and **PIC3 (3x40GE)** shall be powered OFF.
- At least one PIC on every PFE should be configured in power OFF state. **PIC0** and **PIC2** belong to **PFE0** and **PIC1** and **PIC3** belong to **PFE1**.

- If you configure an invalid PIC combination, the default PICs (**PIC0** and **PIC1**) will be powered ON. Also, a syslog message is displayed to indicate the invalid PIC combination selected. When you configure an invalid PIC combination, and commit the change, the commit succeeds and a commit failure message is not displayed.

Table 19 on page 76 lists the active PICs on MPC5E-40G10G based on the configuration.

**Table 19: MPC5E-40G10G Active PICs**

CLI Configuration	PIC Selection
Default (i.e no CLI configuration)	Online: <b>PIC0</b> and <b>PIC1</b> Offline: <b>PIC2</b> and <b>PIC3</b>

### Interoperability of Type 3 FPCs and Type 4 FPCs with Type 5 FPCs

---

Support for interoperability of Type 3 FPCs, Type 4 FPCs, and T640-FPC4-1P-ES with Type 5 FPCs is now possible with fabric notification translation. This feature is supported on T4000 routers.

Basic packet forwarding, IPv4, IPv6, MPLS, and multicast (dataplane) are currently supported through this feature.

- Related Documentation**
- *T4000 FPCs Supported*
  - *T4000 PICs Supported*

## Interoperability Between MPC4E (MPC4E-3D-2CGE-8XGE) and 100-Gigabit Ethernet PICs on Type 4 FPC

---

You can enable interoperability between the MPC4E (MPC4E-3D-2CGE-8XGE) and the 100-Gigabit Ethernet PIC (PD-ICE-CFP-FPC4) by:

- Enabling source address (SA) multicast bit steering mode on the MPC4E.
- Configuring the two 50-Gigabit Ethernet physical interfaces on the 100-Gigabit Ethernet PIC PD-ICE-CFP-FPC4 as one aggregated Ethernet physical interface.

SA multicast mode uses the multicast bit in the source MAC address for packet steering. By default, the SA multicast bit is set to 0 for all packets sent by the MPC4E. The egress packet flow is the traffic flowing from the MPC4E to the 100-Gigabit Ethernet PIC. Because no VLAN tags are available, the SA multicast bit is sent on the outgoing packets. At the other end, the 100-Gigabit Ethernet PIC checks the multicast bit and forwards the packets to either Packet Forwarding Engine 0 or Packet Forwarding Engine 1. The ingress packet flow is the traffic flowing from the 100-Gigabit Ethernet PIC to the MPC4E. When the 100-Gigabit Ethernet PIC sends out a packet, the multicast bit is set based on the packet received from the Packet Forwarding Engine. The multicast bit is then transmitted and the MPC4E checks the multicast bit on ingress.

The 100-Gigabit Ethernet PIC uses a Type 4 FPC and two 50-Gbps Packet Forwarding Engines to achieve a throughput of 100 Gbps. The 50-Gbps physical interfaces are created when the 100-Gigabit Ethernet PIC is plugged in. The two physical interfaces are visible and configuration is allowed on both physical interfaces. The physical interfaces on the 100-Gigabit Ethernet PIC must be configured in static LAG mode without enabling Link Aggregation Control Protocol (LACP). This ensures that a single 100-Gigabit Ethernet aggregated interface is visible on the link connecting to the MPC4E instead of two independent 50-Gbps interfaces.

## Configuring 100-Gigabit Ethernet MICs to Interoperate with Type 4 100-Gigabit Ethernet PICs (PD-ICE-CFP-FPC4) Using SA Multicast Mode

---

To configure a 100-Gigabit Ethernet MIC (MIC3-3D-1X100GE-CFP) to interoperate with Juniper Networks Type 4 100-Gigabit Ethernet PICs (model number PD-ICE-CFP-FPC4), you can use the **forwarding-mode** statement with the **sa-multicast** option at the **[edit chassis fpc slot pic slot]** hierarchy level.

SA multicast mode uses the multicast bit in the source MAC address for packet steering. By default, the SA multicast bit is set to 0 for all packets sent by the 100-Gigabit Ethernet MIC. The egress packet flow is the traffic flowing from the 100-Gigabit Ethernet MIC to the 100-Gigabit Ethernet PIC. Since no VLAN tags are available, the SA multicast bit is

sent on the outgoing packets. At the other end, the 100-Gigabit Ethernet PIC looks at the bit and forwards the packets to either Packet Forwarding Engine 0 or 1. The ingress packet flow is the traffic flowing from a 100-Gigabit Ethernet PIC to a 100-Gigabit Ethernet MIC. When the 100-Gigabit Ethernet PIC is sending out a packet, the multicast bit is set based on the Packet Forwarding Engine packet received. The multicast bit is then transmitted and the MPC3E sees the multicast bit on ingress.

**NOTE:** The SA multicast bit is ignored by MPC3E while learning the source MAC addresses.

### Configuring 100-Gigabit Ethernet MICs

The interoperability mode between the 100-Gigabit Ethernet MIC and the 100-Gigabit Ethernet PIC is configured on a PIC basis. The MPC3E has two MIC slots. A 100-Gigabit Ethernet MIC installed in slot 0 corresponds to **pic 0**, and the MIC installed in slot 1 corresponds to **pic 2**.

**NOTE:** The configuration is valid only on PIC 0 and PIC 2.

To configure SA multicast mode on a Juniper Networks 100-Gigabit Ethernet MIC in MPC 0, PIC 0 for interconnection with another Juniper Networks 100-Gigabit Ethernet PIC, use the **set chassis fpc slot pic slot forwarding-mode sa-multicast** command, as follows:

```
[edit chassis fpc slot pic slot]
forwarding-mode {
  sa-multicast;
}
```

You can use the **show forwarding-mode** command to view the resulting configuration, as follows:

```
[edit chassis fpc slot pic slot]
user@host# show forwarding-mode
```

### Configuring 100-Gigabit Ethernet PIC (PD-ICE-CFP-FPC4)

The default packet steering mode for the 100-Gigabit Ethernet PIC (PD-ICE-CFP-FPC4) is SA multicast bit mode. There is no SA multicast configuration required on the 100-Gigabit Ethernet PIC to enable this mode.

**NOTE:** SA multicast mode can be configured, but it is not necessary.

The 100-Gigabit Ethernet PIC uses a Type 4 FPC and two 50 Gbps Packet Forwarding Engines to achieve 100 Gbps throughput. The 50 Gbps physical interfaces are created when the 100-Gigabit Ethernet PIC is installed. The two physical interfaces are visible and configuration is allowed on both physical interfaces. The physical interfaces on the 100-Gigabit Ethernet PIC should be configured in static LAG mode without enabling Link Aggregation Control Protocol (LACP). This ensures that a single 100-Gigabit aggregated interface is visible on the link connecting to the 100-Gigabit Ethernet MIC instead of two independent 50 Gbps interfaces.

When the PIC is in aggregated Ethernet mode, the two physical interfaces on the same PIC are aggregated into one AE physical interface. When the PIC is configured with two physical interfaces, it creates the physical interfaces **et-fpc/pic/0:0** and **et-fpc/pic/0:1** where *fpc* is the FPC slot number and *pic* is the PIC slot number. The example shows how to configure two physical interfaces for PIC 0 in FPC 5:

```
chassis {
  aggregated-devices {
    ethernet {
      device-count 1;
    }
  }
  interfaces {
    et-5/0/0:0 {
      gigether-options {
        802.3ad ae0;
      }
    }
    et-5/0/0:1 {
      gigether-options {
        802.3ad ae0;
      }
    }
  }
}
```

## Configuring MPC4E (MPC4E-3D-2CGE-8XGE) to Interoperate with 100-Gigabit Ethernet PICs on Type 4 FPC Using SA Multicast Mode

You can enable interoperability between the MPC4E and the 100-Gigabit Ethernet PIC by performing the following tasks:

- [Configuring SA Multicast Bit Steering Mode on MPC4E on page 83](#)
- [Configuring Two 50-Gigabit Ethernet Physical Interfaces on the Ethernet PIC as One Aggregated Ethernet Interface on page 84](#)

### Configuring SA Multicast Bit Steering Mode on MPC4E

The interoperability mode between the MPC4E and the 100-Gigabit Ethernet PIC is configured on a PIC basis. MPC4E-3D-2CGE-8XGE is a fixed-configuration MPC and does not contain separate slots for Modular Interfaces Cards (MICs). MPC4E contains two Packet Forwarding Engines—PFE 0 hosts PIC 0 and PIC 1 and PFE 1 hosts PIC 2 and PIC 3.

**NOTE:** This configuration is valid only on PIC 1 and PIC 3.

To configure SA multicast mode on PIC 1 of an MX480 router with MPC4E for interconnection with the 100-Gigabit Ethernet PIC:

1. To specify the forwarding mode as **sa-multicast**, include the **forwarding-mode** statement at the `[edit chassis fpc slot pic slot]` hierarchy level.

```
[edit chassis]
user@host # set fpc 3 pic 1 forwarding-mode sa-multicast
```

2. To verify that the forwarding mode is set to **sa-multicast**, issue the following command:

```
[edit chassis fpc 3 pic 1]
user@host # show forwarding-mode
```

- See Also**
- *sa-multicast*
  - [Interoperability Between MPC4E \(MPC4E-3D-2CGE-8XGE\) and 100-Gigabit Ethernet PICs on Type 4 FPC on page 80](#)

## Configuring Two 50-Gigabit Ethernet Physical Interfaces on the Ethernet PIC as One Aggregated Ethernet Interface

When the PIC is in aggregated Ethernet mode, the two physical interfaces on the same PIC are aggregated into one aggregated Ethernet physical interface. When the PIC is configured with two physical interfaces, it creates the physical interfaces `et-x/y/0:0` and `et-x/y/0:1` where `x` is the FPC slot number and `y` is the PIC slot number.

The default packet steering mode for the 100-Gigabit Ethernet PIC is SA multicast bit mode. No SA multicast configuration is required on the 100-Gigabit Ethernet PIC to enable this mode.

**NOTE:** SA multicast mode can be configured, but it is not necessary.

1. To specify the number of aggregated Ethernet interfaces to be created:

```
[edit chassis aggregated-devices ethernet]
user@host # set device-count 2
```

2. To specify the members to be included within the aggregated Ethernet bundle:

```
[edit interfaces]
user@host # set et-4/3/0:0 gigether-options 802.3ad ae0
user@host # set et-4/3/0:1 gigether-options 802.3ad ae0
```

3. Verify the configuration at the interface.

```
[edit]
user@host # show interfaces
```

```
..
et-4/3/0:0 {
  gigether-options {
    802.3ad ae0;
  }
}
et-4/3/0:1 {
  gigether-options {
    802.3ad ae0;
  }
}
```

## Interoperability Between MPC7E-MRATE and 100-Gigabit Ethernet PICs on Type 4 FPC

You can enable interoperability between the MPC7E (MPC7E-MRATE) and the 100-Gigabit Ethernet PIC (PD-1CE-CFP-FPC4) by:

- Enabling source address (SA) multicast bit steering mode on the MPC7E
- Configuring the two 50-Gigabit Ethernet physical interfaces on the 100-Gigabit Ethernet PIC PD-1CE-CFP-FPC4 as one aggregated Ethernet physical interface.

SA multicast mode uses the multicast bit in the source MAC address for packet steering. By default, the SA multicast bit is set to 0 for all packets sent by the MPC7E. The egress packet flow is the traffic flowing from the MPC to the 100-Gigabit Ethernet interface. Because no VLAN tags are available, the SA multicast bit is sent on the outgoing packets. At the other end, the 100-Gigabit Ethernet interface checks the multicast bit and forwards the packets to either Packet Forwarding Engine 0 or Packet Forwarding Engine 1. The ingress packet flow is the traffic flowing from the 100-Gigabit Ethernet interface to the MPC7E. When the 100-Gigabit Ethernet interface sends out a packet, the multicast bit is set based on the packet received from the Packet Forwarding Engine. The multicast bit is then transmitted and the MPC7E checks the multicast bit on ingress.

The 100-Gigabit Ethernet PIC uses a Type 4 FPC and two 50-Gbps Packet Forwarding Engines to achieve a throughput of 100 Gbps. The 50-Gbps physical interfaces are created when the 100-Gigabit Ethernet PIC is plugged in. The two physical interfaces are visible and configuration is allowed on both physical interfaces. The physical interfaces on the 100-Gigabit Ethernet PIC must be configured in static LAG mode without enabling Link Aggregation Control Protocol (LACP). This ensures that a single 100-Gigabit Ethernet aggregated interface is visible on the link connecting to the MPC7E instead of two independent 50-Gbps interfaces.

## Configuring MPC7E-MRATE to Interoperate with 100-Gigabit Ethernet PICs on Type 4 FPC Using SA Multicast Mode

---

You can enable interoperability between the MPC7E (MPC7E-MRATE) and the 100-Gigabit Ethernet PIC by performing the following tasks:

- [Configuring SA Multicast Bit Steering Mode on MPC7E on page 86](#)
- [Configuring Two 50-Gigabit Ethernet Physical Interfaces on the Ethernet PIC as One Aggregated Ethernet Interface on page 87](#)

### Configuring SA Multicast Bit Steering Mode on MPC7E

The interoperability mode between the MPC7E (MPC7E-MRATE) and the 100-Gigabit Ethernet PIC is configured on a PIC basis. MPC7E is a fixed-configuration MPC and does not contain separate slots for Modular Interfaces Cards (MICs). MPC7E contains two Packet Forwarding Engines—PFE 0 hosts PIC 0 and PFE 1 hosts PIC 1.

To configure SA multicast mode on FPC13, PIC 1 of MPC7E-MRATE for interconnection with the 100-Gigabit Ethernet PIC:

1. To specify the forwarding mode as **sa-multicast**, include the **forwarding-mode** statement at the **[edit chassis fpc slot pic slot]** hierarchy level.

```
[edit chassis]
user@host # set fpc 13 pic 1 forwarding-mode sa-multicast
```

2. To verify that the forwarding mode is set to **sa-multicast**, issue the following command:

```
[edit chassis fpc 13 pic 1]
user@host # show forwarding-mode
```

**See Also** • *sa-multicast*

- [Interoperability Between MPC7E-MRATE and 100-Gigabit Ethernet PICs on Type 4 FPC on page 85](#)

## Configuring Two 50-Gigabit Ethernet Physical Interfaces on the Ethernet PIC as One Aggregated Ethernet Interface

When the PIC is in aggregated Ethernet mode, the two physical interfaces on the same PIC are aggregated into one aggregated Ethernet physical interface. When the PIC is configured with two physical interfaces, it creates the physical interfaces `et-x/y/0:0` and `et-x/y/0:1` where `x` is the FPC slot number and `y` is the PIC slot number.

The default packet steering mode for the 100-Gigabit Ethernet PIC is SA multicast bit mode. No SA multicast configuration is required on the 100-Gigabit Ethernet PIC to enable this mode.

**NOTE:** SA multicast mode can be configured, but it is not necessary.

1. To specify the number of aggregated Ethernet interfaces to be created:

```
[edit chassis aggregated-devices ethernet]
user@host # set device-count 2
```

2. To specify the members to be included within the aggregated Ethernet bundle:

```
[edit interfaces]
user@host # set et-4/3/0:0 gigether-options 802.3ad ae0
user@host # set et-4/3/0:1 gigether-options 802.3ad ae0
```

3. Verify the configuration at the interface.

```
[edit]
user@host # show interfaces
```

```
..
et-4/3/0:0 {
  gigether-options {
    802.3ad ae0;
  }
}
et-4/3/0:1 {
  gigether-options {
    802.3ad ae0;
  }
}
```

## Interoperability Between MPC8E (MX2K-MPC8E) and 100-Gigabit Ethernet PICs on Type 4 FPC

---

You can enable interoperability between the MPC8E (MX2K-MPC8E) and the 100-Gigabit Ethernet PIC (PD-1CE-CFP-FPC4) by:

- Enabling source address (SA) multicast bit steering mode on the MPC8E.
- Configuring the two 50-Gigabit Ethernet physical interfaces on the 100-Gigabit Ethernet PIC PD-1CE-CFP-FPC4 as one aggregated Ethernet physical interface.

SA multicast mode uses the multicast bit in the source MAC address for packet steering. By default, the SA multicast bit is set to 0 for all packets sent by the MPC8E. The egress packet flow is the traffic flowing from the MPC to the 100-Gigabit Ethernet Interface. Because no VLAN tags are available, the SA multicast bit is sent on the outgoing packets. At the other end, the 100-Gigabit Ethernet Interface checks the multicast bit and forwards the packets to either Packet Forwarding Engine 0 or Packet Forwarding Engine 1. The ingress packet flow is the traffic flowing from the 100-Gigabit Ethernet Interface to the MPC8E. When the 100-Gigabit Ethernet Interface sends out a packet, the multicast bit is set based on the packet received from the Packet Forwarding Engine. The multicast bit is then transmitted and the MPC8E checks the multicast bit on ingress.

The 100-Gigabit Ethernet PIC uses a Type 4 FPC and two 50-Gbps Packet Forwarding Engines to achieve a throughput of 100 Gbps. The 50-Gbps physical interfaces are created when the 100-Gigabit Ethernet PIC is plugged in. The two physical interfaces are visible and configuration is allowed on both physical interfaces. The physical interfaces on the 100-Gigabit Ethernet PIC must be configured in static LAG mode without enabling Link Aggregation Control Protocol (LACP). This ensures that a single 100-Gigabit Ethernet aggregated interface is visible on the link connecting to the MPC8E instead of two independent 50-Gbps interfaces.

## Configuring MPC8E to Interoperate with 100-Gigabit Ethernet PICs on Type 4 FPC Using SA Multicast Mode

You can enable interoperability between the MPC8E (MX2K-MPC8E) and the 100-Gigabit Ethernet PIC by performing the following tasks:

- [Configuring SA Multicast Bit Steering Mode on MPC8E on page 89](#)
- [Configuring Two 50-Gigabit Ethernet Physical Interfaces on the Ethernet PIC as One Aggregated Ethernet Interface on page 90](#)

### Configuring SA Multicast Bit Steering Mode on MPC8E

The interoperability mode between the MPC8E and the 100-Gigabit Ethernet PIC is configured on a PIC basis. MPC8E (MX2K-MPC8E) is a modular MPC that contains two slots for Modular Interfaces Cards (MICs). MPC8E contains four Packet Forwarding Engines—PIC 0 hosts PFE 0 and PFE 1. PIC 1 hosts PFE 2 and PFE 3.

To configure SA multicast mode on FPC 7, PIC 1 of MPC8E for interconnection with the 100-Gigabit Ethernet PIC:

1. To specify the forwarding mode as **sa-multicast**, include the **forwarding-mode** statement at the **[edit chassis fpc slot pic slot]** hierarchy level.

```
[edit chassis]
user@host # set fpc 7 pic 1 forwarding-mode sa-multicast
```

2. To verify that the forwarding mode is set to **sa-multicast**, issue the following command:

```
[edit chassis]
user@host # show fpc 7 pic 1 forwarding-mode
```

```
sa-multicast;
```

**See Also** • *sa-multicast*

- [Interoperability Between MPC8E \(MX2K-MPC8E\) and 100-Gigabit Ethernet PICs on Type 4 FPC on page 88](#)

## Configuring Two 50-Gigabit Ethernet Physical Interfaces on the Ethernet PIC as One Aggregated Ethernet Interface

When the PIC is in aggregated Ethernet mode, the two physical interfaces on the same PIC are aggregated into one aggregated Ethernet physical interface. When the PIC is configured with two physical interfaces, it creates the physical interfaces `et-x/y/0:0` and `et-x/y/0:1` where `x` is the FPC slot number and `y` is the PIC slot number.

The default packet steering mode for the 100-Gigabit Ethernet PIC is SA multicast bit mode. No SA multicast configuration is required on the 100-Gigabit Ethernet PIC to enable this mode.

**NOTE:** SA multicast mode can be configured, but it is not necessary.

1. To specify the number of aggregated Ethernet interfaces to be created:

```
[edit chassis aggregated-devices ethernet]
user@host # set device-count 2
```

2. To specify the members to be included within the aggregated Ethernet bundle:

```
[edit interfaces]
user@host # set et-4/3/0:0 gigether-options 802.3ad ae0
user@host # set et-4/3/0:1 gigether-options 802.3ad ae0
```

3. Verify the configuration at the interface.

```
[edit]
user@host # show interfaces
```

```
..
et-4/3/0:0 {
  gigether-options {
    802.3ad ae0;
  }
}
et-4/3/0:1 {
  gigether-options {
    802.3ad ae0;
  }
}
```

## Interoperability Between MPC9E (MX2K-MPC9E) and 100-Gigabit Ethernet PICs on Type 4 FPC

You can enable interoperability between the MPC9E (MX2K-MPC9E) and the 100-Gigabit Ethernet PIC (PD-ICE-CFP-FPC4) by:

- Enabling source address (SA) multicast bit steering mode on the MPC9E.
- Configuring the two 50-Gigabit Ethernet physical interfaces on the 100-Gigabit Ethernet PIC PD-ICE-CFP-FPC4 as one aggregated Ethernet physical interface.

SA multicast mode uses the multicast bit in the source MAC address for packet steering. By default, the SA multicast bit is set to 0 for all packets sent by the MPC9E. The egress packet flow is the traffic flowing from the MPC9E to the 100-Gigabit Ethernet Interface. Because no VLAN tags are available, the SA multicast bit is sent on the outgoing packets. At the other end, the 100-Gigabit Ethernet Interface checks the multicast bit and forwards the packets to either Packet Forwarding Engine 0 or Packet Forwarding Engine 1. The ingress packet flow is the traffic flowing from the 100-Gigabit Ethernet Interface to the MPC9E. When the 100-Gigabit Ethernet interface sends out a packet, the multicast bit is set based on the packet received from the Packet Forwarding Engine. The multicast bit is then transmitted and the MPC9E checks the multicast bit on ingress.

The 100-Gigabit Ethernet PIC uses a Type 4 FPC and two 50-Gbps Packet Forwarding Engines to achieve a throughput of 100 Gbps. The 50-Gbps physical interfaces are created when the 100-Gigabit Ethernet PIC is plugged in. The two physical interfaces are visible and configuration is allowed on both physical interfaces. The physical interfaces on the 100-Gigabit Ethernet PIC must be configured in static LAG mode without enabling Link Aggregation Control Protocol (LACP). This ensures that a single 100-Gigabit Ethernet aggregated interface is visible on the link connecting to the MPC9E instead of two independent 50-Gbps interfaces.

## Configuring MPC9E to Interoperate with 100-Gigabit Ethernet PICs on Type 4 FPC Using SA Multicast Mode

---

You can enable interoperability between the MPC9E (MX2K-MPC9E) and the 100-Gigabit Ethernet PIC by performing the following tasks:

- [Configuring SA Multicast Bit Steering Mode on MPC9E on page 92](#)
- [Configuring Two 50-Gigabit Ethernet Physical Interfaces on the Ethernet PIC as One Aggregated Ethernet Interface on page 93](#)

### Configuring SA Multicast Bit Steering Mode on MPC9E

The interoperability mode between the MPC9E and the 100-Gigabit Ethernet PIC is configured on a PIC basis. MPC9E (MX2K-MPC9E) is a modular MPC that contains two slots for Modular Interfaces Cards (MICs). MPC9E contains four Packet Forwarding Engines—PIC 0 hosts PFE 0 and PFE 1. PIC 1 hosts PFE 2 and PFE 3.

To configure SA multicast mode on **FPC 19, PIC 1** of MPC9E for interconnection with the 100-Gigabit Ethernet PIC:

1. To specify the forwarding mode as **sa-multicast**, include the **forwarding-mode** statement at the **[edit chassis fpc slot pic slot]** hierarchy level.

```
[edit chassis]
user@host # set fpc 19 pic 1 forwarding-mode sa-multicast
```

2. To verify that the forwarding mode is set to **sa-multicast**, issue the following command:

```
[edit chassis]
user@host # show fpc 19 pic 1 forwarding-mode
```

```
sa-multicast;
```

**See Also** • [\*sa-multicast\*](#)

## Configuring Two 50-Gigabit Ethernet Physical Interfaces on the Ethernet PIC as One Aggregated Ethernet Interface

When the PIC is in aggregated Ethernet mode, the two physical interfaces on the same PIC are aggregated into one aggregated Ethernet physical interface. When the PIC is configured with two physical interfaces, it creates the physical interfaces et-x/y/0:0 and et-x/y/0:1 where x is the FPC slot number and y is the PIC slot number.

The default packet steering mode for the 100-Gigabit Ethernet PIC is SA multicast bit mode. No SA multicast configuration is required on the 100-Gigabit Ethernet PIC to enable this mode.

**NOTE:** SA multicast mode can be configured, but it is not necessary.

1. To specify the number of aggregated Ethernet interfaces to be created:

```
[edit chassis aggregated-devices ethernet]
user@host # set device-count 2
```

2. To specify the members to be included within the aggregated Ethernet bundle:

```
[edit interfaces]
user@host # set et-4/3/0:0 gigether-options 802.3ad ae0
user@host # set et-4/3/0:1 gigether-options 802.3ad ae0
```

3. Verify the configuration at the interface.

```
[edit]
user@host # show interfaces
```

```
..
et-4/3/0:0 {
  gigether-options {
    802.3ad ae0;
  }
}
et-4/3/0:1 {
  gigether-options {
    802.3ad ae0;
  }
}
```

## T4000 Power Management Overview

---

Starting with Junos OS Release 12.3, the power management feature is enabled on a Juniper Networks T4000 Core Router. This feature enables you to limit the overall chassis output power consumption. That is, this feature enables you to limit the router from powering on a Flexible PIC Concentrator (FPC) when sufficient output power is not available to power on the FPC during booting or normal operation.

The power management feature is enabled only when six input feeds with 40 amperes (A) each or four input feeds with 60 A each is configured on the router. The power management feature is *not* enabled for any other input feed—current combination. When the power management feature is *not* enabled, Junos OS tries to power on all the FPCs connected to the router.

**CAUTION:** : If you do not configure the power management feature and the maximum power draw is exceeded by the router during booting or normal operation, FPCs' states might change from Online to Offline or Present, some traffic might drop, or the interfaces might flap.

**TIP:** Interface flapping occurs when a router alternately announces the state of the interface to be as *up* and *down* in quick sequence.

After you connect the input feeds to the router, you must configure the number of input feeds connected to the router and the amount of current received at the input feeds. Use the **feeds** statement and the **input current** statement at the **[edit chassis pem]** hierarchy level to configure the number of input feeds and the amount of current received at each input feeds, respectively.

**NOTE:** You can connect three 80 A DC power cables to the six-input DC power supply by using terminal jumpers. When you do this, ensure that you configure the **feeds** statement to have the value 6 and the **input current** statement to have the value 40. If these configurations are not set, the power management feature is *not* enabled and, therefore, Junos OS tries to power on all the FPCs connected to the router.

When the power management feature is enabled, FPCs connected to the router are powered on based on the power received by the router. If the router receives sufficient power to power on all the FPCs connected to the router, all the FPCs are powered on. If sufficient power is not available, Junos OS limits the number of FPCs brought online. That is, Junos OS uses the total available chassis output power as a factor to decide whether or not to power on an FPC connected to the router.

Of all the supported FPCs of a T4000 router, the T1600 Enhanced Scaling FPC4 (model number: T1600-FPC4-ES) has the greatest power requirement. [Table 20 on page 96](#) compares the FPC connection limits between a six-input feed 40 A connection and a four-input feed 60 A connection when power management is enabled and T1600-FPC4-ES is connected to router.

**Table 20: FPC Connection Limit Comparison**

Six Input Feeds with 40 A Connection	Four Input Feeds with 60 A Connection
When T1600-FPC4-ES is <i>not</i> connected: <ul style="list-style-type: none"> <li>All eight FPC slots can be brought online.</li> </ul>	When T1600-FPC4-ES is <i>not</i> connected: <ul style="list-style-type: none"> <li>A maximum of seven other FPCs can be brought online. That is, only seven slots out of the eight FPC slots can be brought online.</li> </ul>
When only one T1600-FPC4-ES is connected: <ul style="list-style-type: none"> <li>A maximum of seven other FPCs can be brought online. That is, only seven slots out of the eight FPC slots can be brought online.</li> </ul>	When only one T1600-FPC4-ES is connected: <ul style="list-style-type: none"> <li>A maximum of six other FPCs can be brought online. That is, only six slots out of the eight FPC slots can be brought online.</li> </ul>
When only T1600-FPC4-ES FPCs are connected: <ul style="list-style-type: none"> <li>A maximum of six T1600-FPC4-ES FPCs can be brought online.</li> </ul>	More than one T1600-FPC4-ES <i>cannot</i> be brought online.

**NOTE:**

- When the power management feature is enabled, FPC power-on consistency is not maintained across router reboots. That is, the same set of FPCs that were powered on before a reboot might not be powered on after the reboot. Before the router reboot, the FPCs are powered on according to their insertion order in the chassis. After the reboot, the FPCs are powered on according to the FRU power-on sequence configured in the `fru-poweron-sequence` statement at the `[edit chassis]` hierarchy level. If the FRU power-on sequence is not configured, Junos OS uses the ascending order of the slot numbers of the FPCs as the sequence to power on the FPCs.
- Removal of any online FPC from the chassis does not change the state of any other FPC and does not trigger the power management feature to power on the FPCs that were not powered on initially because of the lack of sufficient power. When any online FPC is removed from the chassis, if you need to trigger the power management feature to re-evaluate the situation, you need to reboot or restart the chassis. Alternatively, you can make a configuration change at the `[edit chassis]` hierarchy level and then issue the `commit` command to commit the changes made at the `[edit chassis]` hierarchy level. The power management feature re-evaluates the situation when a configuration change is committed at the `[edit chassis]` hierarchy level.

## Understanding Power Management on the PTX5000

---

Starting in Junos OS Release 14.1, the power management feature for PTX5000 routers ensures that at any time, the chassis power requirements do not exceed the available chassis power. The PTX5000 has two PDUs to meet the power requirements of the chassis. Each PDU is capable of providing power to the chassis on its own. In case the power requirement exceeds the individual capacity of a PDU, the required power is provided by both the PDUs and the **No redundant power supply** alarm is triggered. If the system cannot provide power for all the installed FPCs or PICs, the system brings down FPCs or PICs that in can no longer provide power for and the **Insufficient Power - FRU(s) went offline** alarm is raised.

The power management feature provides the following functionality:

- Power management ensures that high-priority FPCs continue to receive power when the system does not have sufficient power to keep all the FPCs online.
- Power management ensures that if a power supply fails, the router can continue to operate normally by keeping high-priority FPCs online and taking low-priority FPCs offline.
- If power supply failure requires power management to power down some components, power management does so by gracefully powering down lower-priority FPCs.

Power management manages power to router components by employing a power budget policy. In its power budget policy, power management:

- Budgets power for each installed router component that requires power. The amount that power management budgets for each component is the maximum power that component might consume under worst-case operating conditions. For example, for the fan tray, power management budgets the amount of power required to run the fans at their maximum speed setting, even if the current fan speed is much lower.
- Manages the router for  $N+N$  power redundancy, which ensures uninterrupted system operation if one power supply fails.
- Provides power to host subsystem components, such as the Routing Engines, before it provides power to the FPCs.
- Manages the priority of individual FPCs. By assigning different priorities to the FPCs, you can determine which FPCs are more likely to receive power in the event of insufficient power.

### Power Priority of FPCs

The power priority of FPCs determines:

- The order in which FPCs are allocated power.
- How power is reallocated if there is a change in power availability or demand in an operating router.

This section covers:

- [How an FPC's Power Priority Is Determined on page 99](#)
- [FPC Priority and FPC Power Allocation on page 99](#)
- [FPC Priority and Changes in the Power Budget on page 99](#)

### How an FPC's Power Priority Is Determined

Using the CLI, you can assign an explicit power priority to an FPC slot. The power priority is determined by the slot number, with the lowest-numbered slots receiving power first. Thus, if you do not explicitly assign priorities to slots, power priority is determined by slot number, with slot 0 having the highest priority. See [“Configuring Power-On Sequence to Redistribute the Available Power” on page 109](#).

### FPC Priority and FPC Power Allocation

When a PTX5000 is powered on, power management allocates power to components according to its power budget policy. After power management has allocated power to the host subsystem components, it allocates the remaining available power to the FPCs. It powers on the FPCs in the configured order of priority until all FPCs are powered on or the available power provided by both the PDUs is exhausted. Thus if available power is exhausted before all FPCs receive power, higher-priority FPCs are powered on while lower-priority FPCs remain powered off.

FPCs that have been taken offline are not allocated power.

**NOTE:** Because power management does not allocate power to an FPC that has been taken offline, that FPC is brought online only when you commit a configuration. You must explicitly use the `request chassis fpc slot slot-number online` command to bring an FPC online that was taken offline previously.

If an FPC with a high priority in the priority sequence also has high-power requirement, and if the system does not have the required power available, then the lower priority FPCs with lower power requirements are also not powered on. This is to maintain consistency and also avoid powering off of the lower priority FPC when extra power is available. For example, if an FPC that requires 450 W has a higher priority than an FPC that requires 330 W, then the FPC with the lower power requirement (330 W) is also not powered on if the system does not have the required power to power the FPC that requires 450 W.

### FPC Priority and Changes in the Power Budget

In an operating router, power management dynamically reallocates power in response to changes in power availability or demand or changes in FPC priority. Power management uses the configured priority on FPC slots to determine how to reallocate power in response to the following events:

- When a new power supply is brought online, FPCs that were powered off because of insufficient power are powered on in the order of priority.

- When a user changes the assigned power priority of one or more FPCs when power is insufficient to meet the power budget, power management reruns the current power budget policy and powers FPCs on or off based on their priority. As a result, FPCs receive power strictly by the order of priority and previously operating FPCs might no longer receive power.
- When an FPC is installed, Junos OS does not automatically power on and bring the FPC online. This FPC stays in the offline state until the user brings it online through the CLI or by pushing the online button, and only if the available chassis power is more than the budgeted power for this FPC, the FPC becomes operational.

## Power Zones

In a PTX5000 equipped with high capacity PDUs and PSMs, there is one common zone that provides power to all FRUs and all FPCs. A high-capacity PDU can support up to eight PSMs and it does not support power zoning, unlike a normal-capacity PDU. All available PDU power is considered as a part of single zone. All PSMs provide power to the common zone. The PSM LEDs on the craft interface are interpreted as described in *PTX5000 Craft Interface LEDs*. After the PDU upgrade from the normal-capacity PDUs to High-Capacity PDUs, the power management converges all power zones into a single common zone. All FRU power is distributed based on the power available in the common zone.

**NOTE:** Presence of both normal-capacity PDUs and high-capacity PDUs is referred to as mixed-mode of operation and is supported only during the PDU upgrade.

To cater for the increase in the PIC power consumption, the power manager is enhanced to account for the PIC power separately from the FPC. The priority sequence for the PICs follows the priority sequence for the FPCs. That is, PICs installed in high-priority FPCs are given preference over PICs installed in low-priority FPCs. All PICs on an FPC have the same priority.

**NOTE:** You cannot mix existing PDUs with the High Capacity DC PDU.

## Power Supply Redundancy

By default, power management in PTX5000 routers is configured to manage the power supplies for  $N+N$  redundancy, by which power supplies are held in reserve for backup if the other power supplies are removed or fail.

When power is insufficient to meet the budgeted power requirements, power management raises alarms as follows:

- With power supply redundancy, when one PSM fails, it does not cause FPCs to go offline. Only the **No redundant power supply alarm** is raised. However, with no redundancy, FPCs can go offline depending on the total chassis power available at

that time. When an FPC or PIC goes offline due to insufficient power, which is indicated by **No power** in the output of the **show chassis fpc** command, then the **Insufficient Power - FRU(s) went offline** alarm is raised. The alarm gets cleared when there is sufficient power to bring up all the FPCs and PICs. The **Insufficient Power - FRU(s) went offline** alarm is raised when PSMs fail, when PSMs are powered off manually, or any time there is insufficient power for the system to power all the FPCs or PICs in the system.

- When power fails or when a PSM is removed, power management:
  - Calculates the total chassis power available from the remaining PSMs for the FPCs.
  - Powers off the FPCs based on the priority depending on the power budget for the FPCs and the FRUs and their configured power-on sequence.

**NOTE:** In the scenario where the available power is more than the budgeted power required by the FPC but less than its maximum power, the FPC is taken offline and then brought online, but one or more PICs in that FPC are not online.

- When a new PSM is inserted, power management:
  - Checks the power-on sequence of the FPCs and the PICs and brings any offline PICs online when power is available.
  - Powers on the FPCs based on the FPC's budgeted power and its power-on sequence depending on its priority.
  - Maintains the power for high-priority FPCs and their PICs by taking the low-priority FPCs offline when all the FPCs are brought online, depending on the available power.

Power management clears all alarms when sufficient power is available to meet normal operating and reserved power requirements.

#### Release History Table

Release	Description
14.1	Starting in Junos OS Release 14.1, the power management feature for PTX5000 routers ensures that at any time, the chassis power requirements do not exceed the available chassis power.

## Managing Power Allocated to PTX5000 FPCs on the Basis of Chassis Ambient Temperature Configuration

The power management feature of the PTX5000 Packet Transport Router is enhanced to manage the power supplied to the FPCs on the router by configuring the ambient temperature of the chassis. You can set the ambient temperature of the chassis at 25° C,

or 40° C. On system initialization, the power manager reads the ambient temperature and allocates power to the FPC according to the power budget policy at that temperature. If the actual power consumption of any FPC exceeds the configured value for more than three minutes, the power manager overrides the configured ambient temperature setting of that FPC, and resets its ambient temperature to the next higher level and reallocates power according to the new temperature setting. All the overshooting FPCs remain in the dynamic ambient temperature mode until the next reboot, or until you override it with a CLI command. The power manager then resets the power budget of the FRUs according to the configured ambient temperature setting.

**NOTE:** If the ambient temperature is not set, then, 55° C is considered as the default ambient-temperature and FPCs are assigned power according to the default ambient temperature.

For example, if the chassis ambient temperature is set to 25° C, the power manager allocates power to the FPCs according to the power budget policy at 25 ° C. If an FPC consumes more than 90% of the allocated power, an alarm—**Consumption > 90percent of allocated Budget**—is raised. If the FPC power consumption exceeds the allocated power for more than three minutes, the **PWR Range Overshoot** alarm is raised and the power manager reallocates power to that FPC according to the next higher temperature setting, that is, 40° C .

**NOTE:** During the PWR Range Overshoot alarm condition, you cannot reconfigure or delete the ambient temperature setting. You can reset the ambient temperature to the earlier setting after clearing the alarm condition by using the `request chassis power-manager reset ambient-config` command.

**NOTE:** If the PTX5000 chassis has redundant power supply modules, and if one PSM fails, the FPCs can still be online. Only the **No redundant power supply** alarm is raised.

If the PTX5000 chassis does not have redundant power supply modules, failure of one PSM can cause the FPCs to go offline, depending on the total chassis power available at that time.

## Understanding How Dynamic Power Management Enables Better Utilization of Power

You can use the dynamic power management feature to better utilize the power available in the power entry module (PEM). Whether or not a new hardware component is powered on depends on the availability of power in the PEM. A component is not powered on if the PEM cannot meet the worst-case power requirement for that component. The dynamic power management feature is available in the following Junos OS Releases:

- MX Series routers—Junos OS Release 15.1R1 and later
- EX9200 switches—Junos OS Release 17.2R1 and later

The maximum power that each type of MIC consumes is maintained in a static database. The chassis daemon process (**chassisd**), which manages power budgeting for all line cards, uses this data when budgeting power for MICs. MICs are brought online only after the chassis daemon verifies that the worst-case power required for the MICs and the power required for all the online FRUs are available in the PEM.

In Junos OS Release 15.1R1, for MX Series routers, dynamic power management for MICs is disabled by default. You can enable the feature by enabling the **mic-aware-power-management** statement at the **[edit chassis]** hierarchy level. When dynamic power management is disabled, the chassis daemon checks for the worst-case power requirement of the MPC and the MICs before allocating power for the MPC. Whereas, when **mic-aware-power-management** statement is enabled, the chassis daemon considers the power requirement of only the MPCs. The worst-case power consumption by the MICs is not considered while the chassis daemon budgets power for the MPC. Power budgeting for MICs is done only after the MPC is powered on and the MICs come online. Every time you disable or enable dynamic power management, you must restart the chassis or the MPC for the changes to take effect.

In Junos OS Release 17.2R1, for EX9200 switches, dynamic power management for MICs is enabled by default.

Starting from Junos OS Release 17.3R1, for MX10003 routers, mic-aware dynamic power management is enabled by default.

Starting from Junos OS Release 18.2R1, for JNP10K-LC2101 MPC on MX10008 routers, dynamic power management is enabled by default. However, dynamic power management for MICs is not supported on JNP10K-LC2101 because JNP10K-LC2101 is a fixed configuration MPC and supports only built-in PICs.

After you enable the dynamic power management feature, use the **set chassis preserve-fpc-poweron-sequence** configuration mode command to preserve the sequence in which MPCs are powered on. This configuration is required to maintain the order in which the MPCs come online after a router or switch restart.

**NOTE:** In Junos OS Release 15.1F5 and later, dynamic power management is enabled by default on several MPCs. Models include MPC3E-3D-NG, MPC3E-3D-NG-Q, MPC2E-3D-NG, MPC2E-3D-NG-Q, MPC6E, MPC7E-MRATE, and MPC7E-10G on MX240, MX480, MX960, MX2010, and MX2020 and on MPC8E and MPC9E on MX2010, and MX2020 Universal Routing Platforms.

Release History Table

Release	Description
18.2R1	Starting from Junos OS Release 18.2R1, for JNP10K-LC2101 MPC on MX10008 routers, dynamic power management is enabled by default.
17.3R1	Starting from Junos OS Release 17.3R1, for MX10003 routers, mic-aware dynamic power management is enabled by default.
17.2R1	EX9200 switches—Junos OS Release 17.2R1 and later
17.2R1	In Junos OS Release 17.2R1, for EX9200 switches, dynamic power management for MICs is enabled by default.
15.1R1	MX Series routers—Junos OS Release 15.1R1 and later
15.1R1	In Junos OS Release 15.1R1, for MX Series routers, dynamic power management for MICs is disabled by default.
15.1F5	In Junos OS Release 15.1F5 and later, dynamic power management is enabled by default on several MPCs.

## Understanding How Configuring Ambient Temperature Helps Optimize Power Utilization

The key to managing power in network infrastructure is the efficient utilization of provisioned power. Provisioned power is the minimum power that is required to bring a router or a switch online. Junos OS determines the minimum required power by considering the worst-case power requirement for all the FRUs installed in the device. One of the methods to optimize the provisioned power on MX Series routers or EX9200 switches is to configure the device to operate at a cooler temperature. You can enable a device to operate at a lower operating temperature by configuring a lower ambient temperature.

Ambient temperature is the maximum operating temperature for a device. By configuring an ambient temperature, you can optimize power provisioned for the cooling system and the line cards. The maximum speed at which fans operate depends on the configured ambient temperature. As the fan speed increases, the power consumed by the fans increases. As a result, the device consumes more power when the temperature is high

because the fans run faster to maintain the operating temperature of the chassis within the configured limits.

When a router or a switch restarts, the system adjusts the power allocation or the provisioned power for the line cards on the basis of the configured ambient temperature. If enough power is not available, a minor chassis alarm is raised. However, the chassis continues to run with the configured ambient temperature. You can configure a new higher ambient temperature only after you make more power available by adding new power supply modules or by taking a few line cards offline. By using the provisioned power that is saved by configuring a lower ambient temperature, you can bring more hardware components online.

A specific ambient temperature value might not be applicable to a different geographical location, for example, in a colder region. For devices operating in colder regions, you can configure a lower ambient temperature, which helps reduce provisioned power significantly. However, in a region of higher temperature, you might need to configure a higher ambient temperature to ensure smooth functioning of the device. For example, if the router or switch operates in a colder region, you can set the ambient temperature to 25°C, which reduces the maximum fan speed, thereby reducing the maximum power consumption. Thus, by configuring an appropriate ambient temperature, you can reduce the provisioned power and save cost on network power infrastructure.

You can configure ambient temperature by using the **set chassis ambient-temperature (25C|40C|55C)** statement at the **[edit chassis]** hierarchy level. The default ambient temperature for MX Series routers and EX9200 switches is 40°C.

## Monitoring the Power Consumption of PTX5000 FPCs by Configuring the Ambient Temperature

You can configure the ambient temperature of the PTX5000 chassis to manage power allocated to the FPCs. You can set the ambient temperature of the chassis at 25° C, or 40° C. On system initialization, the power manager reads the ambient temperature and allocates power to the FPCs according to the power budget policy at that temperature.

1. To configure the ambient temperature, include the **set chassis ambient-temperature 25|40|55** statement at the **[edit]** hierarchy level in the configuration mode:

```
[edit]
user@host# set chassis ambient-temperature 25|40
```

2. To verify the ambient temperature of the chassis, use the **show chassis ambient-temperature** command at the **[edit]** hierarchy level in the operational mode:

```
[edit]
user@host> show chassis ambient-temperature
```

Ambient Temperature: 25C

To verify the power consumption of the FPCs, use the following statements:

1. Use the **show chassis power detail | grep "FPC"** statement at the **[edit]** hierarchy level to view the power consumption of the FPCs.

```
user@host> show chassis power detail | grep "FPC"
```

```
FPC 0          448
FPC 1          419
FPC 2          373
FPC 3           0
FPC 4           0
FPC 5           0
FPC 6           0
FPC 7           0
```

Alternatively use the SNMP MIB command, **show snmp mib walk jnxOperatingFRUPower | grep "\.7\."** to view the power consumption of each FPC:

```
user@host> show snmp mib walk jnxOperatingFRUPower | grep "\.7\."
```

```
jnxOperatingFRUPower.4.1.7.0 = 0
jnxOperatingFRUPower.7.1.0.0 = 457          < ----- For FPC 0
jnxOperatingFRUPower.7.2.0.0 = 428          < ----- For FPC 1
jnxOperatingFRUPower.7.3.0.0 = 381          < ----- For FPC 2
jnxOperatingFRUPower.15.7.0.0 = 0
```

2. Use the **show chassis alarms** statement to view the alarms generated for any of the FPCs:

```
user@host> show chassis alarms
```

Alarm time	Class	Description
2007-04-08 05:51:12 UTC	Minor	FPC 1, Consumption > 90percent of allocated Budget
2007-04-08 05:51:12 UTC	Minor	FPC 0, Consumption > 90percent of allocated Budget
2007-04-08 05:50:26 UTC	Minor	FPC 0 SIB Link Error
2007-04-08 05:49:34 UTC	Minor	SIB 0 FPC Link Error
2007-04-08 05:48:02 UTC	Minor	No Redundant Power for FPC 0-7
2007-04-08 05:48:01 UTC	Minor	No Redundant Power for Rear Chassis
2007-04-08 05:48:01 UTC	Minor	No Redundant Power for Fan 0-2

If an FPC consumes more than 90% of the allocated power budget, the **Consumption > 90percent of allocated Budget** alarm is raised. FPC power consumption is measured at intervals of 65 seconds.

**NOTE:** Starting in Junos OS Release 18.4R1, the PTX5000 routers do not raise a chassis alarm in the following events:

- Power consumption by an FPC exceeds 90% of the allocated power budget.
- Power consumption by an FPC exceeds 100% of the allocated power budget (in this case, a system log is registered).

**NOTE:** If the PTX5000 chassis has redundant power supply modules, and if one PSM fails, the FPCs can still be online. Only the **No redundant power supply** alarm is raised.

If the PTX5000 chassis does not have redundant power supply modules, failure of one PSM can cause the FPCs to go offline, depending on the total chassis power available at that time.

3. When the power consumption of an FPC is more than the allocated budget for three consecutive intervals, the **Consumption > 90percent of allocated Budget** is cleared and **PWR Range Overshoot** alarms is raised for that particular FPC and the ambient temperature is set to the next higher setting.

```
user@host> show chassis alarms
```

```
9 alarms currently active
Alarm time      Class  Description
2007-04-08 05:56:38 UTC  Minor  FPC 2, Consumption > 90percent of allocated
Budget

2007-04-01 04:36:51 UTC  Minor  No Redundant Power for Fan 0-2
2007-04-01 04:36:47 UTC  Minor  PDU 1 Absent
```

- a. You can verify the temperature by using the **show chassis ambient-temperature** command.

```
user@host> show chassis ambient-temperature
```

```
Ambient Temperature: 25C
```

- b. Enter the configuration mode and check the configured ambient temperature. Use the **show chassis ambient temperature** operational mode command.

```
user@host# show chassis ambient temperature
```

```
Ambient Temperature: 25C
```

This is set to the last configured value.

- c. To clear the temperature set for the overshooting condition, use the **request chassis power-manager reset ambient-config** command.

```
user@host> request chassis power-manager reset ambient-config
```

Verify the ambient temperature after the reset.

```
show chassis ambient-temperature
```

```
Ambient Temperature: 25C
```

4. Verify the active alarms in the chassis by using the **show chassis alarms** command.

```
user@host> show chassis alarms
```

```
7 alarms currently active
```

## Redistributing the Available Power by Configuring Power-On Sequence

Routers running on Junos OS Release 10.0 and later support an enhanced AC Power Entry Module (PEM) to provide the necessary power infrastructure to support up to twelve higher-capacity DPCs with higher port density and slot capacity. To support the cooling requirements for the enhanced AC PEMs, the routers support enhanced fan trays and fans.

The default behavior for MPC power-on sequence is slot number based, that is, slot 0 is brought online first followed by slot 1, slot 2 up to slot 11. For the scenarios, where it is running a mix of high capacity line cards (for core facing), and low capacity line cards

(for access facing) in their system, you can use the [fru-poweron-sequence](#) option to manually set the MPC power on sequence and hence ensure that the more important core facing line cards are brought online first irrespective of which slots these are in. This approach provides fine control over deterministically bringing up MPCs, however, it is heavy on configuration and entails to follow the discipline in slot to MPC mapping across all the systems.

The Junos OS enables you to configure the power-on sequence for the DPCs on an MX Series router chassis containing the new AC PEM. This enables you to redistribute the available power to the DPCs based on your requirements and the calculated power consumption of the DPCs. To configure the power-on sequence, refer to [“Configuring Power-On Sequence to Redistribute the Available Power” on page 109](#).

**Related Documentation**

- [fru-poweron-sequence on page 669](#)

## Configuring Power-On Sequence to Redistribute the Available Power

You can configure the power-on sequence for the Flexible PIC Concentrators (FPCs) on MX, PTX, and T routers. This configuration enables you to redistribute the available power to the FPCs on the basis of your requirements and the calculated power consumption of the FPCs.

To configure the power-on sequence:

1. At the **[edit chassis]** hierarchy level, configure the **fru-poweron-sequence** statement indicating the order in which the FPCs need to be powered on.

```
[edit chassis]
user@host# set fru-poweron-sequence fru-poweron-sequence
```

For example:

```
[edit chassis]
user@host# set fru-poweron-sequence "0 2 1"
```

2. Verify the configuration by using the **show** command at the **[edit chassis]** hierarchy level:

```
[edit chassis]
user@host# run show chassis power sequence
fru-poweron-sequence "0 2 1";
```

---

**NOTE:**

- If the configured sequence contains invalid numbers, Junos OS considers only the valid numbers in the sequence. The invalid numbers are silently discarded.
  - If the power-on sequence is not configured by including the `fru-poweron-sequence` statement, Junos OS uses the ascending order of the slot numbers of the FPCs as the sequence to power on the FPCs.
  - Issue the `show chassis power` command to view power limits and usage details for the FPCs.
-

## Configuring the Six-Input DC Power Supply on T Series Routers

---

By default, the six-input DC power supply is configured to have all the six input feeds connected. You can also choose to provide four or five input feeds to the six-input DC power supply. When providing four or five input feeds on standalone routers, you need to configure the `feeds` statement at the `[edit chassis pem]` hierarchy level. When providing four or five input feeds to an LCC router in a routing matrix, you need to configure the `feeds` statement at the `[edit chassis lcc lcc-number pem]` hierarchy level.

Starting with Junos OS Release 12.3, the power management feature is enabled on T4000 routers with six-input DC power supply. The power management feature is enabled only when six input feeds with 40 amperes (A) each or four input feeds with 60 A each is configured on the router. To do this, you need to configure the `feeds` and `input-current` statements at the `[edit chassis pem]` hierarchy level.

---

**NOTE:**

- Before configuring input feeds for your router, see the *T640 Core Router Hardware Guide*, *T1600 Core Router Hardware Guide*, or *T4000 Core Router Hardware Guide* for special considerations and for the number of input feeds supported by the router.
  - The value assigned to the `feeds` statement must be equal to the number of input feeds provided to the power supply. Else, an alarm message is generated to indicate the mismatch.
-

The following procedures describe how to configure the six-input DC power supply on different routers:

- [Configuring the Six-Input DC Power Supply on an LCC Router in a Routing Matrix on page 111](#)
- [Configuring the Six-Input DC Power Supply on T640 and T1600 Routers on page 111](#)
- [Configuring the Six-Input DC Power Supply on T4000 Routers on page 112](#)

## Configuring the Six-Input DC Power Supply on an LCC Router in a Routing Matrix

To configure the six-input DC power supply on an LCC router in a routing matrix:

1. At the **[edit chassis lcc lcc-number pem]** hierarchy level, configure the **feeds** statement with the number of input feeds provided to the power supply.

```
[edit chassis lcc lcc-number pem]
user@host# set feeds number-of-input-feeds
```

For example:

```
[edit chassis lcc 1 pem]
user@host# set feeds 5
```

**NOTE:** All power supplies in the router must use the same number of inputs feeds.

2. Verify the configuration by using the **show** command at the **[edit chassis]** hierarchy level:

```
[edit chassis lcc 1 pem]
user@host# show
pem {
    feeds 5;
}
```

## Configuring the Six-Input DC Power Supply on T640 and T1600 Routers

To configure the six-input DC power supply on a standalone T640 or T1600 router:

1. At the **[edit chassis pem]** hierarchy level, configure the **feeds** statement with the number of input feeds provided to the power supply.

```
[edit chassis pem]
user@host# set feeds number-of-input-feeds
```

For example:

```
[edit chassis pem]
```

```
user@host# set feeds 5
```

**NOTE:** All power supplies in the router must use the same number of inputs feeds.

2. Verify the configuration by using the **show** command at the **[edit chassis]** hierarchy level:

```
[edit chassis]
user@host# show
pem {
    feeds 5;
}
```

## Configuring the Six-Input DC Power Supply on T4000 Routers

To configure the six-input DC power supply on a T4000 router:

1. At the **[edit chassis pem]** hierarchy level, configure the **feeds** statement with the number of input feeds provided to the power supply.

```
[edit chassis pem]
user@host# set feeds number-of-input-feeds
```

For example:

```
[edit chassis pem]
user@host# set feeds 4
```

**NOTE:** All power supplies in the router must use the same number of inputs feeds.

2. Configure the input current received by the router.

```
[edit chassis pem]
user@host# set input-current amps-in-each-feed
```

For example, if the router receives 60 A of input current:

```
[edit chassis pem]
user@host# set input-current 60
```

**NOTE:** You can connect three 80 A DC power cables to six-input DC power supply by using terminal jumpers. When you do this, ensure that you set the value of the `feeds` statement to 6 and that of the `input-current` statement to 40. If these configurations are not set, the power management feature is *not* enabled. For more information about the power management feature, see [“T4000 Power Management Overview” on page 95](#).

3. Verify the configuration by using the **show** command at the **[edit chassis]** hierarchy level:

```
[edit chassis]
user@host# show
pem {
    feeds 4;
    input-current 60;
}
```

## Understanding Fabric Fault Handling on T4000 Router

---

The T4000 router consists of a Switch Interface Board (SIB) with fabric bandwidth double the capacity of the T1600 router. The fabric fault management functionality is similar to that in T1600 routers. This topic describes the fabric fault handling functionality on T4000 routers.

The fabric fault management functionality involves monitoring all high-speed links connected to the fabric and the ones within the fabric core for link failures and link errors.

Action is taken based on the fault and its location. The actions include:

- Reporting link errors in system log files and sending this information to the Routing Engine.
- Reporting link failures at the Flexible Port Concentrator (FPC) or at the SIB and sending this information to the Routing Engine.
- Marking a SIB in **Check** state.
- Moving a SIB into **Fault** state.

The SIB in T4000 routers forms the core of the fabric with 4:1 redundancy—the redundant SIB becomes active when the active SIB becomes nonfunctional, is deactivated, or is removed. The following are the high-level indications of fabric faults that are monitored by Junos OS:

- An SNMP trap is generated whenever a SIB is reported as **Check** or **Fault**.
- **show chassis alarms**—Indicates that a SIB is in **Check** or **Fault** state.
- **show chassis sibs**—Indicates that a SIB is in **Check** or **Fault** state or that a SIB is in **Offline** state when the SIB initializes (this occurs when the SIB does not power on fully).
- **show chassis fabric fpcs**—Indicates whether any fabric links are in error on the FPCs' side.
- **show chassis fabric sibs**—Indicates whether any fabric links are in error on the SIBs' side.
- The `/var/log/messages` system log messages file at the Routing Engine has error messages with the prefix **CHASSISD\_FM\_ERROR**.
- The SIBs display the **FAIL** LED.

**NOTE:**

The fabric planes in the chassis determine whether the chassis is a T640 router, a T1600 router, or a T4000 router. Power entry modules (PEMs), FPCs, or fan trays do not determine chassis personality. Alarms are raised if the old PEMs or fan trays are present in a T4000 chassis. You can identify a router based on its fabric planes:

- If all planes present are F16-based SIBs, the chassis is a T640 chassis.
- If all planes present are SF-based SIBs, the chassis is a T1600 chassis.
- If all planes present are XF-based SIBs, the chassis is a T4000 chassis.

Note that mixing of fabric planes is not a supported configuration except during upgrade. You can change the personality of a chassis without a reboot by changing all the fabric planes and by issuing the `set chassis fabric upgrade-mode` CLI command to check the personality. If you do not issue the `set chassis fabric upgrade-mode` CLI command, the personality does not change until the next boot.

---

In T4000 routers, you come across the following faults:

- Board-level faults—These faults occur during initialization or during runtime. Power failure during board initialization, high-speed links transmit error, and polled I/O error during runtime are some examples of board-level faults.
- Link-level faults—These faults occur during initialization or during runtime. Link training failure at initialization time (failure of the data plane links between an FPC and a SIB to be trained when the FPC or SIB is initialized), error detected on the channel between the SIB and a Packet Forwarding Engine, cyclic redundancy check (CRC) errors detected at runtime, and Packet Forwarding Engine destination errors are types of link-level faults.
- Faults based on environmental conditions—These faults occur during runtime. Sudden removal of an FPC or a SIB might result in an operator error. When a SIB becomes too hot or when SIB voltages are beyond thresholds, the errors generated are classified into environmental errors.

You can implement one of the following options to handle the faults:

- Log the error and raise an alarm.
- Switch over to the spare plane, if available.
- Continue with a reduced number of parts of a plane.
- Continue with a reduced number of usable planes.
- Use polling-based fault handling.
- Monitor high-speed link errors and manually bring the link down to a suitable threshold.

The polled I/O errors and the link errors are monitored every 500 milliseconds, and the board exhaust temperature and board voltages are monitored every 10 seconds.

## Fabric Fault Handling Overview on PTX5000 Packet Transport Router

Starting with Junos OS Release 14.1, the PTX5000 Packet Transport Router supports nine Switch Interface Boards (SIBs). Each FPC2-PTX-PIA FPC supports 1Tb per slot capacity, thereby resulting in a fabric bandwidth of 16 terabits per second (Tbps), full-duplex (8 Tbps of any-to-any, nonblocking, half-duplex) switching.

The fabric fault management functionality involves monitoring all high-speed links connected to the fabric and the ones within the fabric core for link failures and link errors.

The faults that occur in a PTX5000 can be broadly categorized into:

- Board faults—Faults that arise in a SIB or in an Flexible Port Concentrator (FPC) during initialization or during runtime, including issues that arise when a router component is accessing the SIB or FPC or issues that arise out of midplane failures.
- Link faults—Faults that occur on high-level links in a router during initialization or during runtime.
- Faults due to environmental conditions—Faults that occur because of overvoltage or over-temperature; faults that occur because of an operator mishandling a SIB or an FPC, and so on.

The router takes action on the basis of the fault category and the fault location. The actions include:

- Reporting link errors in system log files and sending this information to the Routing Engine.
- Displaying the link errors when you run one of the operational commands listed in [Table 21 on page 120](#):

**Table 21: List of Operational Mode Commands**

Operational mode command	Description
<code>show chassis sibs</code>	Displays Switch Interface Boards (SIBs) status information.
<code>show chassis fabric fpcs &lt;slot number&gt;</code>	Displays the fabric state of the specified FPC slot. If no slot number is provided, it displays the status of all FPCs.
<code>show chassis fabric sibs &lt;slot number&gt;</code>	Displays the state of the electrical switch fabric link between the SIBs and the FPCs.
<code>show chassis fabric reachability &lt;detail&gt;</code>	Displays the current state of fabric destination reachability.
<code>show chassis fabric unreachable-destinations</code>	Displays the list of destinations that have transitioned from a reachable state to an unreachable state.
<code>show pfe statistics error</code>	Displays Packet Forwarding Engine error statistics.
<code>show chassis fabric topology &lt;sib_slot&gt;</code>	Displays the input-output link topology.
<code>show chassis fabric summary</code>	Displays the state of all fabric planes and the elapsed uptime.

- Reporting link failures at the FPC level or at the SIB level and sending this information to the Routing Engine.
- Reporting link error information in the **show chassis alarms** operational command.
- Moving a SIB into *fault* state.

The following sections explain fabric fault handling functionality on the PTX5000:

- [SIB-Level Faults on page 121](#)
- [FPC-Level Faults on page 122](#)

## SIB-Level Faults

The following sections give a brief overview on the types of faults that occur on a SIB and how to handle them:

- [Types of Faults That Occur on a SIB on page 121](#)
- [Handling SIB-Level Faults on page 122](#)

### Types of Faults That Occur on a SIB

Board faults and link faults occur on a SIB during initialization and during runtime. Some faults occur because of environmental conditions such as overvoltage or over-temperature, or when an operator mishandles the SIB.

**NOTE:** Run the operational mode commands listed in [Table 21 on page 120](#) to detect faults.

During SIB initialization and runtime, the following faults might occur:

- Board faults, such as failure of SIBs to power up, ASICs reset failure, Switch Processor Mezzanine Board (SPMB) polled I/O access failure to ASICs, board component failures such as PIC failures, or router component access failures.
- Link faults such as high-level link errors that occur during link training.
- Faults that occur because of environmental conditions or because of mishandling of the SIB by the operator.

### Handling SIB-Level Faults

---

The following list illustrates how the router handles a fault that occurs on a SIB during initialization, during runtime, because of environmental conditions, and because of mishandling of the SIB by the operator:

- To handle a board fault on a SIB during initialization, the chassis daemon (chassisd) marks the SIB to be in *fault* state. After the SIB is marked as faulty, no operation occurs on this SIB.
- To handle a board fault on a SIB during runtime, chassisd logs an error in the system log file, raises an alarm indication error type, and marks the SIB as faulty. After the SIB is marked as faulty, no operation occurs on this SIB.
- To handle a link fault on a SIB during runtime, when a link error comes up during link training, chassisd informs the FPC corresponding to the link on which the error occurred to disable the links to the affected SIB. The chassisd then sends an error message to all the other FPCs in the router to stop using the failed SIB link and a link error alarm is generated. Note that when more than one FPC report errors for a given SIB, the SIB is disabled for all FPCs and no traffic is sent by the Packet Forwarding Engine through the affected SIB.
- To handle a link fault on a SIB during runtime, chassisd marks the SIB as faulty and specifies a reason for the error, and the SIB is disabled.
- In case of an environmental fault—overvoltage or over-temperature—the SIB is immediately taken offline. Note that an error is logged periodically as the temperature or voltage rises, and the SIB is taken offline when it crosses a certain threshold voltage or temperature.
- When a SIB is abruptly removed or dislodged, all the affected Packet Forwarding Engines stop using that plane to reach other Packet Forwarding Engines in the router.

### FPC-Level Faults

The following sections give a brief overview of the types of faults that occur on an FPC and how to handle them:

- [Types of Faults That Occur on an FPC on page 122](#)
- [Handling FPC-Level Faults on page 123](#)

#### Types of Faults That Occur on an FPC

---

Board faults and link faults occur on an FPC during initialization and during runtime. Some faults also occur because of environmental conditions such as overvoltage, over-temperature, or when the operator mishandles the FPC.

**NOTE:** Run the operational commands listed in [Table 21 on page 120](#) to detect faults.

---

During FPC initialization and runtime, the following faults might occur:

- Board faults such as failure of FPCs to power up, failure of ASICs to come out of reset phase, PMB polled I/O access failure to ASICs, board component failures such as PIC failure, or router component access failures.
- Link faults such as high-level link errors that occur during link training.
- Faults that occur because of environmental conditions or because of mishandling of an FPC by the operator.

Handling FPC-Level Faults

The following list illustrates how the router handles a fault that occurs on an FPC during initialization, during runtime, because of environmental conditions, and because of mishandling of the FPC by the operator:

- To handle a board fault on an FPC during initialization, chassisd marks the FPC to be in *fault* state. After the SIB is marked as faulty, no operation occurs on this FPC.
- To handle a board fault on an FPC during runtime, chassisd logs an error in the system log file, raises an alarm indication error type, and marks the FPC as faulty. After the FPC is marked as faulty, no operation occurs on this FPC.
- To handle onboard link errors on an FPC during initialization or during runtime, the FPC is taken down and all the affected Packet Forwarding Engines stop using that plane to reach other Packet Forwarding Engines in the router.

**NOTE:** No planes are taken down during initialization because the link training process for the fabric is not yet complete.

Onboard link errors during runtime are resolved on the basis of current configuration; either the FPC is rebooted or the error is logged and the FPC continues with initialization.

- In case of an environmental fault—over voltage or over-temperature—the FPC is immediately taken offline. Note that an error is logged periodically as the temperature or voltage rises, and the FPC is taken offline when it crosses a certain threshold voltage or temperature.
- When an FPC is abruptly removed or dislodged, all the other Packet Forwarding Engines stop sending traffic to the Packet Forwarding Engines in this FPC.

Release History Table

Release	Description
14.1	Starting with Junos OS Release 14.1, the PTX5000 Packet Transport Router supports nine Switch Interface Boards (SIBs).

## Fabric Plane Management on AS MLC Modular Carrier Card Overview

The Application Services Modular Line Card (AS MLC) provides high application throughput and storage space, and is designed to run services on the MX240, MX480, and MX960 routers. The AS MLC consists of the following components:

- Application Services Modular Carrier Card (AS MCC)
- Application Services Modular Processing Card (AS MXC)
- Application Services Modular Storage Card (AS MSC)

The AS MCC plugs into the chassis and provides the fabric interface.

An MX960 router can support three Switch Control Boards (SCBs) or six fabric planes. The AS MCC supports six fabric planes. An MX240 or MX480 router can support up to two SCBs or two fabric planes. The AS MCC at any time can provide connectivity to only six of the eight fabric planes. Fabric planes 1 and 5, and 3 and 7 use shared physical links. So between fabric planes 1 and 5 only one plane can be active. Similarly between fabric planes 3 and 7, only one plane can be active.

This behavior impacts the output of fabric-related monitoring commands on MX240 and MX480 routers with AS MCCs.

The **show chassis fpc pic-status** command displays the output for an MX480 router with an AS MCC:

```
user@host>show chassis fpc pic-status
Slot 2   Online      MPC Type 1 3D Q
Slot 1   Online      AS-MCC
PIC 0    Online      AS-MS
PIC 2    Online      AS-MXC
Slot 4    Offline     MPC 3D 16x 10GE
Slot 5    Offline     AS-MCC
```

In the **show chassis fpc pic-status** command output, **Slot 1 and 5** are AS MCC, **PIC 0** is the AS MSC, and **PIC 2** is the AS MXC.

The **show chassis fabric fpcs** command displays the output on an MX480 router with an AS MCC.

## Fabric Plane Management on MPC4E Overview

MPC4E is a fixed-configuration MPC that provides scalability in bandwidth and services capability of routers. MPC4E is supported on MX240, MX480, MX960, MX2010 and MX2020 routers. The MPC4E plugs into the chassis and provides the fabric interface.

By default, MX240 and MX480 routers with MPC4E support four active fabric planes each. However, this default fabric redundancy mode, also known as redundant fabric mode, makes the MPC run in reduced bandwidth state. In increased bandwidth mode, the MX240 and MX480 routers with MPC4E support six active fabric planes each. You can increase the number of active fabric planes by changing the mode from redundant fabric mode to increased bandwidth mode. To configure the MPC4E to function in increased bandwidth mode, use the existing **redundancy-mode increased-bandwidth** statement at the **[edit chassis fabric]** hierarchy level.

If you do not configure the fabric redundancy mode, MPC4E functions in redundant fabric mode. To configure the redundant fabric mode, use the existing **redundancy-mode redundant** statement at the **[edit chassis fabric]** hierarchy level.

An MX960 router can support three Enhanced MX Switch Control Boards (SCBEs) or six fabric planes. MX240 and MX480 routers can support up to two SCBEs or four fabric planes each. MX2020 routers can support eight Switch Fabric Boards (SFBs) or 24 fabric planes.

At any given time, on MX240 and MX480 routers, MPC4E can provide connectivity to only six of the eight fabric planes. Fabric planes 1 and 5 and fabric planes 3 and 7 use shared physical links. So, among fabric planes 1 and 5, only one plane can be active. Similarly, among fabric planes 3 and 7, only one plane can be active.

On MX240 and MX480 routers with MPC4E, if the fabric redundancy mode is not configured, then fabric planes 0, 1, 2, and 3 are online and active and fabric planes 4, 5, 6, and 7 are spare. If you configure the increased bandwidth mode, then the fabric planes 0, 1, 2, 3, 4, and 6 are active and fabric planes 5 and 7 are spare.

On MX960 routers with MPC4E, if you configure increased bandwidth mode, then fabric planes 0, 1, 2, 3, 4, and 5 are online. When MPC4E is plugged into an MX960 router, it does not have any fabric redundancy.

MX2020 routers with MPC4E do not support the existing **redundancy-mode** statement. Of the 24 fabric planes, all 24 planes are active.

## Fabric Plane Management on JNP10K-LC2101 Overview

JNP10K-LC2101 is a fixed-configuration MPC that provides increased port density and performance to MX10008 routers. JNP10K-LC2101 plugs into the chassis and provides the fabric interface.

An MX10008 router has six Switch Fabric Boards (SFBs). JNP10K-LC2101 has six Packet Forwarding Engines, each having 24 connections to the fabric (24 planes, or 4 connections per SFB). MX10008 routers with JNP10K-LC2101 will have 24 planes active when all the six SFBs are populated. However, in case of a failure of one SFB, the line rate can be achieved with 20 planes. The fabric supports a link speed of 25 Gbps.

The MX10008 SFB also supports fabric hardening. Fabric hardening is the process of controlling bandwidth degradation to prevent traffic black hole. The following key CLI commands are available for fabric hardening:

- **set chassis fpc slot-number fabric bandwidth-degradation percentage**—Configures the FPC to take a specific action once bandwidth degradation reaches a certain percentage to avoid causing a traffic black hole in the chassis.
- **set chassis fabric degraded detection-enable**—Enables detection of an FPC with degraded fabric.
- **set chassis fabric degraded action-fpc-restart-disable**—Disables line card restarts to limit recovery actions from a degraded fabric condition.

In MX10008 SFBs, fabric fault handling is supported per plane. Fabric fault handling per plane results in increased granularity, which helps identify, isolate, and repair faults. If an SFB has a single faulty plane, the other three planes can continue to operate. There is no need to take the entire SFB offline. For example, if a plane encounters a training failure error, the line card isolates that faulty plane; while the other planes continue to operate. Also, any cyclic redundancy check (CRC) errors on any link on the SFB are indicated on the plane, not on SFB.

## Example: Configuring Fabric Redundancy Mode on MPC4E

- [Requirements for Configuration of the Fabric Redundancy Mode on MPC4E on page 129](#)
- [Overview on page 129](#)
- [Configuring Increased Bandwidth Mode on page 129](#)
- [Verification on page 130](#)

### Requirements for Configuration of the Fabric Redundancy Mode on MPC4E

This example uses the following hardware and software components:

- Junos OS Release 12.3 R2 or later for MX Series routers
- A single MX480 router with MPC4E

### Overview

This example provides information about configuring the fabric redundancy mode on an MX480 router with MPC4E. You can configure the MPC4E to function in redundant fabric mode or increased bandwidth mode. If you do not configure the mode, the MPC4E, by default, functions in redundant fabric mode. In redundant fabric mode, the number of active fabric planes is 4. If you configure the MPC4E to function in increased bandwidth mode, the number of active fabric planes increases to 6.

### Configuring Increased Bandwidth Mode

#### Step-by-Step Procedure

In this example, you configure increased bandwidth mode on an MX480 router with MPC4E. The existing fabric mode on the MX480 router is redundant fabric mode. To configure the fabric mode, perform the following tasks:

1. Verify the existing fabric mode of the router by using the **show chassis fabric mode** command.

```
user@host > show chassis fabric mode
Fabric Operating Mode :
    Redundant Fabric
```

2. View the number of active fabric planes by using the **show chassis fabric summary** command.

```
user@host > show chassis fabric summary
Plane  State      Uptime
0      Online    2 hours, 58 minutes, 22 seconds
1      Online    6 seconds
2      Online    32 seconds
3      Online    2 hours, 58 minutes, 23 seconds
```

4	Spare	31 seconds
5	Spare	21 seconds
6	Spare	18 seconds
7	Spare	9 seconds

**Note:**

For FPC slots with MPC Type 4 or MCC:

Fabric planes 1 and 5, 3 and 7 use shared physical links.  
Those slots may run in a reduced bandwidth in case both  
plane 1 and 5, or both 3 and 7 are active.

3. In configuration mode, go to the **[edit chassis]** hierarchy level and set the fabric mode to **increased-bandwidth** as follows:

```
[edit chassis]
user@host #set fabric redundancy-mode increased-bandwidth
```

**Results** In **redundant fabric** mode, the number of active fabric planes is 4 while the number of spare planes is also 4. In **increased-bandwidth** mode, the number of active planes is 6 while the number of spare planes is 2.

**NOTE:** Fabric planes 1 and 5 and fabric planes 3 and 7 use shared physical links. So, among fabric planes 1 and 5, only one plane can be active. Similarly, among fabric planes 3 and 7, only one plane can be active.

## Verification

To verify that the fabric mode of the MX480 router with MPC4E, perform the following tasks:

- [Verifying the Fabric Redundancy Mode of the Router on page 130](#)
- [Verifying the Number of Active Fabric Planes on page 131](#)

### Verifying the Fabric Redundancy Mode of the Router

**Purpose** To verify that the fabric redundancy mode of the MX480 router with MPC4E has been modified to **increased-bandwidth**.

**Action** To view the fabric mode of the router, use the **show chassis fabric mode** command.

```
user@host > show chassis fabric mode
Fabric redundancy mode: Increased Bandwidth
```

**Meaning** The MX480 router with MPC4E is functioning in increased bandwidth mode.

### Verifying the Number of Active Fabric Planes

**Purpose** To verify that the number of active fabric planes is 6.

**Action** To view the number of active fabric planes, use the **show chassis fabric summary** command.

```
user@host > show chassis fabric summary
```

Plane	State	Uptime
0	Online	2 hours, 55 minutes, 49 seconds
1	Online	2 hours, 55 minutes, 25 seconds
2	Online	2 hours, 58 minutes, 48 seconds
3	Online	2 hours, 55 minutes, 50 seconds
4	Online	2 hours, 55 minutes, 48 seconds
5	Spare	2 hours, 55 minutes, 40 seconds
6	Online	2 hours, 55 minutes, 37 seconds
7	Spare	2 hours, 55 minutes, 29 seconds

Note:

For FPC slots with MPC Type 4 or MCC:

Fabric planes 1 and 5, 3 and 7 use shared physical links.

Those slots may run in a reduced bandwidth in case both plane 1 and 5, or both 3 and 7 are active.

**Meaning** Number of active planes on the MX480 router with MPC4E is 6 (0, 1, 2, 3, 4, and 6) while the number of spare planes is 2.

### Signaling Neighboring Routers of Fabric Down on T640 and T1600 Routers

In JUNOS OS Release 10.4 and later, T640 and T1600 routers signal neighboring routers if they are unable to carry traffic due to all fabric planes being taken offline for one of the following reasons:

- CLI or button press initiated offline state.
- Automatically taken offline by the SPMB due to high temperature.
- PIO errors or voltage errors detected by the SPMB CPU to the SIBs.

The following scenarios are not supported:

- All PFEs get destination errors on all planes to all destinations, even with the Switch Interface Boards (SIBs) staying online.
- Complete fabric loss caused by destination timeouts, with the SIBs still online.

When chassisd detects all fabric planes are down, the router reboots all the FPCs in the system. When the FPCs come back up, the interfaces will not be created again, since all the fabric planes are down.

Once the user diagnoses and fixes the cause of all fabric planes going down, the user must then online the SIBs. The SIB online process brings up the interfaces.

Fabric down signaling to neighboring routers offers the following benefits:

- FPCs reboot when the control plane connection to the RE times out.
- Extends a simple approach to reboot FPCs when the dataplane blacks out.

When the router transitions from a state where SIBs are online or spare to a state where there are no SIBs in online state, then all the FPCs in the system are rebooted.

An ERRMSG indicates if all fabric planes are down and the FPCs will be rebooted if any fabric planes do not come up in 2 minutes.

An ERRMSG indicates the reason for FPC reboot on fabric connectivity loss.

The chassisd daemon traces when an FPC comes online, but PIC attach is not done due to no fabric plane present.

A warning is issued in the CLI when the last fabric plane is taken offline, that FPCs will reboot. You will need to online the SIBs after fixing the cause of the SIBs not being online. When the first SIB goes online, and link training with the FPCs completes, the interfaces will be created.

Fabric down signaling to neighboring routers functionality is available by default, and no user configuration required to enable it.

No CLI commands or alarms are required for this feature. Alarms indicate an SIBs offline system state to the user.

## Fabric Resiliency and Degradation

---

Juniper routers and switches have built in resiliency to tackle failures and error conditions encountered during normal operation. Immediate action is taken by JUNOS software to remedy the failure conditions to minimize traffic loss. No manual intervention is needed.

Fabric degradation could be one of the reasons leading to such error conditions. The following sections explain how the PFEs recover in a resilient manner from these failures.

- [Packet Forwarding Engine Errors and Recovery on PTX Series Routers on page 133](#)
- [Packet Forwarding Engine Errors and Recovery on T640, T1600 or TX Matrix Routers on page 133](#)

## Packet Forwarding Engine Errors and Recovery on PTX Series Routers

Packet Forwarding Engine destinations can become unreachable on PTX Series routers for the following reasons:

- The fabric Switch Interface Boards (SIBs) are offline as a result of a CLI command or a pressed physical button.
- The fabric SIBs are turned offline by the control board because of high temperature conditions.
- Voltage or polled I/O errors in the SIBs are detected by the control board.
- Unexpected link-training errors occur on all connected planes.
- Two Packet Forwarding Engines can reach the fabric but not each other.
- Link errors occur where two Packet Forwarding Engines have connectivity with the fabric but not through a common plane.

Starting with Junos OS Release 13.3, you can use PTX Series routers to configure Packet Forwarding Engine (PFE)-related error levels and the actions to perform when a specified threshold is reached.

If error levels are not defined, a PTX Series router begins the following phases in the recovery process:

1. SIB restart phase: The router attempts to resolve the issue by restarting the SIBs one by one. This phase does not start if the SIBs are functioning properly and a single line card is facing an issue.
2. SIB and line card restart phase: The router restarts both the SIBs and the line card. If there are line cards that are unable to initiate high-speed links to the fabric after reboot, it is not relevant to loss of live traffic as no interfaces are created for these line cards, preventing the system from issues.
3. Line Card offline phase: Because previous attempts at recovery failed, line cards and interfaces are turned off and the system avoids issues and error conditions.

## Packet Forwarding Engine Errors and Recovery on T640, T1600 or TX Matrix Routers

Packet Forwarding Engine destinations can become unreachable on T640, T1600 or TX Matrix routers for the following reasons:

- The fabric Switch Interface Boards (SIBs) are offline as a result of a CLI command or a pressed physical button.
- The fabric SIBs are turned offline by the Switch Processor Mezzanine Board (SPMB) because of high temperature conditions.
- Voltage or polled I/O errors in the SIBs are detected by the SPMB.
- All Packet Forwarding Engines receive destination errors on all planes from remote Packet Forwarding Engines, even when the SIBs are online.
- Complete fabric loss is caused by destination timeouts, even when the SIBs are online.

The recovery process consists of the following phases:

1. The router restarts the fabric planes one by one. This phase does not start if the fabric plane is functioning properly and a single line card has issues.
2. Fabric plane and Line Card restart phase: The router restarts both the SIBs and the line cards. If there are line cards that are unable to initiate high-speed links to the fabric after reboot, it is not relevant to loss of live traffic as no interfaces are created for these line cards, preventing the system from issues.
3. Line card offline phase: Because previous attempts at recovery failed, line cards and interfaces are turned off and the system avoids issues and error conditions leading to serious consequences.

**NOTE:** Starting in Junos OS Release 14.2R6, if a SIB becomes offline because of extreme conditions such as high voltage or high temperature, then as part of the recovery process, the router does not restart the fabric plane for that SIB.

---

The phased recovery mechanism mentioned above is exhaustive unless there are other errors which could be correlated to these issues.

Starting in Junos OS Release 14.2R6, you can manage fabric degradation in single-chassis systems better by incorporating fabric self-ping and Packet Forwarding Engine liveness mechanisms. Fabric self-ping is a mechanism to detect issues in the fabric data path. Using the fabric self-ping mechanism, every Packet Forwarding Engine ascertains that a packet destined to itself is reaching it when the packet is sent over the fabric path. Packet Forwarding Engine liveness is a mechanism to detect whether a Packet Forwarding Engine is reachable on the fabric plane. To verify that it is reachable, the Packet Forwarding Engine sends a self-destined packet over the fabric plane periodically. If any error is detected by these two mechanisms, the fabric manager raises a *fabric degraded alarm* and initiates recovery by restarting the line card.

Release History Table

Release	Description
14.2R6	Starting in Junos OS Release 14.2R6, if a SIB becomes offline because of extreme conditions such as high voltage or high temperature, then as part of the recovery process, the router does not restart the fabric plane for that SIB.
14.2R6	Starting in Junos OS Release 14.2R6, you can manage fabric degradation in single-chassis systems better by incorporating fabric self-ping and Packet Forwarding Engine liveness mechanisms.
13.3	Starting with Junos OS Release 13.3, you can use PTX Series routers to configure Packet Forwarding Engine (PFE)-related error levels and the actions to perform when a specified threshold is reached.

## Detection and Recovery of Fabric-Related Failures Caused by Loss of Connectivity on MX Series Routers

Connectivity loss in a router occurs when the router is unable to transmit data packets to other neighboring routers, although the interfaces on that router continue to be in the active state. As a result, the other neighboring routers continue to forward traffic to the impacted router, which drops the arriving packets without sending a notification to the other routers.

When a Packet Forwarding Engine in a router is unable to send traffic to other Packet Forwarding Engines over the data plane within the same router, the router is unable to transmit any packets to a neighboring router, although the interfaces are advertised as active on the control plane. Fabric failure can be one of the reasons for the loss of connectivity.

The following fabric failure scenarios can occur:

- Removal of the control board
- High-speed link 2 (HSL2) training failures
- Single link failure on a line card
- Multiple link failures on the same line card or the same fabric plane
- Multiple link failures randomly on a line card or a fabric plane
- Intermittent cyclic redundancy check (CRC) errors
- A complete loss of connectivity for only one destination and not to other destinations

When a line card does not forward traffic due to a certain reason to other line cards within the device, the control protocol on the Routing Engine is unable to detect this condition. The traffic transmission is not diverted to the functional, active line cards and, instead, the packets are continued to be sent to the affected line card and are dropped at that point. The following might be the causes for a line card being unable to forward traffic:

- All the planes in the system are in the **Offline** or **Fault** state.
- All the Packet Forwarding Engines on the line card might have disabled the fabric streams due to destination errors.

If all the Switch Control Boards (SCBs) lose connectivity to the line cards, then all the interfaces are brought down. If a Packet Forwarding Engine of a line card loses complete connectivity to or from the fabric, then that line card is brought down.

System hardware failures can be of the following types:

- A single occurrence or a rare failure for a brief period (such as environmental spikes). This failure is effectively healed without manual intervention by restarting the fabric plane and restarting the line cards and the fabric plane, if necessary.
- Repeated failures that occur frequently.
- A permanent failure.

A recovery from any case of reduced throughput, such as multiple Packet Forwarding Engine destination timeouts on multiple planes is not attempted. Restoration of connectivity is attempted only when all the planes are in the **Offline** or **Fault** state or when the destinations are unreachable on all active planes.

If connectivity loss occurs because of a certain line card, which is either a common source or common destination of the destination timeout, and if you have configured the **action-fpc-restart-disable** statement at the **[edit chassis fabric degraded]** hierarchy level, no recovery action is taken. The **show chassis fabric reachability** command output can be used to verify the status of the fabric and the line card. An alarm is triggered to indicate that the particular line card is causing the connectivity loss.

## Fabric-Failure Detection Methods on MX Series Routers

The chassis daemon (chassisd) process detects the removal of a control board. The removal of the control board causes all the active planes that reside on that board to be disabled and a switchover is performed. If the active Routing Engine is also unplugged along with the control board, the detection of the control board removal is delayed until the switchover of the Routing Engine occurs and the reconnection in the primary, backup Routing Engine pair occurs. If the control board is turned offline by specifying the **request chassis cb slot slot-number offline** or a pressed physical button to cause a graceful shutdown, a fabric failure does not occur, even if the control board is moved to the offline state.

If active fabric planes are removed because of removal of the control board on the master RE, the line card takes the local action of disabling removed planes. If spare planes are available, line card initiates switchover to spare planes. If an active control board on a backup RE is removed, the master RE performs the switchover. The software attempts

to optimize the duration of connectivity loss by disabling all removed planes. The spare planes are transitioned to the online state one by one.

Fabric self-ping is a mechanism to detect any issues in the fabric data path. Each Packet Forwarding Engine forwards fabric data cells that are destined to itself over all active fabric planes. To transmit the data cell, the Packet Forwarding Engine fabric sends the request cells over an active plane and waits for a grant packet. The destination Packet Forwarding Engine sends a grant packet over the same plane on which the request cell is received. When the grant cell is received, the source Packet Forwarding Engine sends the data cell.

The Packet Forwarding Engine fabric contains the capability to detect grant delays. If grants are not received within a certain period of time, a destination timeout is declared. Destination timeout on a certain plane by a Packet Forwarding Engine on two or more line cards is considered as an indication for plane failures. Even if one Packet Forwarding Engine on a line card flashes an error, the line card is considered to be in error. Destination timeouts are noticed when the Packet Forwarding Engine sends traffic actively because requests are sent only for valid data cells. The software takes an appropriate action based on the destination timeout. For self-ping, a data cell is destined to the source Packet Forwarding Engine only.

Fabric ping failure messages are sent to the fabric manager on the Routing Engine, which collates all of the errors reported by all the line cards and takes a corrective action. For example, a ping failure for all links of the same line card might indicate a problem on the line card. Ping failure for multiple line cards for the same fabric plane might indicate a problem with the fabric.

If the Routing Engine determines that a fabric plane is down, based on the information on errors it receives from the line cards or the Packet Forwarding Engines, over a period of 5 seconds, it indicates a fabric failure. The duration of 5 seconds is the period for which the Routing Engine collates the errors from all of the line cards.

Fabric self-ping packets are periodically sent to check the sanity of the fabric links. Self pings are sent at interval of 500 ms. The destination timeout is also checked in intervals of 500 ms. If two timeouts occur successively, self ping failure is detected. When a destination timeout is received, the Packet Forwarding Engine fabric stops the sending of packets to the fabric. To examine the link condition again, the software resets the credits to ensure that new requests are sent again. When a self-ping failure occurs, the line card removes the affected plane from sending data to all destinations. This method ensures that self-ping is not attempted to be sent again on the defective plane.

The following guidelines apply to the self-ping capability:

- By default, self pings are not sent on spare fabric planes because spare planes do not carry traffic.
- The size of self-ping packets is large enough to enable the cells to be loaded over all the active fabric planes (maximum of 8 for MX Series routers).
- A detection of received self-ping packets is not performed.
- High priority queue is used to enable self-ping to be sent for oversubscription cases.

## MX Series Routers Fabric Resiliency

MX routers provide intelligent mechanisms to reduce packet loss in hardware failures scenarios.

This topic contains the following sections that describe fabric resiliency options, failure detection methods used, and corrective actions:

- [Fabric Connectivity Restoration on page 138](#)
- [Line Cards with Degraded Fabric on page 139](#)
- [Connectivity Loss Towards a Single Destination Only on page 139](#)
- [Redundancy Fabric Mode on Active Control Boards on page 140](#)

### Fabric Connectivity Restoration

Packet Forwarding Engine destinations can become unreachable for the following reasons:

- The control boards go offline as a result of a CLI command or a pressed physical button.
- The fabric control boards are turned offline because of high temperature.
- Voltage or polled I/O errors in the fabric.
- All Packet Forwarding Engines receive destination errors on all planes from remote Packet Forwarding Engines, even when the fabrics are online.
- Complete fabric loss caused by destination timeouts, even when the fabrics are online.

When the system detects any unreachable Packet Forwarding Engine destinations, fabric connectivity restoration is attempted. If restoration fails, the system turns off the interfaces to trigger local protection action or traffic re-route on the adjacent routers.

The recovery process consists of the following phases:

1. **Fabric plane restart phase:** Restoration is attempted by restarting the fabric planes one by one. This phase does not start if the fabric plane is functioning properly and an error is reported by one line card only. An error message is generated to specify that a connectivity loss is the reason for the fabric plane being turned offline. This phase is performed for fabric plane errors only.

2. Fabric plane and line card restart phase: The system waits for the first phase to be completed before examining the system state again. If the connectivity is not restored after the first phase is performed or if the problem occurs again within a duration of 10 minutes, connectivity restoration is attempted by restarting both the fabric planes and the line cards. If you configure the **action-fpc-restart-disable** statement at the **[edit chassis fabric degraded]** hierarchy level to disable restart of the line cards when a recovery is attempted, an alarm is triggered to indicate that connectivity loss has occurred. In this second phase, three steps are taken:
  1. All the line cards that have destination errors on a PFE are turned offline.
  2. The fabric planes are turned offline and brought back online, one by one, starting with the spare plane.
  3. The line cards that were turned offline are brought back online.
3. Line card offline phase: The system waits for the second phase to be completed before examining the system state again. Connectivity loss is limited by turning the line cards offline and by turning off interfaces because previous attempts at recovery have failed. If the problem is not resolved by restarting the line cards or if the problem recurs within 10 minutes after restarting the line cards, this phase is performed.

The three phases are controlled by timers. During these phases, if an event (such as offlining/onlining line cards or fabric planes) times out, then the phase skips that event and proceeds to the next event. The timer control has a timeout value of 10 minutes. If the first fabric error occurs in a system with two or more line cards, the fabric planes are restarted. If another fabric error occurs within the next 10 minutes, the fabric planes and line cards are restarted. However, if the second fabric error occurs outside of the timeout period of 10 minutes, then the first phase is performed, which is the restart of only the fabric planes.

In cases where all the destination timeouts are traced to a certain line card, for example, one source line card or one destination line card, only that line card is turned offline and online. The fabric planes are not turned offline and online. If another fabric fault occurs within the period of 10 minutes, the line card is turned offline.

By default, the system limits connectivity loss time by detecting severely degraded fabric. No user interaction is necessary.

## Line Cards with Degraded Fabric

You can configure a line card with degraded fabric to be moved to the offline state. On an MX960, MX480, or MX240 router, you can configure link errors or bad fabric planes. This configuration is particularly useful in partial connectivity loss scenarios where bringing the line card offline results in faster re-routing. To configure this option on a line card, use the **offline-on-fabric-bandwidth-reduction** statement at the **[edit chassis fpc slot-number]** hierarchy level. For more information, see [“Detection and Corrective Actions of Line Cards with Degraded Fabric on MX Series Routers” on page 140](#).

## Connectivity Loss Towards a Single Destination Only

In certain deployments, a line card indicates a complete connectivity loss towards a single destination only, but it functions properly for other destinations. Such cases are

identified and the affected line card is recovered. Consider a sample scenario in which the active planes are 0,1,2,3 and the spare planes are 4,5,6,7 in the connection between line card 0 and line card 1. If line card 0 has single link failures for planes 0 and 1 and if line card 1 has single link failures for planes 2 and 3, a complete connectivity loss occurs between the two line cards. Both line card 0 and line card 1 undergo a phased mode of recovery and fabric healing takes place.

## Redundancy Fabric Mode on Active Control Boards

You can configure the active control board to be in redundancy mode or in increased fabric bandwidth mode. To configure redundancy mode for the active control board, use the **redundancy-mode redundant** statement at the **[edit chassis fabric]** hierarchy level. In redundancy mode, all the line cards use 4 fabric planes as active planes, regardless of the type of the line card. You can enable increased fabric bandwidth of active control boards for optimal and efficient performance and traffic handling. On an MX960, MX480, or MX240 router, you can use the **redundancy-mode increased-bandwidth** statement at the **[edit chassis fabric]** hierarchy level to enable increased fabric bandwidth mode for the active control board to cause all the available fabric planes to be used. In this mode, the maximum number of available fabric planes are used for MX routers and the MPC3E. On MX960 routers with active control boards, 6 active planes are used, and on MX240 and MX480 routers with active control boards, 8 active planes are used.

Increased fabric bandwidth mode is enabled by default on MX routers with Switch Control Board (SCB). On MX routers with Enhanced SCB—SCBE—and the MPC3E, redundancy mode is enabled by default. For more information, see [“Configuring Redundancy Fabric Mode for Active Control Boards on MX Series Routers” on page 145](#).

## Detection and Corrective Actions of Line Cards with Degraded Fabric on MX Series Routers

---

You can configure a line card with degraded fabric to be moved to the offline state on an MX960, MX480, or MX240 router. Configuring this feature does not affect the system. You can configure this feature without restarting the line card or restarting the system.

The following scenarios can occur when you configure the feature to disable line cards with degraded fabric:

- If a line card has degraded fabric bandwidth and if you configure this capability to turn off such a line card after it has been operating with degraded fabric for some time, the corrective action is still taken.
- If a line card has been brought offline because of fabric errors and this functionality to move the line card to offline state is disabled, the line card is transitioned to the online state automatically.
- If a line card has been brought offline because of fabric errors and this functionality to move the line card to offline state is disabled or configured for some other line card, the line card that was turned offline is transitioned to the online state automatically.
- All the line cards that were brought offline because of degraded fabric, when you configured this setting, are brought back online when you commit any configuration under the **[edit chassis]** hierarchy level. Similarly, a restart of the chassis daemon or the Graceful Routing Engine switchover (GRES) operation also causes the line card that is disabled because of degraded fabric to be moved to the online state.

Degraded fabric indicates that a line card is operating with less than the required number of active fabric planes. If an line card is operating with less than four planes, it is considered to be degraded. This rule applies to all types of line cards and fabric. Degraded condition denotes that good fabric traffic exists at a reduced bandwidth.

The following conditions can result in degradation of fabric:

- The fabric control boards go offline as a result of an unintentional, abrupt power shutdown.
- An application-specific integrated circuit (ASIC) error, which causes a plane of a control board to be automatically turned offline.
- Manually bringing the fabric plane or the control board to the offline state.
- Removal of the control board
- Self-ping failure on any plane.
- HSL2 training failure for active plane.
- If a spare fabric plane has CRC errors, and this spare plane is made online, the link with the CRC error is disabled. This mechanism might cause a degradation in fabric in one direction and might cause a traffic black hole in the other direction.
- When a self-ping or HSL2 training failure occurs, the fabric plane is disabled for a particular line card and it is online for other line cards. This condition can also cause a traffic black hole.

If you need to remove the control board or move a fabric plane to the offline state during a system maintenance, you must enable the functionality to turn the line cards with degraded bandwidth to the offline state (by using the **offline-on-fabric-bandwidth-reduction** statement at the **[edit chassis fpc slot-number]** hierarchy level).

The following corrective actions are performed when a traffic black hole or fabric degradation occurs:

- Regardless of whether a spare control board is available or not, self-ping state for each line card is monitored at intervals of 5 seconds at the Routing Engine. Fabric manager uses the following rule to determine the presence of a spare control board:
  - MX960 routers with I-chip or I-chip and Trio-chip-based line cards that contain three control boards
  - MX240 or MX480 routers with I-chip or I-chip and Trio-chip-based line cards that contain two control boards
  - MX960, MX480, or MX240 routers that contain only Trio-based line cards are not considered to contain a spare control board

If during any such interval of 5 seconds, two line cards indicate a failure for the same plane, a switchover to the spare control board. In this case, the control board that reported errors is turned offline and the spare control board is turned online.

- If a spare control board is available, and if you configure the functionality to disable line cards with degraded fabric, self-ping state for each line card is monitored at intervals of 5 seconds at the Routing Engine. The following conditions can occur:
  - During any 5-second interval, if only one line card indicates a failure for a plane, the fabric Manager waits for the next interval. During the subsequent interval, if no other line card indicates a failure for the same plane, switchover of the control board is performed.
  - During any 5-second interval, if multiple line cards show failures for multiple control boards, the fabric manager waits for the next interval. During the subsequent interval, if the same condition remains, all the failing line cards are turned offline even if the spare control board is present.
  - During any 5-second interval, if any line card shows a failure for multiple planes on multiple control boards, the fabric manager waits for the next interval. During the subsequent interval, if the same condition persists, the line card is turned offline even if the spare control board is present.
- If spare planes are not available, the line card is turned offline when it displays a failure for a single plane or multiple planes. The line card is brought offline only if you previously configured the **offline-on-fabric-bandwidth-reduction** statement at the **[edit chassis fpc slot-number]** hierarchy level.

## Managing Bandwidth Degradation

Certain errors result in packets being dropped by a system without notification. Other connected systems continue to forward traffic to the affected system, impacting network performance. A severely degraded fabric plane can be one of the reasons here.

By default, Juniper Networks routers attempt to start healing from such situations when the system detects issues with Packet Forwarding Engines. If the healing fails, the system turns off the interfaces, thereby preventing further escalations.

Junos OS software has the ability and the flexibility where a **bandwidth-degradation** configuration is available to detect and respond to fabric plane degradation in ways the user deems fit. Users can configure the router to specify which healing actions the router should take once such a condition is detected.

The **bandwidth-degradation** statement is configured with a percentage and an action. The **percent-age** value can range from 1 to 99, and it represents the percentage of fabric degradation needed to trigger a response from the line card. The **action** attribute determines the type of response the line card performs once fabric degradation reaches the configured percentage.

The statement is only configured with an **action** attribute, which triggers when the percentage of fabric degradation reaches 100 percent.

The following actions can be applied to either configuration statement:

- **log-only:** A message gets logged in the chassisd and message files when the fabric degradation threshold is reached. No other actions are taken.
- **restart:** The line card with a degraded fabric plane is restarted once the threshold is reached.
- **offline:** The line card with a degraded fabric plane is taken offline once the threshold is reached. The line card requires manual intervention to be brought back online. This is the default action if no action attribute configured.
- **restart-then-offline:** The line card with a degraded fabric plane is restarted once the threshold is reached, and if fabric plane degradation is detected again within 10 minutes, the line card is taken offline. The line card requires manual intervention to be brought back online.

**NOTE:** This feature is available in the Junos OS Release 15.1R1.

## Disabling Line Card Restart to Limit Recovery Actions from Degraded Fabric Conditions

You can disable line card restarts to limit recovery actions from a degraded fabric condition. On T640 and T1600 routers, only the fabric plane is restarted. On PTX Series routers, only the Switch Interface Boards (SIBs) are restarted. To disable the restarting of line cards, use the **action-fpc-restart-disable** statement at the **[edit chassis fabric degraded]** hierarchy level:

```
[edit chassis fabric]
degraded {
  action-fpc-restart-disable;
}
```

Whenever a line card restart is disabled, an alarm is raised when there are unreachable destinations present in the router, and you must restart the line cards manually.

To ensure that both the fabric planes (T640 and T1600 routers) or the SIBs (PTX Series routers) and the line cards are restarted during the recovery process, do not configure the **action-fpc-restart-disable** statement at the **[edit chassis fabric degraded]** hierarchy level.

**Related Documentation**

- [Fabric Resiliency and Degradation on page 132](#)

## Disabling an FPC with Degraded Fabric Bandwidth

You can bring an FPC with degraded fabric bandwidth offline to avoid causing a traffic black hole in the chassis for an extended time. To configure the option to disable an FPC with degraded bandwidth, use the **offline-on-fabric-bandwidth-reduction** statement at the **[edit chassis fpc slot-number]** hierarchy level:

```
[edit chassis]
fpc slot-number {
  offline-on-fabric-bandwidth-reduction;
}
```

The fabric manager checks the number of current active planes periodically. If the number of active planes is lower than the required number of active planes for a particular router, the system waits 10 seconds before it takes any corrective action. If the reduced bandwidth condition persists for an FPC and if this feature has been configured for the FPC, the system brings the FPC offline.

**Related Documentation**

- [offline-on-fabric-bandwidth-reduction on page 723](#)
- [Fabric Resiliency and Degradation on page 132](#)

## Configuring Redundancy Fabric Mode for Active Control Boards on MX Series Routers

You can configure the active control board to be in redundancy mode or in increased fabric bandwidth mode. You can enable increased fabric bandwidth of active control boards for optimal and efficient performance and traffic handling by configuring the active control boards to be in redundancy mode. To configure redundancy mode for the active control board, use the **redundancy-mode redundant** statement at the **[edit chassis fabric]** hierarchy level:

```
[edit chassis fabric]
redundancy-mode {
  redundant;
}
```

When you configure this option, all the FPCs use 4 fabric planes as active planes, regardless of the type of the FPC.

To configure increased bandwidth mode for the active control board, use the **redundancy-mode increased-bandwidth** statement at the **[edit chassis fabric]** hierarchy level:

```
[edit chassis fabric]
redundancy-mode {
  increased-bandwidth;
}
```

In increased fabric bandwidth mode, MX Series routers will use 6 active planes. MX240 and MX480 routers will also use 2 spare planes in addition to the 6 active planes.

Increased fabric bandwidth mode is enabled by default on MX routers with Switch Control Board (SCB). On MX routers with Enhanced SCB—SCBE, regardless of the type of MPC or DPC installed on it, redundancy mode is enabled by default.

Configuring this feature does not affect the system. You can configure this feature without restarting the FPC or restarting the system.

## Understanding Fabric Grant Bypass

Module Port Concentrators (MPCs) contain one, two, or four Packet Forwarding Engines. Each Packet Forwarding Engine handles its forwarding decisions independently. Also, each Packet Forwarding Engine implements fabric queuing and flow control features required to communicate with other Packet Forwarding Engines on the same chassis. Packet Forwarding Engines use the fabric grant bypass feature to communicate with each other. For instance, when a Packet Forwarding Engine wants to send a packet to another Packet Forwarding Engine (on the same MPC or on a different MPC), a request is sent to the Packet Forwarding Engine across the fabric plane. After the request is granted, the source Packet Forwarding Engine sends the packet to the destination Packet Forwarding Engine.

On MX240, MX480, and MX960 routers with Switch Control Boards (SCB, SCBE, and SCBE2), the fabric grant bypass feature is disabled for all MPCs by default. On MX2010 and MX2020 routers with the Switch Fabric Board SFB2, the fabric grant bypass feature is disabled, by default, for all MPCs except MPC1 (MX-MPC1-3D), MPC2 (MX-MPC2-3D), and the 16-port 10-Gigabit Ethernet MPC (MPC-3D-16xGE-SFPP). On MX2010 and MX2020 routers with the Switch Fabric Board SFB, the fabric grant bypass feature is enabled for all MPCs by default. When the fabric grant bypass feature is enabled by default, the source Packet Forwarding Engine has to wait for the fabric plane to grant the request before the packet can be sent to the destination Packet Forwarding Engine. Waiting for the request to be granted can impact system behavior and performance.

Table 22 on page 146 describes the fabric grant bypass behavior on MX Series routers.

**Table 22: Fabric Grant Bypass Behavior on MX Series Routers**

MX Series Routers	Switch Control Board	Switch Fabric Board	Default Fabric Grant Bypass Behavior
MX240, MX480, and MX960	SCB, SCBE, MX-SCBE2	-	Disabled for all MPCs.
MX2010 and MX2020	-	SFB	Enabled for all MPCs.
MX2010 and MX2020	-	SFB2	Enabled for MPC1 (MX-MPC1-3D), MPC2 (MX-MPC2-3D), and 16-port 10-Gigabit Ethernet MPC (MPC-3D-16xGE-SFPP). Disabled for all other MPCs.

Starting in Junos OS Release 16.1, you can disable the fabric grant bypass feature on the MX2020 and MX2010 routers with SFBs. Disabling the default fabric grant bypass feature controls congestion and thus improves system behavior and performance on these routers. After disabling the feature, you must reboot the router for the changes to take effect.

**NOTE:** After you disable the fabric grant bypass feature and reboot the router, existing MPCs where the fabric grant bypass feature is enabled by default—such as MPC1 (MX-MPC1-3D), MPC2 (MX-MPC2-3D), and the 16-port 10-Gigabit Ethernet MPC (MPC-3D-16xGE-SFPP)—do not power on.

You can re-enable the fabric grant bypass feature on the MX2020 and MX2010 routers. After enabling the feature, you must reboot the router for the changes to take effect. If the router has existing MPCs where the fabric grant bypass feature is enabled by default—such as MPC1 (MX-MPC1-3D), MPC2 (MX-MPC2-3D), and the 16-port 10-Gigabit Ethernet MPC (MPC-3D-16xGE-SFPP)—these MPCs power on after the reboot.

**Related Documentation**

- [Disabling Fabric Grant Bypass to Control Congestion and Improve Performance on page 147](#)
- [disable-grant-bypass on page 633](#)

## Disabling Fabric Grant Bypass to Control Congestion and Improve Performance

You can disable the fabric grant bypass feature on the MX2020 and MX2010 routers with SFBs. Disabling the default fabric grant bypass feature controls congestion and thus improves system behavior and performance on MX2010 and MX2020 routers. After disabling the feature, you must reboot the router for the changes to take effect.

**NOTE:** After you disable the fabric grant bypass feature and reboot the router, existing MPCs on the router where the fabric grant bypass feature is enabled by default—such as MPC1 (MX-MPC1-3D), MPC2 (MX-MPC2-3D), and the 16-port 10-Gigabit Ethernet MPC (MPC-3D-16xGE-SFPP)—do not power on.

To disable fabric grant bypass to control congestion and improve system behavior and performance:

1. Disable fabric grant bypass by including the **fabric disable-grant-bypass** statement at the **[edit chassis]** hierarchy level.

```
[edit chassis]
user@host# set fabric disable-grant-bypass
```

2. After disabling fabric grant bypass, commit the configuration.

```
[edit chassis]
user@host# commit
```

**NOTE:** After you disable fabric grant bypass and commit the configuration, the router displays the following warning message:

[edit]

'chassis'

**WARNING:** Chassis configuration for fabric grant bypass has been changed. A system reboot is mandatory. Please reboot the system NOW. Continuing without a reboot might result in unexpected system behavior. commit complete

3. Reboot the router for the configuration to take effect.

```
user@host> request system reboot
```

To re-enable fabric grant bypass feature on the MX2020 and MX2010 routers, use the **delete chassis fabric disable-grant-bypass** command. After enabling the feature, you must reboot the router for the changes to take effect. If the router has existing MPCs where the fabric grant bypass feature is enabled by default—such as MPC1 (MX-MPC1-3D), MPC2 (MX-MPC2-3D), and the 16-port 10-Gigabit Ethernet MPC (MPC-3D-16xGE-SFPP)—these MPCs power on after the reboot.

#### Related Documentation

- [Understanding Fabric Grant Bypass on page 146](#)
- [disable-grant-bypass on page 633](#)
- [Re-Enabling Fabric Grant Bypass on page 148](#)

## Re-Enabling Fabric Grant Bypass

After you disable the fabric grant bypass feature, you can re-enable the feature on the MX2020 and MX2010 routers with SFBs. This is the default behavior on these routers.

**NOTE:** After you enable the fabric grant bypass feature and reboot the router, existing MPCs on the router where the fabric grant bypass feature is enabled by default—such as MPC1 (MX-MPC1-3D), MPC2 (MX-MPC2-3D), and the 16-port 10-Gigabit Ethernet MPC (MPC-3D-16XGE-SFPP)—power on.

To re-enable fabric grant bypass:

1. Use the **delete** statement with the **fabric disable-grant-bypass** statement at the [edit chassis] hierarchy level to enable fabric grant bypass.

```
[edit chassis]
user@host# delete fabric disable-grant-bypass
```

2. After enabling fabric grant bypass, commit the configuration.

```
[edit chassis]
user@host# commit
```

**NOTE:** After you enable fabric grant bypass and commit the configuration, the router displays the following warning message:

```
[edit]
```

```
'chassis'
```

**WARNING:** Chassis configuration for fabric grant bypass has been changed. A system reboot is mandatory. Please reboot the system NOW. Continuing without a reboot might result in unexpected system behavior. commit complete

3. Reboot the router for the configuration to take effect.

```
user@host> request system reboot
```

To disable fabric grant bypass feature on the MX2020 and MX2010 routers, use the **set chassis fabric disable-grant-bypass** command. After disabling the feature, you must reboot the router for the changes to take effect. If the router has existing MPCs where the fabric grant bypass feature is enabled by default—such as MPC1 (MX-MPC1-3D), MPC2 (MX-MPC2-3D), and the 16-port 10-Gigabit Ethernet MPC (MPC-3D-16xGE-SFPP)—these MPCs do not power on after the reboot.

## Understanding the Smooth Upgrade Process

---

The MX2000 line of routers support Switch Fabric Board (SFB; model number: MX2000-SFB) and the enhanced Switch Fabric Board (SFB2; model number: MX2000-SFB-S). SFB2 is designed to support higher bandwidth than that provided by SFB on the MX2000 line of routers. For instance, the MX2000 line of routers with SFB support fabric bandwidth of 800 Gbps. However, the MX2000 line of routers with SFB2 can support fabric bandwidth of 1.92 Tbps. A smooth upgrade enables you to upgrade from SFB to SFB2 with minimal traffic impact on the MX2000 line of routers.

**NOTE:** If you have installed the Junos Continuity software package, you cannot perform a smooth upgrade from Switch Fabric Board (SFB) to Enhanced Switch Fabric Board (SFB2) on MX2010 and MX2020 routers.

This topic explains the smooth upgrade process that takes place when you upgrade from Switch Fabric Board (SFB) to enhanced Switch Fabric Board (SFB2) on MX2000 line of routers.

**NOTE:** The MX2000 line of routers support either SFB or SFB2 only. The MX2000 line of routers do not support SFB and SFB2 at the same time. However, during an upgrade from SFB to SFB2, the MX2000 line of routers support both SFB and SFB2 at the same time for the duration of the upgrade. But, you must upgrade all 8 SFBs to 8 SFB2s. You cannot replace 4 SFBs with 4SFB2s and retain the other SFBs.

The process of smooth upgrade from SFB and SFB2 includes the following steps:

1. Initiating the smooth upgrade process. When you initiate smooth upgrade, the router can support both SFB and SFB2 at the same time.
2. Performing the smooth upgrade. This step consists of replacing all SFBs with SFB2s.
3. Terminating the smooth upgrade. When you terminate the smooth upgrade process, the router stops supporting SFB and SFB2 at the same time.

A smooth upgrade provides the following benefits:

- The smooth upgrade eliminates network downtime during the smooth upgrade window because of 7+1 fabric redundancy. When one SFB is being upgraded to SFB2, the other seven SFBs are available to handle the traffic.

**NOTE:** If multiple SFBs are upgraded at the same time, multiple fabric planes are down at any specified time and so traffic is impacted.

- When multiple fabric boards and planes come online at the same time, you can batch them together and train. This reduces the booting up time and the time taken for the plane to come online.
- On MX2000 line of routers with SFB, fabric grant bypass is enabled by default. Disabling fabric grant bypass helps control congestion and improves performance. On MX2000 line of routers with SFB, you can disable fabric grant bypass by default, fabric grant bypass is disabled for all MPCs on MX2000 line of routers when they connect to SFB2. Fabric grant bypass is enabled by default on MPC1 (MX-MPC1-3D), MPC2 (MX-MPC2-3D), and the 16-port 10-Gigabit Ethernet MPC (MPC-3D-16xGE-SFPP). When fabric grant bypass is enabled by default, when those MPCs connect to SFB2, fabric grant bypass continues to be enabled and cannot be disabled.

To quickly access the information you need, click the links in [Table 23 on page 151](#).

**Table 23: Locating the Information You Need to Work on Smooth Upgrade Process**

Task You Need to Perform	Where The Information Is Located
Before You begin	<a href="#">“Before you Begin the Smooth Upgrade Process” on page 151</a>
Perform a Smooth Upgrade	<a href="#">“Performing a Smooth Upgrade to Enhanced Switch Fabric Board (SFB2) with Minimal Impact on Traffic” on page 160</a>

**Related Documentation**

- [Understanding Fabric Grant Bypass on page 146](#)
- [Disabling Fabric Grant Bypass to Control Congestion and Improve Performance on page 147](#)
- [Before you Begin the Smooth Upgrade Process on page 151](#)
- [Performing a Smooth Upgrade to Enhanced Switch Fabric Board \(SFB2\) with Minimal Impact on Traffic on page 160](#)

**Before you Begin the Smooth Upgrade Process**

Before you begin the smooth upgrade from Switch Fabric Board (SFB) to enhanced Switch Fabric Board (SFB2), complete the following tasks:

**NOTE:** If you have installed the Junos Continuity software package, you cannot perform a smooth upgrade from Switch Fabric Board (SFB) to Enhanced Switch Fabric Board (SFB2) on MX2010 and MX2020 routers.

- Prepare the router and install the version of Junos OS Release (16.1R1 or later) that supports the smooth upgrade process. For more information about how to install or upgrade the version of Junos OS Release, see *Installing the Software Package on a Router with Redundant Routing Engines*.
- Verify that the Switch Fabric Boards and fabric planes are online and operational. At this time, the line cards are connected to SFB.

1. To verify that all the switch fabric boards (SFBs) are online and operational, issue the following command:

```
user@host> show chassis hardware
```

```
Hardware inventory:
```

Item	Version	Part number	Serial number	Description

## Performing a Smooth Upgrade to Enhanced Switch Fabric Board (SFB2) with Minimal Impact on Traffic

This example shows how to perform a smooth upgrade from the Switch Fabric Board (SFB) to the enhanced Switch Fabric Board (SFB2) on the MX2000 line of routers. A smooth upgrade helps reduce network downtime because of 7+1 fabric redundancy.

When one SFB is being upgraded to SFB2, the other 7 SFBs are available to handle the traffic.

**NOTE:** On MX2010 and MX2020 routers, if you have installed the Junos Continuity software package or if the router is not configured to allow multiple versions of the SFBs to coexist, you cannot perform a smooth upgrade from SFB to SFB2.

When not using a smooth upgrade, use one of the following methods to upgrade to SFB2:

- Power off the router, replace the SFB with SFB2, and then power on the router.
- Take both the Routing Engines offline, replace the SFB with SFB2, and then bring both the Routing Engines online.

- [Requirements on page 161](#)
- [Overview on page 161](#)
- [Configuration on page 162](#)
- [Verification on page 164](#)

## Requirements

This example uses the following hardware and software components:

- MX2020 router with dual Routing Engines
- 8 Switch Fabric Boards (SFBs)
- 8 enhanced Switch Fabric Boards (SFB2s)
- Junos OS Release 16.1R1 or later release

Before you begin the smooth upgrade, ensure that you:

- Prepare the router and install the version of Junos OS Release that supports the enhanced Switch Fabric Board (SFB2).
- Verify that the existing SFBs are online and operational and also check the status of the fabric planes.

For more information about what you must do before you commence smooth upgrade, see [“Before you Begin the Smooth Upgrade Process” on page 151](#).

## Overview

The smooth upgrade process is used to upgrade from Switch Fabric Board (SFB) to enhanced Switch Fabric Board (SFB2) with minimal traffic impact. The existing SFBs are replaced one by one, in any order, by the new SFB2s. Because you are replacing a single SFB at a time, the remaining SFBs handle the traffic and so there is minimal impact to traffic. SFB2 is supported only on MX2020 and MX2010 routers.

## Topology

---

This example shows how to perform a smooth upgrade on an MX2020 router that has eight SFBs. The 8 SFBs are replaced with 8 enhanced switch fabric boards (SFB2). First, initiate the smooth upgrade process and then take a single SFB offline. Replace the SFB with an SFB2, and then bring the SFB2 online. You can then repeat the steps for the other seven SFBs.

After you upgrade all the SFBs to SFB2s, the fabric bandwidth per slot of MPC8E and MPC9E on the MX2020 router is increased from 11 Gbps to 25 Gbps. However, the upgrade does not impact the fabric bandwidth per slot of MPC7.

## Configuration

To upgrade from SFB to SFB2, perform the following tasks:

- [Initiating the Smooth Upgrade Process on page 162](#)
- [Performing the Smooth Upgrade on page 163](#)
- [Terminating the Smooth Upgrade Process on page 164](#)

### Initiating the Smooth Upgrade Process

---

#### Step-by-Step Procedure

By default, the MX2000 line of routers do not support both SFB and SFB2 at the same time. However, when you initiate the smooth upgrade process, the router can support both SFB and SFB2 at the same time. So, before you replace an SFB with an SFB2, you must initiate the smooth upgrade process.

1. In configuration mode, at the **[edit]** hierarchy level, Initiate the smooth upgrade process for the SFBs.

```
[edit]
user@host# set chassis state sfb-upgrade on
```

2. Commit the changes by using the **commit** statement and exit the configuration mode.

```
[edit]
user@host# commit
```

3. In operational mode, verify that you have initiated the smooth upgrade process.

```
user@host> show configuration chassis
state {
  sfb-upgrade on;
}
```

## Performing the Smooth Upgrade

### Step-by-Step Procedure

1. In operational mode, take the SFBs offline. There is no specific order that needs to be maintained. In this example, you start with the SFB in slot 7 first.

```
user@host> request chassis sfb slot 7 offline
```

2. Verify that the SFB is offline.

```
user@host> show chassis sfb
```

Slot	State	Uptime
0	Online	1 day, 12 hours, 6 minutes, 59 seconds
1	Online	1 day, 12 hours, 6 minutes, 37 seconds
2	Online	1 day, 12 hours, 6 minutes, 16 seconds
3	Online	1 day, 12 hours, 5 minutes, 55 seconds
4	Online	1 day, 12 hours, 5 minutes, 33 seconds
5	Online	1 day, 12 hours, 5 minutes, 12 seconds
6	Online	1 day, 12 hours, 4 minutes, 51 seconds
7	Offline	--- Offlined by cli command ---

3. Replace the SFB that is offline with the enhanced SFB (SFB2). Minimal traffic loss is expected as only a single SFB is replaced and other seven SFBs are operational and handle the traffic.

4. In operational mode, bring the SFB2 online.

```
user@host> request chassis sfb slot 7 online
```

5. Verify that the SFB2 is online.

```
user@host> show chassis sfb
```

Slot	State	Uptime
0	Online	1 day, 12 hours, 16 minutes, 38 seconds
1	Online	1 day, 12 hours, 16 minutes, 16 seconds
2	Online	1 day, 12 hours, 15 minutes, 55 seconds
3	Online	1 day, 12 hours, 15 minutes, 34 seconds
4	Online	1 day, 12 hours, 15 minutes, 12 seconds
5	Online	1 day, 12 hours, 14 minutes, 51 seconds
6	Online	1 day, 12 hours, 14 minutes, 30 seconds
7	Online	38 seconds

6. Repeat Step 3 through Step 5 for upgrading the other SFBs. We recommend that you upgrade fabric boards one at a time for minimal traffic impact.

## Terminating the Smooth Upgrade Process

---

### Step-by-Step Procedure

After all the SFBs are upgraded to the enhanced SFB (SFB2), you can terminate the smooth upgrade process. When the smooth upgrade process is initiated, SFB and SFB2 can coexist on the same router. When you terminate the smooth upgrade process, the router can have only SFB or SFB2 and not both at the same time.

1. In configuration mode, at the **[edit]** hierarchy level, terminate the smooth upgrade process.

**NOTE:** You can also use the `delete chassis state sfb-upgrade` command to terminate the smooth upgrade process.

```
[edit]
user@host# set chassis state sfb-upgrade off
```

2. Commit the changes by using the **commit** statement and exit configuration mode.

```
[edit]
user@host# commit
```

3. In operational mode, verify that you have initiated the smooth upgrade process.

```
user@host> show configuration chassis
state {
  sfb-upgrade off;
}
```

## Verification

To confirm that you have upgraded SFB to SFB2 on the MX2020 router, perform these tasks:

- [Verifying That the Switch Fabric Board \(SFB\) is Offline on page 164](#)
- [Verifying That the Enhanced Switch Fabric Board \(SFB2\) is Online on page 167](#)

### Verifying That the Switch Fabric Board (SFB) is Offline

---

**Purpose** To verify that the SFB on a particular slot, for instance slot 1, is offline.

**Action** From operational mode, enter the **show chassis fabric fpcs** command.

```
user@host> show chassis fabric fpcs
```

## Understanding Fabric Fault Handling on Enhanced Switch Fabric Board (SFB2)

The MX2000 line of routers support Switch Fabric Boards (SFBs) and enhanced SFBs (SFB2s) but not both at the same time. The SFB and SFB2 host three fabric planes each. So, the chassis supports a total of 24 planes. Junos OS Release 15.1F6 and 16.1R1 support fabric fault handling for each plane in both SFB and SFB2. In earlier releases, fabric fault handling is supported for each SFB, not for each plane.

[Table 24 on page 170](#) lists the differences between fabric fault handling per plane and per SFB.

*Table 24: SFB Versus SFB2 Fabric Fault Handling*

SFB Level (SFB)	Plane Level (SFB and SFB2)
Cyclic redundancy check(CRC) errors on any link on the SFB are indicated on the SFB.	CRC errors on any link on the SFB or SFB2 are indicated on the plane.
On encountering destination errors, the line card isolates the SFB (all 3 planes).	On encountering destination errors, the line card isolates the corresponding plane. Other planes continue to operate.

Fabric fault handling per-plane provides the following benefits:

- Increased granularity, which helps identify, isolate, and repair faults.
- Alarms and log messages provide fault information per plane instead of per SFB, which makes debugging easier.
- If an SFB has a single faulty plane, the other two planes can continue to operate. There is no need to take the entire SFB offline.
- In case of transient errors, while repairing you can isolate a single plane instead of isolating the bouncing the SFB.

To view fabric fault handling information for all 24 planes, use the **extended** option with the existing fabric commands.

## Fabric Management on MPC7E Overview

The two variants of MPC7E—MPC7E-MRATE and MPC7E 10G—provide scalability in bandwidth and services capability of routers. The two MPCs are supported on MX240, MX480, and MX960 routers. The MPCs plug into the chassis and provide the fabric interface.

**NOTE:** The MPC7E-MRATE and MPC7E-10G MPCs are supported only on MX-SCBE2.

An MX960 router can support three Enhanced Switch Control Boards (SCBE2s)—two planes on each SCB and make up a total of six fabric planes. MX240 and MX480 routers can support up to two SCBE2—four fabric planes on each SCBE2 make up a total of eight planes. However, the MX240 and MX480 routers have only six active planes. The remaining two are redundant.

By default, MX240, MX480, and MX960 routers support four active fabric planes each. However, this default fabric redundancy mode, also known as *redundant fabric mode*, makes the MPC run in reduced bandwidth state. In *increased bandwidth mode*, the MX240, MX480, and MX960 routers support six active fabric planes each. You can increase the number of active fabric planes by changing the mode from *redundant fabric mode* to *increased bandwidth mode*. To configure the MPC7E to function in increased bandwidth mode, use the existing **redundancy-mode increased-bandwidth** statement at the **[edit chassis fabric]** hierarchy level. An MPC working with reduced fabric bandwidth can affect the routing process, resulting in reduced throughput. You can enable increased fabric bandwidth of the active SCBE2 for optimal and efficient performance and traffic handling.

On MX240 and MX480 routers, if the fabric redundancy mode is not configured, then fabric planes 0, 1, 2, and 3 are online and active and fabric planes 4, 5, 6, and 7 are redundant. If you configure the increased bandwidth mode, then the fabric planes 0, 1, 2, 3, 4, and 6 are active and fabric planes 5 and 7 are redundant.

On MX960 routers with MPC7E, if you configure increased bandwidth mode, then fabric planes 0, 1, 2, 3, 4, and 5 are active.

The following sections describe the fabric management features supported on the MPC7E MPCs in MX240, MX480, and MX960 routers.

- [Fabric Hardening on page 172](#)
- [Limiting Traffic Disruption by Detecting Packet Forwarding Engine Destinations That Are Unreachable over the Fabric on page 172](#)

## Fabric Hardening

Fabric hardening is the process of controlling bandwidth degradation to prevent traffic black hole. Fabric hardening can be configured with two CLI configuration statements, **per fpc bandwidth-degradation** and **per fpc blackhole-action**. The two statements give you more control over what threshold of bandwidth degradation to react to, and what corrective action to take. The **per fpc bandwidth-degradation** statement determines how the MPC reacts when it reaches a specified bandwidth degradation percentage. The **per fpc blackhole-action** statement determines how the MPC responds to a 100 percent fabric degradation scenario. This statement is optional and overrides the default fabric hardening procedures.

## Limiting Traffic Disruption by Detecting Packet Forwarding Engine Destinations That Are Unreachable over the Fabric

The router is able to detect unreachable destination Packet Forwarding Engines and limit the time for which traffic is disrupted. The router signals neighboring routers when it cannot carry traffic because of the inability of some or all source Packet Forwarding Engines to forward traffic to some or all destination Packet Forwarding Engines on any fabric plane, after interfaces have been created. This inability to forward traffic results in a traffic disruption by the router. When the router detects unreachable Packet Forwarding Engine destinations, it attempts to recover from the condition causing the disruption. If the recovery attempt fails, the system turns off the interfaces, thereby ending the disruption and initiating the recovery process.

The recovery process consists of the following steps:

1. Fabric plane restart phase: The MPC restarts the fabric planes one by one.
2. Fabric plane and MPC restart phase: The router restarts both the fabric planes and the MPCs. If there are unreachable MPCs that are unable to initiate high-speed links to the fabric after reboot, traffic disruption is limited because no interfaces are created for these MPCs.
3. MPC offline phase: When previous attempts at recovery fail, the router makes the MPCs that contribute to the traffic black-hole condition offline and turns off the interfaces.

## Understanding Rate Selectability

---

The maximum amount of data that can be transmitted through a port at any given second either by a network device or by a component of the network device (such as a line card) is known as the port speed. Port speed is measured in kilobits per second (Kbps), gigabits per second (Gbps), and terabits per second (Tbps). If a port can be configured to support both single and multiple speeds, the port is known as a *rate-selectable* port. Because the port is part of a network device (router or switch) or a network component (such as MPC, MIC) the component is known as a rate-selectable component. For instance, if a Modular Port Concentrator (MPC) supports multiple speeds, it is known as a rate-selectable MPC. If a Modular Interface Card (MIC) supports multiple speeds, it is known as a rate-selectable MIC. The term *multi-rate* in the name of a component also indicates support for more than one speed.

Rate selectability enables you to configure the port speed either at the port level or at the PIC or MIC level. To configure all ports to operate at the same speed, you configure rate selectability at the MIC or PIC level. To configure different port speeds for each port, you configure rate selectability at the port level, in which case only the ports that are configured are enabled.

When you configure rate selectability at the MIC or PIC level, all the ports of the MIC or PIC that support the configured speed operate at that speed. To prevent switch fabric interface oversubscription—for example, with the Switch Fabric Board SFB or SFB2—and to ensure a guaranteed bandwidth, you can specify the number of active ports that operate at the configured speed. For instance, on a router with SFB, if you want only eight ports of the MIC to operate at 40 Gbps, you can configure the MIC to operate at 40 Gbps and enable the eight ports that you want to operate at that speed. The remaining ports of the MIC are automatically disabled. For example, on MPC8E with MIC-MRATE, you can configure four 100-Gigabit Ethernet interfaces and two 40-Gigabit Ethernet interfaces per MIC. All other interfaces are automatically disabled. Configuring rate selectability at the MIC level helps you configure the operating speed of the MIC easily.

**NOTE:** The total port speed of the MIC cannot exceed the forwarding capacity of the Packet Forwarding Engine.

---

Configuring rate selectability at the port level provides you the flexibility of operating the ports of the MIC at different supported speeds. For example, you can configure four 10-Gigabit Ethernet interfaces on port 0, one 40-Gigabit Ethernet interface on port 1, and one 100-Gigabit Ethernet interface on port 2.

**NOTE:** When you configure rate selectability at the port level, ensure that you plug in transceivers to the ports according to the speeds that you configure. For instance, use 4x duplex LC breakout transceivers to configure 10-Gigabit Ethernet interfaces, fiber-optic 40-gigabit QSFP+ transceivers to configure 40-Gigabit Ethernet interfaces, and fiber-optic 100-gigabit QSFP28 transceivers to configure 100-Gigabit Ethernet interfaces.

---

## Rate Selectability on MPC7E-MRATE

MPC7E (MPC7E-MRATE) is a fixed-configuration MPC and is supported on MX240, MX480, MX960, MX2010, and MX2020 routers. MPC7E-MRATE contains two built-in PICs, PIC 0 and PIC 1. Each PIC has six physical ports that support quad small form-factor pluggable plus (QSFP+) transceivers. The default port speed is 10 Gbps for all ports. Each of the six ports of PIC 0 and PIC 1 supports speeds of 10 Gbps and 40 Gbps. However, only ports 2 and 5 on both the PICs support 100 Gbps speed.

MPC7E-MRATE has an aggregate forwarding capacity of 480 Gbps and a forwarding capacity of 240 Gbps on each Packet Forwarding Engine. Oversubscription of Packet Forwarding Engine capacity is not supported. The demand on each Packet Forwarding Engine must be less than or equal to its forwarding capacity. For instance, for MPC7E-MRATE, the demand on each Packet Forwarding Engine must be less than or equal to 240 Gbps.

For information about the naming conventions for interfaces on MPC7E-MRATE MPC, see [“Understanding Interface Naming Convention for MPC7E-MRATE” on page 180](#).

## Rate Selectability on MIC-MRATE

MPC8E (MX2K-MPC8E) and MPC9E (MX2K-MPC9E) support two separate slots for MICs as field replaceable units (FRUs). Each of the MIC slots supports only one MIC—MIC-MRATE. MIC-MRATE consists of 12 physical ports that support QSFP+ transceivers and multiple port speeds of 100 Gbps, 40 Gbps, and 10 Gbps. You can configure a port to operate in a specific speed based on your requirement. The default port speed is 10 Gbps for all ports. MIC-MRATE also supports breakout transceivers, which you can use to split a 40-Gigabit Ethernet port into four 10-Gigabit Ethernet ports. MIC-MRATE ports can be split into a maximum of 48 10-Gigabit Ethernet interfaces.

MPC8E has an aggregate forwarding capacity of 960 Gbps and a forwarding capacity of 240 Gbps on each Packet Forwarding Engine. MPC9E has an aggregate forwarding capacity of 1600 Gbps and a forwarding capacity of 400 Gbps on each Packet Forwarding Engine. Oversubscription of Packet Forwarding Engine capacity is not supported. The demand on each Packet Forwarding Engine must be less than or equal to its forwarding capacity. For instance, for MPC8E, the demand on each Packet Forwarding Engine must be less than or equal to 240 Gbps and for MPC9E, the demand per Packet Forwarding Engine must be less than or equal to 400 Gbps.

On MPC8E with MIC-MRATE, you can configure four 100-Gigabit Ethernet interfaces and two 40-Gigabit Ethernet interfaces per MIC. All other interfaces are automatically disabled. On MPC9E with MIC-MRATE, you can configure eight ports as 100-Gigabit Ethernet interfaces and the other ports can be configured only as 40-Gigabit Ethernet interfaces or 10-Gigabit Ethernet interfaces.

For information about the naming conventions for interfaces on MPC8E and MPC9E, see [“Understanding Interface Naming Conventions for MIC-MRATE” on page 182](#).

## Rate Selectability on JNP10K-LC2101

JNP10K-LC2101 is a fixed-configuration MPC and is supported on MX10008 routers. JNP10K-LC2101 contains six built-in PICs, PIC 0 to PIC 5. Each PIC has four physical ports that support quad small form-factor pluggable plus (QSFP+) transceivers. The default port speed is 10 Gbps for all ports. Each of the four ports of PIC 0 to PIC 5 supports speeds of 10 Gbps (using breakout cables), 40 Gbps, and 100 Gbps.

MX10008 routers support eight JNP10K-LC2101 MPCs. By default, each JNP10K-LC2101 MPC provides a maximum bandwidth of 1.44 Tbps. JNP10K-LC2101 has six Packet Forwarding Engines, each providing a maximum bandwidth of up to 240 Gbps, which cannot be oversubscribed. You can configure JNP10K-LC2101 to provide an increased bandwidth of 2.4 Tbps. The demand on each Packet Forwarding Engine must be less than or equal to its forwarding capacity. For instance, by default, for JNP10K-LC2101, the demand on each Packet Forwarding Engine must be less than or equal to 240 Gbps. However, if you have configured JNP10K-LC2101 to provide an increased bandwidth of 2.4 Tbps, the demand on each Packet Forwarding Engine must be less than or equal to 480 Gbps.

For information about the naming conventions for interfaces on JNP10K-LC2101 MPC, see [“Understanding Interface Naming Conventions for JNP10K-LC2101” on page 187](#).

## Rate Selectability on MIC-MACSEC-20GE

The MIC-MACSEC-20GE MIC provides 128-bit and 256-bit MACsec encryption on all the twenty 1GE and on the two 10GE ports in the following hardware configuration:

- Installed directly on the MX80 and MX104 routers
- Installed on MPC1, MPC2, MPC3, MPC2E, MPC3E, MPC2E-NG, and MPC3E-NG line cards on the MX240, MX480, and MX960 routers

By default, 128-bit MACsec encryption is supported.

The twenty 1-Gigabit Ethernet SFP ports distributes the ports across PIC0 and PIC1, that are logical PICs on the physical MIC. The two 10-Gigabit Ethernet SFP+ ports are physically located on PIC1. But, the 10-Gigabit interfaces are created by distributing the ports in either of the PICs. For information about the naming conventions for interfaces on MIC-MACSEC-20GE, see [“Understanding Interface Naming Conventions for MIC-MACSEC-20GE” on page 22](#).

### NOTE:

- When the pic-mode is changed from 1-Gbps to 10-Gbps or vice versa, the Flexible PIC Concentrator (FPC) in MX240, MX480, MX960 routers and the Forwarding Engine Board (FEB) in MX80, MX104 routers undergoes an automatic bounce or reboot.
  - When the MIC-MACSEC-20GE is operating in the 10-Gbps mode, all the other 1-Gbps ports are disabled.

## Guidelines for Configuring Rate Selectability

This topic describes the guidelines to consider when configuring rate selectability at the port level or the PIC or MIC level.

- If rate selectability is not configured, all ports of the MIC-MRATE MIC and MPC7E-MRATE MPC operate as four 10-Gigabit Ethernet interfaces by default. Therefore, when booting the MPC:
  - If rate selectability is not configured or if invalid port speeds are configured, an alarm is generated to indicate that the configuration is invalid. All the ports operate as four 10-Gigabit Ethernet interfaces.
  - If valid port speeds are configured, the PIC and MIC operate at the configured speed.
- When you change an existing port speed configuration at the port level, you must reset the MPC7E-MRATE PIC for the configuration to take effect.

Similarly, when you change an existing port speed configuration at the port level for MPC8E or MPC9E, you must reset the MIC for the configuration to take effect. You can use the **request chassis mic mic-slot mic-slot-number fpc-slot fpc-slot-number (offline | online)** command to reset the MIC and apply your configuration changes.

An alarm is generated indicating the change in port speed configuration.

- When you change an existing port speed configuration with an *invalid* port speed configuration, an alarm is generated indicating that the port speed configuration is invalid. For example, on the MPC7E-MRATE, if you configure the port speed of port 3 as 100 Gbps, it is an invalid configuration. MPC7E -MRATE supports 100 Gbps only on ports 2 and 5. The MPC continues to operate using the existing port speed configuration or the default port speed.
- You cannot configure rate selectability at the PIC level and the port level simultaneously. Error messages are displayed when you try to commit such configurations.
- When you configure rate selectability at the port level, only the configured ports are enabled. Other ports are disabled.

## Guidelines for Configuring Rate Selectability for JNP10K-LC2101

This topic describes the guidelines to consider when configuring rate selectability at the port level or the PIC level for JNP10K-LC2101:

- Each port on the JNP10K-LC2101 MPC supports speeds of 10 Gbps (using breakout cables), 40 Gbps, and 100 Gbps. However, JNP10K-LC2101 MPC does not support bandwidth oversubscription. So, when you configure the ports on all PICs, ensure that the demand on each Packet Forwarding Engine is less than or equal to its forwarding capacity. The default port speed for all PICs is 10G.
- When you change an existing port speed configuration at the port level, you must reset the PIC for the configuration to take effect. When you change an existing port speed configuration at the PIC level, the JNP10K-LC2101 automatically resets the PIC.
- When you change the number of active ports using the **number-of-ports** command, you must reset the PIC for the configuration to take effect. Interfaces are created only for active ports. Only the ports you configure are known as the active ports. The number of active ports enables you to handle bandwidth oversubscription.

**NOTE:** You cannot configure the number of active ports at the port level. If you attempt to configure the number of active ports at the port level, an error message is displayed.

- You cannot configure rate selectability at the PIC level and the port level simultaneously. Error messages are displayed when you try to commit such configurations.
- When you change an existing port speed configuration with an *invalid* port speed configuration, an alarm is generated indicating that the port speed configuration is invalid. The MPC continues to operate using the existing port speed configuration or the default port speed.

## Understanding Interface Naming Convention for MPC7E-MRATE

MPC7E (MPC7E-MRATE) is a fixed-configuration MPC and contains two built-in PICs, PIC 0 and PIC 1. Each of the six ports of PIC 0 and PIC 1 support multiple port speeds of 100 Gbps, 40 Gbps, and 10 Gbps and can be configured as 10-Gigabit Ethernet and 40-Gigabit Ethernet interfaces. However, you can configure only ports 2 and 5 on both the PICs as 100-Gigabit Ethernet interfaces.

MPC7E-MRATE has an aggregate forwarding capacity of 480 Gbps and a forwarding capacity of 240 Gbps on each Packet Forwarding Engine. Oversubscription of Packet Forwarding Engine capacity is not supported. The demand on each Packet Forwarding Engine must be less than or equal to its forwarding capacity. For instance, for MPC7E-MRATE, the demand on each Packet Forwarding Engine must be less than or equal to 240 Gbps.

The 40-Gigabit Ethernet and 100-Gigabit Ethernet interfaces configured on the MPC7E-MRATE MPC follow the naming convention **et-fpc-slot/pic-slot/port-number**. The 10-Gigabit Ethernet interfaces configured on the MPC7E-MRATE MPC follow the naming convention **xe-fpc-slot/pic-slot/port-number:[logical-port-number]**.

For example, **et-0/0/2** indicates either a 40-Gigabit Ethernet or a 100-Gigabit Ethernet interface configured on port 2 of PIC 0 of the MPC7E-MRATE MPC that is installed in the MPC slot 0. **xe-0/0/1:3** indicates a 10-Gigabit Ethernet interface configured on logical port 3 of physical port 1 of the MPC7E-MRATE MPC that is installed in the MPC slot 0.

Table 25 on page 181 lists the naming conventions for interfaces on MPC7E-MRATE for MX240, MX480, MX960, MX2010, and MX2020 routers.

**Table 25: Interface Naming Convention for MPC7E-MRATE**

## Understanding Interface Naming Conventions for MIC-MRATE

MIC-MRATE consists of twelve ports that support multiple port speeds of 100 Gbps, 40 Gbps, and 10 Gbps. MIC-MRATE is supported on MPC8E (MX2K-MPC8E) and MPC9E (MX2K-MPC9E) on MX2000 line of routers.

Starting with Junos OS Release 17.3R1, MIC-MRATE is supported on MX10003 MPC on MX10003 routers.

**NOTE:** By default, the MIC-MRATE ports are configured as 10-Gigabit Ethernet ports.

MPC8E has a forwarding capacity of 240 Gbps for each Packet Forwarding Engine. In Junos OS Release 16.1R1 and later, you can upgrade MPC8E to provide an increased bandwidth of 1600 Gbps (1.6 Tbps), by using an add-on license. After you configure the **bandwidth 1.6T** statement, MPC8E provides an increased bandwidth of 1.6 Tbps. The forwarding capacity is increased to 400 Gbps for each Packet Forwarding Engine.

MPC9E has a forwarding capacity of 400 Gbps for each Packet Forwarding Engine. Packet Forwarding Engine oversubscription is not supported. So, demand on each Packet Forwarding Engine should be less than or equal to its forwarding capacity. For MPC8E, demand on each Packet Forwarding Engine should be less than or equal to 240 Gbps and for MPC9E, demand on each Packet Forwarding Engine should be less than or equal to 400 Gbps.

**NOTE:** On MPC8E with MIC-MRATE, you can configure four ports as 100-Gigabit Ethernet interfaces. On MPC9E with MIC-MRATE and on MPC8E configured to operate at 1.6 Tbps by using an add-on license, you can configure eight ports as 100-Gigabit Ethernet interfaces.

The 40-Gigabit Ethernet and 100-Gigabit Ethernet interfaces configured on the MIC-MRATE MIC follow the naming convention **et-fpc-slot/pic-slot/port-number**. The 10-Gigabit Ethernet interfaces configured on the MIC-MRATE MIC follow the naming convention **xe-fpc-slot/pic-slot/port-number:[logical-port-number]**.

For example, **xe-0/0/1:3** indicates a 10-Gigabit Ethernet interface configured on logical port 3 of physical port 1 of the MIC-MRATE MIC that is installed in the MPC slot 0. The interface name **et-0/0/2** indicates either a 40-Gigabit Ethernet interface or a 100-Gigabit

Ethernet interface configured on port 2 of MIC-MRATE MIC that is installed in the MPC slot 0.

Table 26 on page 183 lists the naming conventions used for interfaces on MIC-MRATE when installed on slot 0 of MPC8E and MPC9E. Table 27 on page 184 lists the naming conventions used for interfaces on MIC-MRATE when installed on slot 1 of MPC8E and MPC9E. MPC8E and MPC9E support two MIC-MRATE MICs each.

**NOTE:** The x in et-x/0/0 and xe-x/0/0:[0-3] refers to the MPC slot number.

**Table 26: Interface Naming Convention for MIC-MRATE Installed on Slot 0 of MPC8E and MPC9E**

Packet Forwarding Engine	10-Gigabit Ethernet Interface	40-Gigabit Ethernet Interface	100-Gigabit Ethernet Interface

## Understanding Interface Naming Conventions for MX10003 MPC

The MX10003 MPC supports a Multi-Rate 12xQSFP28 Ethernet MIC (model numbers: JNP-MIC1 and JNP-MIC1-MACSEC) and the fixed-port PIC (6xQSFP).

Each of the 6 ports of the PIC supports 10-Gigabit Ethernet and 40-Gigabit Ethernet interfaces. Each of the 12 ports of the modular MIC supports 10-Gigabit Ethernet, 40-Gigabit Ethernet, and 100-Gigabit Ethernet interfaces. All the ports of the modular MIC can be configured as 100-Gigabit Ethernet interfaces.

The 40-Gigabit Ethernet and 100-Gigabit Ethernet interfaces configured on the MX10003 MPC follow the naming convention **et-fpc-slot/pic-slot/port-number**. The 10-Gigabit Ethernet interfaces follow the naming convention **xe-fpc-slot/pic-slot/port-number:[logical-port-number]**.

For example, **xe-0/0/1:3** indicates a 10-Gigabit Ethernet interface configured on logical port 3 of physical port 1 of the modular MIC that is installed in the MPC slot 1. The interface name **et-0/0/2** indicates either a 40-Gigabit Ethernet interface or a 100-Gigabit Ethernet interface configured on port 2 of modular MIC that is installed in the MPC slot 1.

[Table 7 on page 22](#) lists the naming conventions used for interfaces on the fixed-port PIC when installed in slot 1 of the MX10003 MPC. [Table 30 on page 186](#) lists the naming conventions used for interfaces on the modular MIC when installed in slot 1 of the MPC.

**NOTE:** The x in et-x/0/0 and xe-x/0/0:[0-3] refers to the MPC slot number.

**Table 29: Interface Naming Convention for the Fixed-Port PIC Installed in Slot 1 of MX10003 MPC**

## Understanding Interface Naming Conventions for JNP10K-LC2101

JNP10K-LC2101 is a fixed-configuration MPC and contains six built-in PICs, PIC 0 to PIC 5. Each PIC supports 4 ports. All ports support multiple port speeds of 100 Gbps, 40 Gbps, and 10 Gbps and can be configured as 10-Gigabit Ethernet, 40-Gigabit Ethernet, and 100-Gigabit Ethernet interfaces.

JNP10K-LC2101 has a forwarding capacity of 240 Gbps for each Packet Forwarding Engine. JNP10K-LC2101 has six Packet Forwarding Engines. In Junos OS Release 18.2R1 and later, you can upgrade JNP10K-LC2101 to provide an increased bandwidth of 2400 Gbps (2.4 Tbps), by using an add-on license. After you configure the [bandwidth 2.4T](#) statement, JNP10K-LC2101 provides an increased bandwidth of 2.4 Tbps. The forwarding capacity is increased to 400 Gbps for each Packet Forwarding Engine. Packet Forwarding Engine oversubscription is not supported. So, demand on each Packet Forwarding Engine should be less than or equal to its forwarding capacity.

The 40-Gigabit Ethernet and 100-Gigabit Ethernet interfaces configured on the JNP10K-LC2101 MPC follow the naming convention **et-fpc-slot/pic-slot/port-number**. The 10-Gigabit Ethernet interfaces configured on the JNP10K-LC2101 MPC follow the naming convention **xe-fpc-slot/pic-slot/port-number:[logical-port-number]**.

For example, **xe-0/0/1:3** indicates a 10-Gigabit Ethernet interface configured on logical port 3 of physical port 1 of the JNP10K-LC2101 MPC that is installed in the MPC slot 0. The interface name **et-0/0/2** indicates either a 40-Gigabit Ethernet interface or a 100-Gigabit Ethernet interface configured on port 2 of the JNP10K-LC2101 MPC that is installed in the MPC slot 0.

**NOTE:** Each Packet Forwarding Engine maps to a single built-in PIC on the JNP10K-LC2101.

[Table 31 on page 188](#) lists the naming conventions used for interfaces on JNP10K-LC2101 for MX10008 routers. MX10008 routers support 8 JNP10K-LC2101 MPCs.

**NOTE:** The *x* in **et-x/0/0** and **xe-x/0/0:[0-3]** refers to the MPC slot number.

Table 31: Interface Naming Convention for JNP10K-LC2101 MPC

Packet Forwarding Engine	10-Gigabit Ethernet Interface	40-Gigabit Ethernet Interface	100-Gigabit Ethernet Interface
0	xe-x/0/0:[0-3]	et-x/0/0	et-x/0/0
	xe-x/0/1:[0-3]	et-x/0/1	et-x/0/1
	xe-x/0/2:[0-3]	et-x/0/2	et-x/0/2
	xe-x/0/3:[0-3]	et-x/0/3	et-x/0/3
1	xe-x/1/0:[0-3]	et-x/1/0	et-x/1/0
	xe-x/1/1:[0-3]	et-x/1/1	et-x/1/1
	xe-x/1/2:[0-3]	et-x/1/2	et-x/1/2
	xe-x/1/3:[0-3]	et-x/1/3	et-x/1/3
2	xe-x/2/0:[0-3]	et-x/2/0	et-x/2/0
	xe-x/2/1:[0-3]	et-x/2/1	et-x/2/1
	xe-x/2/2:[0-3]	et-x/2/2	et-x/2/2
	xe-x/2/3:[0-3]	et-x/2/3	et-x/2/3
3	xe-x/3/0:[0-3]	et-x/3/0	et-x/3/0

## Supported Active Physical Ports for Configuring Rate Selectability to Prevent Oversubscription

MPC7E-MRATE has an aggregate forwarding capacity of 480 Gbps and a forwarding capacity of 240 Gbps on each Packet Forwarding Engine. Oversubscription of Packet Forwarding Engine capacity is not supported. The demand on each Packet Forwarding Engine must be less than or equal to its forwarding capacity. For instance, on MPC7E-MRATE, the demand on each Packet Forwarding Engine must be less than or equal to 240 Gbps.

**NOTE:** By default, the MPC7E-MRATE ports are configured as 10-Gigabit Ethernet ports.

When you configure rate selectability at the MIC level, all the ports supporting that port speed are enabled by default. This can lead to fabric oversubscription in certain cases. To prevent fabric oversubscription, you can configure the number of active ports that operate at the configured speed by using the **number-of-ports** **number-of-active-physical-ports** configuration statement. Additionally, interfaces are created only for the active ports.

**NOTE:** You cannot configure the number of active ports when you configure rate selectability at the port level.

Table 32 on page 190 lists the active physical ports on MPC7E-MRATE.

**Table 32: Active Physical Ports on MPC7E-MRATE MPC for Configuring Rate Selectability at PIC Level**

Ports Configured (number-of-ports Statement)	Active Physical Ports for Different Configured Speeds		
	10-Gigabit Ethernet	40-Gigabit Ethernet	100-Gigabit Ethernet
1	0	0	2
2	0, 1	0, 1	2, 5
3	0, 1, 2	0, 1, 2	2, 5
4	0, 1, 2, 3	0, 1, 2, 3	2, 5
5	0, 1, 2, 3, 4	0, 1, 2, 3, 4	2, 5
6	0, 1, 2, 3, 4, 5	0, 1, 2, 3, 4, 5	2, 5

MPC8E has a forwarding capacity of 240 Gbps for each Packet Forwarding Engine. MPC9E has a forwarding capacity of 400 Gbps for each Packet Forwarding Engine.

Oversubscription of Packet Forwarding Engine capacity is not supported. The demand on each Packet Forwarding Engine must be less than or equal to its forwarding capacity. For instance, on MPC8E, the demand on each Packet Forwarding Engine must be less than or equal to 240 Gbps and on MPC9E, the demand on each Packet Forwarding Engine must be less than or equal to 400 Gbps.

**NOTE:** By default, the MIC-MRATE ports are configured as 10-Gigabit Ethernet ports.

Table 33 on page 190, Table 34 on page 191 list the active physical ports on MPC8E and MPC9E.

**Table 33: Active Physical Ports on MIC-MRATE on MPC8E MPC for Configuring Rate Selectability at MIC Level**

Ports Configured (number-of-ports Statement)	Active Physical Ports for Different Configured Speeds		
	10-Gigabit Ethernet	40-Gigabit Ethernet	100-Gigabit Ethernet
1	0	0	0
2	0, 6	0, 6	0, 6
3	0, 1, 6	0, 1, 6	0, 1, 6

## Supported Active Physical Ports for Configuring Rate Selectability to Prevent Oversubscription on MX10003 MPC

When you configure rate selectability at the MIC level, all the ports supporting that port speed are enabled by default. This can lead to fabric oversubscription in certain cases. To prevent fabric oversubscription, you can configure the number of active ports that operate at the configured speed by using the **number-of-ports** **number-of-active-physical-ports** configuration statement. Additionally, interfaces are created only for the active ports.

**NOTE:** You cannot configure the number of active ports when you configure rate selectability at the port level.

Starting in Junos OS Release 17.3R1, the MX10003 MPC supports rate selectability to prevent oversubscription of the Packet Forwarding Engine bandwidth.

[Table 35 on page 192](#) lists the active physical ports on MX10003 MPC for Configuring Rate Selectability at the MIC Level.

**Table 35: Active Physical Ports on the MX10003 MPC for configuring rate selectability at the MIC level**

Ports Configured (number-of-ports Statement)	Active Physical Ports for Different Configured Speeds		
	10-Gigabit Ethernet	40-Gigabit Ethernet	100-Gigabit Ethernet
1	0	0	0
2	0, 4	0, 4	0, 4
3	0, 4, 8	0, 4, 8	0, 4, 8

## Supported Active Physical Rate-Selectable Ports to Prevent Oversubscription on MX204 Router

The maximum capacity of an MX204 router is 400 Gbps, which cannot be oversubscribed. In MX204, the network ports are available in two groups (referred to as PICs), with restrictions around the number and type of ports that can be configured without oversubscription.

Starting in Junos OS Release 17.4R1, the MX204 supports rate selectability to prevent oversubscription of the Packet Forwarding Engine bandwidth. The MX204 Packet Forwarding Engine has four 100-Gigabit Ethernet QSFP28 ports (referred to as PIC 0 ports) and eight 10-Gigabit Ethernet ports (referred to as PIC 1 ports). Each of the PIC 0 ports can be used as either a 100-Gigabit Ethernet QSFP28 port or a 40-Gigabit Ethernet QSFP28 port, or they can be configured as four 10-Gigabit Ethernet ports (using a breakout cable).

If you configure rate selectability at the PIC level, all the ports supporting that port speed are enabled by default. This can lead to oversubscription in certain cases. To prevent the oversubscription, you can configure the number of active ports that operate at the configured speed by using the **number-of-ports number-of-active-physical-ports** configuration statement. Additionally, interfaces are created only for the active ports.

**NOTE:**

- You cannot configure the number of active ports when you configure rate selectability at the port level.
- 

## Invalid Port Configuration

You must try to avoid configuring ports that can lead to oversubscription.

Following is an example of an invalid configuration:

```
4x100GE + 8X10GE
```

If you try to commit an invalid configuration, the configuration gets committed, but the port is not activated. This is because Junos OS allows you to configure a port before a line card is inserted. You will get an error message in the output of the **show chassis alarms** command and also in the log messages.

**NOTE:** When you are in port configuration mode, all the ports are configured as 10-Gigabit Ethernet.

---

## Configuring Active Ports on MX204 Router with Rate Selectability

Table 37 on page 195 summarizes the active ports with **number-of-ports** configured but without any rate selectability configuration for an MX204 router. Because there is no rate selectability configured, the default speed is used in these cases.

**Table 37: Active Physical Ports on the MX204 Router for Configuring Rate Selectability at PIC level**

PIC	Number of Ports (number-of-ports Statement)	Active Ports		
		PIC Level 10-Gigabit Ethernet Profile	PIC Level 40-Gigabit Ethernet Profile	PIC Level 100-Gigabit Ethernet Profile
PIC 0	0	-	-	-
	1	0	-	-
	2	0, 1	-	-

## Configuring Rate Selectability on MIC-MRATE to Enable Different Port Speeds

Rate selectability enables you to configure the port speed either at the port level or at the MIC level. To configure all ports to operate at the same speed, you configure rate selectability at the MIC level, in which case you cannot configure the speed of individual ports. To configure rate selectability at the MIC level, use the **pic-mode** statement and specify the port speed. To configure different port speeds for each port, you configure rate selectability at the port level, in which case only the ports that are configured are enabled. To configure rate selectability at the port level, use the **speed** statement to

specify the speed of individual ports. This topic describes how to configure port speeds at the port level and at the MIC level.

**NOTE:** The *pic* in the configuration commands refers to the MRATE MIC. To specify *pic-number*, specify the MRATE MIC slot. For instance, when you use the `edit chassis fpc fpc-slot-number pic pic-slot-number` statement, specify the MPC slot number and the MIC-MRATE slot number.

- [Configuring Rate Selectability on MIC-MRATE at MIC Level on page 197](#)
- [Configuring Rate Selectability on MIC-MRATE at Port Level on page 199](#)

## Configuring Rate Selectability on MIC-MRATE at MIC Level

To configure all ports to operate at the same speed, you configure rate selectability at the MIC level. The default port speed is 10 Gbps for all ports. When you configure rate selectability at the MIC level, all the ports of the MIC that support the configured speed operate at that speed. To prevent oversubscription and ensure a guaranteed bandwidth, you can specify the number of active ports that operate at the configured speed by using the `number-of-ports number-of-active-physical-ports` statement. MIC-MRATE supports port speeds of 10 Gbps, 40 Gbps, and 100 Gbps.

For MPC8E, you can only configure 4 ports of the 12 MIC-MRATE ports with 100 Gbps port speed and the other ports are disabled. So, if you configure **100G** as the operating speed for ports 0, 1, 6, and 7, then the other ports are disabled on MPC8E. Similarly, when you configure the port speed as 100 Gbps at the MIC level on MPC9E, you can only configure 8 ports of the 12 MIC-MRATE ports to operate with that speed. So, if you configure **100G** as the operating speed for ports 0, 1, 2, 3, 6, 7, 8, and 9, then the other ports can support only 40 Gbps or 10 Gbps. However, enabling port speed of 40 Gbps or 10 Gbps at the MIC level, enables all ports and sets the desired port speed on all ports.

To configure rate selectability at the MIC level:

1. In configuration mode, navigate to the `[edit chassis fpc fpc-slot pic pic-number]` hierarchy level.

```
[edit ]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit ]
user@host# edit chassis fpc 4 pic 0
```

2. Configure the `pic-mode pic-speed` statement to set the operating speed for the MIC. All ports of the MIC that support the configured speed operate at the configured speed. Values for the `pic-speed` option include: **10G**, **40G**, and **100G**.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set pic-mode pic-speed
```

For example:

```
[edit chassis fpc 4 pic 0]
user@host# set pic-mode 10G
```

3. (Optional) To prevent oversubscription, you can choose to configure the number of active ports that operate at the port speed configured in Step 2. For information about the number of active ports and specific port numbers on MPC7E-MRATE, MPC8E, and MPC9E see [“Supported Active Physical Ports for Configuring Rate Selectability to Prevent Oversubscription”](#) on page 189.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set number-of-ports number-of-active-physical-ports
```

For example:

```
[edit chassis fpc 4 pic 0]
user@host# set number-of-ports 8
```

4. Verify the configuration.

```
[edit chassis fpc 4 pic 0]
user@host# show
pic-mode 10G;
number-of-ports 8;
```

5. Commit your configuration changes.

In this example, you have configured 8 ports on MIC-MRATE with port speed of 10 Gbps. The other ports are disabled.

## Configuring Rate Selectability on MIC-MRATE at Port Level

To configure different port speeds for each port, you configure rate selectability at the port level. Only the ports that are configured are enabled. Other ports are automatically disabled. Configuring rate selectability at the port level provides you the flexibility of operating individual ports of the MIC at different supported speeds. For example, on MPC9E with MIC-MRATE, you can configure four 100-Gigabit Ethernet interfaces on ports 0, 1, 6, and 7 and two 40-Gigabit Ethernet interfaces on ports 3 and 8. You can use breakout transceivers to configure each 40-Gigabit Ethernet interfaces as four 10-Gigabit Ethernet interfaces.

**NOTE:** When you change the port speed at the port level, you must reset the MPC for the configuration to take effect. Because resetting the MPC takes several minutes and since it affects all the PFEs, you can choose to use the `request chassis mic mic-slot mic-slot-number fpc-slot fpc-slot-number (offline | online)` command to reset the MIC and apply your configuration changes. An alarm is generated indicating the change in port speed. For guidelines on configuring rate selectability, see [“Guidelines for Configuring Rate Selectability” on page 179](#).

To configure rate selectability at the port level:

1. In configuration mode, navigate to the `[edit chassis fpc fpc-slot pic pic-number]` hierarchy level.

```
[edit ]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit ]
user@host# edit chassis fpc 4 pic 0
```

2. To indicate the speed at which the ports operate, configure the **speed** statement for the desired ports. According to your requirements, you can choose the **10G**, **40G**, or **100G** speed options.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set port port-number speed (10G | 40G | 100G)
```

For example:

```
[edit chassis fpc 4 pic 0]
user@host# set port 0 speed 100G
user@host# set port 1 speed 100G
user@host# set port 3 speed 40G
user@host# set port 6 speed 100G
user@host# set port 7 speed 100G
```

```
user@host# set port 8 speed 40g
```

**NOTE:** All the twelve ports of MIC-MRATE support 10-Gbps and 40-Gbps port speeds. On MPC8E with MIC-MRATE, you can configure 4 ports out of the twelve MIC-MRATE ports with a port speed of 100 Gbps. On MPC9E with MIC-MRATE, you can configure 8 ports out of the twelve MIC-MRATE ports with a port speed of 100 Gbps.

3. Verify the configuration.

```
[edit chassis fpc 4 pic 0]
user@host# show
port 0 {
    speed 100g;
}
port 1 {
    speed 100g;
}
port 3 {
    speed 40g;
}
port 6 {
    speed 100g;
}
port 7 {
    speed 100g;
}
port 8 {
    speed 40g;
}
```

4. Commit your configuration changes.

In this example, you have configured 4 ports on MIC-MRATE with port speed of 100 Gbps and 2 ports with port speed of 40 Gbps. The total capacity per MIC, based on this configuration, is 480 Gbps. MIC-MRATE has two Packet Forwarding Engines. The forwarding capacity for each Packet Forwarding Engine is 400 Gbps for MPC9E and 240 Gbps for MPC8E. The configured value does not exceed the forwarding capacity and so is a valid configuration.

- [Understanding Rate Selectability on page 176](#)

## Configuring Rate Selectability on MPC7E (Multi-Rate) to Enable Different Port Speeds

Each of the six ports of PIC 0 and PIC 1 of an MPC7E-MRATE MPC supports port speeds of 10 Gbps and 40 Gbps. However, only ports 2 and 5 of both the PICs support port speed of 100 Gbps. Because the MPC7E-MRATE MPC is rate-selectable, you can choose to configure all supported ports of the MPC to operate at the same supported speed or configure all the ports at different supported speeds.

You configure rate selectability at the PIC level if you intend to operate all the ports of the MPC7E-MRATE MPC at the same speed. That is, you can choose to configure the PIC to operate at a supported speed, and then all the *supported ports* of the PIC operate at the configured speed. For example, if you choose to configure PIC 0 at 100-Gbps speed, only ports 2 and 5 of PIC 0 operate at 100-Gbps speed, while the other ports of the PIC are disabled. Similarly, if you choose to configure PIC 0 at 10-Gbps or 40-Gbps speed, all the ports of the PIC are enabled to operate at those speeds. Additionally, you can prevent oversubscription by specifying the number of active physical ports that operate at 10-Gbps, 40-Gbps, and 100-Gbps speeds.

You configure rate selectability at the port level if you intend to operate different ports of the MPC7E-MRATE MPC at different supported speeds. That is, you configure each port to operate at a supported speed.

**NOTE:** The MPC7E-MRATE MPC supports an aggregate bandwidth of 480 Gbps, and each of the two PICs supports a bandwidth limit of 240 Gbps. If the aggregate port capacity configured exceeds 240 Gbps per PIC, the configuration is not supported.

- [Configuring Rate Selectability at PIC Level on page 201](#)
- [Configuring Rate Selectability at Port Level on page 203](#)

### Configuring Rate Selectability at PIC Level

To configure rate selectability at the PIC level:

1. In configuration mode, navigate to the `[edit chassis fpc fpc-slot pic pic-number]` hierarchy level.

```
[edit ]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit ]
user@host# edit chassis fpc 4 pic 0
```

2. Configure the **pic-mode** statement to set the operating speed for the PIC's ports. According to your requirements, you can choose from the options **10G**, **40G**, or **100G**.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set pic-mode pic-speed
```

For example:

```
[edit chassis fpc 4 pic 0]
user@host# set pic-mode 10G
```

- (Optional) To prevent oversubscription, you can choose to configure the number of ports that operate at the mode configured in Step 2.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set number-of-ports number-of-active-physical-ports
```

For example:

```
[edit chassis fpc 4 pic 0]
user@host# set number-of-ports 6
```

- Verify the configuration.

```
[edit chassis fpc 4 pic 0]
user@host# show
pic-mode 10G;
number-of-ports 6;
```

- Commit your configuration changes.

If the **number-of-ports** statement is *not* configured, all the ports that support the speed configured in Step 2 are enabled. That is, depending on that selection, ports 0 through 5 are enabled for speeds of 10-gigabit or 40-gigabit, while ports 2 and 5 are enabled for 100-gigabit. [Table 32 on page 190](#) lists the physical ports that are enabled when the **number-of-ports** statement is configured.

**Table 40: Active Physical Ports on MPC7E-MRATE MPC Based on the number-of-ports Configuration**

Ports Configured (number-of-ports Statement)	Active Physical Ports for Different Configured Speeds		
	10-Gigabit	40-Gigabit	100-Gigabit
1	0	0	2
2	0, 1	0, 1	2, 5
3	0, 1, 2	0, 1, 2	2, 5
4	0, 1, 2, 3	0, 1, 2, 3	2, 5
5	0, 1, 2, 3, 4	0, 1, 2, 3, 4	2, 5

Table 40: Active Physical Ports on MPC7E-MRATE MPC Based on the number-of-ports Configuration (continued)

Ports Configured (number-of-ports Statement)	Active Physical Ports for Different Configured Speeds		
	10-Gigabit	40-Gigabit	100-Gigabit
6	0, 1, 2, 3, 4, 5	0, 1, 2, 3, 4, 5	2, 5

## Configuring Rate Selectability at Port Level

To configure rate selectability at the port level:

1. In configuration mode, navigate to the `[edit chassis fpc fpc-slot pic pic-number]` hierarchy level.

```
[edit ]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit ]
user@host# edit chassis fpc 4 pic 0
```

2. To indicate the speed at which the ports operate, configure the **speed** statement for the desired ports. According to your requirements, you can choose the **10g**, **40g**, or **100g** speed options.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set port port-number speed (10g | 40g | 100g)
```

For example:

```
[edit chassis fpc 4 pic 0]
user@host# set port 0 speed 10g
user@host# set port 1 speed 10g
user@host# set port 2 speed 100g
user@host# set port 3 speed 40g
```

**NOTE:** All the six ports of PIC 0 and PIC 1 of an MPC7E-MRATE MPC support 10-Gbps and 40-Gbps port speeds. However, only ports 2 and 5 of both the PICs support 100-Gbps speed.

3. Verify the configuration.

```
[edit chassis fpc 4 pic 0]
user@host# show
port 0 {
    speed 10g;
}
```

```
port 1 {  
    speed 10g;  
}  
port 2 {  
    speed 100g;  
}  
port 3 {  
    speed 40g;  
}
```

4. Commit your configuration changes.

---

**NOTE:**

Note the following when configuring rate selectability on an MPC7E-MRATE MPC:

- If rate selectability is not configured, all ports of the MPC7E-MRATE MPC operate as four 10-Gigabit Ethernet interfaces by default. Therefore, when booting the MPC:
    - If rate selectability is not configured or if invalid port speeds are configured, each port operates as four 10-Gigabit Ethernet interfaces. An alarm is generated to indicate that the ports of the MPC7E-MRATE MPC are operating as four 10-Gigabit Ethernet interfaces.
    - If valid port speeds are configured, the MPC PICs operate at the configured speed.
  - When you change an existing port speed configuration, you must reset the MPC for the configuration to take effect. Because resetting the MPC takes several minutes and as it affects all the Packet Forwarding Engines, you can choose to use the request chassis pic pic-slot *pic-slot-number* fpc-slot *fpc-slot-number* (online | offline) command to apply your configuration changes quickly. An alarm is generated indicating the change in port speed configuration.
  - When you change an existing port speed configuration with an *invalid* port speed configuration, an alarm is generated indicating that the port speed configuration is invalid. The MPC continues to operate using the previously configured valid port speed configuration. However, if the MPC or PIC is restarted with the committed invalid port configuration, all ports of the MPC operate as four 10-Gigabit Ethernet interfaces by default.
  - You cannot configure rate selectability at the PIC level and the port level simultaneously. Error messages are displayed when you try to commit such configurations.
  - When you configure rate selectability at the port level, only the configured ports are enabled. Other ports are disabled.
  - Logical interfaces can be created only on ports that are enabled.

## MX10003 MPC Rate-Selectability Overview

MX10003 MPC supports a Multi-Rate 12xQSFP28 Ethernet Modular Interface Card (MIC) and a fixed-port PIC (6xQSFP). The MX10003 Packet Forwarding Engine has 6x40GE QSFP ports on the fixed-port PIC and 12x100GE QSFP28 ports on the MIC. For more information see *MX10003 MPC (Multi-Rate)*. Rate selectability enables you to configure the port speed either at the port level or at the MIC level. To configure all ports to operate at the same speed, you configure rate selectability at the MIC or PIC level. For more information see “[Configuring Rate Selectability on MX10003 MPC at MIC/PIC Level](#)” on [page 217](#). To configure different port speeds for each port, you configure rate selectability at the port level, in which case only the ports that are configured are enabled. For more information see “[Configuring Rate Selectability on MX10003 MPC at Port Level](#)” on [page 218](#).

The ports on the MX10003 MPC are called rate-selectable or multirate ports as they support multiple port speeds. You can choose to configure all supported ports of the fixed port PIC or the MIC to operate at the same speed or configure all the ports at different supported speeds. However, all the PIC or MIC ports do not support all the port speeds. For example, you can choose to configure:

- A port in 4x10GE mode using QSFP-4x10GE optics and 4x10GE breakout cables.
- A port in 40GE mode using QSFP optics.
- A port in 100GE mode using QSFP28 optics.
- A port in 1GE mode (for the ports that is already operating in 10GE mode only) using QSFP-4x10GE optics on fixed PIC and non-MacSEC MIC.

### NOTE:

- You can use the [port-checker tool](#) to check whether the combination of ports you want to use is valid or not.
- You can use the [Hardware Compatibility Tool](#) to find information about the pluggable transceivers supported on MX10003 router.

The MX10003 MPC supports three Packet Forwarding Engines. The forwarding capacity of each Packet Forwarding Engine is 400Gbps which cannot be oversubscribed.

The MIC supports 12 ports. Each Packet Forwarding Engine is mapped to 4 ports of the MIC. Port 0 through port 3 are mapped to PFE0, port 4 through port 7 are mapped to PFE1, and port 8 through port 11 are mapped to PFE2. The fixed-port PIC supports 6 ports.

Each Packet Forwarding Engine is mapped to two ports of the fixed-port PIC. Port 0 and port 1 are mapped to PFE0, port 2 and port 3 are mapped to PFE1, and port 4 and port 5 are mapped to PFE2. You can use the command **show chassis pic fpc-slot slot-number pic-slot slot-number** to display Packet Forwarding Engine mapping information and port speed information.

[Table 41 on page 206](#) summarizes the Packet Forwarding Engine mapping and the supported port speeds.

**Table 41: Rate Selectability of MX10003 MPC**

PIC	Port Number	Port Speed Supported
PIC 0 (Fixed-port PIC)	0–5	40-Gigabit Ethernet 4x10-Gigabit Ethernet  <b>NOTE:</b> You can configure one or all 10G port operating in 4X10-Gigabit Ethernet mode to operate in 1-Gigabit Ethernet mode.
PIC 1 (Multi-Rate MIC)	0–11	100-Gigabit Ethernet 40-Gigabit Ethernet 4x10-Gigabit Ethernet  <b>NOTE:</b> On non-MACsec MIC, you can configure one or all the 4X10-Gigabit Ethernet port to 1-Gigabit Ethernet mode.

Starting with Junos OS Release 18.1R1, the non-MACsec MIC on the MX10003 routers support 1-Gigabit Ethernet mode also on 10-Gigabit Ethernet mode ports.

Each of the 100-Gigabit Ethernet or 40-Gigabit Ethernet port can be split to four 10-Gigabit Ethernet ports that can be configured to operate as 1-Gigabit Ethernet port. You can also use 4x10GE LR breakout optics (QSFP-4X10GE-LR) at the MX10003 end and 1-Gigabit Ethernet EX optics at the remote end. It is only optional to use Juniper optics (SFP-GE40KM) at the remote end, as any vendor's EX (not SX or LX) optics can be used. Refer to [Hardware Compatibility Tool](#) for the list of pluggable transceivers supported on MX10003 router.

On MX10003 routers, when the port operates in 10-Gbps speed, you can change the operating speed to 1Gbps using the configuration **speed 1G** as follows:

```
set interfaces interface-name gigether-options speed 1g
```

Refer [speed \(Gigabit Ethernet interface\)](#) for more details.

Once you commit this configuration, the operating speed of the 10-Gbps port changes to 1-Gbps speed, but the **show interface** command displays for the field **Physical interface** (that is, the interface name prefix) as **XE/\_/\_** and the **Speed Configuration** (that is, operating port speed) as **1GE**. On fixed-port PIC and non-MACsec MIC, you can configure one or all 10-Gbps port operating in 4X10-Gbps speed to operate in 1-Gbps speed.

1-Gbps speed is only supported in non-autonegotiation mode.

## NOTE:

- Any interface operating at 10-Gigabit Ethernet mode can be independently converted to 1-Gigabit Ethernet mode. For example, in multi-rate connections through split cables, when one of the ports operates at 1GE mode, the other three ports can still be configured in 1GE or 10GE mode.
- The MACsec MIC does not support 1-Gbps speed.
- The rate selectability at PIC level and port level does not support 1-Gbps speed. But you can configure the port configured at 10-Gbps speed to operate at 1-Gbps speed using the `speed (Gigabit Ethernet interface)` configuration statement at Gigabit Ethernet interface level.
- The 1-Gbps operation mode is only supported in non-autonegotiation mode.
- ISSU is not supported for the interfaces that are configured with 1-Gigabit Ethernet mode. If ISSU upgrade is carried out in 1-Gigabit Ethernet mode, then the behavior is unexpected and traffic loss can be expected. Refer *request vmhost software in-service-upgrade* for more details.

To view the speed configured for the interface, execute the `show interfaces extensive` command. The **Speed Configuration** output parameter in the command output indicates the current operation speed of the interface. If the interface is configured with 1-Gbps speed, then **Speed Configuration** displays **1G**; if the interface is configured with 10-Gbps speed, **Speed Configuration** displays **AUTO**.

For example:

```
user@host>show interfaces xe-0/1/11:0 extensive
Physical interface: xe-0/1/11:0, Enabled, Physical link is Up
Interface index: 284, SNMP ifIndex: 609, Generation: 383
Link-level type: Ethernet, MTU: 9192, MRU: 9200, LAN-PHY mode, Speed: 10Gbps,

  BPDU Error: None, Loop Detect PDU Error: None, MAC-REWRITE Error: None,
  Loopback: None, Source filtering: Disabled, Flow control: Enabled,
  Speed Configuration: 1G
...
```

In this example, the **Speed Configuration** output parameter displays 1G, which means the operation speed of xe-0/1/11:0 interface is 1-Gbps speed.

MX10003 MPC has an aggregate forwarding capacity of 1.2 Tbps and a forwarding capacity of 400 Gbps on each Packet Forwarding Engine. Oversubscription of Packet Forwarding Engine capacity is not supported. The demand on each Packet Forwarding Engine must be less than or equal to its forwarding capacity. For more information see, [“Supported Active Physical Ports for Configuring Rate Selectability to Prevent Oversubscription on MX10003 MPC” on page 192](#). For instance, for MX10003 MPC, the demand on each Packet Forwarding Engine must be less than or equal to 400 Gbps.

For example, on the fixed-port PIC, if you configure the port speed on one ports as 40 Gbps or on two port as 40 Gbps, then you can configure the ports on the MIC in one of the following ways:

- Three 100-Gigabit Ethernet interfaces
- Two 100-Gigabit Ethernet and two 40-Gigabit Ethernet interfaces
- Two 100-Gigabit Ethernet and eight 10-Gigabit Ethernet interfaces

The same rule is applicable to all Packet Forwarding Engines independently.

**NOTE:** Only the Interface that is already operating at 10GE mode can be configured to operate at 1GE mode using `speed (Gigabit Ethernet interface)` configuration statement as follows:

`set interfaces interface-name gigether-options speed lg`

Table 42 on page 208 summarizes the port mode configuration at the Packet Forwarding Engine level.

**Table 42: PFE Based Port Mode Configuration**

Port Speed configuration on PIC1(Gbps)				Port speed configuration on PIC0(Gbps)	
100	100	100	100	0	0
100	100	100	10/40	0	0
100	100	100	0	10/40	10/40
100	100	10/40	10/40	10/40	10/40
100	10/40	10/40	10/40	10/40	10/40
10/40	10/40	10/40	0	10/40	10/40
10/40	10/40	10/40	10/40	0	0

Table 43 on page 208 summarizes the PIC mode configuration.

**Table 43: PIC Mode Configuration**

Port Speed configuration on PIC1(Gbps)	Port speed configuration on PIC0(Gbps)
100	0 Configure the number of ports to 0.
10	10
40	40

Note the following caveats while configuring rate selectability on the MX10003 MPC:

- By default, the MX10003 router comes up with the PIC mode where all the interface operates at the same speed of 10-Gbps. That is, by default, both the PICs (PIC 0 and PIC 1) operate at 10-Gbps speed. To use different port speeds, you must first switch to the port mode and then change the default speed.

To change the default speed, you must select a port and configure a different port speed on it and reset both the PICs for the configuration to take effect. For example, select 40GE or 100GE on PIC 1 and 10GE on PIC 0. For this configuration to take effect, you must reset both PICs.

- Regardless of the line card— MIC (PIC1) or fixed-port PIC (PIC0) installed —you must configure *both the PICs and all the associated ports*, under the **[edit chassis]** hierarchy. Configuring ports on only one of the PICs results in an invalid configuration.
- The port speed configuration on the fixed-port PIC and the MIC must be homogenous. However, at port level you can configure port speeds in heterogeneous mode. For more information, see *Configuring Rate Selectability on MX10003 MPC at Port Level*.

For example, if you want to configure the port speed as 10 Gbps, the port speed of the fixed-port PIC and the MIC should be configured to 10 Gbps. If you want to configure the port speed as 40 Gbps, the port speed of the fixed-port PIC and the MIC should be configured to 40 Gbps. However, if you choose to configure all ports of the MX10003 MPC to operate as 100-Gigabit Ethernet interfaces, the ports on the MIC have to be configured to 100 Gbps and the **number-of-ports number-of-active-physical-ports** statement on the fixed-port PIC must be set to 0.

- When you configure rate selectability at the port level, only the configured ports are active. Other ports are disabled.
- When you choose an existing port speed configuration with an *invalid* port speed configuration, an alarm is generated indicating that the port speed configuration is invalid.
- You cannot configure the ports which will oversubscribe the Packet Forwarding Engine. For example, a combination of eleven 100-Gigabit Ethernet interfaces on the MIC and ten 10-Gigabit Ethernet interfaces on the fixed-port PIC will result in an invalid configuration. If you try to commit an invalid configuration, the configuration will get committed. However, the port will not be activated. You can execute the **show chassis alarms** to display the error message.
- You cannot configure rate selectability at the PIC level and the port level simultaneously. Error messages are displayed when you try to commit such configurations.

## Invalid Port Configuration

You cannot configure the ports which will oversubscribe the Packet Forwarding Engine.

For example, a combination of eleven 100-Gigabit Ethernet interfaces on the MIC and ten 10-Gigabit Ethernet interfaces on the fixed-port PIC will result in an invalid configuration. If you try to commit an invalid configuration, the configuration will get committed. However, the port will not be activated. You can execute the **show chassis alarms** to display the error message. The valid configuration in this case would be eleven

100-Gigabit Ethernet interfaces on the MIC and eight 10-Gigabit Ethernet interfaces on the fixed-port PIC.

#### Release History Table

Release	Description
18.1R1	Starting with Junos OS Release 18.1R1, the non-MACsec MIC on the MX10003 routers support 1-Gigabit Ethernet mode also on 10-Gigabit Ethernet mode ports.

## MX204 Router Rate-Selectability Overview

The maximum amount of data that can be transmitted through a port at any given second either by a network device or by a component of the network device (such as a line card) is known as the port speed. Port speed is measured in kilobits per second (Kbps), gigabits per second (Gbps), and terabits per second (Tbps). If a port can be configured to support both single and multiple speeds, the port is known as a rate-selectable port. Because the port is part of a network device (router or switch) or a network component (such as MPC, MIC) the component is known as a rate-selectable component. Rate selectability enables you to configure different port speeds at the port level or at the PIC level.

The MX204 has four rate-selectable ports (referred to as PIC 0 ports) that can be configured as 100-Gigabit Ethernet ports or 40-Gigabit Ethernet port, or each port can be configured as four 10-Gigabit Ethernet ports (by using a breakout cable). The MX204 also has eight 10-Gigabit Ethernet ports (referred to as PIC 1 ports). On PIC 0 and PIC 1, you can configure the 10-Gigabit Ethernet port(s) to operate in 1-Gigabit Ethernet mode (using [speed \(Gigabit Ethernet interface\)](#) command). The four rate-selectable ports supports QSFP28/QSFP+ transceivers, whereas the eight 10-Gigabit Ethernet ports supports SFP+ transceivers. Knowing the exact details of the port speeds for the PICs helps you to choose the speeds to configure on the ports or on the PICs. You can view the port speeds of the PIC by executing [show chassis pic](#) command. For more information, see [“MX204 Router Overview” on page 45](#) and [“Supported Active Physical Rate-Selectable Ports to Prevent Oversubscription on MX204 Router” on page 193](#).

**NOTE:**

- By default, the MX204 router comes up with the PIC mode where all the interface operates at the same speed of 10-Gbps. that is, by default, both the PICs (PIC 0 and PIC 1) operate at 10-Gbps speed. To use different port speeds, you must first switch to the port mode and then change the default speed.

To change the default speed, you must select a port and configure a different port speed on it and reset both the PICs for the configuration to take effect. For example, select 40GE or 100GE on PIC 0 and 10GE on PIC 1. For this configuration to take effect, you must reset both PICs.

- You can use the [port-checker tool](#) to check whether the combination of ports you want to use is valid or not.
- You can use the [Hardware Compatibility Tool](#) to find information about the pluggable transceivers supported on MX204 router.

The MX204 router supports two types of rate selectability configuration options:

- **PIC Level Configuration:** To configure all ports to operate at the same speed, you configure rate selectability at the PIC level.
- **Port Level Configuration:** To configure different port speeds for each port, you configure rate selectability at the port level, in which case only the ports that are configured are enabled.

To configure all ports to operate at the same speed, configure rate selectability at the PIC level, in which case you cannot configure the speed of individual ports. To configure rate selectability at the PIC level, use the [pic-mode](#) statement and specify the port speed. To configure different port speeds for each port, configure rate selectability at the port level, in which case only the ports that are configured are enabled. To configure rate selectability at the port level, use the [speed](#) statement to specify the speed of individual ports.

The examples below show the sample CLI command output of the port speed capability of the 4-port PIC 0 with QSFP+ transceivers and the 8-port PIC 1 with SFP+ transceivers on the MX204 router.

```
user@host> show chassis pic fpc-slot 0 pic-slot 0
...

...	

Table 41 on page 206 summarizes the rate selectability of the MX204 routers.

**Table 44: Rate Selectability of MX204 Routers**

PIC	Port Number	Port Speed Supported
PIC 0	0–3	100-Gigabit Ethernet 40-Gigabit Ethernet 4x10-Gigabit Ethernet  <b>NOTE:</b> <ul style="list-style-type: none"> <li>Default port speed is 4x10 Gigabit Ethernet.</li> <li>Supports 1-Gbps speed on 10 Gigabit Ethernet ports.</li> </ul>
PIC 1	0–7	10 Gigabit Ethernet  <b>NOTE:</b> Supports 1-Gbps speed on 10 Gigabit Ethernet ports.

Starting with Junos OS Release 18.1R1, the 10-Gbps port can operate in 1-Gbps mode also.

Each of the four 100-Gigabit Ethernet or 40-Gigabit Ethernet port can be split to four 10-Gigabit Ethernet ports that can be configured to operate as 1-Gigabit Ethernet port. You can also use 4x10GE LR breakout optics (QSFP-4X10GE-LR) at the MX204 end and 1-Gigabit Ethernet EX optics at the remote end. It is only optional to use Juniper optics (SFP-GE40KM) at the remote end, as any vendor's EX (not SX or LX) optics can be used. Refer to [Hardware Compatibility Tool](#) for the list of pluggable transceivers supported on MX204 router.

MX204 router also support 1-Gigabit Ethernet port on the fixed 10-Gigabit Ethernet SFP ports with 1GE SFPs in it.

On MX204 routers, when the port is operating in 10-Gbps speed, you can change the operating speed to 1Gbps using the configuration statement **Speed 1G** as follows:

```
set interfaces interface-name gigether-options speed 1g
```

Refer [speed \(Gigabit Ethernet interface\)](#) for more details.

Once you commit this configuration, the operating speed of the 10-Gbps port changes to 1-Gbps speed, but the **show interface** command displays for the field **Physical interface** (that is, the interface name prefix) as **XE /\_/\_** and the **Speed Configuration** (that is, operating port speed) as **1GE**.

On MRATE PIC, each channel per port can be configured individually as 1-Gigabit Ethernet port.

#### NOTE:

- The interface name prefix must be **xe**.
- The rate selectability at PIC level and port level does not support 1-Gbps speed. But you can configure the port configured at 10-Gbps speed to operate at 1-Gbps speed using the **speed (Gigabit Ethernet interface)** configuration statement at Gigabit Ethernet interface level.
- The 1-Gbps operation mode is supported with **speed 1g** configuration. For optics other than SFP-T, in 1G mode, the peer interfaces must be configured to non-autonegotiation mode.

To view the speed configured for the interface, execute the **show interfaces extensive** command. The **Speed Configuration** output parameter in the command output indicates the current operation speed of the interface. If the interface is configured with 1-Gbps speed, then **Speed Configuration** displays 1G; if the interface is configured with 10-Gbps speed, Speed Configuration displays AUTO.

For example:

```
user@host>show interfaces xe-0/1/11:0 extensive
Physical interface: xe-0/1/11:0, Enabled, Physical link is Up
Interface index: 284, SNMP ifIndex: 609, Generation: 383
Link-level type: Ethernet, MTU: 9192, MRU: 9200, LAN-PHY mode, Speed: 10Gbps,

  BPDU Error: None, Loop Detect PDU Error: None, MAC-REWRITE Error: None,
  Loopback: None, Source filtering: Disabled, Flow control: Enabled,
  Speed Configuration: 1G
...
```

In this example, the **Speed Configuration** output parameter displays 1G, which means the operation speed of xe-0/1/11:0 interface is 1-Gbps speed.

## User-Configurable Rate Selectability of MX204 Routers

You can also configure rate selectability on MX204 routers.

[Table 45 on page 214](#) summarizes the user-configurable rate selectability of MX204 routers.

Table 45: Configurable Rate Selectability of MX204 Router

Port Speed Configuration on PIC 0 (Gbps)	Port Speed Configuration on PIC 1 (Gbps)
100	0 Configure the number of active ports to 0.
10	10
40	0 Configure the number of active ports to 0.

Only the Interface that is already operating at 10GE mode can be configured to operate at 1GE mode using `speed (Gigabit Ethernet interface)` configuration statement as follows:

**set interfaces *interface-name* gigether-options speed *lg***

**NOTE:** The MX204 router does not support heterogeneous mode. That is, in PIC mode if 40-Gbps or 100-Gbps speed is configured on PIC 0, then the `number-of-ports` on PIC 1 must be configured to 0 only.

## Maximum number of 10/40/100GE ports Configurable at PIC and Port Mode

Following table summarizes the maximum number of 10/40/100 Gigabit Ethernet ports per PIC configurable at PIC and port levels:

Table 46: Maximum number of 10/40/100 Gigabit Ethernet ports Configurable at PIC and Port Level

Maximum Ports	Maximum Ports configurable at PIC Mode (on both PIC0 and PIC1)	Maximum Ports Configurable at Port Mode (on both PIC0 and PIC1)
10/1 Gigabit Ethernet Ports	24  Which means 16 ports from PIC 0 and 8 Ports from PIC 1.	20  Which means 12 ports from PIC 0 and 8 Ports from PIC 1.
40 Gigabit Ethernet Ports	4  Only 4 ports from PIC 0 as PIC 1 supports only 10 Gbps Speed.	4
100 Gigabit Ethernet Ports	4  Only 4 ports from PIC 0 as PIC 1 supports only 10 Gbps Speed.	4

## Port Configuration - PIC Level

On PIC 0, if each of the four ports is configured to operate at 100-Gbps speed, then you must configure all the 8 ports at PIC 1 to 0 (using `number-of-ports` statement). On PIC

0, if ports 0, 1, and 2 are set to 100-Gbps, and port 3 is set to 10-Gbps or 40-Gbps, then you should configure all the 8 ports at PIC 1 to 0 (using **number-of-port** statement), and so on as listed in the below table.

The following table only lists few valid combination of port speeds on PIC 0 and PIC1 of MX204 router. You are not limited to configure only the below mentioned example port configurations. For more valid port configuration values, refer [port-checker tool](#).

Table 47: Port Configuration at PIC Level in MX204 Routers

Port Mode											
PIC 0				PIC 1							
100	100	100	100	0							
Configure the number of active ports to 0.											
100	100	100	10/40	0							
Configure the number of active ports to 0.											
100	100	10/40	10/40	10	10	10	10	10	10	10	10
100	10/40	10/40	10/40	10	10	10	10	10	10	10	10
10/40	10/40	10/40	10/40	0							
Configure the number of ports to 0.											
PIC Mode											
PIC 0 (with four rate-selectable ports)							PIC 1 (with eight 10-Gigabit Ethernet ports)				
100	100		100	100			0				
							Configure the number of active ports to 0.				
40	40		40	40			0				
							Configure the number of active ports to 0.				
10	10		10	10			10				
							Configure all the eight 10-Gigabit Ethernet ports to 10.				

**NOTE:** Only the Interface that is already operating at 10GE mode can be configured to operate at 1GE mode using **speed (Gigabit Ethernet interface)** configuration statement as follows:

```
set interfaces interface-name gigether-options speed lg
```

#### Release History Table

Release	Description
18.1R1	Starting with Junos OS Release 18.1R1, the 10-Gbps port can operate in 1-Gbps mode also.

## Configuring Rate Selectability on MX10003 MPC to Enable Different Port Speeds

Rate selectability enables you to configure the port speed either at the port level or at the MIC level. To configure all ports to operate at the same speed, configure rate selectability at the MIC level, in which case you cannot configure the speed of individual ports. To configure rate selectability at the MIC level, use the **pic-mode** statement and specify the port speed. To configure different port speeds for each port, configure rate selectability at the port level, in which case only the ports that are configured are enabled. To configure rate selectability at the port level, use the **speed** statement to specify the speed of individual ports. This topic describes how to configure port speeds at the port level and at the MIC or PIC level.

**NOTE:** Regardless of the line card— MIC (PIC1) or fixed-port PIC (PIC0) installed—you must configure *both the PICs and all the associated ports*, under the [edit chassis] hierarchy. Configuring ports on only one of the PICs results in an invalid configuration.

- [Configuring Rate Selectability on MX10003 MPC at MIC/PIC Level on page 217](#)
- [Configuring Rate Selectability on MX10003 MPC at Port Level on page 218](#)

## Configuring Rate Selectability on MX10003 MPC at MIC/PIC Level

To configure all ports to operate at the same speed, configure rate selectability at the MIC or PIC level. When you configure rate selectability at the MIC or PIC level, all the ports of the MIC that support the configured speed operate at that speed. To prevent oversubscription and to ensure a guaranteed bandwidth, specify the number of active ports that operate at the configured speed by using the **number-of-ports** *number-of-active-physical-ports* statement. The MX10003 MPC supports port speeds of 10 Gbps, 40 Gbps, and 100 Gbps.

To configure rate selectability at the MIC/PIC level:

1. In configuration mode, navigate to the **[edit chassis fpc fpc-slot pic pic-number]** hierarchy level.

```
[edit ]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit ]
user@host# edit chassis fpc 0 pic 0
```

2. Configure the **pic-mode pic-speed** statement to set the operating speed for the MIC. All ports of the MIC that support the configured speed operate at the configured speed. Values for the **pic-speed** option are 10G, 40G, and 100G.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set pic-mode pic-speed
```

For example:

```
[edit chassis fpc 0 pic 0]
user@host# set pic-mode 10G
```

3. (Optional) To prevent oversubscription, you can choose to configure the number of active ports that operate at the port speed configured in Step 2. For information about the number of active ports and specific port numbers on the MX10003 MPC, see [“Supported Active Physical Ports for Configuring Rate Selectability to Prevent Oversubscription on MX10003 MPC”](#) on page 192.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set number-of-ports number-of-active-physical-ports
```

For example:

```
[edit chassis fpc 0 pic 0]
user@host# set number-of-ports 8
```

4. Verify the configuration.

```
[edit chassis fpc 0 pic 0]
user@host# show
pic-mode 10G;
number-of-ports 8;
```

5. Commit your configuration changes.

In this example, you have configured 8 ports on the MPC with port speed of 10 Gbps. The other ports are disabled.

## Configuring Rate Selectability on MX10003 MPC at Port Level

To configure different port speeds for each port, you configure rate selectability at the port level. Only the ports that are configured are enabled. Other ports are automatically disabled. Configuring rate selectability at the port level provides you the flexibility of operating individual ports of the PIC at different supported speeds.

If you want to configure a port speed of 40 Gbps on the MIC and the fixed-port PIC, you can choose any of the following example configurations:

- Configure one port of the fixed-port PIC as a 40-Gigabit Ethernet interface and three ports of the MIC as 40-Gigabit Ethernet interfaces.
- Configure two ports of the fixed-port PIC as 40-Gigabit Ethernet interfaces and three ports of the MIC as 40-Gigabit Ethernet interfaces.
- Configure three ports of the MIC as 40-Gigabit Ethernet interfaces and two ports of the fixed-port PIC as 40-Gigabit Ethernet interfaces.
- Configure four ports of the MIC as 40-Gigabit Ethernet interfaces only.

**NOTE:** While configuring rate selectability, when you switch to PIC mode from port mode or vice-versa, the PIC is reset automatically. However, when you change the port speed at the port level, the PIC has to be reset by executing the `request chassis pic pic-slot mic-slot-number fpc-slot fpc-slot-number (offline | online)` command. For guidelines on configuring rate selectability, see [“Guidelines for Configuring Rate Selectability” on page 179](#).

To configure rate selectability at the port level:

1. In configuration mode, navigate to the `[edit chassis fpc fpc-slot pic pic-number]` hierarchy level.

```
[edit ]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit ]
user@host# edit chassis fpc 0 pic 0
```

- To indicate the speed at which the ports operate, configure the **speed** statement for the desired ports. According to your requirements, you can choose the 10G, 40G, and 100G speed options.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set port port-number speed (10G | 40G | 100G)
```

For example:

```
[edit chassis fpc 0 pic 0]
user@host# set port 0 speed 10G
user@host# set port 1 speed 10G
user@host# set port 3 speed 40G
```

- Verify the configuration.

```
[edit chassis fpc 0 pic 0]
user@host# show
port 0 {
    speed 10g;
}
port 1 {
    speed 10g;
}
port 3 {
    speed 40g;
}
```

- Commit your configuration changes.

In this example, you have configured 2 ports with port speed of 10 Gbps and 1 port with port speed of 40 Gbps.

**NOTE:** Starting in Junos OS Release 18.1R1, the 10-Gbps port can operate in 1-Gbps mode also using the [speed \(Gigabit Ethernet interface\)](#) configuration statement at Gigabit Ethernet interface level. Refer to “[MX10003 MPC Rate-Selectability Overview](#)” on page 205 for more details.

#### Related Documentation

## Configuring Rate Selectability on MX204 to Enable Different Port Speeds

---

Rate selectability enables you to configure the port speed either at the port level or at the PIC level. To configure all ports to operate at the same speed, configure rate selectability at the PIC level, in which case you cannot configure the speed of individual ports. To configure rate selectability at the PIC level, use the `pic-mode` statement and specify the port speed. To configure different port speeds for each port, configure rate selectability at the port level, in which case only the ports that are configured are enabled. To configure rate selectability at the port level, use the `speed` statement to specify the speed of individual ports. This topic describes how to configure port speeds at the port level and at the PIC level.

Note the following caveats while configuring rate selectability on the MX204 routers:

- If rate selectability is not configured, all ports of the MX204 router operate as 10-Gigabit Ethernet interfaces.
- In PIC mode, the MX204 router does not support heterogeneous mode. That is, in PIC mode if 40-Gbps or 100-Gbps speed is configured on PIC 0, then the `number-of-ports` on PIC 1 must be configured to 0 only. For more information, see “MX204 Router Rate-Selectability Overview” on page 210.
- The heterogeneous mode is supported only on port mode.
- When you configure rate selectability at the port level, only the configured ports are active. Other ports are disabled.
- When you choose an existing port speed configuration with an *invalid* port speed configuration, an alarm is generated indicating that the port speed configuration is invalid.
- You cannot configure rate selectability at the PIC level and the port level simultaneously. Error messages are displayed when you try to commit such configurations.
- [Configuring Rate Selectability on MX204 at PIC Level on page 220](#)
- [Configuring Rate Selectability on MX204 at Port Level on page 222](#)

### Configuring Rate Selectability on MX204 at PIC Level

To configure all ports to operate at the same speed, you configure rate selectability at the PIC level. When you configure rate selectability at the PIC level, all the ports of the PIC that support the configured speed operate at that speed. To prevent oversubscription and ensure a guaranteed bandwidth, you can specify the number of active ports that operate at the configured speed by using the `number-of-ports` **`number-of-active-physical-ports`** statement. The MX204 has four rate-selectable ports (referred to as PIC 0 ports) that can be configured as 100-Gigabit Ethernet ports or 40-Gigabit Ethernet port, or each port can be configured as four 10-Gigabit Ethernet ports (by using a breakout cable). The MX204 also has eight 10-Gigabit Ethernet ports (referred to as PIC 1 ports).

To configure rate selectability at the PIC level:

1. In configuration mode, navigate to the `[edit chassis fpc fpc-slot pic pic-number]` hierarchy level.

```
[edit ]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit ]
user@host# edit chassis fpc 0 pic 0
```

2. Configure the `pic-mode pic-speed` statement to set the operating speed for the PIC. All ports of the PIC that support the configured speed operate at the configured speed. Values for the `pic-speed` option are **10G**, **40G**, and **100G**.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set pic-mode pic-speed
```

For example:

```
[edit chassis fpc 0 pic 0]
user@host# set pic-mode 10G
```

3. (Optional) To prevent oversubscription, you can choose to configure the number of active ports that operate at the port speed configured in Step 2. For information about the number of active ports and specific port numbers on the MX204 routers see [“Supported Active Physical Rate-Selectable Ports to Prevent Oversubscription on MX204 Router” on page 193](#).

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set number-of-ports number-of-active-physical-ports
```

For example:

```
[edit chassis fpc 0 pic 0]
user@host# set number-of-ports 4
```

4. Verify the configuration.

```
[edit chassis fpc 0 pic 0]
user@host# show
pic-mode 10G;
number-of-ports 4;
```

5. Commit your configuration changes.

In this example, you have configured 4 ports on the PIC0 with port speed of 10 Gbps.

## Configuring Rate Selectability on MX204 at Port Level

To configure different port speeds for each port, you configure rate selectability at the port level. Only the ports that are configured are enabled. Other ports are automatically disabled. Configuring rate selectability at the port level provides you the flexibility of operating individual ports of the PIC at different supported speeds.

**NOTE:** When you change the port speed at the port level, you must reset the PIC for the configuration to take effect. Resetting the PIC takes several minutes and affects all the Packet Forwarding Engines. To avoid this, use the `request chassis pic pic-slot pic-slot-number fpc-slot fpc-slot-number (offline | online)` command to reset the PIC and apply your configuration changes. An alarm is generated indicating the change in port speed. For guidelines on configuring rate selectability, see [“Guidelines for Configuring Rate Selectability” on page 179](#).

To configure rate selectability at the port level:

1. In configuration mode, navigate to the `[edit chassis fpc fpc-slot pic pic-number]` hierarchy level.

```
[edit ]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit ]
user@host# edit chassis fpc 0 pic 0
```

2. To indicate the speed at which the ports operate, configure the **speed** statement for the desired ports. According to your requirements, you can choose the **10G**, **40G**, or **100G** speed options.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set port port-number speed (10G | 40G | 100G)
```

For example:

```
[edit chassis fpc 0 pic 0]
user@host# set port 0 speed 100G
user@host# set port 1 speed 40G
user@host# set port 2 speed 40G
user@host# set port 3 speed 10G
```

3. Verify the configuration.

```
[edit chassis fpc 0 pic 0]
user@host# show
```

```

port 0 {
    speed 100g;
}
port 1 {
    speed 40g;
}
port 2 {
    speed 40g;
}
port 3 {
    speed 10g;
}
}

```

4. Commit your configuration changes.

In this example, you have configured 2 ports on the PICO with port speed of 40 Gbps, 1 port with port speed of 10 Gbps, and 1 port with port speed of 100 Gbps.

**NOTE:** Starting in Junos OS Release 18.1R1, the 10-Gbps port can operate in 1-Gbps mode also using the [speed \(Gigabit Ethernet interface\)](#) configuration statement at Gigabit Ethernet interface level. Refer to “[MX10003 MPC Rate-Selectability Overview](#)” on page 205 for more details.

## Configuring Rate Selectability on JNP10K-2101 MPC to Enable Different Port Speeds

Rate selectability enables you to configure the port speed either at the port level or at the PIC level. To configure all ports to operate at the same speed, configure rate selectability at the PIC level, in which case you cannot configure the speed of individual ports. To configure rate selectability at the PIC level, use the **pic-mode** statement and specify the port speed. To configure different port speeds for each port, configure rate selectability at the port level, in which case only the ports that are configured are enabled. To configure rate selectability at the port level, use the **speed** statement to specify the

speed of individual ports. This topic describes how to configure port speeds at the port level and at the PIC level.

- [Configuring Rate Selectability on JNP10K-2101 MPC at PIC Level on page 224](#)
- [Configuring Rate Selectability on JNP10K-LC2101 MPC at Port Level on page 225](#)

## Configuring Rate Selectability on JNP10K-2101 MPC at PIC Level

To configure all ports to operate at the same speed, configure rate selectability at the PIC level. When you configure rate selectability at the PIC level, all the ports of the PIC that support the configured speed operate at that speed. To prevent oversubscription and to ensure a guaranteed bandwidth, specify the number of active ports that operate at the configured speed by using the **number-of-ports** *number-of-active-physical-ports* statement. The JNP10K-LC2101 MPC supports port speeds of 10 Gbps, 40 Gbps, and 100 Gbps.

To configure rate selectability at the PIC level:

1. In configuration mode, navigate to the **[edit chassis fpc fpc-slot pic pic-number]** hierarchy level.

```
[edit ]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit ]
user@host# edit chassis fpc 5 pic 2
```

2. Configure the **pic-mode** *pic-speed* statement to set the operating speed for the PIC. All ports of the PIC that support the configured speed operate at the configured speed. Values for the *pic-speed* option are 10G, 40G, and 100G.

**NOTE:** When you configure the **pic-mode** as 100 Gbps and the Packet Forwarding Engine bandwidth is 240 Gbps, only the first two ports support 100 Gbps. The other ports are disabled.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set pic-mode pic-speed
```

For example:

```
[edit chassis fpc 5 pic 2]
user@host# set pic-mode 10G
```

3. (Optional) To prevent oversubscription, you can choose to configure the number of active ports that operate at the port speed configured in Step 2.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set number-of-ports number-of-active-physical-ports
```

For example:

```
[edit chassis fpc 5 pic 2]
user@host# set number-of-ports 2
```

4. Verify the configuration.

```
[edit chassis fpc 5 pic 2]
user@host# show
pic-mode 10G;
number-of-ports 2;
```

5. Commit your configuration changes.

In this example, you have configured 2 ports on the MPC with port speed of 10 Gbps. The other ports are disabled.

## Configuring Rate Selectability on JNP10K-LC2101 MPC at Port Level

To configure different port speeds for each port, you configure rate selectability at the port level. Only the ports that are configured are enabled. Other ports are automatically disabled. Configuring rate selectability at the port level provides you the flexibility of operating individual ports of the PIC at different supported speeds.

**NOTE:** While configuring rate selectability, when you switch to PIC mode from port mode or vice-versa, the PIC is reset automatically. However, when you change the port speed at the port level, the PIC has to be reset by executing the `request chassis pic pic-slot pic-slot-number fpc-slot fpc-slot-number (offline | online)` command. For guidelines on configuring rate selectability for JNP10K-LC2101, see [“Guidelines for Configuring Rate Selectability” on page 179](#).

To configure rate selectability at the port level:

1. In configuration mode, navigate to the `[edit chassis fpc fpc-slot pic pic-number]` hierarchy level.

```
[edit ]
user@host# edit chassis fpc fpc-slot pic pic-number
```

For example:

```
[edit ]
user@host# edit chassis fpc 0 pic 0
```

- To indicate the speed at which the ports operate, configure the **speed** statement for the desired ports. According to your requirements, you can choose the 10G, 40G, and 100G speed options.

**NOTE:** If you configure the speed as 100 Gbps for 3 ports and the Packet Forwarding Engine bandwidth is 240 Gbps, an alarm is raised as it is an invalid configuration. The value of only the first two ports support 100 Gbps. The other ports are disabled.

```
[edit chassis fpc fpc-slot pic pic-number]
user@host# set port port-number speed (10G | 40G | 100G)
```

For example:

```
[edit chassis fpc 0 pic 0]
user@host# set port 0 speed 10G
user@host# set port 1 speed 10G
user@host# set port 3 speed 40G
```

- Verify the configuration.

```
[edit chassis fpc 0 pic 0]
user@host# show
port 0 {
    speed 10g;
}
port 1 {
    speed 10g;
}
port 3 {
    speed 40g;
}
```

- Commit your configuration changes.

In this example, you have configured 2 ports with port speed of 10 Gbps and 1 port with port speed of 40 Gbps.

# Port Mirroring Instances Configuration Overview

- [Understanding Port-Mirroring Instances on Different Routers on page 227](#)
- [Configuring Port-Mirroring Instances on M320 Routers on page 228](#)
- [Configuring Port-Mirroring Instances on M120 Routers on page 228](#)
- [Configuring Port-Mirroring Instances on MX Series 5G Universal Routing Platforms on page 229](#)

## Understanding Port-Mirroring Instances on Different Routers

---

You can configure port mirroring for IPv4 and IPv6 traffic on all M Series, T Series, and MX Series routers. In addition, on the M7i, M10i, M120, M320, and MX Series routers, you can configure port mirroring for Layer 2 VPLS traffic.

You configure global port mirroring by including the **port-mirroring** statement at the **[edit forwarding-options]** hierarchy level. Configuring port-mirroring properties globally results in the properties being applied system-wide to all the Packet Forwarding Engines and their respective ports.

On MX Series, M320, and M120 routers, you can configure named port-mirroring instances for Layer 2 VPLS traffic. Configuring port-mirroring instances enables you to customize each instance with different properties for input-sampling and port-mirroring output destinations, instead of having to use a single system-wide configuration for port mirroring.

You configure multiple port-mirroring instances by including the **instance port-mirroring-instance-name** statement at the **[edit forwarding-options port-mirroring]** hierarchy level. You can then associate individual port-mirroring instances with an FPC, PIC, or FEB (depending on the router).

**NOTE:** When you configure port-mirroring for the same traffic flow twice, for example, for family Inet and family VPLS, you must configure separate named port-mirror instances for each traffic flow. Inheriting port-mirroring parameters from another instance might result in unexpected behavior.

For more information about configuring port mirroring on all routers, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide*. For more information on configuring port mirroring for Layer 2 VPLS traffic on MX Series routers, see the *Junos OS Layer 2 Configuration Guide*.

  - [Configuring Port-Mirroring Instances on M120 Routers on page 228](#)

---

## Configuring Port-Mirroring Instances on M320 Routers

You can associate only one port-mirroring instance with a specific FPC on an M320 router.

To associate a port-mirroring instance with a specific FPC, include the **port-mirror-instance** *port-mirroring-instance-name* statement at the **[edit chassis fpc slot-number]** hierarchy level:

```
[edit chassis]
fpc slot-number {
  port-mirror-instance port-mirroring-instance-name;
}
```

The properties of the port-mirroring instance associated with an FPC override any global port-mirroring properties (configured by including the **port-mirroring** statement at the **[edit forwarding-options]** hierarchy level.)

NOTE:

- Layer 2 VPLS port mirroring is supported only for Enhanced III FPCs on M320 routers.
- Ensure that the *port-mirroring-instance-name* specified at the **[edit chassis fpc slot-number]** hierarchy level matches the *port-mirroring-instance-name* configured at the **[edit forwarding-options port-mirroring instance port-mirroring-instance-name]** hierarchy level.

- Related Documentation**
- [Understanding Port-Mirroring Instances on Different Routers on page 227](#)

---

## Configuring Port-Mirroring Instances on M120 Routers

You can associate only one port-mirroring instance with a specific FEB on an M120 router.

To associate a port-mirroring instance with a FEB, include the **port-mirror-instance** *port-mirroring-instance-name* statement at the **[edit chassis feb slot-number]** hierarchy level:

```
[edit chassis]
feb slot-number {
  port-mirror-instance port-mirroring-instance-name;
}
```

The properties of the port-mirroring instance associated with the FEB override any global port-mirroring properties (configured by including the **port-mirroring** statement at the **[edit forwarding-options]** hierarchy level.)

**NOTE:** In a FEB redundancy group, you must associate a port-mirroring instance only with the primary FEB. During failover or switchover, the port-mirroring instance is automatically associated with the backup FEB that fails over or switches over as the primary FEB.

For information about configuring FPC-to-FEB connectivity on an M120 router, see “Configuring the Junos OS to Support FPC to FEB Connectivity on M120 Routers” on page 432.

#### Related Documentation

- [Understanding Port-Mirroring Instances on Different Routers on page 227](#)

## Configuring Port-Mirroring Instances on MX Series 5G Universal Routing Platforms

On an MX Series router with a DPC card, you can configure port-mirroring instances both at the DPC level and at the PIC level. However, on MX Series routers with MPCs, port mirroring instances can only be bound to the FPC level and not up to the PIC level.

- [Configuring Port-Mirroring Instances at the DPC Level on page 229](#)
- [Configuring Port-Mirroring Instances at the PIC Level on page 230](#)

### Configuring Port-Mirroring Instances at the DPC Level

A port-mirroring instance configured at the FPC level for the DPC is bound to all the Packet Forwarding Engines on the DPC.

To associate a port-mirroring instance with a specific DPC and its Packet Forwarding Engines, include the **port-mirror-instance** *port-mirroring-instance-name* statement at the **[edit chassis fpc slot-number]** hierarchy level:

```
[edit chassis]
fpc slot-number {
  port-mirror-instance port-mirroring-instance-name;
}
```

The properties of the port-mirroring instance associated with the DPC override any global port-mirroring properties (configured by including the **port-mirroring** statement at the **[edit forwarding-options]** hierarchy level).

## Configuring Port-Mirroring Instances at the PIC Level

**NOTE:** On MX Series routers with MPCs, port mirroring instances can only be bound to the FPC level and not up to the PIC level. For MX Series routers with a DPC card, both levels are supported.

For MX Series routers, there is a one-to-one mapping of Packet Forwarding Engines and PICs. Therefore, a port-mirroring instance configured at the PIC level is bound to its Packet Forwarding Engines and ports.

To associate a port-mirroring instance with a specific Packet Forwarding Engine, include the **port-mirror-instance** *port-mirroring-instance-name* statement at the **[edit chassis fpc slot-number pic slot-number]** hierarchy level:

```
[edit chassis]
fpc slot-number {
  port-mirror-instance port-mirroring-instance-name-a;
  pic slot-number {
    port-mirror-instance port-mirroring-instance-name-b;
  }
}
```

The properties of the port-mirroring instance associated with the PIC override the properties of the port-mirroring instance associated with the DPC (configured by including the **port-mirroring** *port-mirroring-instance-name* statement at the **[edit chassis fpc slot-number]** hierarchy level).

For more information about configuring port mirroring for Layer 2 VPLS traffic on MX Series routers, see the *Junos MX Series Ethernet Services Routers Layer 2 Configuration Guide*.

## Centralized Clocking Overview

---

Starting with Junos OS Release 12.2, the Enhanced SCB—SCBE—and from Junos OS Release 13.3, the Enhanced SCB—SCBE2—on the MX240, MX480, and MX960 routers support a Stratum 3 clock module that functions as a centralized point within the chassis for clock monitoring, filtering, holdover, and selection.

The Stratum 3 clock module produces a 19.44 MHz clock that is locked to a chassis synchronization clock source that is configured with the highest quality. The chassis clock signals are transmitted through the backplane to all the MPCs. The MPCs route the clock signals to their MICs, where the clock signals are driven out on all line interfaces thereby allowing the timing information to be distributed to the downstream routers.

You can configure external and line input synchronization sources at the **[edit chassis synchronization output]** hierarchy level, at the **[edit chassis synchronization source interfaces]** hierarchy level, and at the **[edit chassis synchronization interfaces]** hierarchy level, that become candidates to be selected by the chassis's clock selection algorithm. The clock selection algorithm selects the highest-quality candidate clock source, which is then used as the chassis's synchronization source.

The external clock interface on SCBE allows the building-integrated timing supply (BITS) clock source or the clock signals received from the global positioning system (GPS) receiver to act as an input clock source to the centralized timing circuit, or allows the centralized timing signals to act as an output clock source to the BITS source or to the GPS receiver.

The centralized mode is applicable to mobile backhaul infrastructures and for network transition from traditional TDM to Ethernet network elements with the support of Synchronous Ethernet.

### Points to Remember

The following are the points to remember about centralized clocking:

- Before you begin configuring centralized clocking on an interface that uses Synchronous Ethernet, ensure that you have configured the interface as a chassis synchronization source to the router that provides a Synchronous Ethernet clock source.
- Before you remove the SCBE from the router, you must delete the configuration under the **[edit chassis synchronization]** hierarchy. Similarly, before you remove the SCBE2 from the router, you must delete the configuration under the **[edit chassis synchronization]** hierarchy.
- On SCBE2, the external-0/0 interface is located on **SCB0** and the external-1/0 interface is located on **SCB1**.

When you configure the external clock interface for input, the BITS or GPS clock source—the source depends on how you configure the interface—sends the synchronized input clock signals to the centralized timing circuit in the SCBE. When you configure the external clock interface for output, the centralized timing circuit

sends out the synchronized clock signal—BITS or GPS—to be transmitted to the downstream routers.

For more information about SCBE hardware, see *SCBE2-MX Description* and *SCBE2-MX LEDs*.

The following sections explain centralized clocking and its features in detail:

**NOTE:** Hereafter, all features that are explained for SCBE are also applicable for SCBE2 unless otherwise specified.

- [Stratum 3 Clock Module on page 233](#)
- [BITS and GPS Support on page 233](#)
- [External Clock Interface Input on page 234](#)
- [External Clock Interface Output on page 236](#)
- [Redundancy on page 236](#)

## Stratum 3 Clock Module

SCBE has a Stratum 3 centralized clock module that takes in synchronization sources on its reference input pins. When instructed by the clock selection algorithm, the clock module selects one of the reference inputs to lock its 19.44 MHz output clock. The MPCs select the chassis clock from the active SCBE to use it as a clock for their interface transmitters, thereby allowing the downstream routers to recover and synchronize to the chassis clock. A 20 MHz oscillator provides Stratum 3 free-run and holdover quality.

The clock module does not perform any automatic switching between the reference clocks, rather when Junos OS detects the loss of signal or clock, frequency inaccuracy, or phase irregularities, the clock module runs a clock selection algorithm and switches to the next highest-quality input reference.

The Stratum 3 clock modules—on the master and the backup SCBE—are cross-wired to eliminate any phase transients during SCBE switchover. The backup SCBE locks to the master's Stratum 3 clock module.

## BITS and GPS Support

[Table 48 on page 233](#) maps the Junos OS Release with the feature release of BITS and GPS on SCBE and SCBE2:

**Table 48: BITS and GPS Support on SCBE and SCBE2**

Feature	Switch Control Board	Junos OS Release
BITS	SCBE	12.3
GPS	SCBE	13.3
BITS	SCBE2	13.3

## External Clock Interface Input

BITS and GPS can be configured on the external clock interface on the SCBE.

The following sections explain external clock interface input for BITS and GPS:

- [External Clock Interface Input for BITS on page 234](#)
- [External Clock Interface Input for GPS on page 234](#)

---

### External Clock Interface Input for BITS

When the BITS clock is qualified by the Stratum 3 clock module, it becomes a candidate clock source to the clock selection algorithm. BITS can simultaneously support both input and output clocking.

The external clock interface for BITS can recover:

- A framed 1.544 Mbps (T1) clock or a framed 2.048 Mbps (E1) clock. The T1/E1 framer supports sending and receiving of SSM quality levels through SA bits.
- An unframed 2048 kHz (G.703 T12) clock. You must configure an input SSM quality level when the external clock interface is configured for a signal type that does not support SSM, such as an unframed 2048 kHz (T12) clock, or a T1 superframe (T1 SF) clock.

On T1/T12 interfaces that do not support SSM, you must configure the SSM quality levels. On E1 interfaces, the Sa bits receive and transmit the SSM quality level.

Starting with 17.3R1, MX10003 router supports T1/E1 framed and 2.048MHz unframed clock input.

Starting with 17.4R1, MX204 router supports T1/E1 framed and 2.048MHz unframed clock input.

---

### External Clock Interface Input for GPS

The GPS external clock interface supports:

- 1 MHz, 5 MHz, and 10 MHz frequencies.
- Pulse per second (PPS) signals on BNC connectors—a special cable converts signals between the BNC connector and the RJ-45 port. These signals are fed into the Stratum 3 centralized clock module for qualification and monitoring. After qualification, the GPS source becomes a valid chassis clock source candidate.
- Time of day (TOD) over a serial link. Most GPS source TOD string formats are supported by Junos OS, thereby enabling you to configure a generic TOD format string. This format tells the Routing Engine how to interpret the incoming TOD character string.

You must also configure an input SSM quality level value, where the quality level is used by the chassis clock selection algorithm when the quality level mode is enabled.

For the GPS receiver to be qualified as a clock source, the frequency and the PPS signal from it must be qualified by the SCBE Stratum 3 module. The SCBE is synchronized with the GPS source TOD.

The 10MHz frequency and PPS are supported by an RJ-45 connector for SCBE/SCBE2. [Figure 4 on page 235](#) illustrates the actual pinout of the connector.

**Figure 4: RJ-45 Connector for SCBE/SCBE2**

**Table 49: RJ-45 Connector Pinout Information for SBE/SCBE2**

Pin	Signal
1	RX
2	RX
3	1 PPS GND
4	TX
5	TX
6	10 MHz GND
7	1 PPS
8	10 MHz

**NOTE:** Note that the GPS receiver is configured to support 10 MHz, 1 PPS, and TOD by default when it acts as a primary reference time clock.

Starting with 17.3R1, MX10003 router supports one GPS port per SPM which can be configured with 1MHz, 5MHz, and 10MHz frequencies and 1PPS signal.

Starting with 17.4R1, MX204 router supports GPS with 1MHz, 5MHz, and 10MHz frequencies and 1PPS signal.

## External Clock Interface Output

The external clock interface can be configured to drive BITS or GPS timing output (GPS timing output for frequency and PPS signal only). The BITS or GPS output is configured to select the output clock source but in the absence of an output configuration, the BITS or the GPS output is disabled. When the external clock interface is configured for output, it selects the clock source on the basis of the configured source mode.

Starting with Junos OS Release 14.1, the external clock interface can be configured to drive BITS timing output. When the external clock interface is configured as a BITS timing output, the following scenarios occur:

- The external clock interface drives the BITS timing output.

The chassis clock or the line clock are used as the source on the basis of the source mode configuration.

The best—configured—line source is transmitted out the BITS interface, when the output **source-mode** statement is configured as line.

The central clock module is set to holdover and the output is suppressed when the BITS output is configured and there are no valid clock sources available.

## Redundancy

On SCBE, the primary and the secondary SCBs monitor their respective clock sources, and the external clock interface source is accessible only to its local clocking hardware. Therefore, the clock signals cannot be routed between the primary and the secondary SCB. Redundancy is achieved after a Routing Engine switchover. When a switchover occurs, the new primary SCB reruns the clock selection algorithm after the configured switchover time expires to select a new clock source.

Starting with Junos OS Release 14.1, on SCBE2, simultaneous BITS/BITS redundancy can be achieved because the external interfaces for BITS on the primary SCB and the secondary SCB are wired. Note that BITS redundancy is achieved without a Routing Engine switchover on SCBE2.

The following scenarios are supported for BITS/BITS redundancy:

- You can configure both the external interfaces for BITS input as reference clocks. Therefore, on the basis of the configured clock quality, one of the BITS inputs is considered as a primary clock source and the other as a secondary clock source.
- When the signal from the primary BITS input stops or degrades, the secondary BITS input takes over as primary, thereby providing redundancy across BITS interfaces.

GRES is supported on MX240, MX480, and MX960 routers with SCBE2.

Release History Table

Release	Description
17.3	Starting with 17.3R1, MX10003 router supports T1/E1 framed and 2.048MHz unframed clock input.
17.3	Starting with 17.4R1, MX204 router supports T1/E1 framed and 2.048MHz unframed clock input.
17.3	Starting with 17.3R1, MX10003 router supports one GPS port per SPM which can be configured with 1MHz, 5MHz, and 10MHz frequencies and 1PPS signal.
17.3	Starting with 17.4R1, MX204 router supports GPS with 1MHz, 5MHz, and 10MHz frequencies and 1PPS signal.
14.1	Starting with Junos OS Release 14.1, the external clock interface can be configured to drive BITS timing output.
14.1	Starting with Junos OS Release 14.1, on SCBE2, simultaneous BITS/BITS redundancy can be achieved because the external interfaces for BITS on the primary SCB and the secondary SCB are wired.
12.1	Starting with Junos OS Release 12.2, the Enhanced SCB—SCBE—and from Junos OS Release 13.3, the Enhanced SCB—SCBE2—on the MX240, MX480, and MX960 routers support a Stratum 3 clock module that functions as a centralized point within the chassis for clock monitoring, filtering, holdover, and selection.

## Ethernet Synchronization Message Channel Overview

---

Ethernet Synchronization Message Channel (ESMC) is a logical communication channel. It transmits Synchronization Status Message (SSM) information, which is the quality level of the transmitting synchronous Ethernet equipment clock (EEC), by using ESMC protocol data units (PDUs). ESMC support is based on the ITU G.8264 specification.

Starting with Junos OS Release 17.3R1, Synchronized Ethernet with Ethernet synchronized Message Channel (ESMC) is supported on MX10003 routers

Starting with Junos OS Release 17.4R1, Synchronized Ethernet with Ethernet synchronized Message Channel (ESMC) is supported on MX204 routers

A Synchronous Ethernet interface is configured to operate in the following modes:

- Nonsynchronous mode—In this mode, the Synchronous Ethernet interface does not process the ESMC message and does not extract the quality level information.
- Synchronous mode—In this mode, the Synchronous Ethernet interface processes the ESMC message and extracts the quality level information. While operating in synchronous mode, the ESMC messages transmit the quality level.

You can enable ESMC on a Synchronous Ethernet port by adding the port to a list of ESMC interfaces. The ESMC messages are transmitted through the port indicating the quality level of the clock it is capable of driving and the ESMC messages are received (if the other endpoint supports ESMC) with the quality level of the transmitting clock. The MPC receiving the ESMC messages on its configured Synchronous Ethernet ports extracts the quality level and transmits it to the Routing Engine. The clock selection algorithm on the Routing Engine collects the ESMC data from each of the ESMC-enabled ports to select the clock sources.

The clock selection process supports revertive and nonrevertive modes. When the clock selection process has selected two clock sources—a primary and a secondary—and the active primary clock source degrades over a period of time and then improves again, this primary clock source again becomes the active clock source only if revertive mode is enabled. If nonrevertive mode is set and the secondary clock source is currently active (due to a previous degradation of primary clock source), the primary clock source is not reactivated even after its quality improves.

The clock selection is based on the following three operational modes:

- Forced free-run—In this mode, you can set the clock source either from a free-run local oscillator or from an external qualified clock. For MX80 routers, the free-run clock is provided by the local oscillator. For MX240, MX480, and MX960 routers, the free-run clock is provided by the Switching Control Board (SCB).
- Forced holdover—This mode is an internal state the synchronous Ethernet Equipment Clock (EEC) goes into, when an upstream clock source that the system locks on to is no longer available. You cannot configure this mode because it is an internal state.
- Automatic selection—In this mode, the system chooses up to two best upstream clock sources. The system then uses the clock recovered from one of the sources to generate

a frequency of 19.44 MHz and clock the transmit side of the Ethernet interfaces. If no upstream clock with acceptable good quality is available or if the system is configured in free-run mode, the system uses the internal clock. Automatic clock selection is based on the quality level, priority, signal fail, and external commands.

For more information about clock selection, see [“Configuring Clock Synchronization Interface on MX Series Routers” on page 293](#).

The synchronous EEC is in free-run mode when the chassis is switched on or restarted. When a synchronous EEC locks on to an upstream reference clock source at least once for a continuous period of 60 seconds, the EEC will have stored sufficient Synchronous Ethernet data in a replay holdover buffer. In case of failure of a reference clock source, the system goes to holdover mode and uses the replay data in the holdover buffer to service the downstream Synchronous Ethernet clients.

When a Modular Port Concentrator (MPC) with an EEC restarts (because of either a system crash or a manual restart), the holdover buffer data gets erased. Therefore, downstream Synchronous Ethernet clients cannot be serviced. This is also applicable when a new MPC containing an EEC is inserted into the system.

In a practical deployment scenario, the status display of holdover mode is invalid only when the chassis is switched on or restarted.

When an MPC containing an EEC is restarted or a new MPC containing an EEC is inserted into a system that is (already) in holdover mode, the EEC on this MPC cannot be considered to be in holdover mode because it does not have any Synchronous Ethernet replay information in its holdover data buffer. Therefore, you must first fix the system holdover issue before attempting to service the downstream Synchronous Ethernet clients on this MPC. To accomplish this, you must find a suitable upstream reference clock source and let the synchronous EEC lock on to this upstream reference clock source, and then service the downstream Synchronous Ethernet clients on this MPC.

**Release History Table**

Release	Description
17.3	Starting with Junos OS Release 17.3R1, Synchronized Ethernet with Ethernet synchronized Message Channel (ESMC) is supported on MX10003 routers
17.3	Starting with Junos OS Release 17.4R1, Synchronized Ethernet with Ethernet synchronized Message Channel (ESMC) is supported on MX204 routers

## Getting Started Configuring Clock Synchronization on PTX Series Routers

System clocking on PTX Series Packet Transport Routers is controlled by a Centralized Clock Generator (CCG). The CCG is capable of deriving a master clock from a valid source and synchronizing all interfaces on the chassis to this master clock.

To quickly access the information you need, click on the link in [Table 50 on page 240](#).

## Interface and Router Clock Sources Overview

- [Interface and Router Clock Sources Description on page 240](#)
- [Configuring an External Synchronization Interface on page 241](#)

### Interface and Router Clock Sources Description

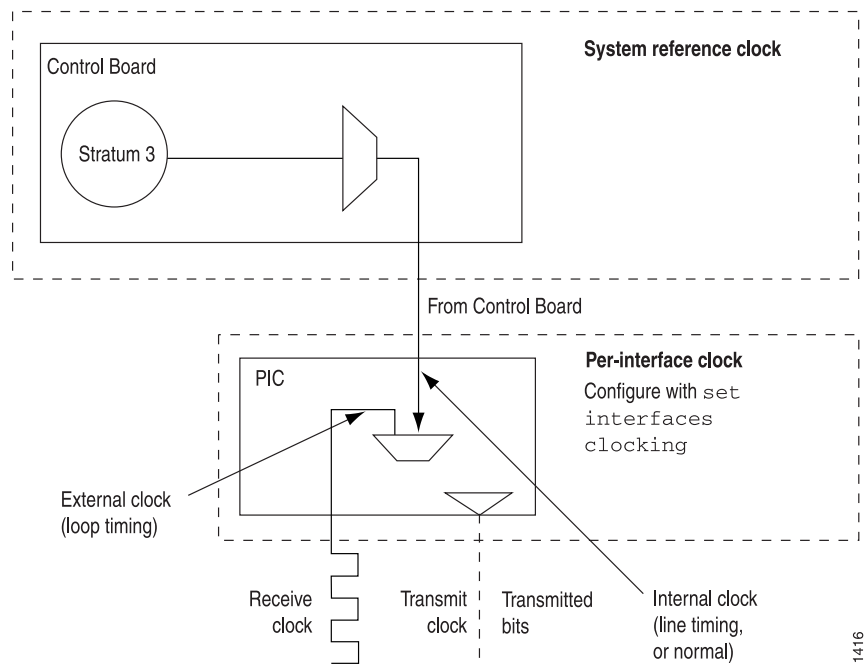

When configuring the router, you can configure the *transmit clock* on each interface; the transmit clock aligns each outgoing packet transmitted over the router's interfaces. For both the router and interfaces, the clock source can be the router's internal Stratum 3 clock, which resides on the control board, or an external clock that is received from the interface you are configuring. For example, interface A can transmit on interface A's received clock (external, loop timing) or the Stratum 3 clock (internal, line timing). Interface A cannot use a clock from any other source.

By default, each interface uses the router's internal Stratum 3 clock. To configure the clock source of each interface, include the **clocking** statement at the **[edit interfaces interface-name]** hierarchy level:

```
[edit interfaces interface-name]
clocking (internal | external);
```

System reference clocks can be generated from different system components, depending on the router type. For example, [Figure 5 on page 241](#) illustrates the different clock sources on the M120 router.

**Figure 5: M120 Router Clock Sources**

## Configuring an External Synchronization Interface

The M40e, M120, M320, T640, and T1600 routers support an external synchronization interface that can be configured to synchronize the internal Stratum 3 clock to an external source, and then synchronize the chassis interface clock to the external source.

This feature can be configured for external primary and secondary interfaces that use Building Integrated Timing System (BITS) or SDH Equipment Timing Source (SETS) timing sources. When internal timing is set for SONET/SDH, Plesiochronous Digital Hierarchy (PDH), and digital hierarchy (DS1) interfaces on the Physical Interface Cards (PICs), the transmit clock of the interface is synchronized to BITS/SETS timing and traceable to timing within the network.

To configure external synchronization on M40e, M120, M320, T640, and T1600 routers, include the **synchronization** statement at the **[edit chassis]** hierarchy level.

For more information about the external synchronization interface, see [“Configuring Junos OS to Support an External Clock Synchronization Interface for M Series, MX Series, and T Series Routers” on page 292](#).

## Synchronous Ethernet Overview

Synchronous Ethernet (ITU-T G.8261 and ITU-T G.8264) is a physical layer technology that functions regardless of the network load and supports hop-by-hop frequency transfer, where all interfaces on the trail must support Synchronous Ethernet. It enables you to deliver synchronization services that meet the requirements of the present-day mobile network, as well as future Long Term Evolution (LTE)–based infrastructures.

The following sections explain Synchronous Ethernet in detail:

- [Understanding Synchronous Ethernet on page 242](#)
- [Supported Platforms on page 243](#)
- [Understanding Synchronous Ethernet on the ACX Series Universal Metro Routers on page 247](#)
- [Understanding Clock Synchronization on page 247](#)
- [Understanding Ingress Monitoring on MX Series Routers on page 247](#)
- [Understanding Distributed Clocking Mode on MX Series Routers on page 248](#)
- [Centralized Clocking Mode Overview on page 248](#)

## Understanding Synchronous Ethernet

Synchronization is a key requirement for circuit (emulation) services and mobile radio access technologies. Traditionally, mobile networks used SONET/SDH technologies to backhaul voice and data traffic, and the native support for frequency of SONET/SDH to synchronize their radio network. With the need for greater-capacity backhaul networks, packet-based technologies such as Carrier Ethernet (which do not support the transfer of frequency) and wireless technologies such as frequency division duplex and time-division duplex require not only frequency synchronization but also proper time and phase alignment. This requirement is fulfilled by Synchronous Ethernet, which is used for physical layer frequency synchronization of connected access devices (such as base stations, access nodes, and so on). Synchronous Ethernet supports sourcing and transfer of frequency for synchronization purposes for both wireless and wireline services and is primarily used for mobile backhaul and converged transport.

Synchronous Ethernet is used to transfer clock signals over Ethernet interfaces. The Synchronous Ethernet operation is described in three ITU recommendations:

- G.8261—Defines the architecture and wander performance of Synchronous Ethernet networks.
- G.8262—Specifies timing characteristics of synchronous Ethernet equipment clock (EEC).
- G.8264—Describes the Ethernet Synchronization Message Channel (ESMC).

Synchronous Ethernet is not supported in the following instances on an MX Series router:

- Slot 10 on an MX Series router with Switch Control Board (SCB).
- RJ45 ports

However, note that Synchronous Ethernet is supported on slot 10 on an MX Series router with SCBE and SCBE2.

**NOTE:** Unified in-service software upgrade (unified ISSU) is currently not supported when clock synchronization is configured for Synchronous Ethernet on MX80 Universal Routing Platforms and on the MICs and MPCs on MX240, MX480, MX960, MX2010, and MX2020 routers.

## Supported Platforms

Table 51 on page 243 summarizes the first Junos OS release that supports Synchronous Ethernet on the various Juniper Networks routers and their components:

**Table 51: Synchronous Ethernet Support on Junos OS**

Routers and Components	First Supported Junos OS Release
MX5, MX10, MX40, and MX80 Universal Routing Platforms with model numbers MX5-T, MX10-T, MX40-T, and MX80-T	11.2R4
10-Gigabit Ethernet MPC with SFP+ transceivers	11.2R4
10-Gigabit Ethernet MIC with XFP in WAN-PHY framing mode	11.2R4
On MX240, MX480, and MX960 routers, the following Enhanced MPCs (MPCEs) support Synchronous Ethernet: <ul style="list-style-type: none"> <li>• MPC1E (MX-MPC1E-3D)</li> <li>• MPC1E Q (MX-MPC1E-3D-Q)</li> <li>• MPC2E (MX-MPC2E-3D)</li> <li>• MPC2E Q (MX-MPC2E-3D-Q)</li> <li>• MPC2E EQ (MX-MPC2E-3D-EQ)</li> </ul>	11.2R4
10-Gigabit Ethernet MIC with XFP in LAN-PHY framing mode	11.4

**Table 51: Synchronous Ethernet Support on Junos OS (continued)**

Routers and Components	First Supported Junos OS Release
Juniper Networks PTX Series Packet Transport Routers with 10-Gigabit Ethernet, 40-Gigabit Ethernet, and 100-Gigabit Ethernet interfaces	12.1
Juniper Networks ACX2000 Series Universal Metro Routers with Gigabit Ethernet and 10-Gigabit Ethernet SFP and SFP+ transceivers.	12.2
<b>On MX240, MX480, and MX960 routers with SCBE, the following MPCs support Synchronous Ethernet:</b>	
MPC-3D-16XGE-SFP	12.3
MPC4E-3D-32XGE-SFPP	15.1
MPC4E-3D-2CGE-8XGE	15.1
MX-MPC1-3D	12.3
MX-MPC1-3D-Q	12.3
MX-MPC2-3D	12.3
MX-MPC2-3D-Q	12.3
MX-MPC2-3D-EQ	12.3
MPC3E (MX-MPC3E-3D) on MX240, MX480, and MX960 routers	13.2
MX104 router	13.2R2
MX104 router	13.2R2
<b>On MX2010 and MX2020 routers, the following Enhanced MPCs (MPCEs) support Synchronous Ethernet:</b>	
<ul style="list-style-type: none"> <li>MPC1E (MX-MPC1E-3D)</li> <li>MPC1E Q (MX-MPC1E-3D-Q)</li> <li>MPC2E (MX-MPC2E-3D)</li> <li>MPC2E Q (MX-MPC2E-3D-Q)</li> <li>MPC2E EQ (MX-MPC2E-3D-EQ)</li> <li>MPC3E (MX-MPC3E-3D)</li> </ul>	13.3

Table 51: Synchronous Ethernet Support on Junos OS (continued)

Routers and Components	First Supported Junos OS Release
On MX240, MX480, and MX960 routers with SCBE2, and MX2010, MX2020 routers, the following MPCs support Synchronous Ethernet:	
MPC-3D-16XGE-SFP	13.3
MPC4E-3D-32XGE-SFPP	15.1
MPC4E-3D-2CGE-8XGE	15.1
MX-MPC1-3D	13.3
MX-MPC1-3D-Q	13.3
MX-MPC2-3D	13.3
MX-MPC2-3D-Q	13.3
MX-MPC2-3D-EQ	13.3
MPC7E-MRATE	16.1R1
MPC7E-10G	16.1R1
MX2K-MPC8E	16.1R1
MX2K-MPC9E	16.1R1
On MX240, MX480, and MX960 routers with SCBE or SCBE2, on MX2010 and on MX2020 routers with RE-CB, the following MPCs support Synchronous Ethernet:	
<ul style="list-style-type: none"> <li>MPC5E (MPC5E-40G10G)</li> <li>MPC5EQ (MPC5EQ-40G10G)</li> <li>MPC5E (MPC5E-100G10G)</li> <li>MPC5EQ (MPC5EQ-100G10G)</li> <li>MPC6E (MX2K-MPC6E)</li> </ul>	13.3R3
On PTX3000, the following third-generation FPCs support Synchronous Ethernet:	
<ul style="list-style-type: none"> <li>FPC3-SFF-PTX-U0</li> <li>FPC3-SFF-PTX-U1</li> </ul>	17.1R1

**NOTE:** Starting with Junos OS Release 12.1, Synchronous Ethernet is supported on Juniper Networks PTX Series Packet Transport Routers. On PTX Series routers, synchronous Ethernet is supported on 10-Gigabit Ethernet, 40-Gigabit Ethernet, and 100-Gigabit Ethernet interfaces and is compliant with ITU-T G.8261 and ITU-T G.8262 standards.

**NOTE:** Starting with Junos OS Release 14.2, Synchronous Ethernet supported on Juniper Networks PTX Series Packet Transport Routers is compliant with ITU-T G.8264 (Ethernet Synchronization Messaging Channel) standards.

**NOTE:** Starting with Junos OS Release 12.2, Synchronous Ethernet is supported on Juniper Networks ACX Series Universal Metro routers with Gigabit Ethernet and 10-Gigabit Ethernet SFP and SFP+ transceivers and is compliant with the ITU-T G.8261 and G.8264 standards.

**NOTE:** The 10-Gigabit Ethernet MIC with XFP supports Synchronous Ethernet, which requires both the MIC and the interface to be configured in LAN framing mode. In LAN mode, the LAN frequency is directly supplied by the MIC's on-board clocking circuitry.

**NOTE:** The 100-Gigabit Ethernet OTN MIC with CFP2 (MIC6-100G-CFP2) on MPC6E (MX2K-MPC6E) supports Synchronous Ethernet on 100-Gigabit Ethernet interfaces and is compliant with ITU-T G.872 standards. You can configure the primary and secondary clock sources on the 100-Gigabit Ethernet OTN MIC. Chassis line cards can be configured to recover network timing clocks at the physical layer via Synchronous Ethernet. The 100-Gigabit Ethernet OTN MIC supports recovery of clocks via the OTN overhead bytes and not from the configured clock sources.

**NOTE:** Starting with Junos OS Release 17.3, Synchronous Ethernet supported on fixed port PIC ( 6xQSFP) and modular MIC (JNP-MIC1) on MX10003 routers is compliant with ITU-T G.8264 (Ethernet Synchronization Messaging Channel) standards.

Starting with Junos OS Release 17.4, Synchronous Ethernet supported on the fixed port PICs (4xQSFP28 PIC and 8xSFPP PIC) on MX204 routers is compliant with ITU-T G.8264 (Ethernet Synchronization Messaging Channel) standards.

## Understanding Synchronous Ethernet on the ACX Series Universal Metro Routers

Synchronous Ethernet is supported on the ACX Series routers with Gigabit Ethernet and 10-Gigabit Ethernet SFP and SFP+ transceivers and is compliant with ITU-T Recommendation G.8261: *Timing and synchronization aspects in packet networks* and ITU-T Recommendation G.8264: *Distribution of timing through packet networks*. Synchronous Ethernet is a physical layer frequency transfer technology modeled after synchronization in SONET/SDH. Traditional Ethernet nodes, which do not support Synchronous Ethernet, do not carry synchronization from one node link to another. Synchronous Ethernet-capable nodes however can synchronize their chassis clock to a clock recovered from an interface connected to an upstream clock master. After this, the clock is used to time data sent to downstream clock slaves, forming a synchronization trail from a Primary Reference Clock (PRC) to Ethernet equipment clocks (EECs) and transferring frequency synchronization along the trail.

The ITU-T G.8264 specification defines the Synchronization Status Message (SSM) protocol and its format for Synchronous Ethernet to ensure interoperability between Synchronous Ethernet equipment used for frequency transfer—for example, SONET/SDH. Synchronous Ethernet provides stable frequency synchronization to a PRC and is not affected by load on the network. However, it requires that all the nodes from the PRC to the last downstream node are Synchronous Ethernet capable. Synchronous Ethernet is a recommended technology for mobile networks that require frequency-only synchronization—for example, 2G or 3G base stations.

## Understanding Clock Synchronization

MX Series and PTX Series routers support external clock synchronization and automatic clock selection for Synchronous Ethernet and external inputs (T1 or E1 line timing sources).

Configuring external clock synchronization and automatic clock selection requires making clock selection, quality level, and priority considerations. The clock source selection algorithm is used to pick the two best upstream clock sources from among the various sources on the basis of system configuration and execution criteria such as quality level, priority, and hardware restrictions.

You can configure several options for external clock synchronization. For an overview about the configuration options, see [“Configuring Clock Synchronization Interface on MX Series Routers” on page 293](#) and for information about configuring these options for MX Series routers, see [“Understanding Clock Synchronization” on page 263](#).

Currently, two types of clocking modes are supported on MX Series routers, the distributed clocking mode and the centralized clocking mode. For information about distributed clocking mode, see [“Understanding Distributed Clocking Mode on MX Series Routers” on page 248](#) and [“Ethernet Synchronization Message Channel Overview” on page 238](#). For information about centralized clocking mode, see [“Centralized Clocking Mode Overview” on page 248](#) and [“Centralized Clocking Overview” on page 232](#).

## Understanding Ingress Monitoring on MX Series Routers

The ingress clock monitoring feature is supported on all MX Series routers including the 16-port 10-Gigabit Ethernet MPC. On these routers, the incoming Synchronous Ethernet

signals cannot be monitored on the 16-port 10-Gigabit Ethernet MPC but are monitored by other Modular Port Concentrators (MPCs) in the chassis. Therefore, you can use the 16-port 10-Gigabit Ethernet MPC for incoming Synchronous Ethernet signals if at least one other MPC with an Ethernet Equipment Clock (EEC) is present in the chassis. This behavior is referred to as *ingress clock monitoring*. Note that the 16-port 10-Gigabit Ethernet MPC does not have a built-in EEC or internal clock; therefore, it can only input (accept) a clock signal but cannot act as a clock source.

When an MX Series router is configured for Synchronous Ethernet on the 16-port 10-Gigabit Ethernet MPC and no other MPC with an EEC is present in the chassis, the Synchronous Ethernet feature cannot be supported by the system. The system notifies the user through log messages and CLI output and justifies its inability to support Synchronous Ethernet.

For information about Synchronous Ethernet support on the 10-Gigabit Ethernet MIC, see [“Synchronous Ethernet on 10-Gigabit Ethernet MIC Overview” on page 252](#).

## Understanding Distributed Clocking Mode on MX Series Routers

In the distributing clocking mode, the Switch Control Board (SCB) supports synchronizing the MX Series router's chassis to an internal Stratum 3 free-run oscillator. The Synchronous Ethernet timing messages are sent through the chassis to support the network timing trails that are traceable to a high-quality timing source. The timing messages are carried through the network by the Ethernet switches that were traditionally handled by time-division multiplexing (TDM) equipment over SONET/SDH interfaces. The distributing clocking mode is handled through ESMC messages. The ESMC support is based on the ITU-G.8264 specification. The ESMC messages transmit the clock quality of the line timing signal in the form of the (Synchronous Status Message) SSM TLV that is carried in the ESMC packet. For more information, see [“Ethernet Synchronization Message Channel Overview” on page 238](#).

The distributed clocking mode has the following limitations:

- There is no SCB centralized clock module to synchronize the entire chassis.
- The recovered line timing is driven out only by the line interface of the 16-port 10-Gigabit Ethernet MPC.
- The distributed mode does not support external clock interface timing.

Centralized clocking mode overcomes these limitations by distributing and driving timing out on all the chassis line interfaces.

## Centralized Clocking Mode Overview

Starting with Junos OS Release 12.2, the Enhanced SCB SCBE on the MX240, MX480, and MX960 routers supports a Stratum 3 clock module. This clock module functions as a centralized point within the chassis for clock monitoring, filtering, holdover, and selection. It has only one external clock interface. For more information, see [“Centralized Clocking Overview” on page 232](#).

Starting from Junos OS Release 13.3, the Enhanced SCB SCBE2 on the MX240, MX480, and MX960 routers supports two external clock interfaces external-0/0 and external-1/0.

The external-0/0 interface refers to the external interface on the SCB in slot 0 and the external 1/0 interface refers to the external interface on the SCB in slot 1.

In SONET/SDH networks, the routers use the best-quality clock available in the network. The quality level of various clock sources in the network is determined by monitoring the Synchronization Status Messages (SSMs) from the clock sources. An SSM occupies a fixed location in the SONET frame. On Ethernet networks that use Synchronous Ethernet for clock synchronization, the SSM is not a part of the timing signal. The SSM is carried in the Ethernet packets that flow in the Ethernet Synchronization Message Channel (ESMC). By interpreting the SSM values, the router determines the clock quality associated with the clock source, and performs its clock selection accordingly. The ESMC messages transmit the clock quality of the line timing signal in the form of the SSM TLV that is part of the ESMC packet.

Note that the clock in the router goes into holdover mode in the absence of any clock sources with best quality level and in turn uses the timing information stored in its buffer to synchronize itself.

The following processes play a crucial role during external synchronization of the clock sources in the control board. Note that PTX Series routers need two best clock sources that act as primary and secondary clock sources, whereas MX Series routers need only one best clock source.

- The clock sync process (clksyncd) performs the clock selection and participates in ESMC message exchange. For clock selection, in the absence of user-configured primary or secondary clock sources, the clksyncd runs a clock selection algorithm and selects the two best clocks available as the primary and secondary clock sources, respectively, for a PTX Series router or selects a best clock for an MX Series router. The clksyncd also sends out periodic ESMC packets to transmit its clock's quality level to the other routers in the network—this is specified in the SSM TLV in the ESMC packet—and receives ESMC packets from other clock sources and tracks the received clock signal quality level. ESMC packets are received on all the interfaces that are configured as clock sources. ESMC packets are also transmitted to the clock-source interfaces on other routers, as well as to the interfaces that are configured to receive ESMC packets on other routers.
- The chassis process (chassisd) is responsible for interfacing with the Enhanced Switch Control Board (SCBE) on MX Series routers and Centralized Clock Generator (CCG) on PTX Series routers. It monitors the clock quality and assists SCBE or the CCG to determine the clock source with the best quality level. When it detects clock quality deterioration, it informs clksyncd to select another primary clock source. After clock selection chassisd is updated with the latest clock source information. Note that in the absence of user-configured primary and secondary clock sources on PTX Series routers, the clock sources are selected through the clock algorithm and chassisd is updated with the latest clock information. Consequently, a new interprocess connection is established between chassisd and clksyncd.
- The periodic packet management process (ppmd) performs periodic transmission of ESMC packets to other routers in the network. It also receives incoming ESMC packets from other routers. The ppmd filters out repetitive ESMC packets to reduce packet flows between ppmd and clksyncd.

The following explains a simple clock selection process using ESMC packets:

- The Synchronous Ethernet (line timing) signal is an Ethernet physical layer signal that is received on the Ethernet interface. ESMC is a Layer 2 Ethernet packet. The Synchronous Ethernet signal and the ESMC packets are received on the Ethernet interface of the router.
- The received Synchronous Ethernet signal is sent to the clock hardware in the SCBE or in the CCG, whereas the ESMC packets—with the quality level—is directed to the `clksyncd`.
- The clock selection algorithm in `clksyncd` selects the best clock signal based on the quality level in the ESMC packet from one of the interfaces that is configured as a clock source. On PTX Series routers, the algorithm also selects the next best—when available—clock as the secondary clock.
- The best clock information is transmitted to the `chassisd`, which in turn generates a command to the clock hardware to use the best clock as the reference clock. On PTX Series routers, both primary and secondary clocks are used..
- The reference clock uses the best—primary in PTX Series routers—clock signal as the system clock that is used to generate Synchronous Ethernet signal to transmit on all its interfaces.
- The ESMC transmit module in `clksyncd` is notified of the quality level corresponding to the best—primary—clock. This quality level is used for ESMC packets that are transmitted out of the router.
- ESMC packets are transmitted on all the source interfaces and on those interfaces that are configured as `esmc-transmit` interfaces.

**NOTE:** On SCBE2, you can configure the external synchronization options only on the external interface on the active SCB. Therefore, if the active SCB is in slot 0, then you can configure the external-0/0 interface only. If the active SCB is in slot 1, then you can configure the external-1/0 interface only.

---

The centralized mode is applicable to mobile backhaul infrastructures and for network transition from traditional TDM to Ethernet network elements with the support of Synchronous Ethernet.

Release History Table

Release	Description
17.3	Starting with Junos OS Release 17.3, Synchronous Ethernet supported on fixed port PIC ( 6xQSFP) and modular MIC (JNP-MIC1) on MX10003 routers is compliant with ITU-T G.8264 (Ethernet Synchronization Messaging Channel) standards.
17.3	Starting with Junos OS Release 17.4, Synchronous Ethernet supported on the fixed port PICs (4xQSFP28 PIC and 8xSFPP PIC) on MX204 routers is compliant with ITU-T G.8264 (Ethernet Synchronization Messaging Channel) standards.
14.2	Starting with Junos OS Release 14.2, Synchronous Ethernet supported on Juniper Networks PTX Series Packet Transport Routers is compliant with ITU-T G.8264 (Ethernet Synchronization Messaging Channel) standards.
13.3	Starting from Junos OS Release 13.3, the Enhanced SCB SCBE2 on the MX240, MX480, and MX960 routers supports two external clock interfaces external-0/0 and external-1/0.
12.2	Starting with Junos OS Release 12.2, Synchronous Ethernet is supported on Juniper Networks ACX Series Universal Metro routers with Gigabit Ethernet and 10-Gigabit Ethernet SFP and SFP+ transceivers and is compliant with the ITU-T G.8261 and G.8264 standards.
12.2	Starting with Junos OS Release 12.2, the Enhanced SCB SCBE on the MX240, MX480, and MX960 routers supports a Stratum 3 clock module.
12.1	Starting with Junos OS Release 12.1, Synchronous Ethernet is supported on Juniper Networks PTX Series Packet Transport Routers.

## Synchronous Ethernet on 10-Gigabit Ethernet MIC Overview

---

Synchronous Ethernet (ITU-T G.8261) is a physical layer technology that functions regardless of the network load. Synchronous Ethernet supports hop-by-hop frequency transfer, where all interfaces on the trail must support Synchronous Ethernet.

Starting with Junos OS Release 11.4, the 10-Gigabit Ethernet MIC with XFP supports Synchronous Ethernet in LAN-PHY framing mode. This is possible only when all the Physical Interface Cards (PICs) under the given Modular Interface Card (MIC) and its ingress interfaces are configured in LAN framing mode. For more information about configuring LAN framing mode, see [“Example: Configuring Framing Mode for Synchronous Ethernet on MX Series Routers with 10-Gigabit Ethernet MIC” on page 316](#). In this mode, the LAN frequency is directly supplied by the MIC's on-board clocking circuitry.

On MX80 Universal Routing Platforms, when the PIC-level framing type is changed, the pluggable MIC (2-port 10-Gigabit Ethernet MIC with XFP) is restarted and the Forwarding Engine Board with the built-in MIC (4-port 10-Gigabit Ethernet MIC with XFP) is restarted.

On MX240, MX480, and MX960 routers, when the PIC-level framing type is changed from LAN mode to non-LAN mode (on a MIC), the entire MPC restarts.

**NOTE:** The default interface framing mode is LAN-PHY framing mode. For WAN-PHY framing mode operation, interface framing needs to be set to the wan-phy framing option explicitly. For more information about the interface-level and PIC-level configuration combination, see [“Example: Configuring Framing Mode for Synchronous Ethernet on MX Series Routers with 10-Gigabit Ethernet MIC” on page 316](#).

Synchronous Ethernet is not supported in the following instances:

- MX240, MX480, and MX960 routers with 10-Gigabit Ethernet MICs or 10-Gigabit Ethernet built-in interfaces do not support Synchronous Ethernet or Ethernet Synchronization Message Channel (ESMC) transmit in LAN physical layer device (LAN-PHY) framing mode. To configure Synchronous Ethernet or ESMC transmit interfaces on these routers with 10-Gigabit Ethernet Interfaces, you must configure all the 10-Gigabit Ethernet interfaces on the MIC in WAN physical layer device (WAN PHY) framing mode.
- Primary and secondary sources cannot be from the same MIC. Alternatively, only the port with the highest quality clock source from a given MIC is used for clock selection.
- Starting with Junos OS Release 11.4, Synchronous Ethernet is not supported on 10-Gigabit Ethernet ports in LAN-PHY mode except for the 10-Gigabit Ethernet MIC with XFP.
- Prior to Junos OS Release 11.4, Synchronous Ethernet was supported only in WAN-PHY framing mode on the 10-Gigabit Ethernet MICs with XFP.

**NOTE:**

On the MX Series 5G Universal Routing Platforms, the placement of MICs varies from router to router, the following key points has to be taken into consideration while configuring the MICs:

- On the fixed MX80 chassis, the MICs (10-Gigabit Ethernet MIC) come preinstalled and cannot be replaced. The MIC is labeled as 0/MIC 0 and it consists of four 10-Gigabit Ethernet ports labeled 0 through 3, left to right.
- On the modular MX5, MX10, MX40, and MX80 chassis, there are two MIC slots that are labeled as 1/MIC 0 and 1/MIC 1.
- On the MX240, MX480, and MX960 Universal Routing Platforms, there are two slots for MICs which are labeled as PIC 0/1 and PIC 2/3 on the Modular Port Concentrators (MPCs).

Note that hereon the term *PIC* is being used in synonymous with the term *MIC slot* or *Ethernet ports* (in the case of fixed MX80 chassis).

You can configure a MIC in LAN-PHY framing mode by configuring all the constituent logical PICs in the same LAN-PHY framing mode on MX80, MX240, MX480, and MX960 routers.

You can also alternatively configure a MIC in WAN-PHY framing mode on MX80, MX240, MX480, and MX960 routers by configuring all the constituent logical PICs in the same WAN-PHY framing mode in any one of the following configurations:

- No framing mode configured on all the constituent logical PICs of the MIC.
- Incompatible framing mode configured on constituent logical PICs of the MIC.
- No framing mode configured on some of the constituent logical PICs of the MIC.

**NOTE:** All the logical PICs in a single MIC must be configured in the same framing mode.

You can also configure the framing mode at the interface level and at the PIC level. For more information about configuring the framing mode at the PIC level and at the interface level, see [“Example: Configuring Framing Mode for Synchronous Ethernet on MX Series Routers with 10-Gigabit Ethernet MIC” on page 316.](#)

When the PIC-level framing type is changed between LAN mode and non-LAN mode on a MIC:

- The Forwarding Engine Board (FEB) is restarted in the case of the built-in MIC (4-port 10-Gigabit Ethernet MIC with XFP) on MX80 routers.
- Only the corresponding MIC is restarted in the case of the pluggable MIC (2-port 10-Gigabit Ethernet MIC with XFP) on MX80 routers.

- The entire MPC restarts in the case of MX240, MX480, and MX960 routers.

**NOTE:** By default, the PIC-level framing mode is set to WAN framing type, that is, `e1 | e3 | sdh | sonet | t1 | t3`. Synchronous Ethernet works on the 10-Gigabit Ethernet MIC with XFP in LAN-PHY mode only when the PIC-level framing configuration is configured to the `lan` framing type explicitly.

By default, the interface-level framing mode is set to `lan-phy`. For WAN-PHY operation, interface framing needs to be set to `wan-phy` framing explicitly.

Table 52 on page 254 summarizes the possible configuration combination for Synchronous Ethernet on the 10-Gigabit Ethernet MIC with XFP that are available at the interface level and the PIC level:

**Table 52: Configuration Options**

Framing Configuration		Operation		
PIC Level	Interface Level	Interface Status	Will Synchronous Ethernet Function?	Will Non-Synchronous Ethernet Functions Work?
LAN	LAN-PHY (Default)	Up	Yes	Yes
LAN	WAN-PHY	Down (Framing Conflict)	No	No
WAN (Default)	LAN-PHY (Default)	Up	No	Yes
WAN (Default)	WAN-PHY	Up	Yes	Yes

The following cases and corresponding behaviors explain Table 52 on page 254 in detail.

- The PIC is being brought up online:

This case is applicable when either the MIC is restarted or when the MIC is being brought online by an operational command. In this case, the behavior can be presented as:

- No framing mode is configured for any or all of the constituent logical PICs of the MIC—The MIC is configured to operate in WAN-PHY framing mode as the WAN mode is the default mode.

Here, the WAN-PHY framing-based interfaces operate in normal state and provides Synchronous Ethernet services. However, the LAN-PHY framing-based interfaces operate normally but cannot provide Synchronous Ethernet services.

- All the constituent logical PICs of a MIC are configured in LAN-PHY mode—The MIC is configured to operate in LAN-PHY framing mode.

In this scenario, the WAN-PHY framing-based interfaces cannot operate in normal state. As a result, these interfaces are administratively brought down. The reason for the interface being in **admin-down** state is displayed as **Framing Conflict** in the output of the **show interfaces** operational command. This is because the interface framing configuration (WAN-PHY) is in conflict with the PIC-level framing configuration of LAN-PHY. Because the interfaces are in **admin-down** state, neither the Synchronous Ethernet services nor other services are provided.

Alternatively, all the LAN-PHY framing-based interfaces can operate in normal state and can continue to provide any of the Synchronous Ethernet services.

- The PIC is already online:
  - In WAN-PHY framing mode—The interface framing configuration on the PIC has changed from WAN-PHY to LAN-PHY.  
The interface continues to be operational for data transceiving purposes. However, it cannot provide any of the Synchronous Ethernet services.
  - In WAN-PHY framing mode—The interface framing configuration on the PIC has changed from LAN-PHY to WAN-PHY.  
The interface continues to be operational for data transceiving purposes, and it can also provide Synchronous Ethernet services.
  - In LAN-PHY framing mode—The interface framing configuration on the PIC has changed from WAN-PHY to LAN-PHY.  
The interface is operational for data transceiving purposes, and it can also provide Synchronous Ethernet services.
  - In LAN-PHY framing mode—The interface framing configuration on the PIC has changed from LAN-PHY to WAN-PHY.  
The interface is down; therefore, it cannot provide any Synchronous Ethernet services.

Support for Synchronous Ethernet is limited in the following instances:

- Primary and secondary sources cannot be from the same MIC. Alternatively, only the port with the highest quality clock source from a given MIC is used for clock selection.
- Prior to Junos OS Release 11.4, Synchronous Ethernet was supported only in WAN-PHY framing mode on the 10-Gigabit Ethernet MICs with XFP.

## Precision Time Protocol Overview

---

Increase in bandwidth requirements on wireless backhaul networks and the need to reduce costs and to improve flexibility have triggered the need for a packet-based backhaul infrastructure. Traditional metro deployments do not cater to the delivery of synchronization services, and this leaves operators with no other choice than to keep older parallel infrastructure. Physical layer-based Synchronous Ethernet and packet-based Precision Time Protocol (PTP) enable routers and switches to deliver synchronization services that meet the requirements of today's mobile network, as well as Long Term Evolution (LTE)-based infrastructures. Physical layer-based technologies function regardless of network load, whereas packet-based technologies require careful architecture and capacity planning. For information about Synchronous Ethernet, see ["Synchronous Ethernet Overview" on page 242](#).

PTP, also known as IEEE 1588v2, is a packet-based technology that enables the operator to deliver synchronization services on packet-based mobile backhaul networks. IEEE 1588 PTP (Version 2) clock synchronization standard is a highly precise protocol for time synchronization that synchronizes clocks in a distributed system. The time synchronization is achieved through packets that are transmitted and received in a session between a master clock and a slave clock.

The system clocks can be categorized based on the role of the node in the network. They are broadly categorized into ordinary clocks and boundary clocks. The master clock and the slave clock are known as ordinary clocks. The boundary clock can operate as either a master clock or a slave clock. The following list explains these clocks in detail:

- Master clock—The master clock transmits the messages to the PTP clients (also called slave node or boundary node). This allows the clients to establish their relative time distance and offset from the master clock (which is the reference point) for phase synchronization. Delivery mechanism to the clients is either unicast or multicast packets over Ethernet or UDP.
- Slave clock—Located in the PTP client (also called slave or slave node), the slave clock performs clock and time recovery operations based on the received and requested timestamps from the master clock.
- Boundary clock—The boundary clock operates as a combination of the master and slave clocks. The boundary clock endpoint acts as a slave clock to the master clock, and also acts as the master to all the slaves reporting to the boundary endpoint.

For more information about configuring PTP, see ["Configuring Precision Time Protocol" on page 319](#) and ["Example: Configuring Precision Time Protocol" on page 325](#).

[Table 53 on page 257](#) summarizes the first Junos OS release that supports PTP on various Juniper Networks devices:

**Table 53: Precision Time Protocol Support**

Juniper Networks Devices	Junos OS Release
MX80 Universal Routing Platforms with model number MX80-P	12.2
MX-MPC2E-3D-P (MPC2E P) on MX240, MX480, and MX960 routers	12.2
MX-MPC2E-3D-P (MPC2E P) on MX2010 and MX2020 routers	12.3
MPC4E-3D-32XGE-SFPP on MX240, MX480, MX960, MX2010, MX2020	15.1R1
MPC4E-3D-2CGE-8XGE on MX240, MX480, MX960, MX2010, MX2020	15.1R1
MPC3E-3D-NG-Q on MX240, MX480, MX960, MX2010, MX2020	15.1R2
MPC3E-3D-NG on MX240, MX480, MX960, MX2010, MX2020	15.1R2
Following enhanced MPCs support PTP (1588v2): <ul style="list-style-type: none"> <li>• MPC5E-40G10G on MX240, MX480, MX960, MX2010, and MX2020 routers</li> <li>• MPC5EQ-40G10G on MX240, MX480, MX960, MX2010, and MX2020 routers</li> <li>• MPC5E-100G10G on MX240, MX480, MX960, MX2010, and MX2020 routers</li> <li>• MPC5EQ-100G10G on MX240, MX480, MX960, MX2010, and MX2020 routers</li> <li>• MX2K-MPC6E on MX2010, and MX2020 routers</li> </ul>	14.2R2
Ethernet Modular Interface Cards (MICs) on MX240, MX480, and MX960 routers	12.2
Ethernet Modular Interface Cards (MICs) on MX2010 and MX2020 routers	12.3
On MX240, MX480, MX960, MX2010, and MX2020 routers, the following Enhanced MPCs (MPCes) support PTP (1588v2) under express licensing only: <ul style="list-style-type: none"> <li>• MPC1E (MX-MPC1E-3D)</li> <li>• MPC1E Q (MX-MPC1E-3D-Q)</li> <li>• MPC2E (MX-MPC2E-3D)</li> <li>• MPC2E Q (MX-MPC2E-3D-Q)</li> <li>• MPC2E EQ (MX-MPC2E-3D-EQ)</li> </ul> For more information about obtaining a license, contact JTAC.	12.3
ACX Series Universal Metro Routers	12.2
MPC6E, MPC7E, MPC8E, MPC9E, MPC2E NG, and MPC3E NG on MX2008.	17.2

Table 53: Precision Time Protocol Support (continued)

Juniper Networks Devices	Junos OS Release
Fixed port PIC (6xQSFP) and modular MIC (JNP-MIC1) on MX10003 routers	17.3
Fixed port PICs (4xQSFP28 and 8xSFPP) on MX204 routers	17.4
MPC7E-10G and MPC7E-MRATE on MX240, MX480, MX960, MX2010, MX2020	17.4
MPC8E and MPC9E on MX2010, MX2020	17.4

You can configure timestamping either at the physical layer or at the nonphysical layer on the 10-Gigabit Ethernet and 100-Gigabit Ethernet ports. Juniper Networks recommends that you configure timestamping at the physical layer if the port supports IEEE 1588 timestamping, which is also known as *PHY timestamping*.

## NOTE:

- On 10-Gigabit Ethernet ports, PHY timestamping and WAN-PHY framing are mutually exclusive—that is, you cannot configure PHY timestamping on 10-Gigabit Ethernet ports if you have configured WAN-PHY framing mode on the port. This is applicable only for MPC5E and MPC6E with 24x10XGE MIC.
- PHY timestamping is *not* supported on the enhanced MPCs MPC1E, MPC2E, and MPC4E. Only hardware timestamping is supported on these MPCs. Therefore, a packet delay variation (also known as jitter) of up to 1 microsecond is observed on these MPCs for a very small percentage of packets occasionally.
- Unified in-service software upgrade (unified ISSU) is currently not supported when clock synchronization is configured for PTP on the MICs and Enhanced MPCs on MX240, MX480, MX960, MX2010, and MX2020 routers.
- To switch between the PTP and Synchronous Ethernet modes, you must first deactivate the configuration for the current mode and then commit the configuration. Wait for a short period of 30 seconds, configure the new mode and its related parameters, and then commit the configuration.

## G.8275.1 Telecom Profile

Profiles were introduced in IEEE 1588-2008 to define a combination of options and attribute values, aimed at supporting a given application. G.8275.1 is a PTP profile for telecom applications requiring accurate phase and time synchronization. It supports the architecture defined in ITU-T G.8275 to enable the distribution of phase and time with full timing support and is based on the second version of PTP defined in [IEEE 1588].

**NOTE:** ACX Series routers do not support G.8275.1 Telecom Profile.

The following sections give a brief overview about the types of clocks supported in the G.8275.1 profile and about the Alternate BMCA:

- [Types of Clocks Supported in the G.8275.1 Profile on page 259](#)
- [Alternate BMCA on page 259](#)

### Types of Clocks Supported in the G.8275.1 Profile

There are two types of clocks supported in this profile, the ordinary clock and the boundary clock.

There are two types of ordinary clocks:

- One that can be only a grandmaster clock (T-GM)
- One that can be only a slave clock (a slave-only ordinary clock or T-TSC)

There are two types of boundary clocks:

- One that can be only a grandmaster clock (T-GM)
- One that can become a master clock and a slave clock to another PTP clock (T-BC)

**NOTE:** MX Series routers support the TSC and TBC clock types.

### Alternate BMCA

The G.8275.1 profile uses an alternate Best Master Clock Algorithm (BMCA). The alternate BMCA allows:

- A new per-port attribute named **notSlave**. The **notSlave** port attribute is implemented using the **protocols ptp master** stanza configuration.
- Multiple active grandmasters.
- Per-port attribute **local-priority** to be used as a tie-breaker in the dataset comparison algorithm.

## PTP over Link Aggregation Group

Junos Supports PTP over LAG based on the recommendation in ITU-T-G.8275.1. For each aggregated Ethernet link configured as PTP master or slave, you can specify one member link of the aggregated Ethernet bundle as primary and another as secondary. PTP switches over to the secondary member in the aggregated Ethernet bundle when the primary aggregated Ethernet link is down. For providing both link-level and FPC-level redundancy, the primary and secondary interfaces of the aggregated Ethernet bundle must be configured on separate line cards. If both primary and secondary are configured on the same line card, it would provide only link-level redundancy.

PTP master streams are created on the FPC on which the primary interface is present. Announce and sync packets are transmitted on this active PTP aggregated Ethernet link. The line card on the PTP slave containing this active PTP aggregated Ethernet link will receive announce and sync packets from the remote master.

This table summarizes the first Junos OS release that supports PTP over LAG on various Juniper Networks devices:

**Table 54: PTP over LAG Support**

Juniper Network Devices	PTP over IPv4	PTP over Ethernet
MPC2E NG	17.2R1	–
MPC3E NG	17.2R1	–
MPC5E	17.2R1	18.2R1
MPC6E	17.2R1	18.2R1
MPC7E-10G	18.1R1	18.3R1
MPC7E-MRATE	18.1R1	18.3R1
MPC8E	18.1R1	18.3R1
MPC9E	18.1R1	18.3R1

  - [Example: Configuring Precision Time Protocol on page 325](#)
  - *IEEE 1588v2 Precision Timing Protocol (PTP)*

## Configuring G.8275.1 Profile

You can configure the G.8275.1 PTP profile for applications requiring accurate phase and time synchronization. It supports the architecture defined in ITU-T G.8275 to enable the distribution of phase and time with full timing support and is based on the second version of PTP defined in [IEEE 1588].

To configure the G.8275.1 profile:

1. In configuration mode, go to the **[edit protocols ptp]** hierarchy level:

```
[edit]
user@host# edit protocols ptp
```

2. Configure the G.8275.1 profile.

```
[edit protocols ptp]
user@host# set profile-type g.8275.1
```

3. Configure the clock mode as either boundary or ordinary.

The **boundary** option signifies that the clock can be both a master clock and a slave clock. The **ordinary** option signifies that the clock is either a master clock or a slave clock.

```
[edit protocols ptp]
user@host# set clock-mode (boundary | ordinary)
```

4. Configure the PTP domain option with values from 24 through 43. The default value is 24.

```
[edit protocols ptp]
user@host# set domain domain-value
```

5. Configure the **priority2** option with values from 0 through 255. The default value is 128.

The **priority2** value differentiates and prioritizes the master clock to avoid confusion when **priority1-value** is the same for different master clocks in a network.

```
[edit protocols ptp]
user@host# set priority2 priority2-value
```

6. Configure stateful interface for boundary clock mode of operation.

```
[edit protocols ptp stateful]
user@host# edit interface interface-name
```

**NOTE:** For the configuration to work, the interface you specify must be configured at the [edit interfaces *interface-name*] hierarchy level.

7. Configure multicast transmission of Precision Time Protocol (PTP) packets.

```
[edit protocols ptp stateful interface interface-name]
user@host# set multicast-mode
```

8. Configure the **local-priority** option. This attribute to be used as a tie-breaker in the dataset comparison algorithm, in the event that all other previous attributes of the datasets being compared are equal.

```
[edit protocols ptp stateful interface interface-name multicast-mode]
```

```
user@host# set local-priority local priority-value
```

9. Specify the encapsulation type for PTP packet transport as Ethernet or IEEE 802.3.

```
[edit protocols ptp stateful interface interface-name multicast-mode]  
user@host# set transport ieee-802.3
```

10. Specify the asymmetry value.

```
[edit protocols ptp stateful interface interface-name multicast-mode]  
user@host# set asymmetry asymmetry value
```

After you have configured the PTP G.8275.1 profile, enter the **commit** command from configuration mode.

## Understanding Clock Synchronization

Starting with Junos OS Release 14.2, MX Series and PTX Series routers support external clock synchronization and automatic clock selection for Synchronous Ethernet, T1 or E1 line timing sources, and external inputs.

Starting with Junos OS Release 17.3, MX 10003 routers support external clock synchronization and automatic clock selection for Synchronous Ethernet, T1 or E1 line timing sources, and external inputs.

Configuring external clock synchronization and automatic clock selection requires making clock selection, quality level, and priority considerations. The clock source selection algorithm is used to pick the two best upstream clock sources from among the various sources on the basis of system configuration and execution criteria such as quality level, priority, and hardware restrictions.

MX5-T, MX10-T, MX40-T, MX80, MX80-T, MX240, MX480, MX960, MX2020, PTX3000, and PTX5000 routers support external clock synchronization using Synchronous Ethernet. Synchronous Ethernet is a physical layer technology that functions regardless of the network load and supports hop-by-hop frequency transfer, where all interfaces on the trail must support Synchronous Ethernet.

The Switch Control Board (SCB) supports distributed clocking mode. Starting from Junos OS Release 12.2, the Enhanced Switch Control Board—SCBE—supports centralized clocking mode and has one external clock interface.

Starting from Junos OS Release 13.3, the Enhanced Switch Control Board—SCBE2—supports centralized clocking mode and has two external clock interfaces external-0/0 and external-1/0. Note that the external-0/0 interface refers to the external interface on the SCB in slot 0 and the external 1/0 interface refers to the external interface on the SCB slot 1.

**NOTE:** On SCBE2, you can configure the external synchronization options only on the external interface on the active SCB. Therefore, if the active SCB is in slot 0, then you can configure the external-0/0 interface only. If the active SCB is in slot 1, then you can configure the external-1/0 interface only.

The PTX Series Packet Transport Routers support an external synchronization interface that can be configured to synchronize the internal Stratum 3 clock on the CCG to an external source, and then synchronize the chassis interface clock to that source.

The following sections explain external clock synchronization and its configuration parameters in detail:

- [Clock Selection on page 264](#)

- [Clock Synchronization Ports on page 276](#)
- [MIC-Level Framing Mode on page 278](#)

## Clock Selection

Configuring external clock synchronization requires making clock selection, quality level, and priority considerations. The clock selection algorithm is used to pick the two best clock sources—primary and secondary—from among the various sources.

The clock selection algorithm is on the basis of the system configuration and execution criteria such as quality level, priority, hardware restrictions, and so on, and is achieved using the following logic and restrictions:

- The following parameters must be configured irrespective of whether the quality level is enabled or not (You can set the quality level with the **set chassis synchronization source interfaces external quality-level *quality-level*** configuration command at the **[edit]** hierarchy level.):
  - Quality level must be configured for nonexternal clocks.
  - In the case of option-1, the quality level must be configured for the external clocks.
  - In the case of option-2, the default quality level for the external clocks is QL\_STU.

The synchronous Ethernet Equipment Clock (EEC) synchronization networking types option-1 and option-2 map to G.813 option 1 (EEC1) and G.812 type IV clock (EEC1) standards, respectively, and can be configured at the **[edit chassis synchronization]** hierarchy level.

- When the **quality-mode-enable** statement is included at the **[edit chassis synchronization]** hierarchy level, the received quality level must be equal to or better than the configured quality level for that particular source, otherwise that source is not considered for clock selection. This is so that a downstream client is guaranteed clock quality of a certain level. (Note that the term *certain level* here denotes the configured quality level.)
- Starting with Junos OS Release 12.2R1, configuring the quality level for a Synchronous Ethernet interface is optional when the **quality-mode-enable** and the **selection-mode received-quality** statements are included at the **[edit chassis synchronization]** hierarchy level.

The default quality level value for a Synchronous Ethernet interface is:

- **SEC** for the option-1 network type.
- **ST3** for the option-2 network type.
- Configuring the **priority** statement is optional. When not specified, the external-a interface has a higher default priority than the external-b interface, and the external-b interface has a higher default priority than Ethernet-based sources such as ge or xe clock sources, which have the lowest default priority.

**NOTE:** Configured priority is higher than any default priority.

- During clock selection:
  - The active source with the highest quality level is selected.
  - The configured (or default) quality level of the selected clock source is used for Ethernet Synchronization Message Channel (ESMC). In order to receive or transmit ESMC messages out of an interface, at least one logical interface must be configured on that interface.
  - [Table 55 on page 265](#) explains a few scenarios that must be taken into consideration during clock selection:

**Table 55: Clock Selection Scenarios**

If	Then
Two or more sources have the same quality level.	The source with highest priority is selected.
Two or more sources have the same quality level and priority.	The current active source, if any, among these sources is selected.
Two or more sources have the same quality level and priority, and none of these is currently active.	Any one of these sources is selected.
Primary clock source is ge xe-x/y/z, where y is even (0 or 2).	<p>The secondary clock source cannot be ge xe-x/y/* or ge xe-x/y + 1/*.</p> <p>For example, if ge-1/2/3 is the primary clock source, then the secondary clock source cannot be ge-1/2/* or ge-1/3/* for an MX80, MX240, MX480, or an MX960 router.</p>
Primary clock source is ge xe-x/y/z, where y is odd (1 or 3).	<p>The secondary clock source cannot be ge xe-x/y/* or ge xe-x/y - 1/*.</p> <p>For example, if xe-2/3/4 is the primary clock source, then the secondary clock source cannot be xe-2/2/* or xe-2/3/* for an MX80, MX240, MX480, or an MX960 router.</p>
Primary clock source is ge xe-x/y/z.	<p>The secondary clock source cannot be ge xe-x/y/* in the case of 12-port or 16-port 10-Gigabit Ethernet DPC on an MX Series router.</p> <p>For example, if ge-0/1/2 is the primary clock source, then ge-0/1/* cannot be the secondary clock source, but ge-0/0/* can be the secondary clock source.</p>

Starting with Junos OS Release 14.2, note that on PTX Series routers, you can specify the primary and secondary clock sources provided the clock source meets the necessary qualification as set by the clock algorithm. However, in the absence of any user-selected clock source, the clock source with the best quality level is selected by the clock algorithm in the router. Note that the user selection is honored even when better quality level clock sources are available. You can select the clock source with the **request chassis synchronization switch clock-source** operational mode command. For more information, see [request chassis synchronization switch](#).

**NOTE:** The clock sources used as primary or secondary clock sources cannot originate from the same FPC.

## Network Option

The clock type or network option is the synchronous Ethernet Equipment Clock (EEC) synchronization networking type. You can set the network option to one of the following values:

- **option-1**—This option maps to G.813 option 1 (EEC1).
- **option-2**—This option maps to G.812 type IV clock (EEC1).

**NOTE:** On MX104 routers, to configure the OC-192, OC-3, OC-12, or OC-48 interfaces as clock sources, ensure that the *option-2* network option is configured.

**NOTE:** For SCB, this option is configured with the **set chassis synchronization network-type (option-1 | option-2)** configuration command at the **[edit]** hierarchy level.

To configure the clock type, execute the **set chassis synchronization network-option (option-1 | option-2)** configuration command at the **[edit]** hierarchy level.

**NOTE:** For Junos OS Releases 11.2R4 through 13.3R3 for MX240, MX480, MX960, MX2010, and MX2020 with SCB, SCBE or SCBE2, you must execute some specific commands after you change the network option at the **[edit chassis synchronization]** hierarchy level. This is because the loop bandwidth does not change automatically when you change the network option. These are the required commands:

```
user@host# deactivate chassis synchronization
user@host# activate chassis synchronization
```

## Clock Mode

You can set the Synchronous Ethernet clock source to one of the following modes:

- **free-run**—In this mode, the free-running local oscillator is used as a clock source.

**NOTE:** For MX80 routers, the free-run clock is provided by the local oscillator.

For MX240, MX480, and MX960 routers with an SCB, the free-run clock is provided by the MPCs.

For MX240, MX480, and MX960 routers with an SCBE or an SCBE2, the free-run clock is provided by the local oscillator.

- **auto-select**—In this mode, the best external clock source is selected.

By default, the auto-select option is selected.

To configure the clock mode, execute the **set chassis synchronization clock-mode (free-run | auto-select)** configuration command at the **[edit]** hierarchy level.

## Quality Mode

When the **quality-mode-enable** statement is included at the **[edit chassis synchronization]** hierarchy level, the system ascertains that the clock selection algorithm uses both quality and priority of the clock sources to select the best clock source for clock synchronization. When the **quality-mode-enable** statement is not included, only the priority of the clock source is taken into account by the algorithm.

To enable the synchronization quality mode, include the **quality-mode-enable** statement at the **[edit chassis synchronization]** hierarchy level.

**NOTE:** The Synchronous Ethernet ESMC quality mode is disabled by default. The Synchronous Ethernet ESMC quality mode is disabled when the **quality-mode-enable** statement is not included.

## Selection Mode

You can specify whether the clock source selection must use the configured or the received ESMC or SSM quality level for a qualifying interface. In both selection modes, the interface qualifies for clock source selection only when the received ESMC or SSM quality level on the interface is equal to or greater than the configured ESMC or SSM quality level for the interface.

The selection modes are:

- **configured-quality**—In this mode, the clock source selection algorithm uses the ESMC or SSM quality level configured for a qualifying interface.

- **received-quality**—In this mode, the clock source selection algorithm uses the ESMC or SSM quality level received on the qualifying interface.

To configure the clock source algorithm selection mode, execute the **set chassis synchronization selection-mode (configured-quality|received-quality)** configuration command at the **[edit]** hierarchy level.

**NOTE:** For the **selection-mode** statement to take effect, you must include the **quality-mode-enable** statement at the **[edit chassis synchronization]** hierarchy level.

## Hold Interval

You can set the chassis synchronization wait time after a change in configuration, the clock selection wait time after reboot of the router, and the switchover wait time after a switchover of SCB before selecting the new clock source. The hold interval options are:

- **configuration-change**—In this mode, the wait time for clock selection after a change in configuration (clock synchronization configuration) can be set from 15 seconds through 60 seconds.
- **restart**—In this mode, the wait time for clock selection after reboot of the router can be set from 60 seconds through 180 seconds.
- **switchover**—In this mode, the switchover wait time after clock recovery can be set from 30 seconds through 60 seconds.

To set the hold interval, execute the **set chassis synchronization hold-interval (configuration-change | restart | switchover) seconds** configuration command at the **[edit]** hierarchy level.

**NOTE:** The default switchover wait time is 30 seconds and the default restart wait time is 120 seconds.

## Switchover Mode

You can set the switchover mode to switch the clock from a lower quality source to higher quality source or to use the current clock source only. You can configure the switchover mode to one of the following:

- **non-revertive**—In this mode, the router uses the current clock source as long as it is valid.
- **revertive**—In this mode, the router automatically switches from a lower to a higher quality clock source whenever the higher clock source becomes available.

The default mode is revertive mode.

To configure the switching mode, execute the **set chassis synchronization switchover-mode (revertive | non-revertive)** configuration command at the **[edit]** hierarchy level.

## Clock Source

You can specify the parameters that must be considered by the clock selection algorithm while selecting the best clock source. The parameters include the quality level value, the priority of the clock source, the request criteria, and the wait time to restore the interface signal to up state. You must specify these parameters on the external clock interfaces or other qualifying interfaces—which are connected to valid clock sources—to select the best clock source on the basis of the timing messages that are received on these interfaces.

For an SCBE, you can configure only one external interface and configure multiple Ethernet interfaces as needed.

On SCBE2, you can configure two external interfaces—external-0/0 and external-1/0—and configure multiple Ethernet interfaces as needed.

To configure the clock source, execute the **set chassis synchronization source interfaces interface-name** configuration command. You can also configure the clock source with the **set chassis synchronization source interfaces external** at the **[edit]** hierarchy level, where the external option refers to an external clock interface.

**NOTE:** Incorporate the external option as needed on the basis of the SCB in your MX Series router.

To specify the clock source for an interface, you must set the following options:

- **priority**—You can set the user priority for the selected clock source from 1 through 5.  
To set the synchronization source priority for the selected clock source, execute the **set chassis synchronization source interfaces interface-name priority number** configuration command or the **set chassis synchronization source interfaces external priority number** configuration command at the **[edit]** hierarchy level.
- **request**—You can set the clock selection request criterion as one of the following:
  - **force-switch**—With this option, you can force the SCB to switch to a clock source you prefer on a particular interface (that is you can select a clock source on an interface overriding the algorithm), provided the source is enabled and not locked out. Only one configured source can be force-switched.
  - **lockout**—With this option configured, the clock source is not to be considered by the selection process. Lockout can be configured for any source.

To configure these options, execute the **set chassis synchronization source interfaces interface-name request (force-switch|lockout)** configuration command or the **set chassis synchronization source interfaces external request (force-switch|lockout)** configuration command at the **[edit]** hierarchy level.

- **wait-to-restore**—You can set the wait-to-restore time for each interface. When an interface's signal transitions out of the signal fail state, it must be fault-free for the wait-to-restore time before it is again considered by the clock selection process. You can configure the interface signal upstate time—wait time before opening the interface to receive ESMC messages—from 0 through 12 minutes. The default time is 5 minutes. When the ESMC clock's EEC quality level (QL) mode is enabled, it sends a signal failure to the clock selection process during the wait-to-restore time. After the wait-to-restore time ends, a new quality level value is sent to the clock selection process.

To configure the wait-to-restore time, execute the **set chassis synchronization source interfaces *interface-name* wait-to-restore *minutes*** configuration command or the **set chassis synchronization source interfaces external wait-to-restore *minutes*** configuration command at the [edit] hierarchy level.

- **hold-off-time**—Starting with Junos OS Release 14.2, you can configure hold-off time for Synchronous Ethernet interfaces and external clock source interfaces to prevent rapid successive switching between signal fail states. If an interface goes down, hold-off time delays short signal failures from being sent to the clock selection process.

**NOTE:** During the hold-off time period, if the clock synchronization process restarts, hold-off time is not considered.

If you configure hold-off time when the ESMC clock's EEC QL mode is enabled, the configured quality level is used in the clock selection process during the hold-off time period. During the hold-off time period, the external clock source appears in a locked state until the hold-off time period ends. After the hold-off time period ends, a signal failure is sent to the clock selection process.

You can configure hold-off time for a range of 300 through 1800 milliseconds. The default hold-off time is 1000 milliseconds.

To configure hold-off time, execute the **set chassis synchronization source interfaces *interface-name* hold-off-time** configuration command at the [edit] hierarchy level.

**NOTE:** When a link goes down and comes back up within the configured hold-off time in a clocking hybrid mode configuration (the combined operation of Synchronous Ethernet and Precision Time Protocol) that includes the protocols **ptp slave convert-clock-class-to-quality-level** configuration statement at the [edit] hierarchy level, the phase might not get locked before the timer expires. This might result in a degradation of clock quality level.

- **quality**—You can set the ESMC clock's EEC quality level as prc, prs, sec, smc, ssu-a, ssu-b, st2, st3, st3e, st4, stu, or tnc. Both option I and option II SSM quality levels are supported. [Table 56 on page 271](#) explains the quality level values.

Table 56: Quality Levels

Quality Level	Description
<b>prc</b>	Timing quality of a primary reference clock (option-1 only).
<b>prs</b>	Clock traceable to a primary reference source (option-2 only).
<b>sec</b>	Timing quality of an SDH equipment clock (option-1 only).
<b>smc</b>	Clock traceable to a self-timed SONET clock (option-2 only).
<b>ssu-a</b>	Timing quality of a type I or IV slave clock (option-1 only).
<b>ssu-b</b>	Timing quality of a type VI slave clock (option-1 only).
<b>st2</b>	Clock traceable to Stratum 2 (option-2 only).
<b>st3</b>	Clock traceable to Stratum 3 (option-2 only).
<b>st3e</b>	Clock traceable to Stratum 3E (option-2 only).
<b>st4</b>	Clock traceable to Stratum 4 free-run (option-2 only).
<b>stu</b>	Clock traceable to an unknown quality (option-2 only).
<b>tnc</b>	Clock traceable to a transit node clock (option-2 only).

**NOTE:** When the quality level is not configured and no ESMC messages are received by the clock source, then the quality level is set to DNU for option-1 and DUS for option-2. You can configure the network options, option-1 and option-2 at the [edit chassis synchronization network-option] hierarchy level.

To avoid source looping on the selected active source—primary or secondary source, whichever is active—even when ESMC transmit is not enabled, a DNU ESMC message is sent out when the **network-option** statement is configured as option-1, and a DUS ESMC message is sent out when the **network-option** statement is configured as option-2. This is applicable only for clock sources configured on the Ethernet interfaces.

To configure the quality level, execute the **set chassis synchronization source interfaces *interface-name* quality-level (prc | prs | sec | smc | ssu-a | ssu-b | st2 | st3 | st3e | st4 | stu | tnc)** configuration command or the **set chassis synchronization source interfaces external quality-level (prc | prs | sec | smc | ssu-a | ssu-b | st2 | st3 | st3e | st4 | stu | tnc)** configuration command at the [edit] hierarchy level.

## ESMC Packet Transmit

You can enable all the interfaces or configure one or more qualifying interfaces on which to permit ESMC transmit messages by executing the **set chassis synchronization esmc-transmit interfaces (all | *interface-name*)** configuration command at the **[edit]** hierarchy level.

## Global Wait To Restore

Starting with Junos OS Release 14.2, you can globally configure the time in minutes for source ports to be up before opening the Ethernet Synchronization Message Channel (ESMC) for messages. When a port's signal transitions out of the signal fail state, it must be fault-free for the global wait-to-restore time before it is again considered by the clock selection process.

To configure the global wait-to-restore time, include the **global-wait-to-restore** statement at the **[edit chassis synchronization]** hierarchy level.

To override the global wait-to-restore time on a specific interface, include the **wait-to-restore** statement at the **[edit chassis source interfaces (external-a | external-b | interface *interface-name*)]** hierarchy level.

## Maximum Transmit Quality Level

To configure the maximum transmit quality level for SCBE2 as prc, prs, sec, smc, ssu-a, ssu-b, st2, st3, st3e, st4, stu, or tnc, execute the **set chassis synchronization max-transmit-quality-level *quality-level*** configuration command at the **[edit]** hierarchy level.

**NOTE:** Starting from Junos OS Release 13.3, you can configure the **max-transmit-quality-level** statement on SCB and SCBE.

**NOTE:** Starting from Junos OS Release 13.3, for GPS external output, when you configure the maximum transmit quality level as PRC and router is rebooted, no valid output is obtained from SCBE. However, when the maximum transmit quality level is configured to any other quality level other than PRC and the router gets rebooted, then the SCBE works normally.

---

## Interfaces with Upstream Clock Source

You can configure the external interface to operate with a connected router for a clock source. This external interface can be configured for a clock source, which then becomes a candidate for selection as the chassis clock source by the clock source selection algorithm. You can configure several options for the external clock source interface on the SCBE and for the two external clock source interfaces on the SCBE2.

The options include E1 interface options, pulse-per-second option, the signal type for the provided reference clocks, and the T1 interface options at the **[edit chassis synchronization interfaces external]** hierarchy level.

The following sections explain the clock source interface parameters in detail:

- [E1 Interface Options on page 273](#)
- [Pulse Per Second on page 274](#)
- [Signal Type on page 274](#)
- [T1 Interface Options on page 274](#)

### E1 Interface Options

You can set the E1 interface-specific options as:

- **framing**—Set the framing mode for the E1 interface as one of the following:
  - **g704**—G.704 framing format for E1 interfaces
  - **g704-no-crc4**—G.704 framing without CRC4 for E1 interfaces.

To set the framing mode for the E1 interface, execute the **set chassis synchronization interfaces external e1-options framing (g704|g704-no-crc4)** configuration command at the **[edit]** hierarchy level for SCBE or the **set chassis synchronization interfaces (external-0/0 | external-1/0) e1-options framing (g704|g704-no-crc4)** configuration command at the **[edit]** hierarchy level for SCBE2.

By default, the g704 framing format is selected.

- **line-encoding**—Set the **line-encoding** statement as automatic mark inversion or high-density bipolar 3 code. The line encoding technique converts signals to bipolar pulses. You can set the **line-encoding** option as one of the following:
  - **ami**—Automatic mark inversion
  - **hdb3**—High-density bipolar 3 code

To configure the **line-encoding** statement on the E1 interface, execute the **set chassis synchronization interfaces external e1-options line-encoding (ami|hdb3)** configuration command for SCBE at the **[edit]** hierarchy level or the **set chassis synchronization interfaces (external-0/0 | external-1/0) e1-options line-encoding (ami|hdb3)** configuration command at the **[edit]** hierarchy level for SCBE2.

By default, the hdb3 line encoding technique is selected.

- **sabit**—Set the SA bit to a value from 4 through 8. SA bits are used for exchanging the SSM quality between the clock source and the router on the E1 interface.

To set the SA bit on the E1 interface, execute the **set chassis synchronization interfaces external e1-options sabit sabit-value** configuration command at the **[edit]** hierarchy level for SCBE or the **set chassis synchronization interfaces (external-0/0 | external-1/0) e1-options sabit sabit-value** configuration command at the **[edit]** hierarchy level for SCBE2.

### Pulse Per Second

---

You can enable the **pulse-per-second-enable** option on the GPS interface to receive the pulse per second (PPS) signal by executing the **set chassis synchronization interfaces external pulse-per-second-enable** configuration command at the **[edit]** hierarchy level for SCBE or the **set chassis synchronization interfaces (external-0/0 | external-1/0) pulse-per-second-enable** configuration command at the **[edit]** hierarchy level for SCBE2.

### Signal Type

---

You can set the frequency for the provided reference clock (GPS or BITS) as one of the following:

- **1mhz**—Set the signal with a clock frequency of 1 MHz.
- **5mhz**—Set the signal with a clock frequency of 5 MHz.
- **10mhz**—Set the signal with a clock frequency of 10 MHz.
- **2048khz**—Set the signal with a clock frequency of 2048 kHz.
- **e1**—Set the signal as an E1-coded 2048 kHz signal on a 120-ohm balanced line.
- **t1**—Set the signal as a T1-coded 1.544 MHz signal on a 100-ohm balanced line.

Configure the signal type by executing the **set chassis synchronization interfaces external signal-type (1mhz | 5mhz | 10mhz | 2048khz | e1 | t1)** configuration command at the **[edit]** hierarchy level for SCBE or the **set chassis synchronization interfaces (external-0/0 | external-1/0) signal-type (1hz | 5mhz | 10mhz | 2048khz | e1 | t1)** configuration command at the **[edit]** hierarchy level for SCBE2.

The 1mhz, 5mhz, and the 10mhz signals are traceable to a GPS-capable clock source, where the source can be an atomic clock. The e1 and t1 signals are traceable to a BITS clock source.

### T1 Interface Options

---

You can set the T1 interface-specific options as:

- **framing**—Set the framing mode for the T1 interface as one of the following:
  - **esf**—Extended superframe
  - **sf**—Superframe

To set the framing mode for the T1 interface, execute the **set chassis synchronization interfaces external t1-options framing (esf|sf)** configuration command at the **[edit]** hierarchy level for SCBE or the **set chassis synchronization interfaces (external-0/0 | external-1/0) t1-options framing (esf|sf)** configuration command at the **[edit]** hierarchy level for SCBE2.

By default, the esf framing mode is selected.

- **line-encoding**—Set the **line-encoding** option on the T1 interface as one of the following:
  - a. **ami**—Automatic mark inversion

b. **b8zs**—8-bit zero suppression

To configure the **line-encoding** option on the T1 interface, execute the **set chassis synchronization interfaces external t1-options line-encoding (ami|b8zs)** configuration command at the **[edit]** hierarchy level for SCBE or the **set chassis synchronization interfaces (external-0/0 | external-1/0) t1-options line-encoding (ami|b8zs)** configuration command at the **[edit]** hierarchy level for SCBE2.

By default, the b8z3 line encoding technique is selected.

## External Output Interface

You can set several options for the external clock output interface for SCBE or for the two external clock output interfaces for SCBE2.

The options include disabling the holdover mode; configuring a minimum quality threshold; configuring a mode to select a clock source; configuring the transmit quality level to DNU or DUS; and disabling wander filtering at the **[edit chassis synchronization output interfaces external]** hierarchy level for SCBE or at the **[edit chassis synchronization output interfaces (external0-0 | external-1/0)]** hierarchy level for SCBE2.

The following sections explain the external output interface parameters in detail:

- [Holdover Mode on page 275](#)
- [Minimum Quality on page 275](#)
- [Source Mode on page 276](#)
- [Transmit Quality Level on page 276](#)
- [Wander Filter on page 276](#)

### Holdover Mode

You can disable the holdover mode on the external output interface by executing the **set chassis synchronization output interfaces external holdover-mode-disable** configuration command at the **[edit]** hierarchy level for SCBE or the **set chassis synchronization output interfaces (external-0/0 | external-1/0) holdover-mode-disable** configuration command at the **[edit]** hierarchy level for SCBE2.

### Minimum Quality

When the quality of the source signal—used to derive the output—falls below a minimum quality level, the output of the external interface is placed in holdover mode. When the signal type supports the SSM quality level, the SSM quality level is set as the holdover quality level. The output interface remains in holdover mode until a source with the minimum quality level or higher is available. Note that when the **holdover-mode-disable** option is configured, the output is suppressed completely.

You can set the minimum quality on the external output interface as prc, prs, sec, smc, ssu-a, ssu-b, st2, st3, st3e, st4, stu, or tnc by executing the **set chassis synchronization output interfaces external minimum-quality quality-level** configuration command at the **[edit]** hierarchy level for SCBE or the **set chassis synchronization output interfaces**

(**external-0/0 | external-1/0**) **minimum-quality *quality-level*** configuration command at the **[edit]** hierarchy level for SCBE2.

---

### Source Mode

When the source mode is set to chassis, the source selected by the chassis clock module is used as the clock source. When the source mode is set to line, the best available line clock is selected.

You can set the source mode for selecting a clock source as either a chassis clock or the best line clock source as output by executing the **set chassis synchronization output interfaces external source-mode (chassis|line)** configuration command at the **[edit]** hierarchy level for SCBE or the **set chassis synchronization output interfaces (external-0/0 | external-1/0) source-mode (chassis|line)** configuration command at the **[edit]** hierarchy level for SCBE2.

---

### Transmit Quality Level

You can configure the **tx-dnu-to-line-source-enable** statement to enable the transmit quality level to DNU or DUS when the chassis clock is the BITS input signal and when a valid line source signal is sent out through the BITS output.

You can set the transmitting quality level to DNU or DUS on the line source interface by executing the **set chassis synchronization output interfaces external tx-dnu-to-line-source-enable** configuration command at the **[edit]** hierarchy level for SCBE or the **set chassis synchronization output interfaces (external-0/0 | external-1/0) tx-dnu-to-line-source-enable** configuration command at the **[edit]** hierarchy level at SCBE2.

---

### Wander Filter

You can disable the wander filter by executing the **set chassis synchronization output interfaces external wander-filter-disable** configuration command at the **[edit]** hierarchy level for SCBE or the **set chassis synchronization output interfaces (external-0/0 | external-1/0) wander-filter-disable** configuration command at the **[edit]** hierarchy level for SCBE2.

## Clock Synchronization Ports

Starting with Junos OS Release 13.3, you can set the **time-of-day-format** statement as an ASCII string on SCBE and SCBE2 by executing the **set chassis synchronization port auxiliary client time-of-day-format ascii string** configuration command at the **[edit]** hierarchy level.

The time of day (TOD) format is specified as a string of ASCII characters. The TOD format string contains information that specifies which ASCII characters to match, which ASCII characters to ignore, and which ASCII characters to translate to particular time units (such as month, day, hour, minute, and so on).

The TOD format string specifies how the incoming string is to be parsed so that the information embedded can be extracted. The format of the TOD option can be executed with the **set chassis synchronization port auxiliary time-of-day-format ascii *string***

configuration command at the **[edit]** hierarchy level, where the format of the data string is `$GPRMC,%hh%mm%ss,^,^,^,^,^,^,^,^,^,^,%DD%MM%YY,^,^,^,^,^,^,^,^`.

[Table 57 on page 277](#) explains pattern-matching characters used in the TOD data string.

**Table 57: Pattern-Matching Characters**

Character construct	Number of characters	Description
-	1	The <i>DO NOT CARE</i> (DNC) character
%hh	2	Hours (00–23)
%mm	2	Minutes (00–59)
%ss	2	Seconds (00–59)
%DD	2	Day (01–31)
%MM	2	Month (01–12)
%YY	2	Year without century
%YYY	4	Year with century
%DDD	3	Day of year (001–366)
%MMM	3	Month of year (JAN, FEB, etc.)
%cc	2	NMEA message checksum
%Q	1	Time quality indicator ('' = valid '*' = error)

There are several patterns that can be received by a router. The following pattern shows an example of a received TOD data string (as defined in the National Marine Electronics Association (NMEA) 0183 standard. The data string is called the Recommended Minimum Specific GPS/Transit Data (RMC) message.) and [Table 58 on page 277](#) explains it in detail.

```
$GPRMC,225446,A,4916.45,N,12311.12,W,0.00,5.054,7,191194,020.3,E*68<CR><LF>
```

**Table 58: Received TOD Data String**

Pattern	Description
\$GPRMC	NMEA sentence ID
225446	UTC time of fix (22:54:46 UTC)
A	Data status (A=Valid position, V=navigation receiver warning)

Table 58: Received TOD Data String (continued)

Pattern	Description
4916.45	Latitude of fix
N	N or S of longitude
12311.12	Longitude of fix
W	E or W of longitude
000.5	Speed over ground in knots
054.7	Track made good in degrees True
191194	UTC date of fix (19 November 1994)
020.3	Magnetic variation degrees
E	E or W of magnetic variation
*68	Checksum (XOR of all characters between \$ and *)

**NOTE:** Whenever a TOD data string does not provide sufficient information, the router extracts it from Junos OS and generates a log message. The TOD data string that is either transmitted or received is always of fixed length and is delimited by a <CR><LF>character pair, where CR (carriage return) and LF (line feed) are the line break types used to end the ASCII format string.

## MIC-Level Framing Mode

You can configure the LAN framing mode on the 10-Gigabit Ethernet MIC with XFP by executing the **set chassis fpc fpc-slot pic pic-slot framing lan** at the **[edit]** hierarchy level.

Note that to operate in LAN framing mode on the 10-Gigabit Ethernet MIC with XFP, you must configure the interface framing mode on the MIC interface. Execute the **set interfaces xe-fpc/pic/port framing-mode (lan-phy | wan-phy)** configuration command at the **[edit]** hierarchy level, where the lan-phy option denotes a 802.3ae 10-Gbps LAN-mode interface and the wan-phy option denotes a 802.3ae 10-Gbps WAN-mode interface.

Release History Table

Release	Description
17.3	Starting with Junos OS Release 17.3, MX 10003 routers support external clock synchronization and automatic clock selection for Synchronous Ethernet, T1 or E1 line timing sources, and external inputs.
14.2	Starting with Junos OS Release 14.2, MX Series and PTX Series routers support external clock synchronization and automatic clock selection for Synchronous Ethernet, T1 or E1 line timing sources, and external inputs.
14.2	Starting with Junos OS Release 14.2, note that on PTX Series routers, you can specify the primary and secondary clock sources provided the clock source meets the necessary qualification as set by the clock algorithm.
14.2	Starting with Junos OS Release 14.2, you can configure hold-off time for Synchronous Ethernet interfaces and external clock source interfaces to prevent rapid successive switching between signal fail states.
14.2	Starting with Junos OS Release 14.2, you can globally configure the time in minutes for source ports to be up before opening the Ethernet Synchronization Message Channel (ESMC) for messages.
13.3	Starting from Junos OS Release 13.3, the Enhanced Switch Control Board—SCBE2—supports centralized clocking mode and has two external clock interfaces external-0/0 and external-1/0.
13.3	Starting from Junos OS Release 13.3, you can configure the <b>max-transmit-quality-level</b> statement on SCB and SCBE.
13.3	Starting from Junos OS Release 13.3, for GPS external output, when you configure the maximum transmit quality level as PRC and router is rebooted, no valid output is obtained from SCBE.
13.3	Starting with Junos OS Release 13.3, you can set the <b>time-of-day-format</b> statement as an ASCII string on SCBE and SCBE2 by executing the <b>set chassis synchronization port auxiliary client time-of-day-format ascii string</b> configuration command at the <b>[edit]</b> hierarchy level.
12.2	Starting from Junos OS Release 12.2, the Enhanced Switch Control Board—SCBE—supports centralized clocking mode and has one external clock interface.
12.2	Starting with Junos OS Release 12.2R1, configuring the quality level for a Synchronous Ethernet interface is optional when the <b>quality-mode-enable</b> and the <b>selection-mode received-quality</b> statements are included at the <b>[edit chassis synchronization]</b> hierarchy level.
11.2-13.3	For Junos OS Releases 11.2R4 through 13.3R3 for MX240, MX480, MX960, MX2010, and MX2020 with SCB, SCBE or SCBE2, you must execute some specific commands after you change the network option at the <b>[edit chassis synchronization]</b> hierarchy level.

## Understanding ESMC Quality Level Mapping

Ethernet Synchronization Message Channel (ESMC) is a logical communication channel. It transmits Synchronization Status Message (SSM) information, which is the quality level of the transmitting synchronous Ethernet equipment clock (EEC), by using ESMC protocol data units (PDUs). ESMC support is based on the ITU G.8264 specification. In order for an interface to receive or transmit ESMC messages, at least one logical interface must be configured on that interface. If the interface is currently not configured with a logical interface, you must configure a logical interface by using the **[set interfaces interface-name unit 0]** statement at the **[edit]** hierarchy level.

The following factors affect the ESMC quality level value that is transmitted out on the interfaces configured at the **[edit chassis synchronization esmc-transmit interfaces]** hierarchy level:

- Quality mode
- Selection mode
- Conversion of PTP clock class flag

Other than the aforementioned factors, the software phase lock loop (spll) state or the hybrid state impacts the transmitted ESMC quality level when the router is in PTP mode or hybrid mode, respectively.

The following sections explain how the ESMC quality level is handled in various situations:

- [Synchronous Ethernet Mode on page 281](#)
- [Precision Time Protocol Mode on page 281](#)
- [Hybrid Mode on page 283](#)
- [Feature Mode Changes on page 283](#)

## Synchronous Ethernet Mode

In Synchronous Ethernet mode, the ESMC quality level is handled in the following way:

- In quality mode:
  - If the **quality-mode-enable** option at the **[show chassis synchronization]** hierarchy level is not set, then the configured quality and the priority set for the clock sources are used for the clock selection. The ESMC quality level is based on the configured quality level corresponding to the active clock source.
  - If the **quality-mode-enable** option at the **[show chassis synchronization]** hierarchy level is set, then only those clock sources that receive ESMC quality level is higher than or equal to the configured quality are considered for selection. The ESMC quality level value transmitted also depends on the selection mode option as discussed next.
- In selection mode:
  - If the **selection-mode** option at the **[show chassis synchronization]** hierarchy level is set to **configured-quality**, then the configured quality for the selected, active source is used as the system ESMC quality level value that is transmitted out.
  - If the **selection-mode** option at the **[show chassis synchronization]** hierarchy level is set to **received-quality**, then the received ESMC quality level value from the selected clock source is transmitted out.
- When no clock sources are locked:
  - a. Do Not Use (DNU)/Don't Use for Synchronization (DUS) quality level is transmitted.
  - b. The ESMC quality level value sent out on the selected, active clock source interface is always DNU/DUS.

## Precision Time Protocol Mode

In Precision Time Protocol (PTP) mode, you can transmit ESMC quality level values with the following parameters set:

- The **network-option** option must be configured at the **[edit chassis synchronization]** hierarchy level.
- Synchronous Ethernet sources must not be configured at the **[edit chassis synchronization]** hierarchy level.
- The **convert-clock-class-to-quality-level** option at the **[edit protocols ptp slave]** hierarchy level must be enabled so that the PTP clock class received from the selected master is converted to the appropriate ESMC quality level.

Clock class is a value that ranges from 80 through 109 and is used to map the clock class to the set ESMC quality level. The ESMC quality level value is mapped to the clock class value by one of the following methods:

- Mapping of PTP clock class to ESMC quality level—By default, the standard mappings suggested by ITU-T G.781 specification are used as shown in [Table 59 on page 282](#) and irrespective of the clock being configured in hybrid mode or pure PTP mode, the outgoing quality level is always based on the PTP clock class mapping. To map the PTP clock class to the ESMC quality level, you must set the **convert-clock-class-to-quality-level** option at the **[edit protocols ptp slave]** hierarchy level. For default mapping values, see [Table 59 on page 282](#).

**Table 59: Default Quality Level to PTP Clock-Class Mapping**

SSM QL (Binary)	Standard Mappings Given in ITU-T G.781 Specification		PTP Clock Class
	Option I	Option II	
0001	-	QL-PRS	80
0000	-	QL-STU	82
0010	QL-PRC	-	84
0111	-	QL-ST2	86
0011	-	-	88
0100	QL-SSU-A	QL-TNC	90
0101	-	-	92
0110	-	-	94
1000	QL-SSU-B	-	96
1001	-	-	98
1101	-	QL-ST3E	100
1010	-	QL-ST3/ QL-EEC2	102
1011	QL-SEC/ QL-EEC1		104
1100	-	QL-SMC	106
1110	-	QL-PROV	108
1111	QL-DNU	QL-DUS	110

- User-defined mapping of PTP clock class to ESMC quality level—You can manually override the clock class to ESMC mapping by setting the **clock-class** option at the **[edit protocols ptp slave clock-class-to-quality-level-mapping quality level ql-value]** hierarchy level.

Unlike Synchronous Ethernet, the DNU/DUS quality level value is not transmitted on the interface on which the PTP master is configured. In PTP mode, an interface is configured as part of the **[edit chassis esmc-transmit interfaces]** hierarchy level, and an appropriate ESMC quality level value is transmitted through it. Note that when the PTP clock class value received from the master changes, the ESMC quality level transmitted also changes appropriately. If there is no valid clock class value as input, then the DNU/DUS value is transmitted on the interfaces configured under the **esmc-transmit** option at the **[edit chassis synchronization]** hierarchy level.

To view the current mapping between the clock class and the ESMC quality level, run the **show ptp quality-level-mapping** operational mode command.

To display the ESMC quality level currently transmitted by the interface, run the **show ptp global-information** operational mode command in PTP or hybrid mode. Note that when the **convert-clock-class-to-quality-level** option is disabled or when there is no valid clock class as input, the **show ptp global information** command does not display the ESMC quality level value.

To view the ESMC quality level transmitted in all modes, run the **show synchronous-ethernet esmc transmit detail** operational mode command.

## Hybrid Mode

Hybrid mode is a combination of PTP and Synchronous Ethernet modes.

The configuration required for transmitting the ESMC quality level in hybrid mode differs from that in PTP mode in the following ways:

- In hybrid mode, synchronous Ethernet source interfaces must be configured at the **[edit chassis synchronization]** hierarchy level.
- In hybrid mode, configuring the **convert-clock-class-to-quality-level** option is optional. When this option is configured, the outgoing ESMC quality level behavior is the same as that in PTP mode. When the **convert-clock-class-to-quality-level** option is not configured, the outgoing ESMC quality level behavior is the same as that in Synchronous Ethernet mode.

## Feature Mode Changes

When the router configuration is changed from one feature mode to another mode—that is from or to Synchronous Ethernet, PTP, or hybrid mode—the following occurs:

1. The ESMC quality level is reset to DNU.
2. Based on the new feature mode, the ESMC quality level is decided:
  - When the reference clock qualifies for Synchronous Ethernet mode.

- When PTP goes into phase-aligned state or hold-over state in PTP mode.
- When the hybrid state reaches *frequency and phase aligned* state in hybrid mode.

Sometimes PTP is required to drive Synchronous Ethernet and ESMC. This scenario occurs when:

- After certain PTP hops, the network branches out, and one branch of the network requires only frequency synchronization while the other branch requires both phase and frequency synchronization.
- A packet-based distribution network is located between a time-division multiplexing (TDM), a SONET, and a Synchronous Ethernet network.

In such situations, the clock recovered by PTP is sent over the Ethernet physical transceiver for Synchronous Ethernet, and the ESMC quality level value mapping with the PTP clock class is sent over the interfaces.

## PTP Trace Overview

Precision Time Protocol (PTP), also known as IEEE 1588v2, works on the principle of phase synchronization and frequency synchronization—it synchronizes both frequency and phase, including time of day. Phase synchronization is achieved either by adjusting the phase of the slave clock (the router's internal clock oscillator) discontinuously—by receiving clock signals from the master clock at irregular periods of time—or by adjusting the phase-locked loop of the slave's internal clock at regular intervals. The accuracy of clock synchronization depends on factors such as packet delay variation, quality of oscillator used, network asymmetry, and so on. For information about PTP, see [“Precision Time Protocol Overview” on page 256](#).

Starting with Junos OS Release 13.3R4, you can implement a path trace mechanism to detect PTP loops that circulate endlessly within a PTP ring of boundary clocks over an IPv4 network. The PTP ring topology implementation uses the 1588v2 path trace mechanism to prevent PTP loops and to provide PTP convergence in the event of any single-point failure.

The following sections explain the path trace mechanism and how it is implemented in a multiple-grandmaster PTP ring topology over an IPv4 network. The sections also explain steady state and failure handling in a PTP ring topology:

- [PTP Ring Topology on page 285](#)
- [Path Trace Mechanism Overview on page 285](#)

- [Steady State on page 286](#)
- [Failure Handling on page 287](#)
- [PTP Ring Topology Without Path Trace Mechanism on page 287](#)

## PTP Ring Topology

A PTP ring topology is a ring topology that consists of one or more grandmaster clocks and several boundary clocks.

Consider a simple ring topology of boundary clocks—BC1 through BC5—driven by one primary PTP grandmaster clock and one backup PTP grandmaster clock—GM-A and GM-B, respectively—as illustrated in [Figure 6 on page 285](#). Assume that GM-A is superior to GM-B—that is, the quality level of GM-A's clock is higher than that of GM-B's clock.

*Figure 6: Multiple-Grandmaster PTP Ring Topology*

Each boundary clock in the PTP ring is configured as both slave and master to its immediate neighbor to provide seamless PTP grandmaster clock switchover in case of grandmaster or boundary clock failure. For example, in [Figure 6 on page 285](#) BC2 is both master and slave to both BC1 and BC3, BC3 is both master and slave to BC2 and BC4, and so on.

## Path Trace Mechanism Overview

During the process of synchronization in a PTP ring topology, certain announce messages—timing information messages that are sent from master to slave—might form in an infinite loop (also called *PTP loop*) in a network trail of boundary clocks. These PTP loops create issues such as a boundary clock potentially synchronizing its local clock with its own timing information, thereby compromising the quality of the recovered clock. The path trace mechanism is used to detect such loops.

A *path trace* is the route that a PTP announce message takes through the network trail of boundary clocks and is tracked through the path trace TLV in the announce message. A path trace TLV (type, length, and value) is a set of octets in an announce message that includes the TLV type, the length field, and the path sequence. The path trace sequence contains the clock ID of each boundary clock that an announce message traverses through the PTP ring.

One of the principal uses of the path trace mechanism is to detect the so-called *rogue announce messages* that circulate endlessly in loops in the PTP ring of boundary clocks. A boundary clock detects a PTP loop when it finds its own clock ID in the path trace of the received announce message. When such a loop is detected, the router discards the received announce message.

To view the trail of the announce message or path trace, use the **show ptp path-trace detail** operational mode command. For more information, see [show ptp path-trace detail](#).

**NOTE:**

- During GRES, the path trace and the best master clock algorithm information are pushed to the kernel. Therefore, this information is available on the backup Routing Engine as well.
  - When the number of boundary clocks in a topology exceeds 20, the path trace TLV is dropped.
  - Currently, the PTP ring topology is supported only for PTP over IPv4 networks.
- 

## Steady State

The PTP ring is considered to be in steady state or operating normally when a router, say BC1, is locked—that is, is connected and synchronized—to a grandmaster clock that has a higher quality level value—higher than the quality level of other grandmaster clocks in the network—and all the other routers in the PTP ring are locked to the grandmaster clock through this router BC1. For example in [Figure 6 on page 285](#), during steady state, BC1 is locked to GM-A, BC2 and BC5 are locked to BC1, BC3 is locked to BC2, and BC4 is locked to BC5. When the path trace mechanism is implemented in this ring topology, a clock ID is assigned to each boundary clock that, in turn, is included in the path trace TLV within the announce message. Therefore, the path trace TLV in the announce message originating from BC1 has its own clock ID—CID1. Similarly, the announce message from BC2 has its own clock ID—CID2—and BC1's clock ID—CID1—and so on.

As router BC2 is master to BC1, BC1 constantly receives BC2's announce messages. The announce messages from BC2 received on BC1 contains BC1's own clock ID—CID1—along with BC2's clock ID—CID2. Because BC1 receives its own clock ID—CID1—in the announce message, BC1 drops BC2's announce messages. Similarly, BC2 drops BC3's announce messages as the messages contain BC2's clock ID—CID2—along with other clock IDs—CID1 and CID3. Note that this behavior is intentional and by design, as is explained in [“Failure Handling” on page 287](#).

## Failure Handling

Consider a scenario where the router BC1 crashes in the PTP ring illustrated in [Figure 6 on page 285](#). This failure is handled in the following way:

1. The router BC2 stops receiving announce messages from BC1.
2. The announce messages now received by BC2 are only those sent by BC3. BC2 drops these announce messages because these messages contain BC2's own clock ID—CID2.
3. Because BC2 does not receive any valid announce messages, it goes into holdover mode and lowers the value of its announce parameters, such as clock class, which results in BC2 announce messages carrying an inferior clock class.
4. When BC3 receives these announce messages with inferior clock class from BC2, it in turn announces this inferior clock class to all the downstream routers.
5. When BC5 eventually receives this announce message with the inferior quality level value from BC4, the best master clock algorithm running on the BC5 router switches BC5 to GM-B automatically and the BC5 router sends announce messages corresponding to the parameters as set by GM-B.
6. When BC4 receives this announce message—carrying superior clock class information as compared to that carried by BC3's announce message—the BC4 router switches to BC5. Similarly, BC3 locks to BC4 and then BC2 locks to BC3. In other words, the ring topology shown in [Figure 6 on page 285](#) converges to a clockwise hierarchy of boundary clocks. This entire process takes a few tens of seconds.

Note that each PTP best master clock algorithm switchover at each boundary clock is seamless and thereby ensures that the performance of the PTP ring does not degrade. However, when there are multiple simultaneous failures in the ring topology—for example, simultaneous link failures between GM-A and BC1 and between BC4 and BC5—the short-term absolute maximum time interval error (MTIE) might go up to 650ns—for example, between routers BC2 to BC4. Note that this type of multiple failures in a ring topology is rare.

MTIE is a maximum phase variation error that is measured over a period of time, where the error is calculated between the phase variation of a signal with the perfect signal.

## PTP Ring Topology Without Path Trace Mechanism

When the PTP path trace mechanism is not implemented, the BC2 router cannot detect announce messages from BC3 that are actually BC2's looped announce messages. This, in turn, results in BC2 attempting to lock to BC3 (while BC3 is already locked to BC2) and a PTP deadlock is created. Because of the PTP deadlock, there is a significant clock drift over a period of time on both BC2 and BC3 and potentially on all the boundary clocks that can be traced to BC3.

Note that when the crashed router BC1 comes up, it chooses GM-A as its master, and it sends out announce messages that carry superior clock class information compared to those carried by announce messages sent out by GM-B. The BC2 router's best master clock algorithm determines that the BC1's announce messages carry superior clock class

information as compared to BC3's, resulting in BC2 switching back to BC1. Similarly, BC3 switches back to BC2. This way, the ring topology is restored to the pre-crash topology.

#### Release History Table

Release	Description
13.3R4	Starting with Junos OS Release 13.3R4, you can implement a path trace mechanism to detect PTP loops that circulate endlessly within a PTP ring of boundary clocks over an IPv4 network.

## Understanding Hybrid Mode

The combined operation of Synchronous Ethernet and Precision Time Protocol (PTP) is also known as hybrid mode.

The following sections explain hybrid mode in detail:

- [Hybrid Mode Overview on page 288](#)
- [Supporting Platforms on page 290](#)

### Hybrid Mode Overview

In hybrid mode, the synchronous Ethernet equipment clock (EEC) on the Modular Port Concentrator (MPC) derives the frequency from Synchronous Ethernet and the phase and time of day from PTP. Time synchronization includes both phase synchronization and frequency synchronization.

Synchronous Ethernet is a physical layer–based technology that functions regardless of the network load. Synchronous Ethernet supports hop-by-hop frequency transfer, where all interfaces on the trail must support Synchronous Ethernet. PTP (also known as IEEE 1588v2) synchronizes clocks between nodes in a network, thereby enabling the distribution of an accurate clock over a packet-switched network. This synchronization is achieved through packets that are transmitted and received in a session between a master clock (commonly called the master) and a slave clock (also known as the slave in PTP terminology).

**NOTE:** Router clocks are categorized based on the role of the router in the network. They are broadly categorized into ordinary clocks and boundary clocks. The master clock and the slave clock are known as ordinary clocks. The boundary clock can operate as either a master or a slave.

Synchronous Ethernet works on the principle of frequency synchronization, whereby the frequencies of all the clocks (intermediate master and slave clocks) in the network are synchronized to the frequency of the master clock at the starting end of the network trail.

PTP works on the principle of phase synchronization and frequency synchronization—it synchronizes both frequency and phase, including time of day. Phase synchronization is achieved either by adjusting the phase of the slave clock (the router's internal clock oscillator) discontinuously by receiving clock signals from the master clock at irregular periods of time or by adjusting the phase-locked loop of the slave internal clock at regular intervals. The accuracy of clock synchronization depends on factors such as packet delay variation, quality of oscillator used, network asymmetry, and so on.

Synchronous Ethernet and PTP provide frequency and phase synchronization; however, accuracy in the order of nanoseconds is difficult to achieve through PTP or Synchronous Ethernet and these technologies do not support a large number of network hops. Hybrid mode resolves these issues by extending the number of network hops and also provides clock synchronization accuracy in the order of tens of nanoseconds. Hybrid mode is configured on the slave. On the slave, you can configure one or more interfaces as Synchronous Ethernet source interfaces.

Hybrid mode has an internal threshold value of 100 nanoseconds for the PTP phase difference before the PTP phase adjustment can initiate. To understand PTP phase difference and adjustment, consider a scenario involving two PTP sources—PTP1 and PTP2—and one Synchronous Ethernet source. Assume that initially the PTP1 source and the Synchronous Ethernet source are up and the PTP2 source is down. Also, assume that the router clock (slave) is synchronized to the available PTP source—PTP1—and the Synchronous Ethernet source. Suppose that after sometime the PTP1 source goes down because of technical issues—during which time the PTP2 source has come up—which, in turn, triggers the best master clock algorithm to run automatically, latching the router clock to the next available PTP source—that is, the PTP2 source—and the Synchronous Ethernet source. Note that a PTP phase adjustment is triggered when the phase difference between the current actual time of day (TOD) and the TOD as calculated by the algorithm as a result of the communication with the PTP2 source is at least 100 nanoseconds. Although this phase difference can occur anytime during the operation of the router in hybrid mode, this phase difference is more likely to occur only during PTP source switchover. You must always add a measurement error of 10 through 20 nanoseconds to the original internal threshold value. This error adjustment results in a phase difference threshold value of 110–120 nanoseconds.

For information about configuring hybrid mode, see “[Configuring Hybrid Mode and ESMC Quality Level Mapping](#)” on page 329. You can use the **show ptp hybrid status** operational command to find the current operating mode.

**NOTE:** Starting in Junos OS Release 14.2R1, in hybrid mode, the EEC in the MPC derives frequency synchronization from Synchronous Ethernet and the phase and time of day from PTP. However, the **show chassis synchronization extensive** operational mode command output displays the lock status that is derived from the EEC located on the SCB.

## Supporting Platforms

Hybrid mode is supported on the Juniper Networks MX104, MX240, MX480, and MX960 Universal Routing Platforms and on the Juniper Networks MX80 Universal Routing Platforms with precision timing support (MX80-P) and with timing support (MX80-T).

Starting in Junos OS Release 17.4R1, the 10GE, 40G, and 100GE WAN ports on MX10003 and MX204 routers support the hybrid mode feature.

On the MX240, MX480, MX960, MX2008, MX2010, and MX2020 routers, the combined operation is possible only when the PTP client and the Synchronous Ethernet source are on the same enhanced MPC and are traceable to the same primary reference clock (PRC). On MX10003, the Synchronous Ethernet source can be from any MPC for the combined operation.

Junos OS supports hybrid mode over link aggregation group (LAG) for MPC2E NG, MPC3E NG, MPC5E, MPC6E, MPC7E-10G, MPC7E-MRATE, MPC8E, and MPC9E line cards. The hybrid operation over LAG is supported only when primary and secondary Synchronous Ethernet interfaces are present on the same line card. The MPC2E NG and MPC3E NG line cards support PTP over IPv4 in hybrid mode over LAG. The MPC5E, MPC6E, MPC7E-10G, MPC7E-MRATE, MPC8E, and MPC9E line cards support both PTP over IPv4 and PTP over Ethernet in hybrid mode over LAG.

This table summarizes the first Junos OS release that supports hybrid mode over LAG on various Juniper Networks devices:

**Table 60: Hybrid mode over LAG Support**

Juniper Network Devices	PTP over IPv4 in hybrid mode over LAG	PTP over Ethernet in hybrid mode over LAG
MPC2E NG	17.2R1	—
MPC3E NG	17.2R1	—
MPC5E	17.2R1	18.2R1
MPC6E	17.2R1	18.2R1
MPC7E-10G	18.1R1	18.3R1
MPC7E-MRATE	18.1R1	18.3R1
MPC8E	18.1R1	18.3R1
MPC9E	18.1R1	18.3R1

When acting as PTP slaves, MX80-P routers can accept any external Synchronous Ethernet clock as reference and do not support building-integrated timing supply (BITS) input as frequency source in hybrid mode of operation. Only Synchronous Ethernet sources

are allowed in hybrid mode. Note that when the selected Synchronous Ethernet reference fails, the router continues to work in PTP mode.

Unified in-service software upgrade (unified ISSU) is not supported when clock synchronization is configured for hybrid mode on MX80-P, MX80-T, MX10003, MX2008, MX2010, MX2020 routers, and on the MICs and enhanced MPCs on MX240, MX480, and MX960 routers.

**NOTE:** To switch between PTP and Synchronous Ethernet modes, you must first deactivate the configuration for the current mode and then commit the configuration. Wait for 30 seconds, configure the new mode and its related parameters, and then commit the configuration.

Release History Table

Release	Description
17.4R1	Starting in Junos OS Release 17.4R1, the 10GE, 40G, and 100GE WAN ports on MX10003 and MX204 routers support the hybrid mode feature.
14.2R1	Starting in Junos OS Release 14.2R1, in hybrid mode, the EEC in the MPC derives frequency synchronization from Synchronous Ethernet and the phase and time of day from PTP.

## Line Card Redundancy Overview

Line card redundancy is one the PTP redundancy scenarios possible in a mobile backhaul solution. Multiple slave streams are configured across line cards and if the currently active slave line card crashes or all streams on that line card lose their timing packets another slave line card can take over if it has been primed to do so.

When you configure line card redundancy, slave streams are created on appropriate line cards. At this time all of the line cards are in DPLL mode. All of the slave streams are primed to receive and process announce messages.

Each line card executes the BMCA algorithm and identifies the best master and the stream serving the best master. The line card sends the best master information to the RE. After receiving best master information from individual line cards, the RE selects the best master to serve the BC node. This information is propagated to all of the line cards. Once the best master is selected by the RE, the regular PTP state machine will be executed.

If the BMCA algorithm results in a stream switchover and the new stream falls on a different line card, a hitless switchover will be triggered. The new slave card may be configured in pure PTP or Hybrid mode. The old slave card may in pure PTP slave or Hybrid slave mode. The line cards need to go through following steps:

- A slave line card transition needs to happen via holdover state on the master line card.
- FSM needs to convert the old slave line card to pure PTP master mode.
- On the new slave card, FSM needs to be triggered based on pure PTP or hybrid mode of operation. All these transitions need to be hitless.

**NOTE:** Line card redundancy is currently only supported on MPC2E P line cards.

## Configuring Junos OS to Support an External Clock Synchronization Interface for M Series, MX Series, and T Series Routers

---

The M40e, M120, M320, T640, and T1600 routers support an external synchronization interface that can be configured to synchronize the internal Stratum 3 clock to an external source, and then synchronize the chassis interface clock to that source.

This feature can be configured for external primary and secondary interfaces that use building-integrated timing system (BITS), SDH Equipment Timing Source (SETS) timing sources, or an equivalent quality timing source. When internal timing is set for SONET/SDH, Plesiochronous Digital Hierarchy (PDH), or digital hierarchy (DS-1) interfaces on the Physical Interface Cards (PICs), the transmit clock of the interface is synchronized to BITS/SETS timing and is traceable to timing within the network.

Routers and switches that support an external clock synchronization interface include:

- M40e, M120, and M320 routers
- T640 and T1600 routers

To configure external synchronization on the router, include the **synchronization** statement at the **[edit chassis]** hierarchy level:

```
[edit chassis]
synchronization {
  signal-type (t1 | e1);
  switching--mode (revertive | non-revertive);
  y-cable-line-termination;
  transmitter-enable;
  validation-interval seconds;
  primary (external-a | external-b);
```

```
secondary (external-a | external-b);
}
```

Use the **synchronization** statement options to specify a primary and secondary timing source. To do this, configure the following options:

- For the M120 and M320 routers, specify a signal type mode for interfaces, either **t1** or **e1**. For the M40e, T640, and T1600 routers, only the **t1** signal type mode is supported. The default setting is **t1**.
- For the T640 and T1600 routers, external clock interfaces are supported on the SONET Clock Generators (SCG-T-EC). The external clock interfaces on the SONET Clock Generators (SCG-T) are not supported.
- Specify the switching mode as **revertive** if a lower-priority synchronization can be switched to a valid, higher-priority synchronization.
- For the M320 router, specify that a single signal should be wired to both Control Boards (CBs) using a Y-cable. For the M40e router, the signal is wired to the CIP and Y-cable functionality is embedded in this system.

The **y-cable-line-termination** option is not available on the M40e, M120, T640, and T1600 routers.

- Control whether the diagnostic timing signal is transmitted.

The **transmitter-enable** option is not available on the M120, T640, and T1600 routers.

- Set a validation interval. The **validation-interval** option validates the synchronized deviation of the synchronization source. If revertive switching is enabled and a higher-priority clock is validated, the clock module is directed to the higher-priority clock, and all configured and active synchronizations are validated. The validation timer resumes after the current validation interval expires. The validation interval can be a value from 90 through 86,400 seconds. The default value is 90 seconds. For the M120 router, the range for the **validation-interval** option is 30 through 86,400 and the default value is **30**.
- Specify the primary external timing source by using the **primary (external-a | external-b)** statement.
- Specify the secondary external timing source by using the **secondary (external-a | external-b)** statement.

## Configuring Clock Synchronization Interface on MX Series Routers

MX Series routers support external clock synchronization for Synchronous Ethernet, T1 or E1 line timing sources, and external inputs. Configuring external clock synchronization requires making clock selection, quality level, and priority considerations. The clock source selection algorithm is used to pick the two best upstream clock sources from among the

various sources on the basis of system configuration and execution criteria such as quality level, priority, and hardware restrictions. For information about the clock synchronization options, see [“Understanding Clock Synchronization” on page 263](#).

The following sections explain configuring clock synchronization options for MX Series routers:

**NOTE:**

Starting with Junos OS Release 13.3, the following scenarios occur when you configure Synchronous Ethernet without the `clock-class-to-quality-level-mapping` statement at the `[edit protocols ptp slave]` hierarchy level:

- Qualified clock source quality level (that is the secondary clock source quality level) is transmitted out of the external interface and the Ethernet interface during clock reference switchover when two clock sources on different MICs of the same FPC exist or when two clock sources on two different FPCs exist.
- Lower quality level is transmitted out the external interface and the Ethernet interface during clock reference switchover when two clock sources on the same MIC of an FPC exist due to hardware limitation.

Before you remove the SCBE from the router, you must delete the configuration under the `[edit chassis synchronization]` hierarchy level. Similarly, before you remove the SCBE2 from the router, you must delete the configuration under the `[edit chassis synchronization]` hierarchy level.

On SCBE2, the external-0/0 interface is located on SCB0 and the external-1/0 interface is located on SCB1.

  - [Display the External Clock Synchronization Configuration for SCB on page 301](#)
  - [Display the External Clock Synchronization Configuration for SCBE on page 302](#)
  - [Display the External Clock Synchronization Configuration for SCBE2 on page 303](#)
  - [Displaying the External Clock Synchronization Configuration for MX2020 Control Board on page 305](#)

## Configuring Clock Synchronization Options

To configure the clock synchronization options.

1. In configuration mode, go to the `[edit chassis synchronization]` hierarchy level.

```
[edit]  
user@host# edit chassis synchronization
```

2. Configure the Synchronous Ethernet clock selection mode as auto-select or free-run.

```
[edit chassis synchronization]
user@host# set clock-mode (auto-select | free-run)
```

3. Configure the ESMC transmit parameters on all the interfaces or on selected interfaces.

```
[edit chassis synchronization]
user@host# set esmc-transmit interfaces (all | interface-name)
```

4. Configure the hold interval as configuration-change, which is the wait time (from 15 seconds through 60 seconds) after a change in configuration; restart, which is the wait time (from 60 seconds through 180 seconds) after reboot of the router; and switchover, which is the switchover wait time (from 30 seconds through 60 seconds) after clock recovery.

```
[edit chassis synchronization]
user@host# set hold-interval configuration-change secs
user@host# set hold-interval restart secs
user@host# set hold-interval switchover secs
```

5. Configure the options for the external interfaces on the basis of the type of Enhanced Switch Control Board on your MX Series router.

The SCBE has only one external interface. Configure the following options for SCBE:

- a. Go to the **[edit chassis synchronization interfaces external]** hierarchy level.

```
[edit chassis synchronization]
user@host# edit interfaces external
```

- b. Configure all the E1 interface-specific options—the **framing** statement as g704 or g704-no-crc, the **line-encoding** statement as ami or hdb3, and the **sabit** statement from 4 bits through 8 bits.

```
[edit chassis synchronization interfaces external]
user@host# set e1-options framing (g704 | g704-no-crc)
user@host# set e1-options line-encoding (ami | hdb3)
user@host# set e1-options sabit bit
```

- c. Configure the **pulse-per-second-enable** statement to enable the pulse per second (PPS) signal to be received on the GPS interface.

```
[edit chassis synchronization interfaces external]
user@host# set pulse-per-second-enable
```

- d. Configure the frequency for the provided reference clock as 1 MHz, 5 MHz, 10 MHz, 2048 kHz, e1, or t1.

```
[edit chassis synchronization interfaces external]
user@host# set signal-type (1hz | 5mhz | 10mhz | 2048khz | e1 | t1)
```

- e. Configure the T1 interface-specific options—the **framing** statement as **esf** or **sf** and the **line-encoding** statement as **ami** or **b8zs**.

```
[edit chassis synchronization interfaces external]
user@host# set t1-options framing (esf | sf)
user@host# set t1-options line-encoding (ami | b8zs)
```

The SCBE2 Control Board has two external interfaces—external-0/0 and external-1/0. Configure the following options for SCBE2 Control Board:

- a. Go to the **[edit chassis synchronization interfaces external-0/0]** or **[edit chassis synchronization interfaces external-1/0]** hierarchy level.

```
[edit chassis synchronization]
user@host# edit interfaces external-0/0
```

OR

```
[edit chassis synchronization]
user@host# edit interfaces external-1/0
```

- b. Configure all the E1 interface-specific options—the **framing** statement as **g704** or **g704-no-crc**, the **line-encoding** statement as **ami** or **hdb3**, and the **sabit** statement from 4 bits through 8 bits—on the external-0/0 interface or the external-1/0 interface.

```
[edit chassis synchronization interfaces (external-0/0 | external-1/0)]
user@host# set e1-options framing (g704 | g704-no-crc)
user@host# set e1-options line-encoding (ami | hdb3)
user@host# set e1-options sabit bit
```

- c. Configure the **pulse-per-second-enable** statement to enable the pulse per second (PPS) signal to be received on the GPS interface of the router.

```
[edit chassis synchronization interfaces (external-0/0 | external-1/0)]
user@host# set pulse-per-second-enable
```

- d. Configure the frequency for the provided reference clock as 1 MHz, 5 MHz, 10 MHz, 2048 kHz, e1, or t1.

```
[edit chassis synchronization interfaces (external-0/0 | external-1/0)]
user@host# set signal-type (1hz | 5mhz | 10mhz | 2048khz | e1 | t1)
```

- e. Configure the T1 interface-specific options—the **framing** statement as **esf** or **sf** and the **line-encoding** statement as **ami** or **b8zs**.

```
[edit chassis synchronization interfaces (external-0/0 | external-1/0)]
user@host# set t1-options framing (esf | sf)
user@host# set t1-options line-encoding (ami | b8zs)
```

The MX2020 Control Board has two external interfaces—external-a and external-b. Configure the following options for MX2020 Control Board:

- a. Go to the **[edit chassis synchronization interfaces external-a]** or **[edit chassis synchronization interfaces external-b]** hierarchy level.

```
[edit chassis synchronization]
user@host# edit interfaces external-a
```

OR

```
[edit chassis synchronization]
user@host# edit interfaces external-b
```

- b. For BITS interface, configure all the E1 interface-specific options—the **framing** statement as **g704** or **g704-no-crc**, the **line-encoding** statement as **ami** or **hdb3**, and the **sabit** statement from 4 bits through 8 bits—on the external-a interface or the external-b interface.

```
[edit chassis synchronization interfaces (external-a | external-b)]
user@host# set e1-options framing (g704 | g704-no-crc)
user@host# set e1-options line-encoding (ami | hdb3)
user@host# set e1-options sabit bit
```

- c. Configure the **pulse-per-second-enable** statement to enable the pulse per second (PPS) signal to be received on the GPS interface of the router.

```
[edit chassis synchronization interfaces (external-a | external-b)]
user@host# set pulse-per-second-enable
```

- d. Configure the frequency for the provided reference clock as 1 MHz, 5 MHz, or 10 MHz for GPS interface and 2048 kHz, e1, or t1 for BITS interface.

```
[edit chassis synchronization interfaces (external-a | external-b)]
user@host# set signal-type (1hz | 5mhz | 10mhz | 2048khz | e1 | t1)
```

- e. For BITS interface, configure the T1 interface-specific options—the **framing** statement as **esf** or **sf** and the **line-encoding** statement as **ami** or **b8zs**.

```
[edit chassis synchronization interfaces (external-a | external-b)]
user@host# set t1-options framing (esf | sf)
```

```
user@host# set t1-options line-encoding (ami | b8zs)
```

6. Configure the maximum transmit quality level as prc, prs, sec, ssu-a, ssu-b, st2, st3e, stu, or tnc.

```
[edit chassis synchronization]
user@host# set max-transmit-quality-level (prc | prs | sec | ssu-a | ssu-b | st2 | st3e |
stu | tnc)
```

7. Configure the EEC synchronization networking type as option-1 or option-2.

```
[edit chassis synchronization]
user@host# set network-option (option-1 | option-2)
```

8. Configure the options for the external clock interface output on the basis of the type of Enhanced Switch Control Board on your MX Series router.

For SCBE:

- a. Go to the **[edit chassis synchronization output interfaces external]** hierarchy level.

```
[edit chassis synchronization]
user@host# edit output interfaces external
```

- b. Configure all the external clock interface output options. The options include the **holdover-mode-disable** statement; the **minimum-quality** statement, which can be set as prc, prs, sec, ssu-a, ssu-b, st2, st3e, stu, or tnc; the **source-mode** statement, which can be set as chassis or line; the **tx-dnu-to-line-source-enable** statement; and the **wander-filter-disable** statement.

```
[edit chassis synchronization output interfaces external]
user@host# set holdover-mode-disable
user@host# set minimum-quality (prc | prs | sec | ssu-a | ssu-b | st2 | st3e | stu |
tnc)
user@host# set source-mode (chassis | line)
user@host# set tx-dnu-to-line-source-enable
user@host# set wander-filter-disable
```

For SCBE2:

- a. Go to the **[edit chassis synchronization output interfaces external-0/0]** hierarchy level or the **[edit chassis synchronization output interfaces external-1/0]** hierarchy level.

```
[edit chassis synchronization]
user@host# edit output interfaces (external-0/0 | external-1/0)
```

- b. Configure all the external clock interface output options on the external-0/0 interface or the external-1/0 interface. The options include the **holdover-mode-disable** statement; the **minimum-quality** statement, which can be set as prc, prs, sec, ssu-a, ssu-b, st2, st3e, stu, or tnc; the **source-mode** option, which can be set as chassis or line; the **tx-dnu-to-line-source-enable** statement; and the **wander-filter-disable** statement.

```
[edit chassis synchronization output interfaces (external-0/0 | external-1/0)]
user@host# set holdover-mode-disable
user@host# set minimum-quality (prc | prs | sec | ssu-a | ssu-b | st2 | st3e | stu |
tnc)
user@host# set source-mode (chassis | line)
user@host# set tx-dnu-to-line-source-enable
user@host# set wander-filter-disable
```

For MX2020 Control Board:

- a. Go to the **[edit chassis synchronization output interfaces external-a]** hierarchy level or the **[edit chassis synchronization output interfaces external-b]** hierarchy level.

```
[edit chassis synchronization]
user@host# edit output interfaces (external-a | external-b)
```

- b. Configure all the external clock interface output options on the external-a interface or the external-b interface. The options include the **holdover-mode-disable** statement; the **minimum-quality** statement, which can be set as prc, prs, sec, ssu-a, ssu-b, st2, st3e, stu, or tnc; the **source-mode** option, which can be set as chassis or line; the **tx-dnu-to-line-source-enable** statement; and the **wander-filter-disable** statement.

```
[edit chassis synchronization output interfaces (external-a | external-b)]
user@host# set holdover-mode-disable
user@host# set minimum-quality (prc | prs | sec | ssu-a | ssu-b | st2 | st3e | stu |
tnc)
user@host# set source-mode (chassis | line)
user@host# set tx-dnu-to-line-source-enable
user@host# set wander-filter-disable
```

9. Configure the time-of-day message format as ASCII on the auxiliary port that receives the external clock signals.

```
[edit chassis synchronization]
user@host# set port auxiliary client time-of-day-format ascii string
```

10. Configure the **quality-mode-enable** statement to enable Synchronous Ethernet ESMC quality mode.

```
[edit chassis synchronization]
user@host# set quality-mode-enable
```

11. Configure the selection mode for the incoming ESMC quality as configured-quality or received-quality.

```
[edit chassis synchronization]
user@host# set selection-mode (configured-quality | received-quality)
```

12. Configure the options for the ESMC source related external clock source interface on the basis of the type of Enhanced Switch Control Board on your MX Series router.

For SCBE:

- a. Go to the **[edit chassis synchronization source interfaces external]** hierarchy level or the **[edit chassis synchronization source interfaces *ethernet-interface-name*]** hierarchy level.

```
[edit chassis synchronization]
user@host# edit source interfaces external
```

OR

```
[edit chassis synchronization]
user@host# edit source interfaces ethernet-interface-name
```

- b. Configure the external clock interface and the Ethernet interface with their options. Configure the **priority** statement from 1 through 5; the **quality-level** statement as prc, prs, sec, ssu-a, ssu-b, st2, st3e, stu, or tnc; the **request** statement as force-switch or lockout; the **wait-to-restore** statement from 0 minutes to 12 minutes; and the **hold-off-time** statement from 300 through 1800 milliseconds. You can configure the same options for the Ethernet interfaces as well.

```
[edit chassis synchronization source interfaces (external | ethernet-interface-name)]
user@host# set priority value
user@host# set quality-level (prc | prs | sec | ssu-a | ssu-b | st2 | st3e | stu | tnc)
user@host# set request (force-switch | lockout)
user@host# set wait-to-restore minutes
user@host# set hold-off-time time
```

For SCBE2 Control Board:

- a. Go to the **[edit chassis synchronization source interfaces (external-0/0)]** hierarchy level or the **[edit chassis synchronization source interfaces (external-1/0)]** hierarchy level.

```
[edit chassis synchronization]
user@host# edit source interfaces external-0/0
```

OR

```
[edit chassis synchronization]
user@host# edit source interfaces external-1/0
```

- b. Configure the options on the external-0/0 interface or the external-1/0 interface. Set the **priority** statement from 1 through 5; the **quality-level** statement as prc, prs, sec, ssu-a, ssu-b, st2, st3e, stu, or tnc; the **request** statement as force-switch or lockout; the **wait-to-restore** statement from 0 minutes to 12 minutes; and the **hold-off-time** statement from 300 through 1800 milliseconds.

```
[edit chassis synchronization source interfaces (external-0/0 | external-1/0)]
user@host# set priority value
user@host# set quality-level (prc | prs | sec | ssu-a | ssu-b | st2 | st3e | stu | tnc)
user@host# set request (force-switch | lockout)
user@host# set wait-to-restore minutes
user@host# set hold-off-time time
```

For MX2020 Control Board:

- a. Go to the [edit chassis synchronization source interfaces (external-a)] hierarchy level or the [edit chassis synchronization source interfaces (external-b)] hierarchy level.

```
[edit chassis synchronization]
user@host# edit source interfaces external-a
```

OR

```
[edit chassis synchronization]
user@host# edit source interfaces external-b
```

- b. Configure the options on the external-a interface or the external-b interface. Set the **priority** statement from 1 through 5; the **quality-level** statement as prc, prs, sec, ssu-a, ssu-b, st2, st3e, stu, or tnc; the **request** statement as force-switch or lockout; the **wait-to-restore** statement from 0 minutes to 12 minutes; and the **hold-off-time** statement from 300 through 1800 milliseconds.

```
[edit chassis synchronization source interfaces (external-a | external-b)]
user@host# set priority value
user@host# set quality-level (prc | prs | sec | ssu-a | ssu-b | st2 | st3e | stu | tnc)
user@host# set request (force-switch | lockout)
user@host# set wait-to-restore minutes
user@host# set hold-off-time time
```

13. Configure the switchover mode as revertive or non-revertive.

```
[edit chassis synchronization]
user@host# set switchover-mode (non-revertive | revertive)
```

## Display the External Clock Synchronization Configuration for SCB

**Purpose** Display the options for external clock synchronization for SCB.

**Action** Execute the **show** command at **[edit chassis]** hierarchy level.

```
[edit chassis]
user@host# show
synchronization {
  clock-mode (auto-select | free-run);
  esmc-transmit {
    interfaces (all | <interface-name>);
  }
  hold-interval {
    configuration-change <seconds>;
    restart <seconds>;
    switchover <seconds>;
  }
  interfaces <interface-name> {
    hold-off-time <time>;
    priority <number>;
    quality-level (prc | prs | sec | smc | ssu-a | ssu-b | st2 | st3 | st3e |
st4 | stu | tnc);
    request (force-switch | lockout);
    wait-to-restore <minutes>;
  }
}
max-transmit-quality-level (prc | prs | sec | ssu-a | ssu-b | st2 | st3e | stu
| tnc); # Applicable from 13.3 onwards
network-type (option-1 | option-2);
quality-mode-enable;
selection-mode (configured-quality | received-quality);
source {
  (external-a | external-b) {
    priority <number>;
    quality-level (prc | prs | sec | smc | ssu-a | ssu-b | st2 | st3 | st3e |
st4 | stu | tnc);
    request (force-switch | lockout);
  }
  switchover-mode (revertive | non-revertive);
}
```

## Display the External Clock Synchronization Configuration for SCBE

**Purpose** Display the options for external clock synchronization for SCBE. Note that the SCBE has only one external interface.

**Action** Execute the **show** command at **[edit chassis]** hierarchy level.

```
[edit chassis]
user@host# show
synchronization {
  clock-mode (auto-select | free-run);
  esmc-transmit {
    interfaces (all | <interface-name>);
  }
  hold-interval {
    configuration-change <seconds>;
    restart <seconds>;
```

```

        switchover <seconds>;
    }
    interfaces {
        external {
            e1-options {
                framing (g704 | g704-no-crc4);
                line-encoding (ami | hdb3);
                sabit <number>;
            }
            pulse-per-second-enable;
            signal-type (1mhz | 5mhz | 10mhz | 2048khz | t1 | e1);
            t1-options {
                framing (esf | sf);
                line-encoding (ami | b8zs);
            }
        }
    }
    max-transmit-quality-level (prc | prs | sec | ssu-a | ssu-b | st2 | st3e | stu
| tnc); # Applicable from 13.3 onwards
    network-option (option-1 | option-2);
    output {
        interfaces {
            external {
                holdover-mode-disable;
                minimum-quality (prc | prs | sec | smc | ssu-a | ssu-b | st2 | st3
| st3e | st4 | stu | tnc);
                source-mode (chassis | line);
                tx-dnu-to-line-source-enable;
                wander-filter-disable;
            }
        }
    }
    port {
        auxiliary client {
            time-of-day-format {
                ascii <string>;
            }
        }
    }
    quality-mode-enable;
    selection-mode (configured-quality | received-quality);
    source {
        interfaces (<interface-name> | external) {
            hold-off-time <time>;
            priority <number>;
            quality-level (prc | prs | sec | smc | ssu-a | ssu-b | st2 | st3 |
st3e | st4 | stu | tnc);
            request (force-switch | lockout);
            wait-to-restore <minutes>;
        }
    }
    switchover-mode (revertive | non-revertive);
}

```

## Display the External Clock Synchronization Configuration for SCBE2

**Purpose** Display the options for external clock synchronization for SCBE2. SCBE2 has two external interfaces, external-0/0 and external-1/0.

**Action** Execute the show command at **[edit chassis]** hierarchy level.

```
[edit chassis]
user@host# show
synchronization {
  clock-mode (auto-select | free-run);
  esmc-transmit {
    interfaces (all | <interface-name>);
  }
  hold-interval {
    configuration-change <seconds>;
    restart <seconds>;
    switchover <seconds>;
  }
  interfaces {
    (external-0/0 | external-1/0) {
      signal-type (1mhz | 5mhz | 10mhz | 2048khz | t1 | e1);
      e1-options {
        framing (g704 | g704-no-crc4);
        line-encoding (ami | hdb3);
        sabit <number>;
      }
      pulse-per-second-enable;
      t1-options {
        framing (esf | sf);
        line-encoding (ami | b8zs);
      }
    }
  }
  max-transmit-quality-level (prc | prs | sec | ssu-a | ssu-b | st2 | st3e | stu
| tnc);
  network-option (option-1 | option-2);
  output {
    interfaces {
      (external-0/0 | external-1/0) {
        holdover-mode-disable;
        minimum-quality (prc | prs | sec | smc | ssu-a | ssu-b | st2 | st3
| st3e | st4 | stu | tnc);
        source-mode (chassis | line);
        tx-dnu-to-line-source-enable;
        wander-filter-disable;
      }
    }
  }
  port {
    auxiliary client {
      time-of-day-format {
        ascii <string>;
      }
    }
  }
  quality-mode-enable;
  selection-mode (configured-quality | received-quality);
  source {
    interfaces {
      (external-0/0 | external-1/0 | <interface-name>) {
        hold-off-time <time>;
        priority <number>;
        quality-level (prc | prs | sec | smc | ssu-a | ssu-b | st2 | st3
| st3e | st4 | stu | tnc);
```

```

        request (force-switch | lockout);
        wait-to-restore <minutes>;
    }
}
switchover-mode (revertive | non-revertive);
}

```

## Displaying the External Clock Synchronization Configuration for MX2020 Control Board

**Purpose** Display the options for external clock synchronization for MX2020 Control Board. MX2020 Control Board has two external interfaces, external-a and external-b.

**Action** Execute the show command at [edit chassis] hierarchy level.

```

[edit chassis]
user@host# show
synchronization {
    clock-mode (auto-select | free-run);
    esmc-transmit {
        interfaces (all | <interface-name>);
    }
    hold-interval {
        configuration-change <seconds>;
        restart <seconds>;
        switchover <seconds>;
    }
    interfaces {
        (external-a | external-b) {
            signal-type (1mhz | 5mhz | 10mhz | 2048khz | t1 | e1);
            e1-options {
                framing (g704 | g704-no-crc4);
                line-encoding (ami | hdb3);
                sabit <number>;
            }
            pulse-per-second-enable;
            t1-options {
                framing (esf | sf);
                line-encoding (ami | b8zs);
            }
        }
    }
    max-transmit-quality-level (prc | prs | sec | ssu-a | ssu-b | st2 | st3e
| stu | tnc);
    network-option (option-1 | option-2);
    output {
        interfaces {
            (external-a | external-b) {
                holdover-mode-disable;
                minimum-quality (prc | prs | sec | smc | ssu-a | ssu-b | st2 | st3
| st3e | st4 | stu | tnc);
                source-mode (chassis | line);
                tx-dnu-to-line-source-enable;
                wander-filter-disable;
            }
        }
    }
    port {

```

```

    auxiliary client {
        time-of-day-format {
            ascii <string>;
        }
    }
}
quality-mode-enable;
selection-mode (configured-quality | received-quality);
source {
    interfaces {
        (external-a | external-b | <interface-name>) {
            hold-off-time <time>;
            priority <number>;
            quality-level (prc | prs | sec | smc | ssu-a | ssu-b | st2 | st3
| st3e | st4 | stu | tnc);
            request (force-switch | lockout);
            wait-to-restore <minutes>;
        }
    }
    switchover-mode (revertive | non-revertive);
}

```

## Clock Sources for PTX Series Packet Transport Routers

System clocking on PTX Series Packet Transport Routers is controlled by a Centralized Clock Generator (CCG). The CCG is capable of deriving a master clock from a valid source and synchronizing all interfaces on the chassis to this master clock. The CCG plugs into the rear of the chassis. A pair of CCGs installed in the chassis provide a redundant fallback option.

Synchronous Ethernet is configured on external primary and secondary interfaces that use building-integrated timing system (BITS), SDH Equipment Timing Source (SETS) timing sources, or an equivalent quality timing source such as GPS. On the PICs, the transmit clock of the interface is synchronized to a BITS or SETS timing source and is traceable to the timing source within the network.

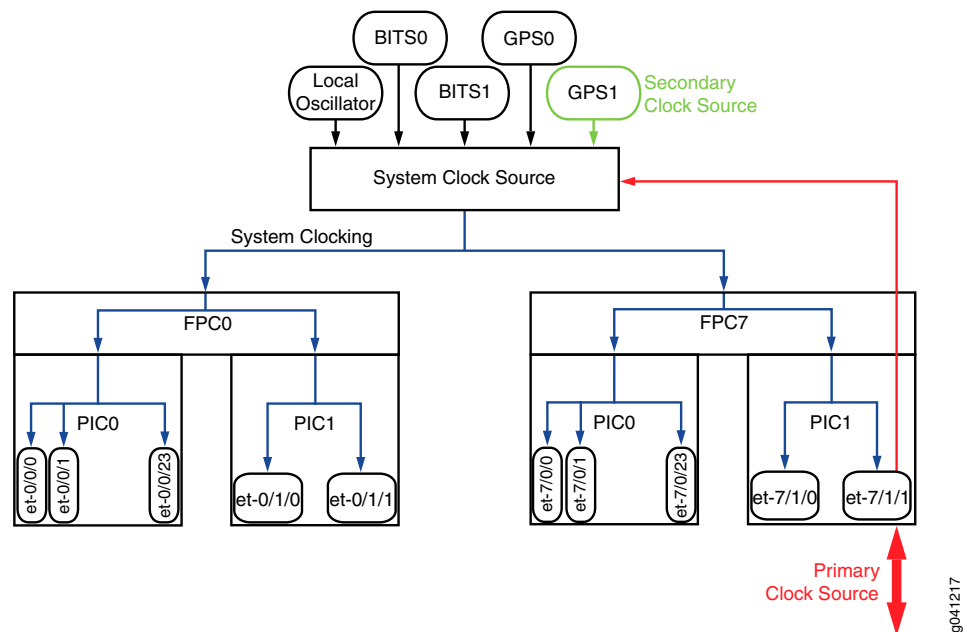

PTX Series Packet Transport Routers can use an internal clock source or it can extract clocking from an external source.

Clock sources and specifications include:

- The PTX Series Packet Transport Router clock is a Stratum 3E-compliant clock with Free Run +/- 4.6 ppm/20 years, Holdover +/- 0.01 ppm/24 hours, and Drift +/- 0.001 ppm/24 hours.
- The internal clock is based on Freerun OCXO with +/- 10 ppb accuracy.
- External clocking includes a choice of GPS-based clock recovery (5 MHz and 10 MHz) or BITS-T1/E1 Line synchronization (1.544 MHz and 2.048 MHz).
- Synchronous Ethernet is supported based on the ITU-T G.8261, ITU-T G.8262, and ITU-T G.8264 specifications with line timing from the 10-Gigabit Ethernet, 40-Gigabit Ethernet, or 100-Gigabit Ethernet interface.

Synchronous Ethernet is a key requirement for circuit (emulation) services and mobile radio access technologies. Synchronous Ethernet supports sourcing and transfer of frequency for synchronization purposes for both wireless and wireline services and is primarily used for mobile backhaul and converged transport.

*Figure 7: Clocking Example for PTX Series Packet Transport Routers*

In this example, the interface et-7/1/1 is configured as the primary clock source and GPS1 as the secondary clock source.

Note that you can specify the primary and secondary clock sources provided that the clock source meets the necessary qualification as set by the clock algorithm. However, in the absence of any user-selected clock source, the clock source with the best quality level is selected by the clock algorithm in the router. Note that the user selection is honored even when better quality level clock sources are available. You can select the clock source with the **request chassis synchronization switch clock-source** operational mode command. For more information, see [request chassis synchronization switch](#).

**NOTE:** The clock sources used as primary or secondary clock sources cannot originate from the same FPC.

For more information about clock source ports, see *PTX3000 Clocking Port Cable Specifications and Pinouts*, *PTX5000 Centralized Clock Generator Description*, and *Connecting the PTX5000 to an External Clocking Device*.

- [synchronization \(PTX Series\) on page 802](#)

## Synchronizing Internal Stratum 3 Clock to External Clock Sources on PTX Series Routers

The PTX Series Packet Transport Routers support an external synchronization interface that can be configured to synchronize the internal Stratum 3 clock to an external source, and then synchronize the chassis interface clock to that source. You can also configure a primary and a secondary clock source.

The following tasks explain how to configure a recovered clock for an FPC and to configure the clock synchronization options:

- [Configuring a Recovered Clock for an FPC on page 308](#)
- [Configuring External Clock Synchronization Options on page 308](#)

### Configuring a Recovered Clock for an FPC

To configure a recovered clock for an FPC on PTX Series routers:

1. Go to the `[edit chassis fpc slot-number pic pic-number]` hierarchy level.

```
[edit]
user@host# edit chassis fpc slot-number pic pic-number
```

2. Configure a port from 0 through 47 through which the clock is recovered.

```
[edit]
user@host# set recovered-clock port port-number
```

### Configuring External Clock Synchronization Options

**NOTE:** Starting with Junos OS Release 15.1F3, you must configure a recovered clock (`recovered-clock port port-number`) for an interface before configuring clock synchronization options for the same interface.

Use the **synchronization** statement options to specify a primary and a secondary timing source. To do this, you must configure the following options:

- Specify the switching mode as **revertive** when a lower-priority synchronization source is to be switched to a valid, higher-priority synchronization source.
- Specify the primary external timing source with the **primary (fpc-slot-number | gps-0 | gps-1 | bits-a | bits-b)** statement.
- Specify the secondary external timing source with the **secondary (fpc-slot-number | gps-0 | gps-1 | bits-a | bits-b)** statement.

**NOTE:** For more information about clock synchronization options, see [“Understanding Clock Synchronization” on page 263](#).

To configure the clock synchronization options:

1. In configuration mode, go to the **[edit chassis synchronization]** hierarchy level.

```
[edit]
user@host# edit chassis synchronization
```

2. Configure the Synchronous Ethernet clock selection mode as *auto-select* to select the best external clock source or *free-run* to use the free-running local oscillator as a clock source.

```
[edit chassis synchronization]
user@host# set clock-mode (auto-select | free-run)
```

3. Configure the ESMC transmit parameters on all the interfaces or on selected interfaces.

```
[edit chassis synchronization]
user@host# set esmc-transmit interfaces (all | interface-name)
```

4. Configure the hold interval as configuration-change, which is the wait time (from 15 seconds through 60 seconds) after a change in configuration; restart, which is the wait time (from 60 seconds through 180 seconds) after reboot of the router; and switchover, which is the switchover wait time (from 30 seconds through 60 seconds) after clock recovery.

```
[edit chassis synchronization]
user@host# set hold-interval configuration-change secs
user@host# set hold-interval restart secs
user@host# set hold-interval switchover secs
```

5. Configure the interface with an available upstream clock source where the clock source is bits-a, bits-b, gps-0, or gps-1. Configure the **pulse-per-second-enable**

statement to enable the pulse per second (PPS) signal to be received on the GPS interface and configure the frequency for the provided reference clock as 5 MHz, 10 MHz, e1, or t1.

```
[edit chassis synchronization]
user@host# set interfaces (bits-a | bits-b | gps-0 | gps-1) (pulse-per-second-enable
| signal-type (5mhz | 10mhz | e1 | t1))
```

6. Configure the maximum transmit quality level as prc, prs, sec, ssu-a, ssu-b, st2, st3e, stu, or tnc.

```
[edit chassis synchronization]
user@host# set max-transmit-quality-level (prc | prs | sec | ssu-a | ssu-b | st2 | st3e |
stu | tnc)
```

7. Configure the EEC synchronization networking type as option-1 to map to G.813 option 1 (EEC1) or option-2 to map to G.812 type IV clock (EEC1).

```
[edit chassis synchronization]
user@host# set network-option (option-1 | option-2)
```

8. Configure the primary synchronization reference source as bits-a, bits-b, gps-0, gps-1, fpc-0, fpc-1, fpc-2, fpc-3, fpc-4, fpc-5, fpc-6, or fpc-7. The selected source is considered to be the best choice among the available sources.

```
[edit chassis synchronization]
user@host# set primary (fpc-slot-number | gps-0 | gps-1 | bits-a | bits-b)
```

9. Configure the **quality-mode-enable** statement to enable Synchronous Ethernet ESMC quality mode.

```
[edit chassis synchronization]
user@host# set quality-mode-enable
```

10. Configure the secondary synchronization reference source as bits-a, bits-b, gps-0, gps-1, fpc-0, fpc-1, fpc-2, fpc-3, fpc-4, fpc-5, fpc-6, or fpc-7. The selected source is considered to be the best alternative among the available sources.

```
[edit chassis synchronization]
user@host# set secondary (fpc-slot-number | gps-0 | gps-1 | bits-a | bits-b)
```

11. Configure the quality selection mode for the incoming ESMC packets as configured-quality or received-quality.

```
[edit chassis synchronization]
user@host# set selection-mode (configured-quality | received-quality)
```

12. Configure the ESMC source as bits-a, bits-b, gps-0, or gps-1. For the configured source, configure the **priority** statement from 1 through 5; the **quality-level** statement as prc, prs, sec, ssu-a, ssu-b, st2, st3e, stu, or tnc; the **request** statement as force-switch or lockout.

```
[edit chassis synchronization]
user@host# source (bits-a | bits-b | gps-0 | gps-1) (priority number | quality-level (prc |
  prs | sec | smc | ssu-a | ssu-b | st2 | st3 | st3e | st4 | stu | tnc) | request (force-switch |
  lockout)
```

13. Configure the switchover mode as revertive or non-revertive.

```
[edit chassis synchronization]
user@host# set switchover-mode (non-revertive | revertive)
```

**NOTE:** To configure the Synchronous Ethernet clock sources, you must configure network-option *option*, quality-mode-enable, and source interfaces *interface-name* priority *value* quality-level *level* along with other parameters as needed at the [edit chassis synchronization] hierarchy level.

To configure ESMC transmit interface, you must configure esmc-transmit interface *interface-name* along with other parameters as needed at the [edit chassis synchronization] hierarchy level.

Release History Table

Release	Description
15.1F3	Starting with Junos OS Release 15.1F3, you must configure a recovered clock ( <b>recovered-clock port</b> <i>port-number</i> ) for an interface before configuring clock synchronization options for the same interface.

#### Related Documentation

- [Clock Sources for PTX Series Packet Transport Routers on page 306](#)
- [Understanding Clock Synchronization on page 263](#)
- [recovered-clock on page 759](#)
- [synchronization on page 802](#)

### Example: Configuring Synchronous Ethernet on MX Series Routers

- [Requirements on page 312](#)
- [Overview on page 312](#)
- [Configuration on page 312](#)
- [Verification on page 314](#)

## Requirements

This example uses the following hardware and software components:

- One MX80-T, MX5-T, MX10-T, MX40-T, MX80, MX240, MX480, or MX960 router
- Junos OS Release 10.4 or later for MX80 Universal Routing Platforms and 11.2R4 or later for MX80-T, MX5, MX10, MX40, MX240, MX480, and MX960 routers.

## Overview

You can configure Synchronous Ethernet on MX5-T, MX10-T, MX40-T, MX80, MX80-T, MX240, MX480, and MX960 routers, which enables you to synchronize clocks between nodes in a network through frequency synchronization.

**NOTE:** You can set the values for each parameter according to your requirement. The values given in this example are for illustration purposes only.

## Configuration

### CLI Quick Configuration

To quickly configure synchronization on the aforementioned routers, copy the following commands, paste them in a text file, remove any line breaks, and then copy and paste the commands into the CLI.

[edit]

```
set chassis synchronization clock-mode auto-select
set chassis synchronization network-type option-1
set chassis synchronization quality-mode-enable
set chassis synchronization selection-mode configured-quality
set chassis synchronization switchover-mode revertive
set chassis synchronization hold-interval configuration-change 1 restart 1 switchover 1
set chassis synchronization esmc-transmit interfaces ge-2/0/0
set chassis synchronization source external-a priority 2 quality-level prc request
force-switch
set chassis synchronization interfaces ge-2/0/0 priority 1 quality-level prc request
force-switch wait-to-restore 1
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

For step-by-step configuration, see [“Configuring Clock Synchronization Interface on MX Series Routers” on page 293](#).

To configure Synchronous Ethernet, perform the following tasks:

1. Configure the clock mode, network type, quality mode, selection mode, and switchover mode.

```
[edit chassis synchronization]
user@host# set clock-mode auto-select network-type option-1 quality-mode-enable
selection-mode configured-quality switchover-mode revertive
```

2. Configure the hold interval for configuration change, restart interval, and the switchover interval in seconds.

```
[edit chassis synchronization]
user@host# set hold-interval configuration-change 1 restart 1 switchover 1
```

3. Configure the interfaces for transmitting ESMC.

```
[edit chassis synchronization]
user@host# set esmc-transmit interfaces ge-2/0/0
```

4. Configure the source node with its quality level, priority, and request type.

```
[edit chassis synchronization]
user@host# set source external-a priority 2 quality-level prc request force-switch
```

5. Configure the interfaces with priority, quality level, request type, and time to restore the interface to default.

```
[edit chassis synchronization]
user@host# set interfaces ge-2/0/0 priority 1 quality-level prc request force-switch
wait-to-restore 1
```

**Results** Display the results of the configuration:

```
user@host# show chassis
synchronization {
  clock-mode (auto-select | free-run);
  esmc-transmit {
    interfaces (all | interface-name);
  }
}
```

```
hold-interval {
  configuration-change seconds;
  restart seconds;
  switchover seconds;
}
network-type (option-1 | option-2);
quality-mode-enable;
selection-mode (configured-quality|received-quality);
switchover-mode (revertive | non-revertive);
source {
  (external-a | external-b) {
    priority number;
    quality-level (prc | prs |sec | smc | ssu-a | ssu-b | st2 | st3 | st3e | st4 | stu | tnc);
    request (force-switch | lockout);
  }
  interfaces interface-name {
    priority number;
    quality-level (prc | prs |sec | smc | ssu-a | ssu-b | st2 | st3 | st3e | st4 | stu | tnc);
    request (force-switch | lockout);
    wait-to-restore minutes;
  }
}
}
```

## Verification

Confirm that the configuration is working properly.

- [Verifying the Basic Parameters for Synchronization on page 314](#)
- [Verifying All the Parameters for Synchronization on page 314](#)
- [Verifying the Global Configuration on page 315](#)
- [Verifying the ESMC Transmit Parameters on page 315](#)
- [Verifying the ESMC Statistics Parameters on page 315](#)
- [Verifying That the ESMC Statistics Are Cleared on page 315](#)

---

### Verifying the Basic Parameters for Synchronization

<b>Purpose</b>	Verify that the basic synchronization parameters such as the current clock status, clock locked to, and configured sources are working as expected.
<b>Action</b>	From operational mode, enter the <b>run show chassis synchronization</b> command to display the synchronization details.
<b>Meaning</b>	The output displays the basic synchronization parameters configured on the interface.

---

### Verifying All the Parameters for Synchronization

<b>Purpose</b>	Verify that all the synchronization parameters are working as expected.
----------------	---

**Action** From operational mode, enter the **run show chassis synchronization extensive** command to display all the synchronization details.

**Meaning** The output displays all the synchronization parameters configured on the interface.

---

### Verifying the Global Configuration

---

**Purpose** Verify that all the global configuration parameters are working as expected.

**Action** From operational mode, enter the **run show synchronous-ethernet global-information** command to display the set parameters for the global configuration.

**Meaning** The output displays global information about the configured node.

---

### Verifying the ESMC Transmit Parameters

---

**Purpose** Verify that the transmission parameters of ESMC on the interface are working as expected.

**Action** From operational mode, enter the **run show synchronous-ethernet esmc transmit detail** command to display the set parameters for the ESMC transmission.

**Meaning** The output displays all the transmission details about the configured ESMC interface.

---

### Verifying the ESMC Statistics Parameters

---

**Purpose** Verify the statistics related to ESMC on the interface.

**Action** From operational mode, enter the **run show synchronous-ethernet esmc statistics** command to display the statistics for the ESMC transmission.

**Meaning** The output displays information about the ESMC statistics.

---

### Verifying That the ESMC Statistics Are Cleared

---

**Purpose** Clear the statistics related to ESMC on the interface.

**Action** From operational mode, enter the **clear synchronous-ethernet esmc statistics** command to clear the statistics for the ESMC transmission.

**Meaning** The output displays the message that the ESMC statistics have been cleared.

## Example: Configuring Framing Mode for Synchronous Ethernet on MX Series Routers with 10-Gigabit Ethernet MIC

---

- [Requirements on page 316](#)
- [Overview on page 316](#)
- [Configuration on page 317](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.4 or later for MX80-T, MX240, MX480, or MX960 routers
- One MX80-T, MX240, MX480, and MX960 router with 10-Gigabit Ethernet MIC with XFP

### Overview

You can set the framing mode at the PIC level and at the interface level with various configuration combinations. For more information about the various configuration combinations, see [“Synchronous Ethernet on 10-Gigabit Ethernet MIC Overview” on page 252](#).

This example provides information about configuring framing mode at the interface level and the PIC level for Synchronous Ethernet on the 10-Gigabit Ethernet MIC with XFP.

The 10-Gigabit Ethernet MIC with XFP supports Synchronous Ethernet in LAN-PHY framing mode. This is possible only when all the logical PICs under the given Modular Interface Card (MIC) and its ingress interfaces are configured in LAN framing mode.

You can also alternatively configure a MIC in WAN-PHY framing mode on MX80, MX240, MX480, and MX960 routers by configuring all the constituent logical PICs in the same WAN-PHY framing mode in any one of the following configurations:

- No framing mode configured on all the constituent logical PICs of the MIC.
- Incompatible framing mode configured on constituent logical PICs of the MIC.
- No framing mode configured on some of the constituent logical PICs of the MIC.

**NOTE:** By default, the PIC-level framing mode is set to WAN framing type, that is e1 | e3 | sdh | sonet | t1 | t3. Synchronous Ethernet works on 10-Gigabit Ethernet MIC with XFP in LAN-PHY mode only when the PIC level framing configuration is configured to lan framing type explicitly.

By default, the interface-level framing mode is set to lan-phy. For WAN-PHY operation, interface framing needs to be set to wan-phy framing explicitly.

**NOTE:** You can set the values for each parameter according to your requirement. The values given in this example are for illustration purposes only.

## Configuration

**CLI Quick Configuration** To quickly configure PIC-level framing and interface-level framing on the 10-Gigabit Ethernet MIC with XFP, copy the following commands and paste it into the CLI.

[edit]

```
set chassis fpc 2 pic 0 framing lan
set chassis fpc 2 pic 1 framing lan
set interfaces xe-2/1/0 framing-mode lan-phy
```

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

For step-by-step configuration of Synchronous Ethernet, see [“Configuring Clock Synchronization Interface on MX Series Routers” on page 293](#).

**Step-by-Step Procedure** To configure PIC-level framing on the 10-Gigabit Ethernet MIC with XFP, perform the following tasks:

1. In configuration mode, go to the **[edit chassis]** hierarchy level.

```
[edit]
user@host# edit chassis
```

2. Configure the FPC slot and the first PIC slot.

```
[edit chassis]
user@host# edit fpc 2 pic 0
```

3. Configure the framing type as LAN on the first PIC slot.

```
[edit chassis fpc2 pic 0]
```

```
user@host# set framing lan
```

4. Configure the FPC slot and the second PIC slot.

```
[edit chassis]
user@host# edit fpc 2 pic 1
```

5. Configure the framing type as LAN on the second PIC slot.

```
[edit chassis fpc2 pic 0]
user@host# set framing lan
```

### Step-by-Step Procedure

To configure interface-level framing on the 10-Gigabit Ethernet MIC with XFP, perform the following tasks:

1. In configuration mode, go to the **[edit interfaces]** hierarchy level and set the interface as **xe-2/1/0**.

```
[edit]
user@host# edit interfaces xe-2/1/0
```

2. Configure the interface in LAN-PHY framing mode.

```
[edit interfaces xe-2/1/0]
user@host# set framing-mode lan-phy
```

## Results

Display the results of the configuration at the PIC level:

```
[edit]
user@host# show
chassis {
  fpc 2 {
    pic 0 {
      framing lan;
    }
  }
  fpc 2 {
    pic 1 {
      framing lan;
    }
  }
}
```

Display the results of the configuration at the interface level:

```
[edit]
user@host# show
interfaces xe-2/1/0 {
  framing-mode lan-phy;
}
```

## Configuring Precision Time Protocol

You can configure the master clock and the slave clock for Precision Time Protocol (PTP) to help synchronize clocks in a distributed system. This time synchronization is achieved through packets that are transmitted and received in a session between the master clock and the slave clock.

- [Configuring Precision Time Protocol and its Options on page 319](#)

### Configuring Precision Time Protocol and its Options

This topic includes the following tasks:

1. [Configuring PTP Options on page 319](#)
2. [Configuring Slave Clock Options on page 320](#)
3. [Configuring Master Clock Options on page 323](#)

#### Configuring PTP Options

To configure PTP options:

1. In configuration mode, go to the **[edit protocols ptp]** hierarchy level:

```
[edit]
user@host# edit protocols ptp
```

2. Configure the clock mode as either boundary or ordinary. This attribute is mandatory and has no default value.

The **boundary** option signifies that the clock can be both a master clock and a slave clock. The **ordinary** option signifies that the clock is either a master clock or a slave clock.

```
[edit protocols ptp]
user@host# set clock-mode (boundary | ordinary)
```

3. Configure the PTP domain option with values from 0 through 127. The default value is 0.

```
[edit protocols ptp]
user@host# set domain domain-value
```

4. Configure the **priority1** option with values from 0 through 254. The default value is 128.  
The **priority1** value determines the best master clock. The *priority1-value* is also advertised in the master clock's announce message to other slaves.

```
[edit protocols ptp]
user@host# set priority1 priority1-value
```

5. Configure the **priority2** option with values from 0 through 255. The default value is 128.

The **priority2** value differentiates and prioritizes the master clock to avoid confusion when *priority1-value* is the same for different master clocks in a network.

```
[edit protocols ptp]
user@host# set priority2 priority2-value
```

6. Configure the **unicast-negotiation** option to enable unicast negotiation.

Unicast negotiation is a method by which the announce, sync, and delay response packet rates are negotiated between the master clock and the slave clock before a PTP session is established.

```
[edit protocols ptp]
user@host# set unicast-negotiation
```

**NOTE:** Unicast negotiation, when enabled, does not allow you to commit any packet rate–related configuration.

---

## Configuring Slave Clock Options

Configure the following options after the aforementioned PTP options have been set.

1. Configure the slave clock.

```
[edit protocols ptp]
user@host# edit slave
```

2. Configure the **announce-timeout** option in the slave node with values from 2 through 10. The default value is 3.

The announce timeout value signifies the number of times an announce interval message has to pass through the slave without receiving the announce message—that is, the timeout period for announce messages.

```
[edit protocols ptp slave]
user@host# set announce-timeout announce-timeout-value
```

3. Configure the **delay-request** option in the slave node with values from –6 through 6. The default value is –4.

The delay request value is the logarithmic mean interval in seconds between the delay request messages sent by the slave to the master.

```
[edit protocols ptp slave]
user@host# set delay-request delay-request-value
```

4. Configure the **frequency-only** option to enable only frequency synchronization in the slave.

```
[edit protocols ptp slave]
user@host# set frequency-only
```

**NOTE:** This option is configured only when PTP is used for frequency synchronization and not for phase synchronization. Also, note that this option can only be set for an ordinary clock acting as slave.

5. Configure the interface for the slave.

```
[edit protocols ptp slave]
user@host# edit interface interface-name
```

6. Configure the **unicast-mode** option for the slave. You can set this option when PTP unicast mode of messaging is needed.

```
[edit protocols ptp slave interface interface-name]
user@host# edit unicast-mode
```

7. Configure the **transport** option in unicast mode as IPv4.

The encapsulation type for PTP packet transport is IPv4.

```
[edit protocols ptp slave interface interface-name unicast-mode]
user@host# set transport ipv4
```

8. Configure the IP address of the slave.

```
[edit protocols ptp slave interface interface-name unicast-mode]
user@host# edit clock-source ip-address
```

9. Configure the IP address of the interface acting as the local PTP slave port.

```
[edit protocols ptp slave interface interface-name unicast-mode clock-source ip-address]
user@host# set local-ip-address local-ip-address
```

**NOTE:** You must configure this IP address at the [edit interfaces *interface-name*] hierarchy level.

10. You can configure PTP over IPv4 over a link aggregation group for MPC2E NG, MPC3E NG, MPC5E, MPC6E, MPC7E-10G, MPC7E-MRATE, MPC8E, and MPC9E.

For each aggregated Ethernet link configured as PTP slave, you can specify one member link of the aggregated Ethernet bundle as primary and another as secondary.

```
[edit protocols ptp slave interface interface-name ]
user@host# set primary interface-name
user@host# set secondary interface-name
```

11. Starting in Junos OS Release 15.2R1, you can configure multicast mode option for the slave port. In this mode, PTP over Ethernet uses multicast addresses and a slave port can automatically start receiving the multicast announce messages transmitted by the master ports on a network. The slave port can start communicating with the master port with minimal or no configuration.

```
[edit protocols ptp slave interface interface-name ]
user@host# set multicast-mode
```

12. Configure Ethernet as the encapsulation type of transport for the PTP packets. You can further enable 802.3 Ethernet encapsulation to use a specific set of multicast MAC addresses while transmitting the PTP packets over Ethernet.

```
[edit protocols ptp slave interface interface-name multicast-mode]
asymmetry number;
transport 802.3 link-local;
```

**NOTE:** It is mandatory to use the transport statement while configuring the multicast-mode for master and slave interfaces.

13. You can configure PTP over Ethernet over a link aggregation group for MPC5E, MPC6E, MPC7E-10G, MPC7E-MRATE, MPC8E, and MPC9E line cards.

For each aggregated Ethernet link configured as PTP slave, you can specify one member link of the aggregated Ethernet bundle as primary and another as secondary.

```
[edit protocols ptp slave interface interface-name ]
user@host# set primary interface-name
user@host# set secondary interface-name
```

### Configuring Master Clock Options

Configure the following options after the aforementioned PTP options and slave clock options have been set.

1. Configure the master clock.

```
[edit protocols ptp]
user@host# edit master
```

2. Configure the **announce interval** option for the master with values from 0 through 4. The default value is 1.

The announce interval is the logarithmic mean interval between announce messages that is sent by the master. By default, one announce message is sent in every two seconds.

```
[edit protocols ptp master]
user@host# set announce-interval announce-interval-value
```

3. Configure the **clock step** option as either one-step or two-step for the master. The default value is one-step.

The clock step determines whether the timing information is sent along with the sync message only (one-step) or a subsequent follow-up message (two-step) is sent corresponding to the previous sync message.

```
[edit protocols ptp master]
user@host# set clock-step (one-step | two-step)
```

4. Configure the **sync interval** option for the master clock with values from -6 through 6. The default value is -6.

The sync interval is the logarithmic mean interval between synchronous messages that is sent by the master. By default, 64 synchronous interval messages are sent per second.

```
[edit protocols ptp master]
user@host# set sync-interval sync-interval-value
```

5. Configure the interface for the master.

```
[edit protocols ptp master]
user@host# edit interface interface-name
```

6. Configure the unicast mode option for the master. You can set this option when PTP unicast mode of messaging is needed.

```
[edit protocols ptp master interface interface-name]
user@host# edit unicast-mode
```

7. Configure the **transport** option in unicast mode as IPv4.

The encapsulation type for PTP packet transport is IPv4.

```
[edit protocols ptp master interface interface-name unicast-mode]
user@host# set transport ipv4
```

8. Configure the IP address for the slave.

```
[edit protocols ptp master interface interface-name unicast-mode]
user@host# edit clock-client ip-address
```

9. Configure the IP address of the interface acting as the local PTP master port.

```
[edit protocols ptp master interface interface-name unicast-mode clock-client
ip-address]
user@host# set local-ip-address local-ip-address
```

10. You can configure PTP over IPv4 over a link aggregation group for MPC2E NG, MPC3E NG, MPC5E, MPC6E, MPC7E-10G, MPC7E-MRATE, MPC8E, and MPC9E.

For each aggregated Ethernet link configured as PTP master, you can specify one member link of the aggregated Ethernet bundle as primary and another as secondary.

```
[edit protocols ptp master interface interface-name ]
user@host# set primary interface-name
user@host# set secondary interface-name
```

11. Starting with Junos OS Release 15.2R1, you can configure multicast mode option for the master port. In this mode, PTP over Ethernet uses multicast addresses and a slave port can automatically start receiving the multicast announce messages transmitted by the master ports on a network. The slave port can start communicating with the master port with minimal or no configuration.

```
[edit protocols ptp master interface interface-name ]
user@host# set multicast-mode
```

12. Configure Ethernet as the encapsulation type of transport for the PTP packets. You can further enable 802.3 Ethernet encapsulation to use a specific set of multicast MAC addresses while transmitting the PTP packets over Ethernet.

```
[edit protocols ptp master interface interface-name multicast-mode]
asymmetry number;
transport 802.3 link-local;
```

**NOTE:** It is mandatory to use the `transport` statement while configuring the `multicast-mode` for master and slave interfaces.

13. You can configure PTP over Ethernet over a link aggregation group for MPC5E, MPC6E, MPC7E-10G, MPC7E-MRATE, MPC8E, and MPC9E line cards.

For each aggregated Ethernet link configured as PTP master, you can specify one member link of the aggregated Ethernet bundle as primary and another as secondary.

```
[edit protocols ptp master interface interface-name ]
user@host# set primary interface-name
user@host# set secondary interface-name
```

Release History Table

Release	Description
15.2R1	Starting in Junos OS Release 15.2R1, you can configure multicast mode option for the slave port.
15.2R1	Starting with Junos OS Release 15.2R1, you can configure multicast mode option for the master port.

## Example: Configuring Precision Time Protocol

- [Requirements for PTP Configuration on page 325](#)
- [Overview on page 326](#)
- [Configuration on page 326](#)
- [Verification on page 328](#)

### Requirements for PTP Configuration

This example uses the following hardware and software components:

- One MX80, MX240, MX480, or MX960 router

- Junos OS Release 12.2 or later

## Overview

This example shows the configuration of Precision Time Protocol (PTP) on all Ethernet Modular Interface Cards (MICs) on the enhanced Module Port Concentrator (MPCE) MX-MPC2E-3D-P on MX240, MX480, and MX960 routers and on the MX80 Universal Routing Platforms with precision timing support (MX80-P).

PTP synchronizes clocks between nodes in a network, thereby enabling the distribution of an accurate clock over a packet switched network. This synchronization is achieved through packets that are transmitted and received in a session between the master clock and the slave clock. PTP also supports boundary clock.

**NOTE:** You can set the values for each parameter according to your requirement. The values given in this example are for illustration purposes only.

## Configuration

### CLI Quick Configuration

To quickly configure PTP on an interface, copy the following commands, paste them in a text file, remove any line breaks, and then copy and paste the commands into the CLI.

[edit]

```
set protocols ptp clock-mode boundary priority1 1 priority2 2 domain 0 unicast-negotiation
set protocols ptp slave announce-timeout 2 delay-request -4 frequency-only
set protocols ptp slave interface ge-1/2/3.0 unicast-mode transport ipv4
set protocols ptp slave interface ge-1/2/3.0 unicast-mode clock-source 2.2.2.2
local-ip-address 3.3.3.3
set protocols ptp master announce-interval 0 clock-step one-step sync-interval 0
set protocols ptp master interface ge-1/2/0.3 unicast-mode transport ipv4
set protocols ptp master interface ge-1/2/0.3 unicast-mode clock-client 10.10.1.1
local-ip-address 100.1.1.1
```

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

For step-by-step configuration, see [“Configuring Precision Time Protocol” on page 319](#).

To configure PTP, perform the following tasks:

1. Configure the clock mode, priorities, domain, and unicast negotiation options for PTP.

```
[edit protocols ptp]
user@host# set clock-mode boundary priority1 1 priority2 2 domain 0
unicast-negotiation
```

2. Configure the announce timeout, delay request, interface IP address, and encapsulation type for the slave.

```
[edit protocols ptp slave]
user@host# set announce-timeout 2 delay-request 0 interface ge-1/2/3.0 unicast-mode
transport ipv4
```

3. Configure the **clock master** option and the **local-ip-address** option for the slave node.

```
[edit protocols ptp slave interface ge-1/2/3.0 unicast-mode]
user@host# set clock-source 2.2.2.2 local-ip-address 3.3.3.3
```

4. Configure the announce interval, clock step, synchronous interval, interface IP address, and encapsulation type for the master.

```
[edit protocols ptp master]
user@host# set announce-interval 0 clock-step one-step sync-interval 0 interface
ge-1/2/3.0 unicast-mode transport ipv4
```

5. Configure the clock client for the master.

```
[edit protocols ptp master interface ge-1/2/3.0 unicast-mode]
user@host# set clock-client 10.10.1.1 local-ip-address 100.1.1.1
```

**Results** Display the results of the configuration:

```
[edit protocols ptp]
user@host# show
{
  clock-mode boundary;
  domain 0;
  priority1 1;
  priority2 2;
  unicast-negotiation;
  slave {
    announce-timeout 2;
    delay-request 0;
    frequency-only;
    interface ge-1/2/3.0 {
      unicast-mode {
        transport ipv4;
        clock-source 2.2.2.2 {
          local-ip-address 3.3.3.3;
        }
      }
    }
  }
}
master {
  announce-interval 0;
  clock-step one-step;
```

```
sync-interval 0;
interface ge-1/2/3.0 {
  unicast-mode {
    transport ipv4;
    clock-client 3.3.3.3 {
      local-ip-address 1.0.1.0;
    }
  }
}
```

## Verification

Confirm that the configuration is working properly.

- [Verifying the PTP Clock Details on page 328](#)
- [Verifying the Lock Status of the Slave on page 328](#)
- [Verifying the PTP Options on the Slave on page 329](#)
- [Verifying the PTP Options and the Current Status of the Master on page 329](#)
- [Verifying the Number and Status of the PTP Ports on page 329](#)

---

### Verifying the PTP Clock Details

<b>Purpose</b>	Verify that the PTP clock is working as expected.
<b>Action</b>	In operational mode, enter the <b>run show ptp clock</b> command to display the clock details.
<b>Meaning</b>	The output displays the clock details, which include the parameters configured on the node. For more information about the <b>run show ptp clock</b> operational command, see <a href="#">show ptp clock</a> .

---

### Verifying the Lock Status of the Slave

<b>Purpose</b>	Verify that the slave clock is aligned to the master clock by checking the lock status of the slave.
<b>Action</b>	In operational mode, enter the <b>run show ptp lock-status</b> command to display the lock status of the slave.
<b>Meaning</b>	The output displays information about the lock status of the slave. The output shows whether the slave is aligned to the master clock or not. For more information about the <b>run show ptp lock-status</b> operational command, see <a href="#">show ptp lock-status</a> .

### Verifying the PTP Options on the Slave

---

- Purpose** Verify the PTP options that are set on the slave and its current status.
- Action** In operational mode, enter the **run show ptp slave** command to display the configured slave.
- Meaning** The output displays information about the configured slave and the status of the slave. For more information about the **run show ptp slave** operational command, see [show ptp slave](#).

### Verifying the PTP Options and the Current Status of the Master

---

- Purpose** Verify the PTP options that are set for the master and its current status.
- Action** In operational mode, enter the **run show ptp master** command to display the configured options for the master.
- Meaning** The output displays information about the configured master and the current status of the master. For more information about the **run show ptp master** operational command, see [show ptp master](#).

### Verifying the Number and Status of the PTP Ports

---

- Purpose** Verify the number of PTP ports and their current status.
- Action** In operational mode, enter the **run show ptp port** command to display the configured ports.
- Meaning** The output displays information about the number of ports created according to the configuration and their current status. For each unique local IP address, one PTP port is created. For more information about the **run show ptp port** operational command, see [show ptp port](#).

## Configuring Hybrid Mode and ESMC Quality Level Mapping

---

You can configure hybrid mode (that is, the combined operation of Synchronous Ethernet and Precision Time Protocol (PTP)) on MX240, MX480, and MX960 Universal Routing Platforms and on MX80 Universal Routing Platforms with precision timing support

(MX80-P) and with timing support (MX80-T). On the MX240, MX480, and MX960 routers, the combined operation is possible only when the PTP client and the Synchronous Ethernet source are on the same enhanced Modular Port Concentrator (MPC) and are traceable to the same master. When acting as a PTP slave, an MX80-P or MX80-T router can accept any external Synchronous Ethernet clock as reference. Note that when the selected Synchronous Ethernet reference fails, the router continues to work in PTP mode.

In hybrid mode, the synchronous Ethernet equipment clock (EEC) on the MPC derives the frequency from Synchronous Ethernet and the phase and time of day from PTP.

The hybrid mode is configured on the slave. On the slave, one or more interfaces are configured as Synchronous Ethernet source interfaces.

The ESMC quality level value is mapped to the clock class value either by mapping the PTP clock class to the ESMC quality level or by configuring a user-defined mapping of PTP clock class to ESMC quality level. For more information, see [“Understanding ESMC Quality Level Mapping” on page 280](#). The following procedures explain configuring hybrid mode with either of the modes in detail.

- [Configuring the Router in Hybrid Mode on page 330](#)
- [Configuring Hybrid Mode with Mapping of the PTP Clock Class to the ESMC Quality Level on page 331](#)
- [Configuring Hybrid Mode with a User-Defined Mapping of the PTP Clock Class to the ESMC Quality Level on page 332](#)

## Configuring the Router in Hybrid Mode

To configure the router in hybrid mode, you must:

1. Configure Synchronous Ethernet options at the **[edit chassis synchronization]** hierarchy level:
  - Configure the **auto-select** mode of operation. You can select the clock source either from a free-run local oscillator or from an external qualified clock.

When the router is configured with the **auto-select** option, the router chooses up to two best upstream clock sources. It then uses the clock recovered from one of the sources to lock the chassis clock. If an upstream clock with acceptable quality is not available or if the router is configured in free-run mode, the router uses the internal oscillator.
  - Configure the **esmc-transmit** and **network-option** options at the **[edit chassis synchronization]** hierarchy level.
  - Configure one or more interfaces at the **[edit chassis synchronization]** hierarchy level as Synchronous Ethernet sources as needed.
2. Configure PTP options at the **[edit protocols ptp]** hierarchy level.
3. Configure hybrid mode options at the **[edit protocols ptp slave]** hierarchy level.

## Configuring Hybrid Mode with Mapping of the PTP Clock Class to the ESMC Quality Level

To configure hybrid mode options with mapping of the PTP clock class to the ESMC quality level, perform the following steps:

1. In configuration mode, go to the **[edit protocols ptp slave]** hierarchy level:

```
[edit]
user@host# edit protocols ptp slave
```

2. Configure the **convert-clock-class-to-quality-level** option to set the default mapping between the ESMC SSM quality level and the PTP clock class.

```
[edit protocols ptp slave]
user@host# set convert-clock-class-to-quality-level
```

3. Configure the hybrid mode option on the slave.

```
[edit protocols ptp slave]
user@host# edit hybrid
```

4. Configure the Synchronous Ethernet mapping option in hybrid mode.

```
[edit protocols ptp slave hybrid]
user@host# edit synchronous-ethernet-mapping
```

5. Configure the IP address of the clock source.

```
[edit protocols ptp slave hybrid synchronous-ethernet-mapping]
user@host# edit clock-source ip-address
```

6. Configure one or more Synchronous Ethernet source interfaces for the slave as needed.

```
[edit protocols ptp slave hybrid synchronous-ethernet-mapping clock-source ip-address]
user@host# set interface interface1-name
user@host# set interface interface2-name
```

**NOTE:** You must first configure these interfaces at the **[edit chassis synchronization]** hierarchy level as Synchronous Ethernet sources. For information about configuring these interfaces, see [synchronization \(MX Series\)](#).

## Configuring Hybrid Mode with a User-Defined Mapping of the PTP Clock Class to the ESMC Quality Level

To configure hybrid mode options with a user-defined mapping of the PTP clock class to the ESMC quality level, perform the following steps:

1. In configuration mode, go to the **[edit protocols ptp slave]** hierarchy level:

```
[edit]
user@host# edit protocols ptp slave
```

2. To override the default mapping option, perform the following steps:

- a. Configure the **clock-class-to-quality-level-mapping** option with one of the quality level values. The quality level values are prc, prs, sec, smc, ssu-a, ssu-b, st2, st3, st3e, st4, stu, and tnc.

```
[edit protocols ptp slave]
user@host# edit clock-class-to-quality-level-mapping quality-level prc | prs | sec
| smc | ssu-a | ssu-b | st2 | st3 | st3e | st4 | stu | tnc
```

- b. Configure the **clock-class** option for the set quality level. The clock class value ranges from 80 through 109.

```
[edit protocols ptp slave clock-class-to-quality-level-mapping quality-level
quality-level-value]
user@host# set clock-class clock-class
```

**NOTE:** In hybrid mode, the boundary node advertises the grandmaster clock class value only after phase lock is achieved.

3. Configure the hybrid mode option on the slave.

```
[edit protocols ptp slave]
user@host# edit hybrid
```

4. Configure the Synchronous Ethernet mapping option in hybrid mode.

```
[edit protocols ptp slave hybrid]
user@host# edit synchronous-ethernet-mapping
```

5. Configure the IP address of the clock source.

```
[edit protocols ptp slave hybrid synchronous-ethernet-mapping]
user@host# edit clock-source ip-address
```

6. Configure one or more Synchronous Ethernet source interfaces for the slave as needed.

```
[edit protocols ptp slave hybrid synchronous-ethernet-mapping clock-source ip-address]
user@host# set interface interface1-name
user@host# set interface interface2-name
```

**NOTE:** You must first configure these interfaces at the [edit chassis synchronization] hierarchy level as Synchronous Ethernet sources. For information about configuring these interfaces, see [synchronization \(MX Series\)](#).

For information about verifying the aforementioned procedure, see “[Example: Configuring Hybrid Mode and ESMC Quality Level Mapping](#)” on page 333.

## Example: Configuring Hybrid Mode and ESMC Quality Level Mapping

This example shows the configuration of hybrid mode by mapping the PTP clock class to the ESMC quality level and also by configuring a user-defined mapping of the PTP clock class to the ESMC quality level on MX240 Universal Routing Platforms.

- [Requirements for Hybrid Mode Configuration on page 333](#)
- [Overview on page 333](#)
- [Configuration on page 335](#)
- [Verification on page 337](#)

### Requirements for Hybrid Mode Configuration

This example uses the following hardware and software components:

- One MX240 router.
- Junos OS Release 12.2R2 or later.

### Overview

The combined operation of Synchronous Ethernet and Precision Time Protocol (PTP) is also known as hybrid mode. In hybrid mode, the synchronous Ethernet equipment clock (EEC) on the Modular Port Concentrator (MPC) derives the frequency from Synchronous Ethernet and the phase and time of day from PTP.

You can configure hybrid mode on MX240, MX480, and MX960 Universal Routing Platforms and on MX80 Universal Routing Platforms with precision timing support (MX80-P) and with timing support (MX80-T). On the MX240, MX480, and MX960 routers, the combined operation is possible only when the PTP slave and the Synchronous Ethernet source are on the same enhanced MPC and are traceable to the same master. When acting as a PTP slave, an MX80-P or MX80-T router can accept any external Synchronous Ethernet clock as reference. Note that when the selected Synchronous Ethernet reference fails, the router continues to work in PTP mode.

Hybrid mode is configured on the slave. On the slave, one or more interfaces are configured as Synchronous Ethernet source interfaces.

**NOTE:** You can set the values for each parameter according to your requirement. The values given in this example are for illustration purposes only.

The ESMC quality level value is mapped to the clock class value either by mapping the PTP clock class to the ESMC quality level or by configuring a user-defined mapping of the PTP clock class to the ESMC quality level. For more information, see [“Understanding ESMC Quality Level Mapping” on page 280](#). The following examples explain configuring hybrid mode with either of the modes in detail.

To configure the router in hybrid mode, you must:

1. Configure Synchronous Ethernet options at the **[edit chassis synchronization]** hierarchy level:
  - Configure the **auto-select** mode of operation. You can select the clock source either from a free-run local oscillator or from an external qualified clock.  
  
When the router is configured with the **auto-select** option, the router chooses up to two best upstream clock sources. It then uses the clock recovered from one of the sources to lock the chassis clock. If an upstream clock with acceptable quality is not available or if the router is configured in free-run mode, the router uses the internal oscillator.
  - Configure the **esmc-transmit** and **network-option** options at the **[edit chassis synchronization]** hierarchy level.
  - Configure one or more interfaces at the **[edit chassis synchronization]** hierarchy level as Synchronous Ethernet sources as needed.
2. Configure PTP options at the **[edit protocols ptp]** hierarchy level.
3. Configure hybrid mode options at the **[edit protocols ptp slave]** hierarchy level.

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*. For step-by-step configuration of hybrid mode, see [“Configuring Hybrid Mode and ESMC Quality Level Mapping” on page 329](#).

## Configuration

- [Hybrid Mode with Mapping of the PTP Clock Class to the ESMC Quality Level on page 335](#)
- [Hybrid Mode with a User-Defined Mapping of the PTP Clock Class to the ESMC Quality Level on page 336](#)

### Hybrid Mode with Mapping of the PTP Clock Class to the ESMC Quality Level

#### CLI Quick Configuration

To quickly configure hybrid mode on the ge-1/2/3.0 interface with the clock source IP address as 2.2.2.2, copy the following commands, paste them in a text file, remove any line breaks, and then copy and paste the commands into the CLI.

[edit]

```
set protocols ptp slave hybrid
set protocols ptp slave hybrid synchronous-ethernet-mapping
set protocols ptp slave hybrid synchronous-ethernet-mapping clock-source 2.2.2.2 interface
ge-1/2/3.0
set protocols ptp slave convert-clock-class-to-quality-level
```

#### Step-by-Step Procedure

To configure hybrid mode on an MX240 router with mapping of the PTP clock class to the ESMC quality level, perform the following steps:

1. Configure the **convert-clock-class-to-quality-level** option on the slave at the **[edit protocols ptp slave]** hierarchy level.

```
[edit protocols ptp slave]
user@host# set convert-clock-class-to-quality-level
```

2. Configure hybrid mode on the slave.

```
[edit protocols ptp slave]
user@host# edit hybrid
```

3. Configure the Synchronous Ethernet mapping option, IP address of the master clock as 2.2.2.2, and the interface ge-1/2/3.0 for hybrid mode on the slave.

```
[edit protocols ptp slave hybrid]
user@host# set synchronous-ethernet-mapping clock-source 2.2.2.2 interface
ge-1/2/3.0
```

#### Results

Display the results of the configuration of hybrid mode with the mapping of the PTP clock class to the ESMC quality level:

```
[edit protocols ptp slave]
user@host# show
```

```

convert-clock-class-to-quality-level
hybrid {
  synchronous-ethernet-mapping {
    clock-source 2.2.2.2 {
      interface ge-1/2/3.0;
    }
  }
}

```

### Hybrid Mode with a User-Defined Mapping of the PTP Clock Class to the ESMC Quality Level

#### CLI Quick Configuration

To quickly configure hybrid mode on the interface ge-1/2/3.0, copy the following commands, paste them in a text file, remove any line breaks, and then copy and paste the commands into the CLI.

[edit]

```

set protocols ptp slave hybrid
set protocols ptp slave hybrid synchronous-ethernet-mapping
set protocols ptp slave hybrid synchronous-ethernet-mapping clock-source 2.2.2.2 interface
ge-1/2/3.0
set protocols ptp slave clock-class-to-quality-level-mapping quality-level prc clock-class
80

```

#### Step-by-Step Procedure

To configure hybrid mode with a user-defined mapping of the PTP clock class to the ESMC quality level on an MX240 router, perform the following steps:

1. Configure the **quality-level** option for the **clock-class-to-quality-level-mapping** statement on the slave at the **[edit protocols ptp slave]** hierarchy level and then configure the **clock-class** option for the set quality level if you want to manually override the mapping of the ESMC quality level to the clock class.

```

[edit protocols ptp slave]
user@host# set clock-class-to-quality-level-mapping quality-level prc clock-class
80

```

2. Configure hybrid mode on the slave.

```

[edit protocols ptp slave]
user@host# edit hybrid

```

3. Configure the Synchronous Ethernet mapping option, IP address of the master clock as 2.2.2.2, and the interface ge-1/2/3.0 for hybrid mode on the slave.

```

[edit protocols ptp slave hybrid]
user@host# set synchronous-ethernet-mapping clock-source 2.2.2.2 interface
ge-1/2/3.0

```

**Results** Display the results of the configuration of hybrid mode with a user-defined mapping of the PTP clock class to the ESMC quality level:

```
[edit protocols ptp slave]
user@host# show
clock-class-to-quality-level-mapping {
  quality-level prc {
    clock-class 80;
  }
}
hybrid {
  synchronous-ethernet-mapping {
    clock-source 2.2.2.2 {
      interface ge-1/2/3.0;
    }
  }
}
```

## Verification

- [Verifying That the Router Is Operating in Hybrid Mode on page 337](#)
- [Verifying the Quality Level Change on the Transmit Side on page 337](#)
- [Verifying Global Information Parameters After Mapping of the PTP Clock Class to the ESMC Quality Level in Hybrid Mode on page 338](#)
- [Verifying Global Information Parameters After Configuring User-Defined Mapping of the PTP Clock Class to the ESMC Quality Level in Hybrid Mode on page 339](#)

### Verifying That the Router Is Operating in Hybrid Mode

**Purpose** Verify the current mode of operation of the slave.

**Action** In operational mode, enter the **run show ptp hybrid** command to display the current configuration and current mode of operation of the slave.

In operational mode, enter the **run show ptp hybrid config** command to display the PTP source to Synchronous Ethernet interface mappings.

In operational mode, enter the **run show ptp hybrid status** command to display the current hybrid mode operational status.

**Meaning** The output displays the current configuration and current mode of operation of the slave. For information about the **run show ptp hybrid** operational command, see [show ptp hybrid](#).

### Verifying the Quality Level Change on the Transmit Side

**Purpose** Verify the quality level change on the transmit side of the router.

**Action** In operational mode, enter the **run show synchronous-ethernet esmc transmit detail** command to display the ESMC transmit interface details.

**Meaning** The output displays the ESMC SSM quality level transmitted out of various Ethernet interfaces. For information about the **run show synchronous-ethernet esmc transmit detail** operational command, see [show synchronous-ethernet esmc transmit](#).

### Verifying Global Information Parameters After Mapping of the PTP Clock Class to the ESMC Quality Level in Hybrid Mode

**Purpose** Verify the global information parameters after mapping of the PTP clock class to the ESMC quality level in hybrid mode by enabling the **convert-clock-class-to-quality-level** option.

**Action** In operational mode, enter the **run show ptp global-information** command to display the following output:

```
user@host> run show ptp global-information
PTP Global Configuration:
Domain number          : 0
Transport Encapsulation : IPv4
Clock mode             : Ordinary
Priority Level1         : 128
Priority Level2         : 128
Unicast Negotiation    : Disabled
ESMC QL From Clock Class: Enabled
Clock Class/ESMC QL    : 84 / (QL SSU-A/SSM 0x4)
Slave Parameters:
  Sync Interval         : -
  Delay Request Interval: -6 (64 packets per second)
  Announce Interval     : -
  Announce Timeout      : 3
Master Parameters:
  Sync Interval         : -6 (64 packets per second)
  Delay Request Interval: -
  Announce Interval     : 1 (1 packet every 2 seconds)
  Clock Step            : one-step
Number of Slaves        : 1
Number of Masters       : 0
```

In operational mode, enter the **run show ptp quality-level-mapping** command to display the following output:

```
user@host> run show ptp quality-level-mapping

quality level      ptp clock class
PRC                84
SSU-A              92
SSU-B              96
SEC                104
```

**Meaning** The output for `run show ptp global-information` displays the parameters set in Synchronous Ethernet mode and the parameters set for the master and the slave.

The output of `run show ptp quality-level-mapping` displays the default mapping of the clock class to the ESMC quality level.

### Verifying Global Information Parameters After Configuring User-Defined Mapping of the PTP Clock Class to the ESMC Quality Level in Hybrid Mode

**Purpose** Verify the global information parameters after configuring a user-defined mapping of the PTP clock class to the ESMC quality level in hybrid mode by disabling the `convert-clock-class-to-quality-level` option.

**Action** In operational mode, enter the `run show ptp global-information` command to display the following output:

```
user@host> run show ptp global-information
PTP Global Configuration:
Domain number          : 0
Transport Encapsulation : IPv4
Clock mode              : Ordinary
Priority Level1         : 128
Priority Level2         : 128
Unicast Negotiation     : Disabled
ESMC QL From Clock Class: Disabled
Clock Class/ESMC QL     : -
Slave Parameters:
  Sync Interval         : -
  Delay Request Interval: -6 (64 packets per second)
  Announce Interval     : -
  Announce Timeout      : 3
Master Parameters:
  Sync Interval         : -6 (64 packets per second)
  Delay Request Interval: -
  Announce Interval     : 1 (1 packet every 2 seconds)
  Clock Step            : one-step
```

**Meaning** The output displays the parameters set in Synchronous Ethernet mode and the parameters set for the master and the slave.

**Related Documentation**

- [Configuring Hybrid Mode and ESMC Quality Level Mapping on page 329](#)

## Example: Configuring Centralized Clocking on the Enhanced MX Switch Control Board

These examples show how to configure the following clock sources and features on an Enhanced MX Switch Control Board (SCBE): Synchronous Ethernet, ordinary Precision Time Protocol (PTP) slave, hybrid PTP slave, and retiming through the building-integrated timing supply (BITS) external interface.

- [Requirements on page 340](#)
- [Overview on page 340](#)
- [Configuration on page 341](#)
- [Verification on page 346](#)

### Requirements

These examples use the following hardware and software components:

- One MX240, MX480, or MX960 router with MPC 16x10GE or MPC2Es (see *MPCs Supported by MX Series Routers*) for Synchronous Ethernet clock sources, or MPC2E-P for PTP clock sources
- One Synchronous Ethernet clock source device (may be an MX240, MX480, or MX960 router)
- One PTP grandmaster device
- One BITS device (may be the same as the PTP grandmaster device)
- Junos OS Release 12.2 or later for MX240, MX480, or MX960 routers
- Junos OS Release 12.3 or later to configure a BITS interface as an input, output, or I/O clock source for MX240, MX480, or MX960 routers

Before you begin configuring centralized clocking on an interface that uses Synchronous Ethernet, ensure that you have configured the MX Series interface as a chassis synchronization source to the device that provides a Synchronous Ethernet clock source.

- Configure the MX Series interface as a chassis synchronization source to the device that provides a Synchronous Ethernet clock source.

### Overview

With the addition of a Stratum 3 clock module to the SCBE, an MX240, MX480, or MX960 chassis can perform clock monitoring, filtering, and holdover in a centralized chassis location. Chassis line cards can be configured to recover network timing clocks at the physical layer via Synchronous Ethernet or by a packet-based PTP implementation. These recovered clocks are routed to the SCBE Stratum 3 clock module via the chassis backplane. A clock selection algorithm is run that selects the best quality recovered clock from the list of configured clock sources. The Stratum 3 clock module locks to the selected clock source and fans it out to the chassis line cards. 16x10GE 3D and MPC2Es (see *MPCs Supported by MX Series Routers*) can distribute this clock to downstream network elements via Synchronous Ethernet.

The Stratum 3 clock module acquires holdover data while locked to the selected clock source. If the clock fails, the Stratum 3 clock module enters holdover mode and replays collected holdover data to maintain its output clock. The Stratum 3 holdover performance depends on the drift of the SCBE OXCO device.

In Junos 12.3, support was added for synchronizing an MX240, MX480, or MX960 chassis with an SCBE to a BITS timing source through an RJ-48 port on the SCBE. The BITS external clock interface supports the sending and receiving of Synchronization Status Message (SSM) quality levels. The quality level is used by the chassis clock-selection algorithm. When BITS output is configured, the source-mode default is the selected line clock source.

The BITS external interface can be connected to a retiming device, which cleans up the clock and sends it back in the external BITS interface. The conditioned input BITS clock is selected as the chassis clock and distributed downstream via Synchronous Ethernet interfaces. The `tx-dnu-to-line-source-enable` option is used to prevent a timing loop. [Figure 8 on page 341](#) shows the BITS retiming functionality using a Synchronization Supply Unit (SSU). For instructions on how to configure retiming through the BITS external interface, see [“Configuring Retiming through the BITS External Interface” on page 344](#).

**Figure 8: BITS Retiming with Synchronization Supply Unit (SSU)**

Prior to the SCBE, clock monitoring, filtering, and holdover functions were distributed throughout the chassis and performed on MPC2E line cards. This distributed clocking mode limits the distribution of timing to downstream network elements on MPC2E interfaces only. Centralized clocking mode removes this limitation by supporting the distribution of timing on MPC 16x 10GE line interfaces as well.

## Configuration

To configure centralized clocking, perform one or more of these tasks:

- [Configuring Centralized Clocking from a Synchronous Ethernet Clock Source on page 341](#)
- [Configuring Centralized Clocking from an Ordinary PTP Clock Source on page 343](#)
- [Configuring Centralized Clocking from a Hybrid PTP Clock Source on page 343](#)
- [Configuring Retiming through the BITS External Interface on page 344](#)

### Configuring Centralized Clocking from a Synchronous Ethernet Clock Source

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set chassis synchronization network-option option-2
set chassis synchronization source interfaces ge-4/1/0 priority 1
set chassis synchronization source interfaces ge-4/1/0 quality-level st3
```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a Synchronous Ethernet clock source:

1. Configure the network option:

```
[edit chassis synchronization]
user@host# set network-option option-2
```

2. Configure the priority and quality level of the clock source on this interface:

```
[edit chassis synchronization source interfaces ge-4/1/0]
user@host# set priority 1
user@host# set quality-level st3
```

### Results

From configuration mode, confirm your configuration by entering the **show chassis synchronization** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show chassis synchronization
network-option option-2;
source {
    interfaces ge-4/1/0 {
        priority 1;
        quality-level st3;
    }
}
```

After you configure the device, enter **commit** from configuration mode.

### Configuring Centralized Clocking from an Ordinary PTP Clock Source

#### Step-by-Step Procedure

To configure a PTP clock source:

1. Configure ordinary mode PTP on the ge-4/1/9 interface to the PTP grandmaster device. See “[Example: Configuring Precision Time Protocol](#)” on page 325.

### Configuring Centralized Clocking from a Hybrid PTP Clock Source

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set chassis synchronization network-option option-2
set chassis synchronization source interfaces ge-4/1/0 priority 1
set chassis synchronization source interfaces ge-4/1/0 quality-level st3
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a hybrid PTP clock source:

1. Configure the network option:

```
[edit chassis synchronization]
user@host# set network-option option-2
```

2. Configure the priority and quality level of the clock source on this interface:

```
[edit chassis synchronization source interfaces ge-4/1/0]
user@host# set priority 1
user@host# set quality-level st3
```

3. Configure hybrid mode PTP on the ge-4/1/9 interface to the PTP grandmaster device. For the **synchronous-ethernet-mapping** interface, specify the Synchronous Ethernet interface used in Step 2.

#### Results

From configuration mode, confirm your configuration by entering the **show chassis synchronization** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show chassis synchronization
```

```

network-option option-2;
source {
    interfaces ge-4/1/0 {
        priority 1;
        quality-level st3;
    }
}

```

After you configure the device, enter **commit** from configuration mode.

### Configuring Retiming through the BITS External Interface

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```

set chassis synchronization network-option option-2
set chassis synchronization interfaces external signal-type t1
set chassis synchronization interfaces external t1-options line-encoding b8zs
set chassis synchronization interfaces external t1-options framing sf
set chassis synchronization output interfaces external wander-filter-disable
set chassis synchronization output interfaces external holdover-mode-disable
set chassis synchronization output interfaces external source-mode line
set chassis synchronization output interfaces external tx-dnu-to-line-source-enable
set chassis synchronization output interfaces external minimum-quality st3
set chassis synchronization source interfaces ge-4/0/1 quality-level st3
set chassis synchronization source interfaces external quality-level prs

```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure retiming through the BITS external interface using an SSU:

1. Configure the network option (G.812 type IV clock):

```

[edit chassis synchronization]
user@host# set network-option option-2

```

2. Configure the external BITS signal type (T1-coded 1.544-MHz signal on 100-ohm balanced line):

```

[edit chassis synchronization interfaces external]
set signal-type t1

```

3. Configure the external BITS signal line-encoding (B8ZS) and framing (superframe) options:

```
[edit chassis synchronization interfaces external]
user@host# set t1-options line-encoding b8zs
user@host# set t1-options framing sf
```

4. Configure the output external BITS signal properties:

- Disable wander filtering:

```
[edit chassis synchronization output interfaces external]
user@host# set wander-filter-disable
```

- Disable holdover:

```
[edit chassis synchronization output interfaces external]
user@host# set holdover-mode-disable
```

- Select the best line clock source for output:

```
[edit chassis synchronization output interfaces external]
user@host# set source-mode line
```

- Set Tx QL to DNU/DUS on the line source interface to prevent a timing loop:

```
[edit chassis synchronization output interfaces external]
user@host# set tx-dnu-to-line-source-enable
```

- Set minimum quality level:

```
[edit chassis synchronization output interfaces external]
user@host# set minimum-quality st3
```

5. Configure the incoming clock source and quality level:

```
[edit chassis synchronization source interfaces ge-4/0/1]
user@host# set quality-level st3
```

6. Configure the external clock source and quality level:

```
[edit chassis synchronization source interfaces external]
user@host# set quality-level prs
```

**Results** From configuration mode, confirm your configuration by entering the **show chassis synchronization** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show chassis synchronization
network-option option-2;
interfaces external {
  signal-type t1;
```

```

    t1-options {
        line-encoding b8zs;
        framing sf;
    }
}
output {
    interfaces external {
        wander-filter-disable;
        holdover-mode-disable;
        source-mode line;
        tx-dnu-to-line-source-enable;
        minimum-quality st3;
    }
}
source {
    interfaces ge-4/0/1 {
        quality-level st3;
    }
    interfaces external {
        quality-level prs;
    }
}

```

After you configure the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying the Synchronous Ethernet Clock Source on page 346](#)
- [Verifying the Ordinary PTP Clock Source on page 347](#)
- [Verifying the Hybrid PTP Clock Source on page 347](#)
- [Verifying the Retiming through the BITS External Interface on page 348](#)

### Verifying the Synchronous Ethernet Clock Source

**Purpose** Verify that the MX Series router recovers, selects, qualifies, and locks to the configured Synchronous Ethernet clock source.

**Action** From operational mode, enter the **show chassis synchronization clock-module** command.

```

user@host> show chassis synchronization clock-module

Clock module on SCB0
Current role      : master
Current state     : locked to ge-4/1/0
State for        : 0 days, 00 hrs, 00 mins, 15 secs
State since      : Mon Jun  6 07:28:47 2011
Monitored clock sources
Interface        Type      Status
ge-4/1/0         syncE    qualified-selected

```

**Meaning** The Monitored clock sources field shows that the ge-4/1/0 interface has the Synchronous Ethernet type and is the qualified and selected centralized clock source.

### Verifying the Ordinary PTP Clock Source

**Purpose** Verify that the MX Series router recovers, selects, qualifies, and locks to the configured PTP clock source.

**Action** From operational mode, enter the **show chassis synchronization clock-module** command.

```
user@host> show chassis synchronization clock-module

Clock module on SCB0
  Current role      : master
  Current state     : locked to ge-4/1/9
    State for       : 0 days, 00 hrs, 00 mins, 45 secs
    State since     : Wed Jun 29 10:52:05 2011
  Monitored clock sources
    Interface      Type      Status
    ge-4/1/9       ptp       qualified-selected
```

**Meaning** The Monitored clock sources field shows that the ge-4/1/9 interface has the ptp type and is the qualified and selected centralized clock source.

### Verifying the Hybrid PTP Clock Source

**Purpose** Verify that the MX Series router recovers, selects, qualifies, and locks to the configured hybrid PTP clock source.

**Action** From operational mode, enter the **show chassis synchronization clock-module** command.

```
user@host> show chassis synchronization clock-module

Clock module on SCB0
  Current role      : master
  Current state     : locked to ge-4/1/9
    State for       : 0 days, 00 hrs, 00 mins, 15 secs
    State since     : Wed Jun 29 11:19:25 2011
  Monitored clock sources
    Interface      Type      Status
    ge-4/1/9       ptp-hybrid qualified-selected

Configured sources:

Interface      : ge-4/1/0
Status         : Primary      Index      : 218
Clock source state : Clk qualified Priority : 1
Configured QL    : ST3        ESMC QL    : DUS
Clock source type : ifd          Clock Event : Clock locked
Kernel flags     : Up,sec,
```

**Meaning** The Monitored clock sources field shows that the ge-4/1/9 interface has the ptp-hybrid type and is the qualified and selected centralized clock source. The Configured sources field shows that the ge-4/1/0 interface has the Clock locked Clock Event .

### Verifying the Retiming through the BITS External Interface

**Purpose** Verify that the MX Series router recovers, selects, qualifies, and locks to the configured clock source, and that the external clock is locked to the configured clock source.

**Action** From operational mode, enter the **show chassis synchronization extensive** command.

```
user@host> show chassis synchronization extensive

Current clock status : Locked
Clock locked to      : Primary

Configured interfaces:

Name      : external
Signal type : t1 (sf b8zs)
Rx status  : active
Tx status  : active
LED color  : green

Configured outputs:

Interface      : external
Tx status      : active
Minimum QL     : ST3           Tx QL           : ST3
Holdover mode  : disabled      Wander filter : disabled
Source mode    : line          Source Tx DNU : enabled
Holdover data  : valid
Current state  : locked to ge-4/0/1
State for      : 0 days, 00 hrs, 24 mins, 47 secs
State since    : Thu Sep  6 13:01:07 2012

Configured sources:

Interface      : external
Status         : Primary      Index        : 0
Clock source state : Clk qualified Priority      : Default(6)
Configured QL    : PRS        ESMC QL         : PRS
Clock source type : extern     Clock Event    : Clock locked
Interface State  : Up,pri,

Interface      : ge-4/0/1
Status         : Secondary    Index        : 152
Clock source state : Clk qualified Priority      : Default(8)
Configured QL    : ST3        ESMC QL         : DUS
Clock source type : ifd        Clock Event    : Clock qualified
Interface State  : Up,sec,ESMC TX(QL DUS/SSM 0xf),
```

**Meaning** The Configured interfaces field shows that the external interface receive and transmit statuses are active. The Configured outputs field shows that the current state is locked to ge-4/0/1. The Configured sources field shows that the external interface is the qualified and selected centralized clock source, and has the Clock locked Clock Event. The Configured sources field shows that the ge-4/0/1 interface is the secondary clock source, and has the Clock qualified Clock Event.

## Example: Configuring Centralized Clocking on an MX2020

These examples show how to configure the following clock sources and features on an MX2020 router: Synchronous Ethernet, Precision Time Protocol (PTP) slave, hybrid PTP slave, and retiming through the building-integrated timing supply (BITS) external interface.

- [Requirements on page 349](#)
- [Overview on page 350](#)
- [Configuration on page 350](#)
- [Verification on page 356](#)

### Requirements

These examples use the following hardware and software components:

- One MX2020, with MPC 16x10GE or MPC2Es (see *MPCs Supported by MX Series Routers*) for Synchronous Ethernet clock sources, or MPC2E-P for PTP clock sources
- One Synchronous Ethernet clock source device
- One PTP grandmaster device
- One BITS device (may be the same as the PTP grandmaster device)
- Junos OS Release 13.3 for MX2020 routers
- Junos OS Release 13.3 or later to configure a BITS interface as an input, output, or I/O clock source for MX2020 router

- Configure the MX Series interface as a chassis synchronization source to the device that provides a Synchronous Ethernet clock source.

## Overview

With the addition of a Stratum 3 (ST3) clock module the MX2020 chassis can perform clock monitoring, filtering, and holdover in a centralized chassis location. Chassis line cards can be configured to recover network timing clocks at the physical layer via Synchronous Ethernet or by a packet-based PTP implementation. These recovered clocks are routed to MX2020 SCB ST3 clock module via the chassis backplane. A clock selection algorithm is run that selects the best quality recovered clock from the list of configured clock sources. The ST3 clock module locks to the selected clock source and fans it out to the chassis line cards. 16x10GE 3D and MPC2Es (see *MPCs Supported by MX Series Routers*) can distribute this clock to downstream network elements via Synchronous Ethernet.

The ST3 clock module acquires holdover data while locked to the selected clock source. If the clock fails, the ST3 clock module enters holdover mode and replays collected holdover data to maintain its output clock. The ST3 holdover performance depends on the drift of the MX SCB OCXO device.

In Junos 13.3, support was added for synchronizing an MX2020 chassis to a BITS timing source using any of the two BITS interfaces. The quality level is used by the chassis clock-selection algorithm. When BITS output is configured, the source-mode can be configured as either **chassis** or **line**.

The BITS external interface can be connected to a retiming device, which cleans up the clock and sends it back in the external BITS interface. The conditioned input BITS clock is selected as the chassis clock and distributed downstream via Synchronous Ethernet interfaces. The **tx-dnu-to-line-source-enable** option is used to prevent a timing loop. For instructions on how to configure retiming through the BITS external interface, see [“Configuring Retiming through the BITS External Interface” on page 344](#).

Prior to 13.3, clock monitoring, filtering, and holdover functions were distributed throughout the chassis and performed on MPC2E line cards. This distributed clocking mode limits the distribution of timing to downstream network elements on MPC2E interfaces only. Centralized clocking mode removes this limitation by supporting the distribution of timing on MPC 16x 10GE line interfaces as well.

## Configuration

To configure centralized clocking, perform one or more of these tasks:

- [Configuring Centralized Clocking from a Synchronous Ethernet Clock Source on page 351](#)
- [Configuring an ordinary PTP Clock Source on page 352](#)
- [Configuring Centralized Clocking from a Hybrid Mode PTP Clock Source on page 352](#)
- [Configuring Hybrid Mode PTP on page 353](#)
- [Configuring Retiming through the BITS External Interface on page 354](#)

### Configuring Centralized Clocking from a Synchronous Ethernet Clock Source

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set chassis synchronization network-option option-2
set chassis synchronization source interfaces ge-4/1/0 priority 1
set chassis synchronization source interfaces ge-4/1/0 quality-level st3
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a Synchronous Ethernet clock source:

1. Configure the network option:

```
[edit chassis synchronization]
user@host# set network-option option-2
```

2. Configure the priority and quality level of the clock source on this interface:

```
[edit chassis synchronization source interfaces ge-4/1/0]
user@host# set priority 1
user@host# set quality-level st3
```

**Results** From configuration mode, confirm your configuration by entering the **show chassis synchronization** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show chassis synchronization
network-option option-2;
source {
    interfaces ge-4/1/0 {
        priority 1;
        quality-level st3;
    }
}
```

After you configure the device, enter **commit** from configuration mode.

### Configuring an ordinary PTP Clock Source

---

#### Step-by-Step Procedure

To configure a PTP clock source:

1. Configure ordinary mode PTP on the ge-4/1/9 interface to the PTP grandmaster device. See [“Example: Configuring Precision Time Protocol” on page 325](#).

### Configuring Centralized Clocking from a Hybrid Mode PTP Clock Source

---

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set chassis synchronization network-option option-2
set chassis synchronization source interfaces ge-4/1/0 priority 1
set chassis synchronization source interfaces ge-4/1/0 quality-level st3
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a hybrid mode PTP clock source:

1. Configure the network option:

```
[edit chassis synchronization]
user@host# set network-option option-2
```

2. Configure the priority and quality level of the clock source on this interface:

```
[edit chassis synchronization source interfaces ge-4/1/0]
user@host# set priority 1
user@host# set quality-level st3
```

3. To configure hybrid mode PTP on the ge-4/1/9 interface to the PTP grandmaster device, see [“Configuring Hybrid Mode PTP” on page 353](#).

#### Results

From configuration mode, confirm your configuration by entering the **show chassis synchronization** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show chassis synchronization
network-option option-2;
source {
```

```

interfaces ge-4/1/0 {
    priority 1;
    quality-level st3;
}

```

After you configure the device, enter **commit** from configuration mode.

### Configuring Hybrid Mode PTP

#### CLI Quick Configuration

To quickly configure hybrid mode on the ge-4/1/0 interface with the clock source IP address as 2.2.2.2, copy the following commands, paste them in a text file, remove any line breaks, and then copy and paste the commands into the CLI.

[edit]

```

set protocols ptp slave hybrid
set protocols ptp slave hybrid synchronous-ethernet-mapping
set protocols ptp slave hybrid synchronous-ethernet-mapping clock-source 2.2.2.2 interface
ge-4/1/0
set protocols ptp slave convert-clock-class-to-quality-level

```

#### Step-by-Step Procedure

To configure hybrid mode on an MX240 router with mapping of the PTP clock class perform the following steps:

1. Configure the **convert-clock-class-to-quality-level** option on the slave at the **[edit protocols ptp slave]** hierarchy level.

```

[edit protocols ptp slave]
user@host# set convert-clock-class-to-quality-level

```

2. Configure hybrid mode on the slave.

```

[edit protocols ptp slave]
user@host# edit hybrid

```

3. Configure the Synchronous Ethernet mapping option, IP address of the master clock as 2.2.2.2, and the interface ge-4/1/0 for hybrid mode on the slave.

```

[edit protocols ptp slave hybrid]
user@host# set synchronous-ethernet-mapping clock-source 2.2.2.2 interface
ge-4/1/0

```

#### Results

Display the results of the configuration of hybrid mode with the mapping of the PTP clock class to the ESMC quality level:

```
[edit protocols ptp slave]
user@host# show
convert-clock-class-to-quality-level
hybrid {
  synchronous-ethernet-mapping {
    clock-source 2.2.2.2 {
      interface ge-4/1/0;
    }
  }
}
```

### Configuring Retiming through the BITS External Interface

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set chassis synchronization network-option option-2
set chassis synchronization interfaces external signal-type t1
set chassis synchronization interfaces external t1-options line-encoding b8zs
set chassis synchronization interfaces external t1-options framing sf
set chassis synchronization output interfaces external wander-filter-disable
set chassis synchronization output interfaces external holdover-mode-disable
set chassis synchronization output interfaces external source-mode line
set chassis synchronization output interfaces external tx-dnu-to-line-source-enable
set chassis synchronization output interfaces external minimum-quality st3
set chassis synchronization source interfaces ge-4/0/1 quality-level st3
set chassis synchronization source interfaces external quality-level prs
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure retiming through the BITS external interface using an SSU:

1. Configure the network option (G.812 type IV clock):

```
[edit chassis synchronization]
user@host# set network-option option-2
```

2. Configure the external BITS signal type (T1-coded 1.544-MHz signal on 100-ohm balanced line):

```
[edit chassis synchronization interfaces external]
set signal-type t1
```

3. Configure the external BITS signal line-encoding (B8ZS) and framing (superframe) options:

```
[edit chassis synchronization interfaces external]
user@host# set t1-options line-encoding b8zs
user@host# set t1-options framing sf
```

4. Configure the output external BITS signal properties:

- Disable wander filtering:

```
[edit chassis synchronization output interfaces external]
user@host# set wander-filter-disable
```

- Disable holdover:

```
[edit chassis synchronization output interfaces external]
user@host# set holdover-mode-disable
```

- Select the best line clock source for output:

```
[edit chassis synchronization output interfaces external]
user@host# set source-mode line
```

- Set Tx QL to DNU/DUS on the line source interface to prevent a timing loop:

```
[edit chassis synchronization output interfaces external]
user@host# set tx-dnu-to-line-source-enable
```

- Set minimum quality level:

```
[edit chassis synchronization output interfaces external]
user@host# set minimum-quality st3
```

5. Configure the incoming clock source and quality level:

```
[edit chassis synchronization source interfaces ge-4/0/1]
user@host# set quality-level st3
```

6. Configure the external clock source and quality level:

```
[edit chassis synchronization source interfaces external]
user@host# set quality-level prs
```

**Results** From configuration mode, confirm your configuration by entering the **show chassis synchronization** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show chassis synchronization
network-option option-2;
interfaces external {
  signal-type t1;
```

```

    t1-options {
        line-encoding b8zs;
        framing sf;
    }
}
output {
    interfaces external {
        wander-filter-disable;
        holdover-mode-disable;
        source-mode line;
        tx-dnu-to-line-source-enable;
        minimum-quality st3;
    }
}
source {
    interfaces ge-4/0/1 {
        quality-level st3;
    }
    interfaces external {
        quality-level prs;
    }
}

```

After you configure the device, enter **commit** from configuration mode.

## Verification

Confirm that the configuration is working properly.

- [Verifying the Synchronous Ethernet Clock Source on page 356](#)
- [Verifying the Ordinary PTP Clock Source on page 357](#)
- [Verifying the Hybrid PTP Clock Source on page 357](#)
- [Verifying the Retiming through the BITS External Interface on page 358](#)

### Verifying the Synchronous Ethernet Clock Source

**Purpose** Verify that the MX Series router recovers, selects, qualifies, and locks to the configured Synchronous Ethernet clock source.

**Action** From operational mode, enter the **show chassis synchronization clock-module** command.

```

user@host> show chassis synchronization clock-module

Clock module on SCB0
Current role      : master
Current state     : locked to ge-4/1/0
State for        : 0 days, 00 hrs, 00 mins, 15 secs
State since      : Mon Jun  6 07:28:47 2011
Monitored clock sources
Interface        Type      Status
ge-4/1/0         syncE    qualified-selected

```

**Meaning** The Monitored clock sources field shows that the ge-4/1/0 interface has the Synchronous Ethernet type and is the qualified and selected centralized clock source.

### Verifying the Ordinary PTP Clock Source

**Purpose** Verify that the MX Series router recovers, selects, qualifies, and locks to the configured PTP clock source.

**Action** From operational mode, enter the **show chassis synchronization clock-module** command.

```
user@host> show chassis synchronization clock-module

Clock module on SCB0
  Current role      : master
  Current state     : locked to ge-4/1/9
    State for       : 0 days, 00 hrs, 00 mins, 45 secs
    State since     : Wed Jun 29 10:52:05 2011
  Monitored clock sources
    Interface      Type      Status
    ge-4/1/9       ptp       qualified-selected
```

**Meaning** The Monitored clock sources field shows that the ge-4/1/9 interface has the ptp type and is the qualified and selected centralized clock source.

### Verifying the Hybrid PTP Clock Source

**Purpose** Verify that the MX Series router recovers, selects, qualifies, and locks to the configured hybrid PTP clock source.

**Action** From operational mode, enter the **show chassis synchronization clock-module** command.

```
user@host> show chassis synchronization clock-module

Clock module on SCB0
  Current role      : master
  Current state     : locked to ge-4/1/9
    State for       : 0 days, 00 hrs, 00 mins, 15 secs
    State since     : Wed Jun 29 11:19:25 2011
  Monitored clock sources
    Interface      Type      Status
    ge-4/1/9       ptp-hybrid qualified-selected

Configured sources:

Interface      : ge-4/1/0
Status         : Primary      Index      : 218
Clock source state : Clk qualified Priority : 1
Configured QL    : ST3        ESMC QL    : DUS
Clock source type : ifd          Clock Event : Clock locked
Kernel flags     : Up,sec,
```

**Meaning** The Monitored clock sources field shows that the ge-4/1/9 interface has the ptp-hybrid type and is the qualified and selected centralized clock source. The Configured sources field shows that the ge-4/1/0 interface has the Clock locked Clock Event .

### Verifying the Retiming through the BITS External Interface

**Purpose** Verify that the MX Series router recovers, selects, qualifies, and locks to the configured clock source, and that the external clock is locked to the configured clock source.

**Action** From operational mode, enter the **show chassis synchronization extensive** command.

```
user@host> show chassis synchronization extensive

Current clock status : Locked
Clock locked to      : Primary

Configured interfaces:

Name      : external
Signal type : t1 (sf b8zs)
Rx status  : active
Tx status  : active
LED color  : green

Configured outputs:

Interface      : external
Tx status      : active
Minimum QL     : ST3           Tx QL           : ST3
Holdover mode  : disabled      Wander filter : disabled
Source mode    : line          Source Tx DNU : enabled
Holdover data  : valid
Current state  : locked to ge-4/0/1
State for      : 0 days, 00 hrs, 24 mins, 47 secs
State since    : Thu Sep  6 13:01:07 2012

Configured sources:

Interface      : external
Status         : Primary       Index          : 0
Clock source state : Clk qualified Priority      : Default(6)
Configured QL     : PRS        ESMC QL          : PRS
Clock source type  : extern     Clock Event     : Clock locked
Interface State   : Up,pri,

Interface      : ge-4/0/1
Status         : Secondary     Index          : 152
Clock source state : Clk qualified Priority      : Default(8)
Configured QL     : ST3        ESMC QL          : DUS
Clock source type  : ifd        Clock Event     : Clock qualified
Interface State   : Up,sec,ESMC TX(QL DUS/SSM 0xf),
```

**Meaning** The Configured interfaces field shows that the external interface receive and transmit statuses are active. The Configured outputs field shows that the current state is locked to ge-4/0/1. The Configured sources field shows that the external interface is the qualified and selected centralized clock source, and has the Clock locked Clock Event. The Configured sources field shows that the ge-4/0/1 interface is the secondary clock source, and has the Clock qualified Clock Event.

## Network Services Mode Overview

---

A network services mode defines how the router chassis recognizes and uses certain modules. You can configure network services modes on MX Series 5G Universal Routing Platforms and on T4000 Core Routers with Type 5 FPCs.

On MX Series 5G Universal Routing Platforms, you can configure IP Network Services mode, Enhanced IP Network Services mode, Ethernet Network Services mode, or Enhanced Ethernet Network Services mode.

You can use either Enhanced IP Network Services mode or Enhanced Ethernet Network Services mode to improve the scaling and performance specific to filters in a subscriber access network that uses statically configured subscriber interfaces. For more information about using enhanced network services modes with firewall filters, see *Firewall Filters and Enhanced Network Services Mode Overview*.

On MX240, MX480, and MX960 routers, the MPC5E and MPC7E line cards power on only if the configured network services mode is **enhanced-ip** or **enhanced-ethernet**. All other MPCs work with any of the network services modes. MX2010 and MX2020 support only **enhanced-ip** and **enhanced-ethernet** network services modes.

**NOTE:** If Dense Port Concentrators (DPCs) in Ethernet Network Services mode or Enhanced Ethernet Network Services mode are up and running, you cannot configure the system for IP Network Services mode. You must first disable any Ethernet Network Services mode DPCs before switching to IP Network Services mode.

**NOTE:** When a chassis starts without any functioning FPCs, the Network Services mode defaults to IP Network Services. When the first FPC comes online, the configured Networks Services mode is applied.

**NOTE:** Starting from Junos OS Release 13.3, you can configure the Enhanced IP Network Services mode and Enhanced Ethernet Network Services mode on MX240, MX480 and MX960 routers with an SCBE2. Specify the **enhanced-ip** option or the **enhanced-ethernet** option at the **[edit chassis network-services]** hierarchy level.

You can configure T4000 Core Routers with Type 5 FPCs to run in Enhanced Network Services mode to enable improved virtual private LAN service (VPLS) MAC address learning. For more information, see [enhanced-mode](#).

[Table 61 on page 362](#) explains how different modules function when the MX Series 5G Universal Routing Platform chassis is configured to run in different network services modes.

**Table 61: Network Services Mode Functions**

Configuration Upon Boot or Configuration Change	Module Function
IP Network Services mode (default; upon boot)	<p>All modules except DPCE-X and DPCE-X-Q are powered on.</p> <p>Starting with Junos OS Release 15.1, you can limit the maximum number of logical interfaces on MX Series routers with MS-DPCs to 64,000 for enhanced IP network services mode. To do this, include the <b>limited-ifl-scaling</b> option with the <b>network-services enhanced-ip</b> statement at the <b>[edit chassis]</b> hierarchy level. Using the <b>limited-ifl-scaling</b> option prevents any collision of logical interface indices that can occur in a scenario in which you enable the Enhanced IP Network Services mode on the router which also contains an MS-DPC.</p>
Ethernet Network Services mode (upon boot)	<p>All modules are powered on. However, operating in Ethernet Network Services mode restricts certain BGP protocol functions and does not support Layer 3 VPN, unicast RPF, and source and destination class usage (SCU and DCU) functions. In addition, the number of externally configured filter terms is restricted to 64K.</p> <p>Ethernet Network Services mode provides support for only Layer 2.5 functions.</p>
Enhanced IP Network Services mode (upon boot)	<p>Only MPCs, MS-MPCs, and MS-DPCs are powered on.</p> <p><b>NOTE:</b> Only Multiservices DPCs (MS-DPCs) and MS-MPCs are powered on with the enhanced network services mode options. No other DPCs function with the enhanced network services mode options.</p>

Table 61: Network Services Mode Functions (continued)

Configuration Upon Boot or Configuration Change	Module Function
Enhanced Ethernet Network Services mode (upon boot)	Only MPCs, MS-MPCs, and MS-DPCs are powered on. All restrictions for operating in Ethernet Network Services mode apply.  <b>NOTE:</b> Only Multiservices DPCs (MS-DPCs) and MS-MPCs are powered on with the enhanced network services mode options. No other DPCs function with the enhanced network services mode options.
Change from IP Network Services mode to Ethernet Network Services mode	DPCE-X and DPCE-X-Q modules are powered on. No reboot is required. No impact to MPCs or MS-DPCs.
Change from Ethernet Network Services mode to IP Network Services mode	Invalid modification. No commit occurs. A warning message indicates if any FPCs (along with their slot location) must be offline before switching to other network services. No impact to MPCs or MS-DPCs.
Change from Enhanced IP Network Services mode to Enhanced Ethernet Network Services mode	No reboot is required. No impact to MPCs or MS-DPCs.
Change from IP Network Services mode to Enhanced IP Network Services mode	System reboot is required (PFE/FPCs)
Change from Ethernet Network Services mode to Enhanced Ethernet Network Services mode	Reboot is required.

For details on the Layer 2.5 support for Ethernet Network Services mode, see [Table 62 on page 365](#).

## Network Services on SCBE2

The following scenarios are to be noted when you use an MX Series router with an SCBE2:

- You must configure the **set chassis network-services (enhanced-ip | enhanced-ethernet)** configuration command and reboot the router to bring up the FPCs on the router. However, after the router reboots, the MS DPC, the MX FPC, and the ADPC are powered off.
- All the FPCs and DPCs in the router are powered off when you reboot the router without configuring either the enhanced-ip option or the enhanced-ethernet option at the **[edit chassis network-services]** hierarchy level.
- You must reboot the router when you configure or delete the enhanced-ip option or the enhanced-ethernet option at the **[edit chassis network-services]** hierarchy level. The following warning message, which prompts you to reboot the router, is displayed when you configure or delete the enhanced-ip or the enhanced-ethernet configuration statement at the **[edit chassis network-services]** hierarchy level.

```
'chassis'
WARNING: Chassis configuration for network services has been changed. A
```

```
system reboot is mandatory. Please reboot the system NOW. Continuing without
a reboot might result in unexpected system behavior.
commit complete
```

- Starting with Junos OS Release 14.2, you must perform a commit synchronization of the settings between dual Routing Engines under some specific conditions. If you configure or remove the **enhanced-ip** or the **enhanced-ethernet** option at the **[edit chassis network-services]** hierarchy level on one of the Routing Engines on a router that contains dual Routing Engines, perform commit synchronization of the settings between the two Routing Engines by entering the **commit synchronize** command at the **[edit system]** hierarchy level. In addition, you must reboot all of the Routing Engines on the router when the enhanced IP network services mode is changed. The reboot is performed to prevent any unexpected system behavior.

**NOTE:** Dynamic multicast replication mode is supported on SCBE2. Static multicast replication mode is not supported on SCBE2.

**NOTE:** If a route's next hop is a unicast next hop through integrated routing and bridging (IRB) and the corresponding MAC address is learned over a label-switched interface (LSI), the IRB derives the Layer 2 information from the indirect next hop for the LSI. If you configure the load-balance per-packet policy statement, the indirect next hop of the LSI points to a unilist, which has all the member links to load balance the packets toward the MPLS cloud. You should configure the enhanced-ip option to enable the unicast next hop for IRB to use the unilist as the Layer 2 forwards next hop and load balance the packets.

Release History Table

Release	Description
15.1	Starting with Junos OS Release 15.1, you can limit the maximum number of logical interfaces on MX Series routers with MS-DPCs to 64,000 for enhanced IP network services mode.
14.2	Starting with Junos OS Release 14.2, you must perform a commit synchronization of the settings between dual Routing Engines under some specific conditions.
13.3	Starting from Junos OS Release 13.3, you can configure the Enhanced IP Network Services mode and Enhanced Ethernet Network Services mode on MX240, MX480 and MX960 routers with an SCBE2.

## Restrictions on Junos OS Ethernet Network Services Mode and Enhanced Ethernet Network Services Mode Features for MX Series Routers

Table 62 on page 365 lists Junos OS feature restrictions when running in Ethernet Network Services mode or Enhanced Ethernet Network Services mode.

Table 62: Restricted Software Features in Ethernet Network Services Mode

Software Feature	Restriction in Ethernet Network Services Mode
BGP	<ul style="list-style-type: none"><li>• Data plane support applies only to Ethernet and MPLS.</li><li>• BGP only supports the following address families: inet labeled-unicast, inet unicast, inet-vpn unicast, l2vpn, and route-target.</li></ul>
L3VPN	<p>Layer 3 VPNs are supported. You can only include loopback interfaces in the Virtual Routing and Forwarding (VRF) instance. A maximum of two VRFs are supported. Each VRF can handle up to 10,000 routes.</p> <p>The <code>ping mpls l3vpn</code> operational mode command is also supported.</p>
Unicast RPF	Unicast reverse-path forwarding is disabled.
Source and destination class usage (SCU and DCU)	Source and Destination Class Usage is disabled.
Filter terms	The number of externally configured filter terms is restricted to 64 KB.
Prefixes	The number of supported prefixes is restricted to 32 K.

**NOTE:** MX Series routers supporting Layer 2.5 functions work as full-scale routers and they support interior gateway protocol (IGP), multicast routing protocols, and other routing features. The restrictions applicable on these routers are that the number of routes is limited and you cannot use BGP.

## Configuring Junos OS to Run a Specific Network Services Mode in MX Series Routers

You can configure MX Series 5G Universal Routing Platforms to run in different network services modes. Each network services mode defines how the chassis recognizes and uses certain modules.

To configure the network services mode of an MX Series router:

1. Access the chassis hierarchy.

```
[edit]
user@host# edit chassis
```

2. Specify the network services mode that you want the router to use.

```
[edit chassis]
user@host# set network-services service
```

## Configuring Enhanced LAN Mode for a Virtual Chassis

Configuring **network-services lan** assumes the system is running in **network-services enhanced-ip** mode.

**NOTE:** Be sure to delete any unsupported configurations before changing to enhanced-ip mode.

To configure MX-LAN Mode for an existing Virtual Chassis:

1. Log into the console for the master Routing Engine in the Virtual Chassis master router (member0-re0 in this procedure).
2. Access the chassis hierarchy.

```
{master:member0-re0}[edit]
user@host# edit chassis
```

3. Configuring MX-LAN Mode on member 0.

```
{master:member0-re0}[edit chassis]
user@host# set network-services lan
```

4. Commit the configuration.
5. When prompted to do so, reboot all Routing Engines in the Virtual Chassis.

```
{master:member0-re0}
user@host> request system reboot
```

The **request system reboot** command reboots both Routing Engines in each member router forming the Virtual Chassis.

**WARNING:** After the chassis configuration for network services has been changed, a system reboot is mandatory. Please reboot the system now. Continuing without a reboot might result in unexpected system behavior.

6. (Optional) Verify that enhanced IP network services has been properly configured for the Virtual Chassis.

Verify that MX-LAN Mode is configured on the master Routing Engine in the Virtual Chassis master router (member0-re0).

```
{master:member0-re0}
user@host> show chassis network-services
```

```
Network Services Mode: MX-LAN
```

You must reboot the router when you configure or delete the enhanced LAN mode on the router. Configuring the **network-services lan** option implies that the system is running in the enhanced IP mode. When you configure a device to function in MX-LAN mode, only the supported configuration statements and operational show commands that are available for enabling or viewing in this mode are displayed in the CLI interface. If your system contains parameters that are not supported in MX-LAN mode in a configuration file, you cannot commit those unsupported attributes. You must remove the settings that are not supported and then commit the configuration. After the successful CLI commit, a system reboot is required for the attributes to become effective. Similarly, if you remove the **network-services lan** statement, the system does not run in MX-LAN mode. Therefore, all of the settings that are supported outside of the MX-LAN mode are displayed and are available for definition in the CLI interface. If your configuration file contains settings that are supported only in MX-LAN mode, you must remove those attributes before you commit the configuration. After the successful CLI commit, a system reboot will be required for the CLI settings to take effect. The Layer 2 Next-Generation

CLI configuration settings are supported in MX-LAN mode. As a result, the typical MX Series-format of CLI configurations might differ in MX-LAN mode.

For more information about the Layer 2 Next-Generation (L2NG) mode, also called Enhanced Layer 2 software (ELS), and the hierarchy levels at which the different configuration statements and commands are available for various parameters, see *Using the Enhanced Layer 2 Software CLI*.

## Limiting the Maximum Number of Logical Interfaces on MX Series Routers With MS-DPCs in Enhanced IP Network Services Mode

---

Starting in Junos OS Release 15.1, you can impose a limitation on the maximum number of logical interfaces on MX Series routers with MS-DPCs to be 64,000 for enhanced IP network services mode. To impose that limit, include the **limited-ifl-scaling** option with the **network-services enhanced-ip** statement at the **[edit chassis]** hierarchy level. When network-services is configured as enhanced IP mode, the kernel increases the total number of logical interfaces to 256,000. However, MS-DPC line cards are not capable of handling more than 64,000 logical interfaces globally on a router. Using the **limited-ifl-scaling** option prevents the problem of a collision of logical interface indices that can occur in a scenario in which you enable enhanced IP services mode and an MS-DPC is also present in the same chassis. To support MS-DPCs with enhanced IP mode on the chassis, you must limit the maximum logical interfaces as 64,000, which is performed with the **limited-ifl-scaling** option.

To define the maximum number of logical interfaces on MX Series routers with MS-DPCs as 64,000, include the **limited-ifl-scaling** option with the **network-services enhanced-ip** statement at the **[edit chassis]** hierarchy level.

```
[edit chassis]
network-services enhanced-ip limited-ifl-scaling;
```

When the default network services mode on a router is IP services mode (by using the **network-services ip** statement), the maximum logical interfaces is set as 64,000. When you change the network services mode as enhanced IP, the chassis process sets a general configuration (GENCFG) script to the kernel that increases the maximum logical interfaces as 256,000. When you configure the **limited-ifl-scaling** option with the **network-services enhanced-ip** statement, the chassis process does not generate a message to the kernel to increase the number of logical interfaces. As a result, the kernel retains the maximum number of logical interfaces as 64,000.

If your router chassis is previously configured with enhanced IP services mode and without the **limited-ifl-scaling** option set, and if you later configure the setting to limit the logical

interfaces for MS-DPCs, the number of logical interfaces remains as 256,000 and it is not reduced. A cold reboot of the router must be performed in such a case to reduce the logical interfaces after you set the **limited-ift-scaling** option with the **network-services enhanced-ip** statement. When you enter the **limited-ift-scaling** option, none of the MPCs are moved to the offline state. All the optimization and scaling capabilities supported with enhanced IP mode apply to enhanced IP mode with the limitation of IFL scaling functionality.

Release History Table

Release	Description
15.1	Starting in Junos OS Release 15.1, you can impose a limitation on the maximum number of logical interfaces on MX Series routers with MS-DPCs to be 64,000 for enhanced IP network services mode.

### **TX Matrix Router and T640 Router Configuration Overview**

---

This topic provides an overview of configuring the TX Matrix router and T640 routers.

- [TX Matrix Router and T640 Router-Based Routing Matrix Overview on page 373](#)
- [Running Different Junos OS Releases on the TX Matrix Router and T640 Routers on page 374](#)
- [TX Matrix Router Software Upgrades and Reinstallation on page 375](#)
- [TX Matrix Router Rebooting Process on page 375](#)
- [Committing Configurations on the TX Matrix Router on page 375](#)
- [TX Matrix and T640 Router Configuration Groups on page 376](#)
- [Routing Matrix System Log Messages on page 376](#)

### **TX Matrix Router and T640 Router-Based Routing Matrix Overview**

A routing matrix is a multichassis architecture that consists of a TX Matrix router and from one to four T640 routers. From the perspective of the user interface, the routing matrix appears as a single router. The TX Matrix router controls all the T640 routers in the routing matrix, as shown in [Figure 9 on page 374](#).

Figure 9: Routing Matrix Composed of a TX Matrix Router and Four T640 Routers

You configure and manage the TX Matrix router and its T640 routers in the routing matrix through the CLI on the TX Matrix router. This means that the configuration file on the TX Matrix router is used for the entire routing matrix.

Because all configuration, troubleshooting, and monitoring are performed through the TX Matrix router, we do not recommend accessing its T640 routers directly (through the console port or management Ethernet [fxp0]). If you do, the following messages appear when you first start the CLI through a T640 router:

```
% cli
warning: This chassis is a Line Card Chassis (LCC) in a multichassis system.
warning: Use of interactive commands should be limited to debugging.
warning: Normal CLI access is provided by the Switch Card Chassis (SCC).
warning: Use 'request routing-engine login scc' to log into the SCC.
{master}
```

These messages appear because any configuration you commit on a T640 router is not propagated to the TX Matrix router or other T640 routers in the routing matrix. For details, see [“Committing Configurations on the TX Matrix Router”](#) on page 375.

## Running Different Junos OS Releases on the TX Matrix Router and T640 Routers

On a routing matrix, if you elect to run different Junos OS Releases on the TX Matrix router and T640 Routing Engines, a change in Routing Engine mastership can cause one or all T640 routers to be logically disconnected from the TX Matrix router.

**NOTE:** The routing matrix supports Release 7.0 and later versions of the Junos OS. All the master Routing Engines on the routing matrix must use the same software version. For information about hardware and software requirements, see the *TX Matrix Router Hardware Guide*.

## TX Matrix Router Software Upgrades and Reinstallation

By default, when you upgrade or reinstall software on the TX Matrix router, the new software image is distributed to the connected T640 routers. Software installed on a primary TX Matrix router is distributed to all connected primary T640 routers and the backup is distributed to all connected backup routers.

## TX Matrix Router Rebooting Process

When you reboot the TX Matrix router master Routing Engine, all the master Routing Engines in the connected T640 routers reboot. In addition, you can selectively reboot the master Routing Engine or any of the connected T640 routers.

## Committing Configurations on the TX Matrix Router

In a routing matrix composed of a TX Matrix router and T640 routers, all configuration must be performed on the TX Matrix router. Any configuration you commit on a T640 router is not propagated to the TX Matrix router or other T640 routers. Only configuration changes you commit on the TX Matrix router are propagated to all T640 routers. A commit on a TX Matrix router overrides any changes you commit on a T640 router.

If you issue the **commit** command, you commit the configuration to all the master Routing Engines in the routing matrix.

```
user@host# commit
scc-re0:
configuration check succeeds
lcc0-re0:
commit complete
lcc1-re0:
commit complete
scc-re0:
commit complete
```

**NOTE:** If a commit operation fails on any node, then the commit operation is not completed for the entire TX Matrix router.

If you issue the **commit synchronize** command on the TX Matrix router, you commit the configuration to all the master and backup Routing Engines in the routing matrix.

```
user@host# commit synchronize
scc-re0:
configuration check succeeds
lcc0-re1:
commit complete
lcc0-re0:
commit complete
lcc1-re1:
commit complete
lcc1-re0:
```

```
commit complete
scc-re1:
commit complete
scc-re0:
commit complete
```

## TX Matrix and T640 Router Configuration Groups

For routers that include two Routing Engines, you can specify two special group names—**re0** and **re1**. These two special group names apply to the Routing Engines in slots 0 and 1 of the TX Matrix router. In addition, the routing matrix supports group names for the Routing Engines for each T640 router: **lcc *n*-re0** and **lcc *n*-re1**. *n* identifies a T640 router from 0 through 3.

## Routing Matrix System Log Messages

You configure the T640 routers to forward their system log messages to the TX Matrix router at the **[edit system syslog host scc-master]** hierarchy level. For information about how to configure system log messages in a routing matrix, see *Junos OS System Log Overview* and *Configuring System Logging for a TX Matrix Router*.

### Related Documentation

- [Using the Junos OS to Configure a T640 Router Within a Routing Matrix on page 378](#)

## TX Matrix Router Chassis and Interface Names

The output from some CLI commands uses the terms SCC and **scc** (for *switch-card chassis*) to refer to the TX Matrix router. Similarly the terms LCC, and **lcc** as a prefix (for *line-card chassis*) refer to a T640 router in a routing matrix.

T640 routers are assigned LCC index numbers, 0 through 3, depending on the hardware setup of the routing matrix. A routing matrix can have up to four T640 routers, and each T640 router has up to eight FPCs. Therefore, the routing matrix can have up to 32 FPCs (0 through 31). The FPCs are configured at the **[edit chassis lcc *number*]** hierarchy level.

In the Junos OS CLI, an interface name has the following format:

```
type-fpc/pic/port
```

When you specify the FPC number, the Junos OS determines which T640 router contains the specified FPC based on the following assignment:

- On LCC 0, FPC hardware slots 0 through 7 correspond to FPC software numbers 0 through 7.
- On LCC 1, FPC hardware slots 0 through 7 correspond to FPC software numbers 8 through 15.

- On LCC 2, FPC hardware slots 0 through 7 correspond to FPC software numbers 16 through 23.
- On LCC 3, FPC hardware slots 0 through 7 correspond to FPC software numbers 24 through 31.

To convert FPC numbers in the T640 routers to the correct FPC in a routing matrix, use the conversion chart shown in [Table 63 on page 377](#). You can use the converted FPC number to configure the interfaces on the TX Matrix router in your routing matrix.

**Table 63: T640 to Routing Matrix FPC Conversion Chart**

FPC Numbering	T640 Routers							
LCC 0								
T640 FPC Slots	0	1	2	3	4	5	6	7
Routing Matrix FPC Slots Equivalent	0	1	2	3	4	5	6	7
LCC 1								
T640 FPC Slots	0	1	2	3	4	5	6	7
Routing Matrix FPC Slots Equivalent	8	9	10	11	12	13	14	15
LCC 2								
T640 FPC Slots	0	1	2	3	4	5	6	7
Routing Matrix FPC Slots Equivalent	16	17	18	19	20	21	22	23
LCC 3								
T640 FPC Slots	0	1	2	3	4	5	6	7
Routing Matrix FPC Slots Equivalent	24	25	26	27	28	29	30	31

Some examples include:

- In a routing matrix that contains **lcc 0** through **lcc 2**, **so-20/0/1** refers to FPC slot 4 of **lcc 2**.
- If you have a Gigabit Ethernet interface installed in FPC slot 7, PIC slot 0, port 0 of T640 router **LCC 3**, you can configure this interface on the TX Matrix router by including the **ge-31/0/0** statement at the **[edit interfaces]** hierarchy level.

```
[edit]
interfaces {
  ge-31/0/0 {
    unit 0 {
      family inet {
```

```

        address ip-address;
    }
}
}
}

```

Documentation**

- [Using the Junos OS to Configure a T640 Router Within a Routing Matrix on page 378](#)

## Using the Junos OS to Configure a T640 Router Within a Routing Matrix

A routing matrix composed of a TX Matrix router and T640 routers supports the same chassis configuration statements as a standalone router (except **ce1**, **ct3**, **mlfr-uni-nni-bundles**, **sparse-dlcis**, and **vtmapping**). By including the **lcc** statement at the **[edit chassis]** hierarchy level, you configure PIC-specific features, such as framing, on specific T640 routers. In addition, a routing matrix has two more chassis configuration statements, **online-expected** and **offline**.

To configure a T640 router that is connected to a TX Matrix router, include the **lcc** statement at the **[edit chassis]** hierarchy level:

```

[edit chassis]
lcc number;

```

*number* can be 0 through 3.

To configure a T640 router within a routing matrix, include the following statements at the **[edit chassis *lcc number*]** hierarchy level:

```

[edit chassis lcc number]
fpc slot-number { # Use the hardware FPC slot number
pic pic-number {
    atm-cell-relay-accumulation;
    atm-l2circuit-mode (cell | aal5 | trunk trunk);
    framing (sdh | sonet);
    idle-cell-format {
        itu-t;
        payload-pattern payload-pattern-byte;
    }
    max-queues-per-interface (8 | 4);
    no-concatenate;
}
offline;
online-expected;
q-pic-large-buffer {
    large-scale;
}
}

```

**NOTE:** For the FPC slot number, specify the actual hardware slot number (numbered 0 through 7) as labeled on the T640 router chassis. Do not use the corresponding software FPC number shown in [Table 63 on page 377](#).

For information about how to configure the **online-expected** and **offline** configuration statements, see “[Configuring Junos OS to Enable the TX Matrix Router to Generate an Alarm If a T640 Router Stays Offline](#)” on page 380.

#### Related Documentation

- [TX Matrix Router and T640 Router Configuration Overview on page 373](#)
- [TX Matrix Router Chassis and Interface Names on page 376](#)
- [Configuring Junos OS to Upgrade and Downgrade Switch Interface Boards on a TX Matrix Router on page 379](#)
- [Configuring Junos OS to Enable the TX Matrix Router to Generate an Alarm If a T640 Router Stays Offline on page 380](#)

## Configuring Junos OS to Upgrade and Downgrade Switch Interface Boards on a TX Matrix Router

The Junos OS does not support mixed mode operation of Switch Interface Boards (SIBs). To successfully upgrade 1.0 SIBs to 2.0 SIBs in a TX Matrix environment, you must force all newly installed 2.0 SIBs to operate in 1.0 mode until the upgrade is complete.

1. [Configuring Junos OS to Upgrade Switch Interface Boards on a TX Matrix Router on page 379](#)
2. [Configuring Junos OS to Downgrade Switch Interface Boards on a TX Matrix Router on page 380](#)

### Configuring Junos OS to Upgrade Switch Interface Boards on a TX Matrix Router

To configure the TX Matrix router to support a SIB upgrade, include the **fabric upgrade-mode** statement at the **[edit chassis]** hierarchy level and commit the changes to update the configuration. Configuration changes that you commit on the TX Matrix router are propagated to all T640 routers in a routing matrix.

```
[edit chassis]
user@host# set chassis fabric upgrade-mode
user@host# commit
```

The **fabric upgrade-mode** statement instructs the newly installed 2.0 boards to operate in 1.0 mode. When all 1.0 boards have been replaced by 2.0 boards, remove the **fabric upgrade-mode** statement from the configuration hierarchy, and commit the changes again.

```
[edit chassis]
user@host# delete chassis fabric upgrade-mode
```

```
user@host# commit
```

In the TX Matrix routing environment, use the **request chassis sib (offline | online)** command sequence to power cycle the newly installed 2.0 SIBs. Power cycling is not needed in a single chassis T640 environment.

```
user@host> request chassis sib offline slot slot-number  
user@host> request chassis sib online slot slot-number
```

As the system discovers each new board, the 2.0 ASIC enables 2.0 features, and the upgrade is complete.

## Configuring Junos OS to Downgrade Switch Interface Boards on a TX Matrix Router

To downgrade your 2.0 SIBs to 1.0 SIBs, follow the upgrade procedure. When you replace the first 2.0 SIB with a 1.0 SIB, the system operates in a downgraded 1.0 mode until all 2.0 SIBs are replaced, and the newly installed 1.0 SIBs are power cycled using a **request chassis sib (offline | online)** command sequence.

**NOTE:** The TX Matrix switch fabric supports 2.0 SIBs for enabling Gigabit FPC-4 and Type 4 PICs. Gigabit FPC-4 devices are not compatible with 1.0 SIBs. Therefore, if you are planning to downgrade from 2.0 SIBs to 1.0 SIBs, you must take all Gigabit FPC-4 devices offline to ensure that the link between the new SIBs and the FPC does not fail.

### Related Documentation

- [TX Matrix Router and T640 Router Configuration Overview on page 373](#)
- [Using the Junos OS to Configure a T640 Router Within a Routing Matrix on page 378](#)

## Configuring Junos OS to Enable the TX Matrix Router to Generate an Alarm If a T640 Router Stays Offline

---

By default, the Junos OS enables all the T640 routers in the routing matrix to come online. The Junos OS also allows you to configure all the T640 routers so that if they do not come online, an alarm is sent by the TX Matrix router.

To configure this alarm, include the **online-expected** statement at the **[edit chassis lcc *number*]** hierarchy level:

```
[edit chassis lcc number]  
online-expected;
```

If you do not want a T640 router to be part of the routing matrix, you can configure it to be offline. This is useful when you are performing maintenance on a T640 router. When the T640 router is ready to come back online, delete the **offline** configuration statement.

To configure a T640 router so that it is offline, include the **offline** statement at the **[edit chassis lcc *number*]** hierarchy level:

```
[edit chassis lcc number]
offline;
```

**NOTE:** If you do not configure the `online-expected` or `offline` statement, any T640 router that is part of the routing matrix is allowed to come online. However, if a T640 router does not come online, the TX Matrix router does not generate an alarm.

## FIB Localization Overview

On Juniper Networks routers, the forwarding table on the Packet Forwarding Engine, also referred to as forwarding information base (FIB), maintains the complete set of active IPv4 (inet) and IPv6 (inet6) routes. In Junos OS Release 11.4 and later, you can configure FIB localization for a Packet Forwarding Engine. FIB-localization characterizes Packet Forwarding Engines in a router as either “FIB-remote” or “FIB-local”.

FIB-local Packet Forwarding Engines install all routes from the default inet and inet6 route tables into the Packet Forwarding Engine forwarding hardware. FIB-remote Packet Forwarding Engines do not install all the routes for the inet and inet6 routing tables. However, they do maintain local and multicast routes.

FIB-remote Packet Forwarding Engines create a default (0/0) route in the Packet Forwarding Engine forwarding hardware for the inet and inet6 table. The default route references a next-hop or a unilist of next-hops that identify the FIB-local Packet Forwarding Engines that can perform full IP table lookups for received packets.

FIB-remote Packet Forwarding Engines forward received packets to the set of FIB-local Packet Forwarding Engines. The FIB-local Packet Forwarding Engines then perform full IP longest-match lookup on the destination address and forward the packet appropriately. The packet might be forwarded out of an egress interface on the same FIB-local Packet Forwarding Engine that performed the lookup or an egress interface on a different FIB-local or FIB-remote Packet Forwarding Engine. The packet might also be forwarded out of an FPC where FIB localization is not configured. The packet might also be received locally at the Routing Engine.

When FIB localization is configured on a router with some Flexible PIC Concentrators (FPCs) being FIB-remote and some others being FIB-local, packets arriving on the interface of the FIB-remote FPC are forwarded to one of the FIB-local FPCs for route lookup and forwarding.

The advantage of configuring FIB localization is that it enables upgrading the hardware forwarding table capacity of FIB-local Packet Forwarding Engines while not requiring upgrades to the FIB-remote Packet Forwarding Engines. In a typical network deployment, FIB-local Packet Forwarding Engines are core-facing, while FIB-remote Packet Forwarding

Engines are edge-facing. The FIB-remote Packet Forwarding Engines also load-balance traffic over the available set of FIB-local Packet Forwarding Engines.

FIB localization is currently supported on T320, T640, T1600, and MX Series routers.

**NOTE:** On MX Series routers, you can configure multiservices Dense Port Concentrators (DPCs) as FIB-remote. However, only Modular Port Concentrators (MPCs) can be configured as FIB-local. FIB-localization is supported only for redundant link services intelligent queuing interfaces that carry Multilink Point-to-Point Protocol (MLPPP) traffic.

### FIB Localization Overview

On Juniper Networks routers, the forwarding table on the Packet Forwarding Engine, also referred to as forwarding information base (FIB), maintains the complete set of active IPv4 (inet) and IPv6 (inet6) routes. In Junos OS Release 11.4 and later, you can configure FIB localization for a Packet Forwarding Engine. FIB-localization characterizes Packet Forwarding Engines in a router as either “FIB-remote” or “FIB-local”.

FIB-local Packet Forwarding Engines install all routes from the default inet and inet6 route tables into the Packet Forwarding Engine forwarding hardware. FIB-remote Packet Forwarding Engines do not install all the routes for the inet and inet6 routing tables. However, they do maintain local and multicast routes.

FIB-remote Packet Forwarding Engines create a default (0/0) route in the Packet Forwarding Engine forwarding hardware for the inet and inet6 table. The default route references a next-hop or a unilist of next-hops that identify the FIB-local Packet Forwarding Engines that can perform full IP table lookups for received packets.

FIB-remote Packet Forwarding Engines forward received packets to the set of FIB-local Packet Forwarding Engines. The FIB-local Packet Forwarding Engines then perform full IP longest-match lookup on the destination address and forward the packet appropriately. The packet might be forwarded out of an egress interface on the same FIB-local Packet Forwarding Engine that performed the lookup or an egress interface on a different FIB-local or FIB-remote Packet Forwarding Engine. The packet might also be forwarded out of an FPC where FIB localization is not configured. The packet might also be received locally at the Routing Engine.

When FIB localization is configured on a router with some Flexible PIC Concentrators (FPCs) being FIB-remote and some others being FIB-local, packets arriving on the interface of the FIB-remote FPC are forwarded to one of the FIB-local FPCs for route lookup and forwarding.

The advantage of configuring FIB localization is that it enables upgrading the hardware forwarding table capacity of FIB-local Packet Forwarding Engines while not requiring upgrades to the FIB-remote Packet Forwarding Engines. In a typical network deployment, FIB-local Packet Forwarding Engines are core-facing, while FIB-remote Packet Forwarding Engines are edge-facing. The FIB-remote Packet Forwarding Engines also load-balance traffic over the available set of FIB-local Packet Forwarding Engines.

FIB localization is currently supported on T320, T640, T1600, and MX Series routers.

**NOTE:** On MX Series routers, you can configure multiservices Dense Port Concentrators (DPCs) as FIB-remote. However, only Modular Port Concentrators (MPCs) can be configured as FIB-local. FIB-localization is supported only for redundant link services intelligent queuing interfaces that carry Multilink Point-to-Point Protocol (MLPPP) traffic.

## Example: Configuring Packet Forwarding Engine FIB Localization

This example shows how to configure Packet Forwarding Engine FIB localization.

- [Requirements on page 383](#)
- [Overview on page 384](#)
- [Configuration on page 384](#)
- [Verification on page 386](#)

### Requirements

Before you begin:

1. Configure device interfaces and loopback interface addresses.
2. Configure static routes.
3. Configure OSPF and OSPFv3 and make sure that OSPF adjacencies and OSPF routes to loopback addresses are established.

This example uses the following hardware and software components:

- A T320, T640, T1600, or MX Series router.
- Junos OS Release 11.4 or later running on the router for T-Series routers. Junos OS Release 12.3 or later running on the router for MX Series routers..

## Overview

In this example, you configure the chassis for IPv4 and IPv6 routes and FIB localization on Router R0 and then configure the edge-facing Packet Forwarding Engines on FPC0 as **fib-remote** and the core-facing Packet Forwarding Engines on FPC1 and FPC2 as **fib-local**. You then configure a routing policy named **fib-policy** with the **no-route-localize** option to ensure that all routes from a specified route filter are installed on the FIB-remote FPC.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
R0
set chassis fpc 0 route-localization fib-remote
set chassis fpc 1 route-localization fib-local
set chassis fpc 2 route-localization fib-local
set chassis route-localization inet
set chassis route-localization inet6
set policy-options policy-statement fib-policy term a from route-filter 4.4.4.4/32 exact
set policy-options policy-statement fib-policy term a then no-route-localize
set policy-options policy-statement fib-policy term b from route-filter fec0:4444::4/128 exact
set policy-options policy-statement fib-policy term b then no-route-localize
set policy-options policy-statement fib-policy then accept
set routing-options forwarding-table export fib-policy
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see the *CLI User Guide*.

To configure Packet Forwarding Engine FIB localization:

1. Configure route localization or FIB localization for IPv4 and IPv6 traffic.

```
[edit chassis]
user@R0# set route-localization inet
user@R0# set route-localization inet6
```

2. Configure the Packet Forwarding Engine of an FPC as either **fib-local** or **fib-remote**.

```
[edit chassis]
user@R0# set fpc 0 route-localization fib-remote
user@R0# set fpc 1 route-localization fib-local
user@R0# set fpc 2 route-localization fib-local
```

3. Configure the routing policy by including the **no-route-localize** statement to enable the forwarding table policy to mark route prefixes such that the routes are installed into forwarding hardware on the FIB-remote Packet Forwarding Engines.

```
[edit policy-options]
user@R0# set policy-statement fib-policy term a from route-filter 4.4.4.4/32 exact
user@R0# set policy-statement fib-policy term a then no-route-localize
user@R0# set policy-statement fib-policy term b from route-filter fec0:4444::4/128
exact
user@R0# set policy-statement fib-policy term b then no-route-localize
user@R0# set policy-statement fib-policy then accept
```

4. Enable the routing policy in the forwarding table by configuring the forwarding table with the **fib-policy** statement.

```
[edit routing-options]
user@R0# set forwarding-table export fib-policy
```

**NOTE:** At least, one Packet Forwarding Engine must be configured as **fib-local** for the commit operation to be successful. If you do not configure **fib-local** for the Packet Forwarding Engine, the CLI displays an appropriate error message and the commit fails.

**Results** From configuration mode, confirm your configuration by entering the **show chassis** and **show policy-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R0# show chassis
fpc 0 {
  route-localization fib-remote;
}
fpc 1 {
  route-localization fib-local;
}
fpc 2 {
  route-localization fib-local;
}
route-localization {
  inet;
  inet6;
}
```

```
user@R0# show policy-options
policy-statement fib-policy {
  term a {
    from {
      route-filter 4.4.4.4/32 exact;
```

```

    }
    then no-route-localize;
  }
  term b {
    from {
      route-filter fec0:4444::4/128 exact;
    }
    then no-route-localize;
  }
  then accept;
}
}

```

### Verification

Confirm that the configuration is working properly.

- [Verifying Policy Configuration on page 386](#)
- [Verifying FIB-Localization Configuration on page 386](#)
- [Verifying Routes After the Policy Is Applied on page 387](#)

#### **Verifying Policy Configuration**

**Purpose** Verify that the configured policy exists.

**Action** Issue the **show policy fib-policy** command to check that the configured policy *fib-policy* exists.

```

user@R0> show policy fib-policy
Policy fib-policy:
  Term a:
    from
      route filter:
        4.4.4.4/32 exact
    then no-route-localize
  Term b:
    from
      route filter:
        fec0:4444::4/128 exact
    then no-route-localize
  Term unnamed:
    then accept

```

#### **Verifying FIB-Localization Configuration**

**Purpose** Verify FIB-localization configuration details by using the **show route localization** and **show route localization detail** commands.

**Action** user@R0> show route localization

```
FIB localization ready FPCs (and FIB-local Forwarding Engine addresses)
FIB-local: FPC2(4,5)
FIB-remote: FPC0, FPC1
Normal: FPC3, FPC4, FPC5, FPC6, FPC7
```

user@R0> show route localization detail

```
FIB localization ready FPCs (and FIB-local Forwarding Engine addresses)
FIB-local: FPC2(4,5)
FIB-remote: FPC0, FPC1
Normal: FPC3, FPC4, FPC5, FPC6, FPC7
FIB localization configuration
Protocols: inet, inet6
FIB-local: FPC2
FIB-remote: FPC0, FPC1
Forwarding Engine addresses
FPC0: 1
FPC1: 2
FPC2: 4, 5
FPC3: 6
FPC4: 8
FPC5: 11
FPC6: 13
FPC7: 15
```

### *Verifying Routes After the Policy Is Applied*

**Purpose** Verify that routes with the `no-route-localize` policy option are installed on the fib-remote FPC.

**Action** user@R0> show route 4.4.4.4/32 extensive

```
inet.0: 30 destinations, 30 routes (29 active, 0 holddown, 1 hidden)
4.4.4.4/32 (1 entry, 1 announced)
TSI:
KRT in-kernel 4.4.4.4/32 -> {130.168.0.2 Flags no-localize}
                        ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
      *Static Preference: 5
        Next hop type: Router, Next hop index: 629
        Next-hop reference count: 3
        Next hop: 130.168.0.2 via ge-1/0/4.0, selected
        State: <Active Int="">
Age: 10:33
Task: RT
Announcement bits (1): 0-KRT
AS path: I</Active

## Example: Configuring Packet Forwarding Engine FIB Localization

---

This example shows how to configure Packet Forwarding Engine FIB localization.

- [Requirements on page 390](#)
- [Overview on page 391](#)
- [Configuration on page 391](#)
- [Verification on page 393](#)

### Requirements

Before you begin:

1. Configure device interfaces and loopback interface addresses.
2. Configure static routes.
3. Configure OSPF and OSPFv3 and make sure that OSPF adjacencies and OSPF routes to loopback addresses are established.

This example uses the following hardware and software components:

- A T320, T640, T1600, or MX Series router.

- Junos OS Release 11.4 or later running on the router for T-Series routers. Junos OS Release 12.3 or later running on the router for MX Series routers..

## Overview

In this example, you configure the chassis for IPv4 and IPv6 routes and FIB localization on Router R0 and then configure the edge-facing Packet Forwarding Engines on FPC0 as **fib-remote** and the core-facing Packet Forwarding Engines on FPC1 and FPC2 as **fib-local**. You then configure a routing policy named **fib-policy** with the **no-route-localize** option to ensure that all routes from a specified route filter are installed on the FIB-remote FPC.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
R0
set chassis fpc 0 route-localization fib-remote
set chassis fpc 1 route-localization fib-local
set chassis fpc 2 route-localization fib-local
set chassis route-localization inet
set chassis route-localization inet6
set policy-options policy-statement fib-policy term a from route-filter 4.4.4.4/32 exact
set policy-options policy-statement fib-policy term a then no-route-localize
set policy-options policy-statement fib-policy term b from route-filter fec0:4444::4/128 exact
set policy-options policy-statement fib-policy term b then no-route-localize
set policy-options policy-statement fib-policy then accept
set routing-options forwarding-table export fib-policy
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see the *CLI User Guide*.

To configure Packet Forwarding Engine FIB localization:

1. Configure route localization or FIB localization for IPv4 and IPv6 traffic.

```
[edit chassis]
user@R0# set route-localization inet
user@R0# set route-localization inet6
```

2. Configure the Packet Forwarding Engine of an FPC as either **fib-local** or **fib-remote**.

```
[edit chassis]
user@R0# set fpc 0 route-localization fib-remote
user@R0# set fpc 1 route-localization fib-local
user@R0# set fpc 2 route-localization fib-local
```

3. Configure the routing policy by including the **no-route-localize** statement to enable the forwarding table policy to mark route prefixes such that the routes are installed into forwarding hardware on the FIB-remote Packet Forwarding Engines.

```
[edit policy-options]
user@R0# set policy-statement fib-policy term a from route-filter 4.4.4.4/32 exact
user@R0# set policy-statement fib-policy term a then no-route-localize
user@R0# set policy-statement fib-policy term b from route-filter fec0:4444::4/128
exact
user@R0# set policy-statement fib-policy term b then no-route-localize
user@R0# set policy-statement fib-policy then accept
```

4. Enable the routing policy in the forwarding table by configuring the forwarding table with the **fib-policy** statement.

```
[edit routing-options]
user@R0# set forwarding-table export fib-policy
```

**NOTE:** At least, one Packet Forwarding Engine must be configured as **fib-local** for the commit operation to be successful. If you do not configure **fib-local** for the Packet Forwarding Engine, the CLI displays an appropriate error message and the commit fails.

**Results** From configuration mode, confirm your configuration by entering the **show chassis** and **show policy-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R0# show chassis
fpc 0 {
  route-localization fib-remote;
}
fpc 1 {
  route-localization fib-local;
}
fpc 2 {
  route-localization fib-local;
}
route-localization {
  inet;
  inet6;
}
```

```
user@R0# show policy-options
policy-statement fib-policy {
  term a {
    from {
      route-filter 4.4.4.4/32 exact;
```

```

    }
    then no-route-localize;
  }
  term b {
    from {
      route-filter fec0:4444::4/128 exact;
    }
    then no-route-localize;
  }
  then accept;
}
}

```

## Verification

Confirm that the configuration is working properly.

- [Verifying Policy Configuration on page 393](#)
- [Verifying FIB-Localization Configuration on page 393](#)
- [Verifying Routes After the Policy Is Applied on page 394](#)

### Verifying Policy Configuration

**Purpose** Verify that the configured policy exists.

**Action** Issue the **show policy fib-policy** command to check that the configured policy *fib-policy* exists.

```

user@R0> show policy fib-policy
Policy fib-policy:
  Term a:
    from
      route filter:
        4.4.4.4/32 exact
    then no-route-localize
  Term b:
    from
      route filter:
        fec0:4444::4/128 exact
    then no-route-localize
  Term unnamed:
    then accept

```

### Verifying FIB-Localization Configuration

**Purpose** Verify FIB-localization configuration details by using the **show route localization** and **show route localization detail** commands.

**Action** user@R0> show route localization

```
FIB localization ready FPCs (and FIB-local Forwarding Engine addresses)
FIB-local: FPC2(4,5)
FIB-remote: FPC0, FPC1
Normal: FPC3, FPC4, FPC5, FPC6, FPC7
```

user@R0> show route localization detail

```
FIB localization ready FPCs (and FIB-local Forwarding Engine addresses)
FIB-local: FPC2(4,5)
FIB-remote: FPC0, FPC1
Normal: FPC3, FPC4, FPC5, FPC6, FPC7
FIB localization configuration
Protocols: inet, inet6
FIB-local: FPC2
FIB-remote: FPC0, FPC1
Forwarding Engine addresses
FPC0: 1
FPC1: 2
FPC2: 4, 5
FPC3: 6
FPC4: 8
FPC5: 11
FPC6: 13
FPC7: 15
```

### Verifying Routes After the Policy Is Applied

**Purpose** Verify that routes with the **no-route-localize** policy option are installed on the fib-remote FPC.

**Action** user@R0> show route 4.4.4.4/32 extensive

```
inet.0: 30 destinations, 30 routes (29 active, 0 holddown, 1 hidden)
4.4.4.4/32 (1 entry, 1 announced)
TSI:
KRT in-kernel 4.4.4.4/32 -> {130.168.0.2 Flags no-localize}
                        ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
*Static Preference: 5
  Next hop type: Router, Next hop index: 629
  Next-hop reference count: 3
  Next hop: 130.168.0.2 via ge-1/0/4.0, selected
  State: <Active Int="">
Age: 10:33
Task: RT
Announcement bits (1): 0-KRT
AS path: I</Active
>
```

## TX Matrix Plus Router and Router-Based Routing Matrix Overview

A routing matrix based on a Juniper Networks TX Matrix Plus Router is a multichassis architecture composed of one TX Matrix Plus router and one of the following line-card chassis (LCC) configurations:

- TXP-T1600 configuration—Supports up to four interconnected Juniper Networks T1600 Core Routers.
- TXP-T1600-3D configuration—Supports up to eight interconnected Juniper Networks T1600 Core Routers.
- TXP-4000-3D configuration—Supports up to four interconnected Juniper Networks T4000 Core Routers.
- TXP-Mixed-LCC-3D configuration—Supports the following combinations of T1600 and T4000 routers:
  - Six T1600 routers and one T4000 router
  - Four T1600 routers and two T4000 routers
  - Two T1600 routers and three T4000 routers

**NOTE:** The TXP-T1600-3D, TXP-T4000-3D, and TXP-Mixed-LCC-3D configurations use 3D SIBs (TXP-F13-3D and TXP-F2S-3D SIBs on the switch-fabric chassis or the SFC and TXP-LCC-3D SIB on the LCCs). For more details on the hardware components used in the routing matrix with TX Matrix Plus Router, see the *TX Matrix Plus Router Hardware Guide*.

From the perspective of the user interface, the routing matrix appears as a single router. The TX Matrix Plus router controls all the T1600 or T4000 routers in the routing matrix.

You configure and manage the TX Matrix Plus router and its T1600 or T4000 routers in the routing matrix through the CLI on the TX Matrix Plus router. This means that the configuration file on the TX Matrix Plus router is used for the entire routing matrix.

Because all configuration, troubleshooting, and monitoring are performed through the TX Matrix Plus router, we do not recommend accessing its T1600 or T4000 routers directly (through the console port or management Ethernet interface [**em0**]). If you do, the following messages appear when you first start the CLI through a T1600 or T4000 router:

warning: This chassis is a Line Card Chassis (LCC) in a multichassis system.  
warning: Use of interactive commands should be limited to debugging.  
warning: Normal CLI access is provided by the Switch Fabric Chassis (SFC).  
warning: Please logout and log into the SFC to use CLI.

These messages appear because any configuration you commit on a T1600 or a T4000 router is not propagated to the TX Matrix Plus router or other T1600 or T4000 routers in the routing matrix. For details, see [“Committing Configurations on the TX Matrix Plus Router” on page 400](#).

## Running Different Junos OS Releases on the TX Matrix Plus Router and T1600 or T4000 Routers

On a routing matrix composed of a TX Matrix Plus router and T1600 or T4000 routers, if you elect to run different Junos OS Releases on the TX Matrix Plus router and T1600 or T4000 Routing Engines, a change in Routing Engine mastership can cause one or all T1600 or T4000 routers to be logically disconnected from the TX Matrix Plus router.

**NOTE:** All the master Routing Engines on the routing matrix must use the same Junos OS version. For information about hardware and software requirements, see the *TX Matrix Plus Router Hardware Guide*.

## TX Matrix Plus Router Software Upgrades and Reinstallation

By default, when you upgrade or reinstall software on the TX Matrix Plus router, the new software image is distributed to the connected routers.

## TX Matrix Plus Router Rebooting Process

When you reboot the master Routing Engine of TX Matrix Plus router, all the master Routing Engines in the connected routers reboot. In addition, you can selectively reboot the master Routing Engine or any of the connected routers.

## TX Matrix Plus Router Routing Engine Rebooting Sequence

The Routing Engines on the TX Matrix Plus router and T1600 or T4000 routers in the routing matrix boot from the storage media in this order: the USB device (if present), the Compact Flash card (if present), the disk (if present) in slot 1, and then the LAN.

## TX Matrix Plus Router Management Ethernet Interfaces

The management Ethernet interface used for the TX Matrix Plus router and the T1600 or T4000 routers in a routing matrix is **em0**. This interface provides an out-of-band method for connecting to the routers in the routing matrix. The Junos OS automatically creates the router's management Ethernet interface, em0. To use **em0** as a management port, you must configure its logical port, **em0.0**, with a valid IP address.

**NOTE:**

- The Routing Engines in the TX Matrix Plus router and in the T1600 or T4000 routers configured in a routing matrix do not support the management Ethernet interface `fxp0` or the internal Ethernet interfaces `fxp1` or `fxp2`.
- Automated scripts that have been developed for standalone routers (T1600 routers not configured in a routing matrix) might contain references to the `fxp0`, `fxp1`, or `fxp2` interfaces. Before reusing the scripts on T1600 routers in a routing matrix, edit any command lines that reference the T1600 router management Ethernet interface `fxp0` by replacing “`fxp0`” with “`em0`”.

## TX Matrix Plus Router Internal Ethernet Interfaces

On a TX Matrix Plus router, the Routing Engine (RE-TXP-SFC) and Control Board (TXP-CB) function as a unit, or a host subsystem. For each host subsystem in the router, Junos OS automatically creates two internal Ethernet interfaces, `ixgbe0` and `ixgbe1`, for the two 10-Gigabit Ethernet ports on the Routing Engine.

## Routing Matrix-Based T1600 or T4000 Router Internal Ethernet Interfaces

On a T1600 or a T4000 router configured in a routing matrix, the Routing Engine (RE-TXP-LCC) and Control Board (LCC-CB) function as a unit, or a host subsystem. For each host subsystem in the router, Junos OS automatically creates two internal Ethernet interfaces, `bcm0` and `em1`, for the two Gigabit Ethernet ports on the Routing Engine.

For more information about the management Ethernet interface and internal Ethernet interfaces on a TX Matrix Plus router and T1600 or T4000 LCCs configured in a routing matrix, see *Junos OS Network Interfaces Library for Routing Devices*.

## Committing Configurations on the TX Matrix Plus Router

In a routing matrix composed of a TX Matrix Plus router and T1600 or T4000 routers, all configuration must be performed on the TX Matrix Plus router. Any configuration you commit on a T1600 or a T4000 router is not propagated to the TX Matrix Plus router or other T1600 or T4000 routers. Only configuration changes you commit on the TX Matrix Plus router are propagated to all routers. A commit operation on the a TX Matrix Plus router overrides any changes you commit on a T1600 or a T4000 router.

If you issue the **commit** command, you commit the configuration to all the master Routing Engines in the routing matrix.

```
user@host# commit
sfc-re0:
configuration check succeeds
lcc0-re0:
commit complete
lcc1-re0:
commit complete
sfc-re0:
commit complete
```

**NOTE:** If a commit operation fails on any node, then the commit operation is not completed for the entire routing matrix.

If you issue the **commit synchronize** command on the TX Matrix Plus router, you commit the configuration to all the master and backup Routing Engines in the routing matrix.

```
user@host# commit synchronize
sfc-re0:
configuration check succeeds
lcc0-re1:
commit complete
lcc0-re0:
commit complete
lcc1-re1:
commit complete
lcc1-re0:
commit complete
sfc-re1:
commit complete
sfc-re0:
commit complete
```

## Routing Matrix Configuration Groups

For routers that include two Routing Engines, you can specify two special group names—**re0** and **re1**. These two special group names apply to the Routing Engines in slots 0 and 1 of the TX Matrix Plus router. In addition, the routing matrix supports group names for the Routing Engines for each T1600 or T4000 router: **lcc n-re0** and **lcc n-re1**. *n* identifies a T1600 or T4000 router depending on the LCC configuration.

## Routing Matrix System Log Messages

You configure the T1600 or T4000 routers to forward their system log messages to the TX Matrix Plus router at the **[edit system syslog host sfc0-master]** hierarchy level. For information about how to configure system log messages on a routing matrix based on a TX Matrix Plus router and T1600 or T4000 LCCs, see *Configuring System Logging for a TX Matrix Plus Router*.

### Related Documentation

- [Using the Junos OS to Configure a T1600 or T4000 Router Within a Routing Matrix on page 405](#)
- [TX Matrix Plus Router Chassis and Interface Names on page 402](#)
- [Configuring Junos OS to Upgrade the T1600 Router Chassis to LCC0 of a TX Matrix Plus Routing Platform on page 407](#)
- [Overview of a Routing Matrix with a TX Matrix Plus Router](#)

## TX Matrix Plus Router Chassis and Interface Names

---

The output from some CLI commands uses the terms SFC and **sfc** (for *switch-fabric chassis*) to refer to the TX Matrix Plus router. Similarly the terms LCC, and **lcc** as a prefix (for *line-card chassis*) refer to a T1600 or T4000 router in a routing matrix composed of a TX Matrix Plus router and T1600 or T4000 routers.

T1600 routers are assigned LCC index numbers, 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix. T1600 routers are assigned LCC index numbers, 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix. The current supported configuration of the routing matrix, can have up to eight T1600 routers, and each T1600 router has up to eight FPCs. Therefore, the routing matrix can have up to 64 FPCs (0 through 63). The FPCs are configured at the **[edit chassis lcc number]** hierarchy level.

In the Junos OS CLI, an interface name has the following format:

```
type-fpc/pic/port
```

When you specify the FPC number, the Junos OS determines which T1600 router contains the specified FPC based on the following assignment:

- On LCC 0, FPC hardware slots 0 through 7 correspond to FPC software numbers 0 through 7.
- On LCC 1, FPC hardware slots 0 through 7 correspond to FPC software numbers 8 through 15.
- On LCC 2, FPC hardware slots 0 through 7 correspond to FPC software numbers 16 through 23.
- On LCC 3, FPC hardware slots 0 through 7 correspond to FPC software numbers 24 through 31.
- On LCC 4, FPC hardware slots 0 through 7 correspond to FPC software numbers 32 through 39.
- On LCC 5, FPC hardware slots 0 through 7 correspond to FPC software numbers 40 through 47.
- On LCC 6, FPC hardware slots 0 through 7 correspond to FPC software numbers 48 through 55.
- On LCC 7, FPC hardware slots 0 through 7 correspond to FPC software numbers 56 through 63.

To convert FPC numbers in the T1600 routers to the correct FPC in a routing matrix, use the conversion chart shown in [Table 64 on page 403](#). You can use the converted FPC number to configure the interfaces on the TX Matrix Plus router in your routing matrix.

Table 64: T1600 Router to Routing Matrix FPC Conversion Chart

FPC Numbering	T1600 Routers							
	LCC 0							
T1600 Router FPC Slots	0	1	2	3	4	5	6	7
Routing Matrix FPC Slots Equivalent	0	1	2	3	4	5	6	7
	LCC 1							
T1600 Router FPC Slots	0	1	2	3	4	5	6	7
Routing Matrix FPC Slots Equivalent	8	9	10	11	12	13	14	15
	LCC 2							
T1600 Router FPC Slots	0	1	2	3	4	5	6	7
Routing Matrix FPC Slots Equivalent	16	17	18	19	20	21	22	23
	LCC 3							
T1600 Router FPC Slots	0	1	2	3	4	5	6	7
Routing Matrix FPC Slots Equivalent	24	25	26	27	28	29	30	31
	LCC 4							
T1600 Router FPC Slots	0	1	2	3	4	5	6	7
Routing Matrix FPC Slots Equivalent	32	33	34	35	36	37	38	39
	LCC 5							
T1600 Router FPC Slots	0	1	2	3	4	5	6	7
Routing Matrix FPC Slots Equivalent	40	41	42	43	44	45	46	47
	LCC 6							
T1600 Router FPC Slots	0	1	2	3	4	5	6	7
Routing Matrix FPC Slots Equivalent	48	49	50	51	52	53	54	55
	LCC 7							
T1600 Router FPC Slots	0	1	2	3	4	5	6	7
Routing Matrix FPC Slots Equivalent	56	57	58	59	60	61	62	63

For example, in a routing matrix that contains **lcc 0** through **lcc 2**, **so-20/0/1** refers to FPC slot 4 of **lcc 2**.

T4000 routers are assigned LCC index numbers, 0, 2, 4, and 6 when T4000 routers are connected to a TX Matrix Plus router in a routing matrix. The current supported configuration of the routing matrix, can have up to four T4000 routers, and each T4000 router has up to eight FPCs. Therefore, the routing matrix can have up to 32 FPCs (0 through 63). The odd numbered LCCs and the FPC slots of these LCCs are unused, when T4000 routers are connected to TX Matrix Plus router in a routing matrix. The FPCs are configured at the **[edit chassis lcc number]** hierarchy level.

In the Junos OS CLI, an interface name has the following format:

```
type-fpc/pic/port
```

When you specify the FPC number, the Junos OS determines which T4000 router contains the specified FPC based on the following assignment:

- On LCC 0, FPC hardware slots 0 through 7 correspond to FPC software numbers 0 through 7.
- On LCC 2, FPC hardware slots 0 through 7 correspond to FPC software numbers 16 through 23.
- On LCC 4, FPC hardware slots 0 through 7 correspond to FPC software numbers 32 through 39.
- On LCC 6, FPC hardware slots 0 through 7 correspond to FPC software numbers 48 through 55.

To convert FPC numbers in the T4000 routers to the correct FPC in a routing matrix, use the conversion chart shown in [Table 65 on page 404](#). You can use the converted FPC number to configure the interfaces on the TX Matrix Plus router in your routing matrix.

**Table 65: T4000 Router to Routing Matrix FPC Conversion Chart**

FPC Numbering	T4000 Routers							
LCC 0								
T4000 Router FPC Slots	0	1	2	3	4	5	6	7
Routing Matrix FPC Slots Equivalent	0	1	2	3	4	5	6	7
LCC 2								
T4000 Router FPC Slots	0	1	2	3	4	5	6	7
Routing Matrix FPC Slots Equivalent	16	17	18	19	20	21	22	23
LCC 4								

Table 65: T4000 Router to Routing Matrix FPC Conversion Chart (continued)

FPC Numbering	T4000 Routers							
T4000 Router FPC Slots	0	1	2	3	4	5	6	7
Routing Matrix FPC Slots Equivalent	32	33	34	35	36	37	38	39
LCC 6								
T4000 Router FPC Slots	0	1	2	3	4	5	6	7
Routing Matrix FPC Slots Equivalent	48	49	50	51	52	53	54	55

**Related Documentation**

- [TX Matrix Plus Router Configuration Overview on page 397](#)
- [Using the Junos OS to Configure a T1600 or T4000 Router Within a Routing Matrix on page 405](#)
- [Configuring Junos OS to Enable the TX Matrix Plus Router to Generate an Alarm If a T1600 or T4000 Router Stays Offline on page 406](#)

## Using the Junos OS to Configure a T1600 or T4000 Router Within a Routing Matrix

A routing matrix composed of a TX Matrix Plus router and T1600 or T4000 routers supports the same chassis configuration statements as a standalone router (except **ce1**, **ct3**, **mlfr-uni-nni-bundles**, **sparse-dlcis**, and **vtmapping**). By including the **lcc** statement at the **[edit chassis]** hierarchy level, you configure PIC-specific features, such as framing, on specific T1600 or T4000 routers. In addition, a TX Matrix Plus router has two more chassis configuration statements, **online-expected** and **offline**.

To configure a T1600 router that is connected to a TX Matrix Plus router, include the **lcc** statement at the **[edit chassis]** hierarchy level:

```
[edit chassis]
lcc number;
```

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

To configure a T1600 or T4000 router within a routing matrix, include the following statements at the **[edit chassis lcc number]** hierarchy level:

```
[edit chassis lcc number]
fpc slot-number { # Use the hardware FPC slot number
pic pic-number {
  atm-cell-relay-accumulation;
  atm-l2circuit-mode (cell | aal5 | trunk trunk);
  framing (sdh | sonet);
  idle-cell-format {
    itu-t;
    payload-pattern payload-pattern-byte;
  }
  max-queues-per-interface (8 | 4);
  no-concatenate;
}
offline;
online-expected;
q-pic-large-buffer {
  large-scale;
}
```

**NOTE:** For the FPC slot number, specify the actual hardware slot number (numbered 0 through 7) as labeled on the T1600 or T4000 router chassis. Do not use the corresponding software FPC number shown in the [“TX Matrix Plus Router Chassis and Interface Names”](#) on page 402.

For information about how to configure the **online-expected** and **offline** configuration statements, see [“Configuring Junos OS to Enable the TX Matrix Plus Router to Generate an Alarm If a T1600 or T4000 Router Stays Offline”](#) on page 406.

#### Related Documentation

- [TX Matrix Plus Router Configuration Overview](#) on page 397
- [TX Matrix Plus Router Chassis and Interface Names](#) on page 402
- [Configuring Junos OS to Upgrade the T1600 Router Chassis to LCC0 of a TX Matrix Plus Routing Platform](#) on page 407

## Configuring Junos OS to Enable the TX Matrix Plus Router to Generate an Alarm If a T1600 or T4000 Router Stays Offline

By default, the Junos OS enables all the T1600 or T4000 routers in the routing matrix to come online. The Junos OS also enables you to configure all the T1600 or T4000 routers so that if they do not come online, an alarm is sent by the TX Matrix Plus router.

To configure this alarm, include the **online-expected** statement at the **[edit chassis lcc number]** hierarchy level:

```
[edit chassis lcc number]
online-expected;
```

If you do not want a T1600 or T4000 router to be part of the routing matrix, you can configure it to be offline. This is useful when you are performing maintenance on a T1600

or T4000 router. When the T1600 or T4000 router is ready to come back online, delete the **offline** configuration statement.

To configure a T1600 or T4000 router so that it is offline, include the **offline** statement at the `[edit chassis lcc number]` hierarchy level:

```
[edit chassis lcc number]  
offline;
```

**NOTE:** If you do not configure the **online-expected** or **offline** statement, any T1600 or T4000 router that is part of the routing matrix is allowed to come online. However, if a T1600 or T4000 router does not come online, the TX Matrix Plus router does not generate an alarm.

#### Related Documentation

- [TX Matrix Plus Router Configuration Overview on page 397](#)
- [Using the Junos OS to Configure a T1600 or T4000 Router Within a Routing Matrix on page 405](#)
- [Configuring Junos OS to Upgrade the T1600 Router Chassis to LCC0 of a TX Matrix Plus Routing Platform on page 407](#)

## Configuring Junos OS to Upgrade the T1600 Router Chassis to LCC0 of a TX Matrix Plus Routing Platform

This topic provides an overview of the T1600 router configuration in order to upgrade it to the LCC0 of a newly configured TX Matrix Plus router. The routing matrix with TX Matrix Plus router consists of one TX Matrix Plus router that acts as the switch-fabric chassis (SFC) and from one to four T1600 routers that act as the line-card chassis (LCC). To perform the in-service upgrade, manually upgrade the Switch Interface Boards (SIBs), Control Boards (CBs) and Routing Engines of the T1600 router, and connect the upgraded T1600 router to the corresponding components of the TX Matrix Plus router with fiber-optic cables. When the SIBs of the T1600 router are upgraded and the data plane connection between the SFC and LCC is set up, the traffic flows in and out of the TX Matrix Plus routing platform through the data plane. When you upgrade the Routing Engines and CBs, the control plane connectivity between the SFC and LCC is set up. For information about the hardware and the installation requirements, see the *TX Matrix Plus Router Hardware Guide*.

This section discusses the following procedures to upgrade a standalone T1600 router to the LCC0 of a TX Matrix Plus routing platform:

- [Preparing the Configuration File and Upgrading Junos OS on the T1600 Router and SFC on page 408](#)
- [Configuring Junos OS for Upgrading SIBs on the T1600 Router and Connecting It to the SFC on page 408](#)

- [Upgrading CBs and Routing Engines of the T1600 Router for Control Plane Connectivity on page 410](#)
- [Changing the Management Ethernet Interface Name for the T1600 Router on page 410](#)
- [Transferring Control of the T1600 Router \(LCC0\) to the SFC on page 410](#)
- [Adding a New T1600 Router to the TX Matrix Plus Routing Platform on page 411](#)
- [Downgrading a T1600 Router from the LCC of a TX Matrix Routing Platform to a Standalone T1600 Router on page 411](#)

## Preparing the Configuration File and Upgrading Junos OS on the T1600 Router and SFC

To prepare the configuration file and upgrade the Junos OS, follow these steps:

1. Save and archive a copy of the active configuration of the T1600 router.
2. Update the active configuration to make it applicable to the LCC.
3. Transfer the file configuration to the SFC (to be applied later).
4. Upgrade the T1600 router and SFC with Junos OS Release 10.1 or later, and reboot.

## Configuring Junos OS for Upgrading SIBs on the T1600 Router and Connecting It to the SFC

Upgrade the Control Boards (CBs) and Routing Engines of the T1600 router by replacing the T-CBs with LCC-CBs and RE 2000 with LCC-RE. To configure the T1600 router to support a SIB upgrade and connect it to the SFC, follow these steps:

1. Issue the **fabric upgrade-mode** CLI command at the **[edit chassis]** hierarchy level and commit the changes to update the configuration. This change in the configuration enables the T1600 chassis to be upgraded with the TXP-T1600 SIBs.

```
[edit]
user@host# set chassis fabric upgrade-mode
user@host# commit
```

You must also modify the configuration of the SFC by including **fabric upgrade-mode** statement at the **[edit chassis]** hierarchy level and commit the configuration on the SFC.

2. Take the backup SIB-I-T1600 offline by issuing the **request chassis sib slot slot-number offline** command.

```
user@host> request chassis sib slot 0 offline
```

3. Replace the offline SIB-I-T1600 with SIB-TXP-T1600.
4. Bring the replaced SIB-TXP-T1600 online, by issuing the **request chassis sib slot slot-number online** command.

```
user@host> request chassis sib slot 0 online
```

The T1600 router automatically updates the links between the replaced SIB-TXP-T1600 and the Flexible PIC Concentrators (FPCs).

5. Establish the data plane connectivity by connecting the SIB-TXP-T1600 on the T1600 router to the ABS-SIB-F13 on the SFC with fiber-optic cables and configuring both routers (T1600 and SFC) for transmitting and receiving traffic on the TX Matrix Plus routing platform. Use the following CLI commands, to manually update the link between the T1600 router and SFC before the data plane is activated:
  - To configure the SFC to receive traffic from the T1600 router, issue the **request chassis sib f13 train-link-receive slot *SFC-SIB-F13-slot-num*** command.  
*SFC-SIB-F13-slot-num* is the slot in the SFC chassis where the ABS-SIB-F13 must be manually connected to SIB-TXP-T1600 in a slot (from 0 through 4) on the T1600 router. You can configure this for a value of 0, 3, 6, 8, or 11.
  - To configure the T1600 router to receive traffic from the SFC, issue the **request chassis sib train-link-receive slot *LCC-SIB-ST-SIB-L-slot-num*** command.  
*LCC-SIB-ST-SIB-L-slot-num* is the slot in the T1600 router chassis where SIB-TXP-T1600 must be manually connected to ABS-SIB-F13 in a slot (0, 3, 6, 8 or 11) on the SFC. You can configure this to be a value in the range from 0 through 4.
  - To configure the SFC to transmit traffic to the T1600 router, issue the **request chassis sib f13 train-link-transmit slot *SFC-SIB-F13-slot-num*** command.  
*SFC-SIB-F13-slot-num* is the slot in the SFC chassis where the ABS-SIB-F13 must be manually connected to SIB-TXP-T1600 in a slot (from 0 through 4) on the T1600 router. You can configure this for a value of 0, 3, 6, 8, or 11.
  - To configure the T1600 router to transmit traffic to the SFC, issue the **request chassis sib train-link-transmit slot *LCC-SIB-ST-SIB-L-slot-num*** command.  
*LCC-SIB-ST-SIB-L-slot-num* is the slot in the T1600 router chassis where SIB-TXP-T1600 must be manually connected to ABS-SIB-F13 in a slot (0, 3, 6, 8 or 11) on the SFC. You can configure this to be a value in the range from 0 through 4.
6. Using the SIB LEDs, manually verify the link between the T1600 router and the SFC. The FPCs will send traffic using the SIB-TXP-T1600 and ABS-SIB-F13.
7. Repeat Steps 2 through 4 for all the SIB-I-T1600s.
8. When all the SIBs are upgraded, delete the fabric upgrade-mode statement from the configuration hierarchy, and commit the changes on both the T1600 router and the SFC.

```
[edit chassis]
user@host# delete chassis fabric upgrade-mode
user@host# commit
```

**WARNING:** You must upgrade the CBs and the Routing Engines of the T1600 router before you upgrade the SIBs.

## Upgrading CBs and Routing Engines of the T1600 Router for Control Plane Connectivity

The CBs and the Routing Engines of the T1600 router are upgraded by replacing the T-CBs with LCC-CBs and RE-2000 with LCC-RE. To establish the control plane connectivity, connect the Ethernet cables from the T1600 router to the SFC. For more information about hardware requirements, see the *TX Matrix Plus Router Hardware Guide*.

## Changing the Management Ethernet Interface Name for the T1600 Router

The Junos OS automatically configures management Ethernet interfaces for both the master and the backup Routing Engines, **fxp0**. However, after you upgrade both Routing Engines (master and backup), you must change the management Ethernet interface name to **em0**.

To change the management Ethernet interface name for the master Routing Engine, include the **interfaces em0** statement at the **[edit groups re0]** hierarchy level.

```
[edit groups re0]
user@host# set interfaces em0
user@host# commit
```

**WARNING:** If you do not change the management Ethernet interface from **fxp0** to **em0** for each upgraded LCC-RE, you cannot access the router remotely through services such as Telnet, SSH, and so on.

## Transferring Control of the T1600 Router (LCC0) to the SFC

To transfer control from a T1600 router to the SFC, follow these steps:

1. Manually set the M/S switch on both replaced CBs of the T1600 router to M (multichassis).
2. Configure the T1600 router as LCC0 by including the **lcc number** statement at the **[edit chassis]** hierarchy level:

```
[edit chassis]
user@host> set lcc number
```

**NOTE:** When you upgrade the other T1600 routers to LCC, you must set the LCC number from 1 to 3.

3. After you configure the LCC0, reboot it for the changes to take effect. This rebooting process establishes the forwarding state of the new LCC in the TX Matrix Plus routing platform by bringing up the SIBs automatically. For more information on hardware connectivity for the control plane, see the *TX Matrix Plus Router Hardware Guide*.

## Adding a New T1600 Router to the TX Matrix Plus Routing Platform

The in-service upgrade of new operational T1600 routers to LCC1, LCC2, and LCC3 using the Junos OS CLI is not supported. To add a second LCC to the TX Matrix Plus routing platform, follow these steps:

1. Upgrade both the CBs and Routing Engines on the T1600 router. For details, see [“Upgrading CBs and Routing Engines of the T1600 Router for Control Plane Connectivity” on page 410](#).
2. Upgrade the T1600 router with the same version of the Junos OS as on the SFC.
3. Upgrade the SIBs of the T1600 router and connect the new SIBs to the SFC. For details, see [“Configuring Junos OS for Upgrading SIBs on the T1600 Router and Connecting It to the SFC” on page 408](#).
4. Connect Ethernet links of the control plane from the T1600 router to the SFC.
5. Reboot the T1600 router. After rebooting, the router becomes a part of the TX Matrix Plus routing platform and is connected to the SFC on the control plane.

## Downgrading a T1600 Router from the LCC of a TX Matrix Routing Platform to a Standalone T1600 Router

To downgrade any LCC to a standalone T1600 router, follow these steps:

1. Transfer the control to the LCC from the SFC:
  - a. Roll back the configuration of the SFC and LCC to the configuration before the T1600 router was added and commit the configuration. For more information about configuring the T1600 router to LCC, see [“Preparing the Configuration File and Upgrading Junos OS on the T1600 Router and SFC” on page 408](#).
  - b. Manually set the M/S switch to single-chassis on the T1600 router on both CBs.
  - c. Reboot both the master and backup Routing Engines on the T1600.
2. Downgrade the SIBs of the LCC and remove the data plane connections:
  - a. Take the spare SIB-TXP-T1600 on the LCC offline by issuing the **request chassis sib slot *slot-number* offline** command.
 

```
user@host> request chassis sib slot 0 offline
```
  - b. Remove the data plane connections from the SIB-TXP-T1600 to the SFC.
  - c. Replace the SIB-TXP-T1600 with SIB-I-T1600 and bring it online.
  - d. Repeat these steps for all SIB-TXP-T1600s.
3. Remove the control plane connectivity by disconnecting the Ethernet cables of the control plane from the T1600 router to the SFC.

The LCC becomes a standalone T1600 router out of the TX Matrix Plus routing platform.

- [TX Matrix Plus Router Configuration Overview on page 397](#)
  - [Using the Junos OS to Configure a T1600 or T4000 Router Within a Routing Matrix on page 405](#)
  - [TX Matrix Plus Router Chassis and Interface Names on page 402](#)
  - [Configuring Junos OS to Enable the TX Matrix Plus Router to Generate an Alarm If a T1600 or T4000 Router Stays Offline on page 406](#)

## Configuring Junos OS to Upgrade the T1600 Router Chassis to LCC 0 of a TX Matrix Plus Router with 3D SIBs

---

This topic describes how to configure Junos OS when you upgrade a T1600 router to LCC 0 of a TX Matrix Plus router with 3D SIBs. A routing matrix with a TX Matrix Plus router consists of one TX Matrix Plus router that acts as the switch-fabric chassis (SFC) and up to eight T1600 routers, or up to four T4000 routers, or a mix of T1600 and T4000 routers that act as the line-card chassis (LCCs). To perform the in-service upgrade, manually upgrade the Switch Interface Boards (SIBs), Control Boards (CBs), and Routing Engines of the T1600 router, and connect the upgraded T1600 router to the corresponding components of the TX Matrix Plus router with fiber-optic cables. When the SIBs of the T1600 router are upgraded and the data plane connection between the SFC and LCC is set up, the traffic flows in and out of the TX Matrix Plus router through the data plane. For information about the hardware and the installation requirements, see the [TX Matrix Plus Hardware Guide](#).

This topic discusses the following procedures to upgrade a standalone T1600 router to LCC 0 of a TX Matrix Plus routing matrix and to configure Junos OS on the LCC and the SFC for the upgrade. The Junos OS configuration includes setting the LCC mode and training and verifying the links between the LCC and the SFC.

**NOTE:**

- The upgraded LCC becomes LCC 0.
  - In-service upgrade for a standalone LCC applies only for the first standalone LCC becoming part of the routing matrix.
  - No other LCC must be already connected to the SFC.
- 
- [Preparing the Configuration File and Upgrading Junos OS on the T1600 Router and the SFC on page 413](#)
  - [Configuring Junos OS for Upgrading the SIBs on the T1600 Router and Connecting It to the SFC on page 413](#)
  - [Transferring Control of the T1600 Router \(LCC 0\) to the SFC on page 418](#)
  - [Adding a New T1600 Router to the TX Matrix Plus Routing Matrix on page 419](#)

## Preparing the Configuration File and Upgrading Junos OS on the T1600 Router and the SFC

To prepare the configuration file and upgrade the Junos OS:

1. Save and archive a copy of the active configuration of Junos OS on the T1600 router.
2. Update the active configuration to make it applicable to the LCC 0.
3. Transfer the modified configuration file that you have prepared to an intermediate server on the out-of-band management network accessible by the standalone router and the TX Matrix Plus router.
4. Transfer the configuration file to the SFC (to be applied later).
5. Upgrade the T1600 router with Junos OS Release 13.2 or later, and reboot.
6. Upgrade the SFC with Junos OS Release 13.2 or later, and reboot.

## Configuring Junos OS for Upgrading the SIBs on the T1600 Router and Connecting It to the SFC

To upgrade and integrate a T1600 router to LCC 0 of the routing matrix with 3D SIBs perform the following tasks:

- [Upgrading the Control Boards, Routing Engines, PEMs, and Rear Fan Tray of the T1600 Router for Control Plane Connectivity on page 413](#)
- [Preparing the SFC and the LCC for the Upgrade on page 413](#)
- [Upgrading the SIBs on page 415](#)
- [Training the Switching Plane Links on page 416](#)
- [Activating and Verifying the Switching Planes on page 417](#)

### Upgrading the Control Boards, Routing Engines, PEMs, and Rear Fan Tray of the T1600 Router for Control Plane Connectivity

---

For control plane connectivity, upgrade the Control Boards (CBs), and Routing Engines of the T1600 router by replacing the T-CBs with LCC-CBs, and RE 2000 with LCC-RE. Replace the power entry module (PEM) with PWR-T-6-60-DC-BB and the rear fan tray with FAN-R-TXP-3D-LCC. See the [TX Matrix Plus Hardware Guide](#) for the installation procedures.

### Preparing the SFC and the LCC for the Upgrade

---

To prepare the SFC and the LCC for the upgrade:

1. Use the **show pfe statistics traffic** command to verify that the level of traffic on each Packet Forwarding Engine in the LCC is within the recommended range for upgrade (which is approximately 50% of line rate).
2. Use the **show chassis fabric plane** command to verify that four planes are active and one plane is spare.

```
user@host> show chassis fabric plane
```

```

Plane State Uptime
0 Online 15 hours, 42 minutes, 9 seconds
1 Online 15 hours, 42 minutes, 9 seconds
2 Spare
3 Online 15 hours, 42 minutes, 9 seconds
4 Online 15 hours, 42 minutes, 9 seconds

```

3. a. Ensure that the **CONFIG-SIZE** dial on the SFC is set to **3** and all the SIBs are online before configuring the **upgrade-mode** statement.
- b. Configure the upgrade mode on the LCC by using the **fabric upgrade-mode 3d-fabric** statement at the **[edit chassis]** hierarchy level and commit the changes. This configuration enables the T1600 chassis to be upgraded with the TXP-3D-LCC SIBs.

```

[edit chassis]
user@host# set fabric upgrade-mode 3d-fabric
user@host# commit

```

This step also checks for the compatibility of Routing Engines, CBs, and FPCs.

#### NOTE:

The following FPCs are not supported:

- T640-FPC1-E and T640-FPC1-E2
- T640-FPC2, T640-FPC2-E, and T640-FPC2-E2
- T640-FPC3, T640-FPC3-E, and T640-FPC3-E2
- T640-FPC4-1P-ES

- c. Configure the upgrade mode on the SFC by including the **fabric upgrade-mode 3d-fabric** statement at the **[edit chassis]** hierarchy level and commit the configuration on the SFC.

```

[edit chassis]
user@host# set fabric upgrade-mode 3d-fabric
user@host# commit

```

4. Set the LCC mode on the SFC's master Routing Engine to **t1600**:

```

[edit chassis]
user@host# set lcc-mode lcc 0 mode t1600
user@host# commit

```

Confirm that the output of **show chassis hardware** on LCC indicates that the chassis is T1600.

## Upgrading the SIBs

You must upgrade the existing SIBs on the LCC to 3D SIBs for the LCC to operate as LCC 0 in the routing matrix of the TX Matrix Plus router with 3D SIBs. To upgrade the SIBs on the LCC follow these steps:

1. Verify that the same planes are spare on the SFC and the LCC by using the **show chassis fabric plane** command. If the same planes are not **spare**, use the **request chassis fabric plane** command to change the states of the required planes.

The output of **show chassis fabric plane** command must show four active planes on the SFC and the LCC. Spare plane numbers must be identical on the SFC and the LCC.

2. Take the spare SIB-I-T1600 offline by issuing the **request chassis sib slot *slot-number* offline** command.
3. Replace the offline SIB-I-T1600 on the T1600 with SIB-TXP-3D-LCC. See [Replacing the SIB](#) for the replacement procedure.
4. Connect the SIBs on the LCC to the SIBs on the SFC by using fiber-optic cables. See [Connecting the Switching Plane Cables](#) for the connection procedure.
5. Bring the replaced SIB-TXP-3D-LCC online by issuing the **request chassis sib slot *slot-number* online** command.

For example, for plane 0:

```
user@host> request chassis sib slot 0 online
```

6. Issue the **show chassis fabric optics** command to verify that all the cables are in **CABLE\_CONNECTED** state on the SFC and the LCC.

```
user@host> show chassis fabric optics
```

Port	Cable state	Module Type
lcc0-sib0:		
0	CABLE_CONNECTED	AOC
1	CABLE_CONNECTED	AOC
2	CABLE_CONNECTED	AOC
3	CABLE_CONNECTED	AOC
4	CABLE_CONNECTED	AOC
5	CABLE_CONNECTED	AOC
6	CABLE_CONNECTED	AOC
7	CABLE_CONNECTED	CXP Module
lcc0-sib1:		
0	CABLE_CONNECTED	CXP Module
1	CABLE_NOT_CONNECTED	AOC
2	CABLE_CONNECTED	AOC
...		

Until all mandatory cables show the **CABLE\_CONNECTED** state, do not proceed to the next step.

**NOTE:** In a T1600 LCC, the mandatory cables 0, 2, 4, and 6 must be in the **CABLE\_CONNECTED** state.

7. Verify that the newly inserted SIB is in **Spare** state and there are no alarms due to faulty hardware by using the **show chassis sibs** and **show chassis alarms** commands. Until the SIB shows the **Spare** state, and there are no alarms, do not proceed to train the switching plane links.

### Training the Switching Plane Links

For the SIBs on the LCC and the SFC to communicate with each other, the links are trained using the **train-link-transmit** and **train-link-receive** commands on the LCC and the SFC. After the links are trained, they are verified using the **show chassis fabric optical-links**, **show chassis fabric plane extensive**, and **show chassis fabric topology** commands.

To manually train the link between the LCC and the SFC before the data plane is activated, perform the following steps:

1. For the SFC to receive traffic from the LCC, issue the **request chassis sib f13 slot f13 slot train-link-receive** command.

**f13 slot** is the slot in the SFC where the SIB-TXP-F13-3D must be manually connected to SIB-TXP-3D-LCC in a slot (from 0 through 4) in the LCC. The SFC's **f13 slot** has a value of 0, 3, 6, 8, or 11.

SIB Slots on the LCC	SIB Slots on the SFC
0	0
1	3
2	6
3	8
4	11

2. To train the links on the LCC to receive traffic from the SFC, issue the **request chassis sib slot sibSlot train-link-receive** command.

**sibSlot** is the slot in the LCC where SIB-TXP-3D-LCC must be manually connected to SIB-TXP-F13-3D in a slot (0, 3, 6, 8, or 11) on the SFC. You can configure the LCC's **sibSlot** to be a value in the range from 0 through 4.

3. To train the links on the SFC to transmit traffic to the LCC, issue the **request chassis sib f13 slot *f13 slot* train-link-transmit** command.

***f13 slot*** is the slot in the SFC where the SIB-TXP-F13-3D must be manually connected to SIB-TXP-3D-LCC in a slot (from 0 through 4) in the T1600 router. ***f13 slot*** has a value of 0, 3, 6, 8, or 11.

4. To train the links on the LCC to transmit traffic to the SFC, issue the **request chassis sib slot *sibSlot* train-link-transmit** command.

***sibSlot*** is the slot in the LCC where SIB-TXP-3D-LCC must be manually connected to SIB-TXP-F13-3D in a slot (0, 3, 6, 8, or 11) in the SFC. You can configure ***sibSlot*** to be a value in the range from 0 through 4.

5. Verify the links between the LCC and the SFC by using the following commands:

- **show chassis fabric optical-links**
- **show chassis fabric plane extensive**
- **show chassis fabric topology**

6. If errors occur at this stage, take the SIB on the LCC offline and bring it back online. On the SFC, take the F13 SIB offline and bring it back online. Start training the links again.

### Activating and Verifying the Switching Planes

To activate and verify the upgraded switching plane:

1. To activate the switching plane with the new SIB, take another switching plane offline:

On the SFC, issue the **request chassis fabric plane *plane-num* offline sfc 0** command.

On the LCC, issue the **request chassis sib slot *sibSlot* offline** command.

For example, on the SFC:

```
user@host# request chassis fabric plane 1 offline sfc 0
```

On the LCC:

```
user@host# request chassis sib slot 1 offline
```

2. Use the **show chassis fabric stats rates summary** command on the LCC and **show chassis fabric stats f13 actPlaneSib1# rates summary** command on the SFC to verify that the traffic is flowing through all the planes in the LCC and the SFC, respectively.

If traffic is flowing smoothly, the statistics for **Data/sec** under **Received** and **Sent** shows a nonzero number.

3. Follow the procedures in [“Upgrading the SIBs” on page 415](#), [“Training the Switching Plane Links” on page 416](#), and [“Activating and Verifying the Switching Planes” on page 417](#) for all the T1600 SIBs in the other planes.

**Related Documentation**

- [Preparing the SFC and the LCC for the Upgrade on page 413](#)
- [Upgrading the SIBs on page 415](#)
- [Training the Switching Plane Links on page 416](#)
- [Activating and Verifying the Switching Planes on page 417](#)

## Transferring Control of the T1600 Router (LCC 0) to the SFC

After upgrading the SIBs of a standalone T1600 router and integrating it into a routing matrix, transfer the control of the T1600 router to the SFC in the routing matrix:

1. On the SFC, confirm that the dial on the left, **CHASSIS ID**, displays **00**, and that on right, **CONFIG-SIZE**, displays **03**.
2. Connect the Ethernet links from the T1600 CBs to the connector interface panel (CIP) on the SFC. Verify that the Ethernet connection LED is lit on the CIP.
3. Manually set the **M/S** switch on both the replaced CBs of the T1600 router to **M** (multichassis).
4. Configure the T1600 router as LCC 0 by including the **lcc number** statement at the **[edit chassis]** hierarchy level.

```
[edit chassis]
user@host>set lcc number
```

5. When all the SIBs are upgraded, delete the **fabric upgrade-mode** statement from the configuration hierarchy, and commit the changes on both the LCC and the SFC.

```
[edit chassis]
user@host# delete chassis fabric upgrade-mode 3d-fabric
user@host# commit
```

6. After you configure LCC 0, reboot it for the changes to take effect. Reboot the SFC also. This rebooting process establishes the forwarding state of the new LCC in the TX Matrix Plus routing matrix by bringing up the SIBs automatically. For more information about hardware connectivity for the control plane, see the [TX Matrix Plus Hardware Guide](#).

## Adding a New T1600 Router to the TX Matrix Plus Routing Matrix

Junos OS does not support the in-service upgrade of T1600 routers to LCC 1 though LCC 7. To add a second LCC to the TX Matrix Plus routing matrix:

1. Upgrade both the CBs and Routing Engines on the T1600 router. For details, see [“Upgrading CBs and Routing Engines of the T1600 Router for Control Plane Connectivity” on page 410](#).
2. Upgrade the T1600 router with the same version of Junos OS as that on the SFC.
3. Upgrade the SIBs of the T1600 router and connect the new SIBs to the SFC. For details, see [“Configuring Junos OS for Upgrading the SIBs on the T1600 Router and Connecting It to the SFC” on page 413](#).
4. Connect Ethernet links of the control plane from the T1600 router to the SFC.
5. Set the LCC mode on SFC's master Routing Engine to **t1600** by using the following commands:

```
user@host# set chassis lcc-mode lcc 0 mode t1600
user@host# commit
```

6. Reboot the T1600 router. After rebooting, the router becomes part of the TX Matrix Plus routing matrix and is connected to the SFC on the control plane.

- [Configuring Junos OS to Upgrade a T4000 Router to LCC 0 of a TX Matrix Plus Router with 3D SIBs on page 419](#)
  - *Upgrading an Operational Standalone Router and Integrating It into a TX Matrix Plus Routing Matrix with 3D SIBs*

## Configuring Junos OS to Upgrade a T4000 Router to LCC 0 of a TX Matrix Plus Router with 3D SIBs

This topic describes how to configure Junos OS when you upgrade a T4000 router to LCC 0 of a TX Matrix Plus router with 3D SIBs. A TX Matrix Plus routing matrix consists of one TX Matrix Plus router that acts as the switch-fabric chassis (SFC) and up to eight T1600 routers, or up to four T4000 routers, or a mix of T1600 and T4000 routers that act as the line-card chassis (LCCs). To perform the in-service upgrade, manually upgrade the Switch Interface Boards (SIBs), Control Boards (CBs), and Routing Engines of the T4000 router, and connect the upgraded T4000 router to the corresponding components of the TX Matrix Plus router with fiber-optic cables. When the SIBs of the T4000 router are upgraded and the data plane connection between the SFC and LCC is set up, the traffic flows in and out of the TX Matrix Plus router through the data plane. For information about the hardware and the installation requirements, see the [TX Matrix Plus Hardware Guide](#).

This topic discusses the following procedures to upgrade a standalone T4000 router to LCC 0 of a TX Matrix Plus routing matrix and to configure Junos OS on the LCC and the

SFC for the upgrade. The Junos OS configuration includes setting the LCC mode and training and verifying the links between the LCC and the SFC.

NOTE:

- The upgraded LCC becomes LCC 0.
  - In-service upgrade for a standalone LCC applies only for the first standalone LCC that becomes part of the routing matrix.
  - No other LCC must be already connected to the SFC.
- 
- [Preparing the Configuration File and Upgrading Junos OS on the T4000 Router and the SFC on page 420](#)

  - [Transferring Control of the T4000 Router \(LCC 0\) to the SFC on page 425](#)
  - [Adding a New T4000 Router to the TX Matrix Plus Routing Matrix on page 426](#)

## Preparing the Configuration File and Upgrading Junos OS on the T4000 Router and the SFC

To prepare the configuration file and upgrade Junos OS:

1. Save and archive a copy of the active configuration of Junos OS on the T4000 router.
2. Update the active configuration to make it applicable to the LCC 0.
3. Transfer the modified configuration file that you have prepared to an intermediate server on the out-of-band management network accessible by the standalone router and the TX Matrix Plus router.
4. Transfer the configuration file to the SFC (to be applied later).
5. Upgrade the T4000 router with Junos OS Release 13.2 or later, and reboot.
6. Upgrade the SFC with Junos OS Release 13.2 or later, and reboot.

## Configuring Junos OS for Upgrading the SIBs on the T4000 Router and Connecting the Router to the SFC

To upgrade and integrate a T4000 router to LCC 0 of the routing matrix with 3D SIBs, perform the following tasks:

- [Upgrading the Control Boards, Routing Engines, PEMs, and Rear Fan Tray of the T4000 Router for Control Plane Connectivity on page 421](#)
- [Preparing the SFC and the LCC for the Upgrade on page 421](#)
- [Upgrading the SIBs on page 422](#)
- [Training the Switching Plane Links on page 423](#)
- [Activating and Verifying the Switching Plane on page 425](#)

## Upgrading the Control Boards, Routing Engines, PEMs, and Rear Fan Tray of the T4000 Router for Control Plane Connectivity

For control plane connectivity, upgrade the Control Boards (CBs) and Routing Engines of the T4000 router by replacing the T-CBs with LCC-CBs, and RE 2000 with LCC-RE. Replace the power entry module (PEM) with PWR-T-6-60-DC-BB and the rear fan tray with FAN-R-TXP-3D-LCC. See the [TX Matrix Plus Hardware Guide](#) for the installation procedures.

## Preparing the SFC and the LCC for the Upgrade

To prepare the SFC and the LCC for the upgrade:

1. Use the **show pfe statistics traffic** command to verify that the level of traffic on each Packet Forwarding Engine in the LCC is within the recommended range for upgrade (which is approximately 50% of line rate).
2. Use the **show chassis fabric plane** command to verify that four data planes are active and one plane is spare.

```
user@host> show chassis fabric plane

Plane State Uptime
0 Online 15 hours, 42 minutes, 9 seconds
1 Online 15 hours, 42 minutes, 9 seconds
2 Spare
3 Online 15 hours, 42 minutes, 9 seconds
4 Online 15 hours, 42 minutes, 9 seconds
```

3. a. Ensure that the **CONFIG-SIZE** dial on the SFC is set to **3** and all the SIBs are online before configuring the **upgrade-mode** statement.
- b. Configure the upgrade mode on the LCC by using the **fabric upgrade-mode 3d-fabric** statement at the **[edit chassis]** hierarchy level and commit the changes. This configuration enables the T4000 chassis to be upgraded with the TXP-3D-LCC SIBs.

```
[edit chassis]
user@host# set fabric upgrade-mode 3d-fabric
user@host# commit
```

This step also checks for the compatibility of Routing Engines, CBs, and FPCs.

### NOTE:

The following FPCs are not supported:

- T640-FPC1-E and T640-FPC1-E2
- T640-FPC2, T640-FPC2-E, and T640-FPC2-E2
- T640-FPC3, T640-FPC3-E, and T640-FPC3-E2
- T640-FPC4-1P-ES

- c. Configure the upgrade-mode on the SFC by including the **fabric upgrade-mode 3d-fabric** statement at the **[edit chassis]** hierarchy level and commit the configuration on the SFC.

```
[edit chassis]
user@host# set fabric upgrade-mode 3d-fabric
user@host# commit
```

4. Configure the LCC mode on the SFC's master Routing Engine to **t4000**:

```
[edit chassis]
user@host# set lcc-mode lcc 0 mode t4000
user@host# set lcc-mode lcc 1 mode empty
user@host# commit
```

**NOTE:** If you configure **lcc-mode** for LCC 0, LCC 2, LCC 4, and LCC 6 as **t4000**, for the next LCC, **lcc-mode** must be **empty**— that is, **lcc-mode** for LCC 3, LCC 5, and LCC 7 must be **empty**.

### Upgrading the SIBs

You must upgrade the existing SIBs on the LCC to 3D SIBs for the LCC to operate as LCC 0 in the routing matrix of the TX Matrix Plus router with 3D SIBs. To upgrade the SIBs on the LCC:

1. Verify that the same planes are spare on the SFC and the LCC by using the **show chassis fabric plane** command. If the same planes are not spare, use the **request chassis fabric plane** command to change the states of the required planes.  
  
The output of **show chassis fabric plane** command must show four active planes on the SFC and the LCC. Spare plane numbers must be identical on the SFC and the LCC.
2. Take the spare SIB-I-T4000 offline by issuing the **request chassis sib slot slot-number offline** command.
3. Replace the offline SIB-I-T4000 with SIB-TXP-3D-LCC. See the [Replacing the SIB](#) for the replacement procedure.
4. Connect the SIBs on the LCC to the SIBs on the SFC by using fiber-optic cables. See the [Connecting the Switching Plane Cables](#) for the connection procedure.
5. Bring the replaced SIB-TXP-3D-LCC online by issuing the **request chassis sib slot slot-number online** command.

For example, for plane 0:

```
user@host> request chassis sib slot 0 online
```

- Issue the **show chassis fabric optics** command to verify that all the cables are in **CABLE\_CONNECTED** state on the SFC and the LCC.

```
user@host> show chassis fabric optics
```

Port	Cable state	Module Type
lcc0-sib0:		
0	CABLE_CONNECTED	AOC
1	CABLE_CONNECTED	AOC
2	CABLE_CONNECTED	AOC
3	CABLE_CONNECTED	AOC
4	CABLE_CONNECTED	AOC
5	CABLE_CONNECTED	AOC
6	CABLE_CONNECTED	AOC
7	CABLE_CONNECTED	CXP Module
lcc0-sib1:		
0	CABLE_CONNECTED	CXP Module
1	CABLE_NOT_CONNECTED	AOC
2	CABLE_CONNECTED	AOC
...		

Until all mandatory cables show the **CABLE\_CONNECTED** state, do not proceed to the next step.

**NOTE:** All the eight cables (0 through 7) on a SIB in the T4000 LCC 0 must be in **CABLE\_CONNECTED** state.

- Verify that the newly inserted SIB is in **Spare** state and there are no alarms due to faulty hardware by using the **show chassis sibs** and **show chassis alarms** commands. Until the SIB shows the **Spare** state, and there are no alarms, do not proceed to train the switching plane links.

### Training the Switching Plane Links

For the SIBs on the LCC and the SFC to communicate with each other, the links are trained using the **train-link-transmit** and **train-link-receive** commands on the LCC and the SFC. After the links are trained, they are verified using the **show chassis fabric optical-links**, **show chassis fabric plane extensive**, and **show chassis fabric topology** commands.

To manually train the link between the LCC and the SFC before the data plane is activated, perform these steps:

1. For the SFC to receive traffic from the LCC, issue the **request chassis sib f13 slot f13 slot train-link-receive** command.

**f13 slot** is the slot in the SFC where the SIB-TXP-F13-3D must be manually connected to SIB-TXP-3D-LCC in a slot (from 0 through 4) in the LCC. The SFC's **f13 slot** has a value of 0, 3, 6, 8, or 11.

SIB Slots on the LCC	SIB Slots on the SFC
0	0
1	3
2	6
3	8
4	11

2. To train the links on the LCC to receive traffic from the SFC, issue the **request chassis sib slot sibSlot train-link-receive** command.

**sibSlot** is the slot in the LCC where SIB-TXP-3D-LCC must be manually connected to SIB-TXP-F13-3D in a slot (0, 3, 6, 8, or 11) in the SFC. You can configure the LCC's **sibSlot** to be a value in the range from 0 through 4.

3. To train the links on the SFC to transmit traffic to the LCC, issue the **request chassis sib f13 slot f13 slot train-link-transmit** command.

**f13 slot** is the slot in the SFC where the SIB-TXP-F13-3D must be manually connected to SIB-TXP-3D-LCC in a slot (from 0 through 4) in the T4000 router. **f13 slot** has a value of 0, 3, 6, 8, or 11.

4. To train the links on the LCC to transmit traffic to the SFC, issue the **request chassis sib slot sibSlot train-link-transmit** command.

**sibSlot** is the slot in the LCC where SIB-TXP-3D-LCC must be manually connected to SIB-TXP-F13-3D in a slot (0, 3, 6, 8, or 11) in the SFC. You can configure **sibSlot** to be a value in the range from 0 through 4.

5. Verify the links between the LCC and the SFC by using the following commands:

- **show chassis fabric optical-links**
- **show chassis fabric plane extensive**
- **show chassis fabric topology**

6. If errors occur at this stage, take the SIB on the LCC offline and bring it back online. On the SFC, take the F13 SIB offline and bring it back online. Start training the links again.

### Activating and Verifying the Switching Plane

To activate and verify the upgraded switching plane:

1. To activate the switching plane with the new SIB, take another switching plane offline:

On the SFC, issue the **request chassis fabric plane *plane-num* offline sfc 0** command.

On the LCC, issue the **request chassis sib slot *sibSlot* offline** command.

For example, on the SFC:

```
user@host# request chassis fabric plane 1 offline sfc 0
```

On the LCC:

```
user@host# request chassis sib slot 1 offline
```

2. Use the **show chassis fabric stats rates summary** command on the LCC and **show chassis fabric stats f13 actPlaneSib1# rates summary** command on the SFC to verify that the traffic is flowing through all the planes in the LCC and the SFC, respectively.

If traffic is flowing smoothly, the statistics for **Data/sec** under **Received** and **Sent** shows a nonzero number.

3. Follow the procedures in “Upgrading the SIBs” on page 422, “Training the Switching Plane Links” on page 423, and “Activating and Verifying the Switching Plane” on page 425 for upgrading all the T4000 SIBs in the other planes.

#### Related Documentation

- [Preparing the SFC and the LCC for the Upgrade on page 421](#)
- [Upgrading the SIBs on page 422](#)
- [Training the Switching Plane Links on page 423](#)
- [Activating and Verifying the Switching Plane on page 425](#)

### Transferring Control of the T4000 Router (LCC 0) to the SFC

After upgrading the SIBs of a standalone T4000 router and integrating it into a routing matrix, transfer the control of the T4000 router to the SFC in the routing matrix:

1. On the SFC, confirm that the dial on the left, **CHASSIS ID**, displays **00** and that on the right, **CONFIG-SIZE**, displays **03**.
2. Connect the Ethernet links from the T4000 CBs to the CIP on the SFC. Verify that the Ethernet connection LED is lit on the CIP.
3. Manually set the **M/S** switch on both the replaced CBs of the T4000 router to **M** (multichassis).
4. Configure the T4000 router as LCC 0 by including the **lcc number** statement at the **[edit chassis]** hierarchy level.

```
[edit chassis]
user@host> set lcc number
```

- When all the SIBs are upgraded, delete the **fabric upgrade-mode** statement from the configuration hierarchy, and commit the changes on both the LCC and the SFC.

```
[edit chassis]
user@host# delete chassis fabric upgrade-mode 3d-fabric
user@host# commit
```

- After you configure LCC 0, reboot it for the changes to take effect. Reboot the SFC also. This rebooting process establishes the forwarding state of the new LCC in the TX Matrix Plus routing matrix by bringing up the SIBs automatically. For more information about hardware connectivity for the control plane, see the [TX Matrix Plus Hardware Guide](#).

## Adding a New T4000 Router to the TX Matrix Plus Routing Matrix

Junos OS does not support in-service upgrade of T4000 routers to LCC 2, LCC 4, and LCC 6. To add a second LCC to the TX Matrix Plus routing matrix:

**NOTE:** When you upgrade other T4000 routers to LCCs in the routing matrix, you must set the LCC number (*lcc-number*) to 2, 4, or 6.

- Upgrade both the CBs and Routing Engines on the T4000 router. For details, see “Upgrading the Control Boards, Routing Engines, PEMs, and Rear Fan Tray of the T4000 Router for Control Plane Connectivity” on page 421.
- Upgrade the T4000 router with the same version of Junos OS as that on the SFC.
- Upgrade the SIBs of the T4000 router and connect the new SIBs to the SFC. For details, see “Configuring Junos OS for Upgrading the SIBs on the T4000 Router and Connecting the Router to the SFC” on page 420.
- Connect Ethernet links of the control plane from the T4000 router to the SFC.
- Set the LCC mode on the SFC’s master Routing Engine to **t4000** by using the following commands:

```
user@host# set chassis lcc-mode lcc 0 mode t4000
user@host# set chassis lcc-mode lcc 1 mode empty
user@host# commit
```

**NOTE:** If you set `lcc-mode` for LCC 0, LCC 2, LCC 4, and LCC 6 as `t4000`, the `lcc-mode` value for the next LCC must be empty. `lcc-mode` for LCC 3, LCC 5, and LCC 7 must be empty in a routing matrix configuration with four T4000 LCCs.

6. Reboot the T4000 router. After rebooting, the router becomes part of the TX Matrix Plus routing matrix and is connected to the SFC on the control plane.

# Configuring M Series Chassis-Level Features

- [Configuring the Junos OS to Enable MTU Path Check for a Routing Instance on M Series Routers on page 429](#)
- [Configuring the Junos OS to Enable an M160 Router to Operate in Packet Scheduling Mode on page 431](#)
- [Configuring the Junos OS to Make an SFM Stay Offline on page 431](#)
- [Configuring the Junos OS to Support FPC to FEB Connectivity on M120 Routers on page 432](#)
- [Configuring the Junos OS to Support Eight Queues on IQ Interfaces for T Series and M320 Routers on page 434](#)
- [Configuring the Junos OS to Support Entry-Level Configuration on an M320 Router with a Minimum Number of SIBs and PIMs on page 435](#)

## Configuring the Junos OS to Enable MTU Path Check for a Routing Instance on M Series Routers

---

By default, the maximum transmission unit (MTU) check for routing instance is disabled on M Series routers (except the M120 and M320 routers).

**NOTE:** The MTU check is automatically present for interfaces belonging to the main router.

On M Series routers (except the M120 and M320 routers) you can configure MTU path checks on the outgoing interface for unicast traffic routed on a virtual private network (VPN) routing and forwarding (VRF) routing instance. When you enable MTU check, the router sends an Internet Control Message Protocol (ICMP) message when the size of a unicast packet traversing a VRF routing instance or virtual-router routing instance has exceeded the MTU size and when an IP packet is set to "do not fragment". The ICMP message uses the routing instance local address as its source address.

For an MTU check to work in a routing instance, you must include the **vrf-mtu-check** statement at the **[edit chassis]** hierarchy level and assign at least one interface containing an IP address to the routing instance.

To configure path MTU checks, complete the following tasks:

1. [Enabling MTU Check for a Routing Instance on page 430](#)
2. [Assigning an IP Address to an Interface in the Routing Instance on page 430](#)

## Enabling MTU Check for a Routing Instance

To enable MTU check for a routing instance, include the **vrf-mtu-check** statement at the **[edit chassis]** hierarchy level:

```
[edit chassis]
vrf-mtu-check;
```

## Assigning an IP Address to an Interface in the Routing Instance

To assign an IP address to an interface in the VRF or virtual-router routing instance, configure the local address for that routing instance. A local address is any IP address derived from an interface that is assigned to the routing instance.

To assign an interface to a routing instance, include the **interface** statement at the **[edit routing-instances *routing-instance-name*]** hierarchy level:

```
[edit routing-instances routing-instance-name]
interface interface-name;
```

To configure an IP address for a loopback interface, include the **address** statement at the **[edit interfaces *interface-name* unit *logical-unit-number* family inet]** hierarchy level:

```
[edit interfaces interface-name unit logical-unit-number family inet]
address address;
```

**NOTE:** If you are assigning Internet Protocol Security (IPsec) or generic routing encapsulation (GRE) tunnel interfaces without IP addresses in the routing instance, include a loopback interface to the routing instance. To do this, include the **lo0.*n*** option at the **[edit routing-instances *routing-instance-name* interface]** hierarchy level. *n* cannot be 0, because lo0.0 is reserved for the main router (and not appropriate for use with routing instances). Also, an IP address must be assigned to this loopback interface in order to work. To set an IP address for a loopback interface, include the **address** statement at the **[edit interfaces lo0 unit *logical-unit-number* family inet]** hierarchy level.

See Also • [vrf-mtu-check on page 824](#)

## Configuring the Junos OS to Enable an M160 Router to Operate in Packet Scheduling Mode

By default, packet scheduling is disabled on M160 Routers. To configure a router to operate in packet-scheduling mode, include the **packet-scheduling** statement at the **[edit chassis]** hierarchy level:

```
[edit chassis]
packet-scheduling;
```

To explicitly disable the **packet-scheduling** statement, include the **no-packet-scheduling** statement at the **[edit chassis]** hierarchy level:

```
[edit chassis]
no-packet-scheduling;
```

When you enable packet-scheduling mode, the Packet Director application-specific integrated circuit (ASIC) schedules packet dispatches to compensate for transport delay differences. This preserves the interpacket gaps as the packets are distributed from the Packet Director ASIC to the Packet Forwarding Engine.

Whenever you change the configuration for packet-scheduling, the system stops all SFMs and FPCs and restarts them in the new mode.

**NOTE:** Packet scheduling is for M160 routers only.

## Configuring the Junos OS to Make an SFM Stay Offline

By default, if you use the **request chassis sfm** CLI command to take a Switching and Forwarding Module (SFM) offline, the SFM attempts to restart when you enter a **commit** CLI command. To prevent a restart, you can configure an SFM to stay offline. This feature is useful for repair situations.

To configure an SFM to stay offline, include the **sfm** statement at the **[edit chassis]** hierarchy level:

```
[edit chassis]
sfm slot-number {
  power off;
}
```

- **slot number**—Slot number in which the SFM is installed.
- **power off**—Take the SFM offline and configure it to remain offline.

For example, the following statement takes an SFM in slot 3 offline:

```
[edit chassis]
```

```
sfm 3 power off;
```

Use the **show chassis sfm** CLI command to confirm the offline status:

```
user@host# show chassis sfm
```

Slot	State	Temp (C)	CPU Utilization (%)		Memory Utilization (%)		
			Total	Interrupt	DRAM (MB)	Heap	Buffer
0	Online	34	2	0	64	16	47
1	Online	38	2	0	64	16	47
2	Online	42	2	0	64	16	47
3	Offline	--- Configured power off ---					

To bring the SFM back online, delete the **edit chassis sfm** statement and then commit the configuration.

## Configuring the Junos OS to Support FPC to FEB Connectivity on M120 Routers

The M120 router supports six Forwarding Engine Boards (FEBs) and six Flexible PIC Concentrators (FPCs). The supported FPCs include:

- Two compact FPCs:
  - OC192 compact FPC (supported only on the D4 chip-based compact FPC)
  - 10-Gigabit Ethernet compact FPC
- Up to four Type 1, Type 2, or Type 3 FPCs

On the M120 router, you can map a connection between any FPC and any FEB. This capability allows you to configure resources for a chassis that contains empty slots, supporting configurations where the FPC and FEB pairs are not in slot order. You do not have to populate every empty slot position, but you must configure a FEB for every FPC.

If you do not want to map a connection between an FPC and a FEB, you must explicitly configure the FPC not to connect to the FEB. To do so, include the **none** option at the **[edit chassis fpc-feb-connectivity fpc number feb]** hierarchy level. If you do not configure FPC and FEB connectivity, it is automatically assigned in the following order: FPC 0 to FEB 0, FPC 1 to FEB 1, and so on.

For each FEB, you can map a maximum of two Type 1 FPCs or one Type 2, Type 3, or compact FPC.

The following restrictions apply when you configure FPC and FEB connectivity:

- When an FPC is configured not to connect to any FEB, interfaces on that FPC are not created.
- If a PIC comes online, but the FEB to which the FPC is configured to connect is not online, the physical interfaces for the PIC are not created. For example, PIC 1 on FPC 2 comes online. The configuration specifies that FPC 2 connects to FEB 3. If FEB 3 is not online at the time PIC 1 comes online, the physical interfaces corresponding to PIC 1 on FPC 2 are not created. If FEB 3 subsequently comes online, the physical interfaces are created.

- If a FEB is brought offline or removed, any interfaces on the FPCs connected to the FEB are deleted. If the FEB is subsequently brought back online, the interfaces are restored.
- FPCs and FEBs might reboot following a change in the FPC and FEB connectivity configuration. If an FPC connects to a different FEB as a result of the configuration change, the FPC is rebooted following the commit. As a result of the reboot, interfaces on the FPC are deleted.
- If a FEB connects to a different FPC or set of FPCs after a connectivity configuration change, the FEB is rebooted. The exception is if the FEB is already connected to one or two Type 1 FPCs and the change only results in the FEB being connected either to one additional or one fewer Type 1 FPC.

To configure a connection between an FPC and a FEB, include the **fpc-feb-connectivity** statement at the **[edit chassis]** hierarchy level:

```
[edit chassis]
fpc-feb-connectivity {
  fpc number feb (slot-number | none);
}
```

For **fpc number**, enter a value from 0 through 5. For **feb slot-number**, enter a value from 0 through 5 or none. The **none** option disconnects the FPC from the FEB.

To view the current FPC and FEB mapping and the status of each FPC and FEB, issue the **show chassis fpc-feb-connectivity** operational mode command. For more information, see the [CLI Explorer](#).

**NOTE:** FPC-to-FEB connectivity is supported only on the M120 router.

In this example, FPC 3 is already mapped to FEB 3 by default. You are also mapping a connection between FPC 2 and FEB 3.

```
[edit chassis]
fpc-feb-connectivity {
  fpc 2 feb 3;
}
```

However, this configuration results in a mismatch between the FPC type and the FEB type. For example, FPC 3 is not a Type 1 FPC. You can map only one FPC that is not a Type 1 FPC to a FEB. Use the **fpc-feb-connectivity** statement to explicitly disconnect FPC 3 from FEB 3. To do so, include the **none** option at the **[edit chassis fpc-feb-connectivity fpc number feb]** hierarchy level:

```
[edit chassis]
fpc-feb-connectivity {
  fpc 2 feb 3;
  fpc 3 feb none;
}
```

**Related Documentation**

- [Configuring Junos OS to Support an External Clock Synchronization Interface for M Series, MX Series, and T Series Routers on page 292](#)
- [Configuring Port-Mirroring Instances on M120 Routers on page 228](#)

## Configuring the Junos OS to Support Eight Queues on IQ Interfaces for T Series and M320 Routers

By default, IQ PICs on T Series and M320 routers are restricted to a maximum of four egress queues per interface. To configure a maximum of eight egress queues on IQ interfaces, include the **max-queues-per-interface** statement at the **[edit chassis fpc slot-number pic pic-number]** hierarchy level:

```
[edit chassis fpc slot-number pic pic-number]
max-queues-per-interface (8 | 4);
```

On a TX Matrix or TX Matrix Plus router, include the **max-queues-per-interface** statement at the **[edit chassis lcc number fpc slot-number pic pic-number]** hierarchy level:

```
[edit chassis lcc number fpc slot-number pic pic-number]
max-queues-per-interface (8 | 4);
```

**NOTE:** The configuration at the **[edit class-of-service]** hierarchy level must also support eight queues per interface.

The maximum number of queues per IQ PIC can be 4 or 8. If you include the **max-queues-per-interface** statement, all ports on the IQ PIC use configured mode and all interfaces on the IQ PIC have the same maximum number of queues.

If you include the **max-queues-per-interface 4** statement, you can configure all four ports and configure up to four queues per port.

For 4-port OC3c/STM1 Type I and Type II PICs on M320 and T Series routers, when you include the **max-queues-per-interface 8** statement, you can configure up to eight queues on ports 0 and 2. After you commit the configuration, the PIC goes offline and comes back online with only ports 0 and 2 operational. No interfaces can be configured on ports 1 and 3.

For Quad T3 and Quad E3 PICs, when you include the **max-queues-per-interface 8** statement, you can configure up to eight queues on ports 0 and 2. After you commit the configuration, the PIC goes offline and comes back online with only ports 0 and 2 operational. No interfaces can be configured on ports 1 and 3.

When you include the **max-queues-per-interface** statement and commit the configuration, all physical interfaces on the IQ PIC are deleted and readded. Also, the PIC is taken offline and then brought back online immediately. You do not need to take the PIC offline and online manually. You should change modes between four queues and eight queues only when there is no active traffic going to the IQ PIC.

## Configuring the Junos OS to Support Entry-Level Configuration on an M320 Router with a Minimum Number of SIBs and PIMs

An M320 router can include an entry-level configuration with a minimum number of SIBs and PEMs. With this configuration, the router may have fewer than four SIBs or four PEMs.

To prevent unwanted alarms from occurring with this entry-level configuration, include the **pem minimum** and **sib minimum** statements at the **[edit chassis]** hierarchy level:

```
[edit chassis]
pem {
  minimum number;
}
sib {
  minimum number;
}
```

**minimum *number*** can be 0 through 3. With this configuration, SIB absent or PEM absent alarms are generated only if the SIB or PEM count falls below the minimum specified. For example, set this number to 2 for an entry-level configuration with 2 Switch Interface Boards and 2 Power Entry Modules.

## Configuring the Junos OS to Enable Session Offloading on MX Series 5G Universal Routing Platforms with MS-DPCs

---

The Junos OS enables you to configure session offloading for Multiservices DPCs on MX Series routers. This enables Fast Update Filters (FUF) at the PIC level for a multiservices interface (***ms-fpc-pic-port***). To configure session offloading, include the **session-offload** statement at the **[edit chassis fpc slot-number pic number adaptive-services service-package extension-provider]** hierarchy level:

```
[edit chassis fpc slot-number pic number adaptive-services service-package  
extension-provider]  
session-offload;
```

Currently, session offloading is supported only for a maximum of one multiservices interface.

**NOTE:** When session offloading is enabled for a Multiservices PIC, we recommend that you limit dynamic application awareness features for Intrusion Detection and Prevention (IDP) only for that interface.

## Configuring Voltage Level Monitoring of FPCs

---

You can monitor the voltage on the flexible PIC concentrator (FPC) at regular intervals. When the voltage falls below 10%, the FPC is offlined.

The faulty FPC is monitored at 500ms intervals. The output of the **show chassis fpc** command shows **Power Failure** for the faulty FPC. The FPC remains in powered down state until the voltage level is normal again.

- [Enabling Voltage Failure Errors on the FPC on page 438](#)
- [Disabling Voltage Failure Errors on the FPC on page 438](#)

### Enabling Voltage Failure Errors on the FPC

**fpc-nmi-volt-fail-knob** controls the behavior of the FPC after detecting voltage failure, and to online or offline the FPC based on the voltage level. To enable monitoring the voltage level on the FPC:

1. Navigate to the **[edit chassis]** hierarchy level.
2. Include the **set chassis fpc-nmi-volt-fail-knob enable** statement to enable voltage monitoring on the FPC.

```
[edit chassis]
{
  fpc-nmi-volt-fail-knob enable;
}
```

### Disabling Voltage Failure Errors on the FPC

To disable monitoring the voltage level on the FPC:

1. Navigate to the **[edit chassis]** hierarchy level.
2. Include the **set chassis fpc-nmi-volt-fail-knob disable** statement to disable voltage monitoring on the FPC.

```
[edit chassis]
{
  fpc-nmi-volt-fail-knob disable;
}
```

  - [fpc-nmi-volt-fail-knob on page 663](#)

## Accounting of the Layer 2 Overhead Attribute in Interface Statistics

On MX Series and T Series routers, you can configure the logical interface statistics to include the Layer 2 overhead size (header and trailer bytes) for both ingress and egress interfaces. Both the transit and total statistical information are computed and displayed for each logical interface. This functionality is supported on 1-Gigabit, 10-Gigabit, 40-Gigabit, and 100-Gigabit Ethernet interfaces on Dense Port Concentrators (DPCs), and Modular Port Concentrators (MPCs) on MX Series routers. Starting with Junos OS Release 13.2, configuring the logical interface statistics to include Layer 2 is supported on 10-Gigabit Ethernet interfaces on MX Series routers with MPC4E. Starting with Junos OS Release 13.3, **account-layer2-overhead** is not supported on MX Series routers with MPC3E (on both PIC and logical interface levels).

You can also configure the capability to compute the Layer 2 overhead bytes in interface statistics on Type-3, Type-4 and Type-5 Flexible Port Concentrators (FPCs) on T Series routers. To enable the Layer 2 overhead bytes to be counted in the interface statistics at the PIC level, you must use the **account-layer2-overhead** statement at the **[edit chassis fpc slot-number pic pic-number]** hierarchy level.

If you configure this capability, all the Layer 2 header details (Layer 2 header and cyclic redundancy check [CRC]) based on the Layer 2 encapsulation configured for an interface are calculated and displayed in the logical interface statistics for ingress and egress interfaces in the output of the **show interfaces interface-name** commands. For logical interfaces, the **Input bytes** and **Output bytes** fields under the Traffic statistics section in the output of the **show interfaces interface-name <detail | extensive>** command include the Layer 2 overhead of the packets. For logical interfaces, the Input rate and Output rate fields under the Traffic statistics section in the output of the **show interfaces interface-name <media | statistics>** command include the Layer 2 overhead of the packets. For logical interfaces, the values for the newly added **Egress account overhead** and **Ingress account overhead** fields display the Layer 2 overhead size for transmitted and received packets respectively.

The input and output octets at the logical interface configured on the PIC includes all the Layer 2 headers. All the logical interfaces on the PIC, including the ae and the non-ae interfaces, are processed for Layer 2 overhead accounting for the arriving and exiting packets. This method of operation impacts the transit statistics that are primarily used for subscriber accounting and billing purposes in customer networks.

Table 66 on page 440 lists the adjustment bytes that are counted based on the encapsulation on the logical interface over the Ethernet interface, when you enable accounting of Layer 2 overhead in interface statistics at the PIC level. The values for the adjustment bytes that are listed for all types of encapsulation are the same for DPCs and MPCs, with the only exception being for the VLAN CCC adjustment value. On DPCs, the VLAN CCC adjustment value is -4 bytes and on MPCs, the VLAN CCC adjustment value is +4 bytes.

*Table 66: Adjustment Bytes for Logical Interfaces over Ethernet Interfaces*

Encapsulation Type on Logical Interfaces	Number of Adjustment Bytes	Description
Ethernet DIXv2 (IP datagrams over Ethernet)	18	Untagged (includes CRC)
Ethernet DIXv2 (IP datagrams over Ethernet)	22	Single-tagged (includes CRC)
Ethernet DIXv2 (IP datagrams over Ethernet)	26	Double-tagged (includes CRC)
VLAN Bridge	4	CRC
VLAN CCC	4	CRC
VLAN TCC	18	Untagged (includes CRC)
VLAN TCC	22	Single-tagged (includes CRC)
VLAN TCC	26	Double-tagged (includes CRC)
VLAN VPLS	4	CRC

### Guidelines for Configuring the Computation of Layer 2 Overhead in Interface Statistics

Keep the following points in mind when you configure the computation of Layer 2 overhead in interface statistics:

- When you configure a native VLAN ID on a logical interface, the Layer 2 header adjustment for input statistics is different for tagged and untagged packets. For such interfaces, if you configure the setting to account for Layer 2 overhead, incorrect statistics might be displayed.
- An untagged packet is considered as a tagged packet and an additional 4 bytes are appended to the counter values displayed in the output of the **show interface** command.
- The computed statistics might not be completely accurate in scenarios where the packets are dropped after they have been included in the interface statistics, but before the packets reach the destination.
- Label-switched interface (LSI) statistics on the ingress direction of interfaces do not include the Layer 2 overhead bytes because this functionality of accounting Layer 2 overhead is not supported for such LSI interfaces.
- Layer 2 overhead accounting is not supported for inline service (si) interfaces.
- The total statistics of interfaces do not indicate the complete Layer 2 adjusted statistics. This behavior occurs because the total statistics count is the sum of transit and local statistics. Only the transit statistics are adjusted for Layer 2 and the local statistics are not adjusted for Layer 2.
- Statistics on ae interfaces are calculated in the same manner as non-ae interfaces.

- Adjustment bytes are applicable only for transit statistics that are displayed for logical interfaces.
- For physical interfaces, the adjustment bytes for transit traffic and the non-adjusted bytes for local or protocol-specific traffic are combined and displayed in the output of the **show interfaces** command. (Segregation is not possible.)
- Layer 2 overhead accounting can be enabled at both PIC level and logical interface level.
- When the **account-layer2-overhead** statement is configured, the Layer 2 overhead size in both input and output statistics is accounted for in Dense Port Concentrator (DPCs) and Modular Port Concentrator (MPCs).
- This **account-layer2-overhead** configuration now supports Layer 2 accounting for the Ethernet bridge encapsulation.
- The Layer 2 overhead bytes in interface statistics are saved across a unified ISSU or a graceful Routing Engine switchover (GRES) operation.

#### Release History Table

Release	Description
13.3	Starting with Junos OS Release 13.3, <b>account-layer2-overhead</b> is not supported on MX Series routers with MPC3E (on both PIC and logical interface levels).
13.2	Starting with Junos OS Release 13.2, configuring the logical interface statistics to include Layer 2 is supported on 10-Gigabit Ethernet interfaces on MX Series routers with MPC4E.

## Configuring Layer 2 Overhead Accounting in Interface Statistics

This topic contains sections that describe the configuration of Layer 2 overhead accounting for interface statistics at the PIC level and logical interface level.

Layer 2 overhead accounting can be enabled at both PIC level and logical interface level through configuration. By default, the physical interface and logical interface statistics do not account for Layer 2 overhead size (header and trailer) in both input and output statistics.

When the **account-layer2-overhead** statement is configured, the Layer 2 overhead size in both input and output statistics is accounted for in the Dense Port Concentrator (DPCs)

and the Modular Port Concentrator (MPCs). This **account-layer2-overhead** configuration now supports Layer 2 accounting for the Ethernet bridge encapsulation.

- [Enabling the Accounting of Layer 2 Overhead in Interface Statistics at the PIC Level on page 442](#)

## Enabling the Accounting of Layer 2 Overhead in Interface Statistics at the PIC Level

You can configure the **account-layer2-overhead** statement at the **edit chassis fpc slot-number pic pic-number** hierarchy level to enable accounting of Layer 2 overhead bytes in the ingress and egress interface statistics at the PIC level.

**CAUTION:** If you modify the setting for accounting of Layer 2 overhead bytes at the PIC level, the PIC is rebooted, causing all of the physical and logical interfaces to be deleted and readded on the PIC. Due to this behavior, we recommend that you exercise caution while using this feature.

The computation method of Layer 2 overhead on different interface types is as follows:

- For Ethernet interfaces, all the Layer 2 headers are counted.
- For non-Ethernet interfaces, the Frame Relay, PPP, or Cisco HDLC headers are counted, while the bit or byte stuffing headers are excluded.

To enable accounting of Layer 2 overhead at the PIC level for ingress and egress traffic on interfaces:

1. Access a DPC or an MPC-occupied slot and the PIC where the interface is to be enabled.

```
[edit chassis]
user@host# edit fpc slot-number pic number
```

2. Specify the Layer 2 overhead value in bytes that is the octet adjustment per packet added to the total octet count for ingress and egress traffic on all the interfaces in the PIC.

```
[edit chassis fpc slot-number pic number]
user@host# set account-layer2-overhead
```

# Configuring T Series Chassis-Level Features

- [Configuring OSS Mapping to Represent a T4000 Chassis as a T1600 or a T640 Chassis on page 447](#)
- [Example: Configuring a T4000 Chassis to Represent a T640 Chassis on page 449](#)

## Configuring OSS Mapping to Represent a T4000 Chassis as a T1600 or a T640 Chassis

You can configure the operations support systems (OSS) mapping feature to represent a T4000 chassis as a T1600 chassis or a T640 chassis. This topic includes the following tasks:

- [Configuring T4000 Chassis as a T1600 Chassis on page 447](#)
- [Configuring T4000 Chassis as a T640 Chassis on page 447](#)
- [Disabling the OSS Mapping Feature on page 448](#)

### Configuring T4000 Chassis as a T1600 Chassis

To configure a T4000 chassis as a T1600 chassis:

1. In configuration mode, go to the **[edit chassis]** hierarchy level.

```
[edit]  
user@T4000# edit chassis
```

2. Configure the OSS mapping feature to map the T4000 chassis to a T1600 chassis.

```
[edit chassis]  
user@T4000# set oss-map model-name t1600
```

### Configuring T4000 Chassis as a T640 Chassis

To configure a T4000 chassis as a T640 chassis:

1. In configuration mode, go to the **[edit chassis]** hierarchy level.

```
[edit]
```

```
user@T4000# edit chassis
```

2. Configure the OSS mapping feature to map the T4000 chassis to a T640 chassis.

```
[edit chassis]  
user@T4000# set oss-map model-name t640
```

**NOTE:** By default, the OSS mapping feature is disabled.

## Disabling the OSS Mapping Feature

To disable the OSS mapping feature:

1. In configuration mode, go to the **[edit chassis]** hierarchy level.

```
[edit]  
user@T4000# edit chassis
```

2. Disable the OSS mapping feature that maps a T4000 chassis to a T640 chassis.

```
[edit chassis]  
user@T4000# delete oss-map model-name t640
```

3. Disable the OSS mapping feature that maps a T4000 chassis to a T1600 chassis.

```
[edit chassis]  
user@T4000# delete oss-map model-name t1600
```

**NOTE:**

- The **set chassis oss-map model-name t640 | t1600** command is applicable only on T4000 routers. You must explicitly set this command when a T1600 chassis or a T640 chassis is upgraded to a T4000 chassis.
- You can execute the **set chassis oss-map model-name t640** command or the **set chassis oss-map model-name t1600** command if the OSS is compatible with either the T640 chassis or the T1600 chassis, respectively.

- See Also**
- [Example: Configuring a T4000 Chassis to Represent a T640 Chassis on page 449](#)
  - [oss-map on page 726](#)
  - [show chassis oss-map on page 2018](#)

## Example: Configuring a T4000 Chassis to Represent a T640 Chassis

This example shows how to configure OSS mapping feature to represent a T4000 chassis as a T640 chassis. You can extend this concept to configure a T4000 chassis to represent as a T1600 chassis as well.

- [Requirements on page 449](#)
- [Overview on page 449](#)
- [Configuring the T4000 Chassis to Represent a T640 Chassis on page 450](#)
- [Verification on page 450](#)

### Requirements

This example uses the following hardware and software components:

- One T4000 router
- Junos OS Release 12.3R3, 13.1R2, 13.2R1, or later

### Overview

Operations support systems (OSS) is used by service providers to maintain their networks. When a new router is added or removed from the network, the OSS must be updated to reflect the changes. This process is tedious and time-consuming.

When a T1600 chassis or a T640 chassis is upgraded to a T4000 chassis, the OSS identifies the new chassis as a new networking element and follows a tedious process of qualifying it for the customer's network. The *OSS mapping feature* helps avoid this scenario.

Using the OSS mapping feature, you can map a T4000 chassis to a T1600 chassis or to a T640 chassis with the **set chassis oss-map model-name t640|t1600** configuration command. This configuration command overrides the chassis model name, so that the OSS recognizes the chassis as a known chassis and proceeds without any requalification.

#### NOTE:

- The **set chassis oss-map model-name t640 | t1600** command is applicable only on T4000 routers. You must explicitly set this command when a T1600 chassis or a T640 chassis is upgraded to a T4000 chassis.
- You can execute the **set chassis oss-map model-name t640** command or the **set chassis oss-map model-name t1600** command, if the OSS is compatible with either the T640 chassis or the T1600 chassis, respectively.

## Configuring the T4000 Chassis to Represent a T640 Chassis

**Step-by-Step Procedure** To configure the T4000 chassis to represent a T640 chassis by using the OSS mapping feature:

1. In configuration mode, go to the **[edit chassis]** hierarchy level.

```
[edit]
user@T4000# edit chassis
```

2. Configure the OSS mapping feature to map the T4000 chassis to a T640 chassis.

```
[edit chassis]
user@T4000# set oss-map model-name t640
```

## Verification

### Verifying the OSS Mapping Feature

**Purpose** To verify that the OSS mapping feature is working on a T4000 router.

**Action** Run the `show chassis operational` command and verify that the configured known chassis name is displayed when the T4000 chassis is mapped to a T640 chassis.

- Run the **show chassis hardware** operational command:

```
user@T4000> show chassis hardware
```

### Verifying the OSS Mapping Feature on SNMP MIBs

**Purpose** To verify that the SNMP MIBs are updated with the configured known chassis name.

**Action** Run the **show snmp mib** operational commands and verify that the configured known chassis name is displayed in SNMP MIBs when the T4000 chassis is mapped to a T640 chassis:

- Run the **show snmp mib walk system** operational command:

```

user@T4000> show snmp mib walk system

sysDescr.0    = Juniper Networks, Inc. t640 internet router, kernel JUNOS
12.3-...Juniper Networks, Inc.
sysObjectID.0 = jnxProductNameT640
...

```

- Run the **show snmp mib walk jnxBoxAnatomy** operational command:

```

user@T4000> show snmp mib walk jnxBoxAnatomy

jnxBoxClass.0 = jnxProductLineT640.0
jnxBoxDescr.0 = Juniper t640 Internet Backbone Router
jnxBoxSerialNo.0 = JN11B3892AHA
jnxBoxRevision.0
....

```

**Meaning** On configuring the OSS mapping feature, the OSS maps the T4000 chassis to a T640 chassis, thereby preventing requalification of the new chassis.

## Configuring Port Speed

---

Starting with Junos OS Release 15.1, some PICs support multiple port speeds. This procedure describes how to configure the port speed for these types of PICs.

To configure a PIC's port speed:

1. Navigate to the **[edit chassis]** hierarchy level.
2. Enter the **port-speed** statement at the **[edit chassis fpc slot-number pic pic-number port port-number]** hierarchy level.

```
[edit chassis]
user@host# set fpc fpc-slot pic pic-number port port-number port-speed ;
```

3. Specify the port speed that needs to be configured. You can use one of the following speed attributes for this configuration.

```
[edit chassis]
user@host# set fpc fpc-slot pic pic-number port port-number port speed 10G;
user@host# set fpc fpc-slot pic pic-number port port-number port speed 40G;
user@host# set fpc fpc-slot pic pic-number port port-number port speed 100G;
```

## Release History Table

Release	Description
15.1	Starting with Junos OS Release 15.1, some PICs support multiple port speeds.

Related Documentation

- [speed on page 743](#)

## License Modes for PTX Series Routers

PTX Series routers are available in two license variants: IR and R. Depending on the license purchased, the router offers full IP or LSR.

[Table 67 on page 454](#) describes the two license variants for the PTX1000.

*Table 67: License Variants for the PTX1000*

License	Description	Scale Restrictions
IR	Scaled up LSR and peering	<ul style="list-style-type: none"> <li>• Up to 1 million routes in the forwarding information base (FIB)</li> <li>• Up to 6 million routes in the routing information base (RIB)</li> <li>• Up to 256 routing instances of the virtual routing and forwarding (VRF) instance type</li> <li>• Up to 128 thousand LSPs</li> </ul>
R	Full IP core	None

**NOTE:** The license-mode statement is only supported on the PTX3000 and PTX5000 Series routers with third-generation FPCs.

[Table 68 on page 454](#) describes the two license variants for the PTX3000 and PTX5000.

*Table 68: License Variants for the PTX3000 and PTX5000 FPCs*

License	Description	Scale Restrictions
IR	Scaled up LSR and peering	<ul style="list-style-type: none"> <li>• Up to 2 million routes in the forwarding information base (FIB)</li> <li>• Up to 6 million routes in the routing information base (RIB)</li> <li>• Up to 256 routing instances of the virtual routing and forwarding (VRF) instance type</li> <li>• Up to 128 thousand LSPs</li> </ul>
R	Full IP core	None

For the PTX3000 and PTX5000, if you purchase two FPCs: one with an IR license and one with an R license. After the FPCs are installed on a router, both FPCs appear identical. To distinguish between an FPC with an IR license and an FPC with an R license after the FPC is installed on the router, you must configure the license mode based on the license purchased. For instance, if you purchased an FPC with the IR license, you must configure the license mode for that FPC as IR. The license mode settings are set specific to each FPC slot. If the FPC is installed in a different slot, or moved to another device, the license mode settings must be reconfigured on the new slot or device. Also, the license mode settings previously configured must be deleted.

**NOTE:** The license mode settings are used only to provide information. You cannot set or alter the license of the FPC by configuring the license mode.

To view the current license mode settings, from the configuration mode, use the **show chassis fpc** command. To view the current license mode settings, from the operational mode, use the **show chassis hardware extensive** command. To delete the existing license mode settings, use the **delete chassis fpc** command.

## Configuring FPC Error Levels and Actions

Starting with Junos OS Release 13.3 or Release 14.2 for M320 routers, you can use MX Series, PTX Series, and T Series routers to configure Packet Forwarding Engine (PFE)-related error levels on FPCs and the actions to perform when a specified threshold is reached. In Junos OS Release 13.2 and earlier, Packet Forwarding Engine errors would disable the FPC. When you use the **error** command, Packet Forwarding Engine errors can be isolated, which reduces the need for a field replacement. This command is available at the **[edit chassis fpc slot-number]** and **[edit chassis]** (MX Series routers only) hierarchies.

To configure Packet Forwarding Engine error levels and actions for an FPC:

- (Optional) Configure the fatal error level threshold and action:

```
[edit chassis fpc fpc-number error]
user@host# set fatal action action
user@host# set fatal threshold threshold-level
```

- (Optional) Configure the major error level threshold and action:

```
[edit chassis fpc fpc-number error]
user@host# set major action action
user@host# set major threshold threshold-level
```

- (Optional) Configure the minor error level threshold and action:

```
[edit chassis fpc fpc-number error]
user@host# set minor action action
user@host# set minor threshold threshold-level
```

Starting with Junos OS Release 18.1R3, MX Series routers support configuration of error thresholds and actions at the error scope and error category levels. Use the command **set chassis fpc fpc-slot error scope error-scope category category (fatal | major | minor) threshold error-threshold action (alarm | disable-pfe | get-state | offline | log | reset)** to configure a threshold and action for a particular error scope and category at the FPC level. You can also configure these features at the chassis level (at the **[edit chassis]** hierarchy). However, threshold and action configured at the **[edit chassis fpc]** hierarchy overrides the same configuration at the **[edit chassis]** hierarchy.

You can use the command **show chassis fpc errors** to view the error information at the error scope and category level.

If you have configured the action **log** against a particular error threshold, the system logs the event when the error count breaches the set threshold. The following sample syslog messages indicate an error threshold breach and the resultant action being taken:

```
Sep 17 23:12:10 sw-s3-u8-03 fpc0 Error:
/fpc/0/pfe/0/cm/0/PE_Chip/1/PECHIP_CMERROR_OQB_INT_REG_RD_ADDR_ERR (0x21078b),
scope: pfe, category: functional, severity: minor, module: PE Chip, type:
Description for PECHIP_CMERROR_OQB_INT_REG_RD_ADDR_ERR
```

```
Sep 17 23:12:10 sw-s3-u8-03 fpc0 Performing action log for error
/fpc/0/pfe/0/cm/0/PE_Chip/1/PECHIP_CMERROR_OQB_INT_REG_RD_ADDR_ERR (0x21078b) in
module: PE Chip with scope: pfe category: functional level: minor
```

#### Release History Table

Release	Description
13.3	Starting with Junos OS Release 13.3 or Release 14.2 for M320 routers, you can use MX Series, PTX Series, and T Series routers to configure Packet Forwarding Engine (PFE)-related error levels on FPCs and the actions to perform when a specified threshold is reached.

#### Related Documentation

- [Fabric Resiliency and Degradation on page 132](#)
- [error on page 641](#)
- [fpc error on page 659](#)
- [Example: Configuring FPC Error Detection and Self-Healing on T Series Core Routers on page 576](#)

## Managing FPC Errors

On the PTX10001 routers, you can disable an FPC error or modify the severity of the error at the error-id level. The error-id, which uniquely identifies an FPC error, is represented

in the uniform resource identifier (URI) format and is composed of a module identifier and an error identifier. If an error occurs, you can find the error-id in the system log messages.

- [Modifying Severity of an Error on page 457](#)
- [Disabling an Error on page 457](#)

## Modifying Severity of an Error

Though you cannot configure a new error severity, you can modify the existing severity of an error. For example, if you do not want to treat a particular error (identified by an error-id) as fatal anymore, you can modify its severity to major or minor as required.

**NOTE:** You cannot modify the error severity at a group (for example, category) level.

To modify the severity of an error, use the following command:

```
user@host# set chassis fpc fpc-slot error error-id severity new-severity
```

See the following example:

```
user@host# set chassis fpc 3 error "/cpu/0/memory/0/ECC_CORRECTED_ERROR" severity
minor
```

In the above example, you modified the severity of the error ID  
“/cpu/0/memory/0/memory-uncorrected-error” in FPC 3 to **minor**.

## Disabling an Error

To configure the system to stop reporting an error, identify the error-id and disable it. You can find the error-id in the system log messages. To disable an error, use the following command:

```
user@host# set chassis fpc fpc-slot error error-id state disable
```

See the following example:

```
user@host# set chassis fpc 3 error "/cpu/0/memory/0/ECC_CORRECTED_ERROR" state disable
```

In the above example, you disabled the error  
“/cpu/0/memory/0/memory-uncorrected-error” in FPC 3.

## Configuring the Junos OS to Make a Flexible PIC Concentrator Stay Offline

---

By default, a Flexible PIC Concentrator (FPC) is configured to restart after a system reboot. To configure an FPC to stay offline and prevent it from restarting, include the **power off** statement at the **[edit chassis fpc slot-number]** hierarchy level:

```
[edit chassis fpc slot-number]  
power off;
```

NOTE: You can use the `request chassis fpc operational mode` command to take an FPC offline, but the FPC attempts to restart when you enter a `commit` CLI command.

To bring an FPC online that is configured to stay offline and configure it to stay online, include the `power on` statement at the `[edit chassis fpc slot-number]` hierarchy level:

```
[edit chassis fpc slot-number]  
power on;
```

**Related  
Documentation**

## Configuring the Junos OS to Enable SONET/SDH Framing for SONET/SDH PICs

In Junos OS Release 8.4 and later, the family of next-generation SONET Phase I PICs includes Type 1 and Type 2 PICs. Each PIC type has three varieties.

Type1 PICs include:

- 2-port OC3
- 4-port OC3
- 1-port OC12

Type 2 PICs include:

- 1-port OC48
- 4-port OC3
- 4-port OC12

The PICs are supported on Type 1 and Type 2 FPC interfaces. Hot-pluggable SFPs are used as optical transponders. The PICs provide unprecedented flexibility by allowing the user to configure a variety of modes on them through the configuration of concatenation/nonconcatenation and speed.

The 4-port OC48 PIC with SFP installed, the next-generation SONET/SDH PICs with SFP, and the 4-port OC192 PIC on M Series and T Series routers, support SONET or SDH framing on a per-port basis. This functionality allows you to mix SONET and SDH modes on interfaces on a single PIC.

Port level framing is supported for only the PICs listed below in Table 1. This is expected behavior.

**Table 69: PICs supporting port level framing**

I2C-ID Name	Model Number	PIC Type
1xCOC12 Q2 PIC	1x CHOC12 IQE SONET	Type 1
4xCOC12 Q2 PIC	4x CHOC12 IQE SONET	Type 2
4xCOC12 Q2 TYPE3 PIC	4x CHOC12 (TYPE3) IQE SONET	Type 3
1x COC48 Q2 PIC	1x CHOC48 IQE SONET	Type 2
1x OC12 Q2 PIC	1x OC12 IQE SONET	Type 1
2xCOC3 Q2 PIC	2x CHOC-3 IQE SONET	Type 1
4xOC3 Q2 PIC	4x OC-3 IQE SONET	Type 1
8OC3OC12 4OC48 MIC	MIC-3D-8OC3OC12-4OC48	—
4OC3OC12 1OC48 MIC	MIC-3D-4OC3OC12-1OC48	—

Table 69: PICs supporting port level framing (continued)

I2C-ID Name	Model Number	PIC Type
8CHOC3 4CHOC12 MIC	MIC-3D-8CHOC3-4CHOC12	—
4CHOC3 2CHOC12 MIC	MIC-3D-4CHOC3-2CHOC12	—
1CHOC48 MIC	MIC-3D-1CHOC48 SFP	—
1OC192 HO VCAT MIC	MIC-3D-1OC192-XFP	—
IQECC 4XOC48 TYPE3 PIC	4x OC-48 IQE SONET	Type 3
CE 4xCOC3 SFP PIC	4x CHOC3 SONET CE SFP	—
2XOC12 8XOC3 ATM SFP MIC	2xOC12/8xOC3 CC-CE	—

For information about configuring port speed for concatenate mode on a next-generation PIC, see the *Junos OS Hardware Network Operations Guide*.

By default, SONET/SDH PICs use SONET framing. For a discussion of the differences between the two standards, see the *SONET/SDH Interfaces Feature Guide for Routing Devices*.

To configure a PIC to use SDH framing, include the **framing** statement at the **[edit chassis fpc slot-number pic pic-number]** hierarchy level, specifying the **sdh** option:

```
[edit chassis]
user@host# set fpc slot-number pic pic-number framing sdh
[edit chassis]
user@host# show
fpc slot-number {
  pic pic-number {
    framing sdh;
  }
}
```

On a TX Matrix or TX Matrix Plus router, include the **framing** statement at the **[edit chassis lcc number fpc slot-number pic pic-number]** hierarchy level, specifying the **sdh** option:

```
[edit chassis lcc number]
user@host# set fpc slot-number pic pic-number framing sdh
[edit chassis lcc number]
user@host# show
fpc slot-number {
  pic pic-number {
    framing sdh;
  }
}
```

To explicitly configure a PIC to use SONET framing, include the **framing** statement at the **[edit chassis fpc slot-number pic pic-number]** hierarchy level, specifying the **sonet** option:

```
[edit chassis]
user@host# set fpc slot-number pic pic-number framing sonet
[edit chassis]
user@host# show
fpc slot-number {
  pic pic-number {
    framing sonet;
  }
}
```

On a TX Matrix or TX Matrix Plus router, include the **framing** statement at the **[edit chassis lcc number fpc slot-number pic pic-number]** hierarchy level, specifying the **sonet** option:

```
user@host# set fpc slot-number pic pic-number framing sonet
[edit chassis lcc number]
user@host# show
fpc slot-number {
  pic pic-number {
    framing sonet;
  }
}
```

---

## Configuring Junos OS to Enable SONET/SDH Framing for ATM MICs

---

In Junos OS Release 12.1 and later, the ATM MIC enables support for ATM pseudowire on MX Series routers. ATM MICs are rate-selectable at the following rates: 2-port OC12 or 8-port OC3. The MICs are supported on MPC interfaces. Hot-pluggable SFPs are used as optical transponders. The MICs allow the user to configure both the mode and the speed. The ATM MIC (2-port OC12 and the 8-port OC3) with SFP installed support SONET or SDH framing on a per-port or per-PIC basis. To enable the entire MIC to function in either SONET or SDH mode, you can configure framing at the MIC level. To enable the framing on a port-by-port basis, you can configure framing at the port level.

**NOTE:** This topic uses the term PIC for ATM MICs and the term FPC for MPC where the reference is to a CLI or Junos OS entity.

---

By default, ATM MICs use SONET framing. For a discussion of the differences between the two standards, see the *SONET/SDH Interfaces Feature Guide for Routing Devices*.

To configure the MIC to use SDH framing on a per-PIC basis:

1. At the **[edit chassis]** hierarchy level in configuration mode, specify the PIC and the framing mode to be configured.

```
[edit chassis]
user@host# set fpc fpc-slot pic pic-number framing sdh;
```

For example:

```
[edit chassis]
user@host# set fpc 2 pic 0 framing sdh;
```

2. Verify the configuration.

```
[edit chassis]
user@host# show
fpc 2 {
  pic 0 {
    framing sdh;
  }
}
```

To configure the MIC to use SDH framing on a per-port basis:

1. At the **[edit chassis]** hierarchy level in configuration mode, specify the PIC, port number, and the framing mode to be configured.

```
[edit chassis]
user@host# set fpc fpc-slot pic pic-number port port-number framing sdh;
```

For example:

```
[edit chassis]
user@host# set fpc 2 pic 0 port 0 framing sdh;
```

2. Verify the configuration.

```
[edit chassis]
user@host# show
fpc 2 {
  pic 0 {
    port 0 {
      framing sdh;
    }
  }
}
```

- Related Documentation**
- [Configuring Port Speed on Multi-Rate MICs on page 475](#)

## Configuring the Junos OS to Use ATM Cell-Relay Accumulation Mode on an ATM1 PIC

You can configure an Asynchronous Transfer Mode (ATM) 1 PIC to use cell-relay accumulation mode. In this mode, the incoming cells (one to eight cells) are packaged into a single packet and forwarded to the label-switched path (LSP). At the edge router, this packet is divided into individual cells and transmitted over the ATM interface.

**NOTE:** When you configure an ATM PIC to use cell-relay accumulation, all ports on the ATM PIC use cell-relay accumulation mode.

To configure an ATM PIC to use cell-relay accumulation mode, include the **atm-cell-relay-accumulation** statement at the **[edit chassis fpc slot-number pic pic-number]** hierarchy level:

```
[edit chassis fpc slot-number pic pic-number ]
  atm-cell-relay-accumulation;
```

On a TX Matrix or TX Matrix Plus router, include the **atm-cell-relay-accumulation** statement at the **[edit chassis lcc number fpc slot-number pic pic-number]** hierarchy level:

```
[edit chassis lcc number fpc slot-number pic pic-number]
  atm-cell-relay-accumulation;
```

## Configuring the Junos OS to Support the Sparse DLCI Mode on Channelized STM1 or Channelized DS3 PICs

By default, original channelized DS3 and original channelized STM1-to-E1 (or T1) interfaces can support a maximum of 64 data-link connection identifiers (DLCIs) per channel—as many as 1792 DLCIs per DS3 interface or 4032 DLCIs per STM1 interface (0 through 63).

In sparse DLCI mode, the full DLCI range (1 through 1022) is supported. This allows you to use circuit cross-connect (CCC) and translation cross-connect (TCC) features by means of Frame Relay on T1 and E1 interfaces.

**NOTE:** Sparse DLCI mode requires a Channelized STM1 or Channelized DS3 PIC.

DLCI 0 is reserved for Local Management Interface (LMI) signaling.

Channelized T3 (CT3) intelligent queuing (IQ) and STM1 IQ interfaces support a maximum of 64 DLCIs, numbered 0 through 1022, and therefore do not require sparse mode.

The CT3 PIC must use field-programmable gate array (FPGA) hardware revision 17 to run sparse DLCI mode.

To configure the router to use sparse DLCI mode, include the **sparse-dlcis** statement at the **[edit chassis fpc slot-number pic pic-number]** hierarchy level:

```
[edit chassis fpc slot-number pic pic-number ]
sparse-dlcis;
```

#### Related Documentation

- [Configuring the Junos OS to Enable Larger Delay Buffers for T1, E1, and DS0 Interfaces Configured on Channelized IQ PICs on page 471](#)

## Configuring the Junos OS to Enable a SONET PIC to Operate in Channelized (Multiplexed) Mode

By default, SONET PICs (interfaces with names **so-fpc/pic/port**) operate in concatenated mode, a mode in which the bandwidth of the interface is in a single channel.

To configure a PIC to operate in channelized (multiplexed) mode, include the **no-concatenate** statement at the **[edit chassis fpc slot-number pic pic-number]** hierarchy level:

```
[edit chassis]
user@host# set fpc slot-number pic pic-number no-concatenate
[edit chassis]
user@host# show
fpc slot-number {
  pic pic-number {
    no-concatenate;
```

```
}
}
```

On a TX Matrix or TX Matrix Plus router, include the **no-concatenate** statement at the **[edit chassis lcc number fpc slot-number pic pic-number]** hierarchy level:

```
[edit chassis lcc number]
user@host# set fpc slot-number pic pic-number no-concatenate
[edit chassis lcc number]
user@host# show
fpc slot-number {
  pic pic-number {
    no-concatenate;
  }
}
```

When configuring and displaying information about interfaces that are operating in channelized mode, you must specify the channel number in the interface name (*physical:channel*); for example, *so-2/2/0:0* and *so-2/2/0:1*.

**NOTE:** On SONET OC48 interfaces that are configured for channelized (multiplexed) mode, the *bytes e1-quiet* and *bytes f1* options in the *sonet-options* statement have no effect. The *bytes f2*, *bytes z3*, *bytes z4*, and *path-trace* options work correctly on channel 0. These bytes work in the transmit direction only on channels 1, 2, and 3.

The M160 four-port SONET/SDH OC12 PIC can run each of the OC12 links in concatenated mode only and requires a Type 2 M160 FPC. Similarly, the 4-port SONET/SDH OC3 PIC cannot run in nonconcatenated mode on any platform.

#### Related Documentation

- [Configuring the Junos OS to Enable SONET/SDH Framing for SONET/SDH PICs on page 461](#)
- [Configuring the Junos OS to Support the Sparse DLCI Mode on Channelized STM1 or Channelized DS3 PICs on page 466](#)

## Configuring the Junos OS to Support Channel Groups and Time Slots for Channelized E1 PICs

Each Channelized E1 PIC has 10 E1 ports that you can channelize to the *NxDS0* level. Each E1 interface has 32 time slots (DS0), in which time slot 0 is reserved. You can combine one or more of these timeslots (DS-0) to create a channel group (*NxDS-0*). There can be a maximum of 32 channel groups per E1 interface. Thus, you can configure as many as 320 channel groups per PIC (10 ports x 32 channel groups per port).

To specify the DS0 channel group number in the interface name, include a colon (:) as a separator. For example, a Channelized E1 PIC might have the following physical and virtual interfaces:

```
ds-0/0/0:x
```

where *x* is a DS0 channel group ranging from 0 through 23. (See [Table 70 on page 470](#) for more information about ranges.)

You can use any of the values within the range available for *x*; you do not have to configure the links sequentially. The software applies the interface options you configure according to the following rules:

- You can configure the **e1-options** statement for channel group 0 only; for example, **ds-0/0/0:0**.
- There are no restrictions on changing the default **ds0-options**.
- If you delete a configuration you previously committed for channel group 0, the options return to the default values.

To configure the channel groups and time slots for a Channelized E1 interface, include the **channel-group** and **timeslots** statements at the **[edit chassis fpc slot-number pic pic-number ce1 e1 port-number]** hierarchy level:

```
[edit chassis fpc slot-number pic pic-number ce1 e1 port-number]
channel-group channel-number timeslots slot-number;
```

**NOTE:** If you commit the interface name but do not include the **[edit chassis]** configuration, the Channelized E1 PIC behaves like a standard E1 PIC: none of the DS0 functionality is accessible.

**NOTE:** The FPC slot range depends on the platform. The maximum range of 0 through 7 applies to M40 routers; for M20 routers, the range is 0 through 3; for M10 routers the range is 0 through 1; for M5 routers, the only applicable value is 0. The Channelized E1 PIC is not supported on M160 routers.

The theoretical maximum number of channel groups possible per PIC is  $10 \times 24 = 240$ . This is within the maximum bandwidth available.

There are 32 time slots on an E1 interface. You can designate any combination of time slots for usage.

To use time slots 1 through 10, designate **slot-number** as in this example:

```
[edit chassis fpc 1 pic 2 ce1 e1 6]
```

```
channel-group 3 timeslots 1-10;
```

To use time slots 1 through 5, time slot 10, and time slot 24, designate *slot-number* as in this example:

```
[edit chassis fpc 3 pic 0 ce1 e1 2]
channel-group 1 timeslots 1-5,10,24;
```

Do not include spaces in a list of time slot numbers.

**Related Documentation**

- [Ranges for Channelized E1 Interfaces Configuration on page 470](#)

## Ranges for Channelized E1 Interfaces Configuration

Table 70 on page 470 shows the ranges for configuring channel groups and time slots for Channelized E1 Interfaces.

*Table 70: Ranges for Channelized E1 Configuration*

Item	Variable	Range
FPC slot	<i>slot-number</i>	0 through 7 (see note below)
PIC slot	<i>pic-number</i>	0 through 3
E1 port	<i>port-number</i>	0 through 9
DSO channel group	<i>group-number</i>	0 through 23
Time slot	<i>slot-number</i>	1 through 32

**NOTE:** The FPC slot range depends on the router. For the TX Matrix and TX Matrix Plus routers, the range is from 0 through 31. For the TX Matrix Plus routers with 3D SIBs, the range is from 0 through 63. For M40, M40e, M160, M320, M120, and other T Series routers, the range is from 0 through 7. For M20 routers, the range is from 0 through 3. For M10 and M10i routers, the range is from 0 through 1. For M5 and M7i routers, the only applicable value is 0.

**Related Documentation**

## Configuring the Junos OS to Support ILMI for Cell Relay Encapsulation on an ATM2 IQ PIC

Integrated Local Management Interface (ILMI) is supported on AAL5 interfaces, regardless of transport mode. To enable ILMI on interfaces with cell-relay encapsulation, you must configure an ATM2 IQ PIC to use Layer 2 circuit trunk transport mode.

To configure ILMI on an interface with cell-relay encapsulation, include the following statements:

```
[edit chassis fpc slot-number pic pic-number]
  atm-l2circuit-mode trunk trunk;
[edit interfaces at-fpc/pic/port]
  encapsulation atm-ccc-cell-relay;
  atm-options {
    ilmi;
    pic-type atm2;
  }
  unit logical-unit-number {
    trunk-id number;
  }
```

**Related Documentation** • [Configuring the Junos OS to Enable ATM2 Intelligent Queuing Layer 2 Circuit Transport Mode on page 501](#)

## Configuring the Junos OS to Enable Larger Delay Buffers for T1, E1, and DS0 Interfaces Configured on Channelized IQ PICs

By default, T1, E1, and NxDS0 interfaces configured on channelized IQ PICs are limited to 100,000 microseconds of delay buffer. (The default average packet size on the IQ PIC is 40 bytes.) For these interfaces, it might be necessary to configure a larger buffer size to prevent congestion and packet dropping.

To ensure traffic is queued and transmitted properly, you can configure a buffer size larger than the default maximum. To set the average packet size used to calculate the number of notification queue entries in the IQ PIC to 256 bytes, include the **q-pic-large-buffer large-scale** statement at the **[edit chassis fpc slot-number pic pic-number]** hierarchy level:

```
[edit chassis fpc slot-number pic pic-number]
  q-pic-large-buffer {
    large-scale;
  }
```

On a TX Matrix router or a TX Matrix Plus router, include the **q-pic-large-buffer large-scale** statement at the **[edit chassis lcc number fpc slot-number pic pic-number]** hierarchy level:

```
[edit chassis lcc number fpc slot-number pic pic-number]
  q-pic-large-buffer {
```

```
large-scale;
}
```

**NOTE:** When you commit the configuration after including the `q-pic-large-buffer` statement for a PIC, the Junos OS temporarily takes the PIC offline and brings it back online before the new configuration is activated and becomes the current operational configuration.

This statement sets the maximum buffer size. (See [Table 71 on page 472](#).)

#### Related Documentation

- [Maximum Delay Buffer with q-pic-large-buffer Statement Enabled on page 472](#)

## Maximum Delay Buffer with q-pic-large-buffer Statement Enabled

[Table 71 on page 472](#) lists the maximum delay buffer that can be configured for T1, E1, and DS0 interfaces configured on Channelized IQ PICs:

**Table 71: Maximum Delay Buffer with q-pic-large-buffer Statement Enabled**

Platform, PIC, or Interface Type	Maximum Buffer Size
<b>With Large Buffer Sizes Not Enabled</b>	
T Series and M320 routers	50,000 microseconds
Other M Series routers	200,000 microseconds
IQ PICs on all routers	100,000 microseconds
Channelized T1/E1 interface on J Series Services Routers	400,000 microseconds
<b>With Large Buffer Sizes Enabled</b>	
Channelized T3 and channelized OC3 DLCIs—Maximum sizes vary by shaping rate:	
With shaping rate from 64,000 through 255,999 bps	4,000,000 microseconds
With shaping rate from 256,000 through 511,999 bps	2,000,000 microseconds
With shaping rate from 512,000 through 1,023,999 bps	1,000,000 microseconds
With shaping rate from 1,024,000 through 2,048,000 bps	500,000 microseconds
With shaping rate from 2,048,001 bps through 10 Mbps	400,000 microseconds

*Table 71: Maximum Delay Buffer with q-pic-large-buffer Statement Enabled (continued)*

Platform, PIC, or Interface Type	Maximum Buffer Size
With shaping rate from 10,000,001 bps through 20 Mbps	300,000 microseconds
With shaping rate from 20,000,001 bps through 30 Mbps	200,000 microseconds
With shaping rate from 30,000,001 bps through 40 Mbps	150,000 microseconds
With shaping rate up to 40,000,001 bps or higher	100,000 microseconds
NxDSO IQ Interfaces—Maximum sizes vary by channel size:	
1xDSO through 3xDSO	4,000,000 microseconds
4xDSO through 7xDSO	2,000,000 microseconds
8xDSO through 15xDSO	1,000,000 microseconds
16xDSO through 32xDSO	500,000 microseconds
Other IQ interfaces	500,000 microseconds

**Related Documentation**

- [Configuring the Junos OS to Enable Larger Delay Buffers for T1, E1, and DSO Interfaces Configured on Channelized IQ PICs on page 471](#)

## Configuring a Policer Overhead

Configuring a policer overhead allows you to control the rate of traffic sent or received on an interface. When you configure a policer overhead, the configured policer overhead value (bytes) is added to the length of the final Ethernet frame. This calculated length of frame is used to determine the policer or the rate limit action. Therefore, the policer overhead enables you to control the rate of traffic sent or received on an interface. You can configure the policer overhead to rate-limit queues and Layer 2 and MAC policers. The policer overhead and the shaping overhead can be configured simultaneously on an interface.

This feature is supported on M Series and T Series routers with IQ2 PICs or IQ2E PICs, and on MX Series DPCs.

To configure a policer overhead for controlling the rate of traffic sent or received on an interface:

1. In the **[edit chassis]** hierarchy level in configuration mode, create the interface on which to add the policer overhead to input or output traffic.

```
[edit chassis]
user@host# edit fpc fpc pic pic
```

For example:

```
[edit chassis]
user@host# edit fpc 0 pic 1
```

2. Configure the policer overhead to control the input or output traffic on the interface. You could use either statement or both the statements for this configuration.

```
[edit chassis fpc fpc pic pic]
user@host# set ingress-policer-overhead bytes;
user@host# set egress-policer-overhead bytes;
```

For example:

```
[edit chassis fpc 0 pic 1]
user@host# set ingress-policer-overhead 10;
user@host# set egress-policer-overhead 20;
```

3. Verify the configuration:

```
[edit chassis]
user@host# show
fpc 0 {
  pic 1 {
    ingress-policer-overhead 10;
    egress-policer-overhead 20;
  }
}
```

**NOTE:** When the configuration for the policer overhead bytes on a PIC is changed, the PIC goes offline and then comes back online. In addition, the configuration in the CLI is on a per-PIC basis and, therefore, applies to all the ports on the PIC.

- Related Documentation
- [egress-policer-overhead on page 638](#)
  - [ingress-policer-overhead on page 679](#)

## Configuring Mixed-Rate Mode Operation

To configure mixed-rate mode operation for a PF-24XGE-SFPP PIC:

1. Navigate to the **[edit chassis]** hierarchy level.

2. On a T4000 router, configure the mixed-rate mode by including the **mixed-rate-mode** statement at the **[edit chassis fpc slot-number pic pic-number]** hierarchy level.

```
[edit chassis]
user@host# set fpc fpc-slot pic pic-number mixed-rate-mode
```

On an LCC in a routing matrix, configure the mixed-rate mode by including the **mixed-rate-mode** statement at the **[edit chassis lcc lcc number fpc slot-number pic pic-number]** hierarchy level.

```
[edit chassis]
user@host# set lcc lcc number fpc fpc-slot pic pic-number mixed-rate-mode
```

3. Specify the port and the port speed that need to be configured. You can use one of the following speed attributes for this configuration.

```
[edit chassis]
user@host# set fpc fpc-slot pic pic-number port port-number speed 1G;
user@host# set fpc fpc-slot pic pic-number port port-number speed 10G;
user@host# set lcc lcc number fpc fpc-slot pic pic-number speed 1G;
user@host# set lcc lcc number fpc fpc-slot pic pic-number speed 10G;
```

**NOTE:** On a 12 port 10-Gigabit Ethernet PIC (PF-12XGE-SFPP), you can configure the port speed as 1G by including the **set fpc fpc-slot pic pic-number port port-number speed 1G** statement at the **[edit chassis]** hierarchy level.

**NOTE:** To change the port speed from 10 Gbps to 1 Gbps on PF-24XGE-SFPP and PF-12XGE-SFPP PICs, SFP optics is required.

To disable mixed-rate mode operation, include the **delete chassis fpc x pic y mixed-rate-mode** statement at the **[edit chassis]** hierarchy level.

- Related Documentation**
- *Modes of Operation of 10-Gigabit Ethernet PICs*
  - [mixed-rate-mode on page 711](#)

## Configuring Port Speed on Multi-Rate MICs

Configuring a port speed allows you to enable rate-selectability on a per-port basis. When you configure a speed on a per-port basis, you can use the same MIC hardware as you upgrade your network from OC3 to OC12 or OC48 speeds.

This feature is supported on MX Series routers with SONET/SDH OC3/STM1 (Multi-Rate) MICs (MIC-3D-8OC3OC12-4OC48-SFP and MIC-3D-4OC3OC12-1OC48-SFP), Channelized

SONET/SDH OC3/STM1 (Multi-Rate) MICs with SFP (MIC-3D-8CHOC3-4CHOC12 and MIC-3D-4CHOC3-2CHOC12), and ATM MICs with SFP (MIC-3D-8OC3-2OC12-ATM).

To configure a port speed on the chassis for enabling rate-selectability on a per-port basis:

1. At the **[edit chassis]** hierarchy level in configuration mode, specify the port and the port speed that need to be configured. You can use one of the following speed attributes for this configuration.

```
[edit chassis]
user@host# set fpc fpc-slot pic pic-number port port-number speed oc12-stm4 ;
user@host# set fpc fpc-slot pic pic-number port port-number speed oc3-stm1 ;
user@host# set fpc fpc-slot pic pic-number port port-number speed oc48-stm16 ;
```

**NOTE:** You can configure the oc12-stm4, oc3-stm1, and oc48-stm16 port speed options for SONET/SDH OC3/STM1 (Multi-Rate) MICs. However, for Channelized SONET/SDH OC3/STM1 (Multi-Rate) MICs with SFP and ATM MICs, you can configure only the oc12-stm4 and oc3-stm1 port speed options.

(MX Series with MPCs and ATM MICs with SFP) To configure up to OC12 CBR bandwidth speed per virtual circuit (VC) on an ATM MIC with SFP (MIC-3D-8OC3-2OC12-ATM), specify oc12-stm4 as the speed for the specified port. You can configure the oc12-stm4 port speed option only for ports 0 and 4 on an ATM MIC. If you configure the oc12-stm4 port speed option for port 0, then ports 1, 2, and 3 are disabled. Similarly, if you configure the oc12-stm4 port speed for port 4, then ports 5, 6, and 7 are disabled.

For example:

```
[edit chassis]
user@host# set fpc 3 pic 0 port 0 speed oc12-stm4
```

2. Verify the configuration:

```
[edit chassis]
user@host# show
fpc 3 {
  pic 0 {
    port 0 {
      speed oc12-stm4;
    }
  }
}
```

By default, rate-selectability is enabled on MX Series routers with SONET/SDH OC3/STM1 (Multi-Rate) MICs, Channelized SONET/SDH OC3/STM1 (Multi-Rate) MICs with SFP, and ATM MICs.

To disable rate-selectability on the 8-port SONET/SDH OC3/STM1 (Multi-Rate) MIC:

1. At the **[edit chassis]** hierarchy level in configuration mode, disable rate-selectability by using the **no-multi-rate** statement.

```
[edit chassis]
user@host# set fpc fpc-slot pic pic-number no-multi-rate
```

For example:

```
[edit chassis]
user@host# set fpc 3 pic 0 no-multi-rate
```

**NOTE:**

- The **no-multi-rate** statement is supported only on MIC-3D-8OC3OC12-4OC48.
- The **no-multi-rate** statement enables the first four ports [0 – 3] exclusively at OC48/STM16 speed.
- The **no-multi-rate** statement disables the last four ports [4 – 7].

2. Verify the configuration:

```
[edit chassis]
user@host# show
fpc 3 {
  pic 0 {
    no-multi-rate;
  }
}
```

**NOTE:** You can disable rate-selectability by using the **no-multi-rate** statement only on the 8-port SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP. The **no-multi-rate** statement has no effect on the 4-port SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, the Channelized SONET/SDH OC3/STM1 (Multi-Rate) MICs with SFP, or the ATM MIC.

# Configuring Resynchronization of FPC Sequence Numbers when a new FPC is Brought Online

- [Configuring the Junos OS to Resynchronize FPC Sequence Numbers with Active FPCs when an FPC Comes Online on page 479](#)

## Configuring the Junos OS to Resynchronize FPC Sequence Numbers with Active FPCs when an FPC Comes Online

---

On M320, T320, T640, T1600, T4000, TX Matrix, and TX Matrix Plus routers, when you bring a Flexible PIC Concentrator (FPC) online, the sequence number on the FPC may not be synchronized with the other active FPCs in the router, which may result in the loss of a small amount of initial traffic.

To avoid any traffic loss, include the **fpc-resync** statement at the **[edit chassis]** hierarchy level. This ensures that the sequence numbers of the FPC that is brought online is resynchronized with the other active FPCs in the router.

```
[edit chassis]
fpc-resync;
```

**NOTE:** In order to prevent traffic blackholing, the **fpc-resync** command will have no effect if a single LMNR based FPC and one or more I-chip FPCs exist in the same chassis.

Related Documentation • [fpc-resync on page 666](#)

# Configuring Chassis Settings to Support Aggregated Devices

- [Configuring Junos OS for Supporting Aggregated Devices on page 481](#)

## Configuring Junos OS for Supporting Aggregated Devices

---

Junos OS supports the aggregation of physical devices into defined virtual links, such as the link aggregation of Ethernet interfaces defined by the IEEE 802.3ad standard.

Tasks for configuring aggregated devices are:

- [Configuring Virtual Links for Aggregated Devices on page 481](#)
- [Configuring LACP Link Protection at the Chassis Level on page 482](#)
- [Enabling LACP Link Protection on page 483](#)
- [Configuring System Priority on page 483](#)
- [Configuring the Maximum Links Limit on page 484](#)
- [Configuring PPM on Junos Fusion on page 484](#)

## Configuring Virtual Links for Aggregated Devices

To define virtual links, you need to specify the associations between physical and logical devices within the **[edit interfaces]** hierarchy, and assign the correct number of logical devices by including the **device-count** statement at the **[edit chassis aggregated-devices ethernet]** and **[edit chassis aggregated-devices sonet]** hierarchy levels:

```
[edit chassis]
aggregated-devices {
  ethernet {
    device-count number;
  }
  sonet {
    device-count number;
  }
}
```

The aggregated interfaces are numbered from **ae0** through **ae4091**. The maximum number of aggregated interfaces supported by different routers is listed below:

- For PTX Series routers, you can configure a maximum of 128 aggregated interfaces.
- For M Series and T Series routers, you can configure a maximum of 128 aggregated interfaces (LAG bundles).
- In Junos release 14.2R2 and earlier, you can configure a maximum of 480 aggregated interfaces on MX Series routers.
- In Junos release 14.2R3 and later, you can configure a maximum of 1000 aggregated interfaces on MX240, MX480, and MX960 routers.
- In Junos release 14.2R3 and later, you can configure a maximum of 800 aggregated interfaces on MX2010 and MX2020 routers.
- In Junos OS 15.1F5 and 15.1F6 releases, you can configure a maximum of 480 aggregated interfaces on MX240, MX480, and MX960 routers.
- In Junos OS 15.1F5 and 15.1F6 releases, you can configure a maximum of 800 aggregated interfaces on MX2010 and MX2020 routers.

For SONET/SDH, starting with Junos OS Release 13.2, the maximum number of logical interfaces is 64, numbered from **as0** through **as63**. In releases before Junos OS Release 13.2, the maximum was 16.

## Configuring LACP Link Protection at the Chassis Level

Link Aggregation Control Protocol (LACP) is one method of bundling several physical interfaces to form one logical interface. You can configure both VLAN-tagged and untagged aggregated Ethernet with or without LACP enabled. LACP exchanges are made between actors and partners. An actor is the local interface in an LACP exchange. A partner is the remote interface in an LACP exchange.

LACP link protection enables you to force active and standby links within an aggregated Ethernet. You configure LACP link protection by using the **link-protection** and **system-priority** statements at either the chassis or interface level and by configuring port priority at the interface level using the **system-priority** statement. Configuring LACP parameters at the chassis level results in all aggregated Ethernet interfaces using the defined values unless overridden by the LACP configuration on a specific interface.

```
[edit chassis]
aggregated-devices {
  ethernet {
    lacp {
      link-protection {
        non-revertive;
      }
      system-priority priority;
    }
  }
}
```

**NOTE:** LACP link protection also uses port priority. You can configure port priority at the Ethernet interface [gigether-options] hierarchy level using the `port-priority` statement. If you choose not to configure port priority, LACP link protection uses the default value for port priority (127).

## See Also

### Enabling LACP Link Protection

To enable LACP link protection for aggregated Ethernet interfaces on the chassis, use the `link-protection` statement at the [edit chassis aggregated-devices ethernet lacp] hierarchy level:

```
[edit chassis aggregated-devices ethernet lacp]
link-protection {
  non-revertive;
}
```

By default, LACP link protection reverts to a higher-priority (lower-numbered) link when that higher-priority link becomes operational or a link is added to the aggregator that is determined to be higher in priority. However, you can suppress link calculation by adding the `non-revertive` statement to the LACP link protection configuration. In nonrevertive mode, after a link is active and collecting and distributing packets, the subsequent addition of a higher-priority (better) link does not result in a switch, and the current link remains active.

**BEST PRACTICE:** (MX Series) In a highly scaled configuration over aggregated Ethernet, we recommend that you prevent the router from performing such a switch by including the `non-revertive` statement. Failure to do so may result in some traffic loss if a MIC on which a member interface is located reboots. Using the `non-revertive` statement for this purpose is not effective if both the primary and secondary interfaces are on the MIC that reboots.

**CAUTION:** If both ends of an aggregator have LACP link protection enabled, make sure to configure both ends of the aggregator to use the same mode. Mismatching LACP link protection modes can result in lost traffic.

### Configuring System Priority

To configure LACP system priority for aggregated Ethernet interfaces on the chassis, use the `system-priority` statement at the [edit chassis aggregated-devices ethernet lacp] hierarchy level:

```
[edit chassis aggregated-devices ethernet lacp]
```

```
system-priority priority;
```

The system priority is a 2-octet binary value that is part of the LACP system ID. The LACP system ID consists of the system priority as the two most-significant octets and the interface MAC address as the six least-significant octets. The system with the numerically lower value for system priority has the higher priority. By default, system priority is 127, with a range of 0 through 65,535.

## Configuring the Maximum Links Limit

To configure the maximum links limit, use the **maximum-links** statement at the **[edit chassis aggregated-devices]** hierarchy level:

```
[edit chassis aggregated-devices]  
maximum-links maximum-links-limit;
```

## Configuring PPM on Junos Fusion

If you use Junos Fusion with Junos OS Release 14.2R3, you need to ensure that link aggregation (and STP) work properly by configuring timers for the periodic packet management (PPM) daemons on the aggregation and satellite devices. We recommend using the following timer values:

```
[edit routing-options ppm]  
redistribution-timer 120;  
tcp-keepalive-interval 3000;  
tcp-keepalive-idle 3000;
```

Starting in Junos OS Release 14.2R4, the timer values that ensure proper link aggregation and STP functions are configured by default if you use Junos Fusion with Junos OS.

Release History Table

Release	Description
15.1F5	In Junos OS 15.1F5 and 15.1F6 releases, you can configure a maximum of 480 aggregated interfaces on MX240, MX480, and MX960 routers.
15.1F5	In Junos OS 15.1F5 and 15.1F6 releases, you can configure a maximum of 800 aggregated interfaces on MX2010 and MX2020 routers.
14.2R4	Starting in Junos OS Release 14.2R4, the timer values that ensure proper link aggregation and STP functions are configured by default if you use Junos Fusion with Junos OS.
14.2R3	In Junos release 14.2R3 and later, you can configure a maximum of 1000 aggregated interfaces on MX240, MX480, and MX960 routers.
14.2R3	In Junos release 14.2R3 and later, you can configure a maximum of 800 aggregated interfaces on MX2010 and MX2020 routers.
14.2R3	If you use Junos Fusion with Junos OS Release 14.2R3, you need to ensure that link aggregation (and STP) work properly by configuring timers for the periodic packet management (PPM) daemons on the aggregation and satellite devices.
14.2R2	In Junos release 14.2R2 and earlier, you can configure a maximum of 480 aggregated interfaces on MX Series routers.
13.2	For SONET/SDH, starting with Junos OS Release 13.2, the maximum number of logical interfaces is 64, numbered from <b>as0</b> through <b>as63</b> .

# Configuring Chassis Settings to Support Load Balancing

- [Configuring ECMP Next Hops for RSVP and LDP LSPs for Load Balancing on page 487](#)
- [Configuring PIC-Level Symmetrical Hashing for Load Balancing on 802.3ad LAGs for MX Series Routers on page 489](#)
- [Examples: Configuring PIC-Level Symmetrical Hashing for Load Balancing on 802.3ad LAGs on MX Series Routers on page 491](#)

## Configuring ECMP Next Hops for RSVP and LDP LSPs for Load Balancing

---

The Junos OS supports configurations of 16, 32, or 64 equal-cost multipath (ECMP) next hops for RSVP and LDP LSPs on M10i routers with an Enhanced CFEB, M320, M120, MX Series, and T Series routers, and routing devices. For networks with high-volume traffic, this provides more flexibility to load-balance the traffic over as many as 64 LSPs.

To configure the maximum limit for ECMP next hops, include the **maximum-ecmp next-hops** statement at the **[edit chassis]** hierarchy level:

```
[edit chassis]
maximum-ecmp next-hops;
```

You can configure a maximum ECMP next-hop limit of 16, 32, or 64 using this statement. The default limit is 16.

**NOTE:** MX Series routers with one or more Modular Port Concentrator (MPC) cards and with Junos OS 11.4 or earlier installed, support the configuration of the **maximum-ecmp** statement with only 16 next hops. You should *not* configure the **maximum-ecmp** statement with 32 or 64 next hops. When you commit the configuration with 32 or 64 next hops, the following warning message appears:

**Error: Number of members in Unilist NH exceeds the maximum supported 16 on Trio.**

The following types of routes support the ECMP maximum next-hop configuration for as many as 64 ECMP gateways:

- Static IPv4 and IPv6 routes with direct and indirect next-hop ECMPs
- LDP ingress and transit routes learned through associated IGP routes
- RSVP ECMP next hops created for LSPs
- OSPF IPv4 and IPv6 route ECMPs
- ISIS IPv4 and IPv6 route ECMPs
- EBGP IPv4 and IPv6 route ECMPs
- IBGP (resolving over IGP routes) IPv4 and IPv6 route ECMPs

The enhanced ECMP limit of up to 64 ECMP next hops is also applicable for Layer 3 VPNs, Layer 2 VPNs, Layer 2 circuits, and VPLS services that resolve over an MPLS route, because the available ECMP paths in the MPLS route can also be used by such traffic.

**NOTE:**

The following FPCs on M320, T640, and T1600 routers only support 16 ECMP next hops:

- (M320, T640, and T1600 routers only) Enhanced II FPC1
- (M320, T640, and T1600 routers only) Enhanced II FPC2
- (M320 and T640 routers only) Enhanced II FPC3
- (T640 and T1600 routers only) FPC2
- (T640 and T1600 routers only) FPC3

If a maximum ECMP next-hop limit of 32 or 64 is configured on an M320, T640, or T1600 router with any of these FPCs installed, the Packet Forwarding Engines on these FPCs use only the first 16 ECMP next hops. For Packet Forwarding Engines on FPCs that support only 16 ECMP next hops, the Junos OS generates a system log message if a maximum ECMP next-hop limit of 32 or 64 is configured. However, for Packet Forwarding Engines on other FPCs installed on the router, a maximum configured ECMP limit of 32 or 64 ECMP next hops is applicable.

---

**NOTE:** If RSVP LSPs are configured with bandwidth allocation, for ECMP next hops with more than 16 LSPs, traffic is not distributed optimally based on bandwidths configured. Some LSPs with smaller allocated bandwidths receive more traffic than the ones configured with higher bandwidths. Traffic distribution does not strictly comply with the configured bandwidth allocation. This caveat is applicable to the following routers:

- T1600 and T640 routers with Enhanced Scaling FPC1, Enhanced Scaling FPC2, Enhanced Scaling FPC3, Enhanced Scaling FPC 4, and all Type 4 FPCs
- M320 routers with Enhanced III FPC1, Enhanced III FPC2, and Enhanced III FPC3
- MX Series routers with all types of FPCs and DPCs, excluding MPCs. This caveat is not applicable to MX Series routers with line cards based on the Junos Trio chipset.
- M120 routers with Type 1, Type 2, and Type 3 FPCs
- M10i routers with Enhanced CFEB

Next-hop cloning and permutations are disabled on T Series routers with Enhanced Scaling FPCs (Enhanced Scaling FPC1, Enhanced Scaling FPC2, Enhanced Scaling FPC3, and Enhanced Scaling FPC 4) that support enhanced load-balancing capability. As a result, memory utilization is reduced for a highly scaled system with a high number of next hops on ECMP or aggregated interfaces. Next-hop cloning and permutations are also disabled on T Series routers with Type-4 FPCs.

To view the details of the ECMP next hops, issue the **show route** command. The **show route summary** command also shows the current configuration for the maximum ECMP limit. To view details of the ECMP LDP paths, issue the **traceroute mpls ldp** command.

## Configuring PIC-Level Symmetrical Hashing for Load Balancing on 802.3ad LAGs for MX Series Routers

Symmetrical hashing for load balancing on an 802.3ad Link Aggregation Group (LAG) is useful when two MX Series routers (for example, Router A and Router B) are connected transparently through Deep Packet Inspection (DPI) devices over a LAG bundle. The DPI devices keep track of traffic flows in both the forward and reverse directions.

If symmetrical hashing is configured, the reverse flow of traffic is also directed through the same child link on the LAG and is bound to flow through the same DPI device. This enables proper accounting on the DPI of the traffic in both the forward and reverse flows.

If symmetrical hashing is not configured, a different child link on the LAG might be chosen for the reverse flow of traffic through a different DPI device. This results in incomplete

information about the forward and reverse flows of traffic on the DPI device leading to incomplete accounting of the traffic by the DPI device.

Symmetrical hashing is computed based on fields like source address and destination address. You can configure symmetrical hashing both at the chassis level and the PIC level for load balancing based on Layer 2, Layer 3, and Layer 4 data unit fields for family inet (IPv4 protocol family) and multiservice (switch or bridge) traffic. Symmetrical hashing configured at the chassis level is applicable to the entire router, and is inherited by all its PICs and Packet Forwarding Engines. Configuring PIC-level symmetrical hashing provides you more granularity at the Packet Forwarding Engine level.

For the two routers connected through the DPI devices over a LAG bundle, you can configure **symmetric-hash** on one router and **symmetric-hash complement** on the remote-end router or vice-versa.

To configure symmetrical hashing at the chassis level, include the **symmetric-hash** or the **symmetric-hash complement** statements at the **[edit forwarding-options hash-key family]** hierarchy level. For information about configuring symmetrical hashing at the chassis level and configuring the link index, see the *Junos OS Network Interfaces Library for Routing Devices* and the *Junos OS VPNs Library for Routing Devices*.

**NOTE:** On MX Series DPCs, configuring symmetrical hashing at the PIC level refers to configuring symmetrical hashing at the Packet Forwarding Engine level.

To configure symmetrical hashing at the PIC level on the inbound traffic interface (where traffic enters the router), include the **symmetric-hash** or **symmetric-hash complement** statement at the **[edit chassis fpc slot-number pic pic-number hash-key]** hierarchy level:

```
[edit chassis fpc slot-number pic pic-number hash-key]
family multiservice {
  source-mac;
  destination-mac;
  payload {
    ip {
      layer-3 (source-ip-only | destination-ip-only);
      layer-4;
    }
  }
  symmetric-hash {
    complement;
  }
}
```

```
family inet {
  layer-3;
  layer-4;
  symmetric-hash {
    complement;
  }
}
```

}

**NOTE:**

- PIC-level symmetrical hashing overrides the chassis-level symmetrical hashing configured at the [edit chassis forwarding-options hash-key] hierarchy level.
- Symmetrical hashing for load balancing on 802.3ad Link Aggregation Groups is currently supported for the VPLS, INET and bridged traffic only.
- Hash key configuration on a PIC or Packet Forwarding Engine can be either in the “symmetric hash” or the “symmetric hash complement” mode, but not both at the same time.

- [symmetric-hash on page 790](#)

## Examples: Configuring PIC-Level Symmetrical Hashing for Load Balancing on 802.3ad LAGs on MX Series Routers

**NOTE:** These examples are applicable only to the DPCs Supported on MX240, MX480, and MX960 Routers. For the list of DPCs supported, see *DPCs Supported on MX240, MX480, and MX960 Routers* in the Related Documentation section.

The following examples show how to configure symmetrical hashing at the PIC level for load balancing on MX Series routers:

- [Configuring Symmetrical Hashing for family multiservice on Both Routers on page 492](#)
- [Configuring Symmetrical Hashing for family inet on Both Routers on page 492](#)
- [Configuring Symmetrical Hashing for family inet and family multiservice on the Two Routers on page 493](#)

## Configuring Symmetrical Hashing for family multiservice on Both Routers

On the inbound traffic interface where traffic enters Router A, include the **symmetric-hash** statement at the **[edit chassis fpc slot-number pic pic-number hash-key family multiservice]** hierarchy level:

```
[edit chassis fpc 2 pic 2 hash-key]
family multiservice {
  source-mac;
  destination-mac;
  payload {
    ip {
      layer-3;
      layer-4;
    }
  }
  symmetric-hash;
}
```

On the inbound traffic interface where traffic enters Router B, include the **symmetric-hash complement** statement at the **[edit chassis fpc slot-number pic pic-number hash-key family multiservice]** hierarchy level:

```
[edit chassis fpc 0 pic 3 hash-key]
family multiservice {
  source-mac;
  destination-mac;
  payload {
    ip {
      layer-3;
      layer-4;
    }
  }
  symmetric-hash {
    complement;
  }
}
```

## Configuring Symmetrical Hashing for family inet on Both Routers

On the inbound traffic interface where traffic enters Router A, include the **symmetric-hash** statement at the **[edit chassis fpc slot-number pic pic-number hash-key family inet]** hierarchy level:

```
[edit chassis fpc 0 pic 1 hash-key]
family inet {
  layer-3;
  layer-4;
  symmetric-hash;
}
```

On the inbound traffic interface where traffic enters Router B, include the **symmetric-hash complement** statement at the **[edit chassis fpc slot-number pic pic-number hash-key family inet]** hierarchy level:

```
[edit chassis fpc 1 pic 2 hash-key]
family inet {
  layer-3;
  layer-4;
  symmetric-hash {
    complement;
  }
}
```

### Configuring Symmetrical Hashing for family inet and family multiservice on the Two Routers

On the inbound traffic interface where traffic enters Router A, include the **symmetric-hash** statement at the **[edit chassis fpc slot-number pic pic-number hash-key family multiservice]** hierarchy level:

```
[edit chassis fpc 1 pic 0 hash-key]
family multiservice {
  payload {
    ip {
      layer-3;
      layer-4;
    }
  }
  symmetric-hash;
}
```

On the inbound traffic interface where traffic enters Router B, include the **symmetric-hash complement** statement at the **[edit chassis fpc slot-number pic pic-number hash-key family inet]** hierarchy level:

```
[edit chassis fpc 0 pic 3 hash-key]
family inet {
  layer-3;
  layer-4;
  symmetric-hash {
    complement;
  }
}
```

# Configuring Chassis Settings to Support Channelized Interfaces

- [Configuring the Junos OS to Support Channelized DS3-to-DS0 Naming for Channel Groups and Time Slots on page 495](#)
- [Ranges for Channelized DS3-to-DS0 Configuration on page 496](#)
- [Configuring the Junos OS to Support Channelized STM1 Interface Virtual Tributary Mapping on page 497](#)
- [Configuring the Junos OS to Enable Channelization on DS3/E3 MIC on page 497](#)

## Configuring the Junos OS to Support Channelized DS3-to-DS0 Naming for Channel Groups and Time Slots

---

You can configure 28 T1 channels per T3 interface. Each T1 link can have up to eight channel groups, and each channel group can hold any combination of DS0 time slots. To specify the T1 link and DS0 channel group number in the name, use colons (:) as separators. For example, a Channelized DS3-to-DS0 PIC might have the following physical and virtual interfaces:

```
ds-0/0/0:x:y
```

where *x* is a T1 link ranging from 0 through 27 and *y* is a DS0 channel group ranging from 0 through 7. (See [Table 72 on page 497](#) for more information about ranges.)

You can use any of the values within the range available for *x* and *y*; you do not have to configure the links sequentially. The software applies the interface options you configure according to the following rules:

- You can configure **t3-options** for **t1** link 0 and channel group 0 only; for example, **ds-0/0/0:0:0**.
- You can configure **t1-options** for any **t1** link value, but only for channel group 0; for example, **ds-0/0/0:x:0**.
- There are no restrictions on changing the default **ds0-options**.
- If you delete a configuration you previously committed for channel group 0, the options return to the default values.

To configure the channel groups and time slots for a channelized DS3 interface, include the **channel-group** and **timeslots** statements at the `[edit chassis fpc slot-number pic pic-number ct3 port port-number t1 link-number]` hierarchy level:

```
[edit chassis fpc slot-number pic pic-number ct3 port port-number t1 link-number]
channel-group channel-number timeslots slot-number;
```

**NOTE:** If you commit the interface name but do not include the `[edit chassis]` configuration, the Channelized DS3-to-DS0 PIC behaves like a Channelized DS3-to-DS1 PIC: none of the DS0 functionality is accessible.

**NOTE:** The FPC slot range depends on the platform. The maximum range of 0 through 7 applies to M40 routers; for M20 routers, the range is 0 through 3; for M10 routers the range is 0 through 1; for M5 routers, the only applicable value is 0. The Multichannel DS3 (Channelized DS3-to-DS0) PIC is not supported on M160 routers.

Bandwidth limitations restrict the interface to a maximum of 128 channel groups per T3 port, rather than the theoretical maximum of  $8 \times 28 = 224$ .

There are 24 time slots on a T1 interface. You can designate any combination of time slots for usage, but you can use each time slot number on only one channel group within the same T1 link.

To use time slots 1 through 10, designate **slot-number** as in this example:

```
[edit chassis fpc 0 pic 1 ct3 port 5 t1 22]
channel-group 7 timeslots 1-10;
```

To use time slots 1 through 5, time slot 10, and time slot 24, designate **slot-number** as in this example:

```
[edit chassis fpc 2 pic pic-number1 ct3 port 0 t1 8]
channel-group 4 timeslots 1-5,10,24;
```

Do not include spaces in the list of time slot numbers.

#### Related Documentation

- [Ranges for Channelized DS3-to-DS0 Configuration on page 496](#)

## Ranges for Channelized DS3-to-DS0 Configuration

Table 72 on page 497 shows the ranges for each of the quantities in the preceding configuration.

Table 72: Ranges for Channelized DS3-to-DS0 Configuration

Item	Variable	Range
FPC slot	<i>slot-number</i>	0 through 7 (see note below)
PIC slot	<i>pic-number</i>	0 through 3
Port	<i>port-number</i>	0 through 1
T1 link	<i>link-number</i>	0 through 27
DS0 channel group	<i>group-number</i>	0 through 7
time slot	<i>slot-number</i>	1 through 24

- Related Documentation**
- [Configuring the Junos OS to Support Channelized DS3-to-DS0 Naming for Channel Groups and Time Slots on page 495](#)

## Configuring the Junos OS to Support Channelized STM1 Interface Virtual Tributary Mapping

By default, virtual tributary mapping uses KLM mode. You can configure virtual tributary mapping to use KLM or ITU-T mode. On the original Channelized STM1 PIC, to configure virtual tributary mapping, include the **vtmapping** statement at the **[edit chassis fpc slot-number pic pic-number]** hierarchy level:

```
[edit chassis fpc slot-number pic pic-number]
  vtmapping (klm | itu-t);
```

For the Channelized STM1 PIC with IQ, you can configure virtual tributary mapping by including the **vtmapping** statement at the **[edit interfaces cau4 fpc slot-number pic pic-number sonet-options]** hierarchy level.

- Related Documentation**
- [Configuring the Junos OS to Support the Sparse DLCI Mode on Channelized STM1 or Channelized DS3 PICs on page 466](#)
  - [Configuring Virtual Tributary Mapping of Channelized STM1 Interfaces](#)

## Configuring the Junos OS to Enable Channelization on DS3/E3 MIC

By default, the DS3/E3 MIC functions in clear-channel mode. To enable the DS3/E3 MIC to function in channelized mode, you need to use the software license S-MIC-3D-8CHDS3. To enable channelization, set the **channelization** statement at the **[edit chassis fpc MPC-slot-number pic MIC-slot-number]** hierarchy level. You can use the **channelization** option to channelize only individual DS3 interfaces.

**NOTE:**

- You can configure the **channelization** statement to enable channelization for the DS3/E3 MIC only. Moreover, you can use the **channelization** statement only on MX Series routers with Queuing and Enhanced Queuing MPCs (MX-MPC1-3D-Q, MX-MPC2-3D-Q, and MX-MPC2-3D-EQ) or on MX80 routers. Configuring the **channelization** statement on other MPCs does not have any effect, and the MICs continue to operate in clear-channel mode.
- Only clear-channel E3 mode is supported on the DS3/E3 MIC. Therefore, configuring the **channelization** statement does not impact the E3 functionality.

To configure channelization on the DS3/E3 MIC:

1. At the **[edit chassis]** hierarchy level in configuration mode, navigate to the hierarchy level that indicates the slot on which the DS3/E3 MIC is located.

```
[edit chassis]
user@host# edit fpc MPC-slot-number pic MIC-slot-number
```

For example, to navigate to the **[edit chassis fpc 1 pic 2]** hierarchy level:

```
[edit chassis]
user@host# edit fpc 1 pic 2
```

2. Configure the **channelization** statement.

```
[edit chassis fpc MPC-slot-number pic MIC-slot-number]
user@host# set channelization
```

For example:

```
[edit chassis fpc 1 pic 2]
user@host# set channelization
```

3. Verify the configuration by using the **show** command at the **[edit chassis]** hierarchy level:

```
[edit chassis]
user@host# show
fpc 1 {
  pic 2 {
    channelization;
  }
}
```

To enable the DS3/E3 MIC to function in clear-channel mode, you need to disable channelization. To do this, delete the **channelization** option at the **[chassis fpc MPC-slot-number pic MIC-slot-number]** hierarchy level.

To disable channelization on the DS3/E3 MIC:

1. At the **[edit chassis]** hierarchy level in configuration mode, navigate to the hierarchy level that indicates the slot on which the DS3/E3 MIC is located.

```
[edit chassis]
user@host# edit fpc MPC-slot-number pic MIC-slot-number
```

For example:

```
[edit chassis]
user@host# edit fpc 1 pic 2
```

2. Delete the **channelization** statement.

```
[edit chassis fpc MPC-slot-number pic MIC-slot-number]
user@host# delete channelization
```

For example:

```
[edit chassis fpc 1 pic 2]
user@host# delete channelization
```

# Configuring Chassis Settings to Support ATM Devices

- [Configuring the Junos OS to Enable ATM2 Intelligent Queuing Layer 2 Circuit Transport Mode on page 501](#)
- [Configuring the Junos OS to Enable Idle Cell Format and Payload Patterns for ATM Devices on page 502](#)

## Configuring the Junos OS to Enable ATM2 Intelligent Queuing Layer 2 Circuit Transport Mode

---

On ATM2 IQ PICs only, you can configure Layer 2 circuit cell relay, Layer 2 circuit ATM Adaptation Layer 5 (AAL5), or Layer 2 circuit trunk mode.

Layer 2 circuit cell relay and Layer 2 circuit AAL5 are defined in the Internet draft *draft-martini-l2circuit-encap-mpls-04.txt*, *Encapsulation Methods for Transport of Layer 2 Frames Over IP and MPLS Networks*.

Layer 2 circuit trunk mode allows you to send ATM cells over Multiprotocol Label Switching (MPLS) trunking.

The four transport modes are defined as follows:

- To tunnel IP packets over an ATM backbone, use the default standard AAL5 transport mode.
- To tunnel a stream of AAL5-encoded ATM segmentation-and-reassembly protocol data units (SAR-PDUs) over an MPLS or IP backbone, use Layer 2 circuit AAL5 transport mode.
- To tunnel a stream of ATM cells over an MPLS or IP backbone, use Layer 2 circuit cell-relay transport mode.
- To transport ATM cells over an MPLS core network that is implemented on some other vendor switches, use Layer 2 circuit trunk mode.

**NOTE:** You can transport AAL5-encoded traffic with Layer 2 circuit cell-relay transport mode, because Layer 2 circuit cell-relay transport mode ignores the encoding of the cell data presented to the ingress interface.

When you configure AAL5 mode Layer 2 circuits, the control word carries cell loss priority (CLP) information by default.

By default, ATM2 IQ PICs are in standard AAL5 transport mode. Standard AAL5 allows multiple applications to tunnel the protocol data units of their Layer 2 protocols over an ATM virtual circuit. To configure the Layer 2 circuit transport modes, include the **atm-l2circuit-mode** statement at the **[edit chassis fpc slot-number pic pic-number]** hierarchy level:

```
[edit chassis fpc slot-number pic pic-number]
atm-l2circuit-mode (cell | aal5 | trunk trunk);
```

On a TX Matrix or TX Matrix Plus router, include the **atm-l2circuit-mode** statement at the **[edit chassis lcc number fpc slot-number pic pic-number]** hierarchy level:

```
[edit chassis lcc number fpc slot-number pic pic-number]
atm-l2circuit-mode (cell | aal5 | trunk trunk);
```

**aal5** tunnels a stream of AAL5-encoded ATM cells over an IP backbone.

**cell** tunnels a stream of ATM cells over an IP backbone.

**trunk** transports ATM cells over an MPLS core network that is implemented on some other vendor switches. Trunk mode can be user-to-network interface (UNI) or network-to-network interface (NNI).

**NOTE:** To determine which vendors support Layer 2 circuit trunk mode, contact Juniper Networks customer support.

---

---

## Configuring the Junos OS to Enable Idle Cell Format and Payload Patterns for ATM Devices

---

ATM devices send idle cells to enable the receiving ATM interface to recognize the start of each new cell. The receiving ATM device does not act on the contents of idle cells and does not pass them up to the ATM layer in the ATM protocol stack.

By default, the idle cell format for ATM cells is (4 bytes): 0x00000000. For ATM 2 PICs and ATM MICs, you can configure the format of the idle cell header and payload bytes.

To configure the idle cell header to use the International Telecommunications Union (ITU-T) standard of 0x00000001, include the **itu-t** statement at the **[edit chassis fpc slot-number pic pic-number idle-cell-format]** hierarchy level:

```
[edit chassis fpc slot-number pic pic-number idle-cell-format]
itu-t;
```

On a TX Matrix or TX Matrix Plus router, include the **itu-t** statement at the **[edit chassis lcc number fpc slot-number pic pic-number idle-cell-format]** hierarchy level:

```
[edit chassis lcc number fpc slot-number pic pic-number idle-cell-format]
itu-t;
```

By default, the payload pattern is cell payload (48 bytes). To configure the idle cell payload pattern, include the **payload-pattern** statement at the **[edit chassis fpc slot-number pic pic-number idle-cell-format]** hierarchy level:

```
[edit chassis fpc slot-number pic pic-number idle-cell-format]
payload-pattern payload-pattern-byte;
```

On a TX Matrix router, include the **payload-pattern** statement at the **[edit chassis lcc number fpc slot-number pic pic-number idle-cell-format]** hierarchy level:

```
[edit chassis lcc number fpc slot-number pic pic-number idle-cell-format]
payload-pattern payload-pattern-byte;
```

The payload pattern byte can range from **0x00** through **0xff**.

For information about the TX Matrix router, see [“TX Matrix Router and T640 Router Configuration Overview” on page 373](#). For information about the TX Matrix Plus router, see [“TX Matrix Plus Router Configuration Overview” on page 397](#).

## Configuring the Junos OS to Support Redundancy on Routers Having Multiple Routing Engines or Switching Boards

---

For routers that have multiple Routing Engines or these multiple switching control boards: Switching and Forwarding Modules (SFMs), System and Switch Boards (SSBs), Forwarding Engine Boards (FEBs), or Compact Forwarding Engine Boards (CFEBs), you can configure redundancy properties.

To configure redundancy, include the following redundancy statements at the **[edit chassis]** hierarchy level:

```
redundancy {
  cfeb slot (always | preferred);
  failover {
    on-disk-failure
    on-loss-of-keepalives;
  }
  feb {
    redundancy-group group-name {
      feb slot-number (backup | primary);
      description description;
      no-auto-failover;
    }
  }
}
```

```

    }
  }
  graceful-switchover;
  keepalive-time seconds;
  routing-engine slot-number (master | backup | disabled);
  sfm slot-number (always | preferred);
  ssb slot-number (always | preferred);
}

```

- [Understanding Routing Engine Redundancy on Juniper Networks Routers](#)

## Configuring the Junos OS to Allocate More Memory for Routing Tables, Firewall Filters, and Layer 3 VPN Labels

The jtree memory on all MX Series, all M120, and some M320, M10i, M7i, T640, T1600, TX Matrix, TX Matrix Plus router Packet Forwarding Engines has two segments: one segment primarily stores routing tables and related information, and the other mainly stores firewall-filter-related information.

The Junos OS provides the **memory-enhanced** statement to reallocate the jtree memory for routes, firewall filters, and Layer 3 VPNs. The statement has the following options:

- **filter**—Include this statement when you want to support larger firewall filters over routing tables. However, we recommend enabling this option only if you do not have a very large routing table configuration.

To allocate more memory for firewall filters, include the **filter** statement at the **[edit chassis memory-enhanced]** hierarchy level:

```
[edit chassis memory-enhanced]
filter;
```

- **route**—Include this statement when you want to support larger routing tables (with more routes) over firewall filters. For example, you can enable this option, when you want to support a large number of routes for Layer 3 VPNs implemented using MPLS. However, we recommend enabling this option only if you do not have a very large firewall configuration.

To allocate more memory for routing tables, include the **route** statement at the **[edit chassis memory-enhanced]** hierarchy level:

```
[edit chassis memory-enhanced]
route;
```

- **vpn-label**—Include this statement when you want to enhance memory to support a larger number of Layer 3 VPN labels.

Layer 3 VPN composite next hops can be enabled by including the **l3vpn-composite-nexthop** statement at the **[edit routing-options]** and **[edit logical-systems logical-system-name routing-options]** hierarchy levels. This statement enables BGP to accept larger numbers of Layer 3 VPN BGP updates with unique inner

VPN labels. Including the **l3vpn-composite-nexthop** in the configuration enhances scaling and convergence performance of PE routers participating in a Layer 3 VPN in a multivendor environment. For more information on configuring the **l3vpn-composite-nexthop** statement, see the *Junos OS VPNs Library for Routing Devices*.

To allocate more memory to support a larger number of Layer 3 VPN labels accepted by the **l3vpn-composite-nexthop** statement, include the **vpn-label** statement at the **[edit chassis memory-enhanced]** hierarchy level:

```
[edit chassis memory-enhanced]  
vpn-label;
```

The **memory-enhanced vpn-label** statement increases the size of the fabric next-hop table, which is held on the egress FPC in the jtree, from the default value of 128,000 entries to 1,000,000 entries. This improves token fabric scaling, at the expense of additional segment 1 usage. This functionality is not applicable to MX Series, or M320 platforms, as these platforms provide for flexibly sized fabric token tables by default. This means that the **memory-enhanced route** statement is applicable to T Series platforms and that you can configure both **memory-enhanced vpn-label** and **memory-enhanced route** on T Series platforms when their combined functionality is desired.

You can configure the **memory-enhanced** statement on the following routers:

- M10i and M7i routers with Enhanced CFEB
- M320 routers with Enhanced III FPC1, Enhanced III FPC2, and Enhanced III FPC3
- M120 routers
- MX Series routers with DPC (I-chip based) line cards
- T Series (T640, T1600, TX Matrix, and TX Matrix Plus) routers with Enhanced Scaling FPC1, Enhanced Scaling FPC2, Enhanced Scaling FPC3, and Enhanced Scaling FPC4.

**NOTE:**

- The following hardware is not supported for the TXP-T1600 configuration for Junos OS Release 10.0 and earlier releases. If you plan to run a release prior to Junos OS Release 10.0, you must remove the following FPCs and any PICs that require these FPCs prior to integrating the LCC into the routing matrix:
  - All type 1 FPCs
  - All type 2 FPCs
  - T640 Enhanced Scaling FPC4-1P FPCs
- The following hardware is not supported for the TXP-T1600-3D or TXP-Mixed-LCC-3D configuration:
  - T640-FPC1-E and T640-FPC1-E2
  - T640-FPC2, T640-FPC2-E, and T640-FPC2-E2
  - T640-FPC3, T640-FPC3-E, and T640-FPC3-E2

As the allocation of more memory for routing tables or firewall filters might disrupt the forwarding operations of a Packet Forwarding Engine, the Junos OS CLI displays a warning to restart all affected FPCs when you commit a configuration that includes the **memory-enhanced route** statement. The configuration does not become effective until you restart the FPC or DPC (on MX Series routers).

To restart a single FPC or DPC without rebooting the entire router, issue the **request chassis fpc slot slot-number restart** command. On an M120 router, issue the **request chassis feb slot slot-number restart** command.

To view if the configuration is active on an FPC or DPC, issue the **show pfe fpc slot-number** command.

**NOTE:**

- For T Series routers only. With Junos OS Release 10.2, enhanced jtree memory allocation is disabled by default. For Junos OS Releases 9.3 through 10.1, the default routing tables (inet.0 and inet6.0) use both memory segments by default.
- In Junos OS Release 11.2 and later, the **memory-enhanced route** statement at the [edit chassis] hierarchy level replaces the **route-memory-enhanced** statement at the [edit chassis] hierarchy level.
- The **filter** and **vpn-label** statements are supported only on T Series routers.

## Configuring the Junos OS to Enable a Routing Engine to Reboot on Hard Disk Errors

When a hard disk error occurs, a Routing Engine might enter a state in which it responds to local pings and interfaces remain up, but no other processes are responding.

To recover from this situation, you can configure a single Routing Engine to reboot automatically when a hard disk error occurs. To enable this feature, include the **on-disk-failure reboot** statement at the **[edit chassis routing-engine]** hierarchy level.

```
[edit chassis routing-engine]
on-disk-failure {
  disk-failure-action (halt | reboot);
}
```

For dual Routing Engine environments, you can configure a backup Routing Engine to assume mastership automatically, if it detects a hard disk error on the master Routing Engine. To enable this feature, include the **on-disk-failure** statement at the **[edit chassis redundancy failover]** hierarchy level. For information about this statement, see the *High Availability Feature Guide*.

You can configure the Routing Engine to halt (instead of rebooting) when the hard disk fails on the Routing Engine. To configure this feature, include the **disk-failure-action (halt | reboot)** statement at the **[edit chassis routing-engine on-disk-failure]** hierarchy level:

```
[edit chassis routing-engine]
on-disk-failure {
  disk-failure-action (halt | reboot);
}
```

Use the **halt** option to configure the Routing Engine to halt when the hard disk fails. Use the **reboot** option to configure the Routing Engine to reboot when the hard disk fails.

## Associating Sampling Instances for Active Flow Monitoring with a Specific FPC, MPC, or DPC

The Junos OS enables you to configure sampling instances for active flow monitoring, by specifying a name for the sampling parameters and associating the instance name with a specific FPC, MPC, or DPC.

To configure active sampling instances, include the **instance** statement at the **[edit forwarding-options sampling]** hierarchy level. For more information about configuring sampling instances, see the *Junos OS Services Interfaces Library for Routing Devices*.

To associate a configured active sampling instance with a specific FPC, MPC, or DPC, include the sampling instance name at the **[edit chassis fpc slot-number]** hierarchy level:

```
[edit chassis fpc slot-number]
sampling-instance instance-name;
```

On a TX Matrix, TX Matrix Plus router, include the **sampling-instance** statement at the **[edit chassis lcc number fpc slot-number]** hierarchy level:

```
[edit chassis lcc number fpc slot-number]
sampling-instance instance-name;
```

## Configuring a Policer Overhead

Configuring a policer overhead allows you to control the rate of traffic sent or received on an interface. When you configure a policer overhead, the configured policer overhead value (bytes) is added to the length of the final Ethernet frame. This calculated length of frame is used to determine the policer or the rate limit action. Therefore, the policer overhead enables you to control the rate of traffic sent or received on an interface. You can configure the policer overhead to rate-limit queues and Layer 2 and MAC policers. The policer overhead and the shaping overhead can be configured simultaneously on an interface.

This feature is supported on M Series and T Series routers with IQ2 PICs or IQ2E PICs, and on MX Series DPCs.

To configure a policer overhead for controlling the rate of traffic sent or received on an interface:

1. In the **[edit chassis]** hierarchy level in configuration mode, create the interface on which to add the policer overhead to input or output traffic.

```
[edit chassis]
user@host# edit fpc fpc pic pic
```

For example:

```
[edit chassis]
user@host# edit fpc 0 pic 1
```

2. Configure the policer overhead to control the input or output traffic on the interface. You could use either statement or both the statements for this configuration.

```
[edit chassis fpc fpc pic pic]
user@host# set ingress-policer-overhead bytes;
user@host# set egress-policer-overhead bytes;
```

For example:

```
[edit chassis fpc 0 pic 1]
user@host# set ingress-policer-overhead 10;
user@host# set egress-policer-overhead 20;
```

### 3. Verify the configuration:

```
[edit chassis]
user@host# show
fpc 0 {
  pic 1 {
    ingress-policer-overhead 10;
    egress-policer-overhead 20;
  }
}
```

**NOTE:** When the configuration for the policer overhead bytes on a PIC is changed, the PIC goes offline and then comes back online. In addition, the configuration in the CLI is on a per-PIC basis and, therefore, applies to all the ports on the PIC.

- [ingress-policer-overhead on page 679](#)

## Configuring Sanity Polling

You can configure the **sanity-poll** statement for a particular FPC or FEB or CFEB to start a periodic sanity check for that FPC or FEB or CFEB. The periodic sanity check includes checking for error conditions such as “register sanity issues,” “high temperature,” “hardware failure,” and so on. If you do not configure the **sanity-poll** statement, then sanity polling is disabled.

**NOTE:** Currently, periodic sanity check is performed only on the routing chip register.

Sanity polling periodically checks for an error condition in an FPC or FEB or CFEB and performs the appropriate actions in case of an error.

- To configure sanity polling for an FPC on T Series routers and M320 routers, include the **sanity-poll** statement and its substatements at the **[edit chassis fpc slot-number]** hierarchy level:

```
[edit chassis]
fpc slot-number {
  sanity-poll {
    retry-count number;
    on-error {
      raise-alarm;
      power (cycle | off);
      write-coredump;
    }
  }
}
```

- To configure sanity polling for a FEB on the M120 router, include the **sanity-poll** statement and its substatements at the **[edit chassis feb slot-number]** hierarchy level:

```
[edit chassis]
feb slot-number {
  sanity-poll {
    retry-count number;
    on-error {
      raise-alarm;
      power (cycle | off);
      write-coredump;
    }
  }
}
```

- To configure sanity polling for a CFEB on M7i and M10 routers, include the **sanity-poll** statement and its substatements at the **[edit chassis cfeb slot-number]** hierarchy level:

```
[edit chassis]
cfcb slot-number {
  sanity-poll {
    retry-count number;
    on-error {
      raise-alarm;
      power (cycle | off);
      write-coredump;
    }
  }
}
```

**NOTE:** On a TX Matrix or TX Matrix Plus router, you can configure the **sanity-poll** statement at the **[edit chassis lcc number fpc number]** hierarchy level.

The **sanity-poll** statement comprises the following substatements:

- The **retry-count** statement specifies the number of rechecks to be performed after the occurrence of a particular error condition. If an error exists in all the periodic checks, then sanity polling reports an error and proceeds to perform the appropriate actions (described as options of the **on-error** statement).

For example, if the periodic sanity check detects an error in the FPC or FEB or CFEB and if you configure the **retry count number** to 15, sanity polling does not report the error immediately. Sanity polling checks 15 times for the same error condition. If an error persists in all 15 rechecks, then it reports an error and takes the appropriate actions.

If you do not configure the **retry-count** statement, then by default, the **sanity-poll** statement rechecks the detected error 10 times before reporting an error condition.

- If sanity polling detects an error condition, the **on-error** statement performs the appropriate actions to eliminate the error.

The following actions are common to all kinds of error conditions:

- To generate a chassis alarm, configure the **raise-alarm** statement. The chassis alarm is displayed in the front panel of the chassis.
- To reboot the FPC or FEB or CFEB after generating a core file, configure the **power cycle** statement. This statement is useful for temporary software errors that are eliminated after reboot.
- To halt the FPC or FEB or CFEB, configure the **power off** statement. This statement is useful in case of permanent hardware failure.

**CAUTION:** The **power off** statement halts the FPC. Ensure that you have backup paths through a different FPC or FEB or CFEB to avoid service outage.

**NOTE:** The **power cycle** and **power off** statements are mutually exclusive: You can configure either the **power cycle** or the **power off** action for an error.

- To trigger the core file, configure the **write-coredump** statement.

You can configure multiple actions for a given FPC or FEB or CFEB. If you do not configure any actions, the **sanity-poll** statement generates only FPC or FEB or CFEB system log messages.

## Configuring Slow Packet Forwarding Engine Alarm

On an M Series, an MX Series, a T Series, or a SRX Series router, the Packet Forwarding Engine might not send a resource acknowledgment message to the Routing Engine within a predetermined time of 360 seconds. This delay in receiving resource acknowledgment could be due to a slow or stuck Packet Forwarding Engine on the M Series, MX Series, T Series, or SRX Series router, or on one of the LCCs connected to a TX Matrix, TX Matrix Plus, or TX Matrix Plus router with 3D SIBs.

Starting with Junos OS Release 13.2R1 (also applicable in Junos OS Releases 12.1R6, 12.2R5, 12.3R3, 13.1R2 and later), to display the issue as an alarm in the **show chassis alarms** command output and to append the alarm to the system log messages file, you must enable the slow Packet Forwarding Engine alarm on the router.

The following sections provide more information about the slow Packet Forwarding Engine alarm:

- [Enabling Slow Packet Forwarding Engine Alarm on page 514](#)
- [Disabling Slow Packet Forwarding Engine Alarm on page 514](#)
- [Verifying That the Alarm Output and System Log Messages are Updated on page 515](#)

### Enabling Slow Packet Forwarding Engine Alarm

To enable the slow Packet Forwarding Engine alarm, perform the following steps:

**NOTE:** By default, the slow Packet Forwarding Engine alarm is disabled.

1. In configuration mode, go to the **[edit chassis]** hierarchy level:

```
[edit]
user@host# edit chassis
```

2. Enable the slow Packet Forwarding Engine alarm by configuring the **slow-pfe-alarm** statement.

```
[edit chassis]
user@host# set slow-pfe-alarm
```

### Disabling Slow Packet Forwarding Engine Alarm

To disable the slow Packet Forwarding Engine alarm, perform the following steps:

1. In configuration mode, go to the **[edit chassis]** hierarchy level:

```
[edit]
user@host# edit chassis
```

2. Disable the slow Packet Forwarding Engine alarm by deleting the **slow-pfe-alarm** statement.

```
[edit chassis]
user@host# delete slow-pfe-alarm
```

## Verifying That the Alarm Output and System Log Messages are Updated

**Purpose** To verify that the output of the **show chassis alarms** operational mode command and the system log messages file are updated with the slow Packet Forwarding Engine alarm when:

- The **slow-pfe-alarm** statement is enabled in the **[edit chassis]** hierarchy.
- The Packet Forwarding Engine resource acknowledgment is not received by the Routing Engine within a predetermined time of 360 seconds.

**Action** To check the output on an M Series, MX Series, T Series, or a SRX Series router:

1. Verify that the alarm is displayed in the output of the **show chassis alarms** operational mode command.

```
user@host> show chassis alarms

1 alarms currently active
Alarm time           Class  Description
2013-02-05 01:12:33 PST  Minor  Potential slow peers are: XDPC2
```

For field descriptions, see [show chassis alarms](#).

2. Verify that the alarm is appended to the system log messages file.

```
/var/log/messages -
... Alarm set: RE color=YELLOW, class=CHASSIS, reason=Potential slow peers
are: XDPC2
... Minor alarm set, Potential slow peers are: XDPC2
```

To check the output on a TX Matrix, TX Matrix Plus, or a TX Matrix Plus with 3D SIBs router:

1. Verify that the alarm is displayed in the output of the **show chassis alarms** operational mode command.

```
user@scc> show chassis alarms

scc-re0:
-----
9 alarms currently active
Alarm time           Class  Description
2013-02-06 00:45:46 PST  Minor  Potential slow peers are: LCC1 LCC0
...
lcc0-re0:
```

```

-----
4 alarms currently active
Alarm time          Class  Description
2013-02-06 00:44:51 PST  Minor Potential slow peers are: GFPC4 GFPC3
...
lcc1-re0:
-----
4 alarms currently active
Alarm time          Class  Description
2013-02-06 00:45:44 PST  Minor Potential slow peers are: GFPC10
...
lcc2-re0:
-----
No alarms currently active
lcc3-re0:
-----
No alarms currently active

```

For field descriptions, see [show chassis alarms](#).

2. Verify that the alarm is appended to the system log messages file.

```

... Alarm set: RE color=YELLOW, class=CHASSIS, reason=Potential slow peers
are: LCC0 LCC1
... Minor alarm set, Potential slow peers are: LCC0
... Alarm set: RE color=YELLOW, class=CHASSIS, reason=Potential slow peers
are: GFPC4 GFPC3
... Minor alarm set, Potential slow peers are: GFPC4 GFPC3
... Alarm set: RE color=YELLOW, class=CHASSIS, reason=Potential slow peers
are: GFPC10
... Minor alarm set, Potential slow peers are: GFPC10

```

**Meaning** The output of **show chassis alarms** operational mode command and the system log messages file are updated as expected when the slow Packet Forwarding Engine alarm is enabled and when the Packet Forwarding Engine resource acknowledgment is not received by the Routing engine within a predetermined time of 360 seconds.

## CHAPTER 23

# Configuring Chassis Settings for the Craft Interface

- [Configuring the Junos OS to Disable the Physical Operation of the Craft Interface on page 517](#)

## Configuring the Junos OS to Disable the Physical Operation of the Craft Interface

You can disable the physical operation of the craft interface front panel on the router. When you disable the operation of the craft interface, the buttons on the front panel, such as the alarm cutoff button, no longer function. To disable the craft interface operation, include the **craft-lockout** statement at the **[edit chassis]** hierarchy level:

```
[edit chassis]  
craft-lockout;
```

## User-Defined Alarm Relay Overview

---

The ACX Series router alarm contact port—labeled ALARM on the front panel—allows you to manage sensors and external devices connected to the router in remote unstaffed facilities.

**NOTE:** Alarm contact port is not applicable on ACX5048 and ACX5096 routers.

- [Alarm Contact Port on page 519](#)
- [Alarm Input on page 520](#)
- [Alarm Output on page 520](#)

## Alarm Contact Port

The ACX Series router alarm contact port is a 15-pin D-type dry contact connector for alarms. The alarm contact port is used to generate LED alarms on the router and to turn external devices on or off. You can connect up to four input alarms and two output alarms. The alarm setting is open or closed.

## Alarm Input

Alarm input provides dry contacts to connect to security sensors such as door or window monitors. The alarm input—open or closed—is sensed and reported to the management software. You can configure up to four alarm input relay ports (0 through 3) to operate as normally open or normally closed, and to trigger a red alarm condition or a yellow alarm condition or to ignore alarm conditions.

## Alarm Output

Alarm output provides dry contacts to connect to external equipment, such as an audible or visual alarm that switches on or off—for example, a bell or a light. The four alarm output relay ports—0 through 3—are set up as follows:

- Ports 0 and 1—These ports can be configured to trigger an alarm when the system temperature goes to the red alarm status and when an alarm input port is triggered.
- Ports 2 and 3—These ports are *not* configured. They are used to indicate system major and minor alarms and are normally open. When a condition triggers an alarm, an alarm message is displayed.

To view the alarm input and output relay information, issue the **show chassis craft-interface** command from the Junos OS command line interface.

### Related Documentation

- *relay (Chassis Alarm)*

---

## Configuring Chassis Alarm Relays

On ACX Series routers, you can configure alarm relays that can trigger alarms and turn external devices on or off. For example, if the router heats up to more than the critical temperature, the output port is activated and a device connected to the output port—such as a fan—is turned on.

To configure conditions that trigger alarms, include the **relay** statement with the **input** and **output** options at the **[edit chassis alarm]** hierarchy level.

```
[edit chassis alarm]
relay
  input {
    port port-number {
      mode (close | open);
      trigger (ignore | red | yellow);
    }
  }
```

```
output{
  port port-number {
    input-relay input-relay;
    mode (close | open);
    temperature;
  }
}
```

The following output shows an example configuration of a chassis relay alarm:

```
[edit chassis alarm]
user@host# show
relay {
  input {
    port 1 {
      mode close;
      trigger red;
    }
  }
  output {
    port 0 {
      temperature;
    }
  }
}
```

#### Related Documentation

- [User-Defined Alarm Relay Overview on page 519](#)
- [input](#)
- [output](#)
- [show chassis craft-interface on page 950](#)
- [show chassis alarms on page 925](#)

## Configuring Chassis Alarm Input

The ACX Series router alarm contact port—labeled ALARM on the front panel—allows you to manage sensors and external devices connected to the router in remote unstaffed facilities. You can configure up to four alarm input ports (0 through 3) to operate as normally open or normally closed, and to trigger a red alarm condition or a yellow alarm condition or to ignore alarm conditions.

To configure an input alarm:

1. Configure the input port:

```
[edit chassis alarm relay input port port-number]
```

For example, to configure input port zero (0):

```
user@host# edit chassis alarm relay input port 0
```

2. Configure the mode in which the input alarm is not active:

```
[edit chassis alarm relay input port port-number mode (close | open)]
```

For example, to configure open mode:

```
[edit chassis alarm relay input port 0]  
user@host# set mode open
```

3. Configure the trigger to set off the alarm:

```
[edit chassis alarm relay input port port-number trigger (ignore | red | yellow)]
```

For example, to set off the yellow alarm:

```
[edit chassis alarm relay input port 0]  
user@host# set trigger yellow
```

4. Verify the configuration with the **show** command:

```
[edit chassis alarm relay input port 0]  
user@host# show  
mode open;  
trigger yellow;
```

5. Commit the configuration with the **commit** command.

To view the alarm input relay information, issue the **show chassis alarms** or **show chassis craft-interface** commands from the Junos OS command line interface.

#### Related Documentation

---

## Configuring Chassis Alarm Output

The ACX Series router alarm contact port—labeled ALARM on the front panel—allows you to manage sensors and external devices connected to the router in remote unstaffed facilities. You can configure up to two alarm output relay ports (0 and 1) to operate as normally open or normally closed, and to trigger an alarm when the system temperature goes to the red alarm status and when an alarm input port is triggered.

**NOTE:** Ports 2 and 3 are *not* configured. They are used to indicate system major and minor alarms and are normally open. When a condition triggers an alarm, an alarm message is displayed, and the corresponding LED turns on.

To configure an output alarm:

1. Configure the output port:

```
[edit chassis alarm relay output port port-number]
```

For example, to configure output port zero (0):

```
user@host# edit chassis alarm relay output port 0
```

2. Configure the trigger to set off the alarm:

```
[edit chassis alarm relay output port port-number (input-relay | mode | temperature)]
```

For example, to set off the alarm when the system temperature goes into the red status:

```
[edit chassis alarm relay output port 0]
user@host# set temperature
```

3. Verify the configuration with the **show** command:

```
[edit chassis alarm relay output port 0]
user@host# show
temperature;
```

4. Commit the configuration with the **commit** command.

To view the alarm output relay information, issue the **show chassis alarms** or **show chassis craft-interface** command from the Junos OS command line interface.

## Chassis Alarms

Table 73 on page 524 lists the chassis-related alarms that are displayed when you execute the **show chassis alarms** operational mode command on PTX Series routers.

**Table 73: Chassis Alarms for PTX series routers**

Message displayed in the output of show chassis alarms Command	Description	Class	Solution
<b>Mix of PDUs (PTX5000)</b>	Appears when AC PDUs and DC PDUs are installed. Also appears when zoning and non- zoning PDUs are installed.	Minor	Install same type of PDUs in all slots.
<b>Power Manager Non Operational (PTX5000)</b>	Appears when zoning and non- zoning PDUs are installed.	Minor	Install same type of PDUs in all slots.
<b>No Redundant Power (PTX5000)</b>	When backup PDUs are absent or down	Minor	Install backup PDU.
<b>PDU 0/1 Converter Failed (PTX5000)</b>	Appears when one or more 36V booster converter fails in PDU (PDU2-PTX-DC ).	Major	Check PDU and replace if required.
<b>No redundant power for system (PTX5000)</b>	Appears when there is no backup PDUs in the router	Minor	Install backup PDU.
<b>No Power for System (PTX5000)</b>	Appears when the router is powered on with only one PSM.	Major	Install backup PDU.
<b>SIB 1 FPC Link Error (PTX5000)</b>	Appears when the indicated SIB is down.	Minor	Replace faulty SIB.
<b>SIB 1 Absent (PTX5000)</b>	Appears when the indicated SIB is absent.	Major	Replace faulty SIB.
<b>PDU 1 PSM 1 Not OK (PTX5000)</b>	Appears when the PSM in the displayed PDU is down.	Major	Replace faulty PSM.
<b>Host x disk drive y smart error(PTX5000)</b>	<p>Appears when there is an issue with the internal state of the disk such as, the disk life remaining is below the threshold.</p> <ul style="list-style-type: none"> <li>• x=0 for Host 0 (RE0) and 1 for Host 1 (RE1)</li> <li>• y=1 for disk 1 and 2 for disk 2</li> </ul>	Minor	Replace the disk.
<b>VMHost x Boot from alternate set(PTX5000)</b>	Appears when the Routing Engine is booted from the alternate set.	Minor	Verify logs. As required, recover the Routing Engine by using the command <b>request vmhost snapshot</b>

Table 73: Chassis Alarms for PTX series routers (continued)

Message displayed in the output of show chassis alarms Command	Description	Class	Solution
<b>VMHost RE x host application failed</b> (PTX5000)	Appears when one of the vmhost daemon has failed.	Minor	Manual mastership switchover followed by reboot using the command <b>request vmhost reboot</b> .
<b>VMHost Boot from alternate disk</b> (PTX5000)	Appears when the primary disk is corrupted and unable to launch the guest.	Minor	Recover the disk by using the command <b>request vmhost snapshot recovery</b> .
<b>Host 0/1 CPU Temperature Warm</b> (PTX5000)	Appears when the Routing Engine CPU temperature is above the TCONTROL threshold.  0 for Host 0 (RE0) and 1 for Host 1 (RE1)	Minor	No recovery action required from the user. Based on the temperature, the fan speed is changed to cool the system, thereby reducing the temperature.
<b>Host 0/1 CPU Temperature Hot</b> (PTX5000)	Appears when the Routing Engine CPU temperature is above the PROCHOT threshold.  0 for Host 0 (RE0) and 1 for Host 1 (RE1)	Minor	No recovery action required from the user. Based on the temperature, the fan speed is changed to cool the system, thereby reducing the temperature.
<b>Host 0/1 ECC single bit parity error</b> (PTX5000)	Appears when single bit ECC error is above the threshold value.  0 for Host 0 (RE0) and 1 for Host 1 (RE1)	Major	No recovery action required from the user. The count gets reset after 24 hours.
<b>Host 0 ECC 53 parity error</b> (PTX5000)	Appears when multiple bit Error Checking and Correction (ECC) error is above the threshold value.	Major	Reboot the router.
<b>VMHost RE x Disk y Missing</b> (PTX5000)	Appears when the disk in the Routing Engine is missing.  <ul style="list-style-type: none"> <li>• x—0 for RE0 and 1 for RE1</li> <li>• y—1 for disk 1 and 2 for disk 2</li> </ul>	Minor	Check if there is missing or a defective disk. Insert healthy disk. Take a snapshot and recover the disk by using the command <b>request vmhost snapshot</b> .  <i>See Disk Recovery Using the VM Host Snapshot in VM Host Installation</i>

Table 73: Chassis Alarms for PTX series routers (continued)

Message displayed in the output of show chassis alarms Command	Description	Class	Solution
<b>VMHost RE x Disk y Label Missing</b> (PTX5000)	<p>Appears when the labels on the disk in the Routing Engine is missing.</p> <ul style="list-style-type: none"> <li>• x-0 for RE0 and 1 for RE1</li> <li>• y-1 for disk 1 and 2 for disk 2</li> </ul>	Minor	Reboot the Routing-Engine from healthy disk and recover the impacted disk using the command <b>request vmhost snapshot</b> .
<b>VMHost RE x Disk y Wrong Slot</b> (PTX5000)	<p>Appears when there is disk swap or pre-labelled disk inserted in wrong slot.</p> <ul style="list-style-type: none"> <li>• x-0 for RE0 and 1 for RE1</li> <li>• y-1 for disk 1 and 2 for disk 2</li> </ul>	Minor	If both the disks are in wrong slot, swap the disks and reboot. If only one disk is in wrong slot, recover the disk via snapshot after booting from healthy disk.
<b>VMHost RE x Disk y File System Errors</b> (PTX5000)	<p>Appears when there is a file system error.</p> <ul style="list-style-type: none"> <li>• x-0 for RE0 and 1 for RE1</li> <li>• y-1 for disk 1 and 2 for disk 2</li> </ul>	Minor	Boot the Routing-engine from healthy disk and recover the impacted disk using the command <b>request vmhost snapshot</b> .
<b>VMHost RE x Disk y Write Rate Threshold Cross</b> (PTX5000)	<p>Appears if write rate threshold is crossed.</p> <ul style="list-style-type: none"> <li>• x-0 for RE0 and 1 for RE1</li> <li>• y-1 for disk 1 and 2 for disk 2</li> </ul>	Minor	Identify the application that is generating excessive writes and apply configuration changes to prevent excessive writes.
<b>VMHost RE x Disk y Size Incorrect</b> (PTX5000)	<p>Appears if the size of the disk is not appropriate for the platform.</p> <ul style="list-style-type: none"> <li>• x-0 for RE0 and 1 for RE1</li> <li>• y-1 for disk 1 and 2 for disk 2</li> </ul>	Minor	Insert an disk of the right size and reboot the Routing Engine.
<b>VMHost RE x Disk y Usage Is Above Threshold</b> (PTX5000)	<p>Appears when the usage of the disk partition is above the threshold limit.</p> <ul style="list-style-type: none"> <li>• x-0 for RE0 and 1 for RE1</li> <li>• y-1 for disk 1 and 2 for disk 2</li> </ul>	Minor	Cleanup the disks using <b>request vmhost cleanup</b> command.
<b>VMHost RE x Secure Boot Disabled</b> (PTX5000)	<p>Appears when Secure Boot is not enforced in the BIOS.</p>	Medium	Enable Secure Boot in the BIOS.

**Table 73: Chassis Alarms for PTX series routers (continued)**

Message displayed in the output of show chassis alarms Command	Description	Class	Solution
<b>VMHost RE x Secure BIOS Version Mismatch</b> (PTX5000)	Appears when current BIOS version is older than the Last Known good BIOS version.	Medium	Upgrade the BIOS using the <b>request system firmware</b> command.
<b>RE x Mismatch in total memory detected</b> (PTX5000)	Appears when total memory for Secure Boot SKUs is not 128-GB.	Medium	Check the available RAM size using <b>show vmhost hardware</b> command. If the RAM size is less than 128-GB, contact JTAC for a RAM upgrade.
<b>FPC x need bounce</b> (PTX10K Series)	Appears when port speed configuration needs an FPC reboot for the new speed configuration to take effect. <ul style="list-style-type: none"> <li>x-FPC slot number.</li> </ul>	Minor	Do one of the following to clear the alarm. <ul style="list-style-type: none"> <li>Manually reboot the FPC for the new port speed configuration to take effect.</li> <li>Delete the new port speed configuration that has triggered the alarm. In this case, the new port speed configuration will not take effect.</li> </ul>

[Table 74 on page 527](#) lists the chassis-related alarms that are displayed when you execute the **show chassis alarms** operational mode command on MX Series routers

**Table 74: Chassis Alarms for MX series routers**

Message displayed in the output of show chassis alarms Command	Description	Class	Solution
<b>Host x disk drive y smart error</b>	Appears when there is an issue with the internal state of the disk such as, the disk life remaining is below the threshold. <ul style="list-style-type: none"> <li>x-0 for Host 0 (RE0) and 1 for Host 1 (RE1)</li> <li>y-1 for disk 1 and 2 for disk 2</li> </ul>	Minor	Replace the disk.
<b>VMHost x Boot from alternate set</b>	Appears when the Routing Engine is booted from the alternate set.	Minor	Verify logs. As required, recover the Routing Engine by using the command <b>request vmhost snapshot</b>

Table 74: Chassis Alarms for MX series routers (continued)

Message displayed in the output of show chassis alarms Command	Description	Class	Solution
<b>VMHost RE x host application failed</b>	Appears when one of the vmhost daemon has failed.	Minor	Manual mastership switchover followed by reboot using the command <b>request vmhost reboot</b> .
<b>VMHost Boot from alternate disk</b>	Appears when the primary disk is corrupted and unable to launch the guest.	Minor	Recover the disk by using the command <b>request vmhost snapshot recovery</b> .
<b>Host 0/1 CPU Temperature Warm</b>	Appears when the Routing Engine CPU temperature is above the TCONTROL threshold.  0 for Host 0 (RE0) and 1 for Host 1 (RE1)	Minor	No recovery action required from the user. Based on the temperature, the fan speed is changed to cool the system thereby reducing the temperature
<b>Host 0/1 CPU Temperature Hot</b>	Appears when the Routing Engine CPU temperature is above the PROCHOT threshold.  0 for Host 0 (RE0) and 1 for Host 1 (RE1)	Minor	No recovery action required from the user. Based on the temperature, the fan speed is changed to cool the system thereby reducing the temperature
<b>Host 0/1 ECC single bit parity error</b>	Appears when single bit ECC error is above the threshold value.  0 for Host 0 (RE0) and 1 for Host 1 (RE1)	Major	No recovery action required from the user. The count gets reset after 24 hours.
<b>Host 0 ECC 53 parity error</b>	Appears when multiple bit ECC error is above the threshold value.	Major	Reboot the router.
<b>Mixed Master and Backup RE types</b>	Appears when dissimilar Routing Engines are present on the chassis.	Major	Both Routing Engines must be of the same model number. Replace one of the Routing Engines.
<b>VMHost RE x Disk y Missing</b>	Appears when the disk in the Routing Engine is missing.  <ul style="list-style-type: none"> <li>x=0 for RE0 and 1 for RE1</li> <li>y=1 for disk 1 and 2 for disk 2</li> </ul>	Minor	Check if there is missing or a defective disk. Insert healthy disk. Take a snapshot and recover the disk by using the command <b>request vmhost snapshot</b> .  See <i>Disk Recovery Using the VM Host Snapshot</i> in <i>VM Host Installation</i>

Table 74: Chassis Alarms for MX series routers (continued)

Message displayed in the output of show chassis alarms Command	Description	Class	Solution
<b>VMHost RE x Disk y Label Missing</b>	<p>Appears when the labels on the disk in the Routing Engine is missing.</p> <ul style="list-style-type: none"> <li>• x-0 for RE0 and 1 for RE1</li> <li>• y-1 for disk 1 and 2 for disk 2</li> </ul>	Minor	Reboot the Routing-Engine from healthy disk and recover the impacted disk using the command <b>request vmhost snapshot</b> .
<b>VMHost RE x Disk y Wrong Slot</b>	<p>Appears when there is disk swap or pre-labelled disk inserted in wrong slot.</p> <ul style="list-style-type: none"> <li>• x-0 for RE0 and 1 for RE1</li> <li>• y-1 for disk 1 and 2 for disk 2</li> </ul>	Minor	If both the disks are in wrong slot, swap the disks and reboot. If only one disk is in wrong slot, recover the disk via snapshot after booting from healthy disk.
<b>VMHost RE x Disk y File System Errors</b>	<p>Appears when there is a file system error.</p> <ul style="list-style-type: none"> <li>• x-0 for RE0 and 1 for RE1</li> <li>• y-1 for disk 1 and 2 for disk 2</li> </ul>	Minor	Boot the Routing-engine from healthy disk and recover the impacted disk using the command <b>request vmhost snapshot</b> .
<b>VMHost RE x Disk y Write Rate Threshold Cross</b>	<p>Appears if write rate threshold is crossed.</p> <ul style="list-style-type: none"> <li>• x-0 for RE0 and 1 for RE1</li> <li>• y-1 for disk 1 and 2 for disk 2</li> </ul>	Minor	Identify the application that is generating excessive writes and apply configuration changes to prevent the excessive writes.
<b>VMHost RE x Disk y Size Incorrect</b>	<p>Appears if the size of the disk is not appropriate for the platform.</p> <ul style="list-style-type: none"> <li>• x-0 for RE0 and 1 for RE1</li> <li>• y-1 for disk 1 and 2 for disk 2</li> </ul>	Minor	Insert an disk of the right size and reboot the Routing Engine.
<b>VMHost RE x Disk y Usage Is Above Threshold</b>	<p>Appears when the usage of the disk partition is above the threshold limit.</p> <ul style="list-style-type: none"> <li>• x-0 for RE0 and 1 for RE1</li> <li>• y-1 for disk 1 and 2 for disk 2</li> </ul>	Minor	Cleanup the disks using <b>request vmhost cleanup</b> command.
<b>VMHost RE x Secure Boot Disabled</b>	Appears when Secure Boot is not enforced in the BIOS.	Medium	Enable Secure Boot in the BIOS.

Table 74: Chassis Alarms for MX series routers (continued)

Message displayed in the output of show chassis alarms Command	Description	Class	Solution
VMHost RE x Secure BIOS Version Mismatch	Appears when current BIOS version is older than the Last Known good BIOS version.	Medium	Upgrade the BIOS using the <b>request system firmware</b> command.
RE x Mismatch in total memory detected	Appears when total memory for Secure Boot SKUs is not 128-GB.	Medium	Check the available RAM size using <b>show vmhost hardware</b> command. If the RAM size is less than 128-GB, contact JTAC for a RAM upgrade.

## Chassis Component Alarm Conditions on M5 and M10 Routers

Table 75 on page 531 lists the alarms that the chassis components can generate on M5 and M10 routers.

**Table 75: Chassis Component Alarm Conditions on M5 and M10 Routers**

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Alternative media	The router boots from an alternate boot device, the hard disk. The CompactFlash card is typically the primary boot device. The Routing Engine boots from the hard disk when the primary boot device fails.	Open a support case using the Case Manager link at <a href="http://www.juniper.net/">www.juniper.net/</a> or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States).	Yellow
Craft interface	The craft interface has failed.	Replace failed craft interface.	Red
Fan trays	One fan tray has been removed from the chassis.	Install missing fan tray.	Yellow
	Two or more fan trays have been removed from the chassis.	Install missing fan trays.	Red
	One fan in the chassis is not spinning or is spinning below required speed.	Replace failed fan tray.	Red
Forwarding Engine Board (FEB)	The control board has failed. If this occurs, the board attempts to reboot.	Replace failed FEB.	Red
Flexible PIC Concentrator (FPC)	An FPC has failed. If this occurs, the FPC attempts to reboot. If the FEB sees that an FPC is rebooting too often, it shuts down the FPC.	Replace failed FPC.	Red

Table 75: Chassis Component Alarm Conditions on M5 and M10 Routers (continued)

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Hot swapping	Too many hot-swap interrupts are occurring. This message generally indicates that a hardware component that plugs into the router's backplane from the front (generally, an FPC) is broken.	Replace failed component.	Red
Routing Engine	Error in reading or writing CompactFlash card.	Reformat CompactFlash card and install bootable image. If this fails, replace failed Routing Engine.	Yellow
	System booted from hard disk.	Install bootable image on CompactFlash card. If this fails, replace failed Routing Engine.	Yellow
	CompactFlash card missing in boot list.	Replace failed Routing Engine.	Red
	Hard disk missing in boot list.	Replace failed Routing Engine.	Red
	The Ethernet management interface ( <b>fxp0</b> or <b>em0</b> ) on the Routing Engine is down.	<ul style="list-style-type: none"> <li>• Check the interface cable connection.</li> <li>• Reboot the system.</li> <li>• If the alarm recurs, open a support case using the Case Manager link at <a href="https://www.juniper.net/support/">https://www.juniper.net/support/</a> or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States)</li> </ul>	Red
Power supplies	A power supply has been removed from the chassis.	Install missing power supply.	Yellow
	A power supply has failed.	Replace failed power supply.	Red

*Table 75: Chassis Component Alarm Conditions on M5 and M10 Routers (continued)*

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Temperature	The chassis temperature has exceeded 55 degrees C (131 degrees F), the fans have been turned on to full speed, and one or more fans have failed.	<ul style="list-style-type: none"> <li>• Check room temperature.</li> <li>• Check air filter and replace it.</li> <li>• Check airflow.</li> <li>• Check fan.</li> </ul>	Yellow
	The chassis temperature has exceeded 65 degrees C (149 degrees F), and the fans have been turned on to full speed.	<ul style="list-style-type: none"> <li>• Check room temperature.</li> <li>• Check air filter and replace it.</li> <li>• Check airflow.</li> <li>• Check fan.</li> </ul>	Yellow
	The chassis temperature has exceeded 65 degrees C (149 degrees F), and a fan has failed. If this condition persists for more than 4 minutes, the router shuts down.	<ul style="list-style-type: none"> <li>• Check room temperature.</li> <li>• Check air filter and replace it.</li> <li>• Check airflow.</li> <li>• Check fan.</li> </ul>	Red
	The chassis temperature has exceeded 75 degrees C (167 degrees F). If this condition persists for more than 4 minutes, the router shuts down.	<ul style="list-style-type: none"> <li>• Check room temperature.</li> <li>• Check air filter and replace it.</li> <li>• Check airflow.</li> <li>• Check fan.</li> </ul>	Red
	The temperature sensor has failed.	<p>Open a support case using the Case Manager link at <a href="http://www.juniper.net/">www.juniper.net/</a></p> <p>or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States).</p>	Red

## Chassis Component Alarm Conditions on M7i and M10i Routers

Table 76 on page 534 lists the alarms that the chassis components can generate on M7i and M10i routers.

**Table 76: Chassis Component Alarm Conditions on M7i and M10i Routers**

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Alternative media	The router boots from an alternate boot device, the hard disk. The CompactFlash card is typically the primary boot device. The Routing Engine boots from the hard disk when the primary boot device fails.	Open a support case using the Case Manager link at <a href="https://www.juniper.net/support/">https://www.juniper.net/support/</a> or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States).	Yellow
Compact FEB (CFEB)	For an M7i router, CFEB has failed. If this occurs, the board attempts to reboot.	Replace failed CFEB.	Red
	For an M10i router, both control boards have been removed or have failed.	Replace failed or missing CFEB.	Red
	Too many hard errors in CFEB memory.	Replace failed CFEB.	Red
	Too many soft errors in CFEB memory.	Replace failed CFEB.	Red
	A CFEB microcode download has failed.	Replace failed CFEB.	Red
Fan trays	A fan has failed.	Replace failed fan tray.	Red
	For an M7i router, a fan tray has been removed from the chassis.	Install missing fan tray.	Red
	For an M10i router, both fan trays are absent from the chassis.	Install missing fan tray.	Red
	For a TX Matrix Plus router, fan tray is not matching the ST-SIB-Ls SIB.	Install a Rev.3 fan tray.	Red
Hot swapping	Too many hot-swap interrupts are occurring. This message generally indicates that a hardware component that plugs into the router's midplane from the front is broken.	Replace failed component.	Red

*Table 76: Chassis Component Alarm Conditions on M7i and M10i Routers (continued)*

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Power supplies	A power supply has been removed.	Insert missing power supply.	Yellow
	A power supply has failed.	Replace failed power supply.	Red
	For an M10i router, only one power supply is operating.	Insert or replace secondary power supply.	Red

Table 76: Chassis Component Alarm Conditions on M7i and M10i Routers (continued)

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Routing Engine	Excessive framing errors on console port.	Replace the serial cable connected to the device.	Yellow
	An excessive framing error alarm is triggered when the default framing error threshold of 20 errors per second on a serial port is exceeded.	If the cable is replaced and no excessive framing errors are detected within 5 minutes from the last detected framing error, the alarm is cleared automatically.	
	This might be caused by a faulty serial console port cable connected to the device.		
	Error in reading or writing hard disk.	Reformat hard disk and install bootable image. If this fails, replace failed Routing Engine.	Yellow
	Error in reading or writing CompactFlash card.	Reformat CompactFlash card and install bootable image. If this fails, replace failed Routing Engine.	Yellow
	System booted from hard disk. This alarm only applies, if you have an optional CompactFlash card.	Install bootable image on CompactFlash card. If this fails, replace failed Routing Engine.	Yellow
	CompactFlash card missing in boot list.	Replace failed Routing Engine.	Red
	Hard disk missing in boot list.	Replace failed Routing Engine.	Red
	Routing Engine failed to boot.	Replace failed Routing Engine.	Red
	The Ethernet management interface ( <b>fxp0</b> or <b>em0</b> ) on the Routing Engine is down.	<ul style="list-style-type: none"> <li>• Check the interface cable connection.</li> <li>• Reboot the system.</li> <li>• If the alarm recurs, open a support case using the Case Manager link at <a href="https://www.juniper.net/support/">https://www.juniper.net/support/</a> or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States)</li> </ul>	Red

*Table 76: Chassis Component Alarm Conditions on M7i and M10i Routers (continued)*

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Temperature	The chassis temperature has exceeded 55 degrees C (131 degrees F), the fans have been turned on to full speed, and one or more fans have failed.	<ul style="list-style-type: none"> <li>• Check room temperature.</li> <li>• Check air filter and replace it.</li> <li>• Check airflow.</li> <li>• Check fan.</li> </ul>	Yellow
	The chassis temperature has exceeded 65 degrees C (149 degrees F), and the fans have been turned on to full speed.	<ul style="list-style-type: none"> <li>• Check room temperature.</li> <li>• Check air filter and replace it.</li> <li>• Check airflow.</li> <li>• Check fan.</li> </ul>	Yellow
	The chassis temperature has exceeded 65 degrees C (149 degrees F), and a fan has failed. If this condition persists for more than 4 minutes, the router shuts down.	<ul style="list-style-type: none"> <li>• Check room temperature.</li> <li>• Check air filter and replace it.</li> <li>• Check airflow.</li> <li>• Check fan.</li> </ul>	Red
	The chassis temperature has exceeded 75 degrees C (167 degrees F). If this condition persists for more than 4 minutes, the router shuts down.	<ul style="list-style-type: none"> <li>• Check room temperature.</li> <li>• Check air filter and replace it.</li> <li>• Check airflow.</li> <li>• Check fan.</li> </ul>	Red
	The temperature sensor has failed.	Open a support case using the Case Manager link at <a href="https://www.junipernet/support/">https://www.junipernet/support/</a> or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States).	Red

## Chassis Component Alarm Conditions on M20 Routers

Table 77 on page 538 lists the alarms that the chassis components can generate on M20 routers.

Table 77: Chassis Component Alarm Conditions on M20 Routers

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Alternative media	The router boots from an alternate boot device, the hard disk. The CompactFlash card is typically the primary boot device. The Routing Engine boots from the hard disk when the primary boot device fails.	Open a support case using the Case Manager link at <a href="https://www.juniper.net/support/">https://www.juniper.net/support/</a> or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States).	Yellow
Craft interface	The craft interface has failed.	Replace failed craft interface.	Red
Fan trays	One fan tray has been removed from the chassis.	Install missing fan tray.	Yellow
	Two or more fan trays have been removed from the chassis.	Install missing fan trays.	Red
	One fan in the chassis is not spinning or is spinning below requires speed.	Replace fan tray.	Red
FPC	An FPC has failed. If this occurs, the FPC attempts to reboot. If the System and Switch Board (SSB) sees that an FPC is rebooting too often, it shuts down the FPC.	Replace failed FPC.	Red
Hot swapping	Too many hot-swap interrupts are occurring. This message generally indicates that a hardware component that plugs in to the router's backplane from the front (generally, an FPC) is broken.	Replace failed component.	Red

Table 77: Chassis Component Alarm Conditions on M20 Routers (continued)

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Routing Engine	Excessive framing errors on console port.	Replace the serial cable connected to the device.	Yellow
	An excessive framing error alarm is triggered when the default framing error threshold of 20 errors per second on a serial port is exceeded.	If the cable is replaced and no excessive framing errors are detected within 5 minutes from the last detected framing error, the alarm is cleared automatically.	
	This might be caused by a faulty serial console port cable connected to the device.		
	Error in reading or writing hard disk.	Reformat hard disk and install bootable image. If this fails, replace failed Routing Engine.	Yellow
	Error in reading or writing CompactFlash card.	Reformat CompactFlash card and install bootable image. If this fails, replace failed Routing Engine.	Yellow
	System booted from default backup Routing Engine. If you manually switched mastership, ignore this alarm condition.	Install bootable image on default master Routing Engine. If this fails, replace failed Routing Engine.	Yellow
	System booted from hard disk.	Install bootable image on CompactFlash card. If this fails, replace failed Routing Engine.	Yellow
	CompactFlash card missing in boot list.	Replace failed Routing Engine.	Red
	Hard disk missing in boot list.	Replace failed Routing Engine.	Red
	The Ethernet management interface ( <b>fxp0</b> or <b>em0</b> ) on the Routing Engine is down.		Red

**Table 77: Chassis Component Alarm Conditions on M20 Routers (continued)**

Chassis Component	Alarm Condition	Remedy	Alarm Severity
		<ul style="list-style-type: none"> <li>• Check the interface cable connection.</li> <li>• Reboot the system.</li> <li>• If the alarm recurs, open a support case using the Case Manager link at <a href="https://www.juniper.net/support/">https://www.juniper.net/support/</a> or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States)</li> </ul>	
	Routing Engine failed to boot.	Replace failed Routing Engine.	Red
Power supplies	A power supply has been removed from the chassis.	Insert power supply into empty slot.	Yellow
	A power supply has failed.	Replace failed power supply.	Red
SSB	The control board has failed. If this occurs, the board attempts to reboot.	Replace failed control board.	Red

**Table 77: Chassis Component Alarm Conditions on M20 Routers (continued)**

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Temperature	The chassis temperature has exceeded 55 degrees C (131 degrees F), the fans have been turned on to full speed, and one or more fans have failed.	<ul style="list-style-type: none"> <li>• Check room temperature.</li> <li>• Check air filter and replace it.</li> <li>• Check airflow.</li> <li>• Check fan.</li> </ul>	Yellow
	The chassis temperature has exceeded 65 degrees C (149 degrees F), and the fans have been turned on to full speed.	<ul style="list-style-type: none"> <li>• Check room temperature.</li> <li>• Check air filter and replace it.</li> <li>• Check airflow.</li> <li>• Check fan.</li> </ul>	Yellow
	The chassis temperature has exceeded 65 degrees C (149 degrees F), and a fan has failed. If this condition persists for more than 4 minutes, the router shuts down.	<ul style="list-style-type: none"> <li>• Check room temperature.</li> <li>• Check air filter and replace it.</li> <li>• Check airflow.</li> <li>• Check fan.</li> </ul>	Red
	The chassis temperature has exceeded 75 degrees C (167 degrees F). If this condition persists for more than 4 minutes, the router shuts down.	<ul style="list-style-type: none"> <li>• Check room temperature.</li> <li>• Check air filter and replace it.</li> <li>• Check airflow.</li> <li>• Check fan.</li> </ul>	Red
	The temperature sensor has failed.	Open a support case using the Case Manager link at <a href="https://www.junipernet/support/">https://www.junipernet/support/</a> or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States).	Red

## Chassis Component Alarm Conditions on M40 Routers

Table 78 on page 541 lists the alarms that the chassis components can generate on M40 routers.

**Table 78: Chassis Component Alarm Conditions on M40 Routers**

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Air filter	Change air filter.	Change air filter.	Yellow

Table 78: Chassis Component Alarm Conditions on M40 Routers (continued)

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Alternative media	The router boots from an alternate boot device, the hard disk. The CompactFlash card is typically the primary boot device. The Routing Engine boots from the hard disk when the primary boot device fails.	Open a support case using the Case Manager link at <a href="https://www.juniper.net/support/">https://www.juniper.net/support/</a> or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States).	Yellow
Craft interface	The craft interface has failed.	Replace failed craft interface.	Red
Fan trays	One fan tray has been removed from the chassis.	Install missing fan tray.	Yellow
	Two or more fan trays have been removed from the chassis.	Install missing fan trays.	Red
	One fan in the chassis is not spinning or is spinning below required speed.	Replace fan tray.	Red
FPC	An FPC has an out of range or invalid temperature reading.	Replace failed FPC.	Yellow
	An FPC microcode download has failed.	Replace failed FPC.	Red
	An FPC has failed. If this occurs, the FPC attempts to reboot. If the SCB sees that an FPC is rebooting too often, it shuts down the FPC.	Replace failed FPC.	Red
	Too many hard errors in FPC memory.	Replace failed FPC.	Red
	Too many soft errors in FPC memory.	Replace failed FPC.	Red
Hot swapping	Too many hot-swap interrupts are occurring. This message generally indicates that a hardware component that plugs into the router's backplane from the front (generally, an FPC) is broken.	Replace failed component.	Red

*Table 78: Chassis Component Alarm Conditions on M40 Routers (continued)*

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Power supplies	A power supply has been removed from the chassis.	Insert power supply into empty slot.	Yellow
	A power supply temperature sensor has failed.	Replace failed power supply or power entry module.	Yellow
	A power supply fan has failed.	Replace failed power supply fan.	Yellow
	A power supply has high temperature.	Replace failed power supply or power entry module.	Red
	A 5-V power supply has failed.	Replace failed power supply or power entry module.	Red
	A 3.3-V power supply has failed.	Replace failed power supply or power entry module.	Red
	A 2.5-V power supply has failed.	Replace failed power supply or power entry module.	Red
	A power supply input has failed.	Check power supply input connection.	Red
	A power supply has failed.	Replace failed power supply or power entry module.	Red

*Table 78: Chassis Component Alarm Conditions on M40 Routers (continued)*

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Routing Engine	Excessive framing errors on console port.	Replace the serial cable connected to the device.	Yellow
	An excessive framing error alarm is triggered when the default framing error threshold of 20 errors per second on a serial port is exceeded.	If the cable is replaced and no excessive framing errors are detected within 5 minutes from the last detected framing error, the alarm is cleared automatically.	
	This might be caused by a faulty serial console port cable connected to the device.		
	Error in reading or writing hard disk.	Reformat hard disk and install bootable image. If this fails, replace failed Routing Engine.	Yellow
	Error in reading or writing CompactFlash card.	Reformat CompactFlash card and install bootable image. If this fails, replace failed Routing Engine.	Yellow
	System booted from default backup Routing Engine. If you manually switched mastership, ignore this alarm condition.	Install bootable image on default master Routing Engine. If this fails, replace failed Routing Engine.	Yellow
	System booted from hard disk.	Install bootable image on CompactFlash card. If this fails, replace failed Routing Engine.	Yellow
	CompactFlash card missing in boot list.	Replace failed Routing Engine.	Red
	Hard disk missing in boot list.	Replace failed Routing Engine.	Red
	Routing Engine failed to boot.	Replace failed Routing Engine.	Red
	The Ethernet management interface ( <b>fxp0</b> or <b>em0</b> ) on the Routing Engine is down.		Red

*Table 78: Chassis Component Alarm Conditions on M40 Routers (continued)*

Chassis Component	Alarm Condition	Remedy	Alarm Severity
		<ul style="list-style-type: none"> <li>• Check the interface cable connection.</li> <li>• Reboot the system.</li> <li>• If the alarm recurs, open a support case using the Case Manager link at <a href="https://www.juniper.net/support/">https://www.juniper.net/support/</a> or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States)</li> </ul>	
SCB	The System Control Board (SCB) has failed. If this occurs, the board attempts to reboot.	Replace failed SCB.	Red

**Table 78: Chassis Component Alarm Conditions on M40 Routers (continued)**

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Temperature	The chassis temperature has exceeded 55 degrees C (131 degrees F), the fans have been turned on to full speed, and one or more fans have failed.	<ul style="list-style-type: none"> <li>• Check room temperature.</li> <li>• Check air filter and replace it.</li> <li>• Check airflow.</li> <li>• Check fan.</li> </ul>	Yellow
	The chassis temperature has exceeded 65 degrees C (149 degrees F), and the fans have been turned on to full speed.	<ul style="list-style-type: none"> <li>• Check room temperature.</li> <li>• Check air filter and replace it.</li> <li>• Check airflow.</li> <li>• Check fan.</li> </ul>	Yellow
	The chassis temperature has exceeded 65 degrees C (149 degrees F), and a fan has failed. If this condition persists for more than 4 minutes, the router shuts down.	<ul style="list-style-type: none"> <li>• Check room temperature.</li> <li>• Check air filter and replace it.</li> <li>• Check airflow.</li> <li>• Check fan.</li> </ul>	Red
	The chassis temperature has exceeded 75 degrees C (167 degrees F). If this condition persists for more than 4 minutes, the router shuts down.	<ul style="list-style-type: none"> <li>• Check room temperature.</li> <li>• Check air filter and replace it.</li> <li>• Check airflow.</li> <li>• Check fan.</li> </ul>	Red
	The temperature sensor has failed.	Open a support case using the Case Manager link at <a href="https://www.junipernet/support/">https://www.junipernet/support/</a> or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States).	Red

## Chassis Component Alarm Conditions on M40e and M160 Routers

Table 79 on page 546 lists the alarms that the chassis components can generate on M40e and M160 routers.

**Table 79: Chassis Component Alarm Conditions on M40e and M160 Routers**

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Air filter	Change air filter.	Change air filter.	Yellow

Table 79: Chassis Component Alarm Conditions on M40e and M160 Routers (continued)

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Alternative media	The router boots from an alternate boot device, the hard disk. The CompactFlash card is typically the primary boot device. The Routing Engine boots from the hard disk when the primary boot device fails.	Open a support case using the Case Manager link at <a href="https://www.juniper.net/support/">https://www.juniper.net/support/</a> or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States).	Yellow
Connector Interface Panel (CIP)	A CIP is missing.	Insert CIP into empty slot.	Red
Craft interface	The craft interface has failed.	Replace failed craft interface.	Red
Fan trays	One fan tray has been removed from the chassis.	Install missing fan tray.	Yellow
	Two or more fan trays have been removed from the chassis.	Install missing fan trays.	Red
	One fan in the chassis is not spinning or spinning below required speed.	Replace fan tray.	Red
FPC	An FPC has an out of range or invalid temperature reading.	Replace failed FPC.	Yellow
	An FPC microcode download has failed.	Replace failed FPC.	Red
	An FPC has failed. If this occurs, the FPC attempts to reboot. If the MCS sees that an FPC is rebooting too often, it shuts down the FPC.	Replace failed FPC.	Red
	Too many hard errors in FPC memory.	Replace failed FPC.	Red
	Too many soft errors in FPC memory.	Replace failed FPC.	Red

*Table 79: Chassis Component Alarm Conditions on M40e and M160 Routers (continued)*

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Hot swapping	Too many hot-swap interrupts are occurring. This message generally indicates that a hardware component that plugs into the router's backplane from the front (generally, an FPC) is broken.	Replace failed component.	Red
Miscellaneous Control Subsystem (MCS)	An MCS has an out of range or invalid temperature reading.	Replace failed MCS.	Yellow
	MCS0 has been removed.	Reinstall MCS0.	Yellow
	An MCS has failed.	Replace failed MCS.	Red
Packet Forwarding Engine Clock Generator (PCG)	A backup PCG is offline.	Set backup PCG online.	Yellow
	A PCG has an out of range or invalid temperature reading.	Replace failed PCG.	Yellow
	A PCG has been removed.	Insert PCG into empty slot.	Yellow
	A PCG has failed to come online.	Replace failed PCG.	Red

Table 79: Chassis Component Alarm Conditions on M40e and M160 Routers (continued)

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Routing Engine	Excessive framing errors on console port.	Replace the serial cable connected to the device.	Yellow
	An excessive framing error alarm is triggered when the default framing error threshold of 20 errors per second on a serial port is exceeded.	If the cable is replaced and no excessive framing errors are detected within 5 minutes from the last detected framing error, the alarm is cleared automatically.	
	This might be caused by a faulty serial console port cable connected to the device.		
	Error in reading or writing hard disk.	Reformat hard disk and install bootable image. If this fails, replace failed Routing Engine.	Yellow
	Error in reading or writing CompactFlash card.	Reformat CompactFlash card and install bootable image. If this fails, replace failed Routing Engine.	Yellow
	System booted from default backup Routing Engine. If you manually switched mastership, ignore this alarm condition.	Install bootable image on default master Routing Engine. If this fails, replace failed Routing Engine.	Yellow
	System booted from hard disk.	Install bootable image on CompactFlash card. If this fails, replace failed Routing Engine.	Yellow
	CompactFlash card missing in boot list.	Replace failed Routing Engine.	Red
	Hard disk missing in boot list.	Replace failed Routing Engine.	Red
	Routing Engine failed to boot.	Replace failed Routing Engine.	Red
	The Ethernet management interface ( <b>fxp0</b> or <b>em0</b> ) on the Routing Engine is down.		Red

## Chassis Component Alarm Conditions on MX Series 5G Universal Routing Platforms

Table 82 on page 561 lists the alarms that the chassis components can generate on MX Series 5G Universal Routing Platforms.

**Table 82: Chassis Component Alarm Conditions on MX Series 5G Universal Routing Platforms**

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Air filters	Change air filter.	Change air filter.	Yellow

**Table 82: Chassis Component Alarm Conditions on MX Series 5G Universal Routing Platforms (continued)**

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Alternative media	The router boots from an alternate boot device, the hard disk. The CompactFlash card is typically the primary boot device. The Routing Engine boots from the hard disk when the primary boot device fails.	Open a support case using the Case Manager link at <a href="https://www.juniper.net/support/">https://www.juniper.net/support/</a> or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States).	Yellow
Craft interface	The craft interface has failed.	Replace failed craft interface.	Red
Dense Port Concentrators (DPC)s	A DPC is offline.	Check DPC. Remove and reinsert the DPC. If this fails, replace failed DPC.	Yellow
	A DPC has failed.	Replace failed DPC.	Red
	A DPC has been removed.	Insert DPC into empty slot.	Red
Fan trays	A fan tray has been removed from the chassis.	Install missing fan tray.	Red
	One fan in the chassis is not spinning or is spinning below required speed.	Replace fan tray.	Red
	A higher-cooling capacity fan tray is required when an MPC is installed on the chassis.	Upgrade to a high-capacity fan tray.	Yellow
Host subsystem	A host subsystem has been removed.	Insert host subsystem into empty slot.	Yellow
	A host subsystem has failed.	Replace failed host subsystem.	Red
Hot swapping	Too many hot-swap interrupts are occurring. This message generally indicates that a hardware component that plugs into the router's backplane from the front (generally, an FPC) is broken.	Replace failed component.	Red

**Table 82: Chassis Component Alarm Conditions on MX Series 5G Universal Routing Platforms (continued)**

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Power supplies	A power supply has been removed from the chassis.	Insert power supply into empty slot.	Yellow
	A power supply has a high temperature.	Replace failed power supply or power entry module.	Red
	A power supply input has failed.	Check power supply input connection.	Red
	A power supply output has failed.	Check power supply output connection.	Red
	A power supply has failed.	Replace failed power supply.	Red
	Invalid AC power supply configuration.	When two AC power supplies are installed, insert one power supply into an odd-numbered slot and the other power supply into an even-numbered slot.	Red
	Invalid DC power supply configuration.	When two DC power supplies are installed, insert one power supply into an odd-numbered slot and the other power supply into an even-numbered slot.	Red
	Mix of AC and DC power supplies.	Do not mix AC and DC power supplies. For DC power, remove the AC power supply. For AC power, remove the DC power supply.	Red
	Not enough power supplies.	Install an additional power supply.	Red

**Table 82: Chassis Component Alarm Conditions on MX Series 5G Universal Routing Platforms (continued)**

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Routing Engine	Excessive framing errors on console port.	Replace the serial cable connected to the device.	Yellow
	An excessive framing error alarm is triggered when the default framing error threshold of 20 errors per second on a serial port is exceeded.	If the cable is replaced and no excessive framing errors are detected within 5 minutes from the last detected framing error, the alarm is cleared automatically.	
	This might be caused by a faulty serial console port cable connected to the device.		
	Error in reading or writing hard disk.	Reformat hard disk and install bootable image. If this fails, replace failed Routing Engine.	Yellow
	Error in reading or writing CompactFlash card.	Reformat CompactFlash card and install bootable image. If this fails, replace failed Routing Engine.	Yellow
	System booted from default backup Routing Engine. If you manually switched mastership, ignore this alarm condition.	Install bootable image on default master Routing Engine. If this fails, replace failed Routing Engine.	Yellow
	System booted from hard disk.	Install bootable image on CompactFlash card. If this fails, replace failed Routing Engine.	Yellow
	CompactFlash card missing in boot list.	Replace failed Routing Engine.	Red
	Hard disk missing in boot list.	Replace failed Routing Engine.	Red
	Routing Engine failed to boot.	Replace failed Routing Engine.	Red
	The Ethernet management interface ( <b>fxp0</b> or <b>em0</b> ) on the Routing Engine is down.		Red

**Table 82: Chassis Component Alarm Conditions on MX Series 5G Universal Routing Platforms (continued)**

Chassis Component	Alarm Condition	Remedy	Alarm Severity
		<ul style="list-style-type: none"> <li>• Check the interface cable connection.</li> <li>• Reboot the system.</li> <li>• If the alarm recurs, open a support case using the Case Manager link at <a href="https://www.juniper.net/support/">https://www.juniper.net/support/</a> or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States)</li> </ul>

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Temperature	The chassis temperature has exceeded 55 degrees C (131 degrees F), the fans have been turned on to full speed, and one or more fans have failed.	<ul style="list-style-type: none"> <li>• Check room temperature.</li> <li>• Check air filter and replace it.</li> <li>• Check airflow.</li> <li>• Check fan.</li> </ul>	Yellow
	The chassis temperature has exceeded 65 degrees C (149 degrees F), and the fans have been turned on to full speed.	<ul style="list-style-type: none"> <li>• Check room temperature.</li> <li>• Check air filter and replace it.</li> <li>• Check airflow.</li> <li>• Check fan.</li> </ul>	Yellow
	The chassis temperature has exceeded 65 degrees C (149 degrees F), and a fan has failed. If this condition persists for more than 4 minutes, the router shuts down.	<ul style="list-style-type: none"> <li>• Check room temperature.</li> <li>• Check air filter and replace it.</li> <li>• Check airflow.</li> <li>• Check fan.</li> </ul>	Red
	Chassis temperature has exceeded 75 degrees C (167 degrees F). If this condition persists for more than 4 minutes, the router shuts down.	<ul style="list-style-type: none"> <li>• Check room temperature.</li> <li>• Check air filter and replace it.</li> <li>• Check airflow.</li> <li>• Check fan.</li> </ul>	Red
	The temperature sensor has failed.	Open a support case using the Case Manager link at <a href="https://www.juniper.net/support/">https://www.juniper.net/support/</a> or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States).	Red

**Table 82: Chassis Component Alarm Conditions on MX Series 5G Universal Routing Platforms (continued)**

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Flexible PIC Concentrator (FPC)	<p>FPC &lt;slot number&gt; Major Errors</p> <p>On MX Series routers with MPC1 and MPC2 line cards, a major chassis alarm is raised when the following transient hardware errors occur</p> <ul style="list-style-type: none"> <li>• CPQ Sram parity error</li> <li>• CPQ RLD RAM double bit ECC error</li> </ul> <p>By default, these errors result in the Packet Forwarding Engine interfaces on the FPC being disabled. You can use the <b>show chassis fpc errors</b> command to view the default or user-configured action that resulted from the error.</p> <p>You can check the syslog messages to know more about the errors. See the following examples:</p> <pre>Oct 5 15:58:02 codeine fpc1 MQCHIP(0) CPQ RLDRAM double bit ECC error, bank 0 addr 0x0  Oct 5 15:58:02 codeine fpc1 MQCHIP(0) CPQ Sram parity error, errlog 0x0</pre>	To resolve the error, restart the line card. If the error is still not resolved, open a support case using the Case Manager link at <a href="https://www.juniper.net/support/">https://www.juniper.net/support/</a> or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States).	Red

## Backup Routing Engine Alarms

For routers with master and backup Routing Engines, a master Routing Engine can generate alarms for events that occur on a backup Routing Engine. [Table 83 on page 568](#) lists chassis alarms generated for a backup Routing Engine.

**NOTE:** Because the failure occurs on the backup Routing Engine, alarm severity for some events (such as Ethernet interface failures) is yellow instead of red.

**NOTE:** For information about configuring redundant Routing Engines, see the *Junos OS High Availability Library for Routing Devices*.

**Table 83: Backup Routing Engine Alarms**

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Alternative media	The backup Routing Engine boots from an alternate boot device, the hard disk. The CompactFlash card is typically the primary boot device. The Routing Engine boots from the hard disk when the primary boot device fails.	Open a support case using the Case Manager link at <a href="https://www.juniper.net/support/">https://www.juniper.net/support/</a> or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States).	Yellow
Boot Device	The boot device (CompactFlash or hard disk) is missing in boot list on the backup Routing Engine.	Replace failed backup Routing Engine.	Red
Ethernet	The Ethernet management interface ( <b>fxp0</b> or <b>em0</b> ) on the backup Routing Engine is down.	<ul style="list-style-type: none"> <li>Check the interface cable connection.</li> <li>Reboot the system.</li> <li>If the alarm recurs, open a support case using the Case Manager link at <a href="https://www.juniper.net/support/">https://www.juniper.net/support/</a> or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States)</li> </ul>	Yellow
FRU Offline	The backup Routing Engine has stopped communicating with the master Routing Engine.	Open a support case using the Case Manager link at <a href="https://www.juniper.net/support/">https://www.juniper.net/support/</a> or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States).	Yellow
Hard Disk	Error in reading or writing hard disk on the backup Routing Engine.	Reformat hard disk and install bootable image. If this fails, replace failed backup Routing Engine.	Yellow

**Table 83: Backup Routing Engine Alarms (continued)**

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Multibit Memory ECC	The backup Routing Engine reports a multibit ECC error.	<ul style="list-style-type: none"> <li>Reboot the system with the board reset button on the backup Routing Engine.</li> <li>If the alarm recurs, open a support case using the Case Manager link at <a href="http://www.juniper.net/support/">www.juniper.net/support/</a> or call 1-888-314-JTAC (within the United States) or 1-408-745-9500 (from outside the United States)</li> </ul>	Yellow

## Chassis Component Alarm Conditions for Guest Network Functions (GNFs)

Table 84 on page 569 lists the Chassis conditions that trigger alarms on guest network functions (GNFs).

Read more about GNFs in [this Junos Node Slicing article](#).

**Table 84: GNF Alarms**

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Routing Engine	<p>Mixed Master and Backup RE types</p> <p>This alarm is raised when the GNF Master Routing Engine and GNF Backup Routing Engine have been assigned either mismatching frequencies ( with difference above 100 MHz), mismatching numbers of cores, or DRAM.</p>	Correct the differences and then relaunch the corrected GNF Routing Engine.	Yellow
Routing Engine	<p>System Incompatibility with BSYS</p> <p>The alarm is shown when any incompatibilities between BSYS and GNF software versions cause the GNF to go offline.</p>	Make the required changes to the BSYS or GNF software through upgrade.	Red

Table 84: GNF Alarms (continued)

Chassis Component	Alarm Condition	Remedy	Alarm Severity
Routing Engine	<p>Feature Incompatibility with BSYS</p> <p>Indicates a minor incompatibility between BSYS and GNF software versions. This could result in a:</p> <ul style="list-style-type: none"> <li>• A warning error for the GNF.</li> <li>• A FRU going offline.</li> </ul> <p><b>NOTE:</b> Minor incompatibilities do not cause the GNF to go offline.</p>	Make the required changes to the BSYS or GNF software through upgrade.	Yellow

## System Alarms

- [System Utilization Alarms on page 570](#)
- [Configuring Junos OS to Determine Conditions That Trigger Alarms on Different Interface Types on page 571](#)

### System Utilization Alarms

Switches provide predefined system alarms that can be triggered by a missing rescue configuration, failure to install a license for a licensed software feature, or high disk usage. You can display alarm messages by issuing the **show system alarms** operational mode command.

For example: The switch might trigger an alarm when disk usage in the **/var** partition exceeds 75 percent. A usage level between 76 and 90 percent indicates high usage and raises a minor alarm condition, whereas a usage level above 90 percent indicates that the partition is full and raises a major alarm condition.

The following sample output shows the system alarm messages that are displayed when disk usage is exceeded on the switch.

```
user@host> show system alarms
```

```
4 alarms currently active
Alarm time      Class  Description
2013-10-08 20:08:20 UTC  Minor  RE 0 /var partition usage is high
2013-10-08 20:08:20 UTC  Major  RE 0 /var partition is full
2013-10-08 20:08:08 UTC  Minor  FPC 1 /var partition usage is high
2013-10-08 20:08:08 UTC  Major  FPC 1 /var partition is full
```

**BEST PRACTICE:** We recommend that you regularly request a system file storage cleanup to optimize the performance of the switch and prevent generating system alarms.

  - [show system alarms](#)

## Configuring Junos OS to Determine Conditions That Trigger Alarms on Different Interface Types

For the different types of PICs, you can configure which conditions trigger alarms and whether they trigger a red or yellow alarm. Red alarm conditions light the **RED ALARM** LED and trigger an audible alarm if one is connected. Yellow alarm conditions light the **YELLOW ALARM** LED and trigger an audible alarm if one is connected.

**NOTE:** By default, any failure condition on the integrated-services interface (Adaptive Services PIC) triggers a red alarm.

To configure conditions that trigger alarms and that can occur on any interface of the specified type, include the **alarm** statement at the **[edit chassis]** hierarchy level.

```
[edit chassis]
alarm {
  interface-type {
    alarm-name (red | yellow | ignore);
  }
}
```

**alarm-name** is the name of an alarm.

## Silencing External Devices Connected to Alarm Relay Contacts

---

You can manually silence external devices connected to alarm relay contacts. To silence an external device, press the alarm cutoff button located on the craft interface front panel of the device.

Silencing the device does not remove the alarm messages from the display (if present on the router or switch) or extinguish the alarm LEDs. In addition, new alarms that occur after an external device is silenced reactivate the external device.

- [Example: Configuring Tunnel Interfaces on a 10-Gigabit Ethernet 4-Port DPC on page 576](#)
- [Example: Configuring FPC Error Detection and Self-Healing on T Series Core Routers on page 576](#)

### Example: Configuring Tunnel Interfaces on a Gigabit Ethernet 40-Port DPC

The following example shows how to create tunnel interfaces on Packet Forwarding Engine 1 of DPC 4 with 1 Gbps of bandwidth reserved for tunnel services. On a Gigabit Ethernet 40-port DPC, tunnel interfaces coexist with Ethernet interfaces. With this configuration, the Gigabit Ethernet interfaces are **ge-4/1/0** through **ge-4/1/9**. The tunnel interfaces created are **gr-4/1/10**, **pe-4/1/10**, **pd-4/1/10**, **vt-4/1/10** and so on.

```
[edit chassis]
fpc 4 pic 1 {
  tunnel-services {
    bandwidth 1g;
  }
}
```

- [bandwidth \(Tunnel Services\) on page 606](#)
- [tunnel-services \(Chassis\) on page 817](#)

## Example: Configuring Tunnel Interfaces on a 10-Gigabit Ethernet 4-Port DPC

---

In this example, you create tunnel interfaces on Packet Forwarding Engine 0 of DPC 4 with 10 Gbps of bandwidth reserved for tunnel traffic. Ethernet and tunnel interfaces cannot coexist on the same Packet Forwarding Engine of a 10-Gigabit Ethernet 4-port DPC. With this configuration, the tunnel interfaces created are **gr-4/0/0**, **pe-4/0/0**, **pd-4/0/0**, **vt-4/0/0** and so on.

```
[edit chassis]
fpc 4 pic 0 {
  tunnel-services {
    bandwidth 10g;
  }
}
```

## Example: Configuring FPC Error Detection and Self-Healing on T Series Core Routers

---

This example shows how to configure error detection and self-healing on a Juniper Networks T Series Core Router with Type 5 FPC.

- [Requirements on page 576](#)
- [Overview on page 576](#)
- [Configuration on page 577](#)
- [Verification on page 580](#)

### Requirements

This example uses the following hardware and software components:

- Juniper Networks T4000 Core Router with Type 5 FPCs.
- Junos OS Release 13.3 or later.

Before you proceed, ensure that the required connections are complete and the interfaces are functional.

### Overview

FPC error detection and self-healing involves configuring a set of actions to be performed on each FPC, when the number of errors for a particular severity increases beyond a user-configured threshold. The error severity is categorized into fatal, major, and minor. Recovery actions include raising an alarm, generating log entries, getting the current state of the FPC, restarting the FPC, taking the FPC offline, and resetting the FPC. For a particular

FPC and error severity, you can configure the error threshold to any value within the allowed limits and map the threshold to an action. In this example, you will set these errors on FPC 0 in Juniper Networks T4000 Core Router.

## Configuration

To configure the error detection and self-healing, you need to set the error severity, threshold values corresponding to each error severity, and actions to be performed when the threshold value is crossed.

- [Configuring the Error Detection and Self-Healing on page 578](#)
- [Results on page 580](#)

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the [edit interfaces] hierarchy level.

```
set chassis fpc 0 fatal threshold 1 action reset
set chassis fpc 0 major threshold 1 action alarm
set chassis fpc 0 minor threshold 10 action log
```

## Configuring the Error Detection and Self-Healing

### **Step-by-Step Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* and the *CLI User Guide*.

- Configure the threshold value and associated action for fatal errors.

1. Set the error severity to fatal.

```
[edit interfaces]
```

```
user@host# set chassis fpc 0 error fatal
```

2. Set the threshold value for fatal errors.

```
[edit interfaces]
```

```
user@host# set chassis fpc 0 error fatal threshold 1
```

3. Set the associated action for fatal errors.

```
[edit interfaces]
```

```
user@host# set chassis fpc 0 error fatal threshold 1 action reset
```

- Configure the threshold value and associated action for major errors.

1. Set the error severity to major.

```
[edit interfaces]
```

```
user@host# set chassis fpc 0 error major
```

2. Set the threshold value for major errors.

```
[edit interfaces]
```

```
user@host# set chassis fpc 0 error major threshold 1
```

3. Set the associated action for major errors.

```
[edit interfaces]
```

```
user@host# set chassis fpc 0 error major threshold 1 action alarm
```

- Configure the threshold value and associated action for minor errors.

1. Set the error severity to minor.

```
[edit interfaces]
```

```
[edit interfaces]
```

```
user@host# set chassis fpc 0 error minor
```

2. Set the threshold value for minor errors.

```
[edit interfaces]
```

```
user@host# set chassis fpc 0 error minor threshold 10
```

3. Set the associated action for minor errors.

```
[edit interfaces]
```

```
user@host# set chassis fpc 0 error minor threshold 10 action log
```

## Results

The following is the result of the configuration for the fatal severity level.

```
user@host# set chassis fpc 0 error ?
Possible completions:
+ apply-groups          Groups from which to inherit configuration data
+ apply-groups-except  Don't inherit configuration data from these groups
> fatal                FPC Fatal errors (default threshold = 1)
> major                FPC Major Level errors (default threshold = 1)
> minor                FPC Minor Level errors (default threshold = 10)
user@host# set chassis fpc 0 error fatal action ?
Possible completions:
alarm                  Raise FPC alarm
get-state              Retrieve FPC state for debugging
log                   Log occurrence to system log file
offline               Offline FPC
offline-pic            Offline PICs associated with PFE on FPC
reset                 Reset FPC
user@host# set chassis fpc 0 error fatal action reset
user@host# set chassis fpc 0 error fatal threshold ?
Possible completions:
<threshold>          Error count at which to take the action (0..4294967295)
user@host# set chassis fpc 0 error fatal threshold 1
```

If you are done configuring the devices, enter **commit** from configuration mode.

## Verification

To verify that the configuration is successful and the router is configured with the correct action, use the **show chassis fpc errors** command.

- [Verifying the Configured Actions Related to Fatal Severity of FPC Error on page 580](#)

### Verifying the Configured Actions Related to Fatal Severity of FPC Error

**Purpose** Make sure that the threshold value and the associated action are set for fatal errors.

**Action** user@host> show chassis fpc errors

```
FPC Level Occurred Cleared Threshold Action-Taken Action
0 Fatal 0 0 1 RESET
Pfe-State: pfe-0 -ENABLED | pfe-1 -ENABLED | pfe-2 -ENABLED | pfe-3 -ENABLED
| pfe-4 -ENABLED | pfe-5 -ENABLED | pfe-6 -ENABLED | pfe-7 -ENABLED |
```

**Meaning** The sample output shows **Fatal** error at FPC **0** with **0** error **Occurred** (no previous occurrences), **0** error **Cleared** (no previous occurrences) with **Threshold** value set to **1** and **Action-Taken** set to **RESET**.

## **account-layer2-overhead (PIC Level)**

<b>Syntax</b>	<code>account-layer2-overhead;</code>
<b>Hierarchy Level</b>	<code>[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 13.2.
<b>Description</b>	Enable the automatic adjustment of Layer 2 overhead in bytes, which is the octet adjustment per packet, based on the encapsulation on the logical interface for the total octet count for ingress and egress traffic on all the interfaces in the PIC.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Accounting of the Layer 2 Overhead Attribute in Interface Statistics on page 439</a></li> <li>• <a href="#">Configuring Layer 2 Overhead Accounting in Interface Statistics on page 441</a></li> <li>• <a href="#">Verifying the Accounting of Layer 2 Overhead in Interface Statistics on page 443</a></li> </ul>

## action

**Syntax**

```
action {
  alarm;
  disable-pfe;
  get-state;
  log;
  offline;
  reset;
}
```

**Hierarchy Level**

- [edit chassis **fpc** *slot-number* **error fatal**]
- [edit chassis **fpc** *slot-number* **error major**]
- [edit chassis **fpc** *slot-number* **error minor**]
- [edit chassis **error fatal**]
- [edit chassis **error major**]
- [edit chassis **error minor**]

**Release Information** Statement introduced for PTX Series routers in Junos OS Release 13.3.  
Statement introduced for MX240, MX480, MX960 routers in Junos OS Release 14.2.

**Description** Depending on the severity level of an error, you can configure one or more actions for the router to perform. For example, if the severity level of an error is major, you can configure the system to raise an alarm and restart the FPC.

**NOTE:** You cannot configure **disable-pfe** and **offline** actions at the same time.

**Options** **alarm**—Raise an FPC alarm.

**disable-pfe**—(PTX routers) Disable Packet Forwarding Engine interfaces on an FPC.  
(MX240, MX480, MX960, MX2020 routers) Disables the interface associated with the ASIC that raised the error. On MX Series routers, an MPC can have multiple ASICs handled by a single PFE. Disabling the PFE in such cases, is not the optimal way to handle the error.

**get-state**—The system starts collecting statistics counters and other data from the affected FPC. The data is written and saved to a file under **/var** on the routing engine.

**offline**—The system shuts down the affected FPC, thus allowing traffic to be re-routed through interfaces on other FPC in the device.

**reset** —The system restarts the affected FPC.

**log**—Log occurrences to the system log file.

**Required Privilege Level**

**interface**—To view this statement in the configuration.

**interface-control**—To add this statement to the configuration.

## action-fpc-restart-disable

**Syntax** `action-fpc-restart-disable;`

**Hierarchy Level** `[edit chassis fabric degraded]`

**Release Information**

Statement added in Junos OS Release 11.4.

Statement introduced in Junos OS Release 12.1 for MX240, MX480, and MX960 routers.

Statement introduced in Junos OS Release 12.1X48R4 for PTX Series Packet Transport Routers.

**Description**

Allow the user to disable restarting of the FPCs during healing from a degraded fabric condition. The device can automatically recover from degraded fabric conditions by restarting both the fabric planes and the FPCs. If the **action-fpc-restart-disable** statement is configured, the healing attempt is limited to restarting the fabric planes only.

**Default** The system will detect a blackholing condition and try to heal the system.

**Required Privilege Level**

**interface**—To view this statement in the configuration.

**interface-control**—To add this statement to the configuration.

**Related Documentation**

- [Disabling Line Card Restart to Limit Recovery Actions from Degraded Fabric Conditions on page 144](#)

## adaptive-services

**Syntax**

```
adaptive-services {
  service-package {
    extension-provider {
      control-cores control-number;
      data-cores data-number;
      data-flow-affinity {
        hash-key (layer-3 | layer-4);
      }
      forwarding-db-size size;
      object-cache-size size;
      package package-name;
      policy-db-size size;
      syslog {
        facility {
          severity;
          destination destination;
        }
      }
      wired-max-processes num-procs;
      wired-process-mem-size mem-size;
    }
    layer-2;
    layer-3;
  }
}
```

**Hierarchy Level** [edit chassis fpc *slot-number* pic *pic-number*]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Enable a service package on adaptive services interfaces.

**Options** The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## aggregated-ether

<b>Syntax</b>	<code>aggregated ether <i>aggregated-ether-group-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit chassis synchronization source interfaces ]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 17.2R1.
<b>Description</b>	Specify an aggregated Ethernet group while configuring a member of the group as the clock source. This is an optional setting. Any number of interfaces from an aggregated Ethernet group can be configured as the clock source. If a member from the aggregated Ethernet group is selected as the locked clock source, then all the members of the group will transmit the Do not Use (DNU) ESMC quality level.
<b>Options</b>	<i>aggregated-ether-group-name</i> —aggregated ethernet group name
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Synchronous Ethernet Overview on page 242</a></li> <li>• <a href="#">show chassis synchronization on page 2153</a></li> </ul>

## aggregate-ports

<b>Syntax</b>	<code>aggregate-ports;</code>
<b>Hierarchy Level</b>	<code>[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.1.
<b>Description</b>	For T Series routers only, specify OC768-over-OC192 mode on the 4-port OC192C PIC. Four OC192 links are aggregated into one OC768 link with one logical interface.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring 4-Port OC192 PIC to Operate in OC768-over-OC192 Mode</a></li> </ul>

## aggregated-devices

```
Syntax aggregated-devices {
    ethernet {
        device-count number;
        lacp {
            link-protection {
                non-revertive;
            }
            system-priority;
        }
    }
    sonet {
        device-count number;
    }
    maximum-links maximum-links-limit;
}
```

Hierarchy Level [edit chassis]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Support for LACP link protection and system priority introduced in Junos OS Release 9.3.

**Description** Configure properties for aggregated devices on the router. Aggregate Ethernet links are logical interfaces defined on the device that bundle together multiple physical interfaces into a single interface for the use of redundancy and bandwidth aggregation. When interconnecting devices you can create aggregate ethernet interfaces to bundle together multiple physical ethernet links to increase bandwidth and redundancy between devices.

Link aggregation enables you to group Ethernet interfaces to form a single link layer interface. Link Aggregation Control Protocol (LACP) is supported in chassis cluster deployments, where aggregated Ethernet interfaces and redundant Ethernet interfaces are supported simultaneously.

You must first configure the system to enable configuring the Aggregated Ethernet (ae) Interfaces. By default, Juniper devices do not have any aggregated ethernet interfaces created. To configure the device to support a given number of ae interfaces, you must define it on a per chassis basis using the **set chassis aggregated-devices devices {1-32}** in configuration mode. The number of devices you define will be the number of aggregated ethernet interfaces that the system will create which can be configured just like any other ethernet interface. Also you can view the interfaces created by using the **show interface terse** command. Once you have defined the number of aggregated ethernet devices on the chassis you can then continue to configure the LAG members on a per ethernet interface basis.

**Options** The remaining statements are explained separately.

<b>Required Privilege</b>	interface—To view this statement in the configuration.
<b>Level</b>	interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Junos OS for Supporting Aggregated Devices on page 481</a></li></ul>

## alarm (chassis)

Syntax	<pre>alarm {   interface-type {     alarm-name (ignore   red   yellow);   } }</pre>
Hierarchy Level	<pre>[edit chassis], [edit chassis interconnect-device name], [edit chassis node-group name]</pre>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 12.2 for the ACX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	<p>Configure the chassis alarms and whether they trigger a red or yellow alarm, or whether they are ignored. Red alarm conditions light the <b>RED ALARM</b> LED on either the router's craft interface or the switch's LCD screen and trigger an audible alarm if one is connected to the contact on the craft interface or LCD screen. Yellow alarm conditions light the <b>YELLOW ALARM</b> LED on either the router's craft interface or the switch's LCD screen and trigger an audible alarm if one is connected to the craft interface or LCD screen.</p> <p>To configure more than one alarm, include multiple <i>alarm-name</i> lines.</p>
Options	<p><i>alarm-name</i>—Alarm condition. For a list of conditions, see <a href="#">Table 85 on page 572</a>.</p> <p><i>ignore</i>—The specified alarm condition does not set off any alarm.</p> <p><i>interface-type</i>—Type of interface on which you are configuring the alarm: <b>atm</b>, <b>ethernet</b>, <b>sonet</b>, or <b>t3</b>.</p> <p><b>red</b>—The specified alarm condition sets off a red alarm.</p> <p><b>yellow</b>—The specified alarm condition sets off a yellow alarm.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <li>• <i>Understanding Alarms</i></li> <li>• <a href="#">Chassis Conditions That Trigger Alarms on page 530</a></li> <li>• <i>Chassis Alarm Messages on a QFX3500 Device</i></li> <li>• <i>Interface Alarm Messages</i></li> </ul>

## allow-sram-parity-errors

<b>Syntax</b>	<code>allow-sram-parity-errors;</code>
<b>Hierarchy Level</b>	<code>[edit chassis fpc <i>slot-number</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.0.
<b>Description</b>	(T Series routers only) Allow SRAM parity errors to occur without restarting the FPC.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

## announce-timeout

<b>Syntax</b>	<code>announce-timeout <i>announce-timeout-value</i>;</code>
<b>Hierarchy Level</b>	<code>[edit protocols ptp <a href="#">slave</a>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2.
<b>Description</b>	Specify the number of announce messages a slave—configured on an ACX Series router—must miss before an announce-timeout is declared. Announce messages are sent by the master to the slave.
<b>Options</b>	<i>announce-timeout-value</i> —The announce timeout value for announce interval messages. <b>Range:</b> 2 through 10 <b>Default:</b> 3
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Precision Time Protocol on page 319</a></li> <li>• <a href="#">Example: Configuring Precision Time Protocol on page 325</a></li> <li>• <a href="#">Precision Time Protocol Overview on page 256</a></li> </ul>

## announce-interval

---

<b>Syntax</b>	<code>announce-interval <i>announce-interval-value</i>;</code>
<b>Hierarchy Level</b>	<code>[edit protocols ptp <a href="#">master</a>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2.
<b>Description</b>	Configure the logarithmic mean interval for the announce messages to be sent by the master. By default, one announce message is sent in every two seconds.
<b>Options</b>	<b><i>announce-interval-value</i></b> —The announce interval value for the announce messages. <b>Range:</b> 0 through 4 <b>Default:</b> 1
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Precision Time Protocol on page 319</a></li><li>• <a href="#">Example: Configuring Precision Time Protocol on page 325</a></li><li>• <a href="#">Precision Time Protocol Overview on page 256</a></li></ul>

## asymmetry

<b>Syntax</b>	<code>asymmetry <i>number</i></code>
<b>Hierarchy Level</b>	<p>For ACX Series and QFX Series:</p> <pre>[edit protocols ptp slave interface unicast-mode clock-source local-ip-address]</pre> <p>For MX Series:</p> <pre>[edit protocols ptp <i>slave</i> interface <i>interface-name</i> <i>multicast-mode</i>], [edit protocols ptp <i>master</i> interface <i>interface-name</i> <i>multicast-mode</i>]</pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 15.2 for MX Series routers.</p> <p>Statement introduced in Junos OS Release 17.3 for QFX Series switches.</p>
<b>Description</b>	<p>Specify the asymmetry value between the master and the slave. A compensating value for networks in which there is path asymmetry between the 1588v2 slave and master. Specify a positive or negative value that is added to the path delay value from the slave to the master, making the delay symmetric and equal to the path from the master to the slave.</p>
<b>Options</b>	<p><b>number</b>—The asymmetry value is in nanoseconds and can vary from minus (–)100 milliseconds to 100 milliseconds, allowing compensation for up to 1/10 of a second of path asymmetry.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>IEEE 1588v2 Precision Timing Protocol (PTP)</i></li> <li>• <a href="#">Precision Time Protocol Overview on page 256</a></li> <li>• <a href="#">Configuring Precision Time Protocol on page 319</a></li> <li>• <a href="#">Example: Configuring Precision Time Protocol on page 325</a></li> </ul>

## atm-cell-relay-accumulation

---

<b>Syntax</b>	atm-cell-relay-accumulation;
<b>Hierarchy Level</b>	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> ], [edit chassis lcc <i>number</i> fpc <i>slot-number</i> pic <i>pic-number</i> ] (Routing Matrix)
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure an Asynchronous Transfer Mode (ATM) Physical Interface Card (PIC) in cell-relay accumulation mode.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Use ATM Cell-Relay Accumulation Mode on an ATM1 PIC on page 466</a></li></ul>

## atm-l2circuit-mode

<b>Syntax</b>	<code>atm-l2circuit-mode (cell   aal5   trunk <i>trunk</i>);</code>
<b>Hierarchy Level</b>	<code>[edit chassis fpc slot-number pic pic-number],</code> <code>[edit chassis lcc number fpc slot-number pic pic-number]</code> (Routing Matrix)
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure the ATM2 intelligent queuing (IQ) Layer 2 circuit transport mode.
<b>Default</b>	<code>aal5</code>
<b>Options</b>	<p><code>aal5</code>—Tunnel a stream of ATM cells encoded with ATM Adaptation Layer (AAL5) over an IP Multiprotocol Label Switching (MPLS) backbone.</p> <p><code>cell</code>—Tunnel a stream of ATM cells over an IP MPLS backbone.</p> <p><code>trunk <i>trunk</i></code>—Transport ATM cells over an MPLS core network that is implemented on some other vendor switches. Trunk mode can be <b>UNI</b> or <b>NNI</b>.</p>
<div>  <p><b>NOTE:</b> To determine which vendors support Layer 2 circuit trunk mode, contact Juniper Networks Customer Support.</p> </div>	
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Junos OS to Enable ATM2 Intelligent Queuing Layer 2 Circuit Transport Mode on page 501</a></li> </ul>

## auto-recovery-disable

---

<b>Syntax</b>	auto-recovery-disable;
<b>Hierarchy Level</b>	[edit chassis fabric degraded]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.2 for TX Matrix Plus routers with 3D SIBs.
<b>Description</b>	Disable the autorecovery option which is used to recover the routing matrix if fabric black-hole condition is detected on links between Packet Forwarding Engines. By default, autorecovery is enabled. If it is disabled, to reenale the autorecovery option, delete the <b>auto-recovery-disable</b> statement from the existing configuration.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show chassis fabric faults recovery-actions on page 1403</a></li></ul>

## bandwidth (MPC Bandwidth)

<b>Syntax</b>	<b>bandwidth</b> <i>bandwidth</i> ;
<b>Hierarchy Level</b>	[edit chassis fpc slot]
<b>Release Information</b>	Statement introduced in Junos OS Release 16.1 for MPC8E.
<b>Description</b>	<p>Configure the MPC bandwidth.</p> <p>By default, MPC8E provides a maximum bandwidth of 960 Gbps. You can upgrade MPC8E to provide an increased bandwidth of 1600 Gbps (1.6 Tbps) by using an add-on license. After you purchase the license and configure the <b>bandwidth 1.6T</b> statement, MPC8E provides an increased bandwidth of 1.6 Tbps. After you upgrade the MPC, you can use the <b>show chassis fpc slot detail</b> command to verify the status as shown in the following example:</p> <pre> [edit] user@router# run show chassis fpc 3 detail Slot 3 information:   State                               Online   Temperature                         29   Total CPU DRAM                      3200 MB   ...    Max Power Consumption               1150 Watts   Configured Bandwidth                1600 G   Operating Bandwidth                 1600 G  [edit] user@router# </pre>
<b>Options</b>	<b>bandwidth</b> —Configure the MPC to operate at a specified bandwidth. You can specify <b>1.6T</b> as the value to configure the MPC to operate at a bandwidth of 1.6 Tbps.
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">MPC8E on MX Series Routers Overview on page 37</a></li> <li>• <a href="#">MPC8E</a></li> </ul>

## bandwidth (Tunnel Services)

Syntax	<code>bandwidth <i>bandwidth-value</i>;</code>
Hierarchy Level	<code>[edit chassis fpc <i>slot-number</i> pic <i>number</i> tunnel-services]</code>
Release Information	Statement introduced in Junos OS Release 8.2. Statement introduced in Junos OS Release 12.3X54 for ACX Series routers.
Description	(ACX Series, MX Series 5G Universal Routing Platforms and T4000 Core Routers only) Configure the amount of bandwidth in gigabits per second reserved on each Packet Forwarding Engine for tunnel traffic using tunnel services. Configuring the bandwidth creates a virtual tunnel interface that is represented as <code>lt-&lt;fpc/pic/port&gt;</code> .
Options	<p><i>bandwidth-value</i>—Amount of bandwidth in Gbps to reserve for tunnel traffic using tunnel services:</p> <ul style="list-style-type: none"> <li>On ACX Series routers, the bandwidth values can be <b>1g</b> or <b>10g</b>.</li> <li>On MX Series routers, the bandwidth values can be as follows: <ul style="list-style-type: none"> <li><b>1g</b></li> <li><b>10g</b> through <b>100g</b> in 10 Gbps increments: <b>10g, 20g, 30g, 40g, 50g, 60g, 70g, 80g, 90g, 100g</b></li> <li><b>100g</b> through <b>400g</b> in 100 Gbps increments: <b>100g, 200g, 300g, 400g</b></li> </ul> </li> <li>On T4000 routers, the bandwidth values can be <b>10g</b> through <b>100g</b> in 10 Gbps increments: <b>10g, 20g, 30g, 40g, 50g, 60g, 70g, 80g, 90g, 100g</b>.</li> </ul>

**NOTE:** The bandwidth that you specify determines the port number of the tunnel interfaces that are created. When you specify a bandwidth of **1g**, the port number is always 10. When you specify any other bandwidth, the port number is always 0.

**NOTE:** If you specify a bandwidth that is not compatible with the type of DPCs or MPCs and their respective Packet Forwarding Engine, tunnel services are not activated. For example, you cannot specify 1 gigabit per second bandwidth for a Packet Forwarding Engine on a 10-Gigabit Ethernet 4-port DPC or 16x10GE 3D MPC.

When the tunnel bandwidth is unspecified in the Routing Engine CLI, the maximum tunnel bandwidth for MPC3E is 60G.

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

## bandwidth-degradation

<b>Syntax</b>	<pre>bandwidth-degradation {   action (log-only   restart   offline   restart-then-offline);   no-fabric-switchover;   percentage (1-99); }</pre>
<b>Hierarchy Level</b>	[edit chassis fpc slot-numberfabric]
<b>Release Information</b>	Statement introduced in Junos OS Release 15.1.
<b>Description</b>	Configure a FPC to take a specific action once bandwidth degradation reaches a certain percentage to avoid causing a traffic black hole in the chassis.
	<div>  <p><b>NOTE:</b> This configuration statement is mutually exclusive with the <b>offline-on-fabric-bandwidth-reduction</b> statement. If both statements are configured, the commit check fails and returns an error.</p> </div>
<b>Options</b>	<p><b>log-only</b>—A message gets logged in the chassisd and message files when the fabric degradation threshold is reached. No other actions are taken.</p> <p><b>restart</b>—The FPC with a degraded fabric plane is restarted once the threshold is reached.</p> <p><b>offline</b>—The FPC with a degraded fabric plane is taken offline once the threshold is reached. The FPC requires manual intervention to be brought back online. This is the default action if no action attribute configured.</p> <p><b>restart-then-offline</b>—The FPC with a degraded fabric plane is restarted once the threshold is reached, and if fabric plane degradation is detected again within 10 minutes, the FPC is taken offline. The FPC requires manual intervention to be brought back online.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Managing Bandwidth Degradation on page 143</a></li> <li>• <a href="#">blackhole-action on page 609</a></li> <li>• <a href="#">offline-on-fabric-bandwidth-reduction on page 723</a></li> </ul>

## blackhole-action

<b>Syntax</b>	<code>blackhole-action (log-only   restart   offline   restart-then-offline);</code>
<b>Hierarchy Level</b>	<code>[edit chassis fpc slot-number fabric]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 15.1.
<b>Description</b>	Configure an FPC to take a specific action when fabric plane degradation reaches 100 percent.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Managing Bandwidth Degradation on page 143</a></li> <li>• <a href="#">bandwidth-degradation on page 608</a></li> </ul>

## cel

<b>Syntax</b>	<pre>cel {   e1 port-number {     channel-group channel-number timeslots slot-number;   } }</pre>
<b>Hierarchy Level</b>	<code>[edit chassis fpc slot-number pic pic-number]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure channelized E1 port and channel specifications.
<b>Options</b>	<p><b>e1 port-number</b>—Any valid E1 port number on the host system.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Junos OS to Support Channel Groups and Time Slots for Channelized E1 PICs on page 468</a></li> </ul>

## channel-group

---

<b>Syntax</b>	<code>channel-group <i>channel-number</i> timeslots <i>slot-number</i>;</code>
<b>Hierarchy Level</b>	<code>[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> ce1 e1 <i>link-number</i>],</code> <code>[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> ct3 port <i>port-number</i> t1 <i>link-number</i>],</code> <code>[edit chassis lcc <i>lcc-index</i> fpc <i>slot-number</i> pic <i>pic-number</i> ce1 e1 <i>link-number</i>],</code> <code>[edit chassis lcc <i>lcc-index</i> fpc <i>slot-number</i> pic <i>pic-number</i> ct3 port <i>port-number</i> t1 <i>link-number</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure the DS0 channel number.
<b>Options</b>	<p><b><i>channel-number</i></b>—DS0 channel group.</p> <p><b>Range:</b> 0 through 7 for DS0 naming, and 0 through 23 for E1 naming.</p> <p><b><i>timeslots slot-number</i></b>—One or more actual time slot numbers allocated.</p> <p><b>Range:</b> 1 through 24 for T1 and 1 through 32 for E1</p> <p><b>Default:</b> All time slots for T1 and all time slots for E1</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Support Channelized DS3-to-DS0 Naming for Channel Groups and Time Slots on page 495</a></li><li>• <a href="#">Configuring the Junos OS to Support Channel Groups and Time Slots for Channelized E1 PICs on page 468</a></li></ul>

## channelization

<b>Syntax</b>	channelization;
<b>Hierarchy Level</b>	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.4.
<b>Description</b>	Enable the DS3/E3 MIC, MIC-3D-16CHE1-T1-CE, and MIC-3D-8CHOC3-4CHOC12 on MX Series routers with Queuing and Enhanced Queuing MPCs (MX-MPC1-3D-Q, MX-MPC2-3D-Q, MX-MPC2-3D-EQ, MPC2E-3D-NG, and MPC3E-3D-NG) or on MX80 routers to function in channelized mode.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Junos OS to Enable Channelization on DS3/E3 MIC on page 497</a></li> </ul>

## chassis

<b>Syntax</b>	chassis { ... }
<b>Hierarchy Level</b>	[edit]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure router chassis properties.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

## chassis (Component Temperature Threshold)

Syntax	<code>chassis [fpc   sib   cb] <i>threshold action to take</i>;</code>
Hierarchy Level	[edit]
Release Information	Statement introduced in Junos OS Release 15.1F3 and 16.1R2 for PTX5000 routers.
Description	The temperature sensor of each component (such as, FPC, SIB, or control board) is set to a predefined threshold. Any of these threshold values can be changed. As the temperature exceeds the threshold, the system attempts to heal the affected zone by increasing the fan speed for the zone in an attempt to lower the temperature. The <b>chassis [fpc sib cb] <i>threshold action to take</i></b> command is used to define the thresholds at which the fans change speeds, the system is shut down, or an alarm is sent.
Default	Each component has its own specific default threshold.
Options	<p><b>fpc</b>—FPC for which you are setting the temperature threshold</p> <p><b>sib</b>—SIB for which you are setting the temperature threshold</p> <p><b>cb</b>—Control board for which you are setting the temperature threshold</p> <p><b><i>threshold</i></b>—Temperature threshold setting, in degrees Celsius</p> <p><b><i>action to take</i></b>—Action that the system should take:</p> <ul style="list-style-type: none"> <li>• <b>fans-on-full-speed</b>—Temperature threshold at which the component's fans run at full speed</li> <li>• <b>fans-to-normal-speed</b>—Temperature threshold at which the component's fans return to normal speed</li> <li>• <b>fire-shutdown</b>—Temperature threshold for the component, which causes the network device to shut down</li> <li>• <b>red-alarm</b>—Temperature threshold at which a red alarm is triggered</li> <li>• <b>yellow-alarm</b>—Temperature threshold at which a yellow alarm is triggered</li> </ul>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <li>• <a href="#">show chassis environment on page 969</a></li> <li>• <a href="#">show chassis environment fpc on page 1099</a></li> <li>• <a href="#">show chassis environment cb on page 1066</a></li> </ul>

- [show chassis environment sib on page 1271](#)
- [show chassis fan on page 1352](#)

## ambient-temperature

<b>Syntax</b>	<code>chassis ambient-temperature (25C 40C 55C);</code>
<b>Hierarchy Level</b>	<code>[edit chassis]</code>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 14.1 for PTX Series routers.</p> <p>Statement introduced in Junos OS Release 15.1 for MX Series routers.</p> <p>Statement introduced in Junos OS Release 17.2R1 for EX9200 switches.</p> <p>Statement introduced in Junos OS Release 17.3 for MX10003 Universal Routing Platforms.</p> <p>Statement introduced in Junos OS Release 18.1R1 for EX9251 switches.</p> <p>Command introduced in Junos OS Release 18.2 for EX9253 Switches.</p> <p>Command introduced in Junos OS Release 18.2 for MX10008 Universal Routing Platforms.</p>
<b>Description</b>	<p>Set the chassis ambient temperature and instruct the power manager to allocate power to the line cards according to the ambient temperature value.</p> <p>On system initialization in a PTX Series router, the power manager reads the ambient temperature and allocates power to the line cards according to the power budget policy at that temperature. If the actual power consumption of any line card exceeds the configured value for more than three minutes, the power manager overrides the configured ambient temperature setting of that line card, and resets its ambient temperature to the next higher level and reallocates power according to the new temperature setting. All the overshooting line cards remain in the dynamic ambient temperature mode until the next reboot, or until you override the configured ambient temperature with a CLI command. The power manager then resets the power budget of the FRUs according to the configured ambient temperature setting.</p> <p>When an MX Series router or an EX9200 switch restarts, the system adjusts the power allocation or the provisioned power for the line cards on the basis of the configured ambient temperature. If enough power is not available, a minor chassis alarm is raised. However, the chassis continues to run with the configured ambient temperature. You can configure a new higher ambient temperature only after you make more power available by adding new power supply modules or by taking a few line cards offline. By using the provisioned power that is saved by configuring a lower ambient temperature, you can bring more hardware components online.</p> <p>For MX960 Universal Routing Platform and the MX2000 line of routers, a maximum operating temperature of 40°C is recommended at an altitude of up to 6000 feet above sea level. The router can operate up to a maximum temperature of 46°C at sea level and can be set accordingly.</p>

**NOTE:** If ambient temperature is not set, then the line cards are allocated power according to the default ambient temperature.

<b>Default</b>	<ul style="list-style-type: none"><li>• MX Series routers—40°C</li><li>• PTX Series routers—40°C</li><li>• EX9200 switches—40°C</li><li>• EX9251 switches—40°C</li><li>• EX9253 switches—40°C</li></ul>
<b>Options</b>	<p><b>25C</b> —Set the ambient temperature of the chassis to 25°C</p> <p><b>40C</b> —Set the ambient temperature of the chassis to 40°C</p> <p><b>55C</b> —Set the ambient temperature of the chassis to 55°C</p>
<b>Required Privilege Level</b>	<p>chassis—To view this statement in the configuration.</p> <p>chassis-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Managing Power Allocated to PTX5000 FPCs on the Basis of Chassis Ambient Temperature Configuration on page 101</a></li><li>• <a href="#">Monitoring the Power Consumption of PTX5000 FPCs by Configuring the Ambient Temperature on page 105</a></li><li>• <a href="#">Understanding How Configuring Ambient Temperature Helps Optimize Power Utilization on page 104</a></li></ul>

## clock-class

---

<b>Syntax</b>	<code>clock-class <i>clock-class-value</i>;</code>
<b>Hierarchy Level</b>	[edit protocols ptp <a href="#">slave clock-class-to-quality-level-mapping</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2R2.
<b>Description</b>	Configure the clock class to the set ESMC quality level.
<b>Default</b>	Following are the default clock class values for various clocks: <ul style="list-style-type: none"><li>• Boundary clock—248</li><li>• Ordinary clock (master)—52</li><li>• Ordinary clock (slave)—255</li></ul>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Hybrid Mode and ESMC Quality Level Mapping on page 329</a></li><li>• <a href="#">Example: Configuring Hybrid Mode and ESMC Quality Level Mapping on page 333</a></li><li>• <a href="#">Understanding Hybrid Mode on page 288</a></li><li>• <a href="#">Precision Time Protocol Overview on page 256</a></li><li>• <a href="#">Synchronous Ethernet Overview on page 242</a></li></ul>

## clock-class-to-quality-level-mapping

**Syntax**

```
clock-class-to-quality-level-mapping {
  clock-class clock-class-value;
  {
    quality-level ql-value;
  }
}
```

**Hierarchy Level** [edit protocols ptp [slave](#)]

**Release Information** Statement introduced in Junos OS Release 12.2R2.

**Description** Configure the slave to override the default Precision Time Protocol (PTP) clock class to Ethernet Synchronization Message Channel (ESMC) mapping.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**

routing—To view this statement in the configuration.
routing-control—To add this statement to the configuration.

## clock-source (slave)

---

Syntax	<pre>clock-source <i>ip-address</i> {     <i>local-ip-address</i> <i>local-ip-address</i>; }</pre>
Hierarchy Level	[edit protocols ptp <i>slave</i> interface <i>interface-name</i> <i>unicast-mode</i> transport]
Release Information	Statement introduced in Junos OS Release 12.2.
Description	Configure the IP address of the master.
Options	<p><i>ip-address</i>—IP address for the master.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring Precision Time Protocol on page 319</a></li><li>• <a href="#">Example: Configuring Precision Time Protocol on page 325</a></li><li>• <a href="#">Precision Time Protocol Overview on page 256</a></li></ul>

## clock-ipv6-source (slave)

Syntax	<pre>clock-ipv6-source <i>master-ipv6-address</i> {     <i>local-ip-address</i> <i>local-ip-address</i>; }</pre>
Hierarchy Level	[edit protocols ptp <i>slave</i> interface <i>interface-name</i> <i>unicast-mode</i> transport]
Release Information	Statement introduced in Junos OS Release 16.1.
Description	Configure the IPv6 address of the master.
Options	<p><i>master-ipv6-address</i>—IPv6 address for the master.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring Precision Time Protocol on page 319</a></li><li>• <a href="#">Example: Configuring Precision Time Protocol on page 325</a></li><li>• <a href="#">Precision Time Protocol Overview on page 256</a></li></ul>

## clock-source (hybrid)

<b>Syntax</b>	<pre>clock-source <i>ip-address</i> {   interface <i>interface1-name</i>;   interface <i>interface2-name</i>; }</pre>
<b>Hierarchy Level</b>	[edit protocols ptp <a href="#">slave hybrid synchronous-ethernet-mapping</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2R2.
<b>Description</b>	Configure the IP address of the PTP master and its possible Synchronous Ethernet source interfaces.
<b>Options</b>	<p><b>interface <i>interface1-name</i></b>—Synchronous Ethernet interface traceable to the same PTP master clock.</p> <p><b>interface <i>interface2-name</i></b>—Synchronous Ethernet interface traceable to the same PTP master clock.</p>
<div>  <p><b>NOTE:</b> You must first configure these interfaces at the [edit chassis synchronization] hierarchy level as Synchronous Ethernet sources. For information about configuring the interfaces, see <a href="#">synchronization (MX Series)</a>.</p> </div>	
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Hybrid Mode and ESMC Quality Level Mapping on page 329</a></li> <li>• <a href="#">Example: Configuring Hybrid Mode and ESMC Quality Level Mapping on page 333</a></li> <li>• <a href="#">Understanding Hybrid Mode on page 288</a></li> <li>• <a href="#">Precision Time Protocol Overview on page 256</a></li> <li>• <a href="#">Synchronous Ethernet Overview on page 242</a></li> </ul>

## clock-mode

<b>Syntax</b>	clock-mode (boundary   ordinary);
<b>Hierarchy Level</b>	[edit protocols ptp]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers. Statement introduced in Junos OS Release 17.3 for the QFX Series.
<b>Description</b>	Configure the clock mode as either boundary clock or ordinary clock. The clock mode determines whether the node is going to act as a slave, master, or both. This attribute is mandatory and has no default value.
<b>Options</b>	<b>boundary</b> —The clock mode of the node is a boundary clock where the clock acts as both master and slave.  <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <div style="display: flex; align-items: center;">  <div> <p><b>NOTE:</b> A boundary clock is not supported on the ACX Series routers for 12.2.</p> </div> </div> </div> <b>ordinary</b> —The clock mode of the node is a system clock where the clock acts either as a master or as a slave.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Precision Time Protocol on page 319</a></li> <li>• <a href="#">Example: Configuring Precision Time Protocol on page 325</a></li> <li>• <a href="#">Precision Time Protocol Overview on page 256</a></li> <li>• <i>IEEE 1588v2 Precision Timing Protocol (PTP)</i></li> <li>• <i>Configuring the Precision Time Protocol G.8275.2 Enhanced Profile (Telecom Profile)</i></li> </ul>

## clock-mode (Clock Synchronization)

---

<b>Syntax</b>	clock-mode (auto-select   free-run);
<b>Hierarchy Level</b>	[edit chassis <a href="#">synchronization</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2R4 for MX Series routers.
<b>Description</b>	Configure the mode of operation to select the clock source from a free-run local oscillator or from an external qualified clock. On MX240, MX480, and MX960 routers with enhanced MPCs, the free-run clock is provided by a local oscillator. On other MX Series routers, the free-run clock is provided by the SCB.
<b>Default</b>	auto-select
<b>Options</b>	<b>auto-select</b> —Select the best external clock source as a clock source. <b>free-run</b> —Select the free-run local oscillator as a clock source.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">synchronization on page 794</a></li></ul>

## clock-client

<b>Syntax</b>	<code>clock-client <i>ip-address</i>;</code> <code>local-ip-address <i>local-ip-address</i>;</code>
<b>Hierarchy Level</b>	[edit protocols ptp <b>master</b> interface <i>interface-name</i> <b>unicast-mode transport</b> ipv4]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 17.3 for the QFX Series.
<b>Description</b>	Configure the IP address of the slave.  The remaining statement is explained separately. See <a href="#">CLI Explorer</a> .
<b>Options</b>	<i>ip-address</i> —The IP address for the slave.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Precision Time Protocol on page 319</a></li> <li>• <a href="#">Example: Configuring Precision Time Protocol on page 325</a></li> <li>• <a href="#">Precision Time Protocol Overview on page 256</a></li> <li>• <a href="#">Configuring the Precision Time Protocol G.8275.2 Enhanced Profile (Telecom Profile)</a></li> </ul>

## clock-ipv6-client

---

Syntax	<code>clock-ipv6-client <i>slave-ip-address</i>;</code>
Hierarchy Level	[edit protocols ptp <b>master</b> interface <i>interface-name</i> <b>unicast-mode transport</b> ipv4]
Release Information	Statement introduced in Junos OS Release 16.1.
Description	Configure the IPv6 address of the slave.
Options	<i>slave-ip-address</i> —The IPv6 address for the slave.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring Precision Time Protocol on page 319</a></li><li>• <a href="#">Example: Configuring Precision Time Protocol on page 325</a></li><li>• <a href="#">Precision Time Protocol Overview on page 256</a></li></ul>

## clock-step

<b>Syntax</b>	clock-step (one-step   two-step);
<b>Hierarchy Level</b>	[edit protocols ptp <b>master</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2.
<b>Description</b>	Configure the clock step that determines whether the timing information is sent along with the synchronous message (one-step) only or a subsequent follow-up message (two-step) is received for the sent synchronous message.
<b>Options</b>	<p><b>one-step</b>—One clock step to send timing information along with the synchronous message.</p> <p><b>two-step</b>—Two clock steps to send timing information and receive a subsequent follow-up message.</p>
<div>  <p><b>NOTE:</b> On MX Series routers, the <b>two-step</b> option is supported only for MPC1E and MPC2E line cards. This option is not supported for MPC5E, MPC6E, MPC7E, MPC8E, and MPC9E line cards.</p> </div>	
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

## convert-clock-class-to-quality-level

---

<b>Syntax</b>	convert-clock-class-to-quality-level;
<b>Hierarchy Level</b>	[edit protocols ptp <a href="#">slave</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers. Statement introduced in Junos OS Release 12.2R2 for MX Series 5G Universal Routing Platforms.
<b>Description</b>	<p>Configure the slave to enable it to retrieve Ethernet Synchronization Message Channel (ESMC) information from the Precision Time Protocol (PTP) clock class.</p> <p>When this option is set, the outgoing quality level depends on the PTP clock class mapping, irrespective of the clock being configured in hybrid mode or pure PTP mode. This is the default mapping mode of the ESMC quality level value to the clock class.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Hybrid Mode and ESMC Quality Level Mapping on page 329</a></li><li>• <a href="#">Example: Configuring Hybrid Mode and ESMC Quality Level Mapping on page 333</a></li><li>• <a href="#">Precision Time Protocol Overview on page 256</a></li><li>• <a href="#">Synchronous Ethernet Overview on page 242</a></li><li>• <a href="#">Understanding ESMC Quality Level Mapping on page 280</a></li><li>• <a href="#">Understanding Hybrid Mode on page 288</a></li></ul>

## craft-lockout

---

<b>Syntax</b>	craft-lockout;
<b>Hierarchy Level</b>	[edit chassis]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.1.
<b>Description</b>	Disable the physical operation of the craft interface front panel.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Disable the Physical Operation of the Craft Interface on page 517</a></li></ul>

## ct3

---

**Syntax**

```
ct3 {  
  port port-number {  
    t1 link-number {  
      channel-group channel-number timeslots slot-number;  
    }  
  }  
}
```

**Hierarchy Level** [edit chassis fpc *slot-number* pic *pic-number*]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Configure channelized T3 port and channel specifications.

**Options** **port** *port-number*—Any valid T3 port number on the host system.

**t1** *link-number*—T1 link.

**Range:** 0 through 27

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

## degraded-fabric-detection-enable

---

<b>Syntax</b>	degraded-fabric-detection-enable;
<b>Hierarchy Level</b>	[edit chassis fabric <a href="#">degraded</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X48R4 for PTX Series Packet Transport Routers.
<b>Description</b>	Enable detection of an FPC with degraded fabric.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Fabric Resiliency and Degradation on page 132</a></li><li>• <a href="#">Disabling Line Card Restart to Limit Recovery Actions from Degraded Fabric Conditions on page 144</a></li></ul>

## degraded-fpc-bad-plane-threshold

---

<b>Syntax</b>	degraded-fpc-bad-plane-threshold <i>number-bad-planes</i> ;
<b>Hierarchy Level</b>	[edit chassis fabric <a href="#">degraded</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X48R4 for PTX Series Packet Transport Routers.
<b>Description</b>	Configure the number of bad planes that indicate an FPC is degraded.
<b>Options</b>	<b>number-bad-planes</b> —Number of bad planes. <b>Range:</b> 4 through 18 <b>Default:</b> 4
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Fabric Resiliency and Degradation on page 132</a></li><li>• <a href="#">Disabling Line Card Restart to Limit Recovery Actions from Degraded Fabric Conditions on page 144</a></li></ul>

## delay-request

<b>Syntax</b>	<code>delay-request <i>delay-request-value</i>;</code>
<b>Hierarchy Level</b>	<code>[edit protocols ptp <a href="#">slave</a>]</code> <code>[edit protocols ptp slave (ACX Series)]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.
<b>Description</b>	Configure the logarithmic mean interval in seconds between the delay request messages sent by the slave to the master.
<b>Options</b>	<b><i>delay-request-value</i></b> —The delay request value for the delay request messages. <b>Range:</b> –6 through +6 <b>Default:</b> 0
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Precision Time Protocol on page 319</a></li> <li>• <a href="#">Example: Configuring Precision Time Protocol on page 325</a></li> <li>• <a href="#">Precision Time Protocol Overview on page 256</a></li> </ul>

## device-count

<b>Syntax</b>	<code>device-count <i>number</i>;</code>
<b>Hierarchy Level</b>	<pre>[edit chassis <a href="#">aggregated-devices ethernet</a>] [edit chassis <a href="#">aggregated-devices sonet</a>]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement functionality updated in Junos OS Release 14.2, as described below.</p>
<b>Description</b>	<p>Configure the number of aggregated logical devices available to the router.</p> <p>Starting in Junos release 14.2, for MX series routers, aggregate Ethernet interfaces created under a logical system can be individually named. Prior to 14.2, ae interfaces were named automatically (AE1, AE2) etc. upon setting the device count. This change allows administrators to use custom naming schemes. System resources are only allocated for named ae interfaces, regardless of how many were declared in the device count. (In Junos 14.2 and earlier, ae naming occurred automatically up to the number specified for device count, and system resources were allocated whether a given ae interface was used or not.)</p>
<b>Options</b>	<p><i>number</i>—Set the number of aggregated logical devices that will be available for configuration.</p>
	<p> <b>NOTE:</b> Starting with Junos OS Release 13.2, a maximum of 64 aggregated interfaces are supported for link aggregation of SONET/SDH interfaces. In releases before Junos OS Release 13.2, a maximum of 16 aggregated interfaces are supported for link aggregation of SONET/SDH interfaces.</p>
	<p><b>Range:</b> 1 - 496. The upper limit for this value is system specific.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Junos OS for Supporting Aggregated Devices on page 481</a></li> <li>• <a href="#">Configuring Aggregated SONET/SDH Interfaces</a></li> </ul>

## disable-grant-bypass

<b>Syntax</b>	disable-grant-bypass;
<b>Hierarchy Level</b>	[edit chassis fabric]
<b>Release Information</b>	Statement introduced in Junos OS Release 16.1.
<b>Description</b>	<p>Disable the fabric grant bypass feature. This feature is used for communication between Packet Forwarding Engines. For instance, when a Packet Forwarding Engine wants to send a packet to another Packet Forwarding Engine (on the same MPC or on a different MPC), a request is sent to the Packet Forwarding Engine across the fabric plane. Only after the request is granted, can the source Packet Forwarding Engine send the packet to the destination Packet Forwarding Engine. Disabling the default behavior controls congestion and thus improves system behavior and performance on MX2010 and MX2020 routers.</p>
	<p> <b>NOTE:</b> After disabling fabric grant bypass feature on the MX2010 and MX2020, you must reboot the router for the changes to take effect. MPC1 (MX-MPC1-3D), MPC2 (MX-MPC2-3D), and the 16-port 10-Gigabit Ethernet MPC (MPC-3D-16XGE-SFP) do not power on after you disable the fabric grant bypass feature and reboot the router.</p>
<b>Default</b>	<p>Enabled for all MPCs on MX2010 and MX2020 routers with Switch Fabric Boards (SFBs). On MX2010 and MX2020 routers with the Switch Fabric Board SFB2, this feature is enabled only on the MPCs, MPC1 (MX-MPC1-3D), MPC2 (MX-MPC2-3D), and the 16-port 10-Gigabit Ethernet MPC (MPC-3D-16XGE-SFP), and disabled on all other MPCs. The feature is disabled on routers with Switch Control Boards (SCBs).</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Fabric Grant Bypass on page 146</a></li> <li>• <a href="#">Disabling Fabric Grant Bypass to Control Congestion and Improve Performance on page 147</a></li> <li>• <a href="#">Re-Enabling Fabric Grant Bypass on page 148</a></li> </ul>

## disk-failure-action

---

<b>Syntax</b>	disk-failure-action (halt   reboot);
<b>Hierarchy Level</b>	[edit chassis routing-engine on-disk-failure]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0.
<b>Description</b>	Configure the Routing Engine to halt or reboot when the Routing Engine hard disk fails.
<b>Options</b>	<b>halt</b> —Specify the Routing Engine to halt. <b>reboot</b> —Specify the Routing Engine to reboot.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Enable a Routing Engine to Reboot on Hard Disk Errors on page 509</a></li></ul>

## domain

<b>Syntax</b>	<code>domain <i>domain-value</i>;</code>
<b>Hierarchy Level</b>	[edit protocols ptp]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.
<b>Description</b>	Configure multiple independent Precision Time Protocol (PTP) domains.
<div>  <b>NOTE:</b> Only one PTP domain is supported at any given point in time. </div>	
<b>Options</b>	<i>domain-value</i> —The PTP domain value. <b>Range:</b> 0 through 127 <b>Default:</b> 0
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Precision Time Protocol on page 319</a></li> <li>• <a href="#">Example: Configuring Precision Time Protocol on page 325</a></li> <li>• <a href="#">Precision Time Protocol Overview on page 256</a></li> </ul>

## dynamic-profile-options

---

<b>Syntax</b>	<pre>dynamic-profile-options {   versioning; }</pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.4.
<b>Description</b>	<p>Configure global dynamic profile options.</p> <p>The remaining statement is explained separately. Search for a statement in <a href="#">CLI Explorer</a> or click a linked statement in the Syntax section for details.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Enabling Dynamic Profiles to Use Multiple Versions</i></li></ul>

## e1

---

<b>Syntax</b>	<pre>e1 <i>port-number</i> {   <a href="#">channel-group</a> <i>channel-number</i> timeslots <i>slot-number</i>; }</pre>
<b>Hierarchy Level</b>	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> ce1]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure the channelized E1 port number on the PIC. The range is from 0 through 9.
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Support Channel Groups and Time Slots for Channelized E1 PICs on page 468</a></li></ul>

## e1-options (Clock Synchronization)

<b>Syntax</b>	<pre>e1-options {   framing (g704   g704-no-crc4);   line-encoding (ami   hdb3);   sabit <i>bit</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit chassis <a href="#">synchronization</a> interfaces external] [edit chassis <a href="#">synchronization</a> interfaces (external-0/0   external-1/0)]</pre>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for MX Series routers.
<b>Description</b>	Configure the E1 interface options.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">synchronization on page 794</a></li> </ul>

## egress-policer-overhead

Syntax	<code>egress-policer-overhead bytes;</code>
Hierarchy Level	<code>[edit chassis fpc slot-number pic pic-number]</code>
Release Information	Statement introduced before Junos OS Release 11.1.
Description	<p>Add the specified number of bytes to the actual length of an Ethernet frame when determining the actions of Layer 2 policers, MAC policers, or queue rate limits applied to output traffic on the line card. You can configure egress policer overhead to account for egress <i>shaping</i> overhead bytes added to output traffic on the line card.</p> <p>On M Series and T Series routers, this statement is supported on Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs and Enhanced IQ2 (IQ2E) PICs. On MX Series routers, this statement is supported for interfaces configured on Dense Port Concentrators (DPCs).</p>
	<div>  <p><b>NOTE:</b> This statement is not supported on Modular Interface Cards (MICs) or Modular Port Concentrators (MPCs) in MX Series routers.</p> </div>
Options	<p><b>bytes</b>—Number of bytes added to a packet exiting an interface.</p> <p><b>Range:</b> 0–255 bytes</p> <p><b>Default:</b> 0</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <li>• <a href="#">egress-shaping-overhead</a></li> <li>• <a href="#">Policer Overhead to Account for Rate Shaping Overview</a></li> <li>• <a href="#">Example: Configuring Policer Overhead to Account for Rate Shaping</a></li> <li>• <a href="#">Configuring a Policer Overhead on page 473</a></li> <li>• <a href="#">CoS on Enhanced IQ2 PICs Overview</a></li> </ul>

## enhanced-mode (Network Services)

<b>Syntax</b>	enhanced-mode;
<b>Hierarchy Level</b>	[edit chassis network-services]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.3 for T4000 Core Routers with Type 5 FPCs.</p> <p>Statement introduced in Junos OS Release 15.1F3 and 16.1R2 for PTX5000 routers with third-generation FPCs.</p> <p>Statement introduced in Junos OS Release 15.1F6 and 16.1R2 for PTX3000 routers with third-generation FPCs.</p> <p>Statement introduced in Junos OS Release 17.3R1 for PTX1000 routers.</p>
<b>Description</b>	<p>PTX1000, PTX3000 and PTX5000 Routers—When you configure <b>enhanced-mode</b> on PTX series routers, the following features are enabled on the router:</p> <ul style="list-style-type: none"> <li>• Filter-based generic routing encapsulation (GRE) for IPV4 and IPV6 tunneling.</li> <li>• <b>promote gre-key</b> statement for configuring gre-key as one of the matches in a filter.</li> <li>• <b>promote dscp</b> under <b>family inet</b>, and <b>promote traffic-class</b> under <b>family inet6</b> statements for configuring these as one of the matches in a filter. (Added in Junos OS 17.1 for all PTX Series routers with third-generation FPCs.)</li> <li>• <b>gtp-tunnel-endpoint-identifier</b> statement for including hash calculation for IPV4 or IPV6 packets in the GPRS tunneling protocol—Tunnel end point ID (GTP-TEID) field hash calculations.</li> <li>• Wider configuration range for Bidirectional Forwarding Detection (BFD) protocol intervals.</li> <li>• Support for up to two million routes per chassis.</li> <li>• Support for Layer 3 VPN. The <b>vrf-table-label</b> statement is supported. (Added in Junos OS 15.1F5 for PTX5000 routers.)</li> <li>• Support for destination class usage (DCU) and source class usage (SCU) accounting. (Added in Junos OS 15.1F5 for PTX5000 routers.)</li> </ul>

### NOTE:

- When you configure the **enhanced-mode** statement, only third-generation FPCs are allowed to be powered on. All other FPCs are powered off and cannot be brought online.
- When you do not configure the **enhanced-mode** statement, third-generation FPCs do not support the advanced features in the preceding list. Third-generation FPC only provide the same functionality as the first-generation and second-generation FPCs.

- After you configure the **enhanced-mode** statement and commit the configuration, the router must reboot.

---

T4000 Routers—When you configure **enhanced-mode** on T4000 routers, improved virtual private LAN service (VPLS) MAC address learning by supporting up to 262,143 MAC addresses per VPLS routing instance is enabled.

**NOTE:**

- The **enhanced-mode** statement supports up to 262,143 MAC addresses per VPLS routing instance. However, the MAC address learning limit for each interface remains the same (that is, 65,535 MAC addresses).
- After you configure the **enhanced-mode** statement and committing the configuration, you receive a warning message that prompts you to reboot the router. You must reboot the router and then modify the size of the VPLS MAC address table; otherwise, the improved VPLS MAC address learning does not take effect.
- When the T4000 router reboots after the **enhanced-mode** statement is configured, only the T4000 Type 5 FPCs are online while the remaining FPCs are offline.

---

**Default** PTX Series Routers—By default, the **enhanced-mode** statement is disabled.

T4000 Routers—By default, the improved VPLS MAC address learning feature is disabled.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## error

```
Syntax  error {
        (fatal | major | minor) {
            threshold threshold value;
            action (alarm | disable-pfe | offline-pic | log | get-state | offline | reset);
        }
        scope error-scope {
            category category {
                (fatal | major | minor) {
                    threshold threshold value;
                    action (alarm | disable-pfe | log | get-state | offline | reset);
                }
            }
        }
    }
```

**Hierarchy Level** [edit chassis]

**Release Information** Statement introduced in Junos OS Release 13.3 on MX Series routers.

**Description** Configure the threshold at which FPC errors will take the action you configure to be performed by the device. Starting from Junos OS Release 18.1R3, you can configure error thresholds and actions at the error scope and error category levels on MX Series .

Some Juniper devices include an internal framework for detecting and correcting FPC errors that can have the potential to affect services. You can classify FPC errors according to severity, set an automatic recovery action for each severity, and set a threshold (i.e., the number of times the error must occur before the action is triggered).

**Options** You can configure the threshold for the following severity levels:

**NOTE:** You cannot configure the severity level of an error. However you can modify the severity of an error by using the error ID. See

- **fatal**—Fatal error on the FPC. An error that results in blockage of considerable amount of traffic across modules is a fatal error.
- **major**—Major error on the FPC. An error that results in continuing loss of packet traffic but does not affect other modules is a major error.
- **minor**—Minor error on the FPC. An error that results in the loss of a single packet but is fully recoverable is a minor error.
- **threshold *threshold-value***—Configure the threshold value at which to take action. If the severity level of the error is fatal, the action is carried out only once when the total number of errors crosses the threshold value. If the severity level of the error is major,

the action is carried out once after the occurrence crosses the threshold. If the severity level is minor, the action is carried out as many times as the value specified by the threshold. For example, when the severity level is minor, and you have configured the threshold value as 10, the action is carried out after the tenth occurrence.

**NOTE:** You can set the threshold value to 0 for errors with severity level as minor. This implies that no action is taken for that error. You cannot set the threshold value to 0 for errors with severity level as major or fatal.

Default: The error count for fatal and major actions is 1. The default error count for minor actions is 10.

Range: 0—429,496,729

The available detection and recovery actions are as follows:

- **alarm**—Raise an alarm.
- **disable-pfe**—Disable the PFE interfaces on the FPC.
- **get-state**—Get the current state of the FPC.
- **log**—Generate a log for the event.
- **offline**—Take the FPC offline.
- **offline-pic**—Take the PIC (installed in the FPC) offline.
- **reset**—Reset the FPC.

**NOTE:** Starting in Junos OS Release 17.2R1, if you configure the **disable-pfe**, **offline**, **offline-pic** or **reset** action on an MX Series or PTX Series router, the **get-state** action is additionally configured on the router. This means, for example, if you configure the **disable-pfe** action on the router, the router gets both **disable-pfe** and **get-state** actions configured.

- **scope error-scope**—Group the errors of a particular severity into different scopes. Errors belonging to each error scope is further grouped into categories, before thresholds and actions are defined at the group level. The following scopes are available: **board** and **pfe**.
- **category category**—Categorize errors into various subgroups under the scope level. An error category helps you group similar errors belonging to a particular scope and define actions for them at once. This feature eliminates the need for configurations against individual error-ids. Some of the error-categories are **functional**, **io** (input/output errors), **storage** (for example, errors related to HDD, SSD, and flash), **memory** (for example, errors related to static RAM), **processing** (for example, CPU-related errors), and **switch**.

**Required Privilege Level**    **interface**—To view this statement in the configuration.  
   **interface-control**—To add this statement to the configuration.

## error-id

<b>Syntax</b>	<pre> error-id {   severity; {     (fatal   major   minor) {     }   }   state {     disable;   } } </pre>
<b>Hierarchy Level</b>	[edit chassis fpc error]
<b>Release Information</b>	Statement introduced in Junos OS Release 18.2R1.
<b>Description</b>	<p>Manage an error by using the error identifier. This feature allows you to disable an error or modify its severity. The <b>disable</b> option allows you to stop the error from being reported in the system until the error is enabled again.</p> <p>An <i>error-id</i>, a unique error identifier, is represented as a Uniform Resource Identifier (URI), and is composed of a module identifier and an error identifier. For example, the error-id <b>"/cpu/0/memory/0/memory-uncorrected-error"</b> indicates an uncorrectable error under CPU memory module instance 0.</p>
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>severity</b>—Apply a new severity to the error ID. You can apply any of the following severities: <ul style="list-style-type: none"> <li>• <b>fatal</b>—Fatal error on the FPC. An error that results in blockage of considerable amount of traffic across modules is a fatal error.</li> <li>• <b>major</b>—Major error on the FPC. An error that results in continuing loss of packet traffic but does not affect other modules is a major error.</li> <li>• <b>minor</b>—Minor error on the FPC. An error that results in the loss of a single packet but is fully recoverable is a minor error.</li> </ul> </li> <li>• <b>state</b>—By default, an error is in "enabled" state. <ul style="list-style-type: none"> <li>• <b>disable</b>—Disable an error.</li> </ul> </li> </ul>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Managing FPC Errors on page 456</a></li> <li>• <a href="#">Configuring FPC Error Levels and Actions on page 455</a></li> <li>• <a href="#">fpc error on page 659</a></li> <li>• <a href="#">show chassis fpc errors on page 1718</a></li> </ul>

## esmc-transmit

Syntax	<pre>esmc-transmit {   interfaces (all   <i>interface-name</i>); }</pre>
Hierarchy Level	[edit chassis <a href="#">synchronization</a> ]
Release Information	Statement introduced in Junos OS Release 11.2R4 for MX Series routers.
Description	Enable Ethernet Synchronization Message Channel (ESMC) packet transmission on all the interfaces or on a specific interface.
Options	<p><i>interface-name</i>—Enable ESMC packet transmission on this interface.</p> <p><i>all</i>—Enable ESMC packet transmission on all interfaces.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

## ethernet (Chassis)

---

Syntax	<pre>ethernet {   device-count <i>number</i>;   lacp {     link-protection {       non-revertive;     }     system-priority;   } }</pre>
Hierarchy Level	[edit chassis <a href="#">aggregated-devices</a> ]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 11.4 for EX Series switches.
Description	Configure properties for Ethernet aggregated devices on the router.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring Junos OS for Supporting Aggregated Devices on page 481</a></li><li>• <i>Configuring LACP Link Protection of Aggregated Ethernet Interfaces for Switches</i></li></ul>

## family

**Syntax**

```
family {
  inet {
    layer-3;
    layer-4;
    symmetric-hash {
      complement;
    }
  }
  multiservice {
    source-mac;
    destination-mac;
    payload {
      ip {
        layer-3;
        layer-4;
      }
    }
    symmetric-hash {
      complement;
    }
  }
}
```

**Hierarchy Level** [edit chassis fpc *slot-number* pic *pic-number* hash-key]

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** (MX Series 5G Universal Routing Platforms only) Configure data used in a hash key for a specific protocol family when configuring PIC-level symmetrical load balancing on an 802.3ad Link Aggregation Group.

**Options** **inet**—Configure data used in a hash key for the **inet** protocol family.

**multiservice**—Configure data used in a hash key for the **multiservice** protocol family.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

- [Configuring PIC-Level Symmetrical Hashing for Load Balancing on 802.3ad LAGs for MX Series Routers on page 489](#)

## fatal

---

**Syntax**

```
fatal {  
  threshold threshold-value;  
  action {  
    alarm;  
    disable-pfe;  
    get-state;  
    log;  
    offline;  
    reset;  
  }  
}
```

**Hierarchy Level** [edit chassis **fpc** slot-number **error**]

[edit chassis]

**Release Information** Statement introduced for PTX Series routers in Junos OS Release 13.3.  
Statement introduced for MX240, MX480, MX960, and MX2020 routers in Junos OS Release 14.2.

**Description** Severity level of the error. An error that results in blockage of considerable amount of traffic across modules is a fatal error. The severity level of an error cannot be configured by a user.

The other statements are explained separately.

**Required Privilege Level** **interface**—To view this statement in the configuration.  
**interface-control**—To add this statement to the configuration.

## feeds (T640, T1600, and T4000 Routers with Six-Input DC Power Supply)

Syntax	<code>feeds number-of-input-feeds;</code>
Hierarchy Level	<code>[edit chassis pem]</code> <code>[edit chassis lcc lcc-number pem]</code> (Routing Matrix)
Release Information	Statement introduced in Junos OS Release 12.1.
Description	<p>Configure the number of input feeds connected to the six-input DC power supply on T640, T1600, or T4000 routers. The value assigned to the <b>feeds</b> statement must be equal to the number of input feeds provided to the power supply.</p> <p>When providing four or five input feeds on standalone routers, you must configure the <b>feeds</b> statement at the <b>[edit chassis pem]</b> hierarchy level. When providing four or five input feeds to an LCC router in a routing matrix, you must configure the <b>feeds</b> statement at the <b>[edit chassis lcc lcc-number pem]</b> hierarchy level.</p> <div style="margin-top: 20px;">  <p><b>NOTE:</b></p> <ul style="list-style-type: none"> <li>Before configuring input feeds for your router, see the <i>T640 Core Router Hardware Guide</i>, <i>T1600 Core Router Hardware Guide</i>, or <i>T4000 Core Router Hardware Guide</i> for special considerations and for the number of input feeds supported by the router.</li> <li>All power supplies in the router must use the same number of inputs feeds.</li> </ul> </div>
Options	<p><b>Range:</b> 4 through 6</p> <p><b>Default:</b> 6</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <li><a href="#">Configuring the Six-Input DC Power Supply on T Series Routers on page 110</a></li> </ul>

## fib-local

---

Syntax	fib-local;
Hierarchy Level	[edit chassis fpc <i>fpc-number</i> route-localization]
Release Information	Statement introduced in Junos OS Release 11.4.
Description	Configure the Packet Forwarding Engine on an FPC as FIB-local.  <div> <b>NOTE:</b> At least, one Packet Forwarding Engine must be configured as <b>fib-local</b> for the commit operation to be successful. If you do not configure <b>fib-local</b> for the Packet Forwarding Engine, the CLI displays an appropriate error message and the commit fails.</div>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Packet Forwarding Engine FIB Localization on page 383</a></li></ul>

## fib-remote

---

Syntax	fib-remote;
Hierarchy Level	[edit chassis fpc <i>fpc-number</i> route-localization]
Release Information	Statement introduced in Junos OS Release 11.4.
Description	Configure the Packet Forwarding Engine on an FPC as FIB-remote.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Packet Forwarding Engine FIB Localization on page 383</a></li></ul>

## filter

<b>Syntax</b>	filter;
<b>Hierarchy Level</b>	[edit chassis <a href="#">memory-enhanced</a> ]
<b>Release Information</b>	Statement added in Junos OS Release 11.1.
<b>Description</b>	Enables storing of firewall filters across multiple static RAM (SRAM) segments, resulting in proper utilization of SRAM segments. This feature is useful in routers with small routing tables and large firewall filters. This statement is supported on T Series routers.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Allocate More Memory for Routing Tables, Firewall Filters, and Layer 3 VPN Labels on page 506</a></li></ul>

## flexible-queuing-mode

---

<b>Syntax</b>	<code>flexible-queuing-mode;</code>
<b>Hierarchy Level</b>	[edit chassis]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.1R1 for MX Series Routers.
<b>Description</b>	<p>Enable flexible queuing on a non-HQoS MPCE that is installed in an MPC slot. A maximum of up to 32,000 queues are supported per port and per card, including queues on both ingress and egress interfaces.</p> <p>When flexible queuing is enabled, the non-HQoS MPC is restarted for the changes to take effect and is brought online only if the power required for the queuing component is available in the power entry module (PEM). The MPC remains offline if the PEM cannot meet the power requirement for the queuing component.</p> <p>You can configure flexible queuing even when a non-HQoS MPC is not present in the chassis. The configuration takes effect when a non-HQoS MPC is installed.</p> <p>For more information about the MPCs and the Junos OS release that support this feature, see <a href="#">“Flexible Queuing Mode” on page 45</a>.</p>
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Upgrading non-HQoS MPCs to Support Flexible Queuing on page 46</a></li><li>• <a href="#">Flexible Queuing Mode Overview on page 45</a></li><li>• <a href="#">MPC3E on MX Series Routers Overview on page 23</a></li><li>• <a href="#">MPC5E on MX Series Routers Overview on page 29</a></li><li>• <a href="#">Protocols and Applications Supported by the MPC5E for MX Series Routers</a></li><li>• <a href="#">Upgrading non-HQoS MPCs to Support Flexible Queuing on page 46</a></li></ul>

## force-switch

---

<b>Syntax</b>	force-switch;
<b>Hierarchy Level</b>	[edit chassis synchronization source (external   <i>interface-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2R4 for MX Series routers.
<b>Description</b>	For MX Series routers operating with Synchronous Ethernet, force a router to use the clock source, provided that the source is enabled and not locked out. Only one configured source may be force-switched.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">synchronization (MX Series) on page 794</a></li></ul>

## fpc (M320, T320, T640 and PTX Series Routers)

```
Syntax  fpc slot-number {
    error {
        [fatal | major | minor] {
            threshold threshold-value;
            action (alarm | disable-pfe | offline-pic | log | get-state | offline | reset);
        }
    }
    optical-options {
        expansion-card {
            fpc fpc-slot;
        }
        express-in {
            fpc fpc-slot;
        }
        tca tca-identifier (enable-tca | no-enable-tca) (threshold number | threshold-24hrs
            number) ;
        wavelength nm{
            switch interface-name{
            }
            wss-express-in fpc-slot;
        }
    }
}

pic pic-number {
    cel {
        el port-number {
            channel-group group-number timeslots slot-number;
        }
    }
    ct3 {
        port port-number {
            tl link-number {
                channel-group group-number timeslots slot-number;
            }
        }
    }
    framing (sdh | sonet);
    idle-cell-format {
        itu-t;
        payload-pattern payload-pattern-byte;
    }
    max-queues-per-interface (8 | 4);
    no-concatenate;
    q-pic-large-buffer (large-scale | small-scale);
}
}
```

Hierarchy Level [edit chassis]

- Release Information** Statement introduced before Junos OS Release 7.4.  
Error statement introduced for PTX Series routers in Junos OS Release 13.3.
- Description** Configure properties for the PICs in individual Flexible PIC Concentrators (FPCs).
- Options** *slot-number*—Slot number in which the FPC is installed.  
**Range:** M320, T640, T1600, T4000, and PTX5000 routers: 0 through 7  
**Range:** PTX3000 routers: 0, 2, 4, 6, 8, 10, 12, 14

**NOTE:** On PTX1000 routers, the FPC number is always 0.

The remaining statements are explained separately.

- Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.
- Related Documentation**

## fpc (MX Series 5G Universal Routing Platforms)

```
Syntax  fpc slot-number {
        inline-services {
            flow-table-size {
                ipv4-flow-table-size units;
                ipv4-flow-table-size units;
                ipv6-extended-attrib;
            }
        }
        ir-mode (R | IR);
        pic number {
            inline-services {
                bandwidth (1g | 10g);
            }
            port-mirror-instance port-mirroring-instance-name-pic-level;
            tunnel-services {
                bandwidth (1g | 10g);
            }
        }
        port-mirror-instance port-mirroring-instance-name-fpc-level;
    }
```

Hierarchy Level [edit chassis]

**Release Information** Statement introduced in Junos OS Release 8.2.  
**port-mirror-instance** option added in Junos OS Release 9.3.  
**ipv6-extended-attrib** option added in Junos OS Release 14.2 for MX Series routers.

**Description** Configure properties for the DPC or MPC and corresponding Packet Forwarding Engines to create tunnel interfaces.

(MX Series Virtual Chassis only) When you configure chassis properties for MPCs installed in a Virtual Chassis member router, statements included at the **[edit chassis member member-id fpc slot slot-number]** hierarchy level apply to the MPC in the specified slot number only on the specified member router in the Virtual Chassis. Statements included at the **[edit chassis fpc slot slot-number]** hierarchy level apply to the MPCs in the specified slot number on *each* member router in the Virtual Chassis.

**BEST PRACTICE:** To ensure that the statement you use to configure MPC chassis properties in an MX Series Virtual Chassis applies to the intended member router and MPC, we recommend that you always include the **member member-ID** option before the **fpc** statement, where **member-id** is 0 or 1 for a two-member MX Series Virtual Chassis.

**Options** **fpc slot-number**—Specify the slot number of the DPC.

**Range:** 0 through 11

**pic number**—Specify the number of the Packet Forwarding Engine. Each DPC includes four Packet Forwarding Engines.

**Range:** 0 through 4

**port-mirror-instance port-mirroring-instance-name-fpc-level**—Associate a port-mirroring instance with the DPC and its corresponding PICs. The port-mirroring instance is configured under the **[edit forwarding-options port-mirroring]** hierarchy level.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege** interface—To view this statement in the configuration.

**Level** interface-control—To add this statement to the configuration.

## fpc (TX Matrix and TX Matrix Plus Routers)

<b>Syntax</b>	<pre>fpc slot-number {   pic pic-number {     atm-cell-relay-accumulation;     atm-l2circuit-mode (cell   aal5   trunk <i>trunk</i>);     framing (sdh   sonet);     idle-cell-format {       itu-t;       payload-pattern <i>payload-pattern-byte</i>;     }     max-queues-per-interface (8   4);     no-concatenate;     no-mcast-replication;     q-pic-large-buffer (large-scale   small-scale);   } }</pre>
<b>Hierarchy Level</b>	[edit chassis <i>lcc number</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	On a TX Matrix or TX Matrix Plus router, configure properties for the PICs in individual FPCs.
<b>Options</b>	<p><b>slot-number</b>—Slot number in which the FPC is installed.</p> <p><b>Range:</b> 0 through 7</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">TX Matrix Router and T640 Router Configuration Overview on page 373</a></li> <li>• <a href="#">TX Matrix Plus Router Configuration Overview on page 397</a></li> <li>• <a href="#">Configuring the Junos OS to Enable SONET/SDH Framing for SONET/SDH PICs on page 461</a></li> <li>• <a href="#">TX Matrix Router Chassis and Interface Names on page 376</a></li> <li>• <a href="#">TX Matrix Plus Router Chassis and Interface Names on page 402</a></li> </ul>

## fpc error

**Syntax**

```
fpc slot number {
  error {
    (fatal | major | minor) {
      threshold threshold value;
      action (alarm | disable-pfe | offline-pic | log | get-state | offline | reset);
    }
    scope error-scope {
      category category {
        (fatal | major | minor) {
          threshold threshold value;
          action (alarm | disable-pfe | log | get-state | offline | reset);
        }
      }
    }
  }
}
```

**Hierarchy Level** [edit chassis]

**Release Information** Statement introduced in Junos OS Release 13.3 on MX Series, PTX Series, and T Series routers.  
Statement introduced in Junos OS Release 14.2 on M320 routers.

**Description** Configure the threshold at which FPC errors will take the action you configure to be performed by the device. Starting from Junos OS Release 18.1R3, you can configure error thresholds and actions at the error scope and error category levels on MX Series routers.

Some Juniper devices include an internal framework for detecting and correcting FPC errors that can have the potential to affect services. For each FPC on the device, you can classify errors according to severity, set an automatic recovery action for each severity, and set a threshold (i.e., the number of times the error must occur before the action is triggered).

**Options** You can configure the threshold for the following severity levels:

- **fatal**—Fatal error on the FPC. An error that results in blockage of considerable amount of traffic across modules is a fatal error.
- **major**—Major error on the FPC. An error that results in continuing loss of packet traffic but does not affect other modules is a major error.
- **minor**—Minor error on the FPC. An error that results in the loss of a single packet but is fully recoverable is a minor error.

**NOTE:** You cannot configure the severity level of an error.

- **threshold *threshold-value***—Configure the threshold value at which to take action. If the severity level of the error is fatal, the action is carried out only once when the total number of errors crosses the threshold value. If the severity level of the error is major, the action is carried out once after the occurrence crosses the threshold. If the severity level is minor, the action is carried out as many times as the value specified by the threshold. For example, when the severity level is minor, and you have configured the threshold value as 10, the action is carried out after the tenth occurrence.

**NOTE:** You can set the threshold value to 0 for errors with severity level as minor. This implies that no action is taken for that error. You cannot set the threshold value to 0 for errors with severity level as major or fatal.

Default: The error count for fatal and major actions is 1. The default error count for minor actions is 10.

Range: 0—429,496,729

The available detection and recovery actions are as follows:

- **alarm**—Raise an alarm.
- **disable-pfe**—Disable the PFE interfaces on the FPC.

**NOTE:** For PTX Series routers, when an alarm occurs and a **disable-pfe** action is the result, to clear the alarm you must place the FPC offline and then back online.

- **get-state**—Get the current state of the FPC.
- **log**—Generate a log for the event.
- **offline**—Take the FPC offline.
- **offline-pic**—Take the PIC (installed in the FPC) offline.
- **reset**—Reset the FPC.

**NOTE:** Starting in Junos OS Release 17.2R1, if you configure the **disable-pfe**, **offline**, **offline-pic** or **reset** action on an MX Series or PTX Series router, the **get-state** action is additionally configured on the router. This means, for example, if you configure the **disable-pfe** action on the router, the router gets both **disable-pfe** and **get-state** actions configured.

- **scope error-scope**—Group the errors of a particular severity into different scopes. Errors belonging to each error scope is further grouped into categories, before thresholds and actions are defined at the category level. The following scopes are available: **board** and **pfe**.
- **category category**—Categorize errors into various subgroups under the scope level. An error category helps you group similar errors belonging to a particular scope and define actions for them at once. This feature eliminates the need for configurations against individual error-ids. Some of the error-categories are **functional**, **io** (input/output errors), **storage** (for example, errors related to HDD, SSD, and flash), **memory** (for example, errors related to static RAM), **processing** (for example, CPU-related errors), and **switch**.
- **error-id**—Use the error ID to disable an error or modify the error severity associated with that error. An *error-id*, which is a unique error identifier, is represented as a Uniform Resource Identifier (URI). For example, `/cpu/0/memory/0/memory-uncorrected-error` is an error ID that indicates an uncorrectable error under CPU memory module instance 0.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## fpc-feb-connectivity

---

<b>Syntax</b>	<pre>fpc-feb-connectivity {   fpc <i>number</i> feb (<i>slot-number</i>   none); }</pre>
<b>Hierarchy Level</b>	[edit chassis]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.0.
<b>Description</b>	On the M120 router only, configure a connection between any Flexible PIC Concentrator (FPC) and any Forwarding Engine Board (FEB).
<b>Options</b>	<p><b>fpc <i>number</i></b>—Specify the FPC slot number. <b>Range:</b> 0 through 5</p> <p><b>feb <i>slot-number</i></b>—Specify the FEB slot number. <b>Range:</b> : 0 through 5</p> <p><b>none</b>—Disconnect the FPC from the FEB.</p>
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Support FPC to FEB Connectivity on M120 Routers on page 432</a></li></ul>

## fpc-offline-on-blackholing

<b>Syntax</b>	fpc-offline-on-blackholing;
<b>Hierarchy Level</b>	[edit chassis fabric degraded]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.2 for TX Matrix Plus routers with 3D SIBs.
<b>Description</b>	Take the FPC offline and raise an alarm if a traffic black-hole condition is detected in the routing matrix. By default, FPCs remain online when a traffic black-hole condition is detected.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show chassis alarms on page 925</a></li> </ul>

## fpc-nmi-volt-fail-knob

<b>Syntax</b>	fpc-nmi-volt-fail-knob (enable   disable)
<b>Hierarchy Level</b>	[edit chassis]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.4R15, 11.4R8-S2, 11.4R9, 12.1R8, 12.2R6, 12.3R3-S1, 12.3R4, 13.1R3, and 13.2R1
<b>Description</b>	Enable or disable the non maskable interrupt (NMI) for the voltage failure errors on the flexible pic concentrator (FPC).
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show chassis fpc on page 1666</a></li> <li>• <a href="#">Configuring Voltage Level Monitoring of FPCs on page 438</a></li> </ul>

## fpc-offline-on-blackholing

---

<b>Syntax</b>	fpc-offline-on-blackholing;
<b>Hierarchy Level</b>	[edit chassis fabric degraded]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.2 for TX Matrix Plus routers with 3D SIBs.
<b>Description</b>	Take the FPC offline and raise an alarm if a traffic black-hole condition is detected in the routing matrix. By default, FPCs remain online when a traffic black-hole condition is detected.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show chassis alarms on page 925</a></li></ul>

## fpc-nmi-volt-fail-knob

---

<b>Syntax</b>	fpc-nmi-volt-fail-knob (enable   disable)
<b>Hierarchy Level</b>	[edit chassis]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.4R15, 11.4R8-S2, 11.4R9, 12.1R8, 12.2R6, 12.3R3-S1, 12.3R4, 13.1R3, and 13.2R1
<b>Description</b>	Enable or disable the non maskable interrupt (NMI) for the voltage failure errors on the flexible pic concentrator (FPC).
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show chassis fpc on page 1666</a></li><li>• <a href="#">Configuring Voltage Level Monitoring of FPCs on page 438</a></li></ul>

## fpc-restart

<b>Syntax</b>	fpc-restart;
<b>Hierarchy Level</b>	[edit chassis fabric degraded]
<b>Release Information</b>	Statement added in Junos OS Release 13.2R6.
<b>Description</b>	Allow the user to restart the FPCs when a traffic black-hole condition is detected in the routing matrix. To enable this feature set the <b>fpc-restart</b> statement at the <b>edit chassis fabric degraded</b> hierarchy level.
<b>Default</b>	FPCs are not restarted when a traffic black-hole condition is detected.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Fabric Resiliency and Degradation on page 132</a></li><li>• <a href="#">Disabling Line Card Restart to Limit Recovery Actions from Degraded Fabric Conditions on page 144</a></li></ul>

## fpc-resync

---

<b>Syntax</b>	fpc-resync;
<b>Hierarchy Level</b>	[edit chassis]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2.
<b>Description</b>	<p>(On M320, T320, T640, T1600, T4000, TX Matrix, and TX Matrix Plus routers only) When a Flexible PIC Concentrator (FPC) is brought online, resynchronize the sequence numbers of the FPC with the other active FPCs.</p> <div><div></div><div><p><b>NOTE:</b> In order to prevent traffic blackholing, the <code>fpc-resync</code> command will have no effect if a single LMNR based FPC and one or more I-chip FPCs exist in the same chassis.</p></div></div>
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Resynchronize FPC Sequence Numbers with Active FPCs when an FPC Comes Online on page 479</a></li><li>• <i>TX Matrix Router Hardware Guide</i></li></ul>

## framing

<b>Syntax</b>	<code>framing (sdh   sonet);</code>
<b>Hierarchy Level</b>	<code>[edit chassis fpc slot-number pic pic-number],</code> <code>[edit chassis lcc number fpc slot-number pic pic-number]</code> (Routing Matrix)
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	On SONET/SDH PICs only, configure the framing type.
<b>Default</b>	<code>sonet</code>
<b>Options</b>	<code>sdh</code> —SDH framing.  <code>sonet</code> —SONET framing.
<b>Required Privilege Level</b>	<code>interface</code> —To view this statement in the configuration. <code>interface-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Enable SONET/SDH Framing for SONET/SDH PICs on page 461</a></li></ul>

## framing (E1 Options)

<b>Syntax</b>	<code>framing (g704   g704-no-crc4);</code>
<b>Hierarchy Level</b>	[edit chassis <a href="#">synchronization</a> interfaces external e1-options] [edit chassis <a href="#">synchronization</a> interfaces (external-0/0   external-1/0) e1-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for MX Series routers.
<b>Description</b>	Configure the framing format for the E1 interface.
<b>Options</b>	<b>g704</b> —Set the G.704 framing format for E1 interfaces. <b>g704-no-crc4</b> —Set the G.704 framing without CRC4 for E1 interfaces.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">synchronization on page 794</a></li> </ul>

## framing (T1 Options)

<b>Syntax</b>	<code>framing (esf   sf);</code>
<b>Hierarchy Level</b>	[edit chassis <a href="#">synchronization</a> interfaces external t1-options] [edit chassis <a href="#">synchronization</a> interfaces (external-0/0   external-1/0) t1-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for MX Series routers.
<b>Description</b>	Configure the framing format for the T1 interface.
<b>Options</b>	<b>esf</b> —Set the framing format as extended super frame. <b>sf</b> —Set the framing format as super frame.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">synchronization on page 794</a></li> </ul>

## fru-poweron-sequence

<b>Syntax</b>	<code>fru-poweron-sequence <i>fru-poweron-sequence</i>;</code>
<b>Hierarchy Level</b>	[edit chassis]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.0.</p> <p>Statement introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.</p> <p>Statement introduced in Junos OS Release 12.3 for MX2020 Universal Routing Platforms.</p> <p>Statement introduced in Junos OS Release 12.3 for T640, T1600, and T4000 routers.</p>
<b>Description</b>	<p>(MX Series 5G Universal Routing Platforms only) Configure the power-on sequence for the DPCs in the chassis for routers with the enhanced AC Power Entry Module (PEM).</p> <p>(T640 routers, T1600 routers, T4000 routers, MX2020 routers, and PTX Series packet transport routers) Configure the power-on sequence for Flexible PIC Concentrators (FPCs) installed in the chassis.</p>
<b>Options</b>	(MX Series 5G Universal Routing Platforms only) <i>fru-poweron-sequence</i> —Power-on sequence for the DPCs in the chassis. The numbers indicate the slot number of the DPCs.

**NOTE:** If the power-on sequence is not configured by including the *fru-poweron-sequence* statement, Junos OS uses the `/var/log/poweron_seq.log` file to determine the power-on sequence for the last power-on operation for the DPCs and the same sequence is used. If the `/var/log/boot_seq.log` file, is not available, Junos OS uses the ascending order of the slot numbers of the DPCs as the sequence to power on the DPCs.

(T640 routers, T1600 routers, T4000 routers, MX2020 routers, and PTX Series packet transport routers) *fru-poweron-sequence*—Power-on sequence for the FPCs in the chassis. The numbers indicate the slot number of the FPCs.

**NOTE:**

- If the configured sequence contains invalid numbers, Junos OS considers only the valid numbers in the sequence. The invalid numbers are silently discarded.
- If the power-on sequence is not configured by including the *fru-poweron-sequence* statement, Junos OS uses the ascending order of the slot numbers of the FPCs as the sequence to power on the FPCs.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

## global-wait-to-restore

<b>Syntax</b>	<code>global-wait-to-restore <i>minutes</i>;</code>
<b>Hierarchy Level</b>	<code>[edit chassis synchronization]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 14.2.
<b>Description</b>	<p>Use this statement to configure the global time to wait before opening the interface to receive ESMC messages.</p> <p>When an interface's signal transitions out of the signal fail state, it must be fault-free for the global-wait-to-restore time before it is again considered by the clock selection process.</p> <p>When the ESMC clock's EEC quality level (QL) mode is enabled, it sends a signal failure to the clock selection process during the global wait-to-restore time. After the global wait-to-restore time ends, a new quality level value is sent to the clock selection process.</p> <p>To override the global wait-to-restore time on a specific interface, include the <a href="#">wait-to-restore</a> statement at the <code>[edit chassis source interfaces (external-a   external-b   interface <i>interface-name</i>)]</code> hierarchy level.</p>
<b>Options</b>	<p><b><i>minutes</i></b>—Set the time for the port signal to be up before the port is opened to receive and transmit ESMC messages.</p> <p><b>Range:</b> 0 through 12 minutes</p> <p><b>Default:</b> 5 minutes</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">synchronization (MX Series) on page 794</a></li> <li>• <a href="#">synchronization (PTX Series) on page 802</a></li> <li>• <a href="#">wait-to-restore on page 826</a></li> </ul>

## hash-key (Chassis LAG)

```
Syntax hash-key {
    family {
        inet {
            layer-3;
            layer-4;
            symmetric-hash {
                complement;
            }
        }
        multiservice {
            source-mac;
            destination-mac;
            payload {
                ip {
                    layer-3 (source-ip-only | destination-ip-only);
                    layer-4;
                }
            }
        }
    }
}
```

**Hierarchy Level** [edit chassis fpc slot-number pic pic-number]

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** (MX Series 5G Universal Routing Platforms only) Configure data used in a hash key for a PIC for symmetrical load balancing on an 802.3ad Link Aggregation Group.

**Options** **family**—Configure data used in a hash key for a protocol family. This statement has the following suboptions:

- **inet**—Configure data used in a hash key for the **inet** protocol family.
- **multiservice**—Configure data used in a hash key for the **multiservice** protocol family.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

## hold-interval (Clock Synchronization)

<b>Syntax</b>	<pre>hold-interval {   configuration-change <i>seconds</i>;   restart <i>seconds</i>;   switchover <i>seconds</i>; }</pre>
<b>Hierarchy Level</b>	[edit chassis <a href="#">synchronization</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2R4 for MX Series routers.
<b>Description</b>	Configure the wait time for clock selection after a change in configuration and after a reboot of the router, and configure the switchover wait time after clock recovery.
<b>Options</b>	<p><b>configuration-change</b>—Set the wait time for clock selection after a change in configuration.  <b>Range:</b> 15 seconds through 60 seconds</p> <p><b>restart</b>—Set the wait time for clock selection after reboot of the router.  <b>Range:</b> 60 seconds through 180 seconds  <b>Default:</b> 120 seconds</p> <p><b>switchover</b>—Set the switchover wait time after clock recovery.  <b>Range:</b> 30 seconds through 60 seconds.  <b>Default:</b> 30 seconds</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">synchronization on page 794</a></li> </ul>

## holdover-mode-disable

---

<b>Syntax</b>	holdover-mode-disable;
<b>Hierarchy Level</b>	[edit chassis <a href="#">synchronization</a> output interfaces external] [edit chassis <a href="#">synchronization</a> output interfaces (external-0/0   external-1/0)]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for MX Series routers.
<b>Description</b>	Disable the holdover mode on the external output interface—external—on SCBE or on the external output interfaces—external-0/0 and external-1/0—on SCBE2.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">synchronization on page 794</a></li></ul>

## hold off time

---

<b>Syntax</b>	hold-off-time <i>time</i> ;
<b>Hierarchy Level</b>	[set chassis <a href="#">synchronization</a> <a href="#">source interfaces</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.2 for MX Series routers.
<b>Description</b>	Enable hold-off time for Synchronous Ethernet interfaces and external clock source interfaces. If an interface goes down, hold-off time delays short signal failures from being sent to the clock selection process to prevent rapid successive switching.
<b>Options</b>	<b>time</b> —Amount of time in milliseconds that a signal is held before being passed to the clock selection process.  <b>Range:</b> 300–1800 milliseconds  <b>Default:</b> 1000 milliseconds
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Clock Synchronization Interface on MX Series Routers on page 293</a></li><li>• <a href="#">Ethernet Synchronization Message Channel Overview on page 238</a></li></ul>

## hybrid

**Syntax**

```

hybrid {
  synchronous-ethernet-mapping {
    clock-source ip-address {
      interface interface1-name;
      interface interface2-name;
    }
  }
}

```

**Hierarchy Level** [edit protocols ptp [slave](#)]

**Release Information** Statement introduced in Junos OS Release 12.2R2.

**Description** Configure hybrid mode.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

## hybrid

---

<b>Syntax</b>	hybrid;
<b>Hierarchy Level</b>	[edit protocols ptp slave]
<b>Release Information</b>	Statement introduced in Junos OS Release 17.1R1.
<b>Description</b>	Configure the timing and synchronization feature to operate in Sync-E assisted PTP mode of operation. Sync-E source is used to derive the frequency and PTP is used to derive phase.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Precision Time Protocol Overview on page 256</a></li></ul>

## idle-cell-format

<b>Syntax</b>	<pre>idle-cell-format {   itu-t;   payload-pattern <i>payload-pattern-byte</i>; }</pre>
<b>Hierarchy Level</b>	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> idle-cell-format], [edit chassis lcc <i>number</i> fpc <i>slot-number</i> pic <i>pic-number</i> idle-cell-format] (Routing Matrix)
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	For ATM2 PICs only, configure the format of the idle cell header and payload bytes.
<b>Options</b>	<p><b>itu-t</b>—Configure the idle cell header to use the International Telecommunications Union (ITU-T) standard of 0x00000001.</p> <p><b>Default:</b> (4 bytes): 0x00000000</p> <p><b><i>payload-pattern-byte</i></b>—Configure the idle cell payload pattern. The payload pattern byte can range from 0x00 through 0xff.</p> <p><b>Default:</b> cell payload (48 bytes)</p>
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Junos OS to Enable Idle Cell Format and Payload Patterns for ATM Devices on page 502</a></li> </ul>

## inet (chassis)

---

<b>Syntax</b>	<pre>inet {   layer-3;   layer-4;   symmetric-hash {     complement;   } }</pre>
<b>Hierarchy Level</b>	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> hash-key family]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6.
<b>Description</b>	(MX Series 5G Universal Routing Platforms only) Configure data used in a hash key for the <b>inet</b> protocol family when configuring PIC-level symmetrical load balancing on an 802.3ad Link Aggregation Group.
<b>Options</b>	<p><b>layer-3</b>—Include Layer 3 IP data in the hash key.</p> <p><b>layer-4</b>—Include Layer 4 IP data in the hash key.</p> <p><b>symmetric-hash</b>—Configure symmetric hash key with source and destination ports.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring PIC-Level Symmetrical Hashing for Load Balancing on 802.3ad LAGs for MX Series Routers on page 489</a></li></ul>

## ingress-policer-overhead

<b>Syntax</b>	<code>ingress-policer-overhead bytes;</code>
<b>Hierarchy Level</b>	<code>[edit chassis fpc slot-number pic pic-number]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 11.1. Statement introduced in Junos OS Release 15.1X49-D30 for vSRX.
<b>Description</b>	<p>Add the configured number of bytes to the length of a packet entering the interface.</p> <p>Configure a policer overhead to control the rate of traffic received on an interface. Use this feature to help prevent denial-of-service (DoS) attacks or to enforce traffic rates to conform to the service-level agreement (SLA). When you configure a policer overhead, the configured policer overhead value (bytes) is added to the length of the final Ethernet frame. This calculated length of frame is used to determine the policer or the rate-limiting action.</p> <p>Traffic policing combines the configured policy bandwidth limits and the burst size to determine how to meter the incoming traffic. If you configure a policer overhead on an interface, Junos OS adds those bytes to the length of incoming Ethernet frames. This added overhead fills each frame closer to the burst size, allowing you to control the rate of traffic received on an interface.</p> <p>You can configure the policer overhead to rate-limit queues and Layer 2 and Layer 3 policers, for standalone (SA) and high-availability (HA) deployments. The policer overhead and the shaping overhead can be configured simultaneously on an interface.</p>

**NOTE:** vSRX supports policer overhead on Layer 3 policers only.

The policer overhead applies to all interfaces on the PIC. In the following example, Junos OS adds 10 bytes of overhead to all incoming Ethernet frames on ports ge-0/0/0 through ge-0/0/4.

```
set chassis fpc 0 pic 0 ingress-policer-overhead 10
```

**NOTE:** vSRX only supports fpc 0 pic 0. When you commit the `ingress-policer-overhead` statement, the vSRX takes the PIC offline and then back online.

You need to craft the policer overhead size to match your network traffic. A value that is too low will have minimal impact on traffic bursts. A value that is too high will rate-limit too much of your incoming traffic.

In this example, the policer overhead of 255 bytes is configured for ge-0/0/0 through ge-0/0/4. The firewall policer is configured to discard traffic when the burst size is over 1500 bytes. This policer is applied to ge-0/0/0 and ge 0/0/1. Junos OS adds 255 bytes to every Ethernet frame that comes into the configured ports. If, during a burst of traffic, the combined length of incoming frames and the overhead bytes exceeds 1500 bytes, the policer starts to discard further incoming traffic.

```
set chassis fpc 0 pic 0 ingress-policer-overhead 255
set interfaces ge-0/0/0 unit 0 family inet policer input overhead_policer
set interfaces ge-0/0/0 unit 0 family inet address 10.9.1.2/24
set interfaces ge-0/0/1 unit 0 family inet policer input overhead_policer
set interfaces ge-0/0/1 unit 0 family inet address 10.9.2.2/24
set firewall policer overhead_policer if-exceeding bandwidth-limit 32k
set firewall policer overhead_policer if-exceeding burst-size-limit 1500
set firewall policer overhead_policer then discard
```

**Options** *bytes*—Number of bytes added to a frame entering an interface.

**Range:** 0–255 bytes

**Default:** 0

```
[edit chassis fpc 0 pic 0]
user@host# set ingress-policer-overhead 10;
```

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## input-current (T4000 Routers)

<b>Syntax</b>	<code>input-current <i>amps-in-each-feed</i>;</code>
<b>Hierarchy Level</b>	[edit chassis pem]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3.
<b>Description</b>	Configure the amount of input current received in each feed. The value assigned to the <b>input-current</b> statement must be equal to the input current capability of each feed.
	<div>  <p><b>NOTE:</b> Before configuring input current for your router, see the <i>T4000 Core Router Hardware Guide</i> for special considerations.</p> </div>
<b>Options</b>	<p><b>Values:</b></p> <ul style="list-style-type: none"> <li>• 40—Indicates 40 A of input current is received in each feed.</li> <li>• 60—Indicates 60 A of input current is received in each feed.</li> </ul> <p><b>Default:</b> 60 A</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Six-Input DC Power Supply on T Series Routers on page 110</a></li> </ul>

## interfaces external

```
Syntax interfaces {
  external/external-0-0/external-1/0 {
    e1-options {
      framing (g704 | g704-no-crc4);
      line-encoding (ami | hdb3);
      sabit bit;
    }
    signal-type (1mhz | 5mhz | 10mhz | 2048khz | t1 | e1);
    t1-options {
      framing (esf | sf);
      line-encoding (ami | b8zs);
    }
    pulse-per-second-enable;
  }
}
```

**Hierarchy Level** [edit chassis [synchronization](#)]

**Release Information** Statement introduced in Junos OS Release 12.3 for MX Series routers.

**Description** Starting from Junos OS Release 12.3, configure options for the external clock source interface—external—for SCBE.

Starting from Junos OS Release 13.3, configure options for the two external clock source interfaces—external-0/0 and external-1/0—for SCBE2.

**Options** The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

## ipv6-extended-attrib

<b>Syntax</b>	ipv6-extended-attrib;
<b>Hierarchy Level</b>	[edit chassis <b>fpc</b> <i>slot-number</i> inline-services ipv6 flow-table-size]
<b>Description</b>	Enable the inclusion of element ID, 54, fragmentIdentification, and element ID, 64, ipv6ExtensionHeaders, in IPFIX flow templates that are exported to the flow collector
<div>  <b>NOTE:</b> Collection of IPv4 fragmentation IDs occurs automatically without having to configure this setting explicitly. </div>	
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Configuring Inline Active Flow Monitoring Using Routers, Switches or NFX250</i></li> </ul>

## ir-mode

<b>Syntax</b>	<code>ir-mode (IR   R);</code>
<b>Hierarchy Level</b>	<code>[edit chassis fpc slot-number]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 14.2.
<b>Description</b>	Configure the license mode of the specified enhanced MPC in an MPC slot as IR or R. Setting the license mode enables you to distinguish between an MPC with an IR license and an MPC with an R license after the MPC is installed on the router.
	<div>  <p><b>NOTE:</b> The license mode settings are used only to provide information. You cannot set or alter the license of the MPC when you configure the mode.</p> </div>
<b>Default</b>	<p>The default IR mode is Base. You do not set this configuration statement if Base is the mode of your license. Base mode includes the following features:</p> <ul style="list-style-type: none"> <li>• All Layer 2, Layer 2.5, and Layer 3 features.</li> <li>• Up to 32 Layer 3 routing instances of the virtual routing and forwarding (VRF) instance type.</li> <li>• Up to 2 million routes in the forwarding information base (FIB), provided there is hardware support. (FIB is also known as forwarding table.)</li> <li>• Up to 6 million routes in the routing information base (RIB), also known as routing table.</li> </ul>
<b>Options</b>	<p><b>IR</b>—Configure the license mode IR for an MPC installed in a specified MPC slot. Includes the following features:</p> <ul style="list-style-type: none"> <li>• All Layer 2, Layer 2.5, and Layer 3 features.</li> <li>• Up to 32 Layer 3 routing instances of the virtual routing and forwarding (VRF) instance type.</li> </ul> <p><b>R</b>—Configure the license mode R for an MPC installed in a specified MPC slot. Includes full-scale Layer 2, Layer 2.5, and Layer 3 features. Scale is determined by the hardware capabilities.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

## lacp

**Syntax**

```
lacp {
  link-protection {
    non-revertive;
  }
  system-priority priority;
}
```

**Hierarchy Level** [edit chassis aggregated-devices ethernet]

**Release Information** Statement introduced in Junos OS Release 9.3.

**Description** For aggregated Ethernet interfaces only, configure Link Aggregation Control Protocol (LACP) parameters at the global level for use by LACP at the interface level.

**Options** The statements are described separately.

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**

- [Configuring Junos OS for Supporting Aggregated Devices on page 481](#)

## lcc

```

Syntax  lcc number {
        fpc slot-number {
            pic pic-number {
                atm-cell-relay-accumulation;
                atm-l2circuit-mode (cell | aal5 | trunk trunk);
                framing (sdh | sonet);
                idle-cell-format {

Hierarchy Level [edit chassis]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Configure a T640 router (on a routing matrix based on a TX Matrix router) or a T1600 router (on a routing matrix based on a TX Matrix Plus router) or a T4000 router (on a routing matrix based on a TX Matrix Plus router).

**Options** *number*—Specify a T640 router or a T1600 router or a T4000 router on a routing matrix.

**Range:**

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## lcc-mode

<b>Syntax</b>	<pre>lcc-mode {   lcc <i>lcc_number</i>{     mode <i>mode</i>;   } }</pre>
<b>Hierarchy Level</b>	[edit chassis]
<b>Release Information</b>	Statement introduced in Junos OS Release 13.1 for TX Matrix Plus routers with 3D SIBs.
<b>Description</b>	Set the line-card chassis (LCC) in a routing matrix to function as a T1600 router or a T4000 router. If you set the value of the <b>mode</b> variable as <b>empty</b> , then the line-card chassis goes offline. If the <b>mode</b> statement is not configured, then by default the LCC functions as a T1600 router.
<b>Default</b>	If you do not include the <b>lcc-mode</b> statement, the LCC functions as a T1600 router.
<b>Options</b>	<p><b>lcc <i>number</i></b>—On a TX Matrix Plus router, display hardware information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> <li>0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.</li> <li>0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.</li> <li>0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.</li> <li>0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.</li> </ul> <p><b>mode <i>mode</i></b>—Configure the LCC to function as a T1600 or a T4000 router. The value of the <i>mode</i> variable can be set as <b>t1600</b>, <b>t4000</b>, or <b>empty</b>.</p>
<b>Required Privilege Level</b>	interface-control
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Overview of a Routing Matrix with a TX Matrix Plus Router</i></li> <li><i>Example: Configuring a Routing Matrix with a TX Matrix Plus Router in Mixed Mode</i></li> </ul>

## led-beacon

<b>Syntax</b>	led-beacon
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name (with port number)</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 15.1F3 and 16.1R2 for PTX5000 routers. Statement introduced in Junos OS Release 15.1F6 and 16.1R2 for PTX3000 routers.
<b>Description</b>	This command causes the LED for the specified port to flash green. You can use the command to physically locate a specific optic port on the PIC.

**NOTE:** At the [edit interfaces *interface-name (with port number)*] hierarchy level, you must include the port number as part of the interface name. For example, et-x/y/z(:n).

<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>show interfaces detail</i></li> </ul>

## license-mode

<b>Syntax</b>	license-mode IR   R
<b>Hierarchy Level</b>	[edit chassis fpc <i>slot-number</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 15.1F3 for PTX Series routers with third-generation FPCs.
<b>Description</b>	Configures the FPC's license mode. This can be used to track the number of PICs configured for a specific mode.
<b>Options</b>	IR—Sets the PIC to LSR mode. R—Sets the PIC to full IP mode.

**NOTE:** Starting in Junos OS Release 16.1R3 for PTX Series routers, the IR and R options are used. For previous releases (starting in Junos OS Release 15.1F3) the Ip (full IP mode) and lsr (LSR mode) options are used.

<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">fpc on page 654</a></li> </ul>

## limited-ifl-scaling

<b>Syntax</b>	limited-ifl-scaling;
<b>Hierarchy Level</b>	[edit chassis network-services enhanced-ip]
<b>Release Information</b>	Command introduced in Junos OS Release 15.1R3 for MX Series routers.
<b>Description</b>	Limits the maximum number of logical interfaces on MX Series routers with MS-DPCs to 64,000 for enhanced IP network services mode.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Limiting the Maximum Number of Logical Interfaces on MX Series Routers With MS-DPCs in Enhanced IP Network Services Mode on page 368</a></li> <li>• <a href="#">Network Services Mode Overview on page 361</a></li> <li>• <a href="#">Configuring Enhanced IP Network Services for a Virtual Chassis</a></li> </ul>

## line-encoding (E1 Options)

<b>Syntax</b>	line-encoding (ami   hdb3);
<b>Hierarchy Level</b>	[edit chassis <a href="#">synchronization</a> interfaces external e1-options] [edit chassis <a href="#">synchronization</a> interfaces (external-0/0   external-1/0) e1-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for MX Series routers.
<b>Description</b>	Configure the line encoding format on the E1 interface.
<b>Options</b>	<b>ami</b> —Set the line encoding format as automatic mark inversion.  <b>hdb3</b> —Set the line encoding format as high-density bipolar 3 code.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">synchronization on page 794</a></li> </ul>

## line-encoding (E1 Options)

<b>Syntax</b>	line-encoding (ami   hdb3);
<b>Hierarchy Level</b>	[edit chassis <a href="#">synchronization</a> interfaces external e1-options] [edit chassis <a href="#">synchronization</a> interfaces (external-0/0   external-1/0) e1-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for MX Series routers.
<b>Description</b>	Configure the line encoding format on the E1 interface.
<b>Options</b>	<b>ami</b> —Set the line encoding format as automatic mark inversion. <b>hdb3</b> —Set the line encoding format as high-density bipolar 3 code.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">synchronization on page 794</a></li> </ul>

## line-encoding (T1 Options)

<b>Syntax</b>	line-encoding (ami   b8zs);
<b>Hierarchy Level</b>	[edit chassis <a href="#">synchronization</a> interfaces external t1-options] [edit chassis <a href="#">synchronization</a> interfaces (external-0/0   external-1/0) t1-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for MX Series routers.
<b>Description</b>	Configure the line encoding format on the T1 interface.
<b>Options</b>	<b>ami</b> —Set the line encoding format as automatic mark inversion. <b>b8zs</b> —Set the line encoding format as 8-bit zero suppression.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">synchronization on page 794</a></li> </ul>

## linerate-mode

<b>Syntax</b>	<code>linerate-mode;</code>
<b>Hierarchy Level</b>	<code>[edit chassis fpc slot-number pic pic-number linerate-mode],</code> <code>[edit chassis lcc number fpc slot-number pic pic-number linerate-mode]</code> (Routing Matrix)
<b>Release Information</b>	Statement introduced in Junos OS Release 10.1.
<b>Description</b>	For 10-port 10-Gigabit Oversubscribed Ethernet (OSE) PICs only, configure the line rate operation.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Junos OS Network Interfaces Library for Routing Devices</i></li> </ul>

## link-protection (Protocols LACP)

<b>Syntax</b>	<code>link-protection {</code> <code>non-revertive;</code> <code>}</code>
<b>Hierarchy Level</b>	<code>[edit chassis aggregated-devices ethernet lacp]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3.
<b>Description</b>	Enable LACP link protection at the global (chassis) level.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Junos OS for Supporting Aggregated Devices on page 481</a></li> </ul>

## lite-mode

Syntax	lite-mode;
Hierarchy Level	[edit chassis fpc 0]
Release Information	Statement introduced in Junos OS Release 15.1F4 and 16.1R1 for vMX routers.
Description	<p>(vMX routers only) Enables vMX to run in lite mode and disables performance mode. Lite mode needs fewer vCPUs and memory to run at lower bandwidth. If you are using paravirtualized network interfaces such as virtio (for KVM) or VMXNET3 (for VMware) for lab simulation use cases, you can enable lite mode.</p> <p>.....</p> <p> <b>NOTE:</b> Make sure you have configured the proper number of vCPUs and memory for your VMs based on your use case. If you have not configured enough vCPUs for performance mode, vMX runs in lite mode.</p> <p>.....</p> <p>Starting with Junos OS Release 15.1F6, performance mode is enabled by default for vMX.</p> <p>.....</p> <p> <b>NOTE:</b> The FPC reboots if you change this configuration.</p> <p>.....</p>
Options	<p><b>lite-mode</b>—Enables lite mode.</p> <p>To disable lite mode, enable performance mode by including the <b>performance-mode</b> statement at the [edit chassis fpc 0] hierarchy level.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <li>• <a href="#">performance-mode on page 732</a></li> </ul>

## local-ip-address (master)

Syntax	<code>local-ip-address <i>local-ip-address</i>;</code>
Hierarchy Level	[edit protocols ptp <b>master</b> interface <i>interface-name</i> <b>unicast-mode clock-client</b> <i>ip-address</i> ]
Release Information	Statement introduced in Junos OS Release 12.2.
Description	The IP address of the interface acting as a master.
Options	<b><i>local-ip-address</i></b> —IP address of the interface.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring Precision Time Protocol on page 319</a></li><li>• <a href="#">Example: Configuring Precision Time Protocol on page 325</a></li><li>• <a href="#">Precision Time Protocol Overview on page 256</a></li></ul>

## local-ip-address (slave)

---

Syntax	<code>local-ip-address <i>local-ip-address</i>;</code>
Hierarchy Level	<code>[edit protocols ptp <b>slave</b> interface <i>interface-name</i> <b>unicast-mode</b> <b>clock-source</b> <i>ip-address</i>]</code>
Release Information	Statement introduced in Junos OS Release 12.2.
Description	Configure the IP address of the interface acting as the slave.  <div> <b>NOTE:</b> You must configure the same IP address at the <code>[edit interfaces <i>interface-name</i>]</code> hierarchy level.</div>
Options	<b><i>local-ip-address</i></b> —The IP address of the interface.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring Precision Time Protocol on page 319</a></li><li>• <a href="#">Example: Configuring Precision Time Protocol on page 325</a></li><li>• <a href="#">Precision Time Protocol Overview on page 256</a></li></ul>

## local-priority

Syntax	<code>local-priority <i>local priority-value</i>;</code>
Hierarchy Level	<pre>[edit protocols ptp ] [edit protocols ptp master interface <i>interface-name</i> multicast-mode] [edit protocols ptp master interface <i>interface-name</i> unicast-mode] [edit protocols ptp slave interface <i>interface-name</i> multicast-mode] [edit protocols ptp slave interface <i>interface-name</i> unicast-mode] [edit protocols ptp stateful interface <i>interface-name</i> multicast-mode] [edit protocols ptp stateful interface <i>interface-name</i> unicast-mode]</pre>
Release Information	<p>Statement introduced in Junos OS Release 17.1R1.</p> <p>Statement introduced in Junos OS Release 17.4R1.</p>
Description	<p> <b>NOTE:</b> The stateful statement is not supported on QFX Series switches that support PTP.</p> <p>Configure a clock's local priority to be used as a tie-breaker in the dataset comparison algorithm, in the event that all other previous attributes of the datasets being compared are equal. The dataset comparison algorithm compares one clock with another by using the datasets representing those clocks, appended with the <b>local-priority</b> attribute. The local priority is assigned to the local clock and is used if needed when the data associated with the local clock is compared with data on another potential grandmaster (or the master) clock.</p>
Options	<p><b>local priority-value</b>—The priority value of the clock.</p> <p><b>Range:</b> 1 through 255</p> <p><b>Default:</b> 128</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <li>• <a href="#">Precision Time Protocol Overview on page 256</a></li> <li>• <a href="#">Configuring the Precision Time Protocol G.8275.2 Enhanced Profile (Telecom Profile)</a></li> </ul>

## major

---

**Syntax**

```
major {  
  threshold threshold-value;  
  action {  
    alarm;  
    disable-pfe;  
    get-state;  
    log;  
    offline;  
    reset;  
  }  
}
```

**Hierarchy Level** [edit chassis **fpc** slot-number **error**]

[edit chassis]

**Release Information** Statement introduced for PTX Series routers in Junos OS Release 13.3.  
Statement introduced for MX240, MX480, MX960, and MX2020 routers in Junos OS Release 14.2.

**Description** Severity level of the error. An error that results in continuing loss of packet traffic but does not affect other modules is a major error. The severity level of an error cannot be configured by a user.

The other statements are explained separately.

**Required Privilege Level** **interface**—To view this statement in the configuration.  
**interface-control**—To add this statement to the configuration.

## maximum-ecmp

Syntax	<code>maximum-ecmp <i>next-hops</i>;</code>
Hierarchy Level	[edit chassis]
Release Information	Statement introduced in Junos OS Release 10.1.
Description	<p>(M10i routers with Enhanced CFEB, and M320, M120, MX Series, and T Series routers) Configure 16, 32, or 64 ECMP next hops for RSVP or LDP LSPs, or MPLS static LSPs that are configured using <b>set protocols mpls static-label-switched-path</b>.</p> <p>This command is used to control the maximum number of ECMP legs in an NH. This command applies to all protocols, and the maximum configurable ECMP next hops are chassis dependent.</p> <p> <b>NOTE:</b> MX Series routers with one or more Modular Port Concentrator (MPC) cards and with Junos OS 11.4 or earlier installed, support the configuration of the <code>maximum-ecmp</code> statement with only 16 next hops. You should <i>not</i> configure the <code>maximum-ecmp</code> statement with 32 or 64 next hops. When you commit the configuration with 32 or 64 next hops, the following warning message appears:</p> <p><b>Error: Number of members in Unilist NH exceeds the maximum supported 16 on Trio.</b></p>
Default	16
Options	<p><b><i>next-hops</i></b>—Specify the number of next hops (16, 32, or 64) for RSVP or LDP LSPs, or MPLS static LSPs.</p> <p>The following types of routes support next hops with up to 64 ECMP gateways:</p> <ul style="list-style-type: none"> <li>• RSVP routes in inet tables where multiple RSVP LSPs are created to the same destination. In the case where LSP path protection or FRR is configured, the combination of active, backup and FRR next-hops is a maximum of 64.</li> <li>• LDP routes in inet.3 and mpls.0 where the associated IGP route contains 64 next-hop gateways.</li> <li>• ISIS, OSPF, iBGP, eBGP and Static routes in inet and inet6 tables.</li> </ul> <p> <b>NOTE:</b> These routes also include routes in routing-instances (<code>foo.inet.0</code>).</p>

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

**Related Documentation** • [Configuring ECMP Next Hops for RSVP and LDP LSPs for Load Balancing on page 487](#)

## maximum-links

Syntax	<code>maximum-links <i>maximum-links-limit</i>;</code>
Hierarchy Level	[edit chassis <a href="#">aggregated-devices</a> ]
Release Information	<p>Statement introduced in Junos OS Release 11.1 for T Series routers.</p> <p>Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.</p> <p>Statement introduced in Junos OS Release 12.3 for MX Series routers.</p>
Description	<p>Configure the maximum links limit for aggregated devices. Note that for MX Series routers, to set a range of 32 or 64 the router must be running in Enhanced IP mode, which is only supported for Trio-based MPCs and multiservice DPCs (MS-DPCs). For more information on Enhanced IP mode, "<a href="#">Network Services Mode Overview</a>" on page 361.</p> <p>For MX series routers and PTX series switches, the option for 64 links is only supported for Junos OS release 12.3 and later.</p>
	<p> <b>NOTE:</b> This statement is not supported on the MX80, MX104, and PTX1000 routers.</p>
Options	<p><i>maximum-links-limit</i>—Maximum links limit for aggregated devices.</p> <p><b>Range:</b> 16, 32, 64</p>
	<p> <b>NOTE:</b> On T-Series routers, the maximum-links supported is 32 in an aggregated Ethernet link.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <li>• <a href="#">Network Services Mode Overview on page 361</a></li> <li>• <a href="#">Configuring Junos OS for Supporting Aggregated Devices on page 481</a></li> <li>• <a href="#">Configuring an Aggregated Ethernet Interface</a></li> <li>• <a href="#">network-services on page 716</a></li> </ul>

## max-queues-per-interface

<b>Syntax</b>	<code>max-queues-per-interface (8   4);</code>
<b>Hierarchy Level</b>	<code>[edit chassis fpc slot-number pic pic-number],</code> <code>[edit chassis lcc number fpc slot-number pic pic-number]</code> (Routing Matrix)
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Support for TX Matrix and TX Matrix Plus added in Junos OS Release 9.6. On MIC or MPC interfaces on MX Series routers, configure eight egress queues.
<b>Description</b>	On IQ, MPC, and DPC interfaces on M120, T320, T640, T1600, TX Matrix, and TX Matrix Plus routers, or on MIC or MPC interfaces on MX Series routers, configure eight egress queues.
<div>  <b>NOTE:</b> Changing the <code>max-queues-per-interface</code> statement restarts the MPC.         </div>	
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Junos OS to Support Eight Queues on IQ Interfaces for T Series and M320 Routers on page 434</a></li> <li>• <i>Configuring Up to 16 Custom Forwarding Classes</i></li> <li>• <i>Enabling Eight Queues on ATM Interfaces</i></li> <li>• <i>Configuring the Maximum Number of Queues for Trio MPC/MIC Interfaces</i></li> <li>• <i>Example: Configuring CoS on SRX5000 Devices with an MPC</i></li> <li>• <i>Example: Enabling Eight-Queue Class of Service on Redundant Ethernet Interfaces on SRX Series Devices in a Chassis Cluster</i></li> </ul>

## max-transmit-quality-level

<b>Syntax</b>	max-transmit-quality-level;
<b>Hierarchy Level</b>	[edit chassis <a href="#">synchronization</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for MX Series routers.
<b>Description</b>	Configure the threshold quality level for the router. If the received quality level is below the threshold quality level, then the router will send out a received quality level of SEC. The available quality levels are listed in <a href="#">Table 56 on page 271</a> .
	<p>.....</p> <div>  <p><b>NOTE:</b> For GPS external output, when you configure the maximum transmit quality level as PRC and the router is rebooted, no valid output is obtained from SCBE. However, when the maximum transmit quality level is configured to any other quality level other than PRC and the router gets rebooted, then the SCBE works normally.</p> </div> <p>.....</p>
<b>Options</b>	<i>quality-level</i> —The available quality levels are as given in <a href="#">Table 56 on page 271</a> .

*Table 86: Quality Levels*

Quality Level	Description
prc	Timing quality of a primary reference clock (option-1 only).
prs	Clock traceable to a primary reference source (option-2 only).
sec	Timing quality of an SDH equipment clock (option-1 only).
smc	Clock traceable to a self-timed SONET (option-2 only).
ssu-a	Timing quality of a type I or IV slave clock (option-1 only).
ssu-b	Timing quality of a type VI slave clock (option-1 only).
st2	Clock traceable to Stratum 2 (option-2 only).
st3	Clock traceable to Stratum 3 (option-2 only).
st3e	Clock traceable to Stratum 3E (option-2 only).
st4	Clock traceable to Stratum 4 free-run (option-2 only).
stu	Clock traceable to an unknown quality (option-2 only).
tnc	Clock traceable to a transit node clock (option-2 only).

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

## member

<b>Syntax</b>	<pre>member <i>member-id</i> {     fabric-tree-root;     location <i>location</i>;     mastership-priority <i>number</i>;     no-management-vlan;     serial-number <i>serial-number</i>;     role <i>role</i>; }</pre>
<b>Hierarchy Level</b>	[edit virtual-chassis]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).</p>
<b>Description</b>	Configure a switch or an XRE200 External Routing Engine as a member of a Virtual Chassis or a Virtual Chassis Fabric (VCF) with characteristics specified by the available options.
<b>Default</b>	<p>When an EX Series switch or a QFX Series devices configured in standalone mode is powered on but not interconnected through its Virtual Chassis ports (VCPs) with other member switches, its default member ID is 0.</p> <p>There is no default member ID in an EX8200 or EX9200 Virtual Chassis. An EX8200 or EX9200 Virtual Chassis must be preprovisioned, and that process configures the member IDs.</p>
<b>Options</b>	<p><b><i>member-id</i></b>—Identifies a specific member switch of a Virtual Chassis or VCF configuration.</p> <p>The exact range for a specific Virtual Chassis or VCF depends on the number of switches allowed in the Virtual Chassis or VCF.</p> <p>In an EX8200 Virtual Chassis, member IDs 0 through 7 are reserved for EX8200 member switches and member IDs 8 and 9 are reserved for the master and backup external Routing Engines.</p> <p>The remaining statement options set characteristics of the Virtual Chassis or VCF member, and are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

## memory-enhanced

**Syntax**

```
memory-enhanced {
  filter;
  route;
  vpn-label;
}
```

**Hierarchy Level** [edit chassis]

**Release Information** Statement added in Junos OS Release 10.4.

**Description** Allocate more jtree memory for routing tables and Layer 3 VPNs.

**NOTE:** The `memory-enhanced` statement supports MX Series routers with DPC (I-chip based) line cards only.

The remaining statements are explained separately.

**Required Privilege Level**

interface	—To view this statement in the configuration.
interface-control	—To add this statement to the configuration.

**Related Documentation**

- [Configuring the Junos OS to Allocate More Memory for Routing Tables, Firewall Filters, and Layer 3 VPN Labels on page 506](#)

## minor

**Syntax**

```
minor {
  threshold threshold-value;
  action {
    alarm;
    disable-pfe;
    get-state;
    log;
    offline;
    reset;
  }
}
```

**Hierarchy Level** [edit chassis [fpc slot-number error](#)]

[edit chassis]

**Release Information** Statement introduced for PTX Series routers in Junos OS Release 13.3.  
Statement introduced for MX240, MX480, MX960, and MX2020 routers in Junos OS Release 14.2.

**Description** Severity level of the error. An error that results in the loss of a single packet but is fully recoverable is a minor error. The severity level of an error cannot be configured by a user.  
  
The other statements are explained separately.

**Required Privilege Level** **interface**—To view this statement in the configuration.  
**interface-control**—To add this statement to the configuration.

**Related Documentation**

- [Fabric Resiliency and Degradation on page 132](#)
- [show chassis fpc errors on page 1718](#)

## minimum-quality

**Syntax** minimum-quality;

**Hierarchy Level** [edit chassis [synchronization](#) output interfaces external]  
[edit chassis [synchronization](#) output interfaces (external-0/0 | external-1/0)]

**Release Information** Statement introduced in Junos OS Release 12.3 for MX Series routers.

**Description** Configure the minimum quality level threshold to select a clock source (see [Table 56 on page 271](#)). If the quality level of the output clock source drops below the configured minimum quality level threshold, the external output clock is suppressed on the external output interface—external—on SCBE and on the external output interfaces—external-0/0 and external-1/0—on SCBE2.

*Table 87: Quality Levels*

Quality Level	Description
prc	Timing quality of a primary reference clock (option-1 only).
prs	Clock traceable to a primary reference source (option-2 only).
sec	Timing quality of an SDH equipment clock (option-1 only).
smc	Clock traceable to a self-timed SONET (option-2 only).
ssu-a	Timing quality of a type I or IV slave clock (option-1 only).
ssu-b	Timing quality of a type VI slave clock (option-1 only).
st2	Clock traceable to Stratum 2 (option-2 only).
st3	Clock traceable to Stratum 3 (option-2 only).
st3e	Clock traceable to Stratum 3E (option-2 only).
st4	Clock traceable to Stratum 4 free-run (option-2 only).
stu	Clock traceable to an unknown quality (option-2 only).
tnc	Clock traceable to a transit node clock (option-2 only).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## mlfr-uni-nni-bundles

Syntax	<code>mlfr-uni-nni-bundles <i>number</i>;</code>
Hierarchy Level	<code>[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i>]</code>
Release Information	Statement introduced before Junos OS Release 7.4.
Description	Configure link services management properties.
Options	<p><b>number</b>—Number of Multilink Frame Relay user-to-network interface network-to-network interface (UNI-NNI) (FRF.16) bundles to allocate on a Link Services PIC.</p> <p><b>Range:</b> 1 through 255</p> <p><b>Default:</b> 16</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	• <a href="#">Configuring the Number of Bundles on Link Services PICs</a>

## mixed-rate-mode

Syntax	<code>mixed-rate-mode;</code>
Hierarchy Level	<code>[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> mixed-rate-mode],</code> <code>[edit chassis lcc <i>number</i> fpc <i>slot-number</i> pic <i>pic-number</i> mixed-rate-mode] (Routing Matrix)</code>
Release Information	Statement introduced in Junos OS Release 13.3.
Description	Configure the mixed-rate mode for the 24-port 10 Gigabit Ethernet PIC (PF-24XGE-SFPP) only.
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <li>• <a href="#">Modes of Operation of 10-Gigabit Ethernet PICs</a></li> <li>• <a href="#">Configuring Mixed-Rate Mode Operation on page 474</a></li> </ul>

## multicast-mode (PTP Master and Slave Interfaces)

**List of Syntax** [MX Series on page 712](#)  
[QFX Series on page 712](#)

**MX Series**

```
multicast-mode {
  asymmetry number;
  transport 802.3 link-local;
}
```

**QFX Series**

```
multicast-mode {
  local-ip-address local IP address;
  local-priority number;
}
transport {
  ieee-802.3;
  ipv4;
}
}
```

**Hierarchy Level** [edit protocols ptp [slave](#) interface *interface-name*],  
 [edit protocols ptp [master](#) interface *interface-name*]

**Release Information** Statement introduced in Junos OS Release 15.2 for MX Series routers.  
 Statement introduced in Junos OS Release 17.4 for the QFX Series.

**Description** Configure multicast transmission of Precision Time Protocol (PTP) packets between the master node and the slave node. The multicast method of transport of PTP packets is applicable in environments in which PTP uses IEEE 802.3 or Ethernet encapsulation for the transmission of PTP packets. Because PTP over Ethernet uses multicast addresses, a slave port can automatically start receiving the multicast announce messages transmitted by the master ports on a network and can also start communicating with the master port with minimal or no configuration. Unlike PTP over IPv4 where IP addresses are used to identify the master and slave ports, with PTP over Ethernet, multicast MAC addresses are used in forwarding of PTP traffic.

On the QFX Series, multicast-mode specifies that PTP should be forwarded with the multicast IPv4 packet format, and is required for the enterprise profile.

**NOTE:** You can configure only multicast mode or only unicast mode of transmission of PTP traffic on an interface at a point in time.

The remaining statements are explained separately. See [CLI Explorer](#).

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## multiservice

<b>Syntax</b>	<pre> multiservice {   source-mac;   destination-mac;   payload {     ip {       layer-3 (source-ip-only   destination-ip-only);       layer-4;     }   }   symmetric-hash {     complement;   } } </pre>
<b>Hierarchy Level</b>	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> hash-key family]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6.
<b>Description</b>	(MX Series 5G Universal Routing Platforms only) Configure data used in a hash key for the <b>multiservice</b> protocol family when configuring PIC-level symmetrical hashing for load balancing on an 802.3ad Link Aggregation Group.
<b>Options</b>	<p><b>destination-mac</b>—Include destination MAC address in the hash key.</p> <p><b>payload</b>—Include payload data in the hash key. This option has the following suboptions:</p> <ul style="list-style-type: none"> <li><b>layer-3</b>—Include Layer 3 IP information in the hash key.</li> <li><b>layer-4</b>—Include Layer 4 IP information in the hash key.</li> </ul> <p><b>source-mac</b>—Include source MAC address in the hash key.</p> <p><b>symmetric-hash</b>—Create a symmetric hash or symmetric hash complement key with any attribute.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Configuring PIC-Level Symmetrical Hashing for Load Balancing on 802.3ad LAGs for MX Series Routers on page 489</a></li> </ul>

## network-option

<b>Syntax</b>	network-option (option-1   option-2);
<b>Hierarchy Level</b>	[edit chassis <a href="#">synchronization</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2R4 for MX Series routers.
<b>Description</b>	<p>Configure the Ethernet equipment clock (EEC) synchronization networking type.</p> <p> <b>NOTE:</b> For SCB, this option is set with the <code>set chassis synchronization network-type (option-1   option-2)</code> configuration command at the [edit] hierarchy level.</p> <p> <b>NOTE:</b> For Junos OS releases 11.2R4 through 13.3R3 for MX240, MX480, and MX960 with SCB, SCBE, and SCBE2; and MX2010 and MX2020 with SCB or SCBE; you must execute the following commands after you change the network option at the [edit chassis synchronization] hierarchy level. This is because the loop bandwidth does not change automatically when you change the network option.</p> <pre>user@host# deactivate chassis synchronization user@host# activate chassis synchronization</pre>
<b>Options</b>	<p>Depending on the configuration of the Synchronization Status Messages (SSM) quality level, the network option functions in the following ways:</p> <ul style="list-style-type: none"> <li><b>option-1</b>—Maps to the G.813 option 1 (EEC1).</li> <li><b>option-2</b>—Maps to the G.812 type IV clock (EEC1).</li> </ul>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">synchronization on page 794</a></li> </ul>

## network-services

<b>Syntax</b>	<code>network-services (ethernet   enhanced-ethernet   ip   enhanced-ip   lan);</code>
<b>Hierarchy Level</b>	<code>[edit chassis]</code>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 8.5.</p> <p><b>enhanced-ethernet</b> and <b>enhanced-ip</b> options introduced in Junos OS Release 11.4.</p> <p><b>limited-ifl-scaling</b> option introduced in Junos OS Release 15.1R3 for MX Series routers.</p>
<b>Description</b>	<p>Set the router's network services to a specific mode of operation. On MX240, MX480, and MX960 routers, MPC5E and MPC7E power on only if the network services mode configured is <b>enhanced-ip</b> or <b>enhanced-ethernet</b>.</p> <p>MX2010 and MX2020 support only <b>enhanced-ip</b> and <b>enhanced-ethernet</b> network services modes.</p>
<b>Default</b>	<ul style="list-style-type: none"> <li>MX80, MX104, MX2010, MX2020—<b>enhanced-ip</b></li> <li>MX240, MX480, MX960—<b>ip</b></li> </ul>
<b>Options</b>	<p><b>ethernet</b>—Set the router's network services to Ethernet and use standard, compiled firewall filter format.</p> <p><b>enhanced-ethernet</b>—Set the router's network services to enhanced Ethernet and use enhanced mode capabilities. Only MPCs and MS-DPCs are powered on in the chassis.</p> <p><b>ip</b>—Set the router's network services to Internet Protocol and use standard, compiled firewall filter format.</p> <p><b>enhanced-ip</b>—Set the router's network services to enhanced Internet Protocol and use enhanced mode capabilities. Only MPCs and MS-DPCs are powered on in the chassis. Non-service DPCs do not work with enhanced network services mode options. This feature is enabled by default on MX80, MX104, MX2010, and MX2020 Universal Routing Platforms.</p> <p><b>lan</b>—Set the router's network services to LAN and use standard, compiled firewall filter format. Reboot the system after setting the router's network services to LAN.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Network Services Mode Overview on page 361</a></li> <li><i>Firewall Filters and Enhanced Network Services Mode Overview</i></li> </ul>

## no-concatenate

Syntax	no-concatenate;
Hierarchy Level	[edit chassis fpc slot-number pic pic-number], [edit chassis lcc number fpc slot-number pic pic-number] (Routing Matrix)
Release Information	Statement introduced before Junos OS Release 7.4.
Description	<p>Do not concatenate (multiplex) the output of a SONET/SDH PIC (an interface with a name <i>so-fpc/pic/port</i>).</p> <p>When configuring and displaying information about interfaces that are operating in channelized mode, you must specify the channel number in the interface name (<i>physical:channel</i>); for example, <i>so-2/2/0:0</i> and <i>so-2/2/0:1</i>.</p> <p>On SONET OC48 interfaces that are configured for channelized (multiplexed) mode, the <b>bytes e1-quiet</b> and <b>bytes f1</b> options in the <b>sonet-options</b> statement have no effect. The <b>bytes f2</b>, <b>bytes z3</b>, <b>bytes z4</b>, and <b>path-trace</b> options work correctly on channel 0. They work in the transmit direction only on channels 1, 2, and 3.</p>
Default	Output is concatenated (multiplexed).
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Junos OS to Enable a SONET PIC to Operate in Channelized (Multiplexed) Mode on page 467</a></li> </ul>

## no-multi-rate

---

Syntax	no-multi-rate;
Hierarchy Level	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> ]
Release Information	Statement introduced in Junos OS Release 11.2.
Description	Disable the rate-selectability configuration.  <div> <b>NOTE:</b><ul style="list-style-type: none"><li>• The <b>no-multi-rate</b> statement is supported only on MIC-3D-8OC3OC12-4OC48.</li><li>• The <b>no-multi-rate</b> statement enables the first four ports [0 – 3] exclusively at OC48/STM16 speed.</li><li>• The <b>no-multi-rate</b> statement disables the last four ports [4 – 7].</li></ul></div>
Default	Rate-selectability is enabled, that is, by default the multirate mode is enabled.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring Port Speed on Multi-Rate MICs on page 475</a></li></ul>

## no-route-localize

<b>Syntax</b>	no-route-localize;
<b>Hierarchy Level</b>	[edit policy-options policy-statement <i>policy-name</i> term <i>term-name</i> then]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.4.
<b>Description</b>	Enforce installation of routes on all FIB-remote Packet Forwarding Engines.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Packet Forwarding Engine FIB Localization on page 383</a></li></ul>

## non-revertive (Chassis)

<b>Syntax</b>	non-revertive;
<b>Hierarchy Level</b>	[edit chassis aggregated-devices ethernet lacp link-protection]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3. Statement introduced in Junos OS Release 11.4 for EX Series switches.
<b>Description</b>	<p>Disable the ability to switch to a better priority link (if one is available) once a link is established as active and a collection or distribution is enabled.</p> <hr/> <div>  <p><b>BEST PRACTICE:</b> (MX Series) By default, Link Aggregation Control Protocol link protection is revertive. This means that after the current link becomes active, the router switches to a higher-priority link if one becomes operational or is added to the aggregated Ethernet bundle. In a highly scaled configuration over aggregated Ethernet, we recommend that you prevent the router from performing such a switch by including the <b>non-revertive</b> statement. Failure to do so may result in some traffic loss if a MIC on which a member interface is located reboots. Using the <b>non-revertive</b> statement for this purpose is not effective if both the primary and secondary interfaces are on the MIC that reboots.</p> </div> <hr/>
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Junos OS for Supporting Aggregated Devices on page 481</a></li> <li>• <a href="#">Configuring LACP Link Protection of Aggregated Ethernet Interfaces for Switches</a></li> </ul>

## number-of-ports

<b>Syntax</b>	<code>number-of-ports <i>number-of-active-physical-ports</i>;</code>
<b>Hierarchy Level</b>	<code>[edit chassis fpc <i>slot-number</i>]</code> <code>[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i>]</code>
<b>Hierarchy Level</b>	<code>[edit chassis fpc <i>fpc-slot</i> pic <i>pic-number</i> pic-mode <i>pic-speed</i>]</code>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.1 for the 16x10GE MPC.</p> <p>Support for MPC3, MPC4, MPC5, and MPC6 introduced in Junos OS Release 13.3R2.</p> <p>Support for MPC7E-MRATE MPC introduced in Junos OS Release 15.1F4.</p> <p>Support for MPC8E and MPC9E introduced in Junos OS Release 15.1F5.</p> <p>Support for MX10003 MPC introduced in Junos OS Release 17.3R1</p> <p>Support for MX204 routers introduced in Junos OS Release 17.4R1</p> <p>Statement introduced in Junos OS Release 16.1 for EX9200 switches.</p>
<b>Description</b>	<p>Administratively enable physical ports, for example, to prevent oversubscription of the line card fabric interface. By default, all available ports are enabled. When disabled, the LED on the affected line card will appear yellow on capable line cards.</p> <p>(MX Series with 16x10GE MPC, MPC3, MPC4, MPC5, and MPC6) You can disable a subset of the physical ports available on the Packet Forwarding Engines of the 16x10GE MPC, and for MICs installed in MPC3, MPC4, MPC5, and MPC6. Specify either 8 or 12 ports by using this statement. When eight active ports are configured, two ports per Packet Forwarding Engine are disabled, and the LEDs on the MPC appear <b>yellow</b>. When you specify 12 active ports, one port per Packet Forwarding Engine is disabled and the corresponding LED appear <b>yellow</b>. When you do not include this statement in the configuration, all 16 default ports on the MPC are active.</p> <p>(MX Series with MPC7E-MRATE, MPC8E, and MPC9E) To ensure guaranteed bandwidth by preventing fabric oversubscription, you can disable a subset of the physical ports available on MPC7E-MRATE, MPC8E, and MPC9E. For information about the active ports for MPC7E-MRATE, MPC8E, and MPC9E, see <a href="#">“Supported Active Physical Ports for Configuring Rate Selectability to Prevent Oversubscription” on page 189</a>.</p> <p>(MX204 routers) To ensure guaranteed bandwidth by preventing oversubscription, you can disable a subset of the physical ports available on MX204 routers. For information about the active ports for MX204 routers, see <a href="#">“Supported Active Physical Rate-Selectable Ports to Prevent Oversubscription on MX204 Router” on page 193</a></p> <p>(EX9200 switches)</p>
<b>Options</b>	<code><i>number-of-active-physical-ports</i></code> —Specify the number of physical ports to enable on PICs or MICs on an MPC.

<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Number of Active Ports on 16-Port MPCs of MX Series Routers on page 61</a></li><li>• <a href="#">Supported Active Physical Ports for Configuring Rate Selectability to Prevent Oversubscription on page 189</a></li><li>• <a href="#">Configuring Rate Selectability on MPC7E (Multi-Rate) to Enable Different Port Speeds on page 201</a></li><li>• <a href="#">Configuring Rate Selectability on MIC-MRATE to Enable Different Port Speeds on page 196</a></li><li>• <a href="#">Configuring Rate Selectability on MX204 to Enable Different Port Speeds on page 220</a></li><li>• <a href="#">Understanding Rate Selectability on page 176</a></li></ul>

---

## offline

---

<b>Syntax</b>	offline;
<b>Hierarchy Level</b>	[edit chassis <i>lcc number</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	(Routing matrix based on the TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, configure a T640 router so that it is not part of the routing matrix. On a TX Matrix Plus router, configure a T1600 or T4000 router so that it is not part of the routing matrix.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">online-expected on page 725</a></li><li>• <a href="#">TX Matrix Router and T640 Router Configuration Overview on page 373</a></li><li>• <a href="#">TX Matrix Plus Router Configuration Overview on page 397</a></li><li>• <a href="#">Configuring Junos OS to Enable the TX Matrix Router to Generate an Alarm If a T640 Router Stays Offline on page 380</a></li><li>• <a href="#">Configuring Junos OS to Enable the TX Matrix Plus Router to Generate an Alarm If a T1600 or T4000 Router Stays Offline on page 406</a></li></ul>

## offline-on-fabric-bandwidth-reduction

<b>Syntax</b>	<code>offline-on-fabric-bandwidth-reduction;</code>
<b>Hierarchy Level</b>	<code>[edit chassis fpc slot-number]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.4.
<b>Description</b>	Configure an FPC with degraded fabric bandwidth offline, to avoid causing a traffic black hole in the chassis for an extended time.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Disabling an FPC with Degraded Fabric Bandwidth on page 144</a></li> <li>• <a href="#">Managing Bandwidth Degradation on page 143</a></li> </ul>

## on-disk-failure (Chassis Routing Engine)

<b>Syntax</b>	<pre>on-disk-failure {   disk-failure-action (halt   reboot); }</pre>
<b>Hierarchy Level</b>	<code>[edit chassis routing-engine]</code>
<b>Release Information</b>	Statement introduced before JUNOS Release 7.4. The <code>disk-failure-action</code> statement added in JUNOS Release 9.0.
<b>Description</b>	Instruct the router to halt or reboot if it detects hard disk errors on the Routing Engine.
<b>Options</b>	The remaining statement is explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Junos OS to Enable a Routing Engine to Reboot on Hard Disk Errors on page 509</a></li> </ul>

## on-error

<b>Syntax</b>	<pre>on-error {   raise-alarm;   power (cycle   off);   write-coredump; }</pre>
<b>Hierarchy Level</b>	<pre>[edit chassis cfep slot-number] [edit chassis feb slot-number] [edit chassis fpc slot-number sanity-poll] [edit chassis lcc number fpc number sanity-poll] (Routing Matrix)</pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 15.1 on M7i, M10, M120, and M320 routers.</p>
<b>Description</b>	Instruct the FPC or FEB or CFEB to perform actions during an error condition.
<b>Options</b>	<p><b>raise-alarm</b>—Generate and display a chassis alarm in case of an error.</p> <p><b>power cycle</b>—Reboot the FPC or FEB or CFEB after generating a core file. This statement is useful in case of temporary software errors that are eliminated after reboot.</p> <p><b>power off</b>—Halt the FPC or FEB or CFEB and keep it offline. This statement is useful in case of permanent hardware failures.</p>
	<div>  <p><b>CAUTION:</b> The <b>power off</b> statement halts the FPC or FEB or CFEB. Ensure that you have backup paths through different FPC or FEB or CFEB to avoid service outage.</p> </div>
	<div>  <p><b>NOTE:</b> The <b>power cycle</b> and <b>power off</b> statements are mutually exclusive: You can configure either the <b>power cycle</b> or the <b>power off</b> statement for an error.</p> </div>
	<p><b>write-coredump</b>—Trigger the core file in case of an error.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Sanity Polling on page 511</a></li> <li>• <a href="#">sanity-poll on page 770</a></li> </ul>

- [retry-count on page 765](#)

## online-expected

<b>Syntax</b>	online-expected;
<b>Hierarchy Level</b>	[edit chassis <i>lcc number</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	(TX Matrix and TX Matrix Plus routing matrix only) On a TX Matrix router, configure a T640 router so that if it does not come online, an alarm is sent to the TX Matrix router. On a TX Matrix Plus router, configure a T1600 or a T4000 router so that if it does not come online, an alarm is sent to the TX Matrix Plus router.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">TX Matrix Router and T640 Router Configuration Overview on page 373</a></li> <li>• <a href="#">TX Matrix Plus Router Configuration Overview on page 397</a></li> <li>• <a href="#">Configuring Junos OS to Enable the TX Matrix Router to Generate an Alarm If a T640 Router Stays Offline on page 380</a></li> <li>• <a href="#">Configuring Junos OS to Enable the TX Matrix Plus Router to Generate an Alarm If a T1600 or T4000 Router Stays Offline on page 406</a></li> <li>• <a href="#">offline on page 722</a></li> </ul>

## oss-map

Syntax	<pre>oss-map {   model-name t640 t1600; }</pre>
Hierarchy Level	[edit chassis]
Release Information	Statement introduced in Junos OS Release 12.3R3, 13.1R2, and 13.2R1 for T4000 routers.
Description	Configure the operations support systems (OSS) mapping feature to map a T4000 chassis to a T1600 chassis or a T640 chassis, so that the T4000 chassis is represented as a T1600 chassis or a T640 chassis, respectively. The configuration helps prevent requalifying the T1600 chassis and T640 chassis as a new chassis on the OSS.
Options	<p><b>model-name t640</b>—Perform OSS mapping on a T4000 chassis to represent it as a T640 chassis, thereby overriding the chassis model name as displayed in the output of the <b>show chassis hardware</b>, the <b>show snmp mib walk system</b>, and the <b>show snmp mib walk jnxBoxAnatomy</b> operational commands.</p> <p><b>model-name t1600</b>—Perform OSS mapping on a T4000 chassis to represent it as a T1600 chassis, thereby overriding the chassis model name as displayed in the output of the <b>show chassis hardware</b>, the <b>show snmp mib walk system</b>, and the <b>show snmp mib walk jnxBoxAnatomy</b> operational commands.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <li><a href="#">Configuring OSS Mapping to Represent a T4000 Chassis as a T1600 or a T640 Chassis on page 447</a></li> <li><a href="#">Example: Configuring a T4000 Chassis to Represent a T640 Chassis on page 449</a></li> <li><a href="#">show chassis oss-map on page 2018</a></li> </ul>

## output interfaces external

<b>Syntax</b>	<pre> output {   interfaces {     external {       holdover-mode-disable;       minimum-quality (prc   prs   sec   smc   ssu-a   ssu-b   st2   st3   st3e   st4   stu   tnc);       source-mode (chassis   line); tx-dnu-to-line-source-enable;       tx-dnu-to-line-source-enable;       wander-filter-disable;     }   } } </pre>
<b>Hierarchy Level</b>	[edit chassis <a href="#">synchronization</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for MX Series routers.
<b>Description</b>	<p>Configure the options for the external clock output interface—external—on SCBE.</p> <p>Configure the options for the external clock output interfaces—external-0/0 and external-1/0—on SCBE2.</p>
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">synchronization on page 794</a></li> </ul>

## packet-scheduling

---

<b>Syntax</b>	(packet-scheduling   no-packet-scheduling);
<b>Hierarchy Level</b>	[edit chassis]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	(M 160 routers only) Enable packet-scheduling mode, in which the Packet Director application-specific integrated circuit (ASIC) schedules packet dispatches to compensate for transport delay differences. This preserves the interpacket gaps as the packets are distributed from the Packet Director ASIC to the Packet Forwarding Engine.
<b>Default</b>	no-packet-scheduling
	<div> <b>NOTE:</b> The packet-scheduling feature is available on M160 routers only.</div>
<b>Options</b>	<p><b>no-packet-scheduling</b>—Do not schedule packets.</p> <p><b>packet-scheduling</b>—Schedule packets to preserve interpacket gaps.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Enable an M160 Router to Operate in Packet Scheduling Mode on page 431</a></li></ul>

## payload

<b>Syntax</b>	<pre>payload {   ip {     layer-3;     layer-4;   } }</pre>
<b>Hierarchy Level</b>	[edit chassis fpc slot-number pic pic-number hash-key family multiservice]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6.
<b>Description</b>	(MX Series 5G Universal Routing Platforms only) Include payload data in a hash key for the <b>multiservice</b> protocol family when configuring PIC-level symmetrical load balancing on an 802.3ad Link Aggregation Group.
<b>Options</b>	<p><b>ip</b>—Include IPv4 payload data in the hash key. This option has the following suboptions:</p> <ul style="list-style-type: none"> <li>• <b>layer-3</b>—Include Layer 3 IP information in the hash key.</li> <li>• <b>layer-4</b>—Include Layer 4 IP information in the hash key.</li> </ul>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring PIC-Level Symmetrical Hashing for Load Balancing on 802.3ad LAGs for MX Series Routers on page 489</a></li> </ul>

## pem (M320 Routers)

---

<b>Syntax</b>	<pre>pem {   minimum <i>number</i>; }</pre>
<b>Hierarchy Level</b>	[edit chassis]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4.
<b>Description</b>	Configure the minimum number of Power Entry Modules (PEMs) on an M320 router. With this configuration, PEM absent alarms are generated only if the PEM count falls below the minimum specified.
<b>Options</b>	<b>minimum <i>number</i></b> —Minimum number of PEMs on the router. <b>Range:</b> 0 through 3
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Support Entry-Level Configuration on an M320 Router with a Minimum Number of SIBs and PIMs on page 435</a></li><li>• <a href="#">sib on page 776</a></li></ul>

## pem (T640, T1600, and T4000 Routers with Six-Input DC Power Supply)

Syntax	<pre>pem {   feeds <i>number-of-input-feeds</i>;   input-current <i>amps-in-each-feed</i>; }</pre>
Hierarchy Level	[edit chassis] [edit chassis lcc <i>lcc-number</i> ] (Routing Matrix)
Release Information	Statement introduced in Junos OS Release 12.1. Option <b>feeds</b> introduced in Junos OS Release 12.1. Option <b>input-current</b> introduced for T4000 routers in Junos OS Release 12.3.
Description	Configure the power supply parameters of the six-input DC power supply on T640, T1600, or T4000 routers.
Options	<b>feeds</b> <i>number-of-input-feeds</i> —Number of input feeds connected to the six-input DC power supply.  (For T4000 routers only) <b>input-current</b> <i>amps-in-each-feed</i> —Input current (in amperes) in each feed.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Six-Input DC Power Supply on T Series Routers on page 110</a></li> </ul>

## performance-mode

Syntax	<pre>performance-mode {   number-of-ucode-workers <i>number-of-ucode-workers</i>; }</pre>
Hierarchy Level	[edit chassis fpc 0]
Release Information	<p>Statement introduced in Junos OS Release 15.1F4 and 16.1R1 for vMX routers.</p> <p><b>number-of-ucode-workers</b> option introduced in Junos OS Release 15.1F6 and 16.2R1 for vMX routers.</p>
Description	<p>(vMX routers only) Enables vMX to run in performance mode. Performance mode needs more vCPUs and memory to run at higher bandwidth.</p> <p>.....</p> <p> <b>NOTE:</b> When you enable performance mode, make sure you have configured the proper number of vCPUs and memory for your VMs based on your use case. If you have not configured enough vCPUs, vMX runs in lite mode.</p> <p>.....</p> <p>Starting with Junos OS Release 15.1F6, performance mode is enabled by default for vMX.</p> <p>.....</p> <p> <b>NOTE:</b> The FPC reboots if you change this configuration.</p> <p>.....</p> <p>You can tune performance mode for unicast traffic by changing the number of Workers dedicated to processing multicast and control traffic. Starting with Junos OS Release 17.2R1, you do not need to specify dedicated Workers for processing multicast traffic. The default specifies that all available Workers are used to process all traffic.</p> <p>The number of dedicated Workers specified in relation to the number of available Workers results in the following behavior:</p> <ul style="list-style-type: none"> <li>• If the number of dedicated Workers is greater than or equal to the number of available Workers, then all available Workers are used to process all traffic.</li> <li>• If the number of dedicated Workers is less than the number of available Workers, then the first set of available Workers (equal to the specified number of dedicated Workers) is used to process multicast and control traffic while the remaining available Workers are used to process flow cache traffic.</li> </ul> <p>Options    <b>performance-mode</b>—Enables performance mode.</p>

To disable performance mode, enable lite mode by including the **lite-mode** statement at the **[edit chassis fpc 0]** hierarchy level.

**number-of-ucode-workers** *number-workers*—Specifies the number of dedicated Workers for processing multicast and control traffic.

**Range:** 0 through 15

**Default:** 0 specifies that all available Workers are used to process all traffic.

**Required Privilege Level** **interface**—To view this statement in the configuration.  
**interface-control**—To add this statement to the configuration.

**Related Documentation**

- [lite-mode on page 694](#)

## phy-timestamping

**Syntax** phy-timestamping

**Hierarchy Level** [edit protocols ptp]

**Release Information** Statement introduced in Junos OS Release 17.1R1.

**Description** Configure timestamping of the IEEE 1588 event packets at the physical layer. Timestamping the packet at the physical layer, also known as PHY timestamping, eliminates the noise or the packet delay variation (PDV) that is introduced by the Packet Forwarding Engine.

By default PHY timestamping is disabled.

**Required Privilege Level** **routing**—To view this statement in the configuration.  
**routing-control**—To add this statement to the configuration.

**Related Documentation**

- [Precision Time Protocol Overview on page 256](#)

## pic (M Series and T Series Routers)

```
Syntax pic pic-number {
    cel {
        el port-number {
            channel-group group-number timeslots slot-number;
        }
    }
    ct3 {
        port port-number {
            tl link-number {
                channel-group group-number timeslots slot-number;
            }
        }
    }
    framing (sdh | sonet);

## pic (TX Matrix and TX Matrix Plus Routers)

<b>Syntax</b>	<pre> pic <i>pic-number</i> {   aggregate-ports;   atm-cell-relay-accumulation;   atm-l2circuit-mode (cell   aal5   trunk <i>trunk</i>);   egress-policer-overhead (<i>count</i>);   framing (sdh   sonet);   idle-cell-format {     itu-t;     payload-pattern <i>payload-pattern-byte</i>;   }   ingress-policer-overhead (<i>count</i>);   max-queues-per-interface (8   4);   no-concatenate;   no-mcast-replication;   q-pic-large-buffer (large-scale   small-scale); } </pre>
<b>Hierarchy Level</b>	[edit chassis lcc <i>number</i> fpc <i>slot-number</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	On a TX Matrix or TX Matrix Plus router, configure properties for an individual PIC.
<b>Options</b>	<p><b><i>pic-number</i></b>—Slot number in which the PIC is installed.</p> <p><b>Range:</b> 0 through 3</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">TX Matrix Router and T640 Router Configuration Overview on page 373</a></li> <li>• <a href="#">TX Matrix Plus Router Configuration Overview on page 397</a></li> <li>• <a href="#">Configuring the Junos OS to Enable SONET/SDH Framing for SONET/SDH PICs on page 461</a></li> </ul>

## pic-mode

<b>Syntax</b>	<code>pic-mode <i>pic-speed</i>;</code>
<b>Hierarchy Level</b>	<code>[edit chassis (EX Series) fpc slot pic <i>pic-number</i> ]</code>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 15.1F4 for MX Series routers with the MPC7E-MRATE MPC.</p> <p>Statement introduced in Junos OS Release 15.1F5 for MX Series routers with the MIC-MRATE MIC.</p> <p>Statement introduced in Junos OS Release 17.3R1 for MX10003 routers with the MX10003 MPC.</p> <p>Statement introduced in Junos OS Release 17.4R1 for MX204 Universal Routing Platforms.</p>
<b>Description</b>	<p>Configure the operating speed of all ports on the MPC7E-MRATE MPC, MIC-MRATE MIC, MX10003 MPC, and MX204 routers.</p> <p>(MX240, MX480, MX960, MX2010, and MX2020 routers with MPC7E-MRATE) To configure 100 Gbps, 10 Gbps, and 40 Gbps speed on all supported ports, specify <b>100G</b>, <b>10G</b>, or <b>40G</b>, respectively, as the speed for the specified PIC. All the six ports of PIC 0 and PIC 1 of an MPC7E-MRATE MPC support 10-Gbps and 40-Gbps speeds. However, only ports 2 and 5 of PIC 0 and PIC 1 support 100-Gbps speed. Therefore, if you configure <b>100G</b> as the operating speed of a PIC, the PIC is rebooted and the ports 0, 1, 3, and 4 are disabled.</p> <p>(MX2010 and MX2020 routers with MIC-MRATE on MPC8E and MPC9E) To configure the port speed at MIC level or on all supported ports, specify <b>100G</b>, <b>10G</b>, or <b>40G</b>, respectively, as the speed for the MIC-MRATE MIC on MPC8E and MPC9E. All the twelve ports of MIC-MRATE MIC support 10 Gbps and 40 Gbps speeds. When you configure the port speed as 100 Gbps at the PIC level for MPC8E, you can configure only 4 ports of the 12 MIC-MRATE ports on MPC8E to operate at 100 Gbps port speed. The other ports are disabled. Therefore, if you configure <b>100G</b> as the operating speed for ports 0, 1, 6, and 7, the other ports are disabled on MPC8E. Similarly, when you configure the port speed as 100 Gbps at the PIC level you can configure only 8 ports of the 12 MIC-MRATE ports on MPC9E with 100 Gbps port speed. Therefore, if you configure <b>100G</b> as the operating speed for ports 0, 1, 2, 3, 6, 7, 8, and 9, the other ports can support only 40 Gbps or 10 Gbps. However, enabling port speed of 40 Gbps or 10 Gbps at the PIC level, enables all ports and sets the desired port speed on all ports.</p> <p>(MX10003 routers with MX10003 MPC) To configure 100 Gbps, 10 Gbps, and 40 Gbps speed on all supported ports, specify 100G, 10G, or 40G, respectively, as the speed for the specified PIC. All the six ports of the fixed port PIC support 10-Gbps and 40-Gbps speeds. All the 12 ports of the Multi-rate MIC support 100-Gbps, 10-Gbps and 40-Gbps speeds. To configure all ports to operate at the same speed, configure rate selectability at the PIC level, in which case you cannot configure the speed of individual ports. To configure rate selectability at the PIC level, use the <b>pic-mode</b> statement and specify the port speed. For more information see <a href="#">“MX10003 MPC on MX10003 Router Overview”</a> on</p>

[page 43](#) and [“Supported Active Physical Ports for Configuring Rate Selectability to Prevent Oversubscription on MX10003 MPC” on page 192.](#)

(MX204 routers) To configure all ports to operate at the same speed, configure rate selectability at the PIC level, in which case you cannot configure the speed of individual ports. To configure rate selectability at the PIC level, use the **pic-mode** statement and specify the port speed. The MX204 has four rate-selectable ports (referred to a PIC 0 ports) that can be configured as 100-Gigabit Ethernet ports or 40-Gigabit Ethernet port, or each port can be configured as four 10-Gigabit Ethernet ports (by using a breakout cable). The MX204 also has eight 10-Gigabit Ethernet ports (referred to as PIC 1 ports).

The MX204 router does not support heterogeneous mode. That is, in PIC mode if 40-Gbps or 100-Gbps speed is configured on PIC 0, then the **number-of-ports** on PIC 1 must be configured to 0 only. For more information, see [“MX204 Router Overview” on page 45](#) and [“Supported Active Physical Rate-Selectable Ports to Prevent Oversubscription on MX204 Router” on page 193.](#)

**Options**    *pic-speed*—Operating speed of the interfaces configured on the ports of an MPC7E-MRATE MPC.

**100G**—Supported ports operate at 100 Gbps speed.

**10G**—Supported ports operate at 10 Gbps speed.

**40G**—Supported ports operate at 40 Gbps speed.

**Default:** 10G

**Required Privilege Level**    interface—To view this statement in the configuration.  
   interface-control—To add this statement to the configuration.

## policer-drop-probability-low

<b>Syntax</b>	policer-drop-probability-low;
<b>Hierarchy Level</b>	[edit chassis]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.4R1.
<b>Description</b>	<p>Reduces the possibility that policers configured on the router might drop packets. For some Juniper Networks routers, policers can mark packets as out-of-specification in accordance with TCP. By default, these policers begin to randomly drop packets when the current credit exceeds the credit limit. In the context of TCP, this random drop mechanism helps to smooth the flow of traffic. The <b>policer-drop-probability-low</b> statement causes the policers to operate as strict rate limiters and to ignore the standard TCP behavior.</p> <p>The <b>policer-drop-probability-low</b> statement is applicable to the following routing platforms:</p> <ul style="list-style-type: none"> <li>• M7i</li> <li>• M10i</li> <li>• M120</li> <li>• M320</li> <li>• MX Series</li> </ul>
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show pfe cfeb on page 2224</a></li> <li>• <a href="#">show pfe feb on page 2228</a></li> <li>• <a href="#">show pfe fpc on page 2234</a></li> </ul>

## port (Chassis)

Syntax	<code>port <i>port-number</i>;</code>
Hierarchy Level	<code>[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> ct3]</code>
Release Information	Statement introduced before Junos OS Release 7.4.
Description	Configure the channelized T3 port number on the PIC.
Options	<i>port-number</i> —Port number. Range: 0 through 1
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> <li><a href="#">Configuring the Junos OS to Support Channelized DS3-to-DS0 Naming for Channel Groups and Time Slots on page 495</a></li> </ul>

## port auxiliary time-of-day-format

Syntax	<code>port auxiliary time-of-day-format ascii <i>string</i>;</code>
Hierarchy Level	<code>[edit chassis synchronization source interfaces (external-a   external-b   interface <i>interface-name</i>)]</code> <code>[edit chassis synchronization source interfaces (external   interface <i>interface-name</i>)]</code> <code>[edit chassis synchronization source interfaces (external-0/0   external-1/0   interface <i>interface-name</i>)]</code>
Release Information	Statement introduced in Junos OS Release 13.3 for MX Series routers.
Description	Configure the time-of-day message format as ASCII on the auxiliary port that receives the external clock signals.
Options	<i>string</i> —Set the message format in ASCII characters.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> <li><a href="#">synchronization (MX Series) on page 794</a></li> </ul>

## speed

Syntax	speed [10G   40G   100G];
Hierarchy Level	[edit chassis fpc slot-number pic pic-number port port-number]
Release Information	Statement introduced in Junos OS Release 15.1F3 and 16.1R2 for PTX5000 routers. Statement introduced in Junos OS Release 15.1F6 and 16.1R2 for PTX3000 routers. Statement introduced in Junos OS Release 16.1X65 for PTX1000 routers.
Description	Configure the port speed on interface modules that support multiple port speeds. To check the port speed, use the <b>show interfaces</b> command. To determine whether a PIC has specific port speed configuration requirements, see the PIC's description in <i>PTX Series Interface Module Reference</i> .
Options	10G—10 Gbps  40G—40 Gbps  100G—100 Gbps
<div>  <p><b>NOTE:</b> For PTX 1000 routers, the default port speed is 10 Gbps.</p> </div>	
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> <li>• <i>Modes of Operation of 10-Gigabit Ethernet PICs</i></li> <li>• <a href="#">Configuring Mixed-Rate Mode Operation on page 474</a></li> <li>• <a href="#">mixed-rate-mode on page 711</a></li> </ul>

## power

Syntax	<code>power (off   on);</code>
Hierarchy Level	<pre>[edit chassis fpc slot-number] [edit chassis fpc name pic], [edit chassis lcc name fpc name pic name], [edit chassis member name fpc name pic]</pre>
Release Information	<p>The <code>edit chassis fpc slot-number</code> statement introduced before Junos OS Release 7.4.</p> <p>The <code>edit chassis fpc slot-number pic pic-number power off</code> introduced in Junos OS Release 13.3R2.</p> <p>Statement introduced in Junos OS Release 17.3 for MX10003 Universal Routing Platforms.</p>
Description	<p>The <code>edit chassis fpc slot-number</code> command configures the Flexible PIC Concentrator (FPC) to stay offline or to come online automatically.</p> <p>.....</p> <div>  <p><b>NOTE:</b> In a node slicing context, issuing the command <code>set chassis fpc slot-number power off</code> on the BSYS (base system) powers off even those FPCs that are assigned to the Guest Network Functions (GNFs) in which unified in-service software upgrade (ISSU) is in progress. Learn more about <a href="#">Junos Node Slicing</a>.</p> </div> <p>.....</p> <p>The <code>edit chassis fpc slot-number pic pic-number power off</code> command turns off the power to the PIC in the specified FPC.</p> <p>.....</p> <div>  <p><b>NOTE:</b> <code>power off</code> command is applicable only to the fixed-configuration MPC with six 40-Gigabit Ethernet ports and twenty-four 10-Gigabit Ethernet ports (MPC5E-40G10G). For other PICs, it is ignored with a syslog message.</p> </div> <p>.....</p>
Default	on
Options	<p><b>off</b>—Take the FPC offline, and configure it to stay offline, as, for example, after a system reboot.</p> <p><b>on</b>—Bring the FPC online, and configure it to come online automatically, as, for example, after a system reboot.</p> <p><b>off</b>—Take the PIC in the specified FPC offline, and configure it to stay offline, as, for example, after a system reboot.</p>

**on**—Bring the PIC in the specified FPC online, and configure it to come online automatically, as, for example, after a system reboot.

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

**Related Documentation** • [Configuring the Junos OS to Make a Flexible PIC Concentrator Stay Offline on page 459](#)

## preserve-fpc-poweron-sequence

---

Syntax	preserve-fpc-poweron-sequence;
Hierarchy Level	[edit chassis]
Release Information	<p>Statement introduced in Junos OS Release 15.1 for MX Series routers.</p> <p>Statement introduced in Junos OS Release 17.2R1 for EX9200 switches.</p> <p>Statement introduced in Junos OS Release 18.2R1 for MX10008 Universal Routing Platforms.</p>
Description	<p>Preserve the sequence in which the line cards—specifically, MPCs on MX series routers—on a router or switch are powered on when the device is restarted. During a system reboot, the line cards are brought online in the sequence specified in the system log file <code>/var/log/fpc_poweron_seq.log</code>. When a line card goes offline, its entry is removed from the log file. You can use the <a href="#">show chassis power sequence</a> command to view the configured power-on sequence.</p>
<div> NOTE:</div> <ul style="list-style-type: none"><li>• If both <code>preserve-fpc-poweron-sequence</code> and <code>fru-poweron-sequence</code> statements are configured, then the power-on sequence specified in the <code>fru-poweron-sequence</code> statement takes precedence.</li><li>• If <code>preserve-fpc-poweron-sequence</code> is configured and <code>fru-poweron-sequence</code> not configured, then the line cards are powered on in the sequence preserved in the system log file <code>/var/log/fpc_poweron_seq.log</code>.</li><li>• If neither of these statements is configured, then the line cards are powered on in the ascending order of their slot numbers. Line cards whose slot numbers are not specified in the log file are powered on in the ascending order of their slot numbers.</li></ul>	
Required Privilege Level	<p>chassis—To view this statement in the configuration.</p> <p>chassis-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">fru-poweron-sequence on page 669</a></li><li>• <a href="#">show chassis power sequence on page 2076</a></li><li>• <a href="#">Understanding How Dynamic Power Management Enables Better Utilization of Power on page 103</a></li></ul>

## primary

---

<b>Syntax</b>	<code>primary interface name;</code>
<b>Hierarchy Level</b>	[edit protocols ptp <a href="#">slave</a> interface <i>interface-name</i> ], [edit protocols ptp <a href="#">master</a> interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 17.2R1.
<b>Description</b>	Configure the primary member link in an aggregated Ethernet bundle to enable Precision Time Protocol (PTP) over a link aggregation group. PTP master streams are created on the FPC on which the primary interface is present. Announce and sync packets are transmitted on this primary PTP Aggregated Ethernet link.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Precision Time Protocol on page 319</a></li><li>• <a href="#">Example: Configuring Precision Time Protocol on page 325</a></li><li>• <a href="#">Precision Time Protocol Overview on page 256</a></li></ul>

## priority1

<b>Syntax</b>	<code>priority1 <i>priority1-value</i>;</code>
<b>Hierarchy Level</b>	<code>[edit protocols ptp]</code>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.2.</p> <p>Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.</p> <p>Statement introduced in Junos OS Release 17.3 for the QFX Series.</p>
<b>Description</b>	<p>Configure the priority as one of the following:</p> <ul style="list-style-type: none"> <li>• In the slave, the priority value is set to select the best master clock. Note that in order to select a particular master clock, the priority value in the master clock's announce message must be equal to or lower than the configured <i>priority1-value</i>.</li> <li>• In the master, the priority value is set to represent itself in the announce message to other slaves.</li> <li>• In the boundary node, the slave uses this value to determine the best master clock, whereas the master uses this value from the announce message of the selected master clock.</li> </ul> <p>Note that the lower value takes precedence.</p>
<b>Options</b>	<p><i>priority1-value</i>—The priority value of the clock.</p> <p><b>Range:</b> 0 through 255</p> <p><b>Default:</b> 128</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Precision Time Protocol on page 319</a></li> <li>• <a href="#">Precision Time Protocol Overview on page 256</a></li> <li>• <i>IEEE 1588v2 Precision Timing Protocol (PTP)</i></li> </ul>

## priority2

Syntax	<code>priority2 priority2-value;</code>
Hierarchy Level	<code>[edit protocols ptp]</code>
Release Information	<p>Statement introduced in Junos OS Release 12.2.</p> <p>Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.</p> <p>Statement introduced in Junos OS Release 17.3 for the QFX Series.</p>
Description	<p>Configure the <b>priority2</b> value. This value is used to differentiate and prioritize the master clocks to avoid confusion when the <b>priority1-value</b> is the same for different master clocks in a network.</p> <p>Note that the lower value takes precedence.</p>
Options	<p><b>priority2-value</b>—The priority value of the clock.</p> <p><b>Range:</b> 0 through 255</p> <p><b>Default:</b> 128</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Precision Time Protocol on page 319</a></li> <li>• <a href="#">Example: Configuring Precision Time Protocol on page 325</a></li> <li>• <a href="#">Precision Time Protocol Overview on page 256</a></li> <li>• <i>IEEE 1588v2 Precision Timing Protocol (PTP)</i></li> </ul>

## priority (Clock Synchronization)

---

<b>Syntax</b>	<code>priority <i>number</i>;</code>
<b>Hierarchy Level</b>	<code>[edit chassis synchronization source interfaces (external-a   external-b   interface <i>interface-name</i>)]</code> <code>[edit chassis synchronization source interfaces (external   interface <i>interface-name</i>)]</code> <code>[edit chassis synchronization source interfaces (external-0/0   external-1/0   interface <i>interface-name</i>)]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2R4 for MX Series routers.
<b>Description</b>	<p>Configure the priority of a clock source in relationship to other clock sources to define a network synchronization flow and to help prevent timing loops.</p> <p>When the priority is not specified, the external-a interface has higher default priority than the external-b interface, and the external-b interface has higher default priority than other Gigabit Ethernet or 10-Gigabit Ethernet clock sources, which have the lowest default priority. Any priority you configure is higher than any default priority.</p>
<b>Options</b>	<p><i>number</i>—Set the priority level of the clock source.</p> <p><b>Range:</b> 1 through 5</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">synchronization (MX Series) on page 794</a></li></ul>

## profile-type

QFX Series (AES67 Profile)	profile-type aes67
QFX Series (AES67+SMPTE Profile)	profile-type aes67-smppte
List of Syntax	<a href="#">QFX Series (AES67 Profile) on page 751</a> <a href="#">QFX Series (AES67+SMPTE Profile) on page 751</a> <a href="#">MX Series on page 751</a> <a href="#">QFX Series (Enterprise Profile) on page 751</a> <a href="#">QFX Series (G.8275.2 Enhanced Profile) on page 751</a> <a href="#">QFX Series (SMPTE Profile ) on page 751</a>
MX Series	profile-type (g.8275.1   g.8275.1.enh)
QFX Series (Enterprise Profile)	profile-type enterprise-profile
QFX Series (G.8275.2 Enhanced Profile)	profile-type g.8275.1.enh
QFX Series (SMPTE Profile )	profile-type smppte
Hierarchy Level	[edit protocols ptp]
Release Information	<p>Statement introduced in Junos OS Release 17.1R1.</p> <p>Statement introduced in Junos OS Release 17.3 for the QFX Series.</p>
Description	<p>On the MX Series, configure the G.8275.1 or the enhanced G.8275.1 PTP profile for applications that require accurate phase and time synchronization. This profile supports the architecture defined in ITU-T G.8275 to enable the distribution of phase and time with full timing support and is based on the second version of PTP defined in IEEE 1588.</p> <p>On QFX Series switches that support the enterprise-profile feature, you can configure the enterprise profile, which supports IEEE 1588 PTPv2 transport over multicast IPv4. If you do not specify a profile, the IEEE 1588 default profile is enabled by default.</p> <p>On QFX Series switches that support the G.8275.2 enhanced profile feature, you can configure the G.8275.2 enhanced profile, which supports telecom applications that require accurate phase and time synchronization for phase alignment and time of day synchronization over a wide area network. This profile supports PTP over IPv4 unicast, ordinary and boundary clocks, and unicast negotiation.</p>

On QFX Series switches that support the media profile, you can configure the SMPTE, AES67, and the AES67+SMPTE profiles to support video applications for capture (for example, cameras), video edit, and playback to be used in professional broadcast environments. The standard allows multiple video sources to stay in synchronization across various equipment by providing time and frequency synchronization to all devices. This profile supports PTP over IPv4 multicast and ordinary and boundary clocks.

**Options**    **aes67**—Enable the AES67 PTP profile.

**aes67-smp****pte**—Enable the AES67+SMPTE PTP profile.

**enterprise-profile**—Enable the enterprise profile. The enterprise profile supports IEEE 1588 PTPv2 transport over multicast IPv4. When the enterprise profile is enabled, no other profiles can be enabled. Also, unicast negotiation is disabled when you enable the enterprise profile.

**g.8275.1**—Enable the G.8275.1 PTP profile.

**g.8275.1.enh**—Enable the enhanced G.8275.1 PTP profile. This profile supports PTP over IPv4.

**g.8275.2.enh**—Enable the enhanced G.8275.2 PTP profile. This profile supports PTP over IPv4 unicast.

**smp****pte**—Enable the SMPTE PTP profile.

**Required Privilege Level**    routing—To view this statement in the configuration.  
   routing-control—To add this statement to the configuration.

## pulse-per-second-enable

<b>Syntax</b>	pulse-per-second-enable;
<b>Hierarchy Level</b>	[edit chassis <a href="#">synchronization</a> interfaces external] [edit chassis <a href="#">synchronization</a> interfaces (external-0/0   external-1/0)]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for MX Series routers.
<b>Description</b>	Configure the external interface to receive the pulse per second (PPS) signal on the GPS interface of the router.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">synchronization on page 794</a></li></ul>

## q-pic-large-buffer

Syntax	<code>q-pic-large-buffer (large-scale   small-scale);</code>
Hierarchy Level	<code>[edit chassis fpc slot-number pic pic-number]</code> <code>[edit chassis lcc number fpc slot-number pic pic-number (Routing Matrix)]</code>
Release Information	<p>Statement introduced in Junos OS Release 7.4.</p> <p>Support for TX Matrix and TX Matrix Plus hierarchy added in Junos OS Release 9.6.</p>
Description	<p>Configure delay buffers.</p> <p> <b>NOTE:</b> When you commit the configuration after including the <code>q-pic-large-buffer</code> statement for a PIC, the Junos OS temporarily takes the PIC offline and brings it back online before the new configuration is activated and becomes the current operational configuration.</p>
Default	<code>small-scale</code>
Options	<p><b>large-scale</b>—(Optional) Set the average packet size used to calculate the number of notification queue entries in the IQ PIC to 256 bytes. Useful for slower interfaces (T1, E1, and NxDS0 interfaces configured on Channelized IQ PICs and Gigabit Ethernet VLANs configured on Gigabit Ethernet IQ PICs).</p> <p><b>small-scale</b>—(Optional) Set the average packet size used to calculate the number of notification queue entries in the IQ PIC to 40 bytes.</p> <p> <b>NOTE:</b> You cannot configure the <code>large-scale</code> and the <code>small-scale</code> options on MX Series routers. Include only the <code>q-pic-large-buffer</code> statement to enable the large delay buffer size on Enhanced Queuing DPCs on MX Series routers.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <li><a href="#">Configuring the Junos OS to Enable Larger Delay Buffers for T1, E1, and DS0 Interfaces Configured on Channelized IQ PICs on page 471</a></li> <li><a href="#">Configuring Schedulers</a></li> </ul>

## quality-level (Clock Synchronization)

<b>Syntax</b>	quality-level (prc   prs   sec   smc   ssu-a   ssu-b   st2   st3   st3e   st4   stu   tnc);
<b>Hierarchy Level</b>	[edit chassis synchronization source interfaces (external-a   external-b   interface <i>interface-name</i> )] [edit chassis synchronization source interfaces (external   interface <i>interface-name</i> )] [edit chassis synchronization source interfaces (external-0/0   external-1/0   interface <i>interface-name</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2R4 for MX Series routers.
<b>Description</b>	<p>Configure the quality level for a timing source so that the router knows the best available source with which to synchronize. The quality level specifies the accuracy level of the clock and is transmitted across the network through Synchronization Status Messages (SSMs) over the Ethernet Synchronization Messaging Channel (ESMC), or through SSMs contained in SONET/SDH frames.</p> <p>SONET SSM messages are either Generation 1 or Generation 2. Generation 1 is the first and most widely deployed SSM message set. Generation 2 is a newer version. Quality level options are available for both Generation 1 and Generation 2.</p>
<b>Options</b>	prs—Primary reference source—Stratum 1  st2—Stratum 2  tnc—Transit node clock  st3e—Stratum 3E  st3—Stratum 3  smc—SONET minimum clock  st4—Stratum 4  prc—Primary reference clock  ssu-a—Synchronization supply unit A  ssu-b—Synchronization supply unit B  sec—SDH equipment clock
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

- Related Documentation**

## quality-level (hybrid)

<b>Syntax</b>	<code>quality-level (prs   st2   tnc   st3e   st3   smc   st4)   (prc   ssu-a   ssu-b   sec);</code>
<b>Hierarchy Level</b>	<code>[edit protocols ptp slave clock-class-to-quality-level-mapping]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2R2.
<b>Description</b>	Configure the quality level for the timing source so that the router knows the best available source with which to synchronize. The quality level specifies the accuracy level of the clock.
<b>Options</b>	<p><b>prs</b>—Primary reference source—Stratum 1</p> <p><b>st2</b>—Stratum 2</p> <p><b>tnc</b>—Transit node clock</p> <p><b>st3e</b>—Stratum 3E</p> <p><b>st3</b>—Stratum 3</p> <p><b>smc</b>—SONET minimum clock</p> <p><b>st4</b>—Stratum 4</p> <p><b>prc</b>—Primary reference clock</p> <p><b>ssu-a</b>—Synchronization supply unit A</p> <p><b>ssu-b</b>—Synchronization supply unit B</p> <p><b>sec</b>—SDH equipment clock</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Hybrid Mode and ESMC Quality Level Mapping on page 329</a></li> <li>• <a href="#">Example: Configuring Hybrid Mode and ESMC Quality Level Mapping on page 333</a></li> <li>• <a href="#">Understanding Hybrid Mode on page 288</a></li> <li>• <a href="#">Precision Time Protocol Overview on page 256</a></li> <li>• <a href="#">Synchronous Ethernet Overview on page 242</a></li> </ul>

## quality-mode-enable (MX)

Syntax	quality-mode-enable;	
Hierarchy Level	[edit chassis <a href="#">synchronization</a> ]	
Release Information	Statement introduced in Junos OS Release 11.2R4 for MX Series routers.	
Description	<p>Enable Synchronous Ethernet ESMC quality mode. The quality level parameter for a Synchronous Ethernet interface is optional when the <b>quality-mode-enable</b> and the <b>selection-mode received-quality</b> statements are included at the <b>[edit chassis synchronization]</b> hierarchy level.</p> <p>The default quality level for a Synchronous Ethernet interface is based on the value of network option: The <b>option-1</b> statement, when set, selects the <b>sec</b> quality level; and the <b>option-2</b> statement, when set, selects the <b>st3</b> quality level.</p> <p><a href="#">Table 88 on page 757</a> shows whether SSM quality level is supported for a given external interface signal type and framing. The default setting is disabled.</p>	
<i>Table 88: SSM-Quality LevelSupport by Signal Type and Framing</i>		
Signal Type	Framing	SSM Quality Level Supported
E1	G.704	yes
E1	G.704 no CRC4	no
T1	ESF	yes
T1	SF	no
2048 KHz	Not applicable	no
Default	By default, this statement is disabled.	
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.	
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">synchronization (MX Series) on page 794</a></li><li>• <a href="#">show chassis synchronization on page 2153</a></li></ul>	

## quality-mode-enable (PTX)

---

Syntax	quality-mode-enable;
Hierarchy Level	[edit chassis <a href="#">synchronization (PTX Series)</a> ]
Release Information	Statement introduced in Junos OS Release 14.2R1 for PTX Series routers.
Description	<p>Enable Synchronous Ethernet ESMC quality mode. The quality level parameter for a Synchronous Ethernet interface is optional when the <b>quality-mode-enable</b> and the <b>selection-mode received-quality</b> statements are included at the [edit chassis <b>synchronization</b>] hierarchy level.</p> <p>The default quality level for a Synchronous Ethernet interface is based on the value of the network option: The <b>option-1</b> statement, when included, selects the <b>sec</b> quality level; and the <b>option-2</b> statement, when included, selects the <b>st3</b> quality level.</p>
Default	By default, this statement is not included.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">synchronization (PTX Series) on page 802</a></li><li>• <a href="#">Synchronizing Internal Stratum 3 Clock to External Clock Sources on PTX Series Routers on page 308</a></li><li>• <a href="#">show chassis synchronization on page 2153</a></li></ul>

## recovered-clock

<b>Syntax</b>	<pre>recovered-clock {   port <i>port-number</i>; }</pre>
<b>Hierarchy Level</b>	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.
<b>Description</b>	Select the port where the synchronous clock may be recovered.
<b>Options</b>	<i>port-number</i> —Port number where the synchronous clock may be recovered.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Clock Sources for PTX Series Packet Transport Routers on page 306</a></li> <li>• <a href="#">Synchronizing Internal Stratum 3 Clock to External Clock Sources on PTX Series Routers on page 308</a></li> <li>• <a href="#">synchronization (PTX Series) on page 802</a></li> </ul>

## red-buffer-occupancy

Syntax	<pre>red-buffer-occupancy {     weighted-averaged [ instant-usage-weight-exponent <i>exponent-value</i> ]; }</pre>
Hierarchy Level	<pre>[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> ], [edit chassis lcc <i>number</i> fpc <i>slot-number</i> pic <i>pic-number</i>]</pre>
Release Information	Statement introduced in Junos OS Release 8.3.
Description	<p>Configure the IQ PIC to base random early detection (RED) queue management on a <i>simple moving average</i> buffer occupancy calculation. If you do not include this statement, the IQ PIC bases RED on an <i>instantaneous</i> buffer occupancy value. As an option, you can specify that the IQ PIC bases RED on a <i>weighted moving average</i> of buffer occupancy values.</p> <p>If you configure this feature on a channelized OC12 intelligent queuing (IQ) PIC, the PIC reboots.</p>
Options	<p><b>weighted-averaged</b>—Configure the IQ PIC to base RED processing on a simple moving average of instantaneous buffer occupancy values instead of an instantaneous buffer occupancy.</p> <p><b>instant-usage-weight-exponent <i>exponent-value</i></b>—(Optional) Specify the integer to be used as the negative exponent of 2 to express a weight value. The PIC performs weighted RED (WRED) by based on a calculation of average buffer occupancy that applies the specified weight value to the instantaneous buffer occupancy and then factors the weighted value into the calculation of average buffer occupancy. Valid exponent range is from 1 through 31 (weight values from <math>2^{-1}</math> through <math>2^{-31}</math>). If you do not specify this option, the default exponent value is 0, which results in a weight value of <math>2^0 = 1</math>. With a weight value of 1, the calculation of weighted average buffer occupancy yields the same value as the simple average buffer occupancy.</p>
	<p> <b>NOTE:</b> You can specify an exponent value greater than 31, and the value displays in the output of <code>show</code> commands. However, the PIC replaces the out-of-range value with the <i>operational</i> value of 31, which results in a weight value of <math>2^{-31} = 1 / 2^{31} = 0.0000000004656612873077392578125</math>.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

## redundancy-mode

<b>Syntax</b>	<code>redundancy-mode (increased-bandwidth   redundant)</code>
<b>Hierarchy Level</b>	[edit chassis fabric]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2.
<b>Description</b>	(MX240, MX480, and MX960 routers only) Configure the active control boards to be in redundancy mode or increased fabric bandwidth mode. In increased fabric bandwidth mode, which is the default behavior for MX Series routers with Switch Control Board (SCB), the maximum number of available fabric planes are used. The MX Series routers that contain the Enhanced SCB—SCBE—and the MPC3E, the control boards operate in redundancy fabric mode (all the FPCs use 4 fabric planes as active planes) by default.
<b>Options</b>	<p><b>increased-bandwidth</b>—Enable increased fabric bandwidth mode for the control boards, which causes all the available fabric planes to be used.</p> <p><b>redundant</b>—Enable redundancy mode for the control boards, which causes all the FPCs to use 4 fabric planes as active planes.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Detection and Corrective Actions of Line Cards with Degraded Fabric on MX Series Routers on page 140</a></li> <li>• <a href="#">Detection and Recovery of Fabric-Related Failures Caused by Loss of Connectivity on MX Series Routers on page 135</a></li> <li>• <a href="#">MX Series Routers Fabric Resiliency on page 138</a></li> <li>• <a href="#">show chassis fabric redundancy-mode on page 1553</a></li> <li>• <a href="#">Configuring Redundancy Fabric Mode for Active Control Boards on MX Series Routers on page 145</a></li> </ul>

## request (Clock Synchronization)

---

<b>Syntax</b>	<code>request (force-switch lockout);</code>
<b>Hierarchy Level</b>	<code>[edit chassis synchronization source interfaces (external-a   external-b   interface <i>interface-name</i>)]</code> <code>[edit chassis synchronization source interfaces (external   interface <i>interface-name</i>)]</code> <code>[edit chassis synchronization source interfaces (external-0/0   external-1/0   interface <i>interface-name</i>)]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2 R4 for MX Series routers.
<b>Description</b>	Specify the clock selection request criterion.
<b>Options</b>	<p><b>force-switch</b>—Force switching to a clock source, provided the clock source is enabled and not locked out. Only one configured source may be force-switched.</p> <p><b>lockout</b>—Clock source is not considered by the selection process. Lockout may be configured for any source.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">synchronization (MX Series) on page 794</a></li></ul>

## restart chassis-control

**List of Syntax**    [Syntax on page 763](#)  
                           [Syntax \(MX Series Routers\) on page 763](#)  
                           [Syntax \(PTX Series\) on page 763](#)

**Syntax**    restart chassis-control  
                   <fcc *number* | sfc *number*>  
                   <gracefully | immediately | soft>

**Syntax (MX Series Routers)**    restart chassis-control  
   <gracefully | immediately | soft>

**Syntax (PTX Series)**    restart chassis-control  
                                   <gracefully | immediately | soft>

**Release Information**    Command introduced before JUNOS Release 7.4.  
                                   Command introduced in Junos OS Release 12.3 for MX2020 Universal Routing Platforms.  
                                   Command introduced in Junos OS Release 12.3 for MX2010 Universal Routing Platforms.  
                                   Command introduced in Junos OS Release 17.2 for MX2008 Universal Routing Platforms.  
                                   Command introduced in Junos OS Release 17.3 for MX10003 Universal Routing Platforms.

**Description**    Restart the chassis management process.

**NOTE:** When GRES is configured and the **restart chassis-control** command is executed on a TX Matrix Plus router with 3D SIBs, we cannot ascertain which Routing Engine becomes a master. This is due to the chassisd restart. The chassis process or chassisd is responsible for maintaining and retaining mastership and when it is restarted, the new chassisd is processed based on the router load. This results in one of the Routing Engines being made master.

**Options**    **fcc *number***—(Routing matrix only) (Optional) Restart the software process for a specific T640 routing node that is connected to a TX Matrix platform. Replace ***number*** with a value from 0 through 3.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Restart the software process on the TX Matrix Plus router (or switch-fabric chassis). Replace ***number*** with 0.

**gracefully**—(Optional) Restart the software process.

**immediately**—(Optional) Immediately restart the software process.

**NOTE:** For PTX Series routers, when the `restart chassis-control` command is executed with the `immediately` option set, the PFE's state will be reset to enabled regardless of whether or not the PFE's state is set to disabled when the action occurs.

**soft**—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, Border Gateway Protocol (BGP) peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.

**Required Privilege Level**    reset

**Related Documentation**    • *restart*

**List of Sample Output**    [restart chassis-control gracefully on page 764](#)  
[restart chassis-control soft on page 764](#)

**Output Fields**    When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### `restart chassis-control gracefully`

```
user@host> restart chassis-control gracefully
Chassis control process started, pid 1631
```

### `restart chassis-control soft`

```
user@host> restart chassis-control soft
Chassis control process started, pid 1653
```

## retry-count

<b>Syntax</b>	<code>retry-count <i>number</i>;</code>
<b>Hierarchy Level</b>	<code>[edit chassis cfeb <i>slot-number</i>]</code> <code>[edit chassis cluster redundancy-group <i>group-number</i> ip-monitoring ]</code> <code>[edit chassis feb <i>slot-number</i>]</code> <code>[edit chassis fpc <i>slot-number</i> sanity-poll]</code> <code>[edit chassis lcc <i>number</i> fpc <i>number</i> sanity-poll]</code> (Routing Matrix)
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 15.1 on M7i, M10, M120, and M320 routers.</p>
<b>Description</b>	Number of times sanity polling periodically checks for an error condition in the FPC.
<b>Options</b>	<p><b><i>number</i></b>—Number of times sanity polling is allowed to check for an error condition.</p> <p><b>Range:</b> 1 through 30</p> <p><b>Default:</b> 10</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Sanity Polling on page 511</a></li> <li>• <a href="#">sanity-poll on page 770</a></li> <li>• <a href="#">on-error on page 724</a></li> </ul>

## route (chassis)

---

<b>Syntax</b>	<code>route;</code>
<b>Hierarchy Level</b>	[edit chassis <a href="#">memory-enhanced</a> ]
<b>Release Information</b>	Statement added in Junos OS Release 10.4.
<b>Description</b>	Allocate more jtree memory for routing tables over firewall filters.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Allocate More Memory for Routing Tables, Firewall Filters, and Layer 3 VPN Labels on page 506</a></li></ul>

## routing-engine (Chassis)

---

<b>Syntax</b>	<pre>routing-engine {   on-disk-failure {     disk-failure-action (halt   reboot);   } }</pre>
<b>Hierarchy Level</b>	[edit chassis]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. The <b>disk-failure-action</b> statement added in Junos OS Release 9.0.
<b>Description</b>	Configure a Routing Engine to halt or reboot automatically when a hard disk error occurs. A hard disk error may cause a Routing Engine to enter a state in which it responds to local pings and interfaces remain up, but no other processes are responding. Rebooting or halting prevents this.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Enable a Routing Engine to Reboot on Hard Disk Errors on page 509</a></li></ul>

---

## route-localization

---

<b>Syntax</b>	<pre>route-localization {   inet;   inet6; }</pre>
<b>Hierarchy Level</b>	[edit chassis]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.4.
<b>Description</b>	Configure FIB localization for IPv4 and IPv6 routes.
<b>Options</b>	<p><b>inet</b>—Configure FIB localization for IPv4 routes.</p> <p><b>inet6</b>—Configure FIB localization for IPv6 routes.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Packet Forwarding Engine FIB Localization on page 383</a></li></ul>

## sabit

---

<b>Syntax</b>	<code>sabit <i>bit</i>;</code>
<b>Hierarchy Level</b>	[edit chassis <a href="#">synchronization</a> interfaces external e1-options] [edit chassis <a href="#">synchronization</a> interfaces (external-0/0   external-1/0) e1-options] [edit chassis <a href="#">synchronization</a> interfaces bits e1-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for MX Series routers. Statement introduced in Junos OS Release 16.1 for the MX104 router.
<b>Description</b>	Configure the SA bit for exchanging the SSM quality on the E1 interface.
<b>Options</b>	<i>bit</i> —SA bit value. <b>Range:</b> 4 through 8.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">synchronization on page 794</a></li></ul>

## sampling-instance

<b>Syntax</b>	<code>sampling-instance <i>instance-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit chassis fpc <i>slot-number</i>],</code> <code>[edit chassis lcc <i>number</i> fpc <i>slot-number</i>] (Routing Matrix),</code> <code>[edit chassis member <i>member-number</i> fpc slot <i>slot-number</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6. Support at the <code>[edit chassis member <i>member-number</i> fpc slot <i>slot-number</i>]</code> hierarchy level introduced in Junos OS Release 14.1. Statement introduced in Junos OS Release 14.1R3 for EX Series switches.
<b>Description</b>	Associate a defined sampling instance with a specific FPC, MPC, or DPC for active sampling instances configured at the <code>[edit forwarding-options sampling]</code> hierarchy level.  For M120 routers with FEB, this statement must also be configured under <code>[edit chassis feb <i>slot-number</i>]</code> , in addition to the <code>[edit forwarding-options sampling]</code> hierarchy level.  In a two-member MX Series Virtual Chassis, the master router (member 0) uses FPC slot numbers 0 through 11 with no offset; the backup router (member 1) uses FPC slot numbers 12 through 23, with an offset of 12.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Associating Sampling Instances for Active Flow Monitoring with a Specific FPC, MPC, or DPC on page 509</a></li> <li>• <a href="#">Inline Flow Monitoring for Virtual Chassis Overview</a></li> </ul>

## sanity-poll

**Syntax**

```
sanity-poll {
  retry-count number;
  on-error {
    raise-alarm;
    power (cycle | off);
    write-coredump;
  }
}
```

**Hierarchy Level**

```
[edit chassis cfeb slot-number]
[edit chassis feb slot-number]
[edit chassis fpc slot-number]
[edit chassis lcc number fpc number] (Routing Matrix)
```

**Release Information** Statement introduced in Junos OS Release 11.4.  
Statement introduced in Junos OS Release 15.1 on M7i, M10, M120, and M320 routers.

**Description** Enable sanity polling and start periodic sanity checking for a particular FPC. The periodic sanity check includes checking for error conditions such as “register sanity issues,” “high temperature,” “hardware failure,” and so on in the FPC.

**NOTE:** Currently, periodic sanity check is performed only on the routing chip register.

**Options** The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

- [Configuring Sanity Polling on page 511](#)
- [retry-count on page 765](#)
- [on-error on page 724](#)

## secondary

<b>Syntax</b>	<code>secondary <i>interface name</i>;</code>
<b>Hierarchy Level</b>	[edit protocols ptp <a href="#">slave</a> interface <i>interface-name</i> ], [edit protocols ptp <a href="#">master</a> interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 17.2R1.
<b>Description</b>	Configure the secondary member link in an aggregated Ethernet bundle to enable Precision Time Protocol (PTP) over a link aggregation group. PTP switches over to the secondary member in the aggregated Ethernet bundle when the primary aggregated Ethernet link is down.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Precision Time Protocol on page 319</a></li><li>• <a href="#">Example: Configuring Precision Time Protocol on page 325</a></li><li>• <a href="#">Precision Time Protocol Overview on page 256</a></li></ul>

## selection-mode

---

Syntax	selection-mode (configured-quality   received-quality);
Hierarchy Level	[edit chassis <a href="#">synchronization</a> ]
Release Information	Statement introduced in Junos OS Release 11.2R4 for MX Series routers.
Description	Specify whether the clock source selection must use the configured or the received ESMC or SSM quality level for a qualifying interface. In both the selection modes, the interface qualifies for clock source selection only when the received ESMC or SSM quality level on the interface is equal to or greater than the configured ESMC or SSM quality level for the interface.
Options	<p><b>configured-quality</b>—Set this option to let the clock source selection algorithm to use the ESMC or SSM quality level that is configured for a qualifying interface.</p> <p><b>received-quality</b>—Set this option to let the clock source selection algorithm to use the ESMC or SSM quality level that is received on the qualifying interface.</p>
	<div> <b>NOTE:</b> For the <b>selection-mode</b> statement configuration to take effect, you must set the <b>quality-mode-enable</b> statement at the [edit chassis <a href="#">synchronization</a>] hierarchy level.</div>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">synchronization on page 794</a></li></ul>

## service-package

<b>Syntax</b>	<pre> service-package {   extension-provider {     control-cores <i>control-number</i>;     data-cores <i>data-number</i>;     data-flow-affinity {       hash-key (layer-3   layer-4);     }     forwarding-db-size <i>size</i>;     object-cache-size <i>size</i>;     package <i>package-name</i>;     policy-db-size <i>size</i>;     syslog {       facility {         severity;         destination <i>destination</i>;       }     }     wired-max-processes <i>num-procs</i>;     wired-process-mem-size <i>mem-size</i>;   }   layer-2;   layer-3; } </pre>
<b>Hierarchy Level</b>	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> <a href="#">adaptive-services</a> ]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced on MX Series 5G Universal Routing Platforms with MS-DPCs in Junos OS Release 9.6.</p>
<b>Description</b>	For adaptive services and multi-services interfaces, enable a service package on the specified Physical Interface Card (PIC).
<b>Options</b>	<p><b>layer-2</b>—Enable a Layer 2 service package on the specified PIC.</p> <p><b>layer-3</b>—Enable a Layer 3 service package on the specified PIC.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Enabling Service Packages</i></li> <li>• <i>Configuring MS-MPC-Based, Static HTTP Redirect Services</i></li> <li>• <i>Configuring MS-MPC-Based, Converged HTTP Redirect Services</i></li> </ul>

## session-offload

---

<b>Syntax</b>	<code>session-offload;</code>
<b>Hierarchy Level</b>	<code>[edit chassis fpc <i>slot-number</i> pic <i>number</i> adaptive-services service-package extension-provider]</code>
<b>Release Information</b>	Statement introduced on MX Series 5G Universal Routing Platforms with MS-DPCs in Junos OS Release 9.6.
<b>Description</b>	Enable session offloading on a per-PIC basis for a Multiservices PIC.
<b>Default</b>	Session offloading is disabled.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Enable Session Offloading on MX Series 5G Universal Routing Platforms with MS-DPCs on page 437</a></li></ul>

## sfm (Chassis)

Syntax	<code>sfm slot-number power off;</code>
Hierarchy Level	[edit chassis]
Release Information	Statement introduced before Junos OS Release 7.4.
Description	<p>For routers with SFMs, configure an SFM to stay offline.</p> <p>By default, if you use the <b>request chassis sfm</b> CLI command to take an SFM offline, the SFM will attempt to restart when you enter a <b>commit</b> CLI command. To prevent a restart, configure an SFM to stay offline. This feature is useful for repair situations. The SFM remains offline until you delete this statement.</p>
Options	<p><b>slot-number</b>—Slot number in which the SFM is installed.</p> <p><b>power off</b>—Take the SFM offline and configure it to remain offline.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Make an SFM Stay Offline on page 431</a></li><li>• <i>High Availability Feature Guide</i></li></ul>

## sib

---

<b>Syntax</b>	<pre>sib {   minimum <i>number</i>; }</pre>
<b>Hierarchy Level</b>	[edit chassis]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4.
<b>Description</b>	Configure the minimum number of SIBs on an M320 router. With this configuration, SIB absent alarms are generated only if the SIB count falls below the minimum specified.
<b>Options</b>	<p><i>number</i>—Minimum number of SIBs on the router.</p> <p><b>Range:</b> 0 through 3</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Support Entry-Level Configuration on an M320 Router with a Minimum Number of SIBs and PIMs on page 435</a></li><li>• <a href="#">pem on page 730</a></li></ul>

## signal-type

<b>Syntax</b>	signal-type (1hz   5mhz   10mhz   2048mhz   e1   t1);
<b>Hierarchy Level</b>	[edit chassis <a href="#">synchronization</a> interfaces external] [edit chassis <a href="#">synchronization</a> interfaces (external-0/0   external-1/0)]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for MX Series routers.
<b>Description</b>	Configure the frequency for the provided reference clock.
<b>Options</b>	<p><b>1mhz</b>—Set the signal with a clock frequency of 1 MHz.</p> <p><b>5mhz</b>—Set the signal with a clock frequency of 5 MHz.</p> <p><b>10mhz</b>—Set the signal with a clock frequency of 10 MHz.</p> <p><b>2048khz</b>—Set the signal as an E1 unframed 2048 kHz G.703 signal.</p> <p><b>e1</b>—Set the signal as an E1-coded 2048-kHz signal on a 120-ohm balanced line.</p> <p><b>t1</b>—Set the signal as a T1-coded 1.544-MHz signal on a 100-ohm balanced line.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">synchronization on page 794</a></li> </ul>

## switchover-mode

---

<b>Syntax</b>	switchover-mode (non-revertive   revertive);
<b>Hierarchy Level</b>	[edit chassis <a href="#">synchronization</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2R4 for MX Series routers.
<b>Description</b>	Specify whether the router must switch from a lower-quality clock source to a higher-quality clock source or use the current clock source only.
<b>Default</b>	revertive
<b>Options</b>	<p><b>non-revertive</b>—Set this option so that the router continues to use the current clock source as long as it is valid.</p> <p><b>revertive</b>—Set the option so that the router automatically switches from a lower to a higher quality clock source whenever the higher clock source becomes available.</p>
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">synchronization (MX Series) on page 794</a></li><li>• <a href="#">synchronization (PTX Series) on page 802</a></li></ul>

## slow-pfe-alarm

<b>Syntax</b>	slow-pfe-alarm;
<b>Hierarchy Level</b>	[edit chassis]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1R6, 12.2R5, 12.3R3, 13.1R2, and 13.2R1.
<b>Description</b>	Enable the slow Packet Forwarding Engine alarm on a M Series, MX Series, or a T Series router.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Slow Packet Forwarding Engine Alarm on page 514</a></li> </ul>

## sonet

<b>Syntax</b>	sonet { device-count <i>number</i> ; }
<b>Hierarchy Level</b>	[edit chassis aggregated-devices]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure properties for SONET/SDH aggregated devices on the router.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Junos OS for Supporting Aggregated Devices on page 481</a></li> </ul>

## slave

List of Syntax [MX Series on page 780](#)  
[QFX Series on page 780](#)

**MX Series**

```
slave {
  announce-interval announce-interval-value
  announce-timeout announce-timeout-value;
  delay-request delay-request-value;
  frequency-only;
  hybrid
  interface interface-name {
    unicast-mode {
      transport ipv4;
      clock-source ip-address {
        local-ip-address local-ip-address {
        }
      }
    }
    multicast-mode {
      hybrid
      transport 802.3 link-local;
    }
  }
  sync-interval interval;
}
```

**QFX Series**

```
slave {
  interface interface-name {
    unicast-mode {
      transport ipv4;
      clock-client ip-address {
        local-ip-address local-ip-address;
      }
    }
  }
  multicast-mode {
    transport (ipv4 | ieee-802.3)
    local-ip-address local-ip-address;
    local-priority local-ip-address;
  }
  max-announce-interval max-announce-interval;
  max-delay-response-interval max-delay-response-interval;
  max-sync-interval max-sync-interval;
  min-announce-interval min-announce-interval;
  min-delay-response-interval min-delay-response-interval;
  min-sync-interval min-sync-interval;
  sync-interval sync-interval;
}
```

Hierarchy Level [\[edit protocols ptp\]](#)

**Release Information** Statement introduced in Junos OS Release 12.2.  
Statement introduced in Junos OS Release 17.3 for the QFX Series.

**Description** Configure the slave with parameters.

**NOTE:** Multicast mode is not supported on the QFX Series.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## source-mode

**Syntax** `source-mode (chassis | line);`

**Hierarchy Level** [edit chassis [synchronization](#) output interfaces external]  
[edit chassis [synchronization](#) output interfaces (external-0/0 | external-1/0)]

**Release Information** Statement introduced in Junos OS Release 12.3 for MX Series routers.

**Description** Configure the source mode for selecting a clock source as either a chassis clock or the best line clock source as output for the configured BITS interface.

**Options** **chassis**—Set the chassis clock for output.  
**line**—Set the best line clock source for output.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

- [synchronization on page 794](#)

## source interfaces

<b>Syntax</b>	<pre>source interfaces (external   <i>interface-name</i>)   hold-off-time <i>time</i>;   priority <i>number</i>;   quality-level (prc   prs   sec   smc   ssu-a   ssu-b   st2   st3   st3e   st4   stu   tnc);   request (force-switch   lockout);   wait-to-restore <i>minutes</i>; }</pre>
<b>Hierarchy Level</b>	[edit chassis synchronization]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2R4 for MX Series routers.
<b>Description</b>	<p>Configure the clock source that is used by the clock selection process on an interface.</p> <ul style="list-style-type: none"> <li>• (SCB only) Specify the primary clock source as the external-a interface and the secondary clock source as the external-b interface. The clock source is chosen using the clock selection process.</li> <li>• (SCBE only) Specify the external interface to select the external clock source.</li> <li>• (SCBE2 only) Specify the external-0/0 interface or the external-1/0 interface to select the external clock source.</li> </ul>
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">synchronization (MX Series) on page 794</a></li> </ul>

## sparse-dlcis

<b>Syntax</b>	<code>sparse-dlcis;</code>
<b>Hierarchy Level</b>	<code>[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i>];</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Support a full data-link connection identifier (DLCI) range (1 through 1022). This enables you to use circuit cross-connect (CCC) and translation cross-connect (TCC) features by means of Frame Relay on T1 and E1 interfaces.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Support the Sparse DLCI Mode on Channelized STM1 or Channelized DS3 PICs on page 466</a></li></ul>

## speed

<b>Syntax</b>	<code>speed (oc3-stm1   oc12-stm4   oc48-stm16   100G   10G   40G);</code>
<b>Hierarchy Level</b>	<code>[edit chassis fpc slot-number pic pic-number port port-number]</code>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 11.2.</p> <p>Support for MPC7E (Multi-Rate) introduced in Junos OS Release 15.1F4.</p> <p>Support for MX10003 MPC introduced in Junos OS Release 17.3R1.</p> <p>Support for MX204 routers introduced in Junos OS Release 17.4R1.</p>
<b>Description</b>	Configure the port speed on MX Series routers. This statement is supported only on MPC7E (Multi-Rate) MPC, SONET/SDH (Multi-Rate) MICs with SFP, Channelized SONET/SDH OC3/STM1 (Multi-Rate) MICs with SFP, ATM MICs, and MX204 routers.
<b>Default</b>	<code>oc3-stm1</code>
<b>Options</b>	<p><code>oc3-stm1</code>—Supported ports operate at OC3 or STM1 speed.</p> <p><code>oc12-stm4</code>—Supported ports operate at OC12 or STM4 speed.</p> <p><code>oc48-stm16</code>—Supported ports operate at OC48 or STM16 speed.</p> <p><code>100G</code>—Supported ports operate at 100-Gbps speed.</p> <p><code>10G</code>—Supported ports operate at 10-Gbps speed.</p> <p><code>40G</code>—Supported ports operate at 40-Gbps speed.</p>

**NOTE:** You can configure the `oc12-stm4`, `oc3-stm1`, and `oc48-stm16` port speed options for SONET/SDH OC3/STM1 (Multi-Rate) MICs. However, for Channelized SONET/SDH OC3/STM1 (Multi-Rate) MICs with SFP and ATM MICs, you can configure only the `oc12-stm4` and `oc3-stm1` port speed options.

(MX Series with MPCs and ATM MICs with SFP) To configure up to OC12 CBR bandwidth speed per virtual circuit (VC) on an ATM MIC with SFP (MIC-3D-8OC3-2OC12-ATM), specify `oc12-stm4` as the speed for the specified port. You can configure the `oc12-stm4` port speed option only for ports 0 and 4 on an ATM MIC. If you configure the `oc12-stm4` port speed option for port 0, then ports 1, 2, and 3 are disabled. Similarly, if you configure the `oc12-stm4` port speed for port 4, then ports 5, 6, and 7 are disabled.

(MX Series with MPC7E-MRATE) To configure 100-Gbps, 10-Gbps, or 40-Gbps speed per port on an MPC7E (Multi-Rate) MPC, specify `100G`, `10G`, or `40G`, respectively, as the speed for the specified port. You can configure `10G` and `40G` port speed options

on all the six ports of PIC 0 and PIC 1 of an MPC7E-MRATE MPC. However, you can configure the **100G** port speed option only for ports 2 and 5 of PIC 0 and PIC 1 of an MPC7E-MRATE MPC.

(MX10003 routers with MX10003 MPC) To configure 100 Gbps, 10 Gbps, and 40 Gbps speed on all supported ports, specify 100G, 10G, or 40G, respectively, as the speed for the specified PIC. All the six ports of the fixed port PIC support 10-Gbps and 40-Gbps speeds. All the 12 ports of the Multi-rate MIC support 100-Gbps, 10-Gbps and 40-Gbps speeds. For more information see [“MX10003 MPC on MX10003 Router Overview” on page 43](#) and [“Supported Active Physical Ports for Configuring Rate Selectability to Prevent Oversubscription on MX10003 MPC” on page 192](#).

(MX204 Routers) The MX204 has four rate-selectable ports (referred to a PIC 0 ports) that can be configured as 100-Gigabit Ethernet ports or 40-Gigabit Ethernet port, or each port can be configured as four 10-Gigabit Ethernet ports (by using a breakout cable). The MX204 also has eight 10-Gigabit Ethernet ports (referred to as PIC 1 ports). For more information, see [“MX204 Router Overview” on page 45](#) and [“Supported Active Physical Rate-Selectable Ports to Prevent Oversubscription on MX204 Router” on page 193](#)

## speed (Gigabit Ethernet interface)

<b>Syntax</b>	<code>speed (1G   10G);</code>
<b>Hierarchy Level</b>	[edit interfaces <i>intf-name</i> together-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 18.1R1 for MX10003 and MX204 routers.
<b>Description</b>	<p>Starting in Junos OS Release 18.1R1, on MX10003 and MX204 routers, the 10-Gbps port can operate in 1-Gbps mode also. On MX10003 and MX204 routers, when the port operates in 10-Gbps speed, you can change the operating speed to 1Gbps using the configuration <b>speed 1G</b> in this configuration statement. Once you commit this configuration, the operating speed of the 10-Gbps port changes to 1-Gbps speed.</p> <p>On fixed-port PIC and non-MACsec MIC of MX10003 router, you can configure one or all 10-Gbps port operating in 4X10-Gbps speed to operate in 1-Gbps speed.</p> <p>On MX204 routers, you can configure the 4X10-Gbps port on one of the fixed-port PICs to operate in 1-Gbps mode. And on the other fixed-port PIC, you can configure the 10-Gbps port to 1-Gbps speed.</p> <p>See <a href="#">“MX10003 MPC Rate-Selectability Overview” on page 205</a> and <a href="#">“MX204 Router Rate-Selectability Overview” on page 210</a> for more details.</p> <p>On MX10003 and MX204 routers, 1-Gbps speed is supported with <b>speed 1g</b> configuration. The 1-Gbps speed is only supported in non-autonegotiation mode. For optics other than SFP-T, in 1-Gbps mode, the peer interfaces must be configured to non-autonegotiation mode.</p>

### NOTE:

- On the MX10003 router, the MACsec MIC does not provide 1-Gbps speed. If you attempt to change the operating speed to 1-Gbps, syslog displays that this feature is not supported on the MACsec MIC.
- On MX10003 and MX204 routers, rate selectability at PIC level and port level does not support 1-Gbps speed.
- On MX10003 and MX204 routers, the interface name prefix must be xe.
- On MX10003 and MX204 routers, even after configuring 1-Gbps speed, the protocol continues to advertise the bandwidth as 10-Gigabit Ethernet.
- On MX10003 and MX204 routers, Link Aggregation Group (LAG) is not supported.

To view the speed configured for the interface, execute the `show interfaces extensive` command. The **Speed Configuration** output parameter in the command output indicates

the current operation speed of the interface. If the interface is configured with 1-Gbps speed, then **Speed Configuration** displays 1G; if the interface is configured with 10-Gbps speed, Speed Configuration displays AUTO.

**Default** 10G

**Options** 1G—Supported ports operate at 1-Gbps speed.

10G—Supported ports operate at 10-Gbps speed.

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

## speed (24-port and 12-port 10 Gigabit Ethernet PIC)

**Syntax** speed 1G | 10G

**Hierarchy Level** [edit chassis fpc *slot-number* pic *pic-number*]  
[edit chassis fpc *slot-number* pic *pic-number* port *port-number*]  
[edit chassis lcc *number* fpc *slot-number* pic *pic-number* mixed-rate-mode] (Routing Matrix)

**Release Information** Statement introduced in Junos OS Release 13.3.  
Statement introduced in Junos OS Release 15.1 for the PTX Series.

**Description** Configure the port speed on the following interface modules:

- PF-24XGE-SFPP or the PF-12XGE-SFPP PIC on a T4000 standalone router or on an LCC in a TX Matrix Plus routing matrix with 3D SIBs

**NOTE:** To change the port speed from 10 Gbps to 1 Gbps on PF-24XGE-SFPP and PF-12XGE-SFPP PICs, SFP optics is required.

- P1-PTX-24-10GE-SFPP PIC on the PTX3000 router
- P1-PTX-24-10GE-SFPP PIC with the FPC2-PTX-P1A on the PTX5000 router

Dual-rate support for the P1-PTX-24-10GE-SFPP enables you to switch all port speeds to either 1 Gbps or 10 Gbps. The default is 10 Gbps. All ports are configured to the same speed; there is no mixed-rate-mode capability. Changing the port speed causes the PIC to reboot.

To return all ports to the 10-Gbps port speed, use the **delete chassis fpc *fpc-number* pic *pic-number* speed 1G** statement. To check the port speed, use the **show interfaces** command.

**NOTE:** For the 1-Gbps port speed on the P1-PTX-24-10GE-SFPP PIC, you can use either the SFP-1GE-SX or the SFP-1GE-LX transceiver.

**Options** 1 G—1 Gbps  
10 G—10 Gbps

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## stateful (MX Series)

**Syntax**

```
stateful {
  interface interface-name {
    multicast-mode
    local-priority
    transport 802.3 ( link-local ) ;
    asymmetry number;
  }
}
```

**Hierarchy Level** [edit protocols ptp]

**Release Information** Statement introduced in Junos OS Release 17.1R1.

**Description** Configure the stateful port or bidirectional port with parameters. A stateful port is useful when you configure PTP over Ethernet for multicast mode of transmission of PTP traffic.

For PTP over Ethernet, you can configure a port to function as both a slave port and a master port. This type of port is called a dynamic port, a stateful port, or a bidirectional port. Such a dynamic port enables the transfer of frequency for synchronization services, in addition to time and phase alignment, when PTP functionality is not hop-by-hop and you have provisioned master and slave roles or interfaces.

**Options** The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

## symmetric-hash

---

<b>Syntax</b>	<pre>symmetric-hash {     complement; }</pre>
<b>Hierarchy Level</b>	[edit chassis fpc slot-number pic slot-number hash-key family inet], [edit chassis fpc slot-number pic slot-number hash-key family multiservice]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6.
<b>Description</b>	(MX Series 5G Universal Routing Platforms only) Configure the symmetric hash or symmetric hash complement at the PIC level for configuring symmetrical load balancing on an 802.3ad Link Aggregation Group.
<b>Options</b>	<b>complement</b> —Include the complement of the symmetric hash in the hash key.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring PIC-Level Symmetrical Hashing for Load Balancing on 802.3ad LAGs for MX Series Routers on page 489</a></li></ul>

## sync-interval

<b>Syntax</b>	<code>sync-interval <i>sync-interval-value</i>;</code>
<b>Hierarchy Level</b>	[edit protocols ptp <a href="#">master</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2.
<b>Description</b>	Configure the logarithmic mean interval for sync interval messages to be sent by the master. By default, 64 sync interval messages are sent per second.
<b>Options</b>	<p><b><i>sync-interval-value</i></b>—The sync interval value for sync interval messages to be sent by the master.</p> <p><b>Range:</b> –6 through +6</p> <p><b>Default:</b> 0</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Precision Time Protocol on page 319</a></li><li>• <a href="#">Example: Configuring Precision Time Protocol on page 325</a></li><li>• <a href="#">Precision Time Protocol Overview on page 256</a></li></ul>

## synchronization (M Series and T Series)

Syntax	<pre>synchronization {   primary (external-a   external-b   fpc-slot-number   gps-0-10mhz   gps-0-5mhz       gps-1-10mhz   gps-1-5mhz   bits-a   bits-b);   secondary (external-a   external-b   fpc-slot-number   gps-0-10mhz   gps-0-5mhz       gps-1-10mhz   gps-1-5mhz   bits-a   bits-b );   signal-type (t1   e1);   switching-mode (revertive   non-revertive);   transmitter-enable;   validation-interval seconds;   y-cable-line-termination; }</pre>
Hierarchy Level	[edit chassis]
Release Information	<p>Statement introduced in Junos OS Release 7.6.</p> <p>Statement introduced in Junos OS Release 9.3 for M120 routers.</p> <p>Statement introduced in Junos OS Release 10.2 for T320, T640, and T1600 routers.</p>
Description	(M320, M40e, M120, T320, T640, and T1600 routers and PTX Series Packet Transport Routers only) Configure an external synchronization interface to synchronize the internal Stratum 3 clock to an external source, and then synchronize the chassis interface clock to that source.
Options	<p><b>primary</b>—First external timing source specified in the configuration hierarchy. This statement has the following suboptions:</p> <ul style="list-style-type: none"> <li><b>external-a</b>—Use <b>external-a</b> as the primary clock synchronization source.</li> <li><b>external-b</b>—Use <b>external-b</b> as the primary clock synchronization source.</li> <li><b>fpc-slot-number</b>—Use <b>fpc-slot-number</b> as the primary clock synchronization source. For the PTX5000 Packet Transport Router, replace <i>slot-number</i> with a value from 0 through 7.</li> <li><b>gps-0-10mhz</b>—Use <b>gps-0-10mhz</b> as the primary clock synchronization source.</li> <li><b>gps-0-5mhz</b>—Use <b>gps-0-5mhz</b> as the primary clock synchronization source.</li> <li><b>gps-1-10mhz</b>—Use <b>gps-1-10mhz</b> as the primary clock synchronization source.</li> <li><b>gps-1-5mhz</b>—Use <b>gps-1-5mhz</b> as the primary clock synchronization source.</li> <li><b>bits-a</b>—Use <b>bits-a</b> as the primary clock synchronization source.</li> <li><b>bits-b</b>—Use <b>bits-b</b> as the primary clock synchronization source.</li> </ul> <p><b>secondary</b>—Second external timing source specified in the configuration hierarchy.</p>

- **external-a**—Use **external-a** as the secondary clock synchronization source.
- **external-b**—Use **external-b** as the secondary clock synchronization source.
- **fpc-slot-number**—Use **fpc-slot-number** as the secondary clock synchronization source. For the PTX5000 Packet Transport Router, replace *slot-number* with a value from 0 to 7.
- **gps-0-10mhz**—Use **gps-0-10mhz** as the secondary clock synchronization source.
- **gps-0-5mhz**—Use **gps-0-5mhz** as the secondary clock synchronization source.
- **gps-1-10mhz**—Use **gps-1-10mhz** as the secondary clock synchronization source.
- **gps-1-5mhz**—Use **gps-1-5mhz** as the secondary clock synchronization source.
- **bits-a**—Use **bits-a** as the secondary clock synchronization source.
- **bits-b**—Use **bits-b** as the secondary clock synchronization source.

**signal-type**—Specify the line encoding mode for interfaces: either **t1** or **e1**. For the M40e router, only the **t1 signal-type** mode is supported.

**Default:** t1

**switching-mode**—Specify **revertive** if a lower-priority synchronization can be switched to a valid, higher-priority synchronization.

**Default:** non-revertive

**transmitter-enable**—(M320 routers only) Control whether the diagnostic timing signal is transmitted.

**validation-interval**—Validate the synchronized deviation. If revertive switching is enabled and a higher-priority clock is validated, the clock module is directed to the higher-priority clock, and all configured and active synchronizations are validated. The validation timer resumes after the current validation interval expires. This feature is not supported on PTX Series Packet Transport Routers.

**Range:** (M320, M40e, T320, T640, T1600 routers) 90 through 86,400 seconds. (M120 routers) 30 through 86,400 seconds.

**Default:** (M320, M40e, T320, T640, T1600 routers) 90 seconds. (M120 routers) 30 seconds

**y-cable-line-termination**—(M320 routers only) Specify that a single signal be wired to both Control Boards (CBs) using a Y-cable.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Hierarchy Level** [edit chassis]

**Release Information** Statement introduced in Junos OS Release 10.4.  
Statement introduced in Junos OS Release 17.3R1 for MX10003 router.  
Options **interfaces**, **output**, and **source interfaces external** introduced in Junos OS Release 12.3.

**Description** (MX5-T, MX10-T, MX40-T, MX80-T, MX240, MX480, MX960 , and MX10003 routers)  
Configure Synchronous Ethernet parameters. For configuration details, see [“Configuring Clock Synchronization Interface on MX Series Routers” on page 293](#).

(MX240, MX480, MX960, and MX2020 routers with SCBE or SCBE2) Configure centralized clocking parameters.

- Starting in Junos 12.2, configure distribution of the selected chassis clock source to downstream network elements through supported line interfaces.
- Starting in Junos 12.3, configure an external building-integrated timing supply (BITS) timing source. You can also configure the selected chassis clock, or an incoming Synchronous Ethernet or PTP line source for transmission out the external interface.
- Starting in Junos 16.1 for the MX104 routers, SSM is supported on the BITS interface and can be configured at the **[edit chassis [synchronization](#) interfaces bits e1-options]** hierarchy level.

For configuration details, see [“Example: Configuring Centralized Clocking on the Enhanced MX Switch Control Board” on page 340](#).

**NOTE:**

- Unified ISSU is not supported when clock synchronization is configured for Synchronous Ethernet.
- The commit operation fails if you configure bits as source, without first configuring bits interface.

**Options** **clock-mode (auto-select | free-run)**—Specify the mode of operation to select the clock source either from a free-run local oscillator or from an external qualified clock. On MX240, MX480, and MX960 routers with enhanced MPCs, the free-run clock is provided by a local oscillator. On other MX Series routers, the free-run clock is provided by the SCB. The default setting is auto-select mode.

**esmc-transmit interfaces (all | interface-name)**—Enable Ethernet Synchronization Message Channel (ESMC) packet transmission.

**hold-interval (configuration-change | restart | switchover) seconds**—Specify the chassis synchronization hold interval type and clock selection wait time:

- **configuration-change**—Clock select wait time after change in configuration. The range is 15 through 60 seconds.
- **restart**—Clock select wait time after reboot. The range is 60 through 180 seconds. The default is 120 seconds.
- **switchover**—Switchover wait time after clock recovery. The range is 30 to 60 seconds. The default is 30 seconds.

**interfaces (external | (external-0/0 | external-1/0))**—Configure the external interface for operating with a connected external device. This interface can be configured as a clock source, which then becomes a candidate for selection as the chassis clock source by the clock source selection algorithm.

- **signal-type (1mhz | 5mhz | 10mhz | 2048khz | e1 | t1)**—Specify the external interface signal type:
  - a. **1mhz**—Set the signal with a clock frequency of 1 MHz.
  - b. **5mhz**—Set the signal with a clock frequency of 5 MHz.
  - c. **10mhz**—Set the signal with a clock frequency of 10 MHz.
  - d. **2048khz**—Set the signal with a clock frequency of 2048 kHz.
  - e. **e1**—Set the signal as an E1-coded 2048 kHz signal on a 120-ohm balanced line.
  - f. **t1**—Set the signal as a T1-coded 1.544 MHz signal on a 100-ohm balanced line.
- **e1-options**—Specify the E1 options:
  - a. **framing (g704 | g704-no-crc4)**—Specify the framing format:
    - **g704**—G.704 framing format for E1 interfaces
    - **g704-no-crc4**—G.704 framing with no CRC4 for E1 interfaces
  - b. **line-encoding (ami | hdb3)**—Specify the line encoding:
    - **ami**—Alternate mark inversion (AMI)
    - **hdb3**—High-density bipolar 3 code (HDB3)
  - c. **sabit number**—Specify the San synchronization status bit used for exchanging SSN quality. The value can be 4, 5, 6, 7, or 8. The default is 4.

- **t1-options**—Specify the T1 options:
    - a. **framing (esf | sf)**—Specify the framing format:
      - **esf**—Extended superframe (ESF)
      - **sf**—Superframe (SF)
    - b. **line-encoding (ami | b8zs)**—Specify the line encoding:
      - **ami**— Alternate mark inversion (AMI)
      - **b8zs**—8-bit zero suppression, bipolar with 8-zero substitution (B8ZS)
- max-transmit-quality-level**—Specify the threshold quality level for the entire system. If the received quality level is below the threshold quality level then the router will send out a received quality level of SEC. The available quality levels are **PRC**, **PRS**, **SEC**, **SMC**, **SSU-A** **SSU-B** **ST2**, **ST3**, **ST3E**, **ST4**, **STU**, and **TNC**.
- network-option (option-1 | option-2)**—Specify the synchronization networking:
- **option-1**— EEC-1 maps to G.813 option 1 clock
  - **option-2**—EEC-2 maps to G.812 type IV clock

**output interfaces external**—(SCBE only) Specify the properties of the external output interface:

**output interfaces (external-0/0 | external-1/0)**—(SCBE2 only) Specify the properties of the external output interface:

- **holdover-mode-disable**—Disable holdover.
- **minimum-quality (prc | prs | sec | smc | ssu-a | ssu-b | st2 | st3 | st3e | st4 | stu | tnc)**—Specify the minimum quality level threshold for selection of this clock (see [Table 56 on page 271](#)). If the quality level of the output clock source drops below the configured minimum quality level threshold, the external output clock is squelched.

*Table 89: Quality Levels*

Quality Level	Description
<b>prc</b>	Timing quality of a primary reference clock (option-1 only).
<b>prs</b>	Clock traceable to a primary reference source (option-2 only).
<b>sec</b>	Timing quality of an SDH equipment clock (option-1 only).
<b>smc</b>	Clock traceable to a self-timed SONET (option-2 only).
<b>ssu-a</b>	Timing quality of a type I or IV slave clock (option-1 only).
<b>ssu-b</b>	Timing quality of a type VI slave clock (option-1 only).
<b>st2</b>	Clock traceable to Stratum 2 (option-2 only).
<b>st3</b>	Clock traceable to Stratum 3 (option-2 only).
<b>st3e</b>	Clock traceable to Stratum 3E (option-2 only).
<b>st4</b>	Clock traceable to Stratum 4 free-run (option-2 only).
<b>stu</b>	Clock traceable to an unknown quality (option-2 only).
<b>tnc</b>	Clock traceable to a transit node clock (option-2 only).

- **source-mode (chassis | line)**—Specify source mode for selecting source to output:
  - a. **chassis**—Chassis clock for output
  - b. **line**—Best line clock source for output
- **tx-dnu-to-line-source-enable**—Set Tx quality level to DNU/DUS on line source interface that has been selected as the external output source.
- **wander-filter-disable**—Disable wander filtering.

**quality-mode-enable**—Specify the clock selection, quality level, and priority setting. The quality level parameter for a Synchronous Ethernet interface is optional when quality mode is enabled and the selection mode is set to **received-quality**. The default quality level for a Synchronous Ethernet interface is based on the value of **network-option**: **option-1** selects **SEC** and **option-2** selects **ST3**. Table 88 on page 757 shows whether SSM quality level is supported for a given external interface signal type and framing. The default setting is disabled.

Table 90: SSM-Quality Level Support by Signal Type and Framing

Signal Type	Framing	SSM Quality Level Supported
E1	G.704	yes
E1	G.704 no CRC4	no
T1	ESF	yes
T1	SF	no
2048 KHz	Not applicable	no

**selection-mode (configured-quality | received-quality)**—Specify whether the clock source selection should use the configured or received ESMC or SSM quality level for a qualifying interface. In both selection modes, the interface qualifies for clock source selection only when the received ESMC or SSM quality level on the interface is equal to or greater than the configured ESMC or SSM quality level for the interface.

**NOTE:** For the **selection-mode** statement configuration to take effect, you must set the **quality-mode-enable** statement at the [edit chassis synchronization] hierarchy level.

- a. **configured-quality**—The clock source selection algorithm uses the ESMC or SSM quality level configured for a qualifying interface.
- b. **received-quality**—The clock source selection algorithm uses the ESMC or SSM quality level received on the qualifying interface.

**source** (**external-a** | **external-b** | **interfaces** (*interface-name*) | **external** | (**external-0/0** | **external-1/0**))—Specify clock sources.

(SCB only) The primary clock source is external-a interface, the secondary clock source is external-b interface. The clock source is chosen using the clock selection process.

(SCBE only) Specify the external interface to select the external clock source.

(SCBE2 only) Specify the external-0/0 interface or external-1/0 interface to select the external clock source.

- **priority number**—Specify a priority level from 1 to 5. When not specified, **external-a** has higher default priority than external-b interface, and external-b interface has higher default priority than other Gigabit Ethernet or 10-Gigabit Ethernet clock sources, which have the lowest default priority. Any priority you configure is higher than any default priority.
- **quality-level** (**prc** | **prs** | **sec** | **smc** | **ssu-a** | **ssu-b** | **st2** | **st3** | **st3e** | **st4** | **stu** | **tnc**)—Specify the **quality-level** option based on the configured **network-option**. For quality level details, see [Table 56 on page 271](#).

**NOTE:** Starting with Junos OS Release 12.2R1, the **quality-level** parameter for a Synchronous Ethernet interface is optional when quality mode is enabled and the selection mode is set to received quality. The default quality level for a Synchronous Ethernet interface is SEC for the option-1 network type and ST3 for the option-2 network type.

Both option I and option II SSM quality levels are supported:

- For option-1, quality level must be configured for external clocks (**external-a** or **external-b**) whether or not quality level is enabled.
  - For option-2, the default quality level for external clocks is QL\_STU whether or not quality level is enabled.
  - Quality level is set to DNU for network-option 1 and set to DUS for network-option 2, if quality-level is not configured and no ESMC messages are received.
  - On the selected active source (primary or secondary, whichever is active), even if ESMC transmit is not enabled, a DNU ESMC will be sent out if network-option is 1, and DUS ESMC will be sent out if network-option is 2. This is applicable only for sources of Ethernet interface type to avoid source looping.
- **request force-switch**—Force a switch to this source if the source is enabled and not locked out. You can configure only one source to be force-switched.
  - **request lockout**—You can configure lockout for any source. When configured, this source is not considered by the clock selection process.

**switchover-mode (revertive | non-revertive)**—Specify revertive or non-revertive switchover mode:

- In revertive mode (the default), the system switches from a lower to a higher quality clock source whenever the higher quality clock source becomes available.
- In non-revertive mode, the system continues to use the current clock source as long as it is valid.

**port auxiliary time-of-day-format ascii *string***—Specify time of day (TOD) format as a string of ASCII characters.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## system-priority

<b>Syntax</b>	<code>system-priority <i>priority</i>;</code>
<b>Hierarchy Level</b>	[edit chassis aggregated-devices ethernet lacp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.3. Statement introduced in Junos OS Release 11.4 for EX Series switches.
<b>Description</b>	<p>Define LACP system priority for aggregated Ethernet interfaces at the global (chassis) level.</p> <p>The device with the lower system priority value determines which links between LACP partner devices are active and which are in standby for each LACP group. The device on the controlling end of the link uses port priorities to determine which ports are bundled into the aggregated bundle and which ports are put in standby mode. Port priorities on the other device (the noncontrolling end of the link) are ignored. In priority comparisons, numerically lower values have higher priority. Therefore, the system with the numerically lower value (higher priority value) for LACP system priority becomes the controlling system. If both devices have the same LACP system priority (for example, they are both configured with the default setting of 127), the device MAC address determines which switch is in control.</p>
<b>Options</b>	<p><b><i>priority</i></b>—Priority for the aggregated Ethernet system. A smaller value indicates a higher priority.</p> <p><b>Range:</b> 0 through 65535</p> <p><b>Default:</b> 127</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Junos OS for Supporting Aggregated Devices on page 481</a></li> <li>• <a href="#">Configuring LACP Link Protection of Aggregated Ethernet Interfaces for Switches</a></li> </ul>

## t1

<b>Syntax</b>	<pre>t1 <i>link-number</i> {   <i>channel-group</i> <i>channel-number</i> timeslots <i>slot-number</i>; }</pre>
<b>Hierarchy Level</b>	[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i> ct3 port <i>port-number</i> ];
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure channelized T1 port and channel specifications.
<b>Options</b>	<p><i>link-number</i>—T1 link.</p> <p><b>Range:</b> 0 through 27 for DS0 naming</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Junos OS to Support Channelized DS3-to-DS0 Naming for Channel Groups and Time Slots on page 495</a></li> </ul>

## t1-options

---

<b>Syntax</b>	<pre>t1-options {   framing (esf   sf);   line-encoding (ami   b8zs); }</pre>
<b>Hierarchy Level</b>	<pre>[edit chassis <a href="#">synchronization</a> interfaces external] [edit chassis <a href="#">synchronization</a> interfaces (external-0/0   external-1/0) e1-options]</pre>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for MX Series routers.
<b>Description</b>	Configure the T1 interface options.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">synchronization on page 794</a></li></ul>

## threshold

<b>Syntax</b>	<code>threshold <i>threshold-value</i>;</code>
<b>Hierarchy Level</b>	<p>[edit chassis <code>fpc slot-number error fatal</code>]</p> <p>[edit chassis <code>fpc slot-number error major</code>]</p> <p>[edit chassis <code>fpc slot-number error minor</code>]</p> <p>[edit chassis <code>error fatal</code>]</p> <p>[edit chassis <code>error major</code>]</p> <p>[edit chassis <code>error minor</code>]</p>
<b>Release Information</b>	<p>Statement introduced for PTX Series routers in Junos OS Release 13.3.</p> <p>Statement introduced for MX240, MX480 MX960, and MX2020 routers in Junos OS Release 14.2.</p>
<b>Description</b>	<p>Configure the threshold value at which to take action. If the severity level of the error is fatal, the action is carried out only once when the total number of errors crosses the threshold value. If the severity level of the error is major, the action is carried out once after the occurrence crosses the threshold. If the severity level is minor, the action is carried out as many times as the value specified by the threshold. For example, when the severity level is minor, and you have configured the threshold value as 10, the action is carried out after the tenth occurrence.</p>
	<p> <b>NOTE:</b> You can set the threshold value to 0 for errors with severity level as minor. This implies that no action is taken for that error. You cannot set the threshold value to 0 for errors with severity level as major or fatal.</p>
<b>Default</b>	By default, the error count for fatal and major actions is 1. The default error count for minor actions is 10.
<b>Options</b>	<p><b><i>number</i></b>—Specify the threshold of error counts at which to take action.</p> <p><b>Range:</b> 0 through 4,294,967,295</p>
<b>Required Privilege Level</b>	<p><b>interface</b>—To view this statement in the configuration.</p> <p><b>interface-control</b>—To add this statement to the configuration.</p>

## traffic-manager

**List of Syntax**   [Syntax \(MX Series, PTX Series\) Configure Queue Monitoring on page 809](#)  
[Syntax \(MX Series, T Series\) on page 809](#)  
[Syntax \(M Series\) on page 809](#)  
[Syntax \(vSRX\) on page 810](#)

**Syntax (MX Series, PTX Series) Configure Queue Monitoring**

```
traffic-manager {
  egress-shaping-overhead number;
  ingress-shaping-overhead number;
  mode {
    egress-only;
    ingress-and-egress;
    session-shaping;
  }
  enhanced-priority-mode;
  no-enhanced-priority-mode;
  packet-timestamp {
    enable;
  }
  queue-threshold {
    fabric-queue {
      priority high/low {
        threshold threshold-percentage;
      }
    }
    wan-queue {
      priority high/medium-high/medium-low/low {
        threshold threshold-percentage;
      }
    }
  }
}
```

**Syntax (MX Series, T Series)**

```
traffic-manager {
  egress-shaping-overhead number;
  ingress-shaping-overhead number;
  mode {
    egress-only;
    ingress-and-egress;
  }
}
```

**Syntax (M Series)**

```
traffic-manager {
  egress-shaping-overhead number;
  ingress-shaping-overhead number;
  mode {
    egress-only;
    ingress-and-egress;
    session-shaping;
  }
}
```

```
}  
}
```

**Syntax (vSRX)**

```
traffic-manager {  
    egress-shaping-overhead number;  
}
```

**Hierarchy Level**

```
[edit chassis fpc slot-number],  
[edit chassis fpc slot-number pic pic-number],  
[edit chassis lcc number fpc slot-number pic pic-number] (Routing Matrix)
```

**Release Information** Statement introduced in Junos OS Release 8.3.

**Description** Enable CoS queuing, scheduling, and shaping on an L2TP session.

**NOTE:** Committing changes to `traffic-manager` automatically restarts any necessary components (PICs, DPCs, or FPCs).

---

**Options** **queue-threshold**—Enable monitoring of Fabric and WAN queues. When the **fabric-queue** statement is configured, an SNMP trap is generated whenever the fabric power utilization exceeds the configured threshold value.

When **wan-queue** is configured, an SNMP trap is generated whenever the WAN queue depth exceeds the configured threshold value.

**egress-shaping-overhead number**—When traffic management (queueing and scheduling) is configured on the egress side, the number of CoS shaping overhead bytes to add to the packets on the egress interface.

Replace **number** with a value from **-63** through **192** bytes.

For vSRX, replace **number** with a value from **-62** through **192** bytes.

**NOTE:** The L2 headers (DA/SA + VLAN tags) are automatically a part of the shaping calculation.

**ingress-shaping-overhead number**—When L2TP session shaping is configured, the number of CoS shaping overhead bytes to add to the packets on the ingress side of the L2TP tunnel to determine the shaped session packet length.

When session shaping is not configured and traffic management (queueing and scheduling) is configured on the ingress side, the number of CoS shaping overhead bytes to add to the packets on the ingress interface.

Replace **number** with a value from **-63** through **192** bytes.

**mode**—Configure CoS traffic manager mode of operation. This option has the following suboptions:

- **egress-only**—Enable CoS queueing and scheduling on the egress side for the PIC that houses the interface. This is the default mode for an Enhanced Queueing (EQ) DPC on MX Series routers.

**NOTE:** If ingress packet drops are observed at a high rate for an IQ2 or IQ2E PIC, configure the **traffic-manager** statement to work in the **egress-only** mode.

- **ingress-and-egress**—Enable CoS queueing and scheduling on both the egress and ingress sides for the PIC. This is the default mode for IQ2 and IQ2E PICs on M Series and T Series routers.

**NOTE:**

- For EQ DPCs, you must configure the **traffic-manager** statement with **ingress-and-egress** mode to enable ingress CoS on the EQ DPC.

- EQ DPCs have 250 ms of buffering, with only egress queueing (default mode). When ingress-and-egress is configured, the buffer is partitioned as 50 ms for the ingress direction and 200 ms for the egress direction.

- 
- **session-shaping**—(M Series routers only) Configure the IQ2 PIC mode for session-aware traffic shaping to enable L2TP session shaping.

**enhanced-priority-mode**—Enable the enhanced priority mode. When you enable the enhanced priority mode, the scheduler supports four additional per-priority shaping rates and two additional excess priorities at the interface and interface set level. The four additional per-priority shaping rates are: Guaranteed Strict-high, Guaranteed Medium-low, Excess medium-high, and Excess medium-low. The two additional excess priorities are: Excess-rate Medium- high and Excess-rate Medium-low. This is the default mode for PTX Series routers.

**no-enhanced-priority-mode**—Disable the enhanced priority mode. This is the default mode for MX Series routers.

**NOTE:** The line card reboots when you enable or disable the enhanced priority mode feature.

---

<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

## transport 802.3 (PTP Multicast Master and Slave)

<b>Syntax</b>	transport 802.3 link-local;
<b>Hierarchy Level</b>	[edit protocols ptp <b>slave</b> interface <i>interface-name</i> <b>multicast-mode</b> ], [edit protocols ptp <b>master</b> interface <i>interface-name</i> <b>multicast-mode</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 15.1 for MX Series routers.
<b>Description</b>	Configure Ethernet as the encapsulation type for transport of Precision Time Protocol (PTP) packets. Ethernet encapsulation type is supported for multicast mode of transmission of PTP packets.

**NOTE:** The **transport** statement is mandatory in the configuration of a master or slave clock.

**Options**    **802.3**—Enable encapsulation for PTP packet transport in multicast mode.

**NOTE:** The **link-local** statement is not supported on the QFX Series.

**link-local**—Enable master or slave to choose either of the two MAC addresses defined in the IEEE 1588-2008 standard. When you configure this option, the system attempts to use the 01-80-C2-00-00-0E MAC address (link-local multicast address) for multicast transmission. This address is contained in the Ethernet frame portion of the PTP packet that contains the Destination MAC field and is expected to be flooded by all types of Ethernet bridges and switches and also by a large number of base station vendors. A node with this MAC address can be a node that does not process PTP packets.

If the link-local multicast address is not available, the standard Ethernet multicast address 01-1B-19-00-00-00 address is used as a second priority. The standard Ethernet multicast address, which is a reserved address in the IEEE 802.1Q standard for Ethernet encapsulation that is required to be filtered and not forwarded, is used in the Destination MAC field of the PTP packets. This MAC address is used to ensure complete end-to-end support of PTP, instead of transmission of packets through any network element that does not support PTP. This address is the default address for G.8275.1 (PTP profile for time or phase distribution), and a node with this MAC address is a node that supports processing of PTP packets.

**Required Privilege Level**    routing—To view this statement in the configuration.  
   routing-control—To add this statement to the configuration.

## tunnel-services (Chassis)

**Syntax**

```
tunnel-services {
  bandwidth bandwidth-value;
  tunnel-only;
}
```

**Hierarchy Level** [edit chassis fpc slot-number pic number]

**Release Information** Statement introduced in Junos OS Release 8.2.  
Statement introduced in Junos OS Release 12.3X54 for ACX Series routers.

**Description** For MX Series 5G Universal Routing Platforms, configure the amount of bandwidth for tunnel services.

For ACX Series routers, configure the amount of bandwidth for tunnel services. Only bandwidths of 1 Gbps and 10 Gbps are supported for ACX routers.

For M7i, M10i, M120, M320, T Series and TX Matrix routers with IQ2 PICs and IQ2E PICs, configure support for per unit scheduling for GRE tunnels. You can specify the IQ2 and IQ2E PICs to work exclusively in tunnel mode or as a regular PIC. The default setting uses IQ2 and IQ2E PICs as a regular PIC. If you do not configure the **tunnel-only** option, the IQ2 and IQ2E PICs operate as regular PICs. For M7i, M10i, M120, M320, T Series and TX Matrix routers with IQ2 PICs and IQ2E PICs, you can use the **tunnel-only** option to specify that an IQ2 or IQ2E PIC work in tunnel mode only.

**NOTE:** Bandwidth rates of 20 gigabits per second and 40 gigabits per second require use of an MX Series router with the 100-Gigabit Ethernet Modular Port Concentrator (MPC) and the 100-Gigabit CFP MIC.

**NOTE:** On MX80 routers and MX Series routers with Trio-based FPCs, when ingress queuing is enabled for a PIC, tunnel services and inline services are not supported on the same PIC.

**Options** **tunnel-only** (Optional)—For M7i, M10i, M120, M320, T Series and TX Matrix routers with IQ2 PICs and IQ2E PICs, specify that an IQ2 or IQ2E PIC work in tunnel mode only.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## ucode-imem-remap

Syntax	ucode-imem-remap;
Hierarchy Level	[edit chassis feb slot <i>number</i> ]
Release Information	Statement introduced in Junos OS Release 10.4R2.
Description	<p>M120 routers with a single type-1 FPC mapped to an FEB support a microcode remap feature to resolve microcode overflow resulting in bad PIC combinations.</p> <p>You can enable the microcode remap by using the <b>ucode-imem-remap</b> statement at the [edit chassis feb slot <i>number</i>] hierarchy level. The default microcode map will continue to be available if the <b>ucode-imem-remap</b> statement is not configured.</p>
	<p> <b>NOTE:</b> On M120 routers, the FEB is automatically restarted once the <b>ucode-imem-remap</b> statement is configured and committed.</p>
Required Privilege Level	<p>interfaces—To view this statement in the configuration.</p> <p>interfaces-control—To add this statement to the configuration.</p>

## unicast-mode (master)

---

Syntax	<pre>unicast-mode {   transport ipv4;   clock-client <i>ip-address</i> {     local-ip-address <i>local-ip-address</i>;   }   transport ipv6;   clock-ipv6-client <i>slave-ip-address</i> {     local-ip-address <i>local-ip-address</i>;   } }</pre>
Hierarchy Level	[edit protocols ptp <b>master</b> interface <i>interface-name</i> ]
Release Information	Statement introduced in Junos OS Release 12.2.
Description	<p>Configure the master in unicast mode. You can set this option when PTP unicast mode of messaging is needed.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring Precision Time Protocol on page 319</a></li><li>• <a href="#">Example: Configuring Precision Time Protocol on page 325</a></li><li>• <a href="#">Precision Time Protocol Overview on page 256</a></li></ul>

## unicast-mode (slave)

<b>Syntax</b>	<pre> unicast-mode {   clock-source ip-address {     local-ip-address local-ip-address;     asymmetry number;   }   transport ipv4;   clock-ipv6-source (slave) master-ipv6-address {     local-ip-address local-ip-address;   }   transport ipv6; } </pre>
<b>Hierarchy Level</b>	[edit protocols ptp <b>slave</b> interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2.
<b>Description</b>	<p>Configure the slave in unicast mode. You can set this option when PTP unicast mode of messaging is needed.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Precision Time Protocol on page 319</a></li> <li>• <a href="#">Example: Configuring Precision Time Protocol on page 325</a></li> <li>• <a href="#">Precision Time Protocol Overview on page 256</a></li> <li>• <i>IEEE 1588v2 Precision Timing Protocol (PTP)</i></li> </ul>

## unicast-negotiation

---

<b>Syntax</b>	unicast-negotiation;
<b>Hierarchy Level</b>	[edit protocols ptp]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2. Statement introduced in Junos OS Release 17.3 for the QFX Series.
<b>Description</b>	Configure unicast negotiation. Unicast negotiation is a method by which the announce, synchronization, and delay response packet rates are negotiated between the master and the slave before a PTP session is established.  ..... <div> <b>NOTE:</b> When unicast negotiation is enabled, you cannot commit any packet rate-related configuration.</div> .....
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Precision Time Protocol on page 319</a></li><li>• <a href="#">Example: Configuring Precision Time Protocol on page 325</a></li><li>• <a href="#">Precision Time Protocol Overview on page 256</a></li><li>• <a href="#">IEEE 1588v2 Precision Timing Protocol (PTP)</a></li></ul>

## upgrade-mode

<b>Syntax</b>	<code>upgrade-mode (3d-fabric   default   t4000);</code>
<b>Hierarchy Level</b>	<code>[edit chassis fabric],</code> <code>[edit chassis member <i>name</i> fabric]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 7.5. Statement introduced in Junos OS Release 15.1F3 for PTX Series Routers with third-generation FPCs.
<b>Description</b>	Configures upgrade mode for SIBs and forces them to operate in the same mode until the upgrade is complete. Upgrade mode is used so that two different types of SIBs can be installed in an operational router or routing matrix. After you upgrade the SIBs delete the <b>upgrade-mode</b> statement from the configuration. See the hardware installation guide for your router for more information about upgrading SIBs in an operational router or routing matrix.
<b>Options</b>	<p><b>3d-fabric</b>—Enables the TX Matrix Plus router to upgrade to a TX Matrix Plus router with 3D SIBs. On the SFC, enables setting proper support for mixed SIBs (TXP-F13 SIB and TXP-F13-3D SIB). On the T640 or T1600 or T4000 routers in a routing matrix enables support for mixed SIBs (TXP-T1600 SIB and TXP-3D-LCC SIBs on the T1600 router and SIB-I-T4000 and TXP-3D-LCC SIBs on the T4000 router).</p> <p><b>default</b>—Enables support for mixed SIBs when upgrading SIBs in the PTX3000 and PTX5000 routers.</p> <p><b>t4000</b>—Enables support for mixed SIBs when upgrading to SIB-I-T4000 SIBs in a T640 or T1600.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">TX Matrix Router and T640 Router Configuration Overview on page 373</a></li> <li>• <a href="#">Configuring Junos OS to Upgrade a T4000 Router to LCC 0 of a TX Matrix Plus Router with 3D SIBs on page 419</a></li> <li>• <a href="#">Configuring Junos OS to Upgrade the T1600 Router Chassis to LCC 0 of a TX Matrix Plus Router with 3D SIBs on page 412</a></li> <li>• <a href="#">Upgrading an Operational Standalone Router and Integrating It into a TX Matrix Plus Routing Matrix with 3D SIBs</a></li> <li>• <a href="#">Upgrading to SIB3-SFF-PTX SIBs in an Operational PTX3000</a></li> <li>• <a href="#">Upgrading the FPCs in an Operational PTX5000</a></li> </ul>

## vpn-label

---

<b>Syntax</b>	vpn-label;
<b>Hierarchy Level</b>	[edit chassis <a href="#">memory-enhanced</a> ]
<b>Release Information</b>	Statement added in Junos OS Release 10.4.
<b>Description</b>	Allocate more jtree memory for Layer 3 VPN labels.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Allocate More Memory for Routing Tables, Firewall Filters, and Layer 3 VPN Labels on page 506</a></li></ul>

## vrf-mtu-check

---

<b>Syntax</b>	vrf-mtu-check;
<b>Hierarchy Level</b>	[edit chassis]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for EX Series switches.
<b>Description</b>	On M Series routers (except the M120 and M320 router) and on EX Series 8200 switches, configure path maximum transmission unit (MTU) checks on the outgoing interface for unicast traffic routed on a virtual private network (VPN) routing and forwarding (VRF) instance.
<b>Default</b>	Disabled.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Path MTU Checks for VPN Routing Instances</a></li><li>• <a href="#">Configuring the Junos OS to Enable MTU Path Check for a Routing Instance on M Series Routers on page 429</a></li></ul>

## vtmapping

<b>Syntax</b>	<code>vtmapping (itu-t   klm);</code>
<b>Hierarchy Level</b>	<code>[edit chassis fpc <i>number</i> pic <i>number</i>],</code> <code>[edit interfaces <i>interface-name</i> sonet-options]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	<p>For the Channelized STM1 IQ PIC or Channelized STM1 PIC, configure virtual tributary mapping.</p> <p>For the Channelized STM1 PIC, you configure virtual tributary mapping at the <code>[edit chassis fpc <i>number</i> pic <i>number</i>]</code> hierarchy level.</p>
	<div>  <p><b>NOTE:</b> The <code>vtmapping</code> statement is not supported for <code>cau4</code> interfaces on the Channelized OC3/STM1 (Multi-Rate) Circuit Emulation MIC with SFP (H).</p> </div>
<b>Options</b>	<p><code>itu-t</code>—International Telephony Union standard.</p> <p><code>klm</code>—KLM standard.</p> <p><b>Default:</b> <code>klm</code></p>
<b>Required Privilege Level</b>	<p><code>interface</code>—To view this statement in the configuration.</p> <p><code>interface-control</code>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Configuring Virtual Tributary Mapping of Channelized STM1 Interfaces</a></li> <li><a href="#">Configuring the Junos OS to Support Channelized STM1 Interface Virtual Tributary Mapping on page 497</a></li> </ul>

## wait-to-restore

<b>Syntax</b>	<code>wait-to-restore <i>minutes</i>;</code>
<b>Hierarchy Level</b>	<code>[edit chassis source interfaces (external-a   external-b   interface <i>interface-name</i>)]</code> <code>[edit chassis source interfaces (external   interface <i>interface-name</i>)]</code> <code>[edit chassis source interfaces (external-0/0   external-1/0   interface <i>interface-name</i>)]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 14.2 for MX Series routers.
<b>Description</b>	<p>Configure the time in minutes for each port to be up before opening the Ethernet Synchronization Message Channel (ESMC) for messages. When a port's signal transitions out of the signal fail state, it must be fault-free for the wait-to-restore time before it is again considered by the clock selection process.</p> <p> <b>NOTE:</b> When you perform GRES on MX Series routers, you must execute the <code>clear synchronous-ethernet wait-to-restore</code> operational mode command on the new master Routing Engine to clear the wait-to-restore timer on it. This is because the <code>clear synchronous-ethernet wait-to-restore</code> operational mode command clears the wait-to-restore timer only on the local Routing Engine.</p>
<b>Options</b>	<p><b><i>minutes</i></b>—Set the time for the port signal to be up before the port is opened to receive and transmit ESMC messages.</p> <p><b>Range:</b> 0 through 12 minutes</p> <p><b>Default:</b> 5 minutes</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">synchronization (MX Series) on page 794</a></li> <li>• <a href="#">synchronization (PTX Series) on page 802</a></li> <li>• <a href="#">global-wait-to-restore on page 671</a></li> </ul>

## wander-filter-disable

---

<b>Syntax</b>	wander-filter-disable;
<b>Hierarchy Level</b>	[edit chassis <a href="#">synchronization</a> output interfaces external] [edit chassis <a href="#">synchronization</a> output interfaces (external-0/0   external-1/0)]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3 for MX Series routers.
<b>Description</b>	Disable the wander filter on the output interface.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">synchronization on page 794</a></li></ul>

## CHAPTER 27

# Administrative Commands

- clear chassis alarms fabric degraded
- clear chassis display message
- clear chassis fpc errors
- clear synchronous-ethernet esmc statistics
- clear synchronous-ethernet wait-to-restore
- request chassis afeb
- request chassis cb
- request chassis ccg
- request chassis cfeb
- request chassis cip
- request chassis clock master switch
- request chassis fabric guided-cabling disable
- request chassis fabric guided-cabling enable
- request chassis fabric plane
- request chassis fabric pfe
- request chassis feb
- request chassis fpc
- request chassis fpm resync
- request chassis lcc
- request chassis mcs
- request chassis mic
- request chassis optics
- request chassis pcg
- request chassis pic
- request chassis port-led
- request chassis redundancy feb slot
- request chassis routing-engine master
- request chassis scg

- request chassis sfb
- request chassis sfm master switch
- request chassis sfm
- request chassis sib
- request chassis sib f13 train-link-receive slot
- request chassis sib f13 train-link-transmit slot
- request chassis sib optics lcc
- request chassis sib optics sfc
- request chassis sib train-link-receive slot
- request chassis sib train-link-transmit slot
- request chassis spmb restart
- request chassis synchronization mode
- request chassis synchronization switch
- set chassis display message

## clear chassis alarms fabric degraded

<b>Syntax (TX Matrix Plus Router with 3D SIBs)</b>	<code>clear chassis alarms fabric degraded lcc <i>number</i> fpc <i>number</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 13.2 for a routing matrix with a TX Matrix Plus routers and 3D SIBs.
<b>Description</b>	Clear the fabric degraded alarm for an FPC.
<b>Options</b>	<p><b>lcc <i>number</i></b>—Line-card chassis number.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> <li>0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.</li> <li>0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.</li> </ul> <p><b>fpc <i>number</i></b>—Flexible PIC Concentrator (FPC) slot number. On a TX Matrix Plus router in the TXP-T1600-3D, TXP-T4000-3D, or TXP-Mixed-LCC-3D configuration, specify the number of a T1600 or T4000 router by using the <b>lcc <i>number</i></b> option and replace <b>fpc <i>number</i></b> with a value from 0 through 7.</p>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><code>show system alarms</code></li> </ul>

## Sample Output

### show system alarms (TX Matrix Plus router with 3D SIBs)

```

## clear chassis display message

<b>List of Syntax</b>	<a href="#">Syntax on page 833</a> <a href="#">Syntax (TX Matrix Router) on page 833</a> <a href="#">Syntax (TX Matrix Plus Router) on page 833</a> <a href="#">Syntax (QFabric Systems) on page 833</a>
<b>Syntax</b>	clear chassis display message
<b>Syntax (TX Matrix Router)</b>	clear chassis display message <lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	clear chassis display message <lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (QFabric Systems)</b>	clear chassis display message <node-device <i>name</i>   interconnect-device <i>name</i> >
<b>Release Information</b>	<p>Command introduced in Junos OS Release 7.5.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option for the TX Matrix Plus routers introduced in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
<b>Description</b>	<p>(M40e, M160, M320, T Series routers, EX Series, and QFabric systems only) Clear or stop a text message on the craft interface display, which is on the front of the router or switch or on the LCD panel display on the router or switch. The craft interface alternates the display of text messages with standard craft interface messages, switching between messages every 2 seconds. By default, on both the router and the switch, the text message is displayed for 5 minutes. The craft interface display has four 20-character lines. The LCD panel display has two 16-character lines, and text messages appear only on the second line.</p>
<b>Options</b>	<p><b>none</b>—Clear or stop a text message on the craft interface display.</p> <p><b>interconnect-device <i>name</i></b>—(QFabric systems only) (Optional) On a QFabric system, clear or stop a text message on the LCD panel display on the specified Interconnect device.</p> <p><b>lcc <i>number</i></b>—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.</p>

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**node-device *name***—(QFabric systems only) (Optional) On a QFabric system, clear or stop a text message on the LCD panel display on the specified Node device in a Node group.

**scc**—(TX Matrix routers only) (Optional) Clear or stop a text message on the craft interface on the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Clear or stop a text message on the craft interface on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**Required Privilege Level** clear

**Related Documentation**

## clear chassis fpc errors

---

Syntax	<code>clear chassis fpc errors fpc-slot <i>fpc-slot</i> (all   error-id <i>error-id</i>)</code>
Release Information	Command introduced in Junos OS Release 18.2R1.
Description	Clear the chassis FPC errors. You can choose to clear a particular error or all errors on the FPC.
Options	<b>fpc-slot <i>fpc-slot</i></b> —The slot number of the FPC in which you want to run this command. <b>all</b> —Clear all the errors on the FPC. <b>error-id <i>error-id</i></b> —Clear a particular error identified by an error-id. An <i>error-id</i> , a unique error identifier, is represented as a Uniform Resource Identifier (URI). For example, <b>"/cpu/0/memory/0/memory-uncorrected-error"</b> is an error-id that indicates an uncorrectable error under CPU memory module instance 0.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">fpc error on page 659</a></li></ul>
List of Sample Output	<a href="#">clear chassis fpc errors on page 836</a>
Output Fields	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear chassis fpc errors

```
user@host> clear chassis fpc errors fpc-slot 1 all
```

```
Clearing error(s) on fpc 1, option all
```

---

## clear synchronous-ethernet esmc statistics

---

Syntax	<code>clear synchronous-ethernet esmc statistics &lt;interface-name&gt;</code>
Release Information	Command introduced before Junos OS Release 10.4.
Description	Clear the ESMC statistics for all the interfaces.
Options	<i>interface-name</i> —(Optional) Clear ESMC statistics for the specified interface.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Synchronous Ethernet on MX Series Routers on page 311</a></li><li>• <a href="#">Synchronous Ethernet Overview on page 242</a></li><li>• <a href="#">show synchronous-ethernet esmc statistics on page 2276</a></li></ul>
List of Sample Output	<a href="#">clear synchronous-ethernet esmc statistics on page 837</a>

### Sample Output

#### clear synchronous-ethernet esmc statistics

The following example displays the message after the **clear synchronous-ethernet esmc statistics** command is entered:

```
user@host> clear synchronous-ethernet esmc statistics
Cleared ESMC statistics for all interfaces
```

## clear synchronous-ethernet wait-to-restore

**Syntax** `clear synchronous-ethernet wait-to-restore  
<interface interface-name>`

**Release Information** Command introduced in Junos OS Release 14.2.

**Description** Clear the wait-to-restore timer for all the interfaces in an MX Series router.

**NOTE:** When you perform GRES on MX Series routers, you must execute the `clear synchronous-ethernet wait-to-restore` operational mode command on the new master Routing Engine to clear the wait-to-restore timer on it. This is because the `clear synchronous-ethernet wait-to-restore` operational mode command clears the wait-to-restore timer only on the local Routing Engine.

**Options** `interface interface-name`—(Optional) Clear wait to restore timer for the specified interface.

**Required Privilege Level** clear

**Related Documentation**

- [Example: Configuring Synchronous Ethernet on MX Series Routers on page 311](#)
- [Synchronous Ethernet Overview on page 242](#)

**List of Sample Output** [clear synchronous-ethernet wait-to-restore interface <interface-name> on page 838](#)

### Sample Output

`clear synchronous-ethernet wait-to-restore interface <interface-name>`

The following example displays the message after the `clear synchronous-ethernet wait-to-restore interface ge-2/1/6` command is entered in operational mode command:

```
user@host> clear synchronous-ethernet wait-to-restore interface ge-2/1/6
Cleared wait-to-restore timer for interface ge-2/1/6
```

## request chassis afeb

<b>Syntax</b>	request chassis afeb (offline   online   restart)
<b>Release Information</b>	Command introduced in Junos OS Release 13.2.
<b>Description</b>	Control the operation of the compact Forwarding Engine Board (FEB).
<b>Options</b>	<b>offline</b> —Take the FEB offline. <b>online</b> —Bring the FEB online. <b>restart</b> —Restart the FEB.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show chassis afeb on page 923</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request chassis afeb online (MX104 Router) on page 839</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request chassis afeb online (MX104 Router)

```
user@host> request chassis afeb online
AFEB is already online
```

## request chassis cb

<b>Syntax (QFabric System)</b>	<code>request chassis cb (offline   online) interconnect-device <i>name</i> slot <i>slot-number</i></code> <code>&lt;interconnect-device <i>name</i> slot <i>slot-number</i> (offline   online)&gt;</code>
<b>Syntax (EX9253 Switches)</b>	<code>request chassis cb (offline   online) <i>name</i> slot <i>slot-number</i></code>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS 9.4 for EX Series switches.</p> <p>sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS 11.3 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 17.2 for MX2008 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 17.3 for MX10003 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 18.2 for EX9253 Series Switches.</p>
<b>Description</b>	(M120, M320, and MX Series routers and T Series routers, QFabric systems, and EX8200 switches only) Control the operation of the Control Board (CB).
<b>Options</b>	<b>offline</b> —Take the Control Board offline.

**NOTE:** On a QFabric system, to bring the backup Control Board on a QFX3008-I Interconnect device offline, issue the `request chassis cb slot backup-slot-number offline` command.

**NOTE:** Only backup Control Board can be turned offline or online. To turn a Control Board offline or to bring it back online, the Routing Engine should be turned offline first.

**online**—Bring the Control Board online.

**interconnect-device *name***—(QFabric systems only) (Optional) Bring the QFX3008-I Interconnect device Control Board either offline or online:

**slot *slot-number***—Control Board slot number:

- (TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, if you specify the number of the T640 router by using the *lcc number* option (the recommended method), replace *cb-slot-number* with a value from 0 through 1.  
  
Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 or T4000 router by using the *lcc number* option (the recommended method), replace *cb-slot-number* with a value from 0 through 1.
- M320 router—Replace *slot-number* with a value from 0 through 1.
- MX480/MX240 routers—Replace *slot-number* with a value from 0 through 1.
- MX960 router—Replace *slot-number* with a value from 0 through 2.
- MX2020, MX2010, and MX2008 routers—Replace *slot-number* with 0 or 1.
- EX8208 switch—Replace *slot-number* with a value from 0 through 2.
- EX8216 switch—Replace *slot-number* with a value from 0 through 1.
- QFabric System—Replace *slot-number* with a value from 0 through 1.

**lcc *number***—(TX Matrix, TX Matrix Plus routers only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Change the CB status for the TX Matrix Plus router (switch-fabric chassis). Replace *number* with 0.

**Required Privilege Level** maintenance

Output Fields	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request chassis cip offline slot (TX Matrix Plus Router)

```
user@host > request chassis cip offline slot 0
CIP 0 offline done
```

### request chassis cip offline slot (TX Matrix Plus Router)

```
user@host > request chassis cip online slot 0
```

CIP 0 online done

## request chassis clock master switch

---

<b>Syntax</b>	request chassis clock master switch
<b>Release Information</b>	Command introduced in Junos OS Release 12.1.
<b>Description</b>	(PTX Series Packet Transport Routers only) Control which Centralized Clock Generator (CCG) is the master.
<b>Options</b>	This command has no options.
<b>Additional Information</b>	<p>By default, the CCG in slot 0 (CCG0) is the master and the CCG in slot 1 (CCG1) is the backup. If you use this command to change the master, and then restart the chassis software for any reason, the master reverts to the default setting. To change the default master CCG, include the <b>ccg</b> statement at the <b>[edit chassis redundancy]</b> hierarchy level in the configuration. For more information, see the <i>Junos OS Administration Library</i>.</p> <p>The configurations on the two CCGs do not have to be the same, and they are not automatically synchronized. If you configure both CCGs as masters, when the chassis software restarts for any reason, the CCG in slot 0 becomes the master and the one in slot 1 becomes the backup.</p> <p>The switchover from the primary CCG to the backup CCG is immediate.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show chassis environment on page 969</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request chassis clock master switch on page 848</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request chassis clock master switch

```
user@host> request chassis clock master switch
CCG master switch initiated, use "show chassis environment ccg" to verify
```

## request chassis fabric guided-cabling disable

<b>Syntax</b>	<code>request chassis fabric guided-cabling disable (all-lcc   lcc <i>lcc-number</i>)</code>
<b>Release Information</b>	Command introduced in Junos OS Release 14.1 for TX Matrix Plus routers with 3D SIBs.
<b>Description</b>	Disable the guided cabling operation.
<b>Options</b>	<p><b>all-lcc</b>—Disable the guided cabling operation for all the LCCs.</p> <p><b>lcc <i>lcc-number</i></b>—Disable the guided cabling operation for the specified LCC.</p>
<b>Required Privilege Level</b>	admin
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request chassis fabric guided-cabling enable on page 850</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request chassis fabric guided-cabling disable all-lcc on page 849</a> <a href="#">request chassis fabric guided-cabling disable lcc 7 on page 849</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request chassis fabric guided-cabling disable all-lcc

```
user@host> request chassis fabric guided-cabling disable all-lcc
Guided Cabling disable initiated
```

### request chassis fabric guided-cabling disable lcc 7

```
user@host> request chassis fabric guided-cabling disable lcc 7
Guided Cabling disable initiated
```

## request chassis fabric guided-cabling enable

<b>Syntax</b>	<code>request chassis fabric guided-cabling enable (plane-by-plane   port-by-port) (all-lcc   lcc <i>lcc-number</i>)</code>
<b>Release Information</b>	Command introduced in Junos OS Release 14.1 for TX Matrix Plus routers with 3D SIBs.
<b>Description</b>	Enable the guided cabling operation by using blinking LEDs on the ports to be connected on the LCC and the SFC.
<b>Options</b>	<p><b>plane-by-plane</b>—Enable blinking of <b>CBL</b> LEDs for all the unconnected ports on a TXP-F13-3D SIB and a TXP-LCC-3D SIB for a particular fabric plane. After you connect all the cables on a TXP-F13-3D SIB and a TXP-LCC-3D SIB, all <b>CBL</b> LEDs blink on the fabric plane that need to be subsequently connected. The operation continues until all the cables are connected for all available fabric planes.</p> <p><b>port-by-port</b>—Enable blinking of the <b>CBL</b> LED for an unconnected port on a TXP-F13-3D SIB and a TXP-LCC-3D SIB. After you connect the cable to a port on a TXP-F13-3D SIB and a TXP-LCC-3D SIB, the <b>CBL</b> LED blinks on the next unconnected port on a TXP-F13-3D SIB and a TXP-LCC-3D SIB.</p> <p><b>all-lcc</b>—Enable the guided cabling operation for all the LCCs.</p> <p><b>lcc <i>lcc-number</i></b>—Enable the guided cabling operation for the specified LCC.</p>
<b>Required Privilege Level</b>	admin
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">request chassis fabric guided-cabling disable on page 849</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request chassis fabric guided-cabling enable plane-by-plane all-lcc on page 850</a> <a href="#">request chassis fabric guided-cabling enable port-by-port all-lcc on page 851</a> <a href="#">request chassis fabric guided-cabling enable plane-by-plane lcc 7 on page 851</a> <a href="#">request chassis fabric guided-cabling enable port-by-port lcc 7 on page 851</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request chassis fabric guided-cabling enable plane-by-plane all-lcc

```
user@host> request chassis fabric guided-cabling enable plane-by-plane all-lcc
Guided Cabling enable initiated
```

**request chassis fabric guided-cabling enable port-by-port all-lcc**

```
user@host> request chassis fabric guided-cabling enable port-by-port all-lcc
Guided Cabling enable initiated
```

**request chassis fabric guided-cabling enable plane-by-plane lcc 7**

```
user@host> request chassis fabric guided-cabling enable plane-by-plane lcc 7
Guided Cabling enable initiated
```

**request chassis fabric guided-cabling enable port-by-port lcc 7**

```
user@host> request chassis fabric guided-cabling enable port-by-port lcc 7
Guided Cabling enable initiated
```

## request chassis fabric plane

---

**List of Syntax**   [Syntax on page 852](#)  
[Syntax \(EX9253 Switches\) on page 852](#)

**Syntax**   `request chassis fabric plane plane-number (offline | online)`

**Syntax (EX9253 Switches)**   `request chassis fabric plane plane-number (offline | online)`

**Release Information**   Command introduced in Junos OS Release 8.0.  
Command introduced in Junos OS Release 9.4 for EX Series switches.  
Command introduced in Junos OS Release 12.3 for MX2020 Universal Routing Platforms.  
Command introduced in Junos OS Release 12.3 for MX2010 Universal Routing Platforms.  
Command introduced in Junos OS Release 17.2 for MX2008 Universal Routing Platforms.  
Command introduced in Junos OS Release 17.3 for MX10003 Universal Routing Platforms.  
Command introduced in Junos OS Release 18.2 for EX9253 Switches.

**Description**   (M120 and MX Series routers and EX8200 switches only) Control the operation of the specified fabric plane.

On an MX480 or MX240 series router, you can configure the active control board for redundancy mode or increased bandwidth mode. When running in increased bandwidth mode, MX series routers with Trio chips and the MPC3E will use all eight active fabric planes.

To take both plane 0 and plane 1 offline on a MX480 and MX240 series routers with one or more MPC4E MICs installed, a X86 Media Service Blade, and/or 100G PFE, and where redundancy-mode is configured for "increased-bandwidth", Juniper recommends taking plane 1 offline before plane 0. Likewise, when the router is configured for increased-bandwidth mode, taking fabric planes 0, 2, 4, and 6 offline can cause the chassis to run in a reduced fabric bandwidth mode. Plane 7 may remain in a "spare" state (as seen in the "show chassis fabric summary" command output) until plane 3 is taken offline and then brought back up.

**Options**   **offline**—Take the fabric plane offline. Use the **request chassis fabric plane *plane-number* offline** command to clear a FAULT state on a fabric plane. To bring the fabric plane back online, use the **request chassis fabric plane *plane-number* online** command.

**online**—Bring the fabric plane online.

**plane *plane-number***—Fabric plane number.

- For the M120 router, replace *plane-number* with a value from 0 through 3.
- For the MX480 and MX240 routers, replace *plane-number* with a value from 0 through 7.

- For the MX2020, MX2010, and MX2008 routers, replace *plane-number* with a value from 0 through 7.
- For the MX960 router, replace *plane-number* with a value from 0 through 5.
- For the EX8208 switch, replace *plane-number* with a value from 0 through 11.
- For the EX8216 switch, replace *plane-number* with a value from 0 through 7.

**Required Privilege Level** maintenance

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request chassis fabric plane 0 online

```
user@host> request chassis fabric plane 0 online
Online initiated, use "show chassis fabric plane" to verify
```

### request chassis fabric plane 0 offline

```
user@host> request chassis fabric plane 0 offline
Offline initiated, use "show chassis fabric plane" to verify
```

### request chassis fabric plane 0 online (EX8200 switch)

```
user@host> request chassis fabric plane 0 online
Plane 0 is already active
```

#### request chassis fabric plane (MX2020 Router)

```
user@host> request chassis fabric plane 2 online  
Plane 2 is already active
```

#### request chassis fabric plane (MX2010 Router)

```
user@host> request chassis fabric plane 4 online  
Plane 4 is already active
```

#### request chassis fabric plane (MX2008 Router)

```
user@host>request chassis fabric plane 4 online  
Plane 4 is already active
```

#### request chassis fabric plane (MX10003 Router)

```
user@host>request chassis fabric plane 4 online  
Plane 4 is already active
```

#### request chassis fabric plane (EX9253 Switch)

```
user@switch>request chassis fabric plane 0 online  
Plane 0 is already active
```

## request chassis fabric pfe

**Syntax** `request chassis fabric pfe pfe-number fpc fpc-number offline`

**Release Information** Command introduced in Junos OS Release 17.2.

**Description** Make a specified fabric of the packet forwarding engine (PFE) offline.

This command makes only the specified PFE of the FPC offline and rest of the PFEs of the FPC are not affected. If a PFE of an FPC is affected because of fabric path wedge errors, the affected PFE is disabled and the associated fabric goes offline as part of fabric hardening actions. The output of the **show chassis fabric fpcs** and **show chassis fabric plane** commands show a new state for the PFE as **Fabric Disabled**.

Fabric stream wedge occurs when the ASIC of the FPC is in the stuck state, and the ingress PFE fails to send traffic to the destination PFE. You can use the request **chassis fabric pfe *pfe-number* fpc *fpc-number* offline** command to make any PFE offline.

**NOTE:** This statement does not have an option to bring the PFE back online. You must restart the FPC to bring the PFE back online.

**Options** `pfe-number—[0–3]`

`pc-number—[0–11] or [0–5] or [0–19] or [0–2], depending on the type of the chassis.`

**Required Privilege Level** `interface`—To view this statement in the configuration.  
`interface-control`—To add this statement to the configuration.

<b>Syntax (PTX Series Packet Transport Routers)</b>	<code>request chassis fpc (offline   online   restart) slot <i>slot-number</i></code>

<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS 11.3 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p> <p>Command introduced in Junos OS Release 16.1R1 for EX9200 switches.</p> <p>Command introduced in Junos OS Release 17.2 for MX2008 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 17.3 for MX10003 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 17.4 for MX204 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 18.1R1 for EX9251 Switches.</p> <p>Command introduced in Junos OS Release 18.2 for EX9253 Switches.</p>
<b>Description</b>	<p>(M20, M40, M40e, M120, M160, M320, MX Series, and T Series routers, QFabric systems, EX Series switches, and PTX Series Packet Transport Routers only) Control the operation of the Flexible PIC Concentrator (FPC).</p>

**NOTE:** Starting with Junos OS Release 12.3, it is possible that FPCs brought offline by using the `request chassis fpc slot fpc-slot offline operational-mode` CLI command can come online during a configuration commit or power-supply replacement procedure. As an alternative, use the `set fpc fpc-slot power off configuration-mode` command at the `[edit chassis]` hierarchy level to ensure that the FPCs remain offline.

**NOTE:** In releases earlier than Junos OS Release 15.1F3 and Junos OS Release 16.1, offline FPCs in the PTX5000 router might be powered on by the router during a reboot, or when triggered by other power management events on the router, such as when you take another FPC offline.

Starting with Junos OS Release 15.1F3 and Junos OS Release 16.1, offline FPCs do not come online during reboots or other power management events. To bring such an FPC online:

1. Delete the `fpc fpc-slot power off` statement from the `[edit chassis]` hierarchy level, if that statement is configured, and commit the configuration.
2. Either issue the `request chassis fpc online slot fpc-slot operational-mode` CLI command or press and hold the FPC ONLINE/OFFLINE button for about 5 seconds until the green OK LED next to the button lights steadily.

**NOTE:** If a CLI-based firmware upgrade is in progress, the specified FPC does not restart. Starting with Junos OS Release 15.1, the following message is displayed when this occurs:

```
user@host> request chassis fpc slot 0 restart
FPC 0 Firmware update in progress. Wait!!!
```

**NOTE:** The command `request chassis fpc (offline | online) slot slot-number` is not supported on PTX1000 router. Whereas, `request chassis fpc restart slot slot-number` is supported on PTX1000 router

**Options** **offline**—Take the FPC offline.

**online**—Bring the FPC online.

**interconnect-device *name***—(QFabric systems only) Bring the FPC on the QFX3008-I Interconnect device either offline or online:

- (QFabric System) On a QFabric system, specify the name of the QFX3008-I Interconnect device containing the FPC you want to bring either offline or online.

**restart**—Restart the FPC.

**slot *slot-number***—FPC slot number:

- M20 router—0 through 3.
- M120 router—0 through 5.
- MX240 router—0 through 2. On the MX240 router, slot-number corresponds to the (DPC slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX480 router—0 through 5. On the MX480 router, slot-number corresponds to the DPC slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX960 router—0 through 11. On the MX960 router, slot-number corresponds to the DPC slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX2020 router—0 through 19.
- MX2010 router—0 through 9.
- MX2008 router—0 through 9.

- TX Matrix and TX Matrix Plus routers only—On the TX Matrix router, if you specify the number of the T640 router by using the *lcc number* option (the recommended method), replace *slot-number* with a value from 0 through 7. Otherwise, replace *slot-number* with a value from 0 through 31.

Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 or T4000 router by using the *lcc number* option (the recommended method), replace *slot-number* with a value from 0 through 7. Otherwise, replace *slot-number* with a value from 0 through 31. In case of TX Matrix Plus router with 3D SIBs, replace *slot-number* with a value from 0 through 63. For example, the following commands have the same result:

```
user@host> request chassis fpc lcc 1 slot 1 offline
user@host> request chassis fpc slot 9 offline
```

- Other routers—0 through 7.
- QFabric System—Replace *slot-number* with a value from 0 through 2.
- EX Series switches:
  - EX4200 switches in a Virtual Chassis configuration—Replace *slot-number* with a value from 0 through 9.
  - EX6210 switches—Replace *slot-number* with a value from 0 through 9.

**NOTE:** These commands are not supported for slots 4 and 5 when a Switch Fabric and Routing Engine (SRE) module is installed in those slots. These commands are supported for slots 4 and 5 only if a line card is installed in them.

- EX8208 switches—Replace *slot-number* with a value from 0 through 7.
- EX8216 switches—Replace *slot-number* with a value from 0 through 15.
- EX9204 switches—Replace *slot-number* with a value from 0 through 2.
- EX9208 switches—Replace *slot-number* with a value from 0 through 5.
- EX9214 switches—Replace *slot-number* with a value from 0 through 11.
- PTX5000 Packet Transport Router—Replace *slot-number* with a value from 0 through 7.

**all-members**—(MX Series routers only) (Optional) Change FPC status of all members of the Virtual Chassis configuration.

**local**—(MX Series routers only) (Optional) Change FPC status of the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Change FPC status of the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**Required Privilege Level** maintenance

## Sample Output

### request chassis fpc

```
user@host> request chassis fpc online slot 0
FPC 0 already online
```

### request chassis fpc (MX Series Routers with Media Services Blade [MSB])

```
user@host> request chassis fpc slot 0
Possible completions:
  offline          Take FPC offline
  online           Bring FPC online
  restart          Restart FPC
```

### request chassis fpc (MX2020 Router)

```
user@host >request chassis fpc online slot 2
FPC 2 already online
```

### request chassis fpc (MX2010 Router)

```
user@host >request chassis fpc offline slot 5
Offline initiated, use "show chassis fpc" to verify
```

### request chassis fpc (MX2008 Router)

```
user@host >request chassis fpc online slot 5
FPC 5 already online
```

### request chassis fpc (MX10003 Router)

```
user@host>request chassis fpc online slot 1
FPC 1 already online
```

### request chassis fpc (MX204 Router)

```
user@host>request chassis fpc online slot 0
FPC 0 already online
```

### request chassis fpc (EX9200 Switch)

```
user@host> request chassis fpc slot 0
Possible completions:
  offline          Take FPC offline
  online           Bring FPC online
  restart          Restart FPC
```

#### request chassis fpc (EX9251 Switch)

```
user@switch> request chassis fpc online slot 0  
FPC 0 already online
```

#### request chassis fpc (EX9253 Switch)

```
user@switch> request chassis online fpc slot 0  
FPC 0 already online
```

[request chassis lcc](#)

```
user@host> request chassis lcc offline slot 0
```

## request chassis mcs

---

Syntax	<code>request chassis mcs (offline   online   restart) slot <i>slot-number</i></code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M40e and M160 routers only) Control the operation of the Miscellaneous Control Subsystem (MCS).
Options	<b>offline</b> —Take the MCS offline. <b>online</b> —Bring the MCS online. <b>restart</b> —Restart the MCS. <b>slot <i>slot-number</i></b> —MCS slot number. Replace <i>slot-number</i> with 0 or 1.
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">show chassis environment mcs on page 1179</a></li></ul>
List of Sample Output	<a href="#">request chassis mcs on page 870</a>
Output Fields	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request chassis mcs

```
user@host> request chassis mcs online slot 0
MCS 0 appears to be online already
```

## request chassis mic

**Syntax** `request chassis mic (offline | online) fpc-slot slot-number mic-slot slot-number`

**Release Information** Command introduced in Junos OS Release 10.1.  
 Command introduced in Junos OS Release 12.3 for ACX4000 Series Router.  
 Command introduced in Junos OS Release 12.3 for MX2020 Universal Routing Platforms.  
 Command introduced in Junos OS Release 12.3 for MX2010 Universal Routing Platforms.  
 Command introduced in Junos OS Release 13.2 for MX104 Universal Routing Platforms.  
 Command introduced in Junos OS Release 17.2 for MX2008 Universal Routing Platforms.

**Description** (MX Series routers only) Control the operation of the Modular Interface Cards (MICs) installed on a Modular Port Concentrator (MPC).

**NOTE:** On MX960 routers, if the MIC is not functioning correctly, you should take the MPC offline, replace it with a new MPC, and reinstall the MIC. On MX104 routers, the `request chassis mic` command is not supported on FPC slot 2 and MIC slot 0.

**Options** **offline**—Take the MIC offline.

**online**—Bring the MIC online.

**fpc-slot *slot-number***—FPC slot number where the MIC is installed:

- ACX4000 router—Replace **fpc-slot** with the value 0 or 1.
- MX80 router—Replace **fpc-slot** with the value 1. This command is not supported on FPC slot 0.
- MX104—Replace **fpc-slot** with the value from 0 through 2.
- MX240 router—Replace **fpc-slot** with a value from 0 through 2.
- MX480 router—Replace **fpc-slot** with a value from 0 through 5.
- MX960 router—Replace **fpc-slot** with a value from 0 through 11.
- MX2020 router—Replace **fpc-slot** with a value from 0 through 19.
- MX2010 router—Replace **fpc-slot** with a value from 0 through 9.
- MX2008 router—Replace **fpc-slot** with a value from 0 through 9.

**mic-slot *slot-number***—MIC slot number. Replace **slot-number** with 0 or 1.

**Required Privilege Level** maintenance

**Related Documentation** • [show chassis hardware on page 1726](#)

<b>Syntax (TX Matrix and TX Matrix Plus Routers)</b>	request chassis pic (offline   online) fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i> <lcc <i>number</i> >
<b>Syntax (EX9251, EX9253 Switches)</b>	request chassis pic (offline   online) pic-slot <i>slot-number</i> fpc--slot <i>slot-number</i> <lcc <i>number</i> >
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.3 for ACX4000 Routers.</p> <p>Command introduced in Junos OS Release 13.2 for the QFX Series.</p> <p>Command introduced in Junos OS Release 17.2 for PTX10008 Routers.</p> <p>Option <b>member</b> introduced in Junos OS Release 14.2 for MX Series routers.</p> <p>Command introduced in Junos OS Release 17.3 for MX10003 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 18.1R1 for EX9251 Switches.</p> <p>Command introduced in Junos OS Release 18.2 for EX9253 Switches.</p>
<b>Description</b>	Control the operation of the PIC.

**NOTE:** The request chassis pic (offline | online) fpc-slot *slot number* pic-slot *slot-number* command is not supported for built-in PICs on MX Series routers.

To view a list of built-in PICs on the router or switch chassis, use the show chassis hardware command.

**NOTE:** This command is not supported on MX960 and MX2020 routers with MPC5EQ.

**NOTE:** T1600 routers and TX Matrix Plus routers with 100-Gigabit Ethernet PICs require two adjacent PIC slots, 0 and 1, for each PIC. Therefore, only online and offline command options to PIC slot 0 are allowed. Use of the online and offline command options for PIC slot 1 with the described router and PIC combination is not allowed.

**NOTE:** In T Series routers, when the PIC state is set from offline to online or vice-versa before the processing is complete for the previous command, you are provided feedback on the status of your request. The following sample messages are displayed if you try to set a PIC offline or online:

```
user@switch> request chassis pic fpc-slot 1 pic-slot 0 online
fpc 1 pic 0 online initiated, use "show chassis fpc pic-status" to verify

user@switch> request chassis pic fpc-slot 1 pic-slot 0 online
FPC 1 PIC 0 already transitioning to online
```

When the same PIC is set to a different state while the transition is in progress, you are provided feedback on the status of your request.

```
user@switch> request chassis pic fpc-slot 1 pic-slot 0 offline
FPC 1, PIC 0 already transitioning to online. Please retry later.
```

**NOTE:** If a CLI-based firmware upgrade is in progress, it prevents the specified PIC from restarting. Starting in Junos OS Release 15.1, the following message is displayed:

```
user@host> request chassis pic fpc-slot 0 pic-slot 1 offline
PIC's Firmware update in progress. Wait!!!
```

**NOTE:** The command `request chassis pic (offline | online) fpc-slot slot-number pic-slot slot-number` is not supported on PTX1000 routers.

**Options**   **offline**—Take the PIC offline.

**online**—Bring the PIC online.

**fpc-slot *slot-number***—Flexible PIC Concentrator (FPC) slot number. Replace *slot-number* with a value appropriate for your router or switch:

- ACX4000 routers—1 or 2.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—0.
  - EX4200 switches in a Virtual Chassis configuration—0 through 9 (switch's member ID).
  - EX8208 switches—0 through 7 (line card).
  - EX8216 switches—0 through 15 (line card).
- M5, M7i, M10, and M10i routers—0 or 1.
- M20 routers—0 through 3.
- M40 and M40e routers—0 through 7.
- M120 routers—0 through 5.
- M160 routers—0 through 7.
- M320 routers—0 through 7.
- MX 5, MX10, and MX40 routers—0 or 1.
- MX80 routers—0 or 1.
- MX240 routers—0 through 2
- MX480 routers—0 through 5
- MX2020 routers—0 through 19.
- MX2010 routers—0 through 9.
- MX960 routers—0 through 11.
- MX10003 routers—0 or 1.
- MX204 routers—0.
- PTX5000 routers—0 or 1.
- T Series routers—0 through 7.
- TX Matrix and TX Matrix Plus routers only—On a TX Matrix router, if you specify the number of the T640 router by using the *lcc number* option (the recommended method), replace *slot-number* with a value from 0 through 7. Otherwise, replace *slot-number* with a value from 0 through 31.

Likewise, on a TX Matrix Plus router, if you specify the *number* of the T1600 or T4000 router by using the *lcc number* option (the recommended method), replace *slot-number* with a value from 0 through 7. Otherwise, for the FPC slot number,

replace *slot-number* with a value from 0 through 31. On a TX Matrix Plus router with 3D SIBs to assign the FPC slot number, replace *slot-number* with a value from 0 through 63. For example, the following commands have the same result:

```
user@host> request chassis pic fpc-slot 1 lcc 1 pic-slot 0 offline
user@host> request chassis pic fpc-slot 9 pic-slot 0 offline
```

- QFX5100 standalone switches—0.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**member *member-id***—(MX Series routers only) (Optional) Change the PIC status on the specified member of the Virtual Chassis configuration. Replace *member-id* with the value that is assigned to the specified member.

**offline**—Take the PIC offline.

**online**—Bring the PIC online.

**pic-slot *slot-number***—PIC slot number.

- EX3200 and EX4200 switches—0 for built-in network interfaces and 1 for interfaces on uplink modules.
- EX8208 and EX8216 switches—0.
- M Series routers—0, 1, 2, or 3
- MX960 router—*slot-number* corresponds to the slot number of the Packet Forwarding Engine.
- MX204 router—0 or 1.
- PTX5000 routers—0 or 1.
- T320 router—0 or 1.
- T640 router—0, 1, 2, or 3.
- T1600 router —0, 1, 2, or 3.

- T4000 router—0, 1, 2, or 3.
- QFX5100 standalone switches—0, 1, or 2. PIC 0 is used for all interfaces that are not configured on expansion modules, and PIC 1 and PIC 2 are used for interfaces configured on expansion modules.

## Sample Output

### `request chassis pic`

```
user@host> request chassis pic pic-slot 0 online fpc-slot 0
FPC 0, PIC 0 is already online
```

### `request chassis pic online member (MX Series Routers)`

```
user@host> request chassis pic online member 1 fpc-slot 11 pic-slot 3
fpc 11 pic 3 online initiated
```

### `request chassis pic offline member (MX Series Routers)`

```
user@host> request chassis pic offline member 1 fpc-slot 11 pic-slot 3
fpc 11 pic 3 offline initiated
```

### `request chassis pic (MX10003 Router)`

```
user@host> request chassis pic online pic-slot 1 fpc-slot 0
FPC 0 is not online
```

**request chassis pic online member (PTX10008 Router)**

```
user@host> request chassis pic online pic-slot 1 fpc-slot 0
FPC 0, PIC 1 is empty
```

**request chassis pic online member (EX9251 Switch)**

```
user@switch> request chassis pic pic-slot 0 online fpc-slot 0
FPC 0, PIC 0 is already online
```

**request chassis pic online member (EX9253 Switch)**

```
user@switch> request chassis pic pic-slot 0 online fpc-slot 0
FPC 0, PIC 0 is already online
```

## request chassis port-led

**Syntax** `request chassis port-led (start | stop) fpc-slot fpc-slot-number pic-slot pic-slot-number port (port-number | all-10g | all-40g | all-100g | all-port) duration duration`

**Release Information** Command introduced in Junos OS Release 15.1F4 for MPC7E-MRATE, MPC8E, and MPC9E. Command introduced in Junos OS Release 17.3 for MX10003 Universal Routing Platforms. Command introduced in Junos OS Release 17.4 for MX204 Universal Routing Platforms. Command introduced in Junos OS Release 18.1R1 for EX9251 Switch. Command introduced in Junos OS Release 18.2R1 for JNP10K-LC2101 on MX10008 Universal Routing Platforms.

**Description** Enable remote port identification of the Modular Interface Card (MIC) or PIC by making the LED of the appropriate active port blink for a duration of time. You can also make the LEDs of all active ports, specific active ports, and specific port types blink. For instance, on MX480 routers with MPC7E-MRATE, you can make the LED of all active ports that support port speeds of 100 Gbps blink. Enabling remote port identification provides cabling assistance and reduces cabling mistakes.

**NOTE:** You can stop a LED from blinking before the end of duration. After the LED stops blinking, it resumes its normal operation of indicating current link status of the port.

**Options** **start**—Start blinking of the LEDs of the specified ports.

**stop**—Stop the LEDs of the specified ports from blinking.

**fpc-slot *fpc-slot-number***—(MX Series routers) Modular Port Concentrator (MPC) slot number. Replace *fpc-slot-number* with a value appropriate for your router:

- MX240 routers—0 through 2.
- MX480 routers—0 through 5.
- MX960 routers—0 through 11.
- MX2010 routers—0 through 9.
- MX2020 routers—0 through 19.
- MX10003 routers—0 through 1.
- MX10008 routers—0 through 6.

**pic-slot *pic-slot-number***—(MX Series routers) MIC slot number. Replace *pic-slot-number* with a value from 0 through 3. For MX10008 routers with JNP10K-LC2101 MPC only, replace *pic-slot-number* with a value from 0 through 5.

**port *port-number***—Port number. Replace *port-number* with a value appropriate for your MPC or line card:

- MIC-MRATE—0 through 11.
- MX10003 MPC—0 through 5 for PIC 0 and 0 through 11 for PIC1
- JNP10K-LC2101 MPC—0 through 3 per PIC. JNP110K-LC2101 supports 6 built-in PICs and each PIC supports 4 ports.

**all-10g**—Active ports that support port speed of 10 Gbps.

**all-40g**—Active ports that support port speed of 40 Gbps.

**all-100g**—Active ports that support port speed of 100 Gbps.

**all-ports**—All active ports.

**duration *duration***—Duration, in seconds, to perform LED blinking. Replace *duration* with a value from 0 through 65,535. The default duration is 5 minutes (300 seconds).

**Required Privilege Level**

**Output Fields**

When you enter this command, you are asked to verify the LED status based on your request.

## Sample Output

[request chassis port-led \(MX2020 Routers with MPC8E\)](#)

```
user@host> request chassis port-led start fpc-slot 3 pic-slot 0 port all-10g duration 5
Command sent to FPC_3. Check physically about LED status on the PIC_0 ports.
```

[request chassis port-led \(MX480 Routers with MPC7E-MRATE\)](#)

```
user@host> request chassis port-led start fpc-slot 3 pic-slot 0 port 2 duration 5
```

```
Command sent to FPC_3. Check physically about LED status on the PIC_0 ports.
```

#### request chassis port-led (MX10003 Router)

```
user@host> request chassis port-led start fpc-slot 1 pic-slot 1 port 0 duration 5
```

```
Command sent to FPC_1. Check physically about LED status on the PIC_1 ports.
```

#### request chassis port-led (MX10003 Router for all active 100GE ports)

```
user@host> request chassis port-led start fpc-slot 1 pic-slot 1 port all-100g duration 5
```

```
Command sent to FPC_1. Check physically about LED status on the PIC_1 ports.
```

#### request chassis port-led (MX10003 Router for all active 40GE ports)

```
user@host> request chassis port-led start fpc-slot 0 pic-slot 1 port all-40g duration 5
```

```
Command sent to FPC_0. Check physically about LED status on the PIC_1 ports.
```

#### request chassis port-led (MX10003 Router for all the active ports in a PIC)

```
user@host> request chassis port-led start fpc-slot 0 pic-slot 0 port all-ports duration 5
```

```
Command sent to FPC_0. Check physically about LED status on the PIC_0 ports.
```

#### request chassis port-led (MX204 Router for all the active ports in a PIC)

```
user@host> request chassis port-led start fpc-slot 0 pic-slot 0 port all-ports duration 5
```

```
Command sent to FPC_0. Check physically about LED status on the PIC_0 ports.
```

#### request chassis port-led (EX9251 Switch)

```
user@switch> request chassis port-led start fpc-slot 0 pic-slot 0 port all-ports duration 5
```

```
Command sent to FPC_0. Check physically about LED status on the PIC_0 ports.
```

#### request chassis port-led (MX10008 Router with JNP10K-LC2101)

```
user@host> request chassis port-led start fpc-slot 0 pic-slot 2 all-ports duration 15
```

```
Command sent to FPC_0. Check physically about LED status on the PIC_2 ports.
```

## request chassis redundancy feb slot

<b>Syntax</b>	<code>request chassis redundancy feb slot <i>slot-number</i> (switch-to-backup   revert-from-backup)</code>
<b>Release Information</b>	Command introduced in Junos OS Release 8.2.
<b>Description</b>	(M120 routers only) Control the operation of the specified Forwarding Engine Board (FEB) in a redundancy group.
<b>Options</b>	<p><b><i>slot-number</i></b>—FEB slot number. Replace <b><i>slot-number</i></b> with a value from 0 through 5.</p> <p><b><i>switch-to-backup</i></b>—Initiate a switchover from the specified active FEB to the backup FEB for the redundancy group.</p> <p><b><i>revert-from-backup</i></b>—Initiate a revert to the specified FEB following a switchover to the backup FEB for a redundancy group.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show chassis redundancy feb on page 2080</a></li> <li>• <i>Configuring FEB Redundancy on the M120 Router</i></li> <li>• <i>Understanding Switching Control Board Redundancy</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request chassis redundancy feb slot 2 switch-to-backup on page 885</a> <a href="#">request chassis redundancy feb slot 3 revert-to-backup on page 885</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request chassis redundancy feb slot 2 switch-to-backup

```
user@host> request chassis redundancy feb slot 2 switch-to-backup
Switch initiated, use "show chassis redundancy febs" to verify
```

### request chassis redundancy feb slot 3 revert-to-backup

```
user@host> request chassis redundancy feb slot 3 revert-to-backup
Revert initiated, use "show chassis redundancy febs" to verify
```

## request chassis routing-engine master

<b>Syntax (QFX Series)</b>	request chassis routing-engine master (release   switch) <check> <interconnect-device <i>name</i> > <node-group <i>name</i> > <no-confirm>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p><b>all-chassis</b> option added in Junos OS Release 8.0.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.3 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 Universal Routing Platforms.</p>

Command introduced in Junos OS Release 13.2 for MX104 Universal Routing Platforms.  
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.  
 Command introduced in Junos OS Release 17.2 for MX2008 Universal Routing Platforms.  
 Command introduced in Junos OS Release 17.2 for PTX10008 Routers.

**Description** For routers or switches with multiple Routing Engines, control which Routing Engine is the master.

**CAUTION:** (Routing matrix based on the TX Matrix or TX Matrix Plus routers only) Within the routing matrix, we recommend that all Routing Engines run the same Junos OS Release. If you run different releases on the Routing Engines and a change in mastership occurs on any backup Routing Engine in the routing matrix, one or all routers (in a routing matrix based on the TX Matrix router or in a routing matrix based on a TX Matrix Plus router) might become logically disconnected from the TX Matrix router and cause data loss. For more information, see the [TX Matrix Router Hardware Guide](#) or the [High Availability Feature Guide](#).

**NOTE:** Successive graceful Routing Engine switchover events must be a minimum of 240 seconds (4 minutes) apart after both Routing Engines have come up.

If the router or switch displays a warning message similar to “Standby Routing Engine is not ready for graceful switchover. Packet Forwarding Engines that are not ready for graceful switchover might be reset,” do not attempt switchover. If you choose to proceed with switchover, only the Packet Forwarding Engines that were not ready for graceful switchover are reset. None of the Flexible PIC concentrators (FPCs) should spontaneously restart. We recommend that you wait until the warning no longer appears and then proceed with the switchover.

You will receive an error message stating “Command aborted. Not ready for mastership switch, try after n seconds” when this command is re-entered before 240 seconds have elapsed on EX Series switches.

**NOTE:** On a QFabric system, to avoid traffic loss on the network Node group, switch mastership of the routing engine to the backup routing engine, and then reboot.

**Options** **acquire**—Attempt to become the master Routing Engine.

**release**—Request that the other Routing Engine become the master.

**switch**—Toggle mastership between Routing Engines.

**NOTE:** The **acquire** option should be used with caution because acquiring a Routing Engine may result in a corrupted database. If possible, use the **switch** option instead.

The **acquire**, **release**, and **switch** options have the following suboptions:

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) On a routing matrix composed of a TX Matrix router and the attached T640 routers, switch mastership on all the Routing Engines in the routing matrix. Likewise, on a routing matrix composed of a TX Matrix Plus router and the attached T1600 or T4000 routers, switch mastership on all the Routing Engines in the routing matrix.

**all-lcc**—(TX Matrix Plus routers only) Request to acquire mastership for all line-card chassis (LCC).

**all-members**—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines in all member routers of the Virtual Chassis configuration.

**check**—(QFabric systems, MX104, MX480, MX960, MX2010, MX2020, and MX2008 routers, and PTX5000 routers only) (Optional) Available with the **switch**, **release**, and **acquire** options. Check graceful switchover status of the standby Routing Engine before toggling mastership between Routing Engines.

**interconnect-device *name***—(QFabric systems only) (Optional) Control Routing Engine mastership on the Routing Engines on an Interconnect device.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines in the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines of the specified member in the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**no-confirm**—(Optional) Do not request confirmation for the switch.

**node-group *name***—(QFabric systems only) (Optional) Control Routing Engine mastership on the Routing Engines on a Node group.

**scc**—(TX Matrix routers only) TX Matrix (switch-card chassis).

**sfc**—(TX Matrix Plus routers only) TX Matrix Plus router (or switch-fabric chassis).

**Additional Information** Because both Routing Engines are always running, the transition from one to the other as the master Routing Engine is immediate. However, the changeover interrupts communication to the System and Switch Board (SSB). The SSB takes several seconds to reinitialize the Flexible PIC Concentrators (FPCs) and restart the PICs. Interior gateway protocol (IGP) and BGP convergence times depend on the specific network environment.

By default, the Routing Engine in slot 0 (**RE0**) is the master and the Routing Engine in slot 1 (**RE1**) is the backup. To change the default master Routing Engine, include the **routing-engine** statement at the **[edit chassis redundancy]** hierarchy level in the configuration. For more information, see the *Junos OS Administration Library*

To have the backup Routing Engine become the master Routing Engine, use the **request chassis routing-engine master switch** command. If you use this command to change the master and then restart the chassis software for any reason, the master reverts to the default setting.

**NOTE:** Although the configurations on the two Routing Engines do not have to be the same and are not automatically synchronized, we recommend making both configurations the same.

**Required Privilege Level** maintenance

- [request chassis routing-engine master switch check on page 890](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request chassis routing-engine master acquire

```
user@host> request chassis routing-engine master acquire
```

```
warning: Traffic will be interrupted while the PFE is re-initialized
```

```
warning: The other routing engine's file system could be corrupted
```

```
Reset other routing engine and become master ? [yes,no] (no)
```

### request chassis routing-engine master switch

```
user@host> request chassis routing-engine master switch
```

```
warning: Traffic will be interrupted while the PFE is re-initialized
```

```
Toggle mastership between Routing Engines ? [yes,no] (no) yes
```

```
Resolving mastership...
```

```
Complete. The other Routing Engine becomes the master.
```

Switch mastership back to the local Routing Engine:

```
user@host> request chassis routing-engine master switch
```

```
warning: Traffic will be interrupted while the PFE is re-initialized
```

```
Toggle mastership between routing engines ? [yes,no] (no) yes
```

```
Resolving mastership...
```

```
Complete. The local routing engine becomes the master.
```

### request chassis routing-engine master switch check

Usage shown for M Series, MX Series, and T Series routers.

```
{master}[edit]
```

```
user@host> request chassis routing-engine master switch check
```

```
warning: Standby Routing Engine is not ready for graceful switchover.
```

```
{master}[edit]
```

```
user@host> request chassis routing-engine master switch check
```

```
Switchover Ready
```

You can similarly check the backup Routing Engine.

## request chassis scg

<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request chassis sfb

```
user@host> request chassis sfb offline slot 1
Backup SFB 1 cannot be set offline, backup RE is online
```

#### request chassis sfb (MX2010 Routers)

```
user@host> request chassis sfb offline slot 7
```

```
Offline initiated, use "show chassis sfb" to verify
```

#### request chassis sfb (MX2008 Routers)

```
user@host>request chassis sfb offline slot 1
```

```
Offline initiated, use "show chassis sfb" to verify
```

## request chassis sfm master switch

<b>Syntax</b>	<code>request chassis sfm master switch</code> <code>&lt;no-confirm&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	(M40e and M160 routers only) Control which Switching and Forwarding Module (SFM) is master.
<b>Options</b>	<b>no-confirm</b> —(Optional) Do not display a switch warning or query.
<b>Additional Information</b>	<p>By default, the SFM in slot 0 (SFM0) is the master and the SFM in slot 1 (SFM1) is the backup. If you use this command to change the master, and then restart the chassis software for any reason, the master reverts to the default setting. To change the default master SFM, include the <b>sfm</b> statement at the <b>[edit chassis redundancy]</b> hierarchy level in the configuration. For more information, see the <i>Junos OS Administration Library</i>.</p> <p>All installed SFMs are always working together to forward packets. If an SFM fails, the other SFMs take over and traffic continues to flow uninterrupted.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show chassis sfm on page 2121</a></li> <li>• <i>Switching the Global Master and Backup Roles in a Virtual Chassis Configuration</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request chassis sfm master switch on page 895</a> <a href="#">request chassis sfm master switch no-confirm on page 896</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request chassis sfm master switch

```

user@host> request chassis sfm master switch

warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between system forwarding module? [yes,no] (no) yes

Switch initiated, use "show chassis sfm" to verify

```

#### request chassis sfm master switch no-confirm

```
user@host> request chassis sfm master switch no-confirm
```

```
Switch initiated, use "show chassis sfm" to verify
```

## request chassis sfm

<b>Syntax</b>	<code>request chassis sfm (offline   online   restart) slot <i>slot-number</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	(M40e and M160 routers only) Control the operation of the specified Switching and Forwarding Module (SFM).
<b>Options</b>	<p><b>offline</b>—Take the SFM offline.</p> <p><b>online</b>—Bring the SFM online.</p> <p><b>restart</b>—Restart the SFM.</p> <p><b>slot <i>slot-number</i></b>—SFM slot number. Replace <i>slot-number</i> with a value from 0 through 3.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show chassis sfm on page 2121</a></li> <li>• <i>Configuring SFM Redundancy on M40e and M160 Routers</i></li> <li>• <i>M40e Switching and Forwarding Module (SFM) Description</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request chassis sfm (M40e) on page 897</a> <a href="#">request chassis sfm (M160) on page 897</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request chassis sfm (M40e)

```
user@host> request chassis sfm slot 1 restart
M40e router:
error: SFM 0 is transitioning to online state.
```

### request chassis sfm (M160)

```
user@host> request chassis sfm slot 1 restart
M160 router:
Restart initiated, use "show chassis sfm" to verify
```

## request chassis sib

<b>List of Syntax</b>	<a href="#">Syntax on page 898</a> <a href="#">Syntax (TX Matrix Router) on page 898</a> <a href="#">Syntax (TX Matrix Plus Router) on page 898</a>
<b>Syntax</b>	<code>request chassis sib (offline   online) slot <i>slot-number</i></code>
<b>Syntax (TX Matrix Router)</b>	<code>request chassis sib (all-chassis   lcc <i>number</i>   scc) (offline   online) slot <i>slot-number</i> (start-receiver <i>number</i>   stop-receiver <i>number</i>)</code>
<b>Syntax (TX Matrix Plus Router)</b>	<code>request chassis sib (all-lcc   f13 <i>slot-number</i>   f2s <i>sib-slot/sib-f2s-slot-number</i>   lcc <i>number</i>   (offline   online) slot <i>slot-number</i>)</code>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p><b>f13</b> and <b>f2s</b> options for the TX Matrix Plus router introduced in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 17.2 for PTX10008 Routers.</p>
<b>Description</b>	(M320 routers and T Series routers only) Control the operation of the specified Switch Interface Board (SIB).
<b>Options</b>	<p><b>all-chassis</b>—(TX Matrix routers only) Control the status of the specified SIB.</p> <p><b>all-lcc</b>—(TX Matrix Plus router only) On TX Matrix Plus router, control the operation of the SIB on all routers connected to the TX Matrix Plus router.</p> <p><b>f13 <i>slot-number</i></b>—Control the operation of F13 SIBs. Replace <i>slot-number</i> with a value <b>0</b>, <b>1</b>, <b>3</b>, <b>4</b>, <b>6</b>, <b>7</b>, <b>8</b>, <b>9</b>, <b>11</b>, or <b>12</b>.</p> <p><b>f2s <i>sib-slot/sib-f2s-slot-number</i></b>—(TX Matrix Plus routers only) (Optional) Control the operation of the SIB F2s. Replace <i>sib-slot</i> with a value from <b>0</b> through <b>4</b>, followed by a <i>sib-f2s-slot-number</i> value <b>0</b>, <b>2</b>, <b>4</b> or <b>6</b>.</p> <p><b>lcc <i>number</i></b>—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> <li>0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.</li> <li>0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.</li> </ul>

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**scc**—(TX Matrix router only) TX Matrix router (switch-card chassis) on a routing matrix.

**offline**—Take the SIB offline.

**NOTE:** In PTX Series (PTX3000 and PTX5000) and T Series (T640 and T1600) Routers with active PFE interfaces, when the last SIB is taken offline, a message displays that if no SIB is brought online within 10 seconds, the system will take action to address the fabric black hole condition. Taking all SIBs offline in these PTX Series or T Series Routers with active PFE interfaces results in traffic black hole condition, and the software takes action to rectify this condition if it persists for more than 10 seconds. If these routers do not have active PFE interfaces, taking all SIBs offline does not result in black hole condition, and the message is not displayed when the last active SIB is taken offline. For details on black hole condition, see [“Fabric Resiliency and Degradation” on page 132](#).

**online**—Bring the SIB online.

**slot *slot-number***—SIB slot number. For the T320 router, replace *slot-number* with a value from 0 through 2. For the T640 router, TX Matrix router, and T1600 router in a routing matrix, replace *slot-number* with a value from 0 through 4.

**start-receiver *number***—(TX Matrix routers only) Start the SIB optical receiver. Replace *number* with a value from 0 through 3.

**stop-receiver *number***—(TX Matrix routers only) Stop the SIB optical receiver. Replace *number* with a value from 0 through 3.

**Required Privilege Level** maintenance

## request chassis sib f13 train-link-receive slot

<b>List of Syntax</b>	<a href="#">Syntax on page 901</a> <a href="#">Syntax (TX Matrix Plus Router) on page 901</a>
<b>Syntax</b>	<code>request chassis sib f13 train-link-receive slot <i>SFC-SIB-F13-slot-num</i></code>
<b>Syntax (TX Matrix Plus Router)</b>	<code>request chassis sib f13 train-link-receive slot <i>SFC-SIB-F13-slot-num</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.1.
<b>Description</b>	(TX Matrix Plus router only) Control the receiving link of the specified Switch Interface Board (SIB) of the SFC.
<b>Options</b>	<code>slot <i>SFC-SIB-F13-slot-num</i></code> — SFC SIB slot number. Replace it with 0, 3, 6, 8 or 11.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request chassis sib f13 train-link-transmit slot on page 902</a></li> <li>• <a href="#">Configuring Junos OS to Upgrade the T1600 Router Chassis to LCC0 of a TX Matrix Plus Routing Platform on page 407</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request chassis sib f13 train-link-receive slot on page 901</a>
<b>Output Fields</b>	When you enter this command, the SFC is ready to receive traffic from the T1600 or T4000 router (LCC).

## Sample Output

### request chassis sib f13 train-link-receive slot

```
user@host> request chassis sib f13 train-link-receive slot 0
```

## request chassis sib f13 train-link-transmit slot

---

<b>Syntax</b>	<code>request chassis sib f13 train-link-transmit slot <i>SFC-SIB-F13-slot-num</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.1.
<b>Description</b>	(TX Matrix Plus router only) Control the transmission link of the specified Switch Interface Board (SIB) of the SFC.
<b>Options</b>	<b>slot</b> <i>SFC-SIB-F13-slot-num</i> —SFC SIB slot number. Replace it with 0, 3, 6, 8 or 11.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">request chassis sib f13 train-link-receive slot on page 901</a></li><li>• <a href="#">Configuring Junos OS to Upgrade the T1600 Router Chassis to LCC0 of a TX Matrix Plus Routing Platform on page 407</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request chassis sib f13 train-link-transmit slot on page 902</a>
<b>Output Fields</b>	When you enter this command, the SFC is ready to transmit traffic to the T1600 or T4000 router (LCC).

## Sample Output

### request chassis sib f13 train-link-transmit slot

```
user@host> request chassis sib f13 train-link-transmit slot 0
```

## request chassis sib optics lcc

<b>Syntax</b>	<code>request chassis sib optics lcc <i>number</i> sib-slot <i>number</i> optics-slot <i>number</i> ( enable   disable)</code>
<b>Release Information</b>	Command introduced in Junos OS Release 13.1 for TX Matrix Routers with 3D SIBs.
<b>Description</b>	(TX Matrix Plus routers with 3D SIBs only) Control the operation of the high-speed links on the LCCs by enabling or disabling the high-speed links.
<b>Options</b>	<p><b>lcc <i>number</i></b>—Line-card chassis number. Replace the <i>number</i> with the following values depending on the LCC configuration.</p> <ul style="list-style-type: none"> <li>0 through 7, T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.</li> <li>0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.</li> </ul> <p><b>sib-slot <i>number</i></b>—SIB slot number. Replace the <i>number</i> with a value from 0 to 15.</p> <p><b>optics-slot <i>number</i></b>—Optics slot number for high-speed link cable. Replace the <i>number</i> with a value from 0 to 15.</p> <p><b>enable</b>—Start the high-speed linkss on the cables and enable the FPCs.</p> <p><b>disable</b>—Disable the FPCs and stop the high-speed links on the cables.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>show chassis fabric optical-links</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request chassis sib optics lcc on page 903</a> <a href="#">request chassis sib optics lcc on page 904</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request chassis sib optics lcc

```
user@host> request chassis sib optics lcc 7 optics-slot 6 sib-slot 6 enable
Optics 6 enable initiated, use "show chassis fabric optical-links detail" to
verify
```

### request chassis sib optics lcc

```
user@host> request chassis sib optics lcc 7 optics-slot 6 sib-slot 6 disable
```

```
Optics 6 disable initiated, use "show chassis fabric optical-links detail" to  
verify
```

## request chassis sib optics sfc

<b>Syntax</b>	<code>request chassis sib optics sfc <i>slot-number</i> sib-slot <i>number</i> optics-slot <i>number</i> ( enable   disable )</code>
<b>Release Information</b>	Command introduced in Junos OS Release 13.1 for TX Matrix Routers with 3D SIBs.
<b>Description</b>	(TX Matrix Plus routers with 3D SIBs only) Control the operation of the high-speed links on the SIBs by enabling or disabling the high-speed links.
<b>Options</b>	<p><b>sfc <i>slot-number</i></b>—SFC slot number. Replace the <i>slot-number</i> with 0.</p> <p><b>sib-slot <i>number</i></b>—SIBslot number. Replace the <i>number</i> with a value from 0 to 15.</p> <p><b>optics-slot <i>number</i></b>—Optics slot number for high-speed link cable. Replace the <i>number</i> with a value from 0 to 15.</p> <p><b>enable</b>—Start the high-speed links on the cables and enable the FPCs.</p> <p><b>disable</b>—Disable the FPCs and stop the HSLs on the cables.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">show chassis fabric optical-links</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request chassis sib optics sfc on page 905</a> <a href="#">request chassis sib optics sfc on page 905</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request chassis sib optics sfc

```
user@host> request chassis sib optics sfc 0 optics-slot 6 sib-slot 6 enable
Optics 6 enable initiated, use "show chassis fabric optical-links detail" to
verify
```

### request chassis sib optics sfc

```
user@host> request chassis sib optics sfc 0 optics-slot 6 sib-slot 6 disable
Optics 6 disable initiated, use "show chassis fabric optical-links detail" to
verify
```

## request chassis sib train-link-receive slot

---

<b>Syntax</b>	<code>request chassis sib train-link-receive slot <i>LCC-SIB-ST-SIB-L-slot-num</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.1.
<b>Description</b>	(T1600 Router (LCC), T4000 Router (LCC), and TX Matrix Plus router only) Control the receiving link of the specified Switch Interface Board (SIB) of the LCC.
<b>Options</b>	<b>slot</b> <i>LCC-SIB-ST-SIB-L-slot-num</i> — LCC SIB slot number. Replace it with a value from 0 through 4.

user@host>request chassis spmb restart slot 0
Restart initiated, use "show chassis spmb" to verify
```

## request chassis synchronization mode

---

<b>Syntax</b>	<code>request chassis synchronization mode (free-run   holdover   auto-select)</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.2R4 for MX Series 5G Universal Routing Platforms.
<b>Description</b>	(MX5-T, MX10-T, MX40-T, MX80, MX80-T, MX240, MX480, and MX960 routers only) Change the chassis synchronization source used for Synchronous Ethernet configuration.
<b>Options</b>	<b>freerun</b> —Change chassis synchronization to free-run mode. <b>holdover</b> —Change chassis synchronization to holdover mode. <b>auto-select</b> —Change chassis synchronization to auto-select mode.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Synchronous Ethernet Overview on page 242</a></li><li>• <a href="#">Configuring an External Clock Synchronization Interface for MX Series Routers on page 293</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request chassis synchronization mode freerun on page 910</a> <a href="#">request chassis synchronization mode holdover on page 910</a> <a href="#">request chassis synchronization mode auto-select on page 911</a>
<b>Output Fields</b>	When you enter this command, the current status of your request is displayed. <ul style="list-style-type: none"><li>• <b>Not configured</b>—Indicates that the source is not configured.</li><li>• <b>Present</b>—Indicates that the source is configured and present.</li><li>• <b>Qualified</b>—Indicates that the source is being used for synchronization.</li></ul>

### Sample Output

#### request chassis synchronization mode freerun

```
user@host> request chassis synchronization mode freerun
mode is freerun, status: qualified
```

### Sample Output

#### request chassis synchronization mode holdover

```
user@host> request chassis synchronization mode holdover
```

```
mode is holdover, status: qualified
```

## Sample Output

**request chassis synchronization mode auto-select**

```
user@host> request chassis synchronization mode auto-select  
mode is auto-select, status: qualified
```

## request chassis synchronization switch

**List of Syntax**    [Syntax on page 912](#)  
                          [Syntax \(M Series, T Series\) on page 912](#)  
                          [Syntax \(PTX Series\) on page 912](#)

**Syntax**    request chassis synchronization switch

**Syntax (M Series, T Series)**    request chassis synchronization switch (external-a | external-b)

**Syntax (PTX Series)**    request chassis synchronization switch (bits-a | bits-b | fpc-slot-number | gps-0 | gps-1 )

**Release Information**    Command introduced in Junos OS Release 7.6.  
                          Command introduced in Junos OS Release 8.3 for M40e routers.  
                          Command introduced in Junos OS Release 9.3 for M120 routers.  
                          Command introduced in Junos OS Release 10.2 for T320, T640, and T1600 routers.  
                          Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Routers.  
                          Command introduced in Junos OS Release 17.2 for PTX10008 Routers.

**Description**    (M320, M40e, M120, T320, T640, and T1600 routers and PTX Packet Transport Routers only) Change the external clock source used for chassis synchronization.

**Options**    **external-a**—(Routing matrix only) Change the synchronization source to external source A.

**external-b**—(Routing matrix only) Change the synchronization source to external source B.

**bits-a**—(PTX Series only) Change the synchronization source to the BITS external source A.

**bits-b**—(PTX Series only) Change the synchronization source to the BITS external source B.

**fpc-slot-number**—(PTX Series only) Change the synchronization source to an FPC in the slot specified. For the PTX5000 Packet Transport Router, replace *slot-number* with a value from 0 through 7.

**gps-0-10mhz**—(PTX Series only) Change the synchronization source to the 10 MHz GPS source on CCG port 0.

**gps-0-5mhz**—(PTX Series only) Change the synchronization source to the 5 MHz GPS source on CCG port 0.

**gps-1-10mhz**—(PTX Series only) Change the synchronization source to the 10 MHz GPS source on CCG port 1.

**gps-1-5mhz**—(PTX Series only) Change the synchronization source to the 5 MHz GPS source on CCG port 1.

**Required Privilege Level** maintenance

**List of Sample Output** [request chassis synchronization switch \(M Series, T Series\) on page 913](#)  
[request chassis synchronization switch \(PTX Series\) on page 913](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. **Not configured** indicates that the source is not configured. **Present** indicates that the source is configured and present. **Qualified** indicates that the source is being used for synchronization.

## Sample Output

### [request chassis synchronization switch \(M Series, T Series\)](#)

```
user@host> request chassis synchronization switch external-a
switching to external-a, status: qualified
```

### [request chassis synchronization switch \(PTX Series\)](#)

```
user@host> request chassis synchronization switch fpc-2
switching to fpc-2, status: qualified
```

## set chassis display message

<b>List of Syntax</b>	<a href="#">Syntax on page 914</a> <a href="#">Syntax (TX Matrix Router) on page 914</a> <a href="#">Syntax (TX Matrix Plus Router) on page 914</a>
<b>Syntax</b>	<pre>set chassis display message "message" &lt;permanent&gt;</pre>
<b>Syntax (TX Matrix Router)</b>	<pre>set chassis display message "message" (lcc number   scc) &lt;permanent&gt;</pre>
<b>Syntax (TX Matrix Plus Router)</b>	<pre>set chassis display message "message" (fpc-slot slot-number   lcc number   sfc number) &lt;permanent&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option for TX Matrix Plus router introduced in Junos OS Release 9.6.</p>
<b>Description</b>	<p>Display or stop a text message on the craft interface display, which is on the front of the router, or on the LCD panel display on the switch. The craft interface alternates the display of text messages with standard craft interface messages three times, switching between messages every 60 seconds.</p>
	<p> <b>NOTE:</b> On T Series routers, when this command is executed with the <b>permanent</b> option, the display of the text message alternates with that of the standard craft interface message continuously every 60 seconds.</p>
	<p>By default, on both the router and the switch, the text message is displayed for 5 minutes. The craft interface display has four 20-character lines. The LCD panel display has two 16-character lines, and text messages appear only on the second line.</p>
<b>Options</b>	<p><b>"message"</b>—Message to display. On the craft interface display, if the message is longer than 20 characters, it wraps onto the next line. If a word does not fit on one line, the entire word moves down to the next line. Any portion of the message that does not fit on the display is truncated. An empty pair of quotation marks (" ") deletes the text message from the craft interface display. On the LCD panel display, the message is limited to 16 characters.</p> <p><b>fpc-slot slot-number</b>—(TX Matrix Plus routers and EX4200 and QFX Series only) On the router or switch, display the text message on the craft interface for a specific Flexible PIC Concentrator (FPC). Replace <b>slot-number</b> with a value from <b>0</b> through <b>31</b>. On the switch, display the text message for a specific member of a Virtual Chassis, where</p>

**fpc-slot** *slot-number* corresponds to the member ID. Replace *slot-number* with a value from 0 through 9. On the QFX Series, the *slot-number* is always 0. On a TX Matrix Plus router with 3D SIBs replace *slot-number* with a value from 0 through 63.

**lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**permanent**—(Optional) Display a text message on the craft interface display or LCD panel display permanently.

**scc**—(TX Matrix routers only) Display the text message on the craft interface display of the TX Matrix router (switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) Display the text message on the craft interface display of the TX Matrix Plus router (or switch-fabric chassis).

**Required Privilege Level** clear

**Output Fields** See [show chassis craft-interface](#) for an explanation of output fields.

## Sample Output

### set chassis display message (Creating)

The following example shows how to set the display message and verify the result:

```
user@host> set chassis display message "NOC contact Dusty (888) 555-1234"
```

```
message sent
```

```
user@host> show chassis craft-interface
```

```
Red alarm:    LED off, relay off
Yellow alarm: LED off, relay off
Host OK LED:  On
Host fail LED: Off
FPCs         0 1 2 3 4 5 6 7
```

```
-----
Green .. *.. * *.
Red      .....
```

```
LCD screen:
```

```
+-----+
|NOC contact Dusty |
|(888) 555-1234    |
+-----+
```

### set chassis display message (Deleting)

The following example shows how to delete the display message and verify that the message is removed:

```
user@host> set chassis display message ""
```

```
message sent
```

```
user@host> show chassis craft-interface
```

```
Red alarm:    LED off, relay off
Yellow alarm: LED off, relay off
Host OK LED:  On
Host fail LED: Off
FPCs         0 1 2 3 4 5 6 7
```

```
-----
Green .. *.. * *.
Red      .....
```

```

<b>Output Fields</b>	Table 91 on page 920 lists the output fields for the <b>show chassis adc</b> command. Output fields are listed in the approximate order in which they appear.

Table 91: show chassis adc Output Fields

Field Name	Field Description
Slot	Slot number.

Table 91: show chassis adc Output Fields (continued)

Field Name	Field Description
<b>State</b>	Status of the adapter card. <ul style="list-style-type: none"> <li>• <b>Online</b>—The adapter card is online and running.</li> <li>• <b>Offline</b>—Adapter card is powered down.</li> </ul>
<b>Uptime</b>	How long the Routing Engine has been connected to the adapter card and, therefore, how long the adapter card has been up and running.
<b>GNF (Node slicing)</b>	GNF identifier for each ADC.

## Sample Output

### show chassis adc (MX2020 Router)

```
user@host> show chassis adc
```

Slot	State	Uptime
0	Online	1 hour, 21 minutes, 7 seconds
1	Online	1 hour, 21 minutes, 3 seconds
2	Online	1 hour, 20 minutes, 59 seconds
3	Online	1 hour, 20 minutes, 54 seconds
4	Online	1 hour, 20 minutes, 50 seconds
5	Online	1 hour, 20 minutes, 46 seconds
6	Online	1 hour, 20 minutes, 42 seconds
7	Online	1 hour, 20 minutes, 37 seconds
8	Online	1 hour, 20 minutes, 33 seconds
9	Online	1 hour, 20 minutes, 28 seconds
10	Online	1 hour, 20 minutes, 24 seconds
11	Online	1 hour, 20 minutes, 19 seconds
12	Online	1 hour, 20 minutes, 15 seconds
13	Online	1 hour, 20 minutes, 8 seconds
14	Online	1 hour, 20 minutes, 4 seconds
15	Online	1 hour, 19 minutes, 59 seconds
16	Online	1 hour, 19 minutes, 55 seconds
17	Online	1 hour, 19 minutes, 50 seconds
18	Online	1 hour, 19 minutes, 45 seconds
19	Online	1 hour, 19 minutes, 39 seconds

### show chassis adc (MX2010 Router)

```
user@host > show chassis adc
```

Slot	State	Uptime
0	Online	12 hours, 17 minutes, 38 seconds
1	Online	12 hours, 17 minutes, 30 seconds
2	Online	12 hours, 17 minutes, 22 seconds
3	Online	12 hours, 17 minutes, 14 seconds
4	Online	12 hours, 17 minutes, 6 seconds
5	Online	12 hours, 16 minutes, 58 seconds
6	Online	12 hours, 16 minutes, 49 seconds
7	Online	12 hours, 16 minutes, 41 seconds
8	Online	12 hours, 16 minutes, 33 seconds
9	Online	12 hours, 16 minutes, 25 seconds

### show chassis adc (MX2008 Router)

```
user@host > show chassis adc
```

Slot	State	Uptime
0	Empty --- Native line card ---	
1	Empty --- Native line card ---	
2	Empty	
3	Empty	
4	Empty	
5	Empty	
6	Empty	
7	Online 1 hour, 14 minutes, 32 seconds	
8	Empty	
9	Empty	

### show chassis adc (Node Slicing)

```
user@router> show chassis adc
```

Slot	State	Uptime	GNF
0	Online	12 hours, 57 minutes, 46 seconds	3
1	Empty	--- Native line card ---	2
2	Online	12 hours, 57 minutes, 18 seconds	3
3	Online	11 minutes, 23 seconds	6
4	Empty	--- Native line card ---	6
5	Empty	--- Native line card ---	4
6	Online	13 hours, 38 minutes, 58 seconds	1
7	Online	13 hours, 3 minutes, 40 seconds	5
8	Empty	--- Native line card ---	5
9	Empty	--- Native line card ---	5

## show chassis afeb

<b>Syntax</b>	show chassis afeb
<b>Release Information</b>	Command introduced in Junos OS Release 13.2.
<b>Description</b>	Display compact Forwarding Engine Board status.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request chassis afeb on page 839</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show chassis afeb (MX104 Router) on page 924</a>
<b>Output Fields</b>	<a href="#">Table 92 on page 923</a> lists the output fields for the <b>show chassis afeb</b> command. Output fields are listed in the approximate order in which they appear.

Table 92: show chassis afeb

Field Name	Field Description
<b>State</b>	State of the compact Forwarding Engine Board: <ul style="list-style-type: none"> <li>• <b>Offline</b>—FEB is powered down.</li> <li>• <b>Online</b>—FEB is operational and running.</li> <li>• <b>Check</b>—FEB is in alarmed state because of the following reasons:               <ul style="list-style-type: none"> <li>• Hardware error.</li> <li>• PFE is unable to boot.</li> </ul> </li> </ul>
<b>Temperature</b>	Temperature of the air passing by the FEB, in degrees Celsius or in both degrees Celsius and degrees Fahrenheit.
<b>CPU Utilization</b>	Total percentage of CPU being used.
<b>Interrupt Utilization</b>	Of the total CPU being used by the FEB processor, the percentage being used for interrupts.
<b>Heap Utilization</b>	Percentage of heap space (dynamic memory) being used by the FEB processor. If this number exceeds 80 percent, you might experience a software problem (memory leak).
<b>Buffer Utilization</b>	Percentage of buffer space being used by the FEB processor for buffering internal messages.
<b>Total CPU DRAM</b>	Total DRAM, in megabytes, available to the FEB processor.
<b>Start time</b>	Time when the Routing Engine detected that the FEB was running.

*Table 92: show chassis afeb (continued)*

Field Name	Field Description
<b>Uptime</b>	How long the Routing Engine has been connected to the FEB and, therefore, how long the compact Forwarding Engine Board has been up and running.

---

## Sample Output

### show chassis afeb (MX104 Router)

```
user@host> show chassis afeb
FEB status:
Slot 0 information:
  State                Online
  Temperature          31 degrees C / 87 degrees F
  CPU utilization       3 percent
  Interrupt utilization 0 percent
  Heap utilization      11 percent
  Buffer utilization     13 percent
  Total CPU DRAM        2048 MB
  Start time:           2013-05-27 08:50:03 IST
  Uptime:               3 hours, 29 minutes, 34 seconds
```

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option introduced in Junos OS Release 9.6 for the TX Matrix Plus router.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Routers.</p> <p>Command introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX 2010 and MX2020 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 13.2 for MX104 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p> <p><b>satellite</b> option introduced in Junos OS Release 14.2R3 for Junos Fusion.</p> <p>Command introduced in Junos OS Release 17.2 for MX2008 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 17.2 for PTX10008 Routers.</p> <p>Command introduced in Junos OS Release 17.3 for MX150 Router Appliance.</p> <p>Command introduced in Junos OS Release 17.3 for MX10003 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 17.4 for MX204 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 18.1R1 for EX9251 Switches.</p> <p>Command introduced in Junos OS Release 18.2 for EX9253 Switches.</p> <p>Command introduced in Junos OS Release 18.2R1 for MX10008 Universal Routing Platforms.</p>
Description	Display information about the conditions that have been configured to trigger alarms.
Options	<p><b>none</b>—Display information about the conditions that have been configured to trigger alarms.</p> <p><b>all-members</b>—(MX Series routers only) (Optional) Display information about alarm conditions for all the member routers of the Virtual Chassis configuration.</p> <p><b>interconnect-device <i>name</i></b>—(QFabric systems only) (Optional) Display information about alarm conditions for the Interconnect device.</p> <p><b>lcc <i>number</i></b>—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.</p>

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display information about alarm conditions for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display information about alarm conditions for the specified member of the Virtual Chassis configuration. Replace *member-id* variable with a value of 0 or 1.

**node-device *name***—(QFabric systems only) (Optional) Display information about alarm conditions for the Node device.

**satellite [*slot-id slot-id*]**—(Junos Fusion only) (Optional) Display information about alarm conditions for the specified satellite device in a Junos Fusion, or for all satellite devices in the Junos Fusion if no satellite devices are specified.

**scc**—(TX Matrix router only) (Optional) Show information about the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus router only) (Optional) Show information about the respective TX Matrix Plus router, which is the switch-fabric chassis. Replace *number* variable with 0.

**Additional Information** Chassis alarms are preset. You cannot modify them.

You cannot clear the alarms for chassis components. Instead, you must remedy the cause of the alarm. When a chassis alarm LED is lit, it indicates that you are running the router or switch in a manner that we do not recommend.

On routers, you can manually silence external devices connected to the alarm relay contacts by pressing the alarm cutoff button, located on the craft interface. Silencing the device does not remove the alarm messages from the display (if present on the router) or extinguish the alarm LEDs. In addition, new alarms that occur after you silence an external device reactivate the external device.

**NOTE:** MX10003 routers do not support craft interface.

In Junos OS release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.

In Junos OS Release 11.2 and later, the command output on EX8200 switches shows the detailed location (**Plane/FPC/PFE**) for link errors in the chassis.

In Junos OS Release 10.2 and later, an alarm is shown on T Series routers for a standby SONET Clock Generator (SCG) that is offline or absent.

You may often see the following error messages, in which only the error code is shown and no other information is provided:

```
Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major Errors
- Error code: 257
Apr 12 08:04:19 send: red alarm set, device FPC 1, reason FPC 1 Major Errors
- Error code: 559
```

To understand what CM\_ALARM error codes mean, you need to first identify the structure of the CM Alarm codes. A CM\_ALARM code has the following structure:

Bits:	Error type:
1-31	Major (1)
0	Minor (0)

According to the table above, the LSB (bit 0) identifies the **Error Type** (major alarm, if the bit is set and minor alarm if the bit is unset). The rest of the bits (1 - 31) identify the actual error code.

Take an example of the following error code, which was logged on a T1600:

```
Apr 12 08:04:10 send: red alarm set, device FPC 1, reason FPC 1 Major Errors
- Error code: 559
```

First, you have to convert 559 to binary; that is **1000101111**. The LSB in this case is 1, which means that this is a major alarm. After removing the LSB, you are left with **100010111**, which is equal to 279 in decimal. This is the actual error code, its meaning can be found from the following list:

Chip Type: L Chip	Code
CMALARM_LCHIP_LOUT_DESRD_PARITY_ERR	1
CMALARM_LCHIP_LOUT_DESRD_UNINIT_ERR	2
CMALARM_LCHIP_LOUT_DESRD_ILLEGALLINK_ERR	3

According to the table above, the **279** error code corresponds to **CMALARM\_NCHIP\_DBUF\_CRC\_ERR**; this means that new CRC errors were seen on the NCHIP of this particular FPC, which is FPC as per the logs.

If you do not want to convert decimal to binary and vice versa, you may use the following shortcut:

For major alarms, the **Actual Error Code = (Error Code - 1)/2**, where **Error Code** is the code that you get in the log message. For example, if you get the following log:

```
Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major
Errors - Error code: 257
```

Actual Error Code =  $(257-1)/2 = 128$ . Similarly, for minor alarms, Actual Error Code =  $(\text{Error Code})/2$

**NOTE:** Starting in Junos OS Release 18.2R1, on MX Series routers, the **show chassis alarms** output does not display error codes for PFE-related errors. You can use the following commands to view more details of the errors that caused the alarms:

- **show chassis errors active**
- **show chassis errors active detail**

**Required Privilege Level** view

**Output Fields** Table 93 on page 933 lists the output fields for the **show chassis alarms** command. Output fields are listed in the approximate order in which they appear.

*Table 93: show chassis alarms Output Fields*

Field Name	Field Description
Alarm time	Date and time the alarm was first recorded.
Class	Severity class for this alarm: <b>Minor</b> or <b>Major</b> .
Description	Information about the alarm.

## Sample Output

### show chassis alarms (Alarms Active)

```
user@host> show chassis alarms
3 alarms are currently active
Alarm time      Class  Description
2000-02-07 10:12:22 UTC Major fxp0: ethernet link down
2000-02-07 10:11:54 UTC Minor YELLOW ALARM - PEM 1 Removed
2000-02-07 10:11:03 UTC Minor YELLOW ALARM - Lower Fan Tray Removed
```

### show chassis alarms (No Alarms Active)

```
user@host> show chassis alarms
No alarms are currently active
```

### show chassis alarms (Fan Tray)

```
user@host> show chassis alarms
4 alarms currently active
Alarm time      Class  Description
2010-11-11 20:27:38 UTC Major Side Fan Tray 7 Failure
2010-11-11 20:27:13 UTC Minor Side Fan Tray 7 Overspeed
2010-11-11 20:27:13 UTC Major Side Fan Tray 5 Failure
2010-11-11 20:27:13 UTC Major Side Fan Tray 0 Failure
```

### show chassis alarms (MX150)

```
user@host > show chassis alarms
1 alarms currently active
Alarm time      Class  Description
2016-06-04 01:49:43 PDT Major Fan Tray 1 Fan 0 failed
```

No alarms currently active

```

**show chassis alarms (MX960, MX480, and MX240 Routers showing Major CB Failure)**

A major CB 0 failure alarm occurs in the event of a bad CB (unknown or mismatched CBs do not trigger this alarm in Junos Release OS 12.3R9 and later). Following GRES or recovery, if the hardware issue persists, the traffic moves to the good CB and continues. If the alarm was triggered by something transient like a power zone budget on GRES, bringing the CB back online can clear the alarm. Otherwise, replace the bad CB. Note that fabric link speed is not impacted by an offline SCB. The alarm might be raised on CB0, CB1, and CB2.

### show chassis alarms (Alarms on a T4000 Router After the enhanced-mode Statement is Enabled)

To enable improved virtual private LAN service (VPLS) MAC address learning on T4000 routers, you must include the **enhanced-mode** statement at the **[edit chassis network-services]** hierarchy level and reboot the router. When router reboots, only the T4000 Type 5 FPCs are required to be present on the router. If there are any other FPCs (apart from T4000 Type 5 FPCs) on the T4000 router, such FPCs become offline, and FPC misconfiguration alarms are generated. The **show chassis alarm** command output displays FPC misconfiguration (**FPC *fpc-slot* misconfig**) as the reason for the generation of the alarms.

### show chassis alarms (PDU Converter Failed Alarm on a PTX5000 Packet Transport Router with FPC2-PTX-PIA)

The **PDU Converter Failed** alarm is raised when one or more 36 V booster converter of a DC PDU fails. If two or more 36 V booster converter fails, fan trays fail and the router might get over heated. Therefore, when this alarm is raised, check the PDU and replace it, if required.

```
user@host> show chassis alarms
```

```

11 alarms currently active

```

### show chassis alarms (MX10003 Router)

If LCMD is down on the backup RE, then the following alarm is seen on the Master.

```
user@host> show chassis alarms
```

```
1 alarm currently active
Alarm time      Class  Description
2017-05-09 13:26:27 PDT Major  VMHost RE 1 host application failed
```

If LCMD is down on the master, then following alarms are displayed.

```
user@host> show chassis alarms
```

```
3 alarms currently active
Alarm time      Class  Description
2017-05-10 14:12:21 PDT Major  VMHost RE 0 host application failed
2017-05-10 14:12:16 PDT Minor  LCM Peer Absent
2017-05-09 13:26:27 PDT Major  VMHost RE 1 host application failed
```

If the LCMD process is crashing on the master, the system will switchover after one minute provided the backup RE LCMD connection is stable. The system will not switchover under the following conditions: if the backup RE LCMD connection is unstable or if the current master just gained mastership. When the master has just gained mastership, the switchover happens only after four minutes.

The LCM peer connection un-stable alarm is raised when the LCMD-CHASD IPC communication flaps three times within a small interval of two to three minutes. Once LCM peer connection un-stable alarm is raised, the connection status is monitored for two minutes.

```
user@host> show chassis alarms
```

```
7 alarms currently active
Alarm time      Class  Description
2017-05-29 10:12:17 PDT Minor  LCM Peer Connection un-stable
2017-05-29 09:04:17 PDT Minor  PEM 8 Not Powered
2017-05-29 09:04:17 PDT Minor  PEM 9 Not Powered
2017-05-29 09:04:17 PDT Minor  PEM 7 Not Powered
2017-05-29 09:04:17 PDT Minor  PEM 3 Not Powered
2017-05-29 09:04:17 PDT Minor  PEM 0 Not Powered
2017-05-29 09:04:08 PDT Minor  Loss of communication with Backup RE
```

If there are no more connection flaps within this two minutes time interval, the LCM peer connection un-stable alarm is cleared.

```
6 alarms currently active
Alarm time      Class  Description
2017-05-29 09:04:17 PDT Minor  PEM 8 Not Powered
2017-05-29 09:04:17 PDT Minor  PEM 9 Not Powered
2017-05-29 09:04:17 PDT Minor  PEM 7 Not Powered
2017-05-29 09:04:17 PDT Minor  PEM 3 Not Powered
2017-05-29 09:04:17 PDT Minor  PEM 0 Not Powered
2017-05-29 09:04:08 PDT Minor  Loss of communication with Backup RE
```

A major alarm is raised even if there is on one PLL lock error, and this alarm can be cleared only through an FPC restart.

```
user@host> show chassis alarms
```

```
4 alarms currently active
```

Alarm time	Class	Description

## show chassis cfeb

<b>Syntax</b>	show chassis cfeb
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	(M7i and M10i routers only) Display status information about the Compact Forwarding Engine Board (CFEB).
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request chassis cfeb on page 845</a></li> <li>• <i>Configuring CFEB Redundancy on the M10i Router</i></li> <li>• <i>CFEB Overview</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show chassis cfeb (M7i) on page 946</a> <a href="#">show chassis cfeb (M10i) on page 946</a>
<b>Output Fields</b>	Table 94 on page 945 lists the output fields for the <b>show chassis cfeb</b> command. Output fields are listed in the approximate order in which they appear.

Table 94: show chassis cfeb Output Fields

Field Name	Field Description
<b>State</b>	Status of the CFEB: <ul style="list-style-type: none"> <li>• <b>Online</b>—CFEB is online and running.</li> <li>• <b>Offline</b>—CFEB is powered down.</li> </ul>
<b>Intake Temperature</b>	Temperature of the air before flowing past the CFEB.
<b>Exhaust Temperature</b>	Temperature of the air after flowing past the CFEB.
<b>CPU utilization</b>	Percentage of CPU being used by the CFEB processor.
<b>Interrupt utilization</b>	Of the total CPU being used by the CFEB processor, the percentage being used for interrupts
<b>Heap Utilization</b>	Percentage of heap space (dynamic memory) being used by the CFEB processor. If this number exceeds 80 percent, there may be a software problem (memory leak).

Table 94: show chassis cfep Output Fields (continued)

Field Name	Field Description
<b>Buffer Utilization</b>	Percentage of buffer space being used by the CFEB processor for buffering internal messages
<b>Total CPU DRAM</b>	Amount of DRAM available to the CFEB CPU.
<b>Internet Processor II</b>	Information about the CFEB processor.
<b>Start time</b>	Time when the Routing Engine detected that the CFEB was running.
<b>Uptime</b>	How long the Routing Engine has been connected to the CFEB and, therefore, how long the Flexible PIC Concentrator (FPC) has been up and running.

## Sample Output

### show chassis cfep (M7i)

```
user@host> show chassis cfep
```

```
CFEB status:
  State                Online
  Intake Temperature   27 degrees C / 80 degrees F
  Exhaust Temperature  33 degrees C / 91 degrees F
  CPU utilization       3 percent
  Interrupt utilization 0 percent
  Heap utilization      8 percent
  Buffer utilization     21 percent
  Total CPU DRAM       128 MB
  Internet Processor II Version 1, Foundry IBM, Part number 164
  Start time:          2003-06-11 11:41:22 PDT
  Uptime:               1 hour, 39 minutes, 31 seconds
```

### show chassis cfep (M10i)

```
user@host> show chassis cfep
```

```
CFEB status:
Slot 0 information:
  StateMaster
  Intake temperature   35 degrees C / 95 degrees F
  Exhaust temperature  43 degrees C / 109 degrees F
  CPU utilization       3 percent
  Interrupt utilization 0 percent
  Heap utilization      10 percent
  Buffer utilization     22 percent
  Total CPU DRAM       128 MB
  Internet Processor II Version 1, Foundry IBM, Part number 164
  Start time:          2004-11-01 03:24:15 PST
  Uptime:               12 hours, 56 minutes, 18 seconds
Slot 1 information:

## show chassis cip

<b>Syntax (TX Matrix Plus Router)</b>	show chassis cip
<b>Release Information</b>	Command introduced in Junos OS Release 9.6.
<b>Description</b>	(TX Matrix Plus routers only) Display environmental information about the Connector Interface Panel (CIP) that provides Ethernet Control Plane connectivity to line-card chassis (LCCs), switch fabric chassis, and other devices.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request chassis cip on page 846</a></li> <li>• <i>Installing a T1600 CIP</i></li> <li>• <i>Installing a T640 CIP</i></li> <li>• <i>Installing a TX-CIP</i></li> <li>• <i>Installing an M320 CIP</i></li> <li>• <i>Installing an M320 CIP</i></li> <li>• <i>Installing the T320 CIP</i></li> <li>• <i>CIP Overview</i></li> </ul>
<b>Output Fields</b>	<a href="#">Table 95 on page 947</a> lists the output fields for the <b>show chassis cip</b> command. Output fields are listed in the approximate order in which they appear.

Table 95: show chassis cip Output Fields

Field Name	Field Description
Eswitch	Ethernet switch used to connect to the LCC or to a JCS1200: 0 or 1.

Table 95: show chassis cip Output Fields (continued)

Field Name	Field Description
Port	Physical port number of the Ethernet switch: <ul style="list-style-type: none"> <li>Port numbers: 4 to 8 on Ethernet switch 0 can be used to connect up to four (reserved for future use) other SFCs or optional JCS1200s.</li> <li><b>NOTE:</b> The current configuration of the routing matrix based on a TX Matrix Plus router supports only one SFC.</li> <li>Port numbers 0 to 15 on Ethernet switch 1 can be used to connect up to 16 LCCs.</li> <li><b>NOTE:</b> The current configuration of a routing matrix based on a TX Matrix Plus router supports only up to eight LCCs. You can connect LCCs to the port numbers corresponding to LCC0 to LCC7 (0 to 15) on the Ethernet switch 1.</li> </ul>
Type	Type of CIP: <ul style="list-style-type: none"> <li><b>XE</b>—Ethernet switch 0 ports used for connections to the SFC control plane or other devices such as JCS1200.</li> <li><b>GE</b>—Ethernet switch 1 ports used for connections to the LCC control plane.</li> </ul>
Connected-to	Show control plane connection to a specific LCC or SFC.
Link	State of the connection to an LCC control plane, SFC control plane, or other devices: <b>Up</b> or <b>Down</b> .
Speed	Ethernet link speed.
Duplex	Type of Ethernet link: <b>Full</b> or <b>Half Duplex</b> .
Auto-neg	Status of autonegotiation for the CIP connection to the LCC, SFC, or other devices: <b>On</b> or <b>Off</b> .

<b>Release Information</b>	Command introduced before Junos OS Release 7.4. sfc option for the TX Matrix Plus router introduced in Junos OS Release 9.6. Command introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers. Command introduced in Junos OS Release 12.3 for MX2020 Universal Routing Platforms. Command introduced in Junos OS Release 12.3 for MX2010 Universal Routing Platforms. Command introduced in Junos OS Release 13.2 for MX104 Universal Routing Platforms. Command introduced in Junos OS Release 17.2 for MX2008 Universal Routing Platforms. Command introduced in Junos OS Release 17.3 for MX150 Router Appliance.
<b>Description</b>	For routers or switches that have a display on the craft interface, show the messages that are currently displayed. On all routers except for the M20 router, you must enter this command on the master Routing Engine.

**Options** **none**—(TX Matrix, TX Matrix Plus routers, MX104, MX2010, MX2020, and MX2008 routers, and ACX Series routers only) On a TX Matrix router, show messages that are currently displayed on the craft interface on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, show messages that are currently displayed on the craft interface on the TX Matrix Plus router and its attached routers.

**all-members**—(MX Series routers only) (Optional) Display information currently on the craft interface for all members of the Virtual Chassis configuration.

**lcc *number***—(TX Matrix, TX Matrix Plus routers only) (Optional) On a TX Matrix router, show messages that are currently displayed on the craft interface for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, show messages that are currently displayed on the craft interface for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display information currently on the craft interface for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display information currently on the craft interface for the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**scc**—(TX Matrix router only) (Optional) Show messages that are currently displayed on the craft interface for the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus router only) (Optional) Show messages that are currently displayed on the craft interface for the respective TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with 0.

**Output Fields** [Table 96 on page 952](#) lists the output fields for the **show chassis craft-interface** command. Output fields are listed in the approximate order in which they appear.

*Table 96: show chassis craft-interface Output Fields*

Field Name	Field Description
LCD screen or FPM Display Contents	<p>Contents of the Front Panel Module display:</p> <ul style="list-style-type: none"> <li>• <b>router-name</b>—Name of the router.</li> <li>• <b>Up</b>—How long the router has been operational, in days, hours, minutes, and seconds.</li> <li>• <b>message</b>—Information about the router traffic load, the power supply status, the fan status, and the temperature status. The display of this information changes every 2 seconds. If a text message has been created with the <b>set chassis display</b> command, this message appears on all four lines of the craft interface display. The display alternates between the text message and the standard system status messages every 2 seconds.</li> </ul>
SFC Front Panel Switch Settings	<p>(TX Matrix Plus Routers)—Display the SFC front panel switch settings:</p> <p><b>SFC Chassis Number</b> and <b>Config Size</b> are settings on physical switches located on the left side of the craft interface of the TX Matrix Plus router.</p> <ul style="list-style-type: none"> <li>• <b>SFC Chassis Number</b>—This field always displays the value <b>00</b>.</li> <li>• <b>Config Size</b>—The value of this field is <b>0</b> for the TX Matrix Plus router. The value of this field is <b>3</b> for TX Matrix Plus router with 3D SIBs.</li> </ul>
Front Panel System LEDs	<p>(MX104, MX2010, MX2020, and MX2008 Routers) Status of the Front Panel System LEDs. A dot (.) indicates the LED is not lit. An asterisk (*) indicates the LED is lit.</p>
Front Panel Alarm Indicators	<p>(MX104, MX2010, MX2020, and MX2008 Routers) Status of the Front Panel Alarm indicators. A dot (.) indicates the relay is off. An asterisk (*) indicates the relay is active.</p>
Input Relay	<p>Status of the configured input relay ports—0 through 3. The mode is normally open or closed. The status is clear or raised.</p>
Output Relay	<p>Status of the configured output ports—0 or 1. The mode is normally open or closed. The status is clear or raised.</p>

Table 96: show chassis craft-interface Output Fields (continued)

Field Name	Field Description
<b>Front Panel FPC LEDs</b>	(MX2010, MX2020, and MX2008 Routers) Status of the Front Panel Flexible PIC Concentrator (FPC) LEDs. A dot (.) indicates the LED is not lit. An asterisk (*) indicates the LED is lit. On MX2010 and MX2008 routers, there are 10 (0-9) FPCs LEDs. On MX2020 routers, there are 20 (0-9 and 10-19) FPCs LEDs.
<b>CB LEDs</b>	Status of the Control Board (CB) LEDs. A dot (.) indicates the LED is not lit. An asterisk (*) indicates the LED is lit.
<b>PS LEDs</b>	(MX2010, MX2020, and MX2008 Routers) Status of the Power Supply (PS) LEDs. A dot (.) indicates the LED is not lit. An asterisk (*) indicates the LED is lit. On MX2010 and MX2008 routers, there are 9 (0-8) PS LEDs. On MX2020 routers, there are 18 (0-8 and 9-17) PS LEDs.
<b>PS Status</b>	(MX104 Routers) Status of the Power Supply (PS). Green indicates that the power supply is functioning. Red indicates that the power supply is not functioning. A dot (.) indicates the LED is not lit. An asterisk (*) indicates the LED is lit.
<b>FAN Tray LEDs</b>	(MX2010, MX2020, and MX2008 Routers) Status of the Fan Tray LEDs. A dot (.) indicates the LED is not lit. An asterisk (*) indicates the LED is lit.
<b>Front Panel SFB LEDs</b>	(MX2010, MX2020, and MX2008 Routers) Status of the Front Panel Switch Fabric Boards (SFB) LEDs. A dot (.) indicates the LED is not lit. An asterisk (*) indicates the LED is lit.
<b>Front Panel Chassis Info</b>	(MX2010, MX2020, and MX2008 Routers) Information about the chassis such as the chassis number and role. User can set the chassis number in multi-chassis configurations.
<b>MCS and SFM LEDs</b>	Status of the Miscellaneous Control Subsystem (MCS) and Switching and Forwarding Module (SFM) LEDs. A dot (.) indicates the LED is not lit. An asterisk (*) indicates the LED is lit. When neither a dot nor an asterisk is displayed, there is no board in that slot.
<b>SIB LEDs</b>	Status of the Switch Interface Board (SIB) LEDs. A dot (.) indicates the LED is not lit. An asterisk (*) indicates the LED is lit.
<b>SCG LEDs</b>	Status of the SONET Clock Generator (SCG) LEDs. A dot (.) indicates the LED is not lit. An asterisk (*) indicates the LED is lit.

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p>

**sfc** option introduced for the TX Matrix Plus router in Junos OS Release 9.6.  
Command introduced in Junos OS Release 11.1 for QFX Series.  
Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.  
**monitored** option added in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.  
Command introduced in Junos OS Release 12.1 for T4000 Core Routers.  
Command introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.  
Command introduced in Junos OS Release 12.3 for MX 2020 and MX2010 Universal Routing Platforms.  
**pem** option introduced in Junos OS Release 12.3 for ACX4000 Universal Metro Routers.  
**satellite** option introduced in Junos OS Release 14.2R3.  
**all-members**, **local**, and **member** *member-id* options introduced in Junos OS Release 15.1 for MX2010 and MX2020 routers.  
Command introduced in Junos OS Release 15.1X54-D20 for ACX5048 and ACX5096 Routers.  
Command introduced in Junos OS Release 17.2 for MX2008 Universal Routing Platforms.  
Command introduced in Junos OS Release 17.3 for MX150 Router Appliance.  
Command introduced in Junos OS Release 17.2 for PTX10008 Routers.  
Command introduced in Junos OS Release 17.3 for MX10003 Universal Routing Platforms.  
Command introduced in Junos OS Release 17.4 for MX204 Universal Routing Platforms.  
Command introduced in Junos OS Release 18.1R1 for EX9251 Switches.  
Command introduced in Junos OS Release 18.2 for EX9253 Switches.  
Command introduced in Junos OS Release 18.2R1 for MX10008 Routers.

**Description** Display environmental information about the router or switch chassis, including the temperature and information about the fans, power supplies, and Routing Engine.

In addition, on ACX4000 routers, display temperature information about the different channels of a Modular Interface Card (MIC). The number of channels displayed depends on the type of MIC installed.

Starting with Junos OS Release 14.1, the **show chassis environment cb cb-slot-number | ccg ccg-slot-number | fpc fpc-slot-number | fpm | monitored | pdu pdu-slot-number | routing-engine re-slot-number | sib sib-slot-number** operational mode command output displays environmental information for the new DC power supply module (PSM) and power distribution unit (PDU) that are added to provide power to the high-density FPC (FPC2-PTX-PIA) and other components in a PTX5000 Packet Transport Router.

**Options** **none**—Display environmental information about the router or switch chassis. On a TX Matrix router, display environmental information about the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about the TX Matrix Plus router and its attached routers.

**all-members**—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for all the members of the Virtual Chassis configuration.

**adc adc-slot-number**—(MX2010, MX2020, and MX2008 routers only) (Optional) Display chassis environmental information for the adapter cards. For MX2020 routers, replace

**adc-slot-number** with a value from 0 through 19. For MX2010 and MX2008 routers, replace **adc-slot-number** with a value from 0 through 9.

**cb cb-slot-number**—(ACX Series Universal Metro Routers, EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2020 routers, MX2010 routers, MX2008 routers, PTX Series Packet Transport Routers, QFX Series, and T Series routers, and TX Matrix Plus routers only) (Optional) Display chassis environmental information for the Control Board. On devices other than EX Series switches, replace **cb-slot** with 0 or 1.

**cip cip-slot-number**—(TX Matrix Plus routers only) (Optional) Display chassis environmental information for the Connection Interface Panel (CIP). Replace the **cip-slot-number** variable with a value of 0 or 1.

**cb interconnect-device name**—(QFabric systems only) (Optional) Display chassis environmental information for the Control Board on an Interconnect device.

**ccg ccg-slot-number**—(PTX Series only) (Optional) Display chassis environmental information for the Centralized Clock Generator. Replace **cb-slot** with a value of 0 or 1.

**fan fantray-slot-number**—(MX2010, MX2020, and MX2008 routers only) (Optional) Display chassis environmental information for the fan trays. Replace **fantray-slot-number** with a value from 0 through 3.

**fpc fpc-slot**—(EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2010 routers, MX2020 routers, MX2008 routers, PTX Series Packet Transport Routers, QFX Series, QFX3500 switches, QFabric systems, T Series routers, and TX Matrix Plus routers) (Optional) Display chassis environmental information for a specified Flexible PIC Concentrator. For MX2010 and MX2008 routers, replace **fpc-slot** with a value from 0 through 9. For MX2020 routers, replace **fpc-slot** with a value from 0 through 19. For information about FPC numbering, see [show chassis environment fpc](#). On a QFabric system, display chassis environmental information for a specified Flexible PIC Concentrator on an Interconnect device. On an EX Series switch, display chassis environmental information for a specified Flexible PIC Concentrator; see the hardware documentation for your switch for information on FPC numbering. On a TX Matrix Plus router with 3D SIBs replace **fpc-slot** with a value from 0 through 63.

**fpm**—(M120, M320, and M40e routers, MX2010 routers, MX2020 routers, MX2008 routers, PTX Series, Packet Transport Routers, T Series routers, and TX Matrix Plus routers only) (Optional) Display chassis environmental information for the craft interface (FPM).

**interconnect-device name**—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for the local Virtual Chassis member.

**member *member-id***—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for the specified member of the Virtual Chassis configuration. On MX Series routers, replace *member-id* with a value of **0** or **1**. For EX Series switches, see [member](#) for member ID values.

**monitored**—(MX2020 routers and PTX Series Packet Transport Routers only) (Optional) Display chassis environmental information for monitored temperatures only. Temperatures that are not included in temperature alarm computations are not displayed.

**node-device *name***—(QFabric systems only) (Optional) Display chassis environmental information for the Node device.

**pdu *pdu-slot-number***—(PTX Series only) (Optional) Display chassis environmental information for the specified power distribution unit.

**pem**—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Interconnect device or Node device.

**pem *pem-slot-number***—(ACX Series Universal Metro Routers, M120, M320, and M40e routers, MX Series routers, MX104 routers, QFX Series, and T Series routers only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Power Entry Module. For information about the options, see [show chassis environment pem](#).

**psm *psm-slot-number***—(MX2010, MX2020, and MX2008 routers only) (Optional) Display chassis environmental information for the power supply module. For MX2020 routers, replace *psm-slot-number* with a value from **0** through **17**. For MX2010 and MX2008 routers, replace *psm-slot-number* with a value from **0** through **8**.

**psu *psu-slot-number***—(EX Series switches only) (Optional) Display chassis environmental information for a specified power supply.

**routing-engine**—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Routing Engine on the specified Interconnect device.

**routing-engine *re-slot-number***—(Optional) Display chassis environmental information for the specified Routing Engine. For information about the options, see [show chassis environment routing-engine](#).

**satellite [*fpc-slot slot-id* | *device-alias alias-name*]**—(Junos Fusion only)(Optional) Display chassis environmental information for the specified satellite device in a Junos Fusion, or for all satellite devices in the Junos Fusion if no satellite devices are specified.

**scg**—(T Series routers only) (Optional) Display chassis environmental information about the SONET Clock Generator.

**scc**—(TX Matrix routers only) (Optional) Display chassis environmental information about the TX Matrix router (switch-card chassis).

**sfb *sfb-slot-number***—(MX2010, MX2020, and MX2008 routers only) (Optional) Display chassis environmental information for the switch fabric board. Replace *sfb-slot-number* with a value from 0 through 7.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display chassis environmental information about the respective TX Matrix Plus router ( switch-fabric chassis). Replace *number* variable with 0.

**sib *sib-slot-number***—(M320 routers, PTX Series Packet Transport Routers, and T Series routers only) (Optional) Display chassis environmental information about the specified switch interface board. For information about the options, see [show chassis environment sib](#).

**Output Fields** [Table 97 on page 978](#) lists the output fields for the **show chassis environment** command. Output fields are listed in the approximate order in which they appear.

Table 97: show chassis environment Output Fields

Field Name	Field Description
<b>Class</b>	<p>Information about the category or class of chassis component:</p> <ul style="list-style-type: none"> <li>• <b>Power:</b> Power information: <ul style="list-style-type: none"> <li>• (M5, M10, M20, and M40 routers and EX Series switches only) Power supply status: <b>OK</b>, <b>Testing</b>, (during initial power-on), <b>Failed</b>, or <b>Absent</b>.</li> <li>• (M7i, M10i, M40e, M120, M160, M320, and T Series routers and EX Series switches only) Power Entry Modules status: <b>OK</b>, <b>Testing</b>, (during initial power-on), <b>Check</b>, <b>Failed</b>, or <b>Absent</b>.</li> <li>• (PTX Series only) Power information is reported in PDU or PSM combinations. The status is: <b>OK</b>, <b>Testing</b>, (during initial power-on), <b>Check</b>, <b>Failed</b>, or <b>Absent</b>.</li> </ul> </li> <li>• <b>Temp:</b> Temperature of air flowing through the chassis in degrees Celsius (C) and Fahrenheit (F). <ul style="list-style-type: none"> <li>• On PTX Series Packet Transport Routers and MX2010, MX2020, and MX2008 Routers, multiple cooling zones are supported. FRU temperatures in each zone are coordinated with the fan speed of fan trays in those zones.</li> <li>• EX2200 switches have a side-to-rear cooling system. The <b>Local Intake</b> temperature is measured by the sensor on the right side of the chassis, and the <b>Remote Intake</b> temperature is measured by the sensor on the left side of the chassis.</li> </ul> </li> <li>• <b>Pic:</b> On ACX4000 routers, multiple temperature channels on a MIC. The status is: <b>OK</b> and the <b>Measurement</b> is in degrees Celsius (C) and Fahrenheit (F).</li> <li>• <b>Fan:</b> Fan status: <b>OK</b>, <b>Testing</b> (during initial power-on), <b>Failed</b>, or <b>Absent</b>. On PTX Series Packet Transport Routers and MX2010, MX2020, and MX2008 Routers, multiple fan trays are supported. Fan status is reported in Fan Tray or Fan combinations. <b>Measurement</b> indicates actual fan RPM (PTX and MX2010, MX2020, and MX2008 Routers only).</li> <li>• <b>Misc:</b> Information about other components of the chassis. <ul style="list-style-type: none"> <li>• On some routers, this field indicates the status of one or more additional components.</li> <li>• On the M40e, M160, and M320 router, <b>Misc</b> includes <b>CIP</b> (Connector Interface Panel). <b>OK</b> indicates that the CIP is present. <b>Absent</b> indicates that the CIP is not present.</li> <li>• On T Series routers, <b>Misc</b> includes <b>CIP</b> and <b>SPMB</b> (Switch Processor Mezzanine Board). <b>OK</b> indicates that the <b>CIP</b> or <b>SPMB</b> is present. <b>Absent</b> indicates that the <b>CIP</b> or <b>SPMB</b> is not present.</li> <li>• On PTX Series Packet Transport Routers, <b>Misc</b> includes the <b>SPMB</b> (Switch Processor Mezzanine Board). The SPMB is located on the control boards. <b>OK</b> indicates that the control board is present. <b>Absent</b> indicates that the control board is not present.</li> </ul> </li> </ul>
<b>Item</b>	<p>(MX2010, MX2020, and MX2008 Routers) Information about the chassis component: Routing Engines, Controls Boards (CBs), Switch Fabric Boards (SFBs), PICs, Flexible PIC Concentrators (FPCs), and Adapter Cards (ADCs).</p> <p>(MX104 Routers) Information about the chassis components: Routing Engines, Control Board (CB), Power Entry Module (PEM), and Compact Forwarding Engine Board (AFEB).</p> <p>(QFabric Systems) Information about the chassis component: Control Boards, Routing Engines, Flexible PIC Concentrators (FPCs), and Power Entry Modules (PEMs), Node Devices, and Interconnect Devices.</p> <p>(QFX Series) Information about the chassis component: Flexible PIC Concentrators (FPCs), and Power Entry Modules (PEMs).</p>

Table 97: show chassis environment Output Fields (continued)

Field Name	Field Description
<b>Status</b>	<p>(MX104, MX2010, MX2020, and MX2008 Routers) Status of the specified chassis component. For example, if the Class is Fan, the fan status can be:</p> <ul style="list-style-type: none"> <li>• <b>OK:</b> The fans are operational.</li> <li>• <b>Testing:</b> The fans are being tested during initial power-on.</li> <li>• <b>Failed:</b> The fans have failed or the fans are not spinning.</li> <li>• <b>Absent:</b> The fan tray is not installed.</li> </ul> <p>If the Class is Power, the power supply status can be:</p> <ul style="list-style-type: none"> <li>• <b>OK:</b> The power component is operational.</li> <li>• <b>Testing:</b> The power component is being tested during initial power-on.</li> <li>• <b>Check:</b> There is insufficient power---that is, fewer than the minimum required feeds are connected.</li> <li>• <b>Failed:</b> The inputs leads have failed.</li> <li>• <b>Absent:</b> The power component is not installed.</li> </ul>
<b>Measurement</b>	<p>(MX104, MX2010, MX2020, and MX2008 Routers) Dependant on the Class. For example, if the Class is Temp, indicates the temperature in degree Celsius and degrees Fahrenheit. If the Class is Fan, indicates actual fan RPM.</p>

## Sample Output

### show chassis environment (M5 Router)

```

user@host> show chassis environment

Class Item           Status Measurement
Power Power Supply A   OK
      Power Supply B   Absent
Temp  FPC 0            OK      30 degrees C / 86 degrees F
      FEB             OK      33 degrees C / 91 degrees F
      PS Intake        OK      27 degrees C / 80 degrees F
      PS Exhaust       OK      27 degrees C / 80 degrees F
      Routing Engine    OK      34 degrees C / 93 degrees F
Fans  Left Fan 1       OK      Spinning at normal speed
      Left Fan 2       OK      Spinning at normal speed

### show chassis environment (ACX4000 Universal Metro Router)

On the ACX4000 router, the MIC output of the **show chassis environment** command varies depending on the number of temperature channels present in the installed MIC.

```
user@host> show chassis environment
```

## show chassis environment adc

<b>Syntax</b>	<pre>show chassis environment adc &lt;adc-slot-number&gt; &lt;all-members&gt; &lt;local&gt; &lt;member member-id&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 12.3 for MX2020 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 Universal Routing Platforms.</p> <p><b>all-members</b>, <b>local</b>, and <b>member member-id</b> options introduced in Junos OS Release 15.1 for MX2020 and MX2010 routers.</p> <p>Command introduced in Junos OS Release 17.2 for MX2008 Universal Routing Platforms.</p>
<b>Description</b>	Display chassis environmental information about the adapter cards.
<b>Options</b>	<p><b>none</b>—Display environmental information about all adapter cards.</p> <p><b>adc-slot-number</b>—(Optional) Display environmental information about the specified adapter card. For MX2020 routers, replace <b>adc-slot-number</b> with a value of <b>0</b> through <b>19</b>. For MX2010 and MX2008 routers, replace <b>adc-slot-number</b> with a value of <b>0</b> through <b>9</b>.</p> <p><b>all-members</b>—(Optional) Display chassis environmental information about the adapter cards (ADCs) in all members of the Virtual Chassis configuration.</p> <p><b>local</b>—(Optional) Display chassis environmental information about the ADCs in the local member of the Virtual Chassis.</p> <p><b>member member-id</b>—(Optional) Display chassis environmental information about the ADCs in the specified member of the Virtual Chassis. Replace <b>member-id</b> with the value <b>0</b> or <b>1</b>.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show chassis adc on page 920</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show chassis environment adc (MX2020 Router) on page 1055</a></p> <p><a href="#">show chassis environment adc (MX2010 Router) on page 1061</a></p> <p><a href="#">show chassis environment adc (MX2008 Router) on page 1064</a></p>
<b>Output Fields</b>	<p><a href="#">Table 98 on page 1055</a> lists the output fields for the <b>show chassis environment adc</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 98: show chassis environment adc Output Fields

Field Name	Field Description
<b>State</b>	Status of the adapter card. <ul style="list-style-type: none"> <li>• <b>Online</b>—The adapter card is online and running.</li> <li>• <b>Offline</b>—Adapter card is powered down.</li> </ul>
<b>Temperature</b>	Temperature in Celsius (C) and Fahrenheit (F) of the air flowing past the adapter card. <ul style="list-style-type: none"> <li>• <b>Intake Temperature</b>—Measures the temperature of the air intake.</li> <li>• <b>Exhaust Temperature</b>—Measures the temperature of the hot air exhaust.</li> <li>• <b>ADC-XF1</b>—Measures the temperature of the ADC chipset, ADC-XF1.</li> <li>• <b>ADC-XF0</b>—Measures the temperature of the ADC chipset, ADC-XF0.</li> </ul>
<b>Power</b>	Power required and measured on the adapter card. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.

## Sample Output

### show chassis environment adc (MX2020 Router)

```

user@host> show chassis environment adc

ADC 0 status:
  State           Online
  Intake Temperature 39 degrees C / 102 degrees F
  Exhaust Temperature 50 degrees C / 122 degrees F
  ADC-XF1 Temperature 58 degrees C / 136 degrees F
  ADC-XF0 Temperature 64 degrees C / 147 degrees F
  Power
    LTC3880-XF0-1.0v-RAIL 1029 mV
    LTC3880-XF0-1.0v-CH0 1029 mV
    LTC3880-XF0-1.0v-CH1 1033 mV
    LTC3880-XF0-1.5v-RAIL 1499 mV
    LTC3880-XF0-1.5v-CH0 1499 mV

**Release Information**

Command introduced before Junos Release 7.4.  
 Command introduced in Junos OS Release 9.4 for EX Series switches.  
 Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.  
 Command introduced in Junos OS Release 12.1 for T4000 Core Routers.  
 option introduced for the TX Matrix Plus router in Junos Release 9.6.  
 Command introduced in Junos OS Release 11.3 for the QFX Series.  
 Command introduced in Junos OS Release 12.3 for MX2020 Universal Routing Platforms.  
 Command introduced in Junos OS Release 12.3 for MX2010 Universal Routing Platforms.  
 Command introduced in Junos OS Release 13.2 for MX104 Universal Routing Platforms.  
 Command introduced in Junos OS Release 17.2 for MX2008 Universal Routing Platforms.  
 Command introduced in Junos OS Release 17.2 for PTX10008 Routers.  
 Command introduced in Junos OS Release 17.3 for MX10003 Universal Routing Platforms.  
 Command introduced in Junos OS Release 17.4 for MX204 Universal Routing Platforms.  
 Command introduced in Junos OS Release 18.1R1 for EX9251 switches.  
 Command introduced in Junos OS Release 18.2 for EX9253 Switches.  
 Command introduced in Junos OS Release 18.2 for MX10008 Universal Routing Platforms..

**Description**

(M120, M320, MX Series, and T Series routers, EX8200 switches, and PTX Series Packet Transport Routers only) Display environmental information about the Control Boards (CBs).

**Options**

**none**—Display environmental information about all CBs. For a TX Matrix router, display environmental information about all CBs on the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display environmental information about all CBs on the TX Matrix Plus router and its attached T1600 or T4000 routers.

**all-members**—(MX Series routers only) (Optional) Display environmental information about the CBs on all the members of the Virtual Chassis configuration.

**interconnect-device**—(QFabric systems only) Display environmental information about CBs on the Interconnect device.

**lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display environmental information about the CBs on the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display environmental information about the CBs on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**scc**—(TX Matrix router only) (Optional) Display environmental information about the CBs in the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus router only) (Optional) Display environmental information about the CBs in the TX Matrix Plus router (or switch-fabric chassis).

**slot**—(Optional) Display environmental information about the specified CB. On routers and PTX Series Packet Transport Routers, replace *slot* with **0** or **1**. On EX Series switches replace *slot* with **0**, **1**, or **2**. On QFX Series switches, replace *slot* with **0** or **1**.

**Output Fields** Table 99 on page 1069 lists the output fields for the **show chassis environment cb** command. Output fields are listed in the approximate order in which they appear.

*Table 99: show chassis environment cb Output Fields*

Field Name	Field Description
<b>State</b>	<p>Status of the CB. If two CBs are installed and online, one is functioning as the master, and the other is the standby.</p> <ul style="list-style-type: none"> <li>• <b>Online</b>—CB is online and running.</li> <li>• <b>Offline</b>—CB is powered down.</li> </ul> <p><b>NOTE:</b> On the EX8208 switch, the installation can include three CBs.</p>
<b>Temperature</b>	<p>Temperature in Celsius (C) and Fahrenheit (F) of the air flowing past the CB.</p> <ul style="list-style-type: none"> <li>• <b>Temperature Intake</b>—Measures the temperature of the air intake to cool the power supplies.</li> <li>• <b>Temperature Exhaust</b>—Measures the temperature of the hot air exhaust.</li> </ul> <p><b>NOTE:</b> On the MX2010, MX2020, and MX2008 routers, the intake temperature measures the temperature of the air intake to cool the Control Board (CB). The MX2010, MX2020, and MX2008 routers include intake and exhaust temperatures for multiple zones (<b>Intake A</b>, <b>Intake B</b>, <b>Intake C</b>, <b>Exhaust A</b>, <b>Exhaust B</b>, and <b>TCBC</b>).</p>
<b>Power</b>	<p>Power required and measured on the CB. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.</p>
<b>BUS Revision</b>	<p>Revision level of the generic bus device. (Not on switches.)</p>
<b>FPGA Revision</b>	<p>Revision level of the field-programmable gate array (FPGA). (Not on switches.)</p>
<b>PMBus device</b> (on MX240, MX480, and MX960 routers with Enhanced MX SCB)	<p>Enhanced SCB on MX 240, MX480, and MX960 routers allows the system to save power by supplying only the amount of voltage that is required. Configurable PMBus devices are used to provide the voltage for each individual device. There is one PMBus device for each XF ASIC so that the output can be customized to each device. The following PMBus device information is displayed for routers with Enhanced MX SCB:</p> <ul style="list-style-type: none"> <li>• <b>Expected voltage</b></li> <li>• <b>Measured voltage</b></li> <li>• <b>Measured current</b></li> <li>• <b>Calculated power</b></li> </ul>

## show chassis environment ccg

**Syntax** `show chassis environment ccg  
<slot>`

**Release Information** Command introduced in Junos OS Release 12.1.

**Description** (PTX5000 Packet Transport Routers only) Display environmental information about the Centralized Clock Generators (CCGs).

**Options** **none**—Display environmental information about all CCGs on the router.

**slot** —(Optional) Display environmental information about the specified CCG. Replace *slot* with 0 or 1.

**Required Privilege Level** view

**Related Documentation**

- [Clock Sources for PTX Series Packet Transport Routers on page 306](#)
- [show chassis environment on page 969](#)

**List of Sample Output** [show chassis environment ccg \(PTX5000\) on page 1094](#)

**Output Fields** [Table 100 on page 1093](#) lists the output fields for the **show chassis environment ccg** command. Output fields are listed in the approximate order in which they appear.

*Table 100: show chassis environment cb Output Fields*

Field Name	Field Description
<b>State</b>	Status of the CCG: <b>Online - Master clock</b> , <b>Online - Standby</b> , or <b>Offline</b> . If two CCGs are installed and online, one is functioning as the master clock, and the other is the standby clock.
<b>Temperature</b>	Temperature of the air flowing past the CCG.
<b>Power</b>	Power required and measured on the CCG. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.
<b>BUS Revision</b>	Revision level of the generic bus device.

## Sample Output

### show chassis environment ccg (PTX5000)

```
user@host> show chassis environment ccg
```

#### CCG 0 status:

State	Online - Master clock
Temperature	31 degrees C / 87 degrees F
Power	
1.2 V bias	1200 mV
1.8 V	1799 mV
3.3 V	3300 mV
3.3 V bias	3300 mV
Bus Revision	103

#### CCG 1 status:

State	Offline
Power	Disabled
Temperature	31 degrees C / 87 degrees F
Power	
1.2 V bias	1198 mV
1.8 V	161 mV
3.3 V	451 mV
3.3 V bias	3311 mV
Bus Revision	103

## show chassis environment fan

<b>Syntax</b>	<pre>show chassis environment fan &lt;all-members&gt; &lt;fantray-slot-number&gt; &lt;local&gt; &lt;member member-id&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 12.3 for MX2020 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 Universal Routing Platforms.</p> <p><b>all-members</b>, <b>local</b>, and <b>member member-id</b> options introduced in Junos OS Release 15.1 for MX2020 and MX2010 routers.</p> <p>Command introduced in Junos OS Release 17.2 for PTX10008 Routers.</p> <p>Command introduced in Junos OS Release 18.2R1 for MX10008 Routers.</p>
<b>Description</b>	(MX2020 and MX2010 routers only) Display environmental information about the fans and fan trays.
<b>Options</b>	<p><b>none</b>—Display environmental information about all fans and fan trays.</p> <p><b>all-members</b>—(Optional) Display environmental information about the fan and fan trays in all members of the Virtual Chassis configuration.</p> <p><b>fantray-slot-number</b>—(Optional) Display environmental information about the specified fan tray. Replace <i>fantray-slot-number</i> with a value from 0 through 3.</p> <p><b>local</b>—(Optional) Display environmental information about the fans and fan trays in the local member of the Virtual Chassis.</p> <p><b>member member-id</b>—(Optional) Display environmental information about the fans and fan trays in the specified member of the Virtual Chassis. Replace <i>member-id</i> with the value 0 or 1.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show chassis environment on page 969</a></li> <li>• <a href="#">show chassis fan on page 1352</a></li> </ul>

**Output Fields** Table 99 on page 1069 lists the output fields for the **show chassis environment fan** command. Output fields are listed in the approximate order in which they appear.

*Table 101: show chassis environment fan Output Fields*

Field Name	Field Description
<b>Fan Tray Status</b>	Status of the fan tray.
<b>Temperature</b>	Temperature in Celsius (C) and Fahrenheit (F) maintained by the fans.
<b>Power</b>	Power required and measured on the fan tray. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.
<b>Max Power Consumption</b>	Maximum power consumed by the fan tray.

## Sample Output

### show chassis environment fan (MX2020 routers)

```

user@host> show chassis environment fan

Fan Tray 0 status:
  Temperature      23 degrees C / 73 degrees F
  Power
    1.2 V          1189 mV
    3.3 V          3293 mV
    5.0 V          5230 mV
    5.0 V bias     5278 mV
    52.0 V A       49944 mV
    52.0 V B       435 mV
  Max Power Consumption 1150 Watts
Fan Tray 1 status:
  Temperature      22 degrees C / 71 degrees F
  Power
    1.2 V          1192 mV
    3.3 V          3300 mV
    5.0 V          5230 mV
    5.0 V bias     5230 mV
    52.0 V A       50205 mV
    52.0 V B       435 mV
  Max Power Consumption 1150 Watts
Fan Tray 2 status:
  Temperature      31 degrees C / 87 degrees F
  Power
    1.2 V          1192 mV
    3.3 V          3287 mV
    5.0 V          5211 mV
    5.0 V bias     5220 mV
    52.0 V A       50031 mV
    52.0 V B       435 mV
  Max Power Consumption 1150 Watts
Fan Tray 3 status:
  Temperature      31 degrees C / 87 degrees F
  Power
    1.2 V          1208 mV

```

3.3 V	3306 mV
5.0 V	5240 mV
5.0 V bias	5259 mV
52.0 V A	50553 mV
52.0 V B	435 mV
Max Power Consumption	1150 Watts

### show chassis environment fan 3 (MX2020 routers)

<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.</p> <p>Command introduced in Junos OS Release 12.1 for T4000 Core Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX 2010 and MX2020 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p> <p><b>satellite</b> option introduced in Junos OS Release 14.2R3.</p> <p>Command introduced in Junos OS Release 17.2 for MX2008 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 17.2 for PTX10008 Routers.</p> <p>Command introduced in Junos OS Release 17.3 for MX10003 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 17.4 for MX204 Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 18.1R1 for EX9251 switches.</p> <p>Command introduced in Junos OS Release 18.2 for EX9253 Switches.</p> <p>Command introduced in Junos OS Release 18.2R1 for MX10008 Universal Routing Platforms.</p>
<b>Description</b>	(M40e, M120, M160, M320, MX Series, T Series routers, EX Series, QFX Series, and PTX Series routers only) Display environmental information about Flexible PIC Concentrators (FPCs).
<b>Options</b>	<p><b>none</b>—Display environmental information about all FPCs. On a TX Matrix router, display environmental information about all FPCs on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about all FPCs on the TX Matrix Plus router and its attached routers.</p> <p><b>all-members</b>—(MX Series routers only) (Optional) Display environmental information for the FPCs in all the members of the Virtual Chassis configuration.</p> <p><b>interconnect-device <i>name</i></b>—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.</p> <p><b>lcc <i>number</i></b>—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.</p>

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display environmental information for the FPCs in the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display environmental information for the FPCs in the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**satellite [*fpc-slot slot-id* | *device-alias alias-name*]**—(Junos Fusion only)(Optional) Display environmental information for the FPCs in the specified satellite device in a Junos Fusion, or for all satellite devices in the Junos Fusion if no satellite devices are specified.

***slot* or *fpc-slot***—(Optional) Display environmental information about an individual FPC:

- (TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, if you specify the number of the T640 router by using only the **lcc *number*** option (the recommended method), replace ***slot*** with a value from 0 through 7. Similarly, on a TX Matrix Plus router, if you specify the number of the router by using only the **lcc *number*** option (the recommended method), replace ***slot*** with a value from 0 through 7. Otherwise, replace ***slot*** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show chassis environment fpc 1 lcc 1
user@host> show chassis environment fpc 9
```

- M120 router—Replace ***slot*** with a value from 0 through 5.
- MX240 router—Replace ***slot*** with a value from 0 through 2.
- MX480 router—Replace ***slot*** with a value from 0 through 5.
- MX960 router—Replace ***slot*** with a value from 0 through 11.
- MX2010 router—Replace ***slot*** with a value from 0 through 9.
- MX2020 router—Replace ***slot*** with a value from 0 through 19.
- MX2008 router—Replace ***slot*** with a value from 0 through 9.
- Other routers—Replace ***slot*** with a value from 0 through 7.

- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace **slot** with 0.
  - EX4200 switches in a Virtual Chassis configuration—Replace **slot** with a value from 0 through 9 (switch's member ID).
  - EX6210 switches—Replace **slot** with a value from 0 through 3 (line card only), 4 or 5 (line card or Switch Fabric and Rotuing Engine (SRE) module), or 6 through 9 (line card only).
  - EX8208 switches—Replace **slot** with a value from 0 through 7 (line card).
  - EX8216 switches—Replace **slot** with a value from 0 through 15 (line card).
- QFX3500 switches —Replace **fpc-slot** with 0 through 15.
- PTX5000 Packet Transport Router—Replace **fpc-slot** with 0 through 7.
- PTX3000 Packet Transport Router—Replace **fpc-slot** with 0 through 15.

**Output Fields** Table 102 on page 1103 lists the output fields for the **show chassis environment fpc** command. Output fields are listed in the approximate order in which they appear.

*Table 102: show chassis environment fpc Output Fields*

Field Name	Field Description
<b>State</b>	Status of the FPC: <ul style="list-style-type: none"> <li>• <b>Unknown</b>—FPC is not detected by the router.</li> <li>• <b>Empty</b>—No FPC is present.</li> <li>• <b>Present</b>—FPC is detected by the chassis daemon but is either not supported by the current version of the Junos OS, or the FPC is coming up but not yet online.</li> <li>• <b>Ready</b>—FPC is in intermediate or transition state.</li> <li>• <b>Announce online</b>—Intermediate state during which the FPC is coming up but not yet online, and the chassis manager acknowledges the chassisd FPC online initiative.</li> <li>• <b>Online</b>—FPC is online and running.</li> <li>• <b>Offline</b>—FPC is powered down.</li> <li>• <b>Diagnostics</b>—FPC is set to operate in diagnostics mode.</li> </ul>
<b>Temperature</b>	(M40e and M160 routers and QFX Series only) Temperature of the air flowing past the FPC.
<b>PMB Temperature</b>	(PTX Series only) Temperature of the air flowing past the PMB (bottom of the FPC).  The PTX5000 Packet Transport Router with FPC2-PTX-PIA include multiple temperatures for PMB ( <b>TEMPO</b> and <b>TEMP1</b> ).
<b>PMB CPU Temperature</b>	(PTX5000 Packet Transport Router with FPC2-PTX-PIA only) Temperature of the air flowing past the PMB CPU.
<b>Temperature Intake</b>	(M320 routers, MX2010 routers, MX2020 routers, MX2008 routers, and PTX Series only) Temperature of the air flowing into the chassis.
<b>Temperature Top</b>	(T Series routers only) Temperature of the air flowing past the top of the FPC.

Table 102: show chassis environment fpc Output Fields (continued)

Field Name	Field Description
<b>Temperature Exhaust</b>	(M120 and M320 routers, MX2010 routers, MX2020 routers, MX2008 routers, and PTX Series only) Temperature of the air flowing out of the chassis.  The PTX Series Packet Transport Routers, and the MX2010, MX2020, and MX2008 routers include exhaust temperatures for multiple zones ( <b>Exhaust A</b> and <b>Exhaust B</b> ).
<b>Temperature Bottom</b>	(T Series routers only) Temperature of the air flowing past the bottom of the FPC.
<b>TL n Temperature</b>	(PTX Series only) Temperature of the air flowing past the specified TL area of the packet forwarding engine (PFE) on the FPC.
<b>TQ n Temperature</b>	(PTX Series only) Temperature of the air flowing past the specified TQ area of the packet forwarding engine (PFE) on the FPC.
<b>Temperature MMBO</b>	(T640 router only) Temperature of the air flowing past the type 3 FPC.
<b>Temperature MMB1</b>	(M320 and T Series routers only) Temperature of the air flowing past the type 1, type 2, and type 3 FPC.
<b>Power</b>	Information about the voltage supplied to the FPC. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.
<b>CMB Revision or BUS revision</b>	Revision level of the chassis management bus device (M Series router) or bus (T Series routers).

## Sample Output
