Release Information	Statement introduced in Junos OS Release 15.1 for MX Series routers.
Description	<p>Configure the threshold value for average frame delay, in microseconds, for two-way Ethernet frame delay measurement (ETH-DM). When the configured threshold for average frame delay is exceeded, an SNMP trap is generated for ETH-DM. SNMP traps are triggered if you configure either the average frame-delay threshold or the average inter-frame delay variance threshold. If you do not configure either the frame-delay threshold or the frame delay variation threshold, no SNMP traps are generated. You can configure these threshold values only with a two-way ETH-DM SLA iterator.</p> <p>Frame delay refers to the difference, in microseconds, between the time a frame is sent and when it is received. Frame delay variation refers to the difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.” For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet frame delay measurement, only the initiator MEP (on the local system) collects statistics.</p>
Options	<p>avg-fd-twoway-threshold-value—Threshold value for average frame delay, in microseconds, for two-way ETH-DM.</p> <p>Range: 1 through 4294967295 microseconds</p> <p>flap-trap-monitor seconds—Duration in seconds, for summarizing flap occurrences and send out a single jnxSoamPm ThresholdFlapAlarm notification to the network management system (NMS).</p> <p>Range: 1 through 360 seconds</p>
Required Privilege Level	<p>Configure—To enter configuration mode.</p> <p>Control—To modify any configuration.</p>

avg-flr-forward-threshold

Syntax	<code>avg-flr-forward-threshold <i>avg-flr-forward-threshold-value</i>; flap-trap-monitor <i>seconds</i>; }</code>
Hierarchy Level	[edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles <i>profile-name</i>]
Release Information	Statement introduced in Junos OS Release 15.1 for MX Series routers.
Description	<p>Configure the threshold value for average frame loss ratio, in milli-percent, in the upstream or forward direction for Ethernet loss measurement (ETH-LM) and Ethernet synthetic loss measurement (ETH-SLM). When the configured threshold for average forward frame loss ratio is exceeded, an SNMP trap is generated for ETH-LM and ETH-SLM. SNMP traps are triggered if you configure either the average backward frame loss ratio threshold or the average forward frame loss ratio threshold. If you do not configure either the average backward frame loss ratio threshold or the average forward frame loss ratio threshold, no SNMP traps are generated. You can configure these threshold values with an SLA iterator for ETH-SLM and ETH-LM.</p> <p>ETH-SLM is an application that enables the calculation of frame loss by using synthetic frames instead of data traffic. This mechanism can be considered as a statistical sample to approximate the frame loss ratio of data traffic.</p>
Options	<p><i>avg-flr-forward-threshold-value</i>—Threshold value for average frame loss ratio in the forward or upstream direction, in milli-percent, for ETH-SLM and ETH-LM. Range: 1 through 100000 milli-percent</p> <p><i>flap-trap-monitor seconds</i>—Duration in seconds, for summarizing flap occurrences and send out a single jnxSoamPm ThresholdFlapAlarm notification to the network management system (NMS). Range: 1 through 360 seconds</p>
Required Privilege Level	<p>configure—To enter configuration mode.</p> <p>control—To modify any configuration.</p>

calculation-weight

Syntax

```
calculation-weight {
  delay delay-value;
  delay-variation delay-variation-value;
}
```

Hierarchy Level [edit protocols [oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles](#) *profile-name*]

Release Information Statement introduced in Junos OS Release 11.1.
Statement introduced in Junos OS Release 11.4 for EX Series switches.

Description Configure the calculation weight for delay and delay variation.

NOTE: This option is applicable only for two-way delay measurement.

The remaining statements are explained separately. See [CLI Explorer](#).

Required Privilege Level Configure—To enter configuration mode.
Control—To modify any configuration.

convey-loss-threshold

Syntax	<code>convey-loss-threshold;</code>
Hierarchy Level	<code>[edit protocols oam ethernet connectivity-fault-management maintenance-domain <i>domain-name</i> maintenance-association <i>ma-name</i> continuity-check]</code>
Description	<p>Enable loss-threshold-tlv transmission.</p> <p>During a unified ISSU, the control plane may go down for several seconds and cause CFM continuity check packets to get dropped. This may cause the remote maintenance endpoint (MEP) to detect a connectivity loss and mark the MEP as down. To keep the MEP active during a unified ISSU, the loss threshold TLV communicates the minimum threshold value the receiving MEP requires to keep the MEP active. The receiving MEP parses the TLV and updates the loss threshold value, but only if the new threshold value is greater than the locally configured threshold value. You can control the transmission of the loss threshold TLV in continuity check messages PDUs. The convey-loss-threshold statement specifies that the loss threshold TLV must be transmitted as part of the continuity check messages. If the statement is not specified, continuity check messages transmit this TLV only when a unified ISSU is in progress.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

cross-connect-ccm

Syntax	<code>cross-connect-ccm;</code>
Hierarchy Level	<code>[edit protocols oam ethernet connectivity-fault-management action-profile <i>action-profile-name</i> event ais-trigger-condition]</code>
Release Information	Statement introduced in Junos OS Release 14.2.
Description	Configure the defect condition that raises an alarm indication signal when any cross-connect continuity check messages (CCMs) are received by the MEP.
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

hardware-assisted-timestamping

Syntax	hardware-assisted-timestamping;
Hierarchy Level	[edit protocols oam ethernet connectivity-fault-management performance-monitoring]
Release Information	Statement introduced in Junos OS Release 9.5.
Description	<p>For Ethernet interfaces on Enhanced and Enhanced Queuing Dense Port Concentrators (DPCs) in MX Series routers only, enable hardware-assisted timestamping support for Ethernet frame delay measurement.</p> <p>By default, the ETH-DM feature calculates frame delays using software-based timestamping of the ETH-DM PDU frames sent and received by the MEPs in the session. As an option that can increase the accuracy of ETH-DM calculations when the DPC is loaded with heavy traffic in the receive direction, you can enable hardware-assisted timestamping of session frames in the receive direction.</p>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Ethernet Frame Delay Measurements Overview on page 794• Guidelines for Configuring Routers to Support an ETH-DM Session on page 840• Enabling the Hardware-Assisted Timestamping Option on page 851

hardware-assisted-keepalives

Syntax	<code>hardware-assisted-keepalives [enable disable];</code>
Hierarchy Level	[edit protocols oam ethernet connectivity-fault-management performance-monitoring]
Release Information	Statement introduced in Junos OS Release 14.2R1.
Description	<p>For Ethernet interfaces on Modular Port Concentrators (MPCs) in MX Series routers only, delegate the transmission of the continuity check messages (CCMs) to the forwarding ASIC (that is, to the hardware) by enabling inline transmission of CCMs. Inline transmission of CCMs is also known as Inline-KA.</p> <p>By default, CCMs are transmitted by the CPU of the MPC and not by the hardware. If the duration between transmissions of CCMs is low or if the CCMs for a specific line card scale, we recommend that you enable delegation of the transmission of CCMs to the hardware. By enabling inline transmission of CCMs, you can achieve maximum scaling of CCMs.</p> <p> NOTE: Starting in Junos OS Release 16.1R1, the inline support for 1s interval is supported on MPC1 to MPC7 (except MPC3 and MPC4) line cards.</p>
Default	Inline transmission is disabled by default.
Options	<p>enable—Enable inline transmission of CCMs.</p> <p> NOTE: Inline transmission of CCMs is not enabled when there is a CFM session already established. To enable inline transmission, you must first deactivate the CFM session using the <code>deactivate</code> command and then reactivate the CFM session using the <code>activate</code> command.</p> <p>disable—Disable inline transmission of CCMs.</p> <p> NOTE: After disabling inline transmission of CCMs, you must reboot the router for the changes to take effect.</p>

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

interface-status-send-rdi

Syntax	<code>interface-status-send-rdi <i>interface-status-send-rdi</i>;</code>
Hierarchy Level	<code>[edit logical-systems <i>name</i> protocols oam ethernet connectivity-fault-management maintenance-domain <i>name</i> maintenance-association <i>name</i> continuity-check],</code> <code>[edit protocols oam ethernet connectivity-fault-management maintenance-domain <i>name</i> maintenance-association <i>name</i> continuity-check]</code>
Release Information	Statement introduced in Junos OS Release 17.3R1 for MX Series Routers.
Description	<p>Configure CFM to propagate the status of the provider edge device via the remote defect indication (RDI) bit in the CC messages when the interface is down. When the status of the EVPN provider edge device is standby, the EVPN VPWS service is notified and it sets the interface status to CCC-down. When the interface status is CCC-down, it indicates that the provider edge service is down. When you enable CFM monitoring, CFM propagates the status of the provider edge device via the remote defect indication (RDI) bit in the CC messages. Thus, the customer edge device is aware that the provider edge device is down.</p> <p>Usually, when the interface goes down, CFM propagates the status of the provider edge device via the interface status TLV. If the customer edge device does not support the interface status TLV, you can use the RDI bit to propagate the status of the provider edge device.</p>
Required Privilege Level	routing—To view this statement in the configuration.

interval

Syntax	<code>interval (100ms 10m 10ms 10s 1m 1s);</code>
Hierarchy Level	<code>[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name maintenance-association ma-name continuity-check]</code>
Release Information	<p>Statement introduced in Junos OS Release 8.4.</p> <p>Option 10ms introduced in Junos OS Release 9.1.</p> <p>Third-party interoperability during a unified in-service software upgrade (ISSU) introduced in Junos OS Release 17.1.</p>
Description	<p>Configure the interval between successive transmissions of continuity check messages (CCMs) as part of the connectivity fault detection strategy. When the receiving maintenance association end point (MEP) does not receive a CCM at the configured interval, the loss-threshold statement determines how many CCMs can be lost before the sending MEP is marked as down. The hold-interval statement then determines the frequency at which the database of MEPs in the maintenance association (MA) is flushed in the absence of updates.</p> <p>During a unified in-service software upgrade (ISSU), Junos OS connectivity fault management (CFM) works when the peer device is not a Juniper Networks router. Interoperating with the router of another vendor, the Juniper Networks router retains session information and continues to transmit CCM (continuity check message) PDUs during the unified ISSU upgrade. For this feature to work, you must enable Packet Forwarding Engine keepalives with the hardware-assisted-keepalives statement, and configure the interval between CCMs to be 1 second with interval statement.</p>
	<p> NOTE: For the continuity check message interval to be configured for 10 milliseconds, periodic packet management (PPM) runs on the Routing Engine and Packet Forwarding Engine by default. You can disable PPM only on the Packet Forwarding Engine. To disable PPM on the Packet Forwarding Engine, use the no-delegate-processing statement at the <code>[edit routing-options ppm]</code> hierarchy level.</p>
	<p> NOTE: A continuity check interval of 10 milliseconds is not supported for CFM sessions over a label-switched interface (LSI).</p>
Options	<p>100ms—100 milliseconds.</p> <p>10m—10 minutes.</p>

10ms—10 milliseconds.

10s—10 seconds.

1m—1 minute.

1s—1 second.

Default: 1m

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Syntax	<code>priority <i>value</i>;</code>
Hierarchy Level	<code>[edit protocols oam ethernet connectivity-fault-management action-profile <i>action-profile-name</i> action log-generate-ais]</code>
Release Information	Statement introduced in Junos OS Release 14.2.
Description	Configure the 802.1p priority of the AIS packet.
Options	value —Priority level. Range: 0 through 7
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Ethernet Alarm Indication Signal (ETH-AIS) Function Overview on page 878• Configuring ETH-AIS on a CFM MEP on page 883

priority (OAM Connectivity-Fault Management)

Syntax	<code>priority <i>number</i>;</code>
Hierarchy Level	<p>[edit protocols oam ethernet connectivity-fault-management maintenance-domain <i>md-name</i> maintenance-association <i>ma-name</i> mep <i>mep-id</i>]</p> <p>For EX Series Switches:</p> <p>[edit protocols oam ethernet connectivity-fault-management maintenance-domain <i>domain-name</i> maintenance-association <i>ma-name</i> mep <i>mep-id</i>]</p>
Release Information	Statement introduced in Junos OS Release 8.4.
Description	IEEE 802.1p priority bits used by the continuity check messages.
Options	<p><i>number</i>—Configure the IEEE 802.1p priority bits to be used in the VLAN header of the CFM packets.</p> <p>Range: 0 through 7</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> Configuring a MEP to Generate and Respond to CFM Protocol Messages on page 685

protocol (Server MEP)

Syntax	<pre>protocol (l2circuit l2vpn ethernet) { interface <i>interface-name</i>; }</pre>
Hierarchy Level	[edit protocols oam ethernet connectivity-fault-management]
Release Information	Statement introduced in Junos OS Release 14.2.
Description	Configure the protocol as Layer 2 circuit, Layer 2 VPN, or Ethernet and associate the interface to the protocol that needs to be monitored for ETH-AIS.
Options	<p>l2circuit—Configure the protocol for the server MEP as Layer 2 circuit.</p> <p>l2vpn—Configure the protocol for the server MEP as Layer 2 VPN.</p> <p>ethernet—Configure the protocol for the server MEP as Ethernet.</p> <p>interface <i>interface-name</i>—The interface that is to be associated with the protocol that needs monitoring for ETH-AIS.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Ethernet Alarm Indication Signal (ETH-AIS) Function Overview on page 878 • Configuring ETH-AIS on a CFM MEP on page 883

protect-maintenance-association (OAM)

Syntax	<code>protect-maintenance-association <i>protect-ma-name</i>;</code>
Hierarchy Level	<code>[edit protocols oam ethernet connectivity-fault-management maintenance-domain <i>domain-name</i> maintenance-association <i>ma-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 11.4
Description	Configure the name of the protect transport path for the maintenance-association.
Options	<i>protect-ma-name</i> —The name of the protect transport path.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring a MEP to Generate and Respond to CFM Protocol Messages on page 685

receive-ais

Syntax	<code>receive-ais;</code>
Hierarchy Level	<code>[edit protocols oam ethernet connectivity-fault-management action-profile <i>action-profile-name</i> event ais-trigger-condition]</code>
Release Information	Statement introduced in Junos OS Release 14.2.
Description	Send a message to the peer MEPs when an AIS message is received by a peer MEP at its own maintenance level.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Ethernet Alarm Indication Signal (ETH-AIS) Function Overview on page 878• Configuring ETH-AIS on a CFM MEP on page 883

remote-maintenance-association (OAM)

Syntax	<code>remote-maintenance-association <i>remote-ma-name</i>;</code>
Hierarchy Level	[edit protocols oam ethernet connectivity-fault-management maintenance-domain <i>domain-name</i> maintenance-association <i>ma-name</i>]
Release Information	Statement introduced in Junos OS Release 11.4.
Description	Configure the name of the remote maintenance association.
Options	<i>remote-ma-name</i> —Name of the remote maintenance association.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring a MEP to Generate and Respond to CFM Protocol Messages on page 685

remote-mep

Syntax	<pre>remote-mep mep-id { action-profile profile-name; sla-iterator-profile profile-name { data-tlv-size size; iteration-count count-value; priority priority-value; } detect-loc; }</pre>
Hierarchy Level	[edit protocols oam ethernet connectivity-fault-management maintenance-domain <i>md-name</i> maintenance-association <i>ma-name</i> mep <i>mep-id</i>]
Release Information	Statement introduced in Junos OS Release 8.4.
Description	Configure the numeric identifier of the remote maintenance association end point (MEP) within the maintenance association.
Options	<p>mep-id—Numeric identifier of the MEP.</p> <p>Range: 1 through 8191</p> <p>The remaining statements are explained separately. See CLI Explorer.</p>
Required Privilege Level	<p>Configure—To enter configuration mode.</p> <p>Control—To modify any configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Configuring a MEP to Generate and Respond to CFM Protocol Messages on page 685 • detect-loc on page 1090

sendid-tlv

Syntax	<pre>sendid-tlv { send-chassis-tlv; }</pre>
Hierarchy Level	<pre>[edit protocols oam ethernet connectivity-fault-management] [edit protocols oam ethernet connectivity-fault-management maintenance-domain maintenance-domain-name maintenance-association maintenance-association-name continuity-check]</pre>
Release Information	Statement introduced in Junos OS Release 16.1R2.
Description	Configures Junos OS to send the sender ID TLV along with the packets. The sender ID TLV is an optional TLV that is sent in continuity check messages (CCMs), loopback messages, and Link Trace Messages (LTMs), as specified in the IEEE 802.1ag standard. TLVs (type, length, and value) are described in the IEEE 802.1ag standard for Connectivity Fault Management (CFM) as a method of encoding variable-length and optional information in a protocol data unit (PDU).
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Junos OS Support for Chassis ID TLV on page 674

short-name-format

Syntax	<code>short-name-format (character-string vlan 2octet rfc-2685-vpn-id);</code>
Hierarchy Level	<code>[edit protocols oam ethernet connectivity-fault-management maintenance-domain domain-name maintenance-association ma-name]</code>
Release Information	Statement introduced in Junos OS Release 8.4. Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.
Description	Specify the name format of the maintenance association name.
Options	<p>character-string—The name is an ASCII character string.</p> <p>vlan—The primary VLAN identifier.</p> <p>2octet—A number in the range 0 through 65,535.</p> <p>rfc-2685-vpn-id—A VPN identifier that complies with RFC 2685.</p> <p>Default: <code>character-string</code></p>

NOTE: The PTX Series Packet Transport Routers support the `vlan` and `2octet` options only.

Required Privilege Level	<p><code>interface</code>—To view this statement in the configuration.</p> <p><code>interface-control</code>—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Creating a Maintenance Association on page 682

sla-iterator-profile

Syntax	<pre>sla-iterator-profile <i>profile-name</i> { data-tlv-size <i>size</i>; iteration-count <i>count-value</i>; priority <i>priority-value</i>; }</pre>
Hierarchy Level	[edit protocols oam ethernet connectivity-fault-management maintenance-domain md-name maintenance-association ma-name mep mep-id remote-mep remote-mep-id]
Release Information	Statement introduced in Junos OS Release 11.1.
Description	Configure a remote MEP with an iterator profile and specify the options.
Options	<p><i>profile-name</i>—Name of the iterator profile configured for a remote MEP. For more information about configuring a remote MEP with an iterator profile, see “Configuring a Remote MEP with an Iterator Profile” on page 837.</p> <p>The remaining statements are explained separately. See CLI Explorer.</p>
Required Privilege Level	<p>Configure—To enter configuration mode.</p> <p>Control—To modify any configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Configuring an Iterator Profile on page 826 • Configuring a Remote MEP with an Iterator Profile on page 837 • Verifying the Configuration of an Iterator Profile on page 829 • Managing Iterator Statistics on page 832 • sla-iterator-profiles on page 1134

sla-iterator-profiles

Syntax	<pre>sla-iterator-profiles { profile-name { avg-fd-twoway-threshold; avg-ifdv-twoway-threshold; avg-flr-forward-threshold; avg-flr-backward-threshold; calculation-weight { delay delay-weight; delay-variation delay-variation-weight; } cycle-time milliseconds; flap-trap-monitor seconds iteration-period iteration-period-value; measurement-type (loss statistical-frame-loss two-way-delay); } }</pre>
Hierarchy Level	[edit protocols oam ethernet connectivity-fault-management performance-monitoring]
Release Information	Statement introduced in Junos OS Release 11.1.
Description	Configure an iterator application and specify the iterator profile options.
Options	<p>profile-name—Name of the iterator profile. For more information about configuring the iterator profile, see “Configuring an Iterator Profile” on page 826.</p> <p>The remaining statements are explained separately. See CLI Explorer.</p>
Required Privilege Level	<p>Configure—To enter configuration mode.</p> <p>Control—To modify any configuration.</p>

802.3ad

Syntax	<pre> 802.3ad { primary backup; ae <i>interface-number</i> ; lacp { port-priority <i>priority-number</i>; } link-index <i>index-number</i> distribution-list <i>distribution-list-number</i> } </pre>
Hierarchy Level	<p>[edit interfaces <i>interface-name</i> fastether-options],</p> <p>[edit interfaces <i>interface-name</i> gigether-options]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>primary and backup options added in Junos OS Release 8.3.</p>
Description	Specify aggregated Ethernet logical interface number.
Options	<p>bundle—Join an aggregated Ethernet interface.</p> <p>ae <i>interface-number</i>—Aggregated Ethernet logical interface number. For MX Series routers running Junos release 14.2R3 and later you can configure a maximum of 1000 aggregated interfaces. On MX2010 and MX2020 routers you can configure a maximum of 800 aggregated interfaces.</p> <p>primary backup—For link protection configurations, specify the link as primary link or backup link for egress traffic.</p> <p>lacp—Configure Link Aggregation Control Protocol. Specify the port priority in the range 0 through 65535. Default port-priority is 127.</p> <p>link-index—Specify the desired child link index within the aggregated Ethernet Interface. Index number of the logical interface reflects its initialization sequence.</p> <p>distribution-list—For targeted distribution, specify the distribution list to which the interface belongs.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Configuring an Aggregated Ethernet Interface on page 110 • Configuring Aggregated Ethernet Link Protection on page 152

accept-source-mac

Syntax	<pre>accept-source-mac { mac-address mac-address { policer { input cos-policer-name; output cos-policer-name; } } }</pre>
Hierarchy Level	<p>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i>]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.1X48 for PTX Packet Transport Routers.</p> <p>Statement introduced in Junos OS Release 13.2 for the QFX Series.</p>
Description	<p>For Gigabit Ethernet intelligent queuing (IQ) interfaces only, accept traffic from and to the specified remote media access control (MAC) address.</p> <p>The accept-source-mac statement is equivalent to the source-address-filter statement, which is valid for aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only. To allow the interface to receive packets from specific MAC addresses, include the accept-source-mac statement.</p> <p>On untagged Gigabit Ethernet interfaces, you should not configure the source-address-filter statement and the accept-source-mac statement simultaneously. On tagged Gigabit Ethernet interfaces, you should not configure the source-address-filter statement and the accept-source-mac statement with an identical MAC address specified in both filters.</p> <p>The remaining statements are explained separately. See CLI Explorer.</p>

NOTE: The **policer** statement is not supported on PTX Series Packet Transport Routers.

NOTE: On QFX platforms, if you configure source MAC addresses for an interface using the *static-mac* or *persistent-learning* statements and later configure a different MAC address for the same interface using the **accept-source-mac** statement, the MAC addresses that you previously configured for the interface remain in the ethernet-switching table and can still be used to send packets to the interface.

Required Privilege interface—To view this statement in the configuration.
Level interface-control—To add this statement to the configuration.

Hierarchy Level [edit interfaces *interface-name* unit *logical-unit-number* family *family*],
[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*
family *family*]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 11.1 for the QFX Series.

Description Configure the interface address.

NOTE: If you configure the same address on multiple interfaces in the same routing instance, Junos OS uses only the first configuration, and the remaining address configurations are ignored and can leave interfaces without an address. Interfaces that do not have an assigned address cannot be used as a donor interface for an unnumbered Ethernet interface.

For example, in the following configuration the address configuration of interface xe-0/0/1.0 is ignored:

```
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 192.168.1.1/8;
      }
    }
  }
  xe-0/0/1 {
    unit 0 {
      family inet {
        address 192.168.1.1/8;
      }
    }
  }
}
```

For more information on configuring the same address on multiple interfaces, see *Configuring the Interface Address*.

- In Junos OS Release 13.3 and later, when you configure an IPv6 host address and an IPv6 subnet address on an interface, the commit operation fails.
- In releases earlier than Junos OS Release 13.3, when you use the same configuration on an interface, the commit operation succeeds, but only one of the IPv6 addresses that was entered is assigned to the interface. The other address is not applied.

Options *address*—Address of the interface.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

NOTE: The `edit logical-systems` hierarchy is not available on QFabric systems.

Required Privilege Level interface—To view this statement in the configuration.

agent-specifier

Syntax	<pre>agent-specifier { aci <i>circuit-id-string</i> ari <i>remote-id-string</i> { drop; delay <i>seconds</i>; terminate; dynamic-profile <i>profile-name</i>; routing-instance <i>routing-instance-name</i>; static-interface <i>interface-name</i>; } }</pre>
Hierarchy Level	[edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i>]
Release Information	<p>Statement introduced in Junos OS Release 10.0.</p> <p>drop, delay, terminate, dynamic-profile, routing-instance, and static-interface options introduced in Junos OS Release 10.2.</p>
Description	<p>Specify the action taken by the interface for the specified agent circuit identifier/agent remote identifier (ACI/ARI) pair when the interface receives a PPPoE Active Discovery Initiation (PADI) control packet that includes the vendor-specific tag with ACI/ARI pair information. You can configure an ACI/ARI pair for a named service, empty service, or any service in a PPPoE service name table. A maximum of 8000 ACI/ARI pairs are supported per PPPoE service name table. You can distribute the ACI/ARI pairs in any combination among the named, empty, and any service entries in the service name table.</p> <p>You can use an asterisk (*) as a wildcard character to match ACI/ARI pairs, the ACI alone, or the ARI alone. The asterisk can be placed only at the beginning, the end, or both the beginning and end of the identifier string. You can also specify an asterisk alone for either the ACI or the ARI. You cannot specify only an asterisk for both the ACI and the ARI. When you specify a single asterisk as the identifier, that identifier is ignored in the PADI packet.</p> <p>For example, suppose you care about matching only the ACI and do not care what value the ARI has in the PADI packet, or even whether the packet contains an ARI value. In this case you can set the remote-id-string to a single asterisk. Then the interface ignores the ARI received in the packet and the interface takes action based only on matching the specified ACI.</p>
Default	The default action is terminate.
Options	<p>aci <i>circuit-id-string</i>—Identifier for the agent circuit ID that corresponds to the DSLAM interface that initiated the service request. This is a string of up to 63 characters.</p> <p>ari <i>remote-id-string</i>—Identifier for the subscriber associated with the DSLAM interface that initiated the service request. This is a string of up to 63 characters.</p>

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

            }
            system-priority;
        }
    }
    sonet {
        device-count number;
    }
    maximum-links maximum-links-limit;
}
```

Hierarchy Level [edit chassis]

Release Information Statement introduced before Junos OS Release 7.4.
Support for LACP link protection and system priority introduced in Junos OS Release 9.3.

Description Configure properties for aggregated devices on the router. Aggregate Ethernet links are logical interfaces defined on the device that bundle together multiple physical interfaces into a single interface for the use of redundancy and bandwidth aggregation. When interconnecting devices you can create aggregate ethernet interfaces to bundle together multiple physical ethernet links to increase bandwidth and redundancy between devices.

Link aggregation enables you to group Ethernet interfaces to form a single link layer interface. Link Aggregation Control Protocol (LACP) is supported in chassis cluster deployments, where aggregated Ethernet interfaces and redundant Ethernet interfaces are supported simultaneously.

You must first configure the system to enable configuring the Aggregated Ethernet (ae) Interfaces. By default, Juniper devices do not have any aggregated ethernet interfaces created. To configure the device to support a given number of ae interfaces, you must define it on a per chassis basis using the **set chassis aggregated-devices devices {1-32}** in configuration mode. The number of devices you define will be the number of aggregated ethernet interfaces that the system will create which can be configured just like any other ethernet interface. Also you can view the interfaces created by using the **show interface terse** command. Once you have defined the number of aggregated ethernet devices on the chassis you can then continue to configure the LAG members on a per ethernet interface basis.

Options The remaining statements are explained separately.

Required Privilege	interface—To view this statement in the configuration.
Level	interface-control—To add this statement to the configuration.

  interfaces {
    interface-name {
      aging-timer minutes;
    }
  }
  passive-learning;
  purging;
}
```

Syntax (EX Series) `arp {
 aging-timer minutes;
}`

Hierarchy Level `[edit system]`

`[edit interfaces interface-name unit logical-unit-number family inet address address],`

`[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet address address]`

NOTE: The edit logical-systems hierarchy is not available on QFabric systems.

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 9.0 for EX Series switches.
Statement introduced in Junos OS Release 11.1 for the QFX Series.
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description For Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only, configure Address Resolution Protocol (ARP) table entries, mapping IP addresses to MAC addresses. You can enable backup VRRP routers to learn ARP requests for VRRP-IP to VRRP-MAC address translation. You can also set the time interval between ARP updates.

NOTE: By default, an ARP policer is installed that is shared among all the Ethernet interfaces on which you have configured the family inet statement. By including the arp statement at the `[edit interfaces interface-name unit`

logical-unit-number family inet policer] hierarchy level, you can apply a specific ARP-packet policer to an interface. This feature is not available on EX Series switches.

When you need to conserve IP addresses, you can configure an Ethernet interface to be unnumbered by including the `unnumbered-address` statement at the [edit interfaces *interface-name* unit *logical-unit-number* family inet] hierarchy level.

NOTE: For EX-Series switches, set only the time interval between ARP updates.

Options **ip-address**—IP address to map to the MAC address. The IP address specified must be part of the subnet defined in the enclosing **address** statement.

mac *mac-address*—MAC address to map to the IP address. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, **0000.5e00.5355** or **00:00:5e:00:53:55**.

multicast-mac *mac-address*—Multicast MAC address to map to the IP address. Specify the multicast MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, **0000.5e00.5355** or **00:00:5e:00:53:55**.

publish—(Optional) Have the router or switch reply to ARP requests for the specified IP address. If you omit this option, the router or switch uses the entry to reach the destination but does not reply to ARP requests.

NOTE: For unicast MAC addresses only, if you include the **publish** option, the router or switch replies to proxy ARP requests.

aging-timer—Time interval in minutes between ARP updates. In environments where the number of ARP entries to update is high (for example, on routers only, metro Ethernet environments), increasing the time between updates can improve system performance.

passive-learning (QFX-Series only)—Configure backup VRRP routers or switches to learn the ARP mappings (IP-to-MAC address) for hosts sending the requests. By default, the backup VRRP router drops these requests; therefore, if the master router fails, the backup router must learn all entries present in the ARP cache of the master router. Configuring passive learning reduces transition delay when the backup router is activated.

Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration. system—To view this statement in the configuration. system-control—To add this statement to the configuration.

auto-negotiation

Syntax	(auto-negotiation no-auto-negotiation) <remote-fault (local-interface-online local-interface-offline)>;
Hierarchy Level	[edit interfaces <i>interface-name</i> ether-options], [edit interfaces <i>interface-name</i> gigether-options], [edit interfaces <i>ge-pim</i> /0/0 switch-options switch-port <i>port-number</i>]
Release Information	Statement introduced in Junos OS Release 7.6. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Description	For Gigabit Ethernet interfaces on M Series, MX Series, T Series, TX Matrix routers, and ACX Series routers explicitly enable autonegotiation and remote fault. For EX Series switches, explicitly enable autonegotiation only. <ul style="list-style-type: none"> • auto-negotiation—Enables autonegotiation. This is the default. • no-auto-negotiation—Disable autonegotiation. When autonegotiation is disabled, you must explicitly configure the link mode and speed. <p>When you configure Tri-Rate Ethernet copper interfaces to operate at 1 Gbps, autonegotiation must be enabled.</p>

NOTE: On EX Series switches, an interface configuration that disables autonegotiation and manually sets the link speed to 1 Gbps is accepted when you commit the configuration; however, if the interface you are configuring is a Tri-Rate Ethernet copper interface, the configuration is ignored as invalid and autonegotiation is enabled by default.

To correct the invalid configuration and disable autonegotiation:

1. Delete the **no-auto-negotiation** statement and commit the configuration.
2. Set the link speed to 10 or 100 Mbps, set **no-auto-negotiation**, and commit the configuration.

On EX Series switches, if the link speed and duplex mode are also configured, the interfaces use the values configured as the desired values in the negotiation. If autonegotiation is disabled, the link speed and link mode must be configured.

NOTE: On T4000 routers, the **auto-negotiation** command is ignored for interfaces other than Gigabit Ethernet.

NOTE: On ACX Series routers, when you configure fiber interfaces (fiber media mode) to operate at 1 Gbps, autonegotiation is enabled by default to negotiate the speed and duplex settings. You can disable autonegotiation by using the `(no-auto-negotiation)` statement, and commit the configuration, in the fiber media mode. In copper interfaces (copper media mode), autonegotiation is enabled by default. To disable autonegotiation, you need to explicitly configure the link speed to 10 or 100 Mbps, set `no-auto-negotiation`, and commit the configuration.

Default	Autonegotiation is automatically enabled. No explicit action is taken after the autonegotiation is complete or if the negotiation fails.
Options	remote-fault (local-interface-online local-interface-offline) —(Optional) For M Series, MX Series, T Series, TX Matrix routers, and ACX Series routers only, manually configure remote fault on an interface. Default: local-interface-online
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

bfd-liveness-detection (LAG)

Syntax

```

bfd-liveness-detection {
  authentication {
    algorithm algorithm-name;
    key-chain key-chain-name;
    loose-check;
  }
  detection-time {
    threshold milliseconds;
  }
  holddown-interval milliseconds;
  local-address bfd-local-address;
  minimum-interval milliseconds;
  minimum-receive-interval milliseconds;
  multiplier number;
  neighbor bfd-neighbor-address;
  no-adaptation;
  transmit-interval {
    minimum-interval milliseconds;
    threshold milliseconds;
  }
  version (1 | automatic);
}

```

Hierarchy Level [edit interfaces *aex* aggregated-ether-options]

Release Information Statement introduced in Junos OS Release 13.3.

Description Configure Bidirectional Forwarding Detection (BFD) timers and authentication for aggregated Ethernet interfaces.

Options **holddown-interval *milliseconds***— Specify a time limit, in milliseconds, indicating the time that a BFD session remains up before a state change notification is sent. If the BFD session goes down and then comes back up during the hold-down interval, the timer is restarted.

Range: 0 through 255,000

Default: 0

local-address *bfd-local-address*— Specify the loopback address or the AE interface address of the source of the BFD session.

NOTE: Beginning with Release 16.1R2, Junos OS checks and validates the configured micro BFD *local-address* against the interface or loopback IP address before the configuration commit. Junos OS performs this

check on both IPv4 and IPv6 micro BFD address configurations, and if they do not match, the commit fails.

minimum-interval *milliseconds*— Specify a minimum time interval after which the local routing device transmits a BFD packet and then expects to receive a reply from the BFD neighbor. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the **transmit-interval minimum-interval** statement.

Range: 1 through 255,000

minimum-receive-interval *milliseconds*— Specify the minimum time interval after which the routing device expects to receive a reply from the BFD neighbor.

Range: 1 through 255,000

multiplier *number*— Specify the number of BFD packets that were not received by the BFD neighbor before the originating interface is declared down.

Range: 1 through 255

neighbor *bfd-neighbor-address*— Specify the loopback address or the AE interface address of a remote destination to send BFD packets.

no-adaptation— Disable the BFD adaptation. Include this statement if you do not want the BFD sessions to adapt to changing network conditions. We recommend that you do not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

version— Configure the BFD version to detect (BFD version 1) or autodetect (the BFD version).

NOTE: The version option is not supported on the QFX Series.

Default: automatic

The remaining statements are explained separately. See [CLI Explorer](#).

Hierarchy Level [edit protocols]

Release Information Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.

Description Specify the design elements of a captive portal login page.

Options **banner-message**—The first screen displayed before the captive portal login page is displayed—for example, a disclaimer message.

Range: 1–2047 characters

footer-bgcolor —The hexadecimal color code for the color of the footer bar across the bottom of the captive portal login page—for example, #2E8B57 (sea green).

Values: # symbol followed by six characters.

footer-message—Text message displayed in the footer bar across the bottom of the captive portal login page.

Range: 1–2047 characters

Default: Copyright ©2010, Juniper Networks Inc.

footer-text-color — Color of the text in the footer.

Default: The default color is white.

form-header-bgcolor —The hexadecimal color code for the background color of the header bar across the top of the form area of the captive portal login page.

Values: # symbol followed by six characters.

form-header-message—Text message displayed in the header bar across the top of the form area of the captive portal login page.

Range: 1–255 characters

Default: Captive Portal User Authentication

form-header-text-color—Color of the text in the form header.

Default: The default color is black.

form-reset-label—Label displayed in the button that the user can select to clear the username and password fields on the form.

Range: 1–255 characters

Default: Reset

form-submit-label —Label displayed in the button that the user selects to submit their login information—for example, **Log In** .

Range: 1–255 characters

Default: Log In

header-bgcolor—The hexadecimal color code for the color of the header bar across the top of the captive portal login page.

Values: # symbol followed by six characters.

header-logo—Filename of the file containing the image of the logo displayed at the top of the captive portal login page. The image file can be in GIF, JPEG, or PNG format.

Default: The Juniper Networks logo

header-message—Text displayed in the header bar across the bottom of the captive portal login page.

Range: 1–2047 characters

Default: User Authentication

header-text-color—Color of the text in the header.

Default: The default color is white.

post-authentication-url—URL to which the users are directed upon successful authentication—for example **www.mycafe.com**.

Range: 1–255 characters

Default: The page originally requested by the user.

**Required Privilege
Level**

routing—To view this statement in the configuration.

routing-control—To add this statement to the configuration.

centralized

Syntax	centralized;
Hierarchy Level	[edit protocols lacp ppm]
Release Information	<p>Statement introduced in Junos OS Release 9.4 for MX Series routers.</p> <p>Statement introduced in Junos OS Release 10.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	<p>Disable distributed periodic packet management (PPM) processing for Link Aggregation Control Protocol (LACP) packets and run all PPM processing for LACP packets on the Routing Engine.</p> <p>This statement disables distributed PPM processing for only LACP packets. You can disable distributed PPM processing for all packets that use PPM and run all PPM processing on the Routing Engine by configuring the no-delegate-processing statement in the [edit routing-options ppm] hierarchy.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 20px;">  <p>BEST PRACTICE: We generally recommend that you disable distributed PPM only if Juniper Networks Customer Service advises you to do so. You should disable distributed PPM only if you have a compelling reason to disable it.</p> </div>
Default	Distributed PPM processing is enabled for all packets that use PPM.
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring Distributed Periodic Packet Management on an EX Series Switch (CLI Procedure)</i> • <i>Configuring Aggregated Ethernet LACP (CLI Procedure)</i> • Configuring Distributed Periodic Packet Management on page 202 • <i>Configuring Link Aggregation</i>

cipher-suite (MACsec)

Syntax	<code>cipher-suite <i>encryption-algorithm-name</i>;</code>
Hierarchy Level	<code>[edit security macsec connectivity-association <i>connectivity-association-name</i>]</code>
Release Information	<p>Statement introduced in Junos OS Release 16.2R1 for MX240, MX480, MX960, MX2020, and MX2010 routers.</p> <p>Statement introduced in Junos OS Release 17.2R1 for QFX Series switches.</p> <p>Statement introduced in Junos OS Release 17.3R1 for JNP-MIC1-MACSEC MIC on MX10003 routers.</p> <p>Statement introduced in Junos OS Release 18.2R1 for EX Series switches.</p>
Description	<p>Specify the set of ciphers used to encrypt traffic on an Ethernet link that is secured with Media Access Control Security (MACsec). The encryption used by MACsec ensures that the data in the Ethernet frame cannot be viewed by anybody monitoring traffic on the link. MACsec encryption is optional and user-configurable. The configured cipher suites should be the same between MACsec peers.</p> <p>MACsec utilizes the Galois/Counter Mode Advanced Encryption Standard (GCM-AES). The default cipher suite used for MACsec is GCM-AES-128, with a maximum key length of 128 bits. MACsec also supports GCM-AES-256, with a maximum key length of 256 bits.</p> <p>GCM-AES-128 and GCM-AES-256 use a 32-bit packet number as part of the initial value that has to be unique for every packet sent with a given secure association key (SAK). When the permutations of the 32-bit packet number are exhausted, the SAK must be refreshed. The frequency of SAK refreshes can be reduced by using a cipher suite with Extended Packet Numbering (XPN), which increases the size of the packet number to 64-bits. Both GCM-AES-128 and GCM-AES-256 are available with XPN.</p> <div style="margin-top: 20px;">  <p>NOTE: When enabling MACsec on ports with speeds greater than 10-Gigabit Ethernet, we recommend using either the GCM-AES-XPN-128 or GCM-AES-XPN-256 cipher suite.</p> </div> <div style="margin-top: 20px;">  <p>NOTE: On EX4300-48MP switches, the XPN cipher suites are not supported on multi-rate ports.</p> </div>
Default	If the cipher-suite statement is not configured, the default cipher suite used for encryption is GCM-AES-128.

Options **gcm-aes-128**—GCM-AES-128 has a maximum key size of 128 bits.

gcm-aes-xpn-128—GCM-AES-XPB-128 has a maximum key size of 128 bits and extended packet number.

gcm-aes-256—GCM-AES-256 has a maximum key size of 256 bits.

gcm-aes-xpn-256—GCM-AES-XPB-256 has a maximum key size of 256 bits and extended packet number.

Required Privilege admin— To view this statement in the configuration.
Level admin-control— To add this statement to the configuration.

ckn (MX Series)

Syntax	<code>ckn <i>hexadecimal-number</i>;</code>
Hierarchy Level	[edit security macsec connectivity-association <i>connectivity-association-name</i> pre-shared-key]
Release Information	Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers. Statement introduced in Junos OS Release 17.3R1 for MX10003 Universal Routing Platforms.
Description	<p>Specifies the connectivity association key name (CKN) for a pre-shared key.</p> <p>A pre-shared key includes a CKN and a connectivity association key (CAK). A pre-shared key is exchanged between two devices at each end of a point-to-point link to enable MACsec using dynamic security keys. The MACsec Key Agreement (MKA) protocol is enabled once the pre-shared keys are successfully exchanged. The pre-shared key—the CKN and CAK—must match on both ends of a link</p>
Default	No CKN exists, by default.
Options	<p><i>hexadecimal-number</i>—The key name, in hexadecimal format.</p> <p>The key name is 32 hexadecimal characters in length. If you enter a key name that is less than 32 characters long, the remaining characters are set to 0.</p> <ul style="list-style-type: none"> On MX10003 router, if you configure the length of CKN to the value less than 64 hexadecimal digits, then the following warning message is displayed: <p>warning: To maximize security, recommend configuring all 64 digits of pre-shared-key ckn</p> On MX10003 router, if you configure the length of CKN to an odd value, then the commit will not be successful and the following error message is displayed: <p>error: ckn: 'abcde': Must be an even-length string up to 64 hexadecimal digits (0-9, a-f, A-F)</p>
Required Privilege Level	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>

Syntax	<code>device-count <i>number</i>;</code>
Hierarchy Level	<pre>[edit chassis aggregated-devices ethernet] [edit chassis aggregated-devices sonet]</pre>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement functionality updated in Junos OS Release 14.2, as described below.</p>
Description	<p>Configure the number of aggregated logical devices available to the router.</p> <p>Starting in Junos release 14.2, for MX series routers, aggregate Ethernet interfaces created under a logical system can be individually named. Prior to 14.2, ae interfaces were named automatically (AE1, AE2) etc. upon setting the device count. This change allows administrators to use custom naming schemes. System resources are only allocated for named ae interfaces, regardless of how many were declared in the device count. (In Junos 14.2 and earlier, ae naming occurred automatically up to the number specified for device count, and system resources were allocated whether a given ae interface was used or not.)</p>
Options	<p><i>number</i>—Set the number of aggregated logical devices that will be available for configuration.</p>
	<p> NOTE: Starting with Junos OS Release 13.2, a maximum of 64 aggregated interfaces are supported for link aggregation of SONET/SDH interfaces. In releases before Junos OS Release 13.2, a maximum of 16 aggregated interfaces are supported for link aggregation of SONET/SDH interfaces.</p>
	<p>Range: 1 - 496. The upper limit for this value is system specific.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

direction (MX Series)

Syntax	<code>direction (inbound outbound);</code>
Hierarchy Level	<code>[edit security macsec connectivity-association <i>connectivity-association-name</i> secure-channel <i>secure-channel-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.
Description	<p>Configure whether the secure channel applies MACsec security to traffic entering or leaving an interface.</p> <p>If you need to apply MACsec on traffic entering and leaving an interface, you need to create one secure channel to apply MACsec on incoming traffic and another secure channel to apply MACsec on outgoing traffic within the same connectivity association. When you associate the connectivity association with an interface, MACsec is applied on traffic entering and leaving that interface.</p> <p>You only use this configuration option when you are configuring MACsec using static secure association keys (SAK) security mode. When you are configuring MACsec using static connectivity association keys (CAK) security mode, two secure channels that are not user-configurable—one inbound secure channel and one outbound secure channel—are automatically created within the connectivity association.</p>
Default	<p>This statement does not have a default value.</p> <p>If you have configured a secure channel to enable MACsec using static SAK security mode, you must specify whether the secure channel applies MACsec to traffic entering or leaving an interface. A candidate configuration that contains a secure channel that has not configured a direction cannot be committed.</p>
Options	<p>inbound—Enable MACsec security on traffic entering the interface that has applied the secure channel.</p> <p>outbound—Enable MACsec security on traffic leaving the interface that has applied the secure channel.</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>

Hierarchy Level	[edit protocols authentication-access-control interface (all [<i>interface-names</i>])]
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	<p>Configure 802.1X authentication for Port-Based Network Access Control. 802.1X authentication is supported on interfaces that are members of private VLANs (PVLANS).</p> <p>The remaining statements are explained separately. See CLI Explorer.</p>
Default	802.1X is disabled.
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

domain-id

Syntax	<code>domain-id <i>domain-id</i>;</code>
Hierarchy Level	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols (ospf ospf3)], [edit routing-instances <i>routing-instance-name</i> protocols (ospf ospf3)]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Specify a domain ID for a route. The domain ID identifies the OSPF domain from which the route originated.
Options	<i>domain-id</i> —You can specify either an IP address or an IP address and a local identifier using the following format: <i>ip-address:local-identifier</i> . If you do not specify a local identifier with the IP address, the identifier is assumed to have a value of 0. Default: If the router ID is not configured in the routing instance, the router ID is derived from an interface address belonging to the routing instance.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

drop (PPPoE Service Name Tables)

Syntax	<code>drop;</code>
Hierarchy Level	<code>[edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i>],</code> <code>[edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i> agent-specifier</code> <code>aci <i>circuit-id-string</i> ari <i>remote-id-string</i>]</code>
Release Information	Statement introduced in Junos OS Release 10.0. Support at <code>[edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i> agent-specifier aci <i>circuit-id-string</i> ari <i>remote-id-string</i>]</code> hierarchy level introduced in Junos OS Release 10.2.
Description	Direct the router to drop (ignore) a PPPoE Active Discovery Initiation (PADI) control packet received from a PPPoE client that contains the specified service name tag or agent circuit identifier/agent remote identifier (ACI/ARI) information. This action effectively denies the client's request to provide the specified service, or to accept requests from the subscriber or subscribers represented by the ACI/ARI information.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><i>Configuring PPPoE Service Name Tables</i>

dynamic-profile (PPPoE Service Name Tables)

Syntax	<code>dynamic-profile <i>profile-name</i>;</code>
Hierarchy Level	<code>[edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i>],</code> <code>[edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i> agent-specifier</code> <code>aci <i>circuit-id-string</i> ari <i>remote-id-string</i>]</code>
Release Information	Statement introduced in Junos OS Release 10.2.
Description	<p>Specify a dynamic profile to instantiate a dynamic PPPoE interface. You can associate a dynamic profile with a named service entry, empty service entry, or any service entry configured in a PPPoE service name table, or with an agent circuit identifier/agent remote identifier (ACI/ARI) pair defined for these services.</p> <p>The dynamic profile associated with a service entry in a PPPoE service name table overrides the dynamic profile associated with the PPPoE underlying interface on which the dynamic PPPoE interface is created.</p> <p>If you include the dynamic-profile statement at the <code>[edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i> agent-specifier aci <i>circuit-id-string</i> ari <i>remote-id-string</i>]</code> hierarchy level, you cannot also include the static-interface statement at this level. The dynamic-profile and static-interface statements are mutually exclusive for ACI/ARI pair configurations.</p>
Options	<i>profile-name</i> —Name of the dynamic profile that the router uses to instantiate a dynamic PPPoE interface.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> <i>Configuring PPPoE Service Name Tables</i> <i>Assigning a Dynamic Profile and Routing Instance to a Service Name or ACI/ARI Pair for Dynamic PPPoE Interface Creation</i>

east-interface

Syntax

```
east-interface {
  node-id mac-address;
  control-channel channel-name {
    vlan number;
    interface name interface-name
  }
  interface-none
  ring-protection-link-end;
}
```

Hierarchy Level [edit protocols [protection-group ethernet-ring ring-name](#)]

Release Information Statement introduced in Junos OS Release 9.4.
Statement introduced in Junos OS Release 12.1 for EX Series switches.
Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.

Description Define one of the two interface ports for Ethernet ring protection, the other being defined by the **west-interface** statement at the same hierarchy level. The interface must use the control channel's logical interface name. The control channel is a dedicated VLAN channel for the ring port.

EX Series switches do not use the node-id statement--the node ID is automatically configured on the switches using the MAC address.

NOTE: Always configure this port first, before configuring the **west-interface** statement.

NOTE: The Node ID is not configurable on EX Series switches. The node ID is automatically configured using the MAC address.

The remaining statements are explained separately. See [CLI Explorer](#).

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

egress-policer-overhead

Syntax	<code>egress-policer-overhead <i>bytes</i>;</code>
Hierarchy Level	<code>[edit chassis fpc <i>slot-number</i> pic <i>pic-number</i>]</code>
Release Information	Statement introduced before Junos OS Release 11.1.
Description	<p>Add the specified number of bytes to the actual length of an Ethernet frame when determining the actions of Layer 2 policers, MAC policers, or queue rate limits applied to output traffic on the line card. You can configure egress policer overhead to account for egress <i>shaping</i> overhead bytes added to output traffic on the line card.</p> <p>On M Series and T Series routers, this statement is supported on Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs and Enhanced IQ2 (IQ2E) PICs. On MX Series routers, this statement is supported for interfaces configured on Dense Port Concentrators (DPCs).</p>
	<p> NOTE: This statement is not supported on Modular Interface Cards (MICs) or Modular Port Concentrators (MPCs) in MX Series routers.</p>
Options	<p>bytes—Number of bytes added to a packet exiting an interface.</p> <p>Range: 0–255 bytes</p> <p>Default: 0</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

encapsulation (Logical Interface)

Syntax	encapsulation (atm-ccc-cell-relay atm-ccc-vc-mux atm-cisco-nlpid atm-mlppp-llc atm-nlpid atm-ppp-llc atm-ppp-vc-mux atm-snap atm-tcc-snap atm-tcc-vc-mux atm-vc-mux ether-over-atm-llc ether-vpls-over-atm-llc ether-vpls-over-fr ether-vpls-over-ppp ethernet ethernet-ccc ethernet-vpls ethernet-vpls-fr frame-relay-ccc frame-relay-ether-type frame-relay-ether-type-tcc frame-relay-ppp frame-relay-tcc gre-fragmentation multilink-frame-relay-end-to-end multilink-ppp ppp-over-ether ppp-over-ether-over-atm-llc vlan-bridge vlan-ccc vlan-vci-ccc vlan-tcc vlan-vpls vxlan);
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i>], [edit interfaces rlsq <i>number</i> unit <i>logical-unit-number</i>] [edit protocols evpn]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers (ethernet , vlan-ccc , and vlan-tcc options only). Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers. Only the atm-ccc-cell-relay and atm-ccc-vc-mux options are supported on ACX Series routers. Statement introduced in Junos OS Release 17.3R1 for QFX10000 Series switches (ethernet-ccc and vlan-ccc options only).
Description	Configure a logical link-layer encapsulation type. Not all encapsulation types are supported on the switches. See the switch CLI.
Options	<p>atm-ccc-cell-relay—Use ATM cell-relay encapsulation.</p> <p>atm-ccc-vc-mux—Use ATM virtual circuit (VC) multiplex encapsulation on CCC circuits. When you use this encapsulation type, you can configure the ccc family only.</p> <p>atm-cisco-nlpid—Use Cisco ATM network layer protocol identifier (NLPID) encapsulation. When you use this encapsulation type, you can configure the inet family only.</p> <p>atm-mlppp-llc—For ATM2 IQ interfaces only, use Multilink Point-to-Point (MLPPP) over AAL5 LLC. For this encapsulation type, your router must be equipped with a Link Services or Voice Services PIC. MLPPP over ATM encapsulation is not supported on ATM2 IQ OC48 interfaces.</p> <p>atm-nlpid—Use ATM NLPID encapsulation. When you use this encapsulation type, you can configure the inet family only.</p> <p>atm-ppp-llc—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over AAL5 LLC encapsulation.</p>

atm-ppp-vc-mux—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over ATM AAL5 multiplex encapsulation.

atm-snap—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM subnetwork attachment point (SNAP) encapsulation.

atm-tcc-snap—Use ATM SNAP encapsulation on translational cross-connect (TCC) circuits.

atm-tcc-vc-mux—Use ATM VC multiplex encapsulation on TCC circuits. When you use this encapsulation type, you can configure the **tcc** family only.

atm-vc-mux—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM VC multiplex encapsulation. When you use this encapsulation type, you can configure the **inet** family only.

ether-over-atm-llc—(All IP interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) For interfaces that carry IP traffic, use Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces.

ether-vpls-over-atm-llc—For ATM2 IQ interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

ether-vpls-over-fr—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Frame Relay encapsulation to support Bridged Ethernet over Frame Relay encapsulated TDM interfaces for VPLS applications, per RFC 2427, *Multiprotocol Interconnect over Frame Relay*.

NOTE: The SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, the Channelized SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, and the DS3/E3 MIC do not support Ethernet over Frame Relay encapsulation.

ether-vpls-over-ppp—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Point-to-Point Protocol (PPP) encapsulation to support Bridged Ethernet over PPP-encapsulated TDM interfaces for VPLS applications.

ethernet—Use Ethernet II encapsulation (as described in RFC 894, *A Standard for the Transmission of IP Datagrams over Ethernet Networks*).

ethernet-ccc—Use Ethernet CCC encapsulation on Ethernet interfaces.

ethernet-vpls—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard Tag Protocol ID (TPID) values.

NOTE: The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

ethernet-vpls-fr—Use in a VPLS setup when a CE device is connected to a PE router over a time-division multiplexing (TDM) link. This encapsulation type enables the PE router to terminate the outer layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.

frame-relay-ccc—Use Frame Relay encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

frame-relay-ether-type—Use Frame Relay ether type encapsulation for compatibility with Cisco Frame Relay. The physical interface must be configured with flexible-frame-relay encapsulation.

frame-relay-ether-type-tcc—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. The physical interface must be configured with flexible-frame-relay encapsulation.

frame-relay-ppp—Use PPP over Frame Relay circuits. When you use this encapsulation type, you can configure the **ppp** family only.

frame-relay-tcc—Use Frame Relay encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the **tcc** family only.

gre-fragmentation—For adaptive services interfaces only, use GRE fragmentation encapsulation to enable fragmentation of IPv4 packets in GRE tunnels. This encapsulation clears the do not fragment (DF) bit in the packet header. If the packet's size exceeds the tunnel's maximum transmission unit (MTU) value, the packet is fragmented before encapsulation.

multilink-frame-relay-end-to-end—Use MLFR FRF.15 encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

multilink-ppp—Use MLPPP encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces.

ppp-over-ether—Use PPP over Ethernet encapsulation to configure an underlying Ethernet interface for a dynamic PPPoE logical interface on M120 and M320 routers with Intelligent Queuing 2 (IQ2) PICs, and on MX Series routers with MPCs.

ppp-over-ether-over-atm-llc—(MX Series routers with MPCs using the ATM MIC with SFP only) For underlying ATM interfaces, use PPP over Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure the interface address. Instead, configure the interface address on the PPP interface.

vlan-bridge—Use Ethernet VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q tagging, flexible-ethernet-services, and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

vlan-ccc—Use Ethernet virtual LAN (VLAN) encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

vlan-vci-ccc—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

vlan-tcc—Use Ethernet VLAN encapsulation on TCC circuits. When you use this encapsulation type, you can configure the **tcc** family only.

vlan-vpls—Use Ethernet VLAN encapsulation on VPLS circuits.

vxlan—Use VXLAN data plane encapsulation for EVPN.

Required Privilege Level	interface—To view this statement in the configuration.
	interface-control—To add this statement to the configuration.

	<p> NOTE: Not all encapsulation types are supported on the switches. See the switch CLI.</p>
Default	ppp —Use serial PPP encapsulation.

Physical Interface Options and Logical Interface Options

[Warning: element unresolved in stylesheets: <title> (in <config-options>). This is probably a new element that is not yet supported in the stylesheets.]

Physical Interface Options and Logical Interface Options

For physical interfaces:

NOTE: Frame Relay, ATM, PPP, SONET, and SATSOP options are not supported on EX Series switches.

- **atm-ccc-cell-relay**—Use ATM cell-relay encapsulation.
- **atm-pvc**—Defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*. When you configure physical ATM interfaces with ATM PVC encapsulation, an RFC 2684-compliant ATM Adaptation Layer 5 (AAL5) tunnel is set up to route the ATM cells over a Multiprotocol Label Switching (MPLS) path that is typically established between two MPLS-capable routers using the Label Distribution Protocol (LDP).
- **cisco-hdlc**—Use Cisco-compatible High-Level Data Link Control (HDLC) framing. E1, E3, SONET/SDH, T1, and T3 interfaces can use Cisco HDLC encapsulation. Two related versions are supported:
 - CCC version (**cisco-hdlc-ccc**)—The logical interface does not require an encapsulation statement. When you use this encapsulation type, you can configure the **ccc** family only.
 - TCC version (**cisco-hdlc-tcc**)—Similar to CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.
- **cisco-hdlc-ccc**—Use Cisco-compatible HDLC framing on CCC circuits.
- **cisco-hdlc-tcc**—Use Cisco-compatible HDLC framing on TCC circuits for connecting different media.
- **ethernet-bridge**—Use Ethernet bridge encapsulation on Ethernet interfaces that have bridging enabled and that must accept all packets.
- **ethernet-over-atm**—For interfaces that carry IPv4 traffic, use Ethernet over ATM encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces. As defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*, this encapsulation type allows ATM interfaces to connect to devices that support only bridge protocol data units (BPDUs). Junos OS does not completely support bridging, but accepts BPDU packets as a default gateway. If you use the router as an edge device, then the router acts as a default gateway. It accepts Ethernet LLC/SNAP frames with IP or ARP in the payload, and drops the rest. For packets destined to the Ethernet LAN, a route lookup is done using the destination IP address. If the route lookup yields a full address match, the packet is encapsulated with an LLC/SNAP and MAC header, and the packet is forwarded to the ATM interface.
- **ethernet-tcc**—For interfaces that carry IPv4 traffic, use Ethernet TCC encapsulation on interfaces that must accept packets carrying standard TPID values. For 8-port, 12-port, and 48-port Fast Ethernet PICs, TCC is not supported.

- **ethernet-vpls**—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard TPID values. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.
- **ethernet-vpls-fr**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.
- **ethernet-vpls-ppp**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 PPP connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use it to forward the packet into a given VPLS instance.
- **ether-vpls-over-atm-llc**—For ATM intelligent queuing (IQ) interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.
- **extended-frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to CCC. When you use this encapsulation type, you can configure the **ccc** family only.
- **extended-frame-relay-ether-type-tcc**—Use extended Frame Relay ether type TCC for Cisco-compatible Frame Relay for DLCIs 1 through 1022. This encapsulation type is used for circuits with different media on either side of the connection.
- **extended-frame-relay-tcc**—Use Frame Relay encapsulation on TCC circuits to connect different media. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to TCC.
- **extended-vlan-bridge**—Use extended VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q VLAN tagging and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.
- **extended-vlan-ccc**—Use extended VLAN encapsulation on CCC circuits with Gigabit Ethernet and 4-port Fast Ethernet interfaces that must accept packets carrying 802.1Q values. Extended VLAN CCC encapsulation supports TPIDs 0x8100, 0x9100, and 0x9901. When you use this encapsulation type, you can configure the **ccc** family only. For 8-port, 12-port, and 48-port Fast Ethernet PICs, extended VLAN CCC is not supported. For 4-port Gigabit Ethernet PICs, extended VLAN CCC is not supported.
- **extended-vlan-tcc**—For interfaces that carry IPv4 traffic, use extended VLAN encapsulation on TCC circuits with Gigabit Ethernet interfaces on which you want to use 802.1Q tagging. For 4-port Gigabit Ethernet PICs, extended VLAN TCC is not supported.

- **extended-vlan-vpls**—Use extended VLAN VPLS encapsulation on Ethernet interfaces that have VLAN 802.1Q tagging and VPLS enabled and that must accept packets carrying TPIDs 0x8100, 0x9100, and 0x9901. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

NOTE: The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

- **flexible-ethernet-services**—For Gigabit Ethernet IQ interfaces and Gigabit Ethernet PICs with small form-factor pluggable transceivers (SFPs) (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and for Gigabit Ethernet interfaces, use flexible Ethernet services encapsulation when you want to configure multiple per-unit Ethernet encapsulations. Aggregated Ethernet bundles can use this encapsulation type. This encapsulation type allows you to configure any combination of route, TCC, CCC, Layer 2 virtual private networks (VPNs), and VPLS encapsulations on a single physical port. If you configure flexible Ethernet services encapsulation on the physical interface, VLAN IDs from 1 through 511 are no longer reserved for normal VLANs.
- **flexible-frame-relay**—For IQ interfaces only, use flexible Frame Relay encapsulation when you want to configure multiple per-unit Frame Relay encapsulations. This encapsulation type allows you to configure any combination of TCC, CCC, and standard Frame Relay encapsulations on a single physical port. Also, each logical interface can have any DLCI value from 1 through 1022.
- **frame-relay**—Use Frame Relay encapsulation is defined in RFC 1490, *Multiprotocol Interconnect over Frame Relay*. E1, E3, link services, SONET/SDH, T1, T3, and voice services interfaces can use Frame Relay encapsulation.
- **frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation is same as standard Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to CCC. The logical interface must also have **frame-relay-ccc** encapsulation. When you use this encapsulation type, you can configure the **ccc** family only.
- **frame-relay-ether-type**—Use Frame Relay ether type encapsulation for compatibility with the Cisco Frame Relay. IETF frame relay encapsulation identifies the payload format using NLPID and SNAP formats. Cisco-compatible Frame Relay encapsulation uses the Ethernet type to identify the type of payload.

NOTE: When the encapsulation type is set to Cisco-compatible Frame Relay encapsulation, ensure that the LMI type is set to ANSI or Q933-A.

- **frame-relay-ether-type-tcc**—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. This encapsulation is Cisco-compatible Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to TCC.

- **frame-relay-port-ccc**—Use Frame Relay port CCC encapsulation to transparently carry all the DLCIs between two customer edge (CE) routers without explicitly configuring each DLCI on the two provider edge (PE) routers with Frame Relay transport. The connection between the two CE routers can be either user-to-network interface (UNI) or network-to-network interface (NNI); this is completely transparent to the PE routers. When you use this encapsulation type, you can configure the **ccc** family only.
- **frame-relay-tcc**—This encapsulation is similar to Frame Relay CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.
- **generic-services**—Use generic services encapsulation for services with a hierarchical scheduler.
- **multilink-frame-relay-uni-nni**—Use MLFR UNI NNI encapsulation. This encapsulation is used on link services, voice services interfaces functioning as FRF.16 bundles, and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.
-
- **ppp**—Use serial PPP encapsulation. This encapsulation is defined in RFC 1661, *The Point-to-Point Protocol (PPP) for the Transmission of Multiprotocol Datagrams over Point-to-Point Links*. PPP is the default encapsulation type for physical interfaces. E1, E3, SONET/SDH, T1, and T3 interfaces can use PPP encapsulation.
- **ppp-ccc**—Use serial PPP encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.
- **ppp-tcc**—Use serial PPP encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the **tcc** family only.
- **vlan-ccc**—Use Ethernet VLAN encapsulation on CCC circuits. VLAN CCC encapsulation supports TPID 0x8100 only. When you use this encapsulation type, you can configure the **ccc** family only.

- **vlan-vci-ccc**—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only. All logical interfaces configured on the Ethernet interface must also have the encapsulation type set to **vlan-vci-ccc**.
- **vlan-vpls**—Use VLAN VPLS encapsulation on Ethernet interfaces with VLAN tagging and VPLS enabled. Interfaces with VLAN VPLS encapsulation accept packets carrying standard TPID values only. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

**NOTE:**

- Label-switched interfaces (LSIs) do not support VLAN VPLS encapsulation. Therefore, you can only use VLAN VPLS encapsulation on a PE-router-to-CE-router interface and not a core-facing interface.
- Starting with Junos OS release 13.3, a commit error occurs when you configure **vlan-vpls** encapsulation on a physical interface and configure **family inet** on one of the logical units. Previously, it was possible to commit this invalid configuration.

For logical interfaces:

- **frame-relay**—Configure a Frame Relay encapsulation when the physical interface has multiple logical units, and the units are either point to point or multipoint.
- **multilink-frame-relay-uni-nni**—Link services interfaces functioning as FRF.16 bundles can use Multilink Frame Relay UNI NNI encapsulation.
- **ppp**—For normal mode (when the device is using only one ISDN B-channel per call). Point-to-Point Protocol is for communication between two computers using a serial interface.
- **ppp-over-ether**—This encapsulation is used for underlying interfaces of pp0 interfaces.

Required Privilege	interface—To view this statement in the configuration.
Level	interface-control—To add this statement to the configuration.

encryption (MACsec for MX Series)

Syntax	encryption;
Hierarchy Level	[edit security macsec connectivity-association <i>connectivity-association-name</i> secure-channel <i>secure-channel-name</i>]
Release Information	Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.
Description	<p>Enable MACsec encryption within a secure channel.</p> <p>You can enable MACsec without enabling encryption. If a connectivity association with a secure channel that has not enabled MACsec encryption is associated with an interface, traffic is forwarded across the Ethernet link in clear text. You are, therefore, able to view this unencrypted traffic when you are monitoring the link. The MACsec header is still applied to the frame, however, and all MACsec data integrity checks are run on both ends of the link to ensure the traffic has not been tampered with and does not represent a security threat.</p> <p>Traffic traversing a MAC-enabled point-to-point Ethernet link traverses the link at the same speed regardless of whether encryption is enabled or disabled. You cannot increase the speed of traffic traversing a MACsec-enabled Ethernet link by disabling encryption.</p> <p>This command is used to enable encryption when MACsec is configured using secure association key (SAK) security mode only. When MACsec is configuring using static connectivity association key (CAK) security mode, the encryption setting is configured outside of the secure channel using the no-encryption configuration statement.</p>
Default	MACsec encryption is disabled when MACsec is configured using static SAK security mode, by default.

enhanced-convergence

Syntax	enhanced-convergence;
Hierarchy Level	[edit interfaces aeX aggregated-ether-options mc-ae] [edit interfaces irb unit <i>unit-number</i>]
Release Information	Statement introduced in Junos OS Release 15.1R1. Statement introduced in Junos OS Release 15.1X53-D60 for the QFX Series.
Description	<p> NOTE: On EX9200 and QFX10000 switches, enhanced convergence is applicable for unicast traffic only—for example, when a MAC address is learned over an MC-AE interface, or an ARP entry is resolved over an MC-AE interface.</p> <p>Improves Layer 2 and Layer 3 convergence time when a multichassis aggregated Ethernet (MC-AE) link goes down or comes up in a bridge domain or VLAN. Convergence time is improved because the traffic on the MC-AE interface is switched to the interchassis link (ICL) without waiting for a MAC address update.</p> <p>If you have configured an IRB interface over an MC-AE interface that has enhanced convergences enabled, then you must configure enhanced convergence on the IRB interface as well. Enhanced convergence must be enabled for both Layer 2 and Layer 3 interfaces.</p>

```

Hierarchy Level [edit interfaces *interface-name* gigether-options [ethernet-switch-profile](#)],
[edit interfaces *interface-name* aggregated-ether-options [ethernet-switch-profile](#)]

Release Information Statement introduced before Junos OS Release 7.4.

Description

NOTE: On QFX Series standalone switches, this statement hierarchy is only supported on the Enhanced Layer 2 Switching CLI.

For Gigabit Ethernet IQ, 10-Gigabit Ethernet, Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and 100-Gigabit Ethernet Type 5 PIC with CFP, configure a class of service (CoS)-based policer. Policing applies to the inner VLAN identifiers, not to the outer tag. For Gigabit Ethernet interfaces with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), the **premium** policer is not supported.

The remaining statements are explained separately. See [CLI Explorer](#).

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

```

Hierarchy Level [edit interfaces *interface-name* [gigether-options](#)],
[edit interfaces *interface-name* [aggregated-ether-options](#)],
[edit interfaces *interface-name* aggregated-ether-options],
[edit interfaces *interface-name* ether-options]

Release Information Statement introduced before Junos OS Release 7.4.
Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Statement introduced in Junos OS Release 13.2 for the QFX Series.
Statement introduced in Junos OS Release 13.2X50-D15 for the EX Series switches.

Description

NOTE: On QFX Series standalone switches, the `ethernet-policer-profile` CLI hierarchy and the `mac-learn-enable` statement are supported only on the Enhanced Layer 2 Switching CLI.

For Gigabit Ethernet IQ, 10-Gigabit Ethernet IQ2 and IQ2-E, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC, aggregated Ethernet with Gigabit Ethernet IQ interfaces, the built-in Gigabit Ethernet port on the M7i router); 100-Gigabit Ethernet Type 5 PIC with CFP; and Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces on EX Series switches, configure VLAN tag and MAC address accounting and filtering properties.

The remaining statements are explained separately. See [CLI Explorer](#).

NOTE: When you gather interfaces into a bridge domain, the `no-mac-learn-enable` statement at the [edit interfaces *interface-name* *gigether-options* ethernet-switch-profile] hierarchy level is not supported. You must use the `no-mac-learning` statement at the [edit bridge-domains *bridge-domain-name* bridge-options interface *interface-name*] hierarchy level to disable MAC learning on an interface in a bridge domain. For information on disabling MAC learning for a bridge domain, see the *MX Series Layer 2 Configuration Guide*.

Default	If the <code>ethernet-switch-profile</code> statement is not configured, Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router) behave like Gigabit Ethernet interfaces.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

Hierarchy Level [edit interfaces *interface-name* **unit** *logical-unit-number*],
[edit logical-systems *logical-system-name* interfaces *interface-name* **unit** *logical-unit-number*]

Release Information Statement introduced before Junos OS Release 7.4.
Option **max-sessions-vs-a-ignore** introduced in Junos OS Release 11.4.

Description Configure protocol family information for the logical interface.

NOTE: Not all subordinate statements are available to every protocol family.

Options *family*—Protocol family:

- **any**—Protocol-independent family used for Layer 2 packet filtering

NOTE: This option is not supported on T4000 Type 5 FPCs.

- **bridge**—(M Series and T Series routers only) Configure only when the physical interface is configured with **ethernet-bridge** type encapsulation or when the logical interface is configured with **vlan-bridge** type encapsulation. You can optionally configure this protocol family for the logical interface on which you configure VPLS.
- **ethernet-switching**—(M Series and T Series routers only) Configure only when the physical interface is configured with **ethernet-bridge** type encapsulation or when the logical interface is configured with **vlan-bridge** type encapsulation
- **ccc**—Circuit cross-connect protocol suite. You can configure this protocol family for the logical interface of CCC physical interfaces. When you use this encapsulation type, you can configure the **ccc** family only.
- **inet**—Internet Protocol version 4 suite. You must configure this protocol family for the logical interface to support IP protocol traffic, including Open Shortest Path First (OSPF), Border Gateway Protocol (BGP), Internet Control Message Protocol (ICMP), and Internet Protocol Control Protocol (IPCP).
- **inet6**—Internet Protocol version 6 suite. You must configure this protocol family for the logical interface to support IPv6 protocol traffic, including Routing Information Protocol for IPv6 (RIPng), Intermediate System-to-Intermediate System (IS-IS), BGP, and Virtual Router Redundancy Protocol for IPv6 (VRRP).
- **iso**—International Organization for Standardization Open Systems Interconnection (ISO OSI) protocol suite. You must configure this protocol family for the logical interface to support IS-IS traffic.
- **mlfr-end-to-end**—Multilink Frame Relay FRF.15. You must configure this protocol or multilink Point-to-Point Protocol (MLPPP) for the logical interface to support multilink bundling.
- **mlfr-uni-nni**—Multilink Frame Relay FRF.16. You must configure this protocol or **mlfr-end-to-end** for the logical interface to support link services and voice services bundling.
- **multilink-ppp**—Multilink Point-to-Point Protocol. You must configure this protocol (or **mlfr-end-to-end**) for the logical interface to support multilink bundling.
- **mpls**—Multiprotocol Label Switching (MPLS). You must configure this protocol family for the logical interface to participate in an MPLS path.
- **pppoe**—Point-to-Point Protocol over Ethernet
- **tcc**—Translational cross-connect protocol suite. You can configure this protocol family for the logical interface of TCC physical interfaces.

- **tnp**—Trivial Network Protocol. This protocol is used to communicate between the Routing Engine and the router's packet forwarding components. The Junos OS automatically configures this protocol family on the router's internal interfaces only, as discussed in *Understanding Internal Ethernet Interfaces*.
- **vpls**—(M Series and T Series routers only) Virtual private LAN service. You can optionally configure this protocol family for the logical interface on which you configure VPLS. VPLS provides an Ethernet-based point-to-multipoint Layer 2 VPN to connect customer edge (CE) routers across an MPLS backbone. When you configure a VPLS encapsulation type, the **family vpls** statement is assumed by default.

MX Series routers support dynamic profiles for VPLS pseudowires, VLAN identifier translation, and automatic bridge domain configuration.

For more information about VPLS, see the *Junos OS VPNs Library for Routing Devices*.

The remaining statements are explained separately. See [CLI Explorer](#).

frame-error

Syntax	<code>frame-error count;</code>
Hierarchy Level	[edit protocols oam ethernet link-fault-management action-profile event link-event-rate], [edit protocols oam link-fault-management interface <i>interface-name</i> event-thresholds]
Release Information	Statement introduced in Junos OS Release 8.4.
Description	<p>Threshold for sending frame error events or taking the action specified in the action profile.</p> <p>A frame error is any frame error on the underlying physical layer. The threshold is reached when the number of frame errors reaches the configured value within the window.</p> <p>The window or period during which frame errors are counted is 5 seconds or multiples of it (with a maximum value of 1 minute). This window denotes the duration as intervals of 100 milliseconds, encoded as a 16-bit unsigned integer. This window is not configurable in Junos OS. According to the IEEE 802.3ah standard, the default value of the frame-errors window is 1 second. This window has a lower bound of 1 second and an upper bound of 1 minute.</p>
Options	<p>count—Threshold count for frame error events.</p> <p>Range: 0 through 100</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none">• Configuring Threshold Values for Local Fault Events on an Interface on page 767• Configuring Threshold Values for Fault Events in an Action Profile on page 775

frame-period

Syntax	<code>frame-period <i>count</i>;</code>
Hierarchy Level	[edit protocols oam ethernet link-fault-management action-profile event link-event-rate], [edit protocols oam link-fault-management interface <i>interface-name</i> event-thresholds]
Release Information	Statement introduced in Junos OS Release 8.4.
Description	<p>Threshold for sending frame period error events or taking the action specified in the action profile.</p> <p>A frame error is any frame error on the underlying physical layer. The frame period threshold is reached when the number of frame errors reaches the configured value within the period window. The default period window is the number of minimum-size frames that can be transmitted on the underlying physical layer in 1 second. The window is not configurable.</p>
Options	<p><i>count</i>—Threshold count for frame period error events.</p> <p>Range: 0 through 100</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Configuring Threshold Values for Local Fault Events on an Interface on page 767 • Configuring Threshold Values for Fault Events in an Action Profile on page 775

frame-period-summary

Syntax	<code>frame-period-summary <i>count</i>;</code>
Hierarchy Level	[edit protocols oam ethernet link-fault-management action-profile event link-event-rate], [edit protocols oam link-fault-management interface <i>interface-name</i> event-thresholds]
Release Information	Statement introduced in Junos OS Release 8.4.
Description	<p>Threshold for sending frame period summary error events or taking the action specified in the action profile.</p> <p>An errored frame second is any 1-second period that has at least one errored frame. This event is generated if the number of errored frame seconds is equal to or greater than the specified threshold for that period window. The default window is 60 seconds. The window is not configurable.</p>
Options	<p>count—Threshold count for frame period summary error events.</p> <p>Range: 0 through 100</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

framing (10-Gigabit Ethernet Interfaces)

Syntax	<code>framing (lan-phy wan-phy);</code>
Hierarchy Level	<p><code>[edit interfaces xe-fpc/pic/port]</code></p> <p><code>[edit interfaces et-fpc/pic/port]</code> (PTX Series Packet Transport Routers and MX Series Routers)</p>
Release Information	<p>Statement introduced in Junos OS Release 8.0.</p> <p>Statement introduced in Junos OS Release 12.3R2 for PTX Series Packet Transport Routers.</p>
Description	<p>For routers supporting the 10-Gigabit Ethernet interface, configure the framing format. WAN PHY mode is supported on MX240, MX480, MX960, T640, T1600, T4000, and PTX Series Packet Transport Routers routers only.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> NOTE:</p> <ul style="list-style-type: none"> The T4000 Core Router supports only LAN PHY mode in Junos OS Release 12.1R1. Starting with Junos OS Release 12.1R2, WAN PHY mode is supported on the T4000 routers with the 12-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-12XGE-SFPP). Starting with Junos OS Release 12.2, WAN PHY mode is supported on the T4000 routers with the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-24XGE-SFPP). On PTX Series routers, WAN PHY mode is supported only on the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ . When the PHY mode changes, interface traffic is disrupted because of port reinitialization. </div>
Default	Operates in LAN PHY mode.
Options	<p>lan-phy—10GBASE-R interface framing format that bypasses the WIS sublayer to directly stream block-encoded Ethernet frames on a 10-Gigabit Ethernet serial interface.</p> <p>wan-phy—10GBASE-W interface framing format that allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and SONET devices.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

guest-vlan (MX Series in Enhanced LAN Mode)

Syntax	<code>guest-vlan (vlan-id vlan-name);</code>
Hierarchy Level	<code>[edit protocols authentication-access-control interface (all [interface-names]) dot1x]</code>
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	Specify the VLAN to which an interface is moved when no 802.1X supplicants are connected on the interface. The VLAN specified must already exist on the switch.
Default	None
Options	<i> vlan-id </i> —VLAN tag identifier of the guest VLAN. <i> vlan-name </i> —Name of the guest VLAN.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

guard-interval

Syntax	<code>guard-interval <i>number</i>;</code>
Hierarchy Level	[edit protocols protection-group ethernet-ring <i>ring-name</i>]
Release Information	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 12.1 for EX Series switches. Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.
Description	When a link goes down, the ring protection link (RPL) activates. When the downed link comes back up, the RPL link receives notification, restores the link, and waits for the restore interval before issuing another block on the same link. This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value.
Options	<i>number</i> —Guard timer interval, in milliseconds. Range: 10 through 2000 ms Default: 500 ms
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Ethernet Ring Protection Switching Overview on page 227• Example: Configuring Ethernet Ring Protection Switching on EX Series Switches on page 249• Example: Configuring Ethernet Ring Protection Switching on QFX Series and EX Series Switches Supporting ELS on page 265• Configuring Ethernet Ring Protection Switching on Switches (CLI Procedure) on page 236

hold-interval (Protection Group)

Syntax	hold-interval <i>number</i> ;
Hierarchy Level	[edit protocols protection-group ethernet-ring name]
Release Information	Statement introduced in Junos OS Release 9.4.
Description	Specify the hold-off timer interval <i>for all rings</i> in 100 millisecond (ms) increments.
Options	<i>number</i> —Hold-timer interval, in milliseconds. Range: 0 through 10,000 ms Default: 100 ms
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Ethernet Ring Protection Switching Overview on page 227• Example: Configuring Ethernet Ring Protection Switching on QFX Series and EX Series Switches Supporting ELS on page 265

hold-multiplier

Syntax	<code>hold-multiplier <i>number</i>;</code>
Hierarchy Level	[edit protocols lldp], [edit routing-instances <i>routing-instance-name</i> protocols lldp]
Release Information	Statement introduced in Junos OS Release 9.6.
Description	<p>Configure a value for the LLDP hold multiplier.</p> <p>Hold timer interval in seconds to cache learned LLDP information before discarding.</p>
Options	<p><i>number</i>—Advertisement interval multiplier for LLDP cache discard.</p> <p>Default: 4 (giving 120 second LLDP cache lifetime with other defaults)</p> <p>Range: 2 through 10</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

hold-time up

Syntax	<code>hold-time up <i>timer-value</i>;</code>
Hierarchy Level	[edit interfaces aex aggregated-ether-options lacp],
Release Information	Statement introduced in Junos OS Release 14.2R3.
Description	<p>Specifies the time period for which the Link Aggregation Control Protocol (LACP) maintains the state of a child (member) link as expired or default.</p> <p>When a child link goes from the current state to the expired state, the LACP monitors the reception of protocol data units (PDUs) on the child link for the configured hold-up time interval and does not allow the child link to transition back to the current state. This configuration thus prevents excessive flapping of a child link on an aggregated Ethernet interface.</p> <p>The configured hold-up timer value is applicable to all the child links within a link aggregated (LAG) interface. By default, this feature is disabled.</p>
Options	<p><i>timer-value</i>—Hold-up interval in seconds.</p> <p>Range: 1 to 6000 seconds</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

iccp

Syntax

```
iccp {
  traceoptions; {
    file <filename> <files number> <match regular-expression> <microsecond-stamp>
      <size size> <world-readable | no-world-readable>;
    flag flag;
    no-remote-trace;
  }
  local-ip-address ip address;
  session-establishment-hold-time value;
  authentication-key string;
  peer ip-address {
    local-ip-address ip address;
    session-establishment-hold-time value;
    authentication-key string;
    redundancy-group-id-list redundancy-group-id-list;
    liveness-detection;
  }
}
```

Hierarchy Level [edit protocols iccp]
[edit logical-systems *logical-system-name* protocols iccp]

Release Information Statement introduced in Junos OS Release 10.0.
Support for logical systems introduced in Junos OS Release 14.1.

Description Configure Interchassis Control Protocol (ICCP) between the multichassis link aggregation group (MC-LAG) peers. ICCP replicates forwarding information, validates configurations, and propagates the operational state of the MC-LAG members.

Default If you do not include this statement, no ICCP protocol tracing operations are performed.

Options

- traceoptions**—Set Interchassis Control Protocol (ICCP) tracing options.
- local-ip-address**—Specify the source address where the ICCP packet is routed.
- session-establishment-hold-time**—Specify if the chassis takes over as the master at the ICCP session.
- authentication-key**—Specify TCP Message Digest 5 (MD5) option for an ICCP TCP session.
- peer ip-address**—Specify the IP address of the peer that hosts an MC-LAG. You must configure ICCP for both peers that host the MC-LAG.
- redundancy-group-id-list**—Specify the redundancy groups between two ICCP peers.
- liveness-detection**—Specify Bidirectional Forwarding Detection (BFD) protocol options.

Required Privilege Level interface—To view this statement in the configuration.
 interface-control—To add this statement to the configuration.

Description Configure IGMP snooping to constrain multicast traffic to only the ports that have receivers attached. IGMP snooping enables the device to selectively send out multicast packets on only the ports that need them. Without IGMP snooping, the device floods the packets on every port. The device listens for the exchange of IGMP messages by the device and the end hosts. In this way, the device builds an IGMP snooping table that has a list of all the ports that have requested a particular multicast group. The factory default configuration enables IGMP snooping on all VLANs.

NOTE: IGMP snooping must be disabled on the device before enabling ISSU.

Default IGMP snooping is disabled on the device.

Options The remaining statements are explained separately. See [CLI Explorer](#).

Required Privilege Level routing—To view this statement in the configuration.

include-sci (MACsec for MX Series)

Syntax	include-sci;
Hierarchy Level	[edit security macsec connectivity-association <i>connectivity-association-name</i>]
Release Information	Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.
Description	<p>Specifies that the SCI tag should be appended to each packet on a link that has enabled MACsec.</p> <p>SCI tags are automatically appended to packets leaving a MACsec-enabled interface on an MX240, MX480, or MX960 router. This option is, therefore, redundant to be configured.</p> <p>This option is used only when connecting a router to a host device that requires SCI tagging. SCI tags are eight octets long, so appending an SCI tag to all traffic on the link adds a significant amount of unneeded overhead.</p>
Default	SCI tagging is enabled on MX Series routers that have enabled MACsec using static connectivity association key (CAK) security mode, by default.
Required Privilege Level	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring MACsec on MX Series Routers</i>

ingress-policer-overhead

Syntax	<code>ingress-policer-overhead bytes;</code>
Hierarchy Level	<code>[edit chassis fpc slot-number pic pic-number]</code>
Release Information	Statement introduced before Junos OS Release 11.1. Statement introduced in Junos OS Release 15.1X49-D30 for vSRX.
Description	<p>Add the configured number of bytes to the length of a packet entering the interface.</p> <p>Configure a policer overhead to control the rate of traffic received on an interface. Use this feature to help prevent denial-of-service (DoS) attacks or to enforce traffic rates to conform to the service-level agreement (SLA). When you configure a policer overhead, the configured policer overhead value (bytes) is added to the length of the final Ethernet frame. This calculated length of frame is used to determine the policer or the rate-limiting action.</p> <p>Traffic policing combines the configured policy bandwidth limits and the burst size to determine how to meter the incoming traffic. If you configure a policer overhead on an interface, Junos OS adds those bytes to the length of incoming Ethernet frames. This added overhead fills each frame closer to the burst size, allowing you to control the rate of traffic received on an interface.</p> <p>You can configure the policer overhead to rate-limit queues and Layer 2 and Layer 3 policers, for standalone (SA) and high-availability (HA) deployments. The policer overhead and the shaping overhead can be configured simultaneously on an interface.</p>

NOTE: vSRX supports policer overhead on Layer 3 policers only.

The policer overhead applies to all interfaces on the PIC. In the following example, Junos OS adds 10 bytes of overhead to all incoming Ethernet frames on ports ge-0/0/0 through ge-0/0/4.

```
set chassis fpc 0 pic 0 ingress-policer-overhead 10
```

NOTE: vSRX only supports fpc 0 pic 0. When you commit the `ingress-policer-overhead` statement, the vSRX takes the PIC offline and then back online.

You need to craft the policer overhead size to match your network traffic. A value that is too low will have minimal impact on traffic bursts. A value that is too high will rate-limit too much of your incoming traffic.

In this example, the policer overhead of 255 bytes is configured for ge-0/0/0 through ge-0/0/4. The firewall policer is configured to discard traffic when the burst size is over 1500 bytes. This policer is applied to ge-0/0/0 and ge 0/0/1. Junos OS adds 255 bytes to every Ethernet frame that comes into the configured ports. If, during a burst of traffic, the combined length of incoming frames and the overhead bytes exceeds 1500 bytes, the policer starts to discard further incoming traffic.

```
set chassis fpc 0 pic 0 ingress-policer-overhead 255
set interfaces ge-0/0/0 unit 0 family inet policer input overhead_policer
set interfaces ge-0/0/0 unit 0 family inet address 10.9.1.2/24
set interfaces ge-0/0/1 unit 0 family inet policer input overhead_policer
set interfaces ge-0/0/1 unit 0 family inet address 10.9.2.2/24
set firewall policer overhead_policer if-exceeding bandwidth-limit 32k
set firewall policer overhead_policer if-exceeding burst-size-limit 1500
set firewall policer overhead_policer then discard
```

Options *bytes*—Number of bytes added to a frame entering an interface.
Range: 0–255 bytes
Default: 0

```
[edit chassis fpc 0 pic 0]
user@host# set ingress-policer-overhead 10;
```

Required Privilege Level interface—To view this statement in the configuration.
 interface-control—To add this statement to the configuration.

interfaces (MACsec for MX Series)

Syntax `interfaces interface-name {
 connectivity-association connectivity-association-name;
}`

Hierarchy Level [edit security macsec]

Release Information Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description Applies the specified connectivity association to the specified interface to enable MACsec.

One connectivity association can be applied to multiple interfaces.

You must always use this statement to apply a connectivity association to an interface to enable MACsec. You must complete this configuration step regardless of whether MACsec is enabled using static connectivity association key (CAK) security mode or static secure association key (SAK) security mode.

If you are enabling MACsec using static SAK security mode and need to configure MACsec on inbound and outbound traffic on the same interface, you must configure a connectivity association with one secure channel for inbound traffic and a second secure channel for outbound traffic. The connectivity association is then applied to the interface using this statement to enable MACsec for traffic entering and leaving the interface.

NOTE: Starting in Junos OS Release 16.1R2, when Media Access Control Security (MACsec) is enabled on an interface, the interface flow control capability is enabled by default, regardless of the configuration that you set using the (flow-control | no-flow-control) statement at the [edit interfaces *interface-name* gige-ether-options] hierarchy level. When MACsec is disabled, interface flow control is restored to the configuration that you set using the flow-control statement at the [edit interfaces] hierarchy level. When MACsec is enabled, additional header bytes are added to the packet by the MACsec PHY. With line rate traffic, when MACsec is enabled and flow control is disabled, the pause frames sent by the MACsec PHY are terminated by the MIC's MAC (enhanced 20-port Gigabit Ethernet MICs on MX Series routers) and not transferred to the Packet Forwarding Engine, causing framing errors. Therefore, when MACsec is enabled on an interface, flow control is also automatically enabled on such an interface.

Default Interfaces are not associated with any connectivity associations, by default.

Required Privilege Level admin—To view this statement in the configuration.
admin-control—To add this statement to the configuration.

interface-none

Syntax	interface-none;
Hierarchy Level	[edit protocols protection-group ethernet-ring ring-name east-interface]
	[edit protocols protection-group ethernet-ring ring-name west-interface]
Description	Designates port as not used for Ethernet ring protection.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Ethernet Ring Protection Switching Overview on page 227 • Ethernet Ring Protection Using Ring Instances for Load Balancing on page 931 • Example: Configuring Ethernet Ring Protection Switching on EX Series Switches on page 249 • Configuring Ethernet Ring Protection Switching on Switches (CLI Procedure) on page 236

isolated-vlan (MX Series)

Syntax	<code>isolated-vlan <i>vlan-id</i>;</code>
Hierarchy Level	<pre>[edit bridge-domains <i>bridge-domain-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> bridge-options], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i> , [edit routing-instances <i>routing-instance-name</i> bridge-domains <i>bridge-domain-name</i>],</pre>
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers.
Description	Configure the specified isolated VLAN to be a secondary VLAN of the specified primary VLAN. An isolated VLAN receives packets only from the primary VLAN and forwards frames upstream to the primary VLAN.
	<div>  <p>NOTE: When you specify this configuration statement, the VLAN ID of a logical interface that you associate with a bridge domain that matches with the VLAN ID that you specify using the <code>isolated-vlan</code> state is treated as an isolated port.</p> </div>
Options	<i>vlan-id</i> —Individual VLAN IDs separated by a space.
Required Privilege Level	system—To view this statement in the configuration. system—control—To add this statement to the configuration.
Related Documentation	

key (MACsec for MX Series)

Syntax	<code>key <i>key-string</i>;</code>
Hierarchy Level	[edit security macsec connectivity-association <i>connectivity-association-name</i> secure-channel <i>secure-channel-name</i> security-association <i>security-association-number</i>]
Release Information	Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.
Description	<p>Specifies the static security key to exchange to enable MACsec using static secure association key (SAK) security mode.</p> <p>The key string is a 32-digit hexadecimal number. The key string and the security association must match on both sides of an Ethernet connection to secure traffic using MACsec when enabling MACsec using SAK security mode.</p> <p>You must configure at least two security associations with unique security association numbers and key strings to enable MACsec using static SAK security mode. MACsec initially establishes a secure connection when a security association number and key match on both ends of an Ethernet link. After a certain number of Ethernet frames are securely transmitted across the Ethernet link, MACsec automatically rotates to a new security association with a new security association number and key to maintain the secured Ethernet link. This rotation continues each time a certain number of Ethernet frames are securely transmitted across the secured Ethernet link, so you must always configure MACsec to have at least two security associations.</p>
Default	This statement does not have a default value.
Options	<i>key-string</i> —Specifies the key to exchange with the other end of the link on the secure channel. The <i>key-string</i> is a 32-digit hexadecimal string that is created by the user.
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring MACsec on MX Series Routers</i>

key-server-priority (MACsec for MX Series)

Syntax	<code>key-server-priority <i>priority-number</i>;</code>
Hierarchy Level	<code>[edit security macsec connectivity-association <i>connectivity-association-name</i> mka]</code>
Release Information	Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.
Description	<p>Specifies the key server priority used by the MACsec Key Agreement (MKA) protocol to select the key server when MACsec is enabled using static connectivity association key (CAK) security mode.</p> <p>The switch with the lower <i>priority-number</i> is selected as the key server.</p> <p>If the <i>priority-number</i> is identical on both sides of a point-to-point link, the MKA protocol selects the device with the lower MAC address as the key server.</p>
Default	The default key server priority number is 16.
Options	<p><i>priority-number</i>—Specifies the MKA server election priority number.</p> <p>The <i>priority-number</i> can be any number between 0 and 255. The lower the number, the higher the priority.</p>
Required Privilege Level	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>

Hierarchy Level (EX Series) [edit interfaces aex [aggregated-ether-options](#)]
 [edit logical-systems *logical-system-name* interfaces aeX aggregated-ether-options]

Hierarchy Level (NFX Series) [edit interfaces *interface-name* aggregated-ether-options]

Release Information Statement introduced in Junos OS Release 9.0 for EX Series switches.
 Statement introduced in Junos OS Release 11.1 for the QFX Series.
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Configure the Link Aggregation Control Protocol (LACP) parameters for interfaces. The remaining statement is explained separately.

For EX Series, when you configure the **accept-data** statement at the **[edit interfaces aex aggregated-ether-options lacp]** hierarchy level, the router processes packets received on a member link irrespective of the LACP state if the aggregated Ethernet bundle is up.

NOTE: When you configure the `accept-data` statement at the `[edit interfaces aeX aggregated-ether-options lacp]` hierarchy level, this behavior occurs:

- By default, the `accept-data` statement is not configured when LACP is enabled.
- You can configure the `accept-data` statement to improve convergence and reduce the number of dropped packets when member links in the bundle are enabled or disabled.
- When LACP is down and a member link receives packets, the router or switch does not process packets as defined in the IEEE 802.1ax standard. According to this standard, the packets should be dropped, but they are processed instead because the `accept-data` statement is configured.

NOTE: The `force-up` statement is not supported on QFX10002 switches.

Default If you do not specify LACP as either **active** or **passive**, LACP remains passive.

Options **active**—Initiate transmission of LACP packets.

admin-key *number*—Specify an administrative key for the router or switch.

NOTE: You must also configure multichassis link aggregation (MC-LAG) when you configure the `admin-key`.

fast-failover—Specify to override the IEEE 802.3ad standard and allow the standby link to receive traffic. Overriding the default behavior facilitates subsecond failover.

passive—Respond to LACP packets.

The remaining statements are explained separately. See [CLI Explorer](#).

Required Privilege Level **interface**—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

legacy-pm-display (Delay measurement)

Syntax	legacy-pm-display;
Hierarchy Level	[edit logical-systems <i>name</i> protocols oam ethernet connectivity-fault-management performance-monitoring], [edit protocols oam ethernet connectivity-fault-management performance-monitoring]
Release Information	Statement introduced in Junos OS 18.3R1 for MX series routers.
Description	Displays the legacy performance monitoring output for Delay Measurement in MEF (Metro Ethernet Forum) mode. Performance monitoring supports both MEF-compliant mode and non MEF-compliant mode (also known as legacy mode). Based on the performance monitoring mode configured, the output for the iterator is displayed. For instance, if the performance monitoring mode is MEF-compliant, the output for the iterator is also MEF-compliant. However, to view the legacy (non MEF-compliant mode) output when the performance monitoring mode is MEF-compliant mode, use the legacy-pm-display statement.
<div>  <p>NOTE: The legacy-pm-display can be set only in MEF mode (that is, when enhanced-cfm-mode or measurement-interval has been already set).</p> </div>	
Required Privilege Level	Configure—To enter configuration mode. Control—To modify any configuration.

link-discovery

Syntax	link-discovery (active passive);
Hierarchy Level	[edit protocols oam ethernet link-fault-management interface interface-name]
Release Information	Statement introduced in Junos OS Release 8.2.
Description	For Ethernet interfaces on EX Series switches, and M320, M120, MX Series, and T Series routers, specify the discovery mode used for IEEE 802.3ah Operation, Administration, and Management (OAM) support. The discovery process is triggered automatically when OAM 802.3ah functionality is enabled on a port. Link monitoring is done when the interface sends periodic OAM PDUs.
Options	(active passive) —Passive or active mode. In active mode, the interface discovers and monitors the peer on the link if the peer also supports IEEE 802.3ah OAM functionality. In passive mode, the peer initiates the discovery process. Once the discovery process is initiated, both sides participate in discovery.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring Link Discovery on page 764

link-degrade-monitor

Syntax	<pre> link-degrade-monitor { actions media-based; recovery { (auto manual); timer <i>timer</i>; } thresholds { clear <i>clear-value</i>; interval <i>interval-value</i>; set <i>set-value</i>; warning-clear <i>warning-clear-value</i>; warning-set <i>warning-set-value</i>; } } </pre>
Hierarchy Level	[edit interfaces <i>interfaces-name</i>]
Release Information	Statement introduced in Junos OS Release 15.1.
Description	<p>Configure link degrade monitoring on an interface and specify the corrective action to be triggered when a link degrade event is detected. Deleting the configuration disables the feature. When configured, the feature monitors the quality of physical links on Ethernet interfaces (10-Gigabit, 40-Gigabit, and 100-Gigabit) and triggers the user-configured action when the link's bit error rate (BER) value breaches the preconfigured threshold. This feature can detect a BER value as low as 10^{-13} to 10^{-5}.</p>
Options	<p>actions media based—Action to be taken when a link degrade event is detected. A media-based action brings down the physical link at both local and remote ends of the interface, and stops BER monitoring at the local end until an autorecovery is triggered.</p> <p>The remaining statements are described separately.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

link-mode

Syntax	<code>link-mode <i>mode</i> (automatic full-duplex half-duplex);</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i>],</code> <code>[edit interfaces <i>interface-name</i> ether-options],</code> <code>[edit interfaces ge-<i>pim</i>/0/0 <i>switch-options</i> <i>switch-port</i> <i>port-number</i>]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Description	Set the device's link connection characteristic.
Options	<p><i>mode</i>—Link characteristics:</p> <ul style="list-style-type: none"> • automatic—Link mode is negotiated. This is the default for EX Series switches. • full-duplex—Connection is full duplex. • half-duplex—Connection is half duplex. <p>Default: Fast Ethernet interfaces can operate in either full-duplex or half-duplex mode. The router's or switch's management Ethernet interface, fxp0 or em0, and the built-in Fast Ethernet interfaces on the FIC (M7i router) autonegotiate whether to operate in full-duplex or half-duplex mode. Unless otherwise noted here, all other interfaces operate only in full-duplex mode.</p>

NOTE: On EX Series switches, if **no-auto-negotiation** is specified in `[edit interfaces interface-name ether-options]`, you can select only **full-duplex** or **half-duplex**. If **auto-negotiation** is specified, you can select any mode.

NOTE:

- Member links of an aggregated Ethernet bundle must not be explicitly configured with a link mode. You must remove any such link-mode configuration before committing the aggregated Ethernet configuration.
- Starting with Junos OS release 17.4R1 and later, the link-mode configuration is not supported for 10-Gigabit Ethernet interfaces.
- Starting in Junos OS release 18.4R1, half-duplex mode is supported on SRX340 and SRX345 devices.

lmi (Ethernet OAM)

Syntax

```
lmi {
  status-counter count;
  polling-verification-timer value;
  interface name {
    uni-id uni-name;
    status-counter number;
    polling-verification-timer value;
    evc-map-type (all-to-one-bundling | bundling | service-multiplexing);
    evc evc-name {
      default-evc;
      vlan-list vlan-id-list;
    }
  }
}
```

Hierarchy Level [edit protocols [oam ethernet](#)]

Release Information Statement introduced in Junos OS Release 9.5.

Description On routers with **ge**, **xe**, or **ae** interfaces, configure an OAM Ethernet Local Management Interface (E-LMI).

NOTE: On MX Series routers, E-LMI is supported on Gigabit Ethernet (**ge**), 10-Gigabit Ethernet (**xe**), and Aggregated Ethernet (**ae**) interfaces configured on MX Series routers with DPC only.

Options

- status-counter *count***—Status counter (N393), defaults to 4.
- interface *name***—Polling verification timer (T392), defaults to 15 seconds.
- uni-id *uni-name***—(Optional) Defaults to the physical interface name.
- status-counter *number***—(Optional) Defaults to a global value.
- polling-verification-timer *value***—(Optional) Defaults to a global value.
- evc-map-type (all-to-one-bundling | bundling | service-multiplexing)**—Specify the Ethernet virtual connection (EVC) map type.
- evc *evc-name***—Specify the name of the EVC.
- default-evc**—Set the specified EVC as the default EVC.
- vlan-list *vlan-id-list***—Specify a group of VLANs to assign to the EVC.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

load-balance

Syntax

```
load-balance {  
  adaptive{  
    pps;  
    scan-interval multiple;  
    tolerance percentage;  
  }  
  no-adaptive;  
  per-packet;  
}
```

Hierarchy Level [edit interfaces aex aggregated-ether-options]

Release Information Statement introduced in Junos OS Release 13.3.
Statement introduced in Junos OS Release 14.1 for PTX Series Packet Transport Routers.

Description Load-balances the received traffic across all the available paths of aggregated Ethernet bundles for better link utilization.

Options

adaptive— (MX Series and PTX Series) Corrects a genuine traffic imbalance by using a feedback mechanism to distribute the traffic across the links of an Aggregated Ethernet bundle.

no-adaptive— (MX Series and PTX Series) Disables the adaptive load-balancing solution configured to distribute traffic by using a feedback mechanism.

per-packet— (MX Series only) Randomly sprays packets to the aggregate next hops in a round-robin manner to avoid traffic imbalance.

Required Privilege Level interface - To view statement in the configuration.
interface-control - To add this statement to the configuration.

load-balance-stateful (Aggregated Ethernet Interfaces)

Syntax	<pre>load-balance-stateful { per-flow; rebalance <i>interval</i>; load-type (low medium large); }</pre>
Hierarchy Level	[edit interfaces aeX <i>unit logical-unit-number</i> forwarding-options]
Release Information	Statement introduced in Junos OS Release 13.2R1.
Description	<p>Define the capability to perform uniform load balancing and also perform rebalancing is introduced on MX Series routers with MPCs, except MPC3Es and MPC4Es. Rebalancing is not supported when load-balancing is skewed or distorted owing to a change in the number of flows. The mechanism to record and retain states for the flows and distribute the traffic load accordingly is added. As a result, for m number of flows, they are distributed among n member links of a LAG bundle or among the unilist of next-hops in an ECMP link. This method of splitting the load among member links is called stateful load balancing and it uses 5-tuple information (source and destination addresses, protocol, source and destination ports). Such a method can be mapped directly to the flows, or to a precompute hash based on certain fields in the flow. As a result, the deviation observed on each child link is reduced.</p>
Options	stateful —Define the stateful load-distribution mechanism for traffic flows on aggregated Ethernet interfaces.
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Configuring Stateful Load Balancing on Aggregated Ethernet Interfaces on page 185

load-type (Aggregated Ethernet Interfaces)

Syntax	<code>load-type (low medium large);</code>
Hierarchy Level	<code>[edit interfaces aeX unit logical-unit-number forwarding-options load-balance-stateful]</code>
Release Information	Statement introduced in Junos OS Release 13.2R1.
Description	Define the load-balancing type to inform the Packet Forwarding Engine regarding the appropriate memory pattern to be used for traffic flows. The approximate number of flows for effective load-balancing for each keyword is a derivative.
Options	<p>low—Define a low load-balancing method if the number of flows that flow on the specified aggregated Ethernet interface is less or minimal (between 1 and 100 flows).</p> <p>medium—Define a medium or moderate load-balancing method if the number of flows that flow on the specified aggregated Ethernet interface is relatively higher (between 100 and 1000 flows).</p> <p>large—Define a high load-balancing method if the number of flows that flow on the specified aggregated Ethernet interface is excessive or reaches the maximum supported flows (between 1000 and 10,000 flows).</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none">• Configuring Stateful Load Balancing on Aggregated Ethernet Interfaces on page 185

lockout

Syntax	<code>request protection-group ethernet-aps lockout md <md> ma <ma></code>
Hierarchy Level	<code>[edit protocols protection-group ethernet-aps]</code>
Description	Configure a lockout of the protection path, forcing the use of the working path and locking out the protect path regardless of anything else.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

logical-interface-policer

Syntax	<code>logical-interface-policer;</code>
Hierarchy Level	<code>[edit dynamic-profiles <i>profile-name</i> firewall policer <i>policer-name</i>],</code> <code>[edit dynamic-profiles <i>profile-name</i> firewall three-color-policer <i>name</i>],</code> <code>[edit firewall atm-policer <i>atm-policer-name</i>],</code> <code>[edit firewall policer <i>policer-name</i>],</code> <code>[edit firewall policer <i>policer-template-name</i>],</code> <code>[edit firewall three-color-policer <i>policer-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> firewall policer <i>policer-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> firewall three-color-policer <i>name</i>]</code>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Support at the <code>[edit firewall three-color-policer <i>policer-name</i>]</code> hierarchy level introduced in Junos OS Release 8.2.</p> <p>Logical systems support introduced in Junos OS Release 9.3.</p> <p>Support at the <code>[edit dynamic-profiles ... policer <i>policer-name</i>]</code> and <code>[edit dynamic-profiles ... three-color-policer <i>name</i>]</code> hierarchy levels introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Support for PTX series routers with third-generation FPCs added in Junos OS Release 18.3R1.</p>
Description	<p>Configure a logical interface policer. For PTX series routers running Junos OS Release 18.3R1 or later, you can use this command to configure separate firewall filters for different family address types (IPv4 and IPv6) that share the same interface, and configure the same policer as an action for the filter.</p> <p>To configure the aggregate policer, configure the firewall policer you want to use as logical-interface-policer. And at the firewall family <i>family-name</i> filter <i>filter-name</i> hierarchy level where you will reference the policer, make the policer an interface-specific firewall filter action.</p> <p>The sample configuration shows the relationship.</p>

```

firewall {
  policer Shared_Policer {
    logical-interface-policer;
    if-exceeding {
      bandwidth-limit 100m;
      burst-size-limit 500k;
    }
    then {
      discard;
    }
  }
}

```

```

family inet {
  filter filter_name {
    interface-specific;
    term term_name {
      then {
        policer Shared_Policer;
        count cinet;
      }
    }
  }
}

```

NOTE: Starting in Junos OS Release 12.2R2, on T Series Core Routers only, you can configure an MPLS LSP policer for a specific LSP to be shared across different protocol family types. You must include the `logical-interface-policer` statement to do so.

Required Privilege Level firewall—To view this statement in the configuration.
 firewall-control—To add this statement to the configuration.

mac-radius (MX Series in Enhanced LAN Mode)

Syntax	<code>mac-radius <flap-on-disconnect> <restrict>;</code>
Hierarchy Level	<code>[edit protocols authentication-access-control interface (all [<i>interface-names</i>]) dot1x]</code>
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	<p>Configure MAC RADIUS authentication for specific interfaces. MAC RADIUS authentication allows LAN access to permitted MAC addresses. When a new MAC address appears on an interface, the switch consults the RADIUS server to check whether the MAC address is a permitted address. If the MAC address is configured on the RADIUS server, the device is allowed access to the LAN.</p> <p>If MAC RADIUS is configured, the switch first tries to get a response from the host for 802.1X authentication. If the host is unresponsive, the switch attempts to authenticate using MAC RADIUS.</p> <p>To restrict authentication to MAC RADIUS only, use the restrict option. In restrictive mode, all 802.1X packets are eliminated and the attached device on the interface is considered a nonresponsive host.</p>
Options	<p>flap-on-disconnect—(Optional) When the RADIUS server sends a disconnect message to a supplicant, the switch resets the interface on which the supplicant is authenticated. If the interface is configured for multiple supplicant mode, the switch resets all the supplicants on the specified interface. This option takes effect only when the restrict option is also set.</p> <p>restrict—(Optional) Restricts authentication to MAC RADIUS only. When mac-radius restrict is configured the switch drops all 802.1X packets. This option is useful when no other 802.1X authentication methods, such as guest VLAN, are needed on the interface, and eliminates the delay that occurs while the switch determines that a connected device is a non-802.1X-enabled host.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

mac-validate

Syntax	<code>mac-validate (loose strict);</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.3. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Description	Enable IP and MAC address validation for static Ethernet and IP demux interfaces.
Options	<p>loose—Forwards incoming packets when both the IP source address and the MAC source address match one of the trusted address tuples. Drops packets when the IP source address matches one of the trusted tuples, but the MAC address does not match the MAC address of the tuple. Continues to forward incoming packets when the source address of the incoming packet does not match any of the trusted IP addresses.</p> <p>strict—Forwards incoming packets when both the IP source address and the MAC source address match one of the trusted address tuples. Drops packets when the MAC address does not match the tuple's MAC source address, or when IP source address of the incoming packet does not match any of the trusted IP addresses.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

master-only

Syntax	master-only;
Hierarchy Level	[edit groups rex interfaces (fxp0 em0) unit <i>logical-unit-number</i> family <i>family</i> address], [edit groups rex logical-systems <i>logical-system-name</i> interfaces fxp0 unit <i>logical-unit-number</i> family <i>family</i> address], [edit interfaces (fxp0 em0) unit <i>logical-unit-number</i> family <i>family</i> address], [edit logical-systems <i>logical-system-name</i> interfaces fxp0 unit <i>logical-unit-number</i> family <i>family</i> address]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series.
Description	Configure the IP address to be used when the Routing Engine is the current master.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring a Consistent Management IP Address on page 28• <i>CLI User Guide</i>

max-sessions (PPPoE Service Name Tables)

Syntax	<code>max-sessions <i>number</i>;</code>
Hierarchy Level	<code>[edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 10.2.
Description	<p>Configure the maximum number of active PPPoE sessions using either static or dynamic PPPoE interfaces that the router can establish with the specified named service, empty service, or any service entry in a PPPoE service name table. The router maintains a count of active PPPoE sessions for each service entry to determine when the maximum sessions limit has been reached.</p> <p>The router uses the max-sessions value for a PPPoE service name table entry in conjunction with the max-sessions value configured for the PPPoE underlying interface, and with the maximum number of PPPoE sessions supported on your router. If your configuration exceeds any of these maximum session limits, the router is unable to establish the PPPoE session.</p>
Options	<i>number</i> —Maximum number of active PPPoE sessions that the router can establish with the specified PPPoE service name table entry, in the range 1 to the platform-specific maximum PPPoE sessions supported for your router. The default value is equal to the maximum number of PPPoE sessions supported on your routing platform.
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • <i>Limiting the Number of Active PPPoE Sessions Established with a Specified Service Name</i> • <i>Configuring PPPoE Service Name Tables</i> • <i>PPPoE Maximum Session Limit Overview</i> • <i>Configuring an Interface Set of Subscribers in a Dynamic Profile</i> • <i>Subscriber Interfaces and PPPoE Overview</i>

max-sessions-vsa-ignore (Static and Dynamic Subscribers)

Syntax	<code>max-sessions-vsa-ignore;</code>
Hierarchy Level	<pre>[edit dynamic-profiles <i>profile-name</i> interfaces demux0 unit <i>logical-unit-number</i> family pppoe], [edit dynamic-profiles <i>profile-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family pppoe], [edit dynamic-profiles <i>profile-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> pppoe-underlying-options], [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family pppoe], [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> pppoe-underlying-options], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family pppoe], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> pppoe-underlying-options]</pre>
Release Information	Statement introduced in Junos OS Release 11.4.
Description	Configure the router to ignore (clear) the value returned by RADIUS in the Max-Clients-Per-Interface Juniper Networks vendor-specific attribute (VSA) [26-143], and restore the PPPoE maximum session value on the underlying interface to the value configured in the CLI with the max-sessions statement. The PPPoE maximum session value specifies the maximum number of concurrent static or dynamic PPPoE logical interfaces (sessions) that the router can activate on the PPPoE underlying interface, or the maximum number of active static or dynamic PPPoE sessions that the router can establish with a particular service entry in a PPPoE service name table.
Default	If you do not include the max-sessions-vsa-ignore statement, the maximum session value returned by RADIUS in the Max-Clients-Per-Interface VSA takes precedence over the PPPoE maximum session value configured with the max-sessions statement.
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

maximum-requests

Syntax	<code>maximum-requests <i>times</i>;</code>
Hierarchy Level	<code>[edit protocols dot1x authenticator interface <i>interface-id</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.3.
Description	Specify the maximum number of retransmission times of an EAPOL Request packet to the client before it times out the authentication session.
Options	<i>times</i> —Specify the maximum number of retransmission times. Range: 1 through 10 times Default: 2 times
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• IEEE 802.1x Port-Based Network Access Control Overview on page 35• authenticator on page 1170• dot1x on page 1209• interface (IEEE 802.1x) on page 1293

maximum-requests (MX Series in Enhanced LAN Mode)

Syntax	<code>maximum-requests <i>number</i>;</code>
Hierarchy Level	<code>[edit protocols authentication-access-control interface (all [<i>interface-names</i>]) dot1x]</code>
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	For 802.1X authentication, configure the maximum number of times an EAPOL request packet is retransmitted to the supplicant before the authentication session times out.
Default	Two retransmission attempts
Options	<p><i>number</i>—Number of retransmission attempts.</p> <p>Range: 1 through 10</p> <p>Default: 2</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

mc-ae

Syntax	<pre> mc-ae { chassis-id <i>chassis-id</i>; events { iccp-peer-down; force-icl-down; prefer-status-control-active; } init-delay-time <i>seconds</i>; mc-ae-id <i>mc-ae-id</i>; mode (active-active active-standby); redundancy-group <i>group-id</i>; revert-time <i>revert-time</i>; status-control (active standby); switchover-mode (non-revertive revertive); } </pre>
Hierarchy Level	<p>[edit interfaces aeX aggregated-ether-options], [edit logical-systems <i>logical-system-name</i> interfaces aeX aggregated-ether-options]</p>
Release Information	<p>Statement introduced in Junos OS Release 9.6 for MX Series routers.</p> <p>events statement introduced in Junos OS Release 11.4R4 for MX Series routers.</p> <p>Statement introduced in Junos OS Release 12.2 for the QFX Series. Only the chassis-id, mc-ae-id, mode active-active, and status-control (active standby) options are supported on QFX Series devices.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>prefer-status-control-active statement introduced in Junos OS Release 13.2R1 for EX Series switches.</p> <p>init-delay-time <i>seconds</i> statement introduced in Junos OS Release 13.2R3 for EX Series switches.</p> <p>switchover-mode and revert-time statements introduced in Junos OS Release 13.3.</p> <p>Support for logical systems introduced in Junos OS Release 14.1.</p>
Description	<p>Enable multichassis link aggregation groups (MC-LAG), which enables one device to form a logical LAG interface with two or more other devices.</p>
Options	<p>chassis-id—Specify the chassis ID for Link Aggregation Control Protocol (LACP) to calculate the port number of MC-LAG physical member links.</p> <p>Values: 0 or 1</p> <p>events—Specify an action if a specific MC-LAG event occurs.</p> <p>iccp-peer-down—Specify an action if the ICCP peer of this node goes down.</p> <p>force-icl-down—If the node's ICCP peer goes down, bring down the interchassis-link logical interface.</p>

prefer-status-control-active—Specify that the node configured as **status-control active** become the active node if the peer of this node goes down.

When ICCP goes down, you can use this keyword to make a mc-lag PE to become the active PE. For example, if you want mc-lag PE1 to be Active on ICCP down, then configure this keyword in PE1. It is not recommended to configure this keyword in both the mc-lag PEs.

NOTE: The **prefer-status-control-active** statement can be configured with the **status-control standby** configuration to prevent the LACP MC-LAG system ID from reverting to the default LACP system ID on ICCP failure. Use this configuration only if you can ensure that ICCP will not go down unless the router or switch is down. You must also configure the **hold-time down** value (at the [edit interfaces *interface-name*] hierarchy level) for the interchassis link with the **status-control standby** configuration to be higher than the ICCP BFD timeout. This configuration prevents data traffic loss by ensuring that when the router or switch with the **status-control active** configuration goes down, the router or switch with the **status-control standby** configuration does not go into standby mode.

To make the **prefer-status-control-active** configuration work with the **status-control standby** configuration when an interchassis-link logical interface is configured on aggregate Ethernet interface, you must either configure the **lACP periodic interval** statement at the [edit interface *interface-name* aggregated-ether-options] hierarchy level as **slow** or configure the **detection-time threshold** statement at the [edit protocols iccp peer liveness-detection] hierarchy level as less than 3 seconds.

init-delay-time seconds—To minimize traffic loss, specify the number of seconds in which to delay bringing the multichassis aggregated Ethernet interface back to the up state when you reboot an MC-LAG peer.

mc-ae-id mc-ae-id—Specify the identification number of the MC-LAG device. The two MC-LAG network devices that manage a given MC-LAG must have the same identification number.

Range: 1 through 65,535

mode (active-active | active-standby)—Specify whether the MC-LAG is in active-active or active-standby mode.

NOTE: You can configure IPv4 (inet) and IPv6 (inet6) addresses on mc-ae interfaces when the active-standby mode is configured.

redundancy-group *group-id*—Specify the redundancy group identification number. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate multiple chassis that perform similar redundancy functions.

Range: 1 through 4,294,967,294

revert-time—Wait interval (in minutes) before the switchover to the preferred node is performed when the **switchover-mode** is configured as revertive.

Range: 1 through 10

status-control (active | standby)—Specify whether the chassis becomes active or remains in standby mode when an interchassis link failure occurs.

switchover-mode (non-revertive | revertive)—Specify whether Junos OS should trigger a link switchover to the preferred node when the active node is available.

NOTE: For revertive mode to automatically switch over to the preferred node, the **status-control** statement should be configured as active.

init-delay-time *seconds*—To minimize traffic loss, specify the number of seconds by which to delay bringing the multichassis aggregated Ethernet (mc-ae) interface back to the up state when you reboot an MC-LAG peer.

Required Privilege	interface—To view this statement in the configuration.
Level	interface-control—To add this statement to the configuration.

minimum-bandwidth (aggregated Ethernet)

Syntax	<code>minimum-bandwidth bw-unit <i>unit</i> bw-value <i>value</i>;</code>
Hierarchy Level	[edit interfaces aex aggregated-ether-options]
Release Information	Statement introduced before Junos OS Release 14.1R1 and 14.2 for MX Series.
Description	Configure the minimum bandwidth unit for an aggregated Ethernet bundle as bps, Gbps, Kbps, or Mbps and the bandwidth value from 1 through 128,000.
Options	<p><i>unit</i>—Minimum bandwidth unit for the aggregated Ethernet bundle as bps, Gbps, Kbps, or Mbps.</p> <p><i>value</i>—Minimum bandwidth value from 1 through 128,000.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Aggregated Ethernet Interfaces Overview on page 104 • Understanding Mixed Rates and Mixed Modes on Aggregated Ethernet Bundles on page 120 • Configuring Mixed Rates and Mixed Modes on Aggregated Ethernet Bundles on page 127

minimum-links

Syntax (SRX, MX, T, M, EX, QFX Series, EX4600, Qfabric System)	<code>minimum-links <i>number</i>;</code>
Hierarchy Level (EX Series)	<code>[edit interfaces aex aggregated-ether-options],</code> <code>[edit interfaces aex aggregated-sonet-options],</code> <code>[edit interfaces <i>interface-name</i> mlfr-uni-nni-bundle-options],</code> <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>],</code> <code>[edit interfaces interface-range <i>range</i> aggregated-ether-options],</code> <code>[edit interfaces interface-range <i>range</i> aggregated-sonet-options],</code> <code>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i>]</code>
Hierarchy Level (QFX Series)	<code>[edit interfaces aex aggregated-ether-options]</code>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
Description	For aggregated Ethernet, SONET/SDH, multilink, link services, and voice services interfaces only, set the minimum number of links that must be up for the bundle to be labeled up.
Options	<p><i>number</i>—Number of links.</p> <p>Range: On M120, M320, MX Series, T Series, and TX Matrix routers with Ethernet interfaces, the valid range for minimum-links number is 1 through 64. When the maximum value (16) is specified, all configured links of a bundle must be up for the bundle to be labeled up. On all other routers and on EX Series switches, other than EX8200 switches, the range of valid values for minimum-links number is 1 through 8. When the maximum value (8) is specified, all configured links of a bundle must be up for the bundle to be labeled up. On EX8200 switches, the range of valid values for minimum-links number is 1 through 12. When the maximum value (12) is specified, all configured links of a bundle must be up for the bundle to be labeled up. On EX4600, QFX Series and Q Fabric Systems, the range of valid values for minimum-links number is 1 through 8. When the maximum value (8) is specified, all configured links of a bundle must be up for the bundle to be labeled up.</p> <p>Default: 1</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

mixed-rate-mode

Syntax	mixed-rate-mode;
Hierarchy Level	[edit chassis fpc slot-number pic pic-number mixed-rate-mode], [edit chassis lcc number fpc slot-number pic pic-number mixed-rate-mode] (Routing Matrix)
Release Information	Statement introduced in Junos OS Release 13.3.
Description	Configure the mixed-rate mode for the 24-port 10 Gigabit Ethernet PIC (PF-24XGE-SFPP) only.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Modes of Operation of 10-Gigabit Ethernet PICs on page 441 • Configuring Mixed-Rate Mode Operation on page 447

mka (MX Series)

Syntax	<pre>mka { must-secure; key-server-priority <i>priority-number</i>; transmit-interval <i>interval</i>; eapol-address (pae provider-bridge lldp-multicast); }</pre>
Hierarchy Level	[edit security macsec connectivity-association <i>connectivity-association-name</i>]
Release Information	Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers. Option eapol-address introduced in Junos OS Release 18.3R1 for MX Series routers.
Description	Specify parameters for the MACsec Key Agreement (MKA) protocol.
Options	The remaining statements are explained separately.
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Configuring MACsec on MX Series Routers</i>• <i>eapol-address</i>

must-secure (MX Series)

Syntax	<code>must-secure;</code>
Hierarchy Level	<code>[edit security macsec connectivity-association <i>connectivity-association-name</i> mka]</code>
Release Information	Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.
Description	<p>Specifies that all traffic travelling on the MACsec-secured link must be MACsec-secured to be forwarded onward.</p> <p>When the must-secure option is enabled, all traffic that is not MACsec-secured that is received on the interface is dropped.</p> <p>When the must-secure option is disabled, all traffic from devices that support MACsec is MACsec-secured while traffic received from devices that do not support MACsec is forwarded through the network.</p> <p>The must-secure option is particularly useful in scenarios where multiple devices, such as a phone and a PC, are accessing the network through the same Ethernet interface. If one of the devices supports MACsec while the other device does not support MACsec, the device that doesn't support MACsec can continue to send and receive traffic over the network—provided the must-secure option is disabled—while traffic to and from the device that supports MACsec is MACsec-secured. In this scenario, traffic to the device that is not MACsec-secured must be VLAN-tagged.</p>
Default	The must-secure option is disabled.
Required Privilege Level	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring MACsec on MX Series Routers</i>

mtu

Syntax	<code>mtu bytes;</code>
Hierarchy Level	<pre> [edit interfaces <i>interface-name</i>], [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i>], [edit interfaces <i>interface-range name</i>], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i>], [edit logical-systems <i>logical-system-name</i> protocols l2circuit local-switching interface <i>interface-name</i> backup-neighbor <i>address</i>], [edit logical-systems <i>logical-system-name</i> protocols l2circuit neighbor <i>address</i> interface <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> protocols l2circuit neighbor <i>address</i> interface <i>interface-name</i> backup-neighbor <i>address</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols l2vpn interface <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> protocols vpls], [edit protocols l2circuit local-switching interface <i>interface-name</i> backup-neighbor <i>address</i>], [edit protocols l2circuit neighbor <i>address</i> interface <i>interface-name</i>] [edit protocols l2circuit neighbor <i>address</i> interface <i>interface-name</i> backup-neighbor <i>address</i>], [edit routing-instances <i>routing-instance-name</i> protocols l2vpn interface <i>interface-name</i>], [edit routing-instances <i>routing-instance-name</i> protocols vpls], [edit logical-systems <i>name</i> protocols ospf area <i>name</i> interface], [edit logical-systems <i>name</i> routing-instances <i>name</i> protocols ospf area <i>name</i> interface], [edit protocols ospf area <i>name</i> interface], [edit routing-instances <i>name</i> protocols ospf area <i>name</i> interface] </pre>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for Layer 2 VPNs and VPLS introduced in Junos OS Release 10.4.</p> <p>Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.</p> <p>Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.</p> <p>Support at the <code>[set interfaces interface-name unit logical-unit-number family ccc]</code> hierarchy level introduced in Junos OS Release 12.3R3 for MX Series routers.</p> <p>Statement introduced in Junos OS 17.3R1 Release for MX Series Routers.</p>
Description	<p>Specify the maximum transmission unit (MTU) size for the media or protocol. The default MTU size depends on the device type. Changing the media MTU or protocol MTU causes an interface to be deleted and added again.</p> <p>To route jumbo data packets on an integrated routing and bridging (IRB) interface or routed VLAN interface (RVI) on EX Series switches, you must configure the jumbo MTU size on the member physical interfaces of the VLAN that you have associated with the IRB interface or RVI, as well as on the IRB interface or RVI itself (the interface named <code>irb</code> or <code>vlan</code>, respectively).</p>

.....

CAUTION: For EX Series switches, setting or deleting the jumbo MTU size on an IRB interface or RVI while the switch is transmitting packets might cause packets to be dropped.

.....

.....

NOTE:

The MTU for an IRB interface is calculated by removing the Ethernet header overhead [6(DMAC)+6(SMAC)+2(EtherType)]. Because, the MTU is the lower value of the MTU configured on the IRB interface and the MTU configured on the IRB's associated bridge domain IFDs or IFLs, the IRB MTU is calculated as follows:

- In case of Layer 2 IFL configured with the `flexible-vlan-tagging` statement, the IRB MTU is calculated by including 8 bytes overhead (SVLAN+CVLAN).
 - In case of Layer 2 IFL configured with the `vlan-tagging` statement, the IRB MTU is calculated by including a single VLAN 4 bytes overhead.
-

NOTE:

- If a packet whose size is larger than the configured MTU size is received on the receiving interface, the packet is eventually dropped. The value considered for MRU (maximum receive unit) size is also the same as the MTU size configured on that interface.
- Not all devices allow you to set an MTU value, and some devices have restrictions on the range of allowable MTU values. You cannot configure an MTU for management Ethernet interfaces (fxp0, em0, or me0) or for loopback, multilink, and multicast tunnel devices.
- On ACX Series routers, you can configure the protocol MTU by including the `mtu` statement at the [edit interfaces *interface-name* unit *logical-unit-number* family inet] or [edit interfaces *interface-name* unit *logical-unit-number* family inet6] hierarchy level.
 - If you configure the protocol MTU at any of these hierarchy levels, the configured value is applied to all families that are configured on the logical interface.
 - If you are configuring the protocol MTU for both inet and inet6 families on the same logical interface, you must configure the same value for both the families. It is not recommended to configure different MTU size values for inet and inet6 families that are configured on the same logical interface.
- Starting in Release 14.2, MTU for IRB interfaces is calculated by removing the Ethernet header overhead (6(DMAC)+6(SMAC)+2(EtherType)), and the MTU is a minimum of the two values:
 - Configured MTU
 - Associated bridge domain's physical or logical interface MTU
 - For Layer 2 logical interfaces configured with flexible-vlan-tagging, IRB MTU is calculated by including 8 bytes overhead (SVLAN+CVLAN).
 - For Layer 2 logical interfaces configured with vlan-tagging, IRB MTU is calculated by including single VLAN 4 bytes overhead.

NOTE: Changing the Layer 2 logical interface option from `vlan-tagging` to `flexible-vlan-tagging` or vice versa adjusts the logical interface MTU by 4 bytes with the existing MTU size. As a result, the Layer 2 logical interface is deleted and re-added, and the IRB MTU is re-computed appropriately.

For more information about configuring MTU for specific interfaces and router or switch combinations, see *Configuring the Media MTU*.

Options *bytes*—MTU size.

Range: 256 through 9192 bytes, 256 through 9216 (EX Series switch interfaces), 256 through 9500 bytes (Junos OS 12.1X48R2 for PTX Series routers), 256 through 9500 bytes (Junos OS 16.1R1 for MX Series routers)

NOTE: Starting in Junos OS Release 16.1R1, the MTU size for a media or protocol is increased from 9192 to 9500 for Ethernet interfaces on the following MX Series MPCs:

- MPC1
- MPC2
- MPC2E
- MPC3E
- MPC4E
- MPC5E
- MPC6E

Default: 1500 bytes (INET, INET6, and ISO families), 1448 bytes (MPLS), 1514 bytes (EX Series switch interfaces)

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

multi-chassis-protection

Syntax

```
multi-chassis-protection {
  peer a.b.c.d {
    interface interface-name;
  }
}
```

Hierarchy Level [edit interfaces *interface-name*]

Release Information Statement introduced in Junos OS Release 11.1.

Description For MX Series routers with multichassis aggregated Ethernet (MC-AE) interfaces, you can use this statement under the physical interface level to reduce the configuration at the logical interface level if the following assumption exists:

If there are $n + 1$ logical interfaces under **ae0**, from **ae0.0** through **ae0.n**, there will be $n + 1$ logical interfaces under **ge-0/0/0** as well, from **ge-0/0/0.0** through **ge-0/0/0.n**, and each **ge-0/0/0** logical interface will be a protection link for the **ae0** logical interface.

NOTE: A bridge domain cannot have MC-AE logical interfaces which belong to different redundancy groups.

If the Inter-Chassis Control Protocol (ICCP) connection is UP and the interchassis data link (ICL) comes UP, the router configured as standby will bring up the MC-AE interfaces shared with the peer.

The remaining statements are explained separately. See [CLI Explorer](#).

Options **interface interface-name**—Specify the interface: **interface interface-name-fpc/pic/port**

Required Privilege Level

interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

no-encryption (MACsec for MX Series)

Syntax	no-encryption;
Hierarchy Level	[edit security macsec connectivity-association <i>connectivity-association-name</i>]
Release Information	Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.
Description	<p>Disables MACsec encryption for a connectivity association that is configured to enable MACsec using static connectivity association key (CAK) or dynamic security mode.</p> <p>You can enable MACsec without enabling encryption. If a connectivity association that has not enabled MACsec encryption is associated with an interface, traffic is forwarded across the Ethernet link in clear text. You are, therefore, able to view this unencrypted traffic when you are monitoring the link. The MACsec header is still applied to the packet, however, and all MACsec data integrity checks are run on both ends of the link to ensure the traffic does not represent a security threat.</p> <p>This command is used to disable encryption when MACsec is configured using static CAK or dynamic security mode only. When MACsec is configuring using static secure association key (SAK) security mode, the encryption setting is managed in the secure channel using the encryption configuration statement.</p>
Default	MACsec encryption is enabled if MACsec is enabled using static CAK or dynamic security mode.
Required Privilege Level	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <i>Configuring MACsec on MX Series Routers</i>

no-auto-mdix

Syntax	no-auto-mdix;
Hierarchy Level	[edit interface <i>ge-fpc/port/pic</i> <i>gigether-options</i>]
Release Information	Statement introduced in Junos OS Release 9.5. Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Description	<p>Disable the Auto MDI/MDIX feature.</p> <p>MX Series routers with Gigabit Ethernet interfaces automatically detect MDI and MDIX port connections. Use this statement to override the default setting. Remove this statement to return to the default setting.</p>
Default	Auto MDI/MDIX is enabled by default.
Options	There are no options for this statement.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Ethernet Interfaces Overview on page 3• gigether-options on page 1267.

no-gratuitous-arp-request

Syntax	no-gratuitous-arp-request;
Hierarchy Level	[edit interfaces <i>interface-name</i>]
Release Information	Statement introduced in Junos OS Release 9.6 for EX Series switches. Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Description	For Ethernet interfaces and pseudowire logical interfaces, do not respond to gratuitous ARP requests.
Default	Gratuitous ARP responses are enabled on all Ethernet interfaces.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Gratuitous ARP on page 20

no-keepalives

Syntax	no-keepalives;
Hierarchy Level	[edit interfaces <i>interface-name</i>], [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i>]
Release Information	Statement introduced before Junos OS Release 7.4.
Description	<p>Disable the sending of keepalives on a physical interface configured with PPP, Frame Relay, or Cisco HDLC encapsulation. The default keepalive interval is 10 seconds.</p> <p>For ATM2 IQ interfaces only, you can disable keepalives on a logical interface unit if the logical interface is configured with one of the following PPP over ATM encapsulation types:</p> <ul style="list-style-type: none">• atm-ppp-llc—PPP over AAL5 LLC encapsulation.• atm-ppp-vc-mux—PPP over AAL5 multiplex encapsulation.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

no-mac-table-binding (802.1X for MX Series in Enhanced LAN Mode)

Syntax	no-mac-table-binding;
Hierarchy Level	[edit protocols authentication-access-control]
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	For 802.1X authentication, disable the removal of the session from the authentication session table when the MAC address ages out of the Ethernet switching table.
Default	Not enabled
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	

no-native-vlan-insert

Syntax	no-native-vlan-insert;
Hierarchy Level	[edit interfaces <i>interface-name</i>]
Release Information	Statement introduced in Junos OS Release 17.1R1.
Description	<p>Send traffic without the native VLAN ID (<i>native-vlan-id</i>) to the remote end of the network if untagged traffic is received.</p> <p>If this statement is not configured, then <i>native-vlan-id</i> is added to untagged traffic. But if this statement is configured, then <i>native-vlan-id</i> is not added to untagged traffic.</p>
	<div>  <p>NOTE:</p> <ul style="list-style-type: none"> This feature works only on MX Series routers with MPCs/MICs. Configuring this statement on MX Series routers with DPCs results in no behavioral change. However, if you configure the statement on aggregated Ethernet (ae) interfaces with logical interfaces across MPCs/MICs and DPCs, then the MPCs/MICs and DPCs behave differently. In the egress direction, this feature is disrupted by VLAN normalization. Because of normalization, the egress interface cannot distinguish between untagged traffic and tagged traffic. And untagged traffic is sent out with <i>native-vlan-id</i>. Consider this while configuring both VLAN normalization and new <i>native-vlan-id</i> statement. <p>There will be a problem with ingress firewall filter if filter term includes <i>native-vlan-id</i>. With no-native-vlan-insert statement configured, <i>native-vlan-id</i> will not be inserted to untagged traffic. So, firewall filter term will not match with untagged traffic. But if incoming traffic have VLAN ID which is equal to <i>native-vlan-id</i>, then firewall filter term will match and firewall will work.</p> <ul style="list-style-type: none"> When this feature is used with AE, all sub-interfaces of AE should be in same type of FPC. </div>
Default	By default, <i>native-vlan-id</i> is inserted to untagged traffic. That is, if this statement is not configured, then <i>native-vlan-id</i> is inserted to untagged traffic.
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

no-pre-classifier

Syntax	no-pre-classifier;
Hierarchy Level	[edit chassis fpc <i>n</i> pic <i>n</i>]
Release Information	Statement introduced in Junos OS Release 10.4.
Description	Specify disabling the control queue for all ports on the 10-Gigabit Ethernet LAN/WAN PIC. Deleting this configuration re-enables the control queue feature on all ports of the 10-Gigabit Ethernet LAN/WAN PIC.
	<div>  <p>NOTE: For the 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (model number PD-5-10XGE-SFPP), the control queue has a rate limiter to limit the control traffic to 2 Mbps (fixed, not user-configurable) per port. If the transit control traffic crosses this limit, then it can cause drops on locally terminating control traffic, causing flap of protocols such as BGP and OSPF. To avoid the control traffic being dropped, configure the no-pre-classifier statement to disable the control queue.</p> </div>
Default	The no-pre-classifier statement is not configured and the control queue is operational.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • 10-port 10-Gigabit Ethernet LAN/WAN PIC Overview on page 433 • Configuring Control Queue Disable on a 10-port 10-Gigabit Ethernet LAN/WAN PIC on page 443

no-reauthentication (MX Series in Enhanced LAN Mode)

Syntax	no-reauthentication;
Hierarchy Level	[edit protocols authentication-access-control interface (all <i>[interface-names]</i>) dot1x]
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	For 802.1X authentication, disables reauthentication.
Default	Not disabled
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

no-send-pads-ac-info

Syntax	no-send-pads-ac-info;
Hierarchy Level	[edit protocols pppoe]
Release Information	Statement introduced in Junos OS Release 12.2.
Description	<p>Prevent the router from sending the AC-Name and AC-Cookie tags in the PPPoE Active Discovery Session (PADS) packet. When you configure this statement, it affects PADS packets sent on all PPPoE interfaces configured on the router after the command is issued; it has no effect on previously created PPPoE interfaces. By default, the AC-Name and AC-Cookie tags are transmitted in the PADS packet, along with the Service-Name, Host-Uniq, Relay-Session-Id, and PPP-Max-Payload tags.</p>
	<p> NOTE: In Junos OS Release 12.1 and earlier, only the Service-Name, Host-Uniq, Relay-Session-Id, and PPP-Max-Payload tags are contained in the PADS packet by default. The AC-Name and AC-Cookie tags are not transmitted in the PADS packet by default.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> Disabling the Sending of PPPoE Access Concentrator Tags in PADS Packets

no-send-pads-error

Syntax	no-send-pads-error;
Hierarchy Level	[edit protocols pppoe]
Release Information	Statement introduced in Junos OS Release 12.3.
Description	Discard PADR messages to prevent transmission of PADS control packets with AC-System-Error tags.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Discarding PADR Messages to Accommodate Abnormal CPE Behavior</i>

non-revertive (Interfaces)

Syntax	non-revertive;
Hierarchy Level	[edit interfaces aeX aggregated-ether-options lacp link-protection]
Release Information	Statement introduced in Junos OS Release 9.3. Statement introduced in Junos OS Release 11.4 for EX Series switches. Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.
Description	Disable the ability to switch to a better priority link (if one is available) once a link is established as active and collection distribution is enabled.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• link-protection on page 1316• Configuring Aggregated Ethernet Link Protection on page 152• <i>Configuring LACP Link Protection of Aggregated Ethernet Interfaces for Switches</i>

non-revertive

Syntax	non-revertive;
Hierarchy Level	[edit protocols protection-group ethernet-ring ring-name]
Release Information	Statement introduced in Junos OS Release 14.2.
Description	Enable nonrevertive operation where traffic is allowed to use the RPL if it has not failed, even after a switch condition has cleared. The default mode of operation is revertive.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Ethernet Ring Protection Switching Overview on page 227 • Configuring Ethernet Ring Protection Switching on Switches (CLI Procedure) on page 236

non-vc-mode

Syntax	non-vc-mode;
Hierarchy Level	[edit protocols protection-group ethernet-ring ring-name]
Release Information	Statement introduced in Junos OS Release 14.2.
Description	Configure a node on the sub-ring to operate in non-virtual channel mode. If this option is enabled then all the nodes in the sub-ring are configured with this option. Also, the non-vc-mode option should be used with care and only for open rings. Using this option for closed rings creates loops for RAPS control messages.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Ethernet Ring Protection Switching Overview on page 227 • Configuring Ethernet Ring Protection Switching on Switches (CLI Procedure) on page 236

node-id

Syntax	<code>node-id mac-address;</code>
Hierarchy Level	[edit protocols protection-group ethernet-ring ring-name]
Release Information	Statement introduced in Junos OS Release 9.4.
Description	<p>For EX Series switches and QFX Series switches, node-id is not configurable.</p> <p>For MX Series routers, optionally specify the MAC address of a node in the protection group. If this statement is not included, the router assigns the node's MAC address.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none">• Ethernet Ring Protection Switching Overview on page 227• Example: Configuring Ethernet Ring Protection Switching on EX Series Switches on page 249• Example: Configuring Ethernet Ring Protection Switching on QFX Series and EX Series Switches Supporting ELS on page 265

offset (MX Series)

Syntax	<code>offset (0 30 50);</code>
Hierarchy Level	<code>[edit security macsec connectivity-association <i>connectivity-association-name</i>]</code> <code>[edit security macsec connectivity-association <i>connectivity-association-name</i> secure-channel <i>secure-channel-name</i>]</code>
Release Information	Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.
Description	<p>Specifies the number of octets in an Ethernet frame that are sent in unencrypted plain-text when encryption is enabled for MACsec.</p> <p>Setting the offset to 30 allows a feature to see the IPv4 header and the TCP/UDP header while encrypting the remaining traffic. Setting the offset to 50 allows a feature to see the IPv6 header and the TCP/UDP header while encrypting the remaining traffic.</p> <p>You would typically forward traffic with the first 30 or 50 octets unencrypted if a feature needed to see the data in the octets to perform a function, but you otherwise prefer to encrypt the remaining data in the frames traversing the link. Load balancing features, in particular, typically need to see the IP and TCP/UDP headers in the first 30 or 50 octets to properly load balance traffic.</p> <p>You configure the offset in the <code>[edit security macsec connectivity-association <i>connectivity-association-name</i>]</code> hierarchy when you are enabling MACsec using static connectivity association key (CAK) or dynamic security mode.</p> <p>You configure the offset in the <code>[edit security macsec connectivity-association <i>connectivity-association-name</i> secure-channel <i>secure-channel-name</i>]</code> hierarchy when you are enabling MACsec using static secure association key (SAK) security mode.</p>
Default	0
Options	<p>0—Specifies that no octets are unencrypted. When you set the offset to 0, all traffic on the interface where the connectivity association or secure channel is applied is encrypted.</p> <p>30—Specifies that the first 30 octets of each Ethernet frame are unencrypted.</p>

NOTE: In IPv4 traffic, setting the offset to 30 allows a feature to see the IPv4 header and the TCP/UDP header while encrypting the rest of the traffic. An offset of 30, therefore, is typically used when a feature needs this information to perform a task on IPv4 traffic.

50—Specified that the first 50 octets of each Ethernet frame are unencrypted.

NOTE: In IPv6 traffic, setting the offset to 50 allows a feature to see the IPv6 header and the TCP/UDP header while encrypting the rest of the traffic. An offset of 50, therefore, is typically used when a feature needs this information to perform a task on IPv6 traffic.

Required Privilege Level admin—To view this statement in the configuration.
 admin-control—To add this statement to the configuration.

pdu-interval

Syntax	<code>pdu-interval <i>interval</i>;</code>
Hierarchy Level	[edit protocols oam ethernet link-fault-management interface <i>interface-name</i>]
Release Information	Statement introduced in Junos OS Release 8.2 for MX, M, T, ACX, Series routers, SRX Series firewalls, and EX Series Switches. Statement introduced in Junos OS Release 9.4 for EX Series switches.
Description	For Ethernet interfaces on EX Series switches and M320, M120, MX Series, and T Series routers, specify the periodic OAM PDU sending interval for fault detection. Used for IEEE 802.3ah Operation, Administration, and Management (OAM) support.
Options	interval —Periodic OAM PDU sending interval. Range: For MX, M, T, ACX, Series routers, SRX Series firewalls and EX Series switches – 100 through 1000 milliseconds Default: For EX Series switches –1000 milliseconds
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration. routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring the OAM PDU Interval on page 765 • Example: Configuring Ethernet OAM Link Fault Management • Configuring Ethernet OAM Link Fault Management

pdu-threshold

Syntax	<code>pdu-threshold <i>threshold-value</i>;</code>
Hierarchy Level	[edit protocols oam ethernet link-fault-management interface <i>interface-name</i>]
Release Information	Statement introduced in Junos OS Release 8.2 for T, M, MX and ACX Series routers, SRX Series firewalls and EX Series switches. Statement introduced in Junos OS Release 9.4 for EX Series switches and NFX Series devices.
Description	Configure how many protocol data units (PDUs) are missed before declaring the peer lost in Ethernet OAM link fault management (LFM) for all interfaces or for specific interfaces. For Ethernet interfaces on EX Series switches and M320, M120, MX Series, and T Series routers, specify the number of OAM PDUs to miss before an error is logged. Used for IEEE 802.3ah Operation, Administration, and Management (OAM) support.
Options	<i>threshold-value</i> —The number of PDUs missed before declaring the peer lost. Range: 3 through 10 PDUs Default: 3 PDUs
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring the OAM PDU Threshold on page 766 • Configuring Ethernet OAM Link Fault Management

per-flow (Aggregated Ethernet Interfaces)

Syntax	<code>per-flow;</code>
Hierarchy Level	<code>[edit interfaces aeX unit logical-unit-number forwarding-options load-balance-stateful]</code>
Release Information	Statement introduced in Junos OS Release 13.2R1.
Description	Enable the mechanism to perform an even, effective distribution of traffic flows across member links of an aggregated Ethernet interface (ae) bundle on MX Series routers with MPCs, except MPC3Es and MPC4Es. When multiple flows are transmitted out of an ae interface, the flows must be distributed across the different member links evenly to enable an effective and optimal load-balancing behavior. To obtain a streamlined and robust method of load-balancing, the member link of the aggregated Ethernet interface bundle that is selected each time for load balancing plays a significant part.
Options	per-flow —Enable the stateful load-distribution mechanism per traffic flow on an aggregated Ethernet interface.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Stateful Load Balancing on Aggregated Ethernet Interfaces on page 185

peer

Syntax	<pre>peer <i>a.b.c.d</i> { interface <i>interface-name</i>; }</pre>
Hierarchy Level	[edit interfaces <i>interface-name</i> multi-chassis-protection]
Release Information	Statement introduced in Junos OS Release 11.1.
Description	For MX Series routers with multichassis aggregated Ethernet (MC-AE) interfaces, use the multi-chassis-protection statement under the physical interface level to reduce the configuration at the logical interface level. If the interchassis control protocol connection (ICCP) is UP and the interchassis data link (ICL) comes UP, the router configured as standby will bring up the MC-AE interfaces shared with the peer active-active node specified by the peer statement. You must also specify the peer's physical interface.
Options	<p><i>a.b.c.d</i>—Specify the IP address of the peer.</p> <p>interface <i>interface-name</i>—Specify the peer's physical interface: interface <i>interface-name-fpc/pic/port</i></p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

policer (CFM Firewall)

Syntax

```
policer cfm-policer {  
  if-exceeding {  
    bandwidth-limit 8k;  
    burst-size-limit 2k;  
  }  
  then discard;  
}
```

Hierarchy Level [edit firewall]

Release Information Statement introduced in Junos OS Release 10.0.

Description Attach an explicit policer to CFM sessions.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

Related Documentation

port-description-type

Syntax	<pre>port-description-type { interface-alias; interface-description; }</pre>
Hierarchy Level	[edit protocols lldp] [edit routing- instances <i>routing-instance-name</i> protocols lldp]
Release Information	Statement introduced in Junos OS Release 13.3R5, 14.2R2, 14.1R4, and 12.3R9.
Description	For Link Layer Discovery Protocol, configure the value to be used for port description TLV.
Options	<p>interface-alias—Use the <i>ifAlias</i> MIB object value to generate the port description TLV.</p> <p>interface-description—Use the <i>ifDescr</i> MIB object value to generate the port description TLV.</p> <p>Default: By default, interface-alias is used for generation of port description TLV. The interface-alias value is same as description of an interface configured by statement set interface <i>name</i> description <i>description</i>.</p>
<div>  <p>NOTE: The LLDP MIB <i>lldpLocPortDesc</i> value gets changed depending on the setting of port-description-type statement. That is:</p> <ul style="list-style-type: none"> If you configure the port-description-type interface-alias statement, the MIB variable <i>lldpLocPortDesc</i> displays the value same as that of MIB variable <i>ifAlias</i>, which is same as the description of the interface. By default, the MIB variable <i>lldpLocPortDesc</i> displays the value same as that of MIB variable <i>ifAlias</i>. If you configure the port-description-type interface-description statement, the MIB variable <i>lldpLocPortDesc</i> displays the value of MIB variable <i>ifDescr</i>, which is same as that of interface name. </div>	
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

port-id (MACsec for MX Series)

Syntax	<code>port-id <i>port-id-number</i>;</code>
Hierarchy Level	[edit security macsec connectivity-association <i>connectivity-association-name</i> secure-channel <i>secure-channel-name</i> id]
Release Information	Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.
Description	<p>Specify a port ID in a secure channel when enabling MACsec using static secure association key (SAK) security mode. The port IDs must match on a sending and receiving secure channel on each side of a link to enable MACsec.</p> <p>Once the port numbers match, MACsec is enabled for all traffic on the connection.</p> <p>You only use this configuration option when you are configuring MACsec using static SAK security mode. This option does not need to be specified when you are enabling MACsec using static connectivity association key (CAK) security mode.</p>
Default	No port ID is specified.
Options	<i>port-id-number</i> —The port ID number.
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Configuring MACsec on MX Series Routers</i>

port-priority

Syntax	<code>port-priority <i>priority</i>;</code>
Hierarchy Level	[edit interfaces <i>interface-name</i> <i>gigether-options</i> 802.3ad lacp]
Release Information	Statement introduced in Junos OS Release 9.3. Statement introduced in Junos OS Release 11.4 for EX Series switches. Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.
Description	Define LACP port priority at the interface level.
Options	<p><i>priority</i>—Priority for being elected to be the active port and both collect and distribute traffic. A smaller value indicates a higher priority for being elected.</p> <p>Range: 0 through 65535</p> <p>Default: 127</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

port-id-subtype

Syntax

```
port-id-subtype {
  interface-name;
  locally-assigned;
}
```

Hierarchy Level

```
[edit protocols lldp]
[edit routing- instances routing-instance-name protocols lldp]
```

Release Information Statement introduced in Junos OS Release 12.3R1

Description For Link Layer Discovery Protocol, configure the port ID type, length, and value (TLV).

Options **interface-name**—Use the interface name to generate the port ID TLV.
Default: Use the SNMP index of the interface to generate the port ID TLV. This is the default option used to generate port ID TLV.

NOTE: For QFX5200 switches, the default value used to generate port ID TLV in LLDP messages is interface name, not SNMP index.

NOTE: The `show lldp neighbors` command displays the content of the port ID TLV received from the peer in the port Info field. Changing the configuration of `port-id-subtype` affects the display of the `show lldp neighbors` command on the peer device running Junos OS.

When the value of `port-id-subtype` is set to `locally-assigned`, which is the default value, the `show lldp neighbors` command on the peer device running Junos OS displays the SNMP index as the port information for the local device.

When the value of `port-id-subtype` is set to `interface-name`, the `show lldp neighbors` command on the peer device running Junos OS displays the interface name as the port information for the local device.

The value of the MIB variable instance `lldpLocPortId` depends on the entity that is used to generate the port ID TLV. If the port ID TLV generation is configured to use the `interface-name` in the command `set port-id-subtype interface-name`, then the value of the MIB variable `lldpLocPortId` instance is the interface name and not the SNMP index.

Required Privilege routing—To view this statement in the configuration.
Level routing-control—To add this statement to the configuration.

pppoe-options

Syntax	<pre>pppoe-options { access-concentrator name; auto-reconnect seconds; (client server); service-name name; underlying-interface interface-name; ppp-max-payload ppp-max-payload }</pre>
Hierarchy Level	<pre>[edit interfaces pp0 unit logical-unit-number], [edit logical-systems logical-system-name interfaces pp0 unit logical-unit-number] [set interface ppp interface-unit logical-unit-number ppp-max-payload ppp-max-payload],</pre>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>client Statement introduced in Junos OS Release 8.5.</p> <p>server Statement introduced in Junos OS Release 8.5.</p> <p>client Statement introduced in Junos OS Release 15.1X49-D100.</p>
Description	<p>Configure PPP over Ethernet-specific interface properties.</p> <p>The remaining statements are explained separately. Search for a statement in CLI Explorer or click a linked statement in the Syntax section for details.</p> <p>The maximum payload allowed on an Ethernet frame is 1500 bytes. For a PPPoE interface, the PPPoE header uses 6 bytes and the PPP protocol ID uses 2 bytes. This restricts the maximum MTU size on a PPPoE interface to 1492 bytes, which can cause frequent fragmentation and reassembly of larger PPP packets received over the PPPoE interface. To prevent frequent fragmentation and reassembly for PPP packets over Ethernet, you can configure the maximum transmission unit (MTU) and MRU sizes for PPP subscribers.</p> <p>For PPPoE subscribers, the PPP MRU or PPP MTU size can be greater than 1492 bytes if the PPP-Max-Payload tag is received in the PPPoE Active Discovery Request (PADR) packets.</p> <p>The PPP-Max-Payload option allows you to override the default behavior of the PPPoE client by providing a maximum size that the PPP payload can support in both sending and receiving directions. The PPPoE server might allow the negotiation of an MRU larger than 1492 octets and the ability to use an MTU larger than 1500 octets.</p> <p>It is important to set an appropriate value for the MTU size of the physical interface before setting ppp-max-payload. The value of mtu must be greater than the value of ppp-max-payload.</p> <p>To enable Jumbo frames refer <i>Understanding Jumbo Frames Support for Ethernet Interfaces</i>.</p>

proxy

Syntax	<code>proxy inet-address <i>address</i>;</code>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family tcc], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family tcc]
Release Information	Statement introduced before Junos OS Release 7.4.
Description	For Layer 2.5 VPNs using an Ethernet interface as the TCC router, configure the IP address for which the TCC router is proxying. Ethernet TCC is supported on interfaces that carry IPv4 traffic only. Ethernet TCC encapsulation is supported on 1-port Gigabit Ethernet, 2-port Gigabit Ethernet, 4-port Gigabit Ethernet, and 4-port Fast Ethernet PICs only. Ethernet TCC is not supported on the T640 router.
Options	inet-address —Configure the IP address of the neighbor to the TCC router.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring Translation Cross-Connect Interface Switching on page 416• <i>Example: Configuring an Ethernet TCC or Extended VLAN TCC</i>• remote on page 1436• <i>Junos OS VPNs Library for Routing Devices</i>

proxy-arp

Syntax	proxy-arp (restricted unrestricted);
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.6 for EX Series switches. restricted added in Junos OS Release 10.0 for EX Series switches. Statement introduced in Junos OS Release 12.2 for the QFX Series.
Description	For Ethernet interfaces only, configure the router or switch to respond to any ARP request, as long as the router or switch has an active route to the ARP request's target address.
	<div>  <p>NOTE: You must configure the IP address and the inet family for the interface when you enable proxy ARP.</p> </div>
Default	Proxy ARP is not enabled. The router or switch responds to an ARP request only if the destination IP address is its own.
Options	<ul style="list-style-type: none"> none—The router or switch responds to any ARP request for a local or remote address if the router or switch has a route to the target IP address. restricted—(Optional) The router or switch responds to ARP requests in which the physical networks of the source and target are different and does not respond if the source and target IP addresses are in the same subnet. The router or switch must also have a route to the target IP address. unrestricted—(Optional) The router or switch responds to any ARP request for a local or remote address if the router or switch has a route to the target IP address. <p>Default: unrestricted</p>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

quiet-period (MX Series in Enhanced LAN Mode)

Syntax	<code>quiet-period <i>seconds</i>;</code>
Hierarchy Level	<code>[edit protocols authentication-access-control interface (all [<i>interface-names</i>])]</code>
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	For 802.1X and captive portal authentication, configure the number of seconds the interface remains in the wait state following a failed authentication attempt by a supplicant before reattempting authentication.
Default	60 seconds
Options	<i>seconds</i> —Number of seconds the interface remains in the wait state. Range: 0 through 65,535 seconds Default: 60 seconds
Required Privilege Level	routing —To view this statement in the configuration. routing-control —To add this statement to the configuration.

reauthentication

Syntax	reauthentication (disable interval <i>seconds</i>);
Hierarchy Level	[edit protocols dot1x authenticator interface <i>interface-id</i>]
Release Information	Statement introduced in Junos OS Release 9.3.
Description	Set or disable the periodic reauthentication of the client.
Options	<ul style="list-style-type: none">• disable—Disable the periodic reauthentication of the client.• interval <i>seconds</i>—Specify the periodic reauthentication time interval. <p>Range: 1 through 65,535 seconds</p> <p>Default: 3600 seconds</p>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• IEEE 802.1x Port-Based Network Access Control Overview on page 35• dot1x on page 1209• interface (IEEE 802.1x) on page 1293• quiet-period on page 1430

reauthentication (MX Series in Enhanced LAN Mode)

Syntax	<code>reauthentication <i>interval</i>;</code>
Hierarchy Level	<code>[edit protocols authentication-access-control interface (all [<i>interface-names</i>]) dot1x]</code>
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	For 802.1X authentication, specify the number of seconds before an authentication session times out.
Options	<p><i>interval</i>—Sets the periodic reauthentication time interval in seconds.</p> <p>Range: 1 through 4,294,967,296 seconds</p> <p>Default: 3600 seconds</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

rebalance (Aggregated Ethernet Interfaces)

Syntax	<code>rebalance <i>interval</i></code>
Hierarchy Level	<code>[edit interfaces aeX <i>unit logical-unit-number</i> forwarding-options load-balance-stateful per-flow]</code>
Release Information	Statement introduced in Junos OS Release 13.2R1.
Description	Configure periodic rebalancing of traffic flows of an aggregated Ethernet bundle by clearing the load balance state at a specified interval.
Options	<p><i>interval</i>—Number of minutes after which the load-balancing state must be cleared for the specified interface.</p> <p>Range: 1 through 1000 flows per minute</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Configuring Stateful Load Balancing on Aggregated Ethernet Interfaces on page 185

receive-options-packets

Syntax	receive-options-packets;
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet]
Release Information	Statement introduced before Junos OS Release 7.4.
Description	For a Monitoring Services PIC and an ATM or SONET/SDH PIC installed in an M160, M40e, or T Series router, guarantee conformity with cflowd records structure. This statement is required when you enable passive monitoring.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Enabling Passive Monitoring on ATM Interfaces</i>• <i>Enabling Packet Flow Monitoring on SONET/SDH Interfaces</i>

receive-ttl-exceeded

Syntax	receive-ttl-exceeded;

recovery

Syntax

```
recovery {
  (auto | manual);
  timer timer-value;
}
```

Hierarchy Level [edit interfaces *interfaces-name* link-degrade-monitor]

Release Information Statement introduced in Junos OS Release 15.1.

Description Configure the mechanism to be used to recover a degraded link. The recovery options supported are auto and manual.

Options **auto**—Recover a degraded link automatically. Use this option with the media-based action when there are no Layer 2 or Layer 3 protocols configured on the interface. If this option is configured, the degraded link is monitored at user-configured intervals; and if the link quality is found to have improved (if bit error rate hits the clear threshold), the link is automatically recovered. With this configuration, you must configure a timer value.

manual—Recover a degraded link manually. Use this option with the media-based action configuration when Layer 2 and Layer 3 protocols are configured on the interface. If this option is configured, you need to use the **request interface link-degrade-recover *interface-name*** statement to recover the link.

NOTE: The manual recovery option is recommended for user deployments that have static route configurations causing the remote end of the link to start forwarding packets (as soon as the physical link is up) while autorecovery is in progress.

timer *timer-value*—Specify the interval value (in seconds) after which autorecovery of the degraded link must be triggered. This option is applicable if you configure the autorecovery option. The interval period starts from the time the link is degraded. The default interval is 1800 seconds. The autorecovery attempt is repeated until the link is recovered or the link monitoring feature is disabled through configuration.

NOTE: During autorecovery, you might notice link flaps at the remote end of the link.

Required Privilege Level interface—To view this statement in the configuration.
 interface-control—To add this statement to the configuration.

remote

Syntax

```
remote {
  (inet-address address | mac-address address);
}
```

Hierarchy Level [edit interfaces *interface-name* [unit](#) *logical-unit-number* [family](#) tcc],
 [edit logical-systems *logical-system-name* interfaces *interface-name* [unit](#) *logical-unit-number* [family](#) tcc]

Release Information Statement introduced before Junos OS Release 7.4.

Description For Layer 2.5 VPNs using an Ethernet interface as the TCC router, configure the location of the remote router. Ethernet TCC is supported on interfaces that carry IPv4 traffic only. Ethernet TCC encapsulation is supported on 1-port Gigabit Ethernet, 2-port Gigabit Ethernet, 4-port Gigabit Ethernet, and 4-port Fast Ethernet PICs only.

Options **mac-address**—Configure the MAC address of the remote site.
inet-address—Configure the IP address of the remote site.

Required Privilege Level interface—To view this statement in the configuration.
 interface-control—To add this statement to the configuration.

remote-loopback

Syntax	remote-loopback;
Hierarchy Level	[edit protocols oam link-fault-management interface <i>interface-name</i>]
Release Information	Statement introduced in Junos OS Release 8.2.
Description	For Ethernet interfaces on EX Series switches and M320, M120, MX Series, and T Series routers, set the remote DTE into loopback mode. Remove the statement from the configuration to take the remote DTE out of loopback mode. Used for IEEE 802.3ah Operation, Administration, and Management (OAM) support.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Setting a Remote Interface into Loopback Mode on page 777

replay-window-size (MX Series)

Syntax	<code>replay-window-size <i>number-of-packets</i>;</code>
Hierarchy Level	<code>[edit security macsec connectivity-association <i>connectivity-association-name</i> replay-protect]</code>
Release Information	Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.
Description	<p>Specifies the size of the replay protection window.</p> <p>This statement has to be configured to enable replay protection.</p> <p>When MACsec is enabled on an Ethernet link, an ID number is assigned to each packet entering the link. The ID number of the packet is checked by the receiving interface after the packet has traversed the MACsec-enabled link.</p> <p>When replay protection is enabled, the sequence of the ID number of received packets are checked. If the packet arrives out of sequence and the difference between the packet numbers exceeds the replay protection window size, the packet is dropped by the receiving interface. For instance, if the replay protection window size is set to five and a packet assigned the ID of 1006 arrives on the receiving link immediately after the packet assigned the ID of 1000, the packet that is assigned the ID of 1006 is dropped because it falls outside the parameters of the replay protection window.</p> <p>Replay protection is especially useful for fighting man-in-the-middle attacks. A packet that is replayed by a man-in-the-middle attacker on the Ethernet link will arrive on the receiving link out of sequence, so replay protection helps ensure the replayed packet is dropped instead of forwarded through the network.</p> <p>Replay protection should not be enabled in cases where packets are expected to arrive out of order.</p>
Default	Replay protection is disabled.
Options	<p><i>number-of-packets</i>—Specifies the size of the replay protection window, in packets.</p> <p>When this variable is set to 0, all packets that arrive out-of-order are dropped.</p>
Required Privilege Level	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>

retries (MX Series in Enhanced LAN Mode)

Syntax	<code>retries <i>number</i>;</code>
Hierarchy Level	<code>[edit protocols authentication-access-control interface (all [<i>interface-names</i>])]</code>
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	For 802.1X and captive portal authentication, configure the number of times the switch attempts to authenticate the port after an initial failure. The port remains in a wait state during the quiet period after the authentication attempt.
Options	<i>number</i> —Number of retries. Default: 3 retries Range: 1 through 10
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

revertive

Syntax	revertive;
Hierarchy Level	[edit interfaces aeX aggregated-ether-options lacp link-protection]
Release Information	Statement introduced in Junos OS Release 9.3. Statement introduced in Junos OS Release 12.3 for EX Series switches. Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.
Description	Enable the ability to switch to a better priority link (if one is available).
	<div>  <p>NOTE: By default, LACP link protection is revertive. However, you can use this statement to define a specific aggregated Ethernet interface as revertive to override a global non-revertive statement specified at the [edit chassis] hierarchy level.</p> </div>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> <i>non-revertive (Chassis)</i> <i>Configuring LACP Link Protection of Aggregated Ethernet Interfaces for Switches</i>

ring-id

Syntax	<code>ring-id <i>number</i>;</code>
Hierarchy Level	[edit protocols protection-group ethernet-ring <i>ring-name</i>]
Release Information	Statement introduced in Junos OS Release 14.2.
Description	Specify the ring ID.
Options	<i>number</i> —Ring ID number. Range: 1 through 239 Default: 1
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Ethernet Ring Protection Switching Overview on page 227• Configuring Ethernet Ring Protection Switching on Switches (CLI Procedure) on page 236

ring-protection-link-end

Syntax	<code>ring-protection-link-end;</code>
Hierarchy Level	[edit protocols <code>protection-group ethernet-ring</code> <i>ring-name</i> (<code>east-interface</code> <code>west-interface</code>)]
Release Information	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 12.1 for EX Series switches.
Description	Specify that the port is one side of a ring protection link (RPL) by setting the RPL end flag.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Ethernet Ring Protection Switching Overview on page 227 • Example: Configuring Ethernet Ring Protection Switching on EX Series Switches on page 249 • Example: Configuring Ethernet Ring Protection Switching on QFX Series and EX Series Switches Supporting ELS on page 265 • Configuring Ethernet Ring Protection Switching on Switches (CLI Procedure) on page 236

ring-protection-link-owner

Syntax	ring-protection-link-owner;
Hierarchy Level	[edit protocols protection-group ethernet-ring <i>ring-name</i>]
Release Information	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 12.1 for EX Series switches. Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.
Description	Specify the ring protection link (RPL) owner flag in the Ethernet protection ring. Include this statement only once for each ring (only one node can function as the RPL owner).
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Ethernet Ring Protection Switching Overview on page 227• Example: Configuring Ethernet Ring Protection Switching on EX Series Switches on page 249• Example: Configuring Ethernet Ring Protection Switching on QFX Series and EX Series Switches Supporting ELS on page 265

routing-instance

Syntax	<pre>routing-instance { destination <i>routing-instance-name</i>; }</pre>
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> tunnel], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> tunnel]
Release Information	Statement introduced before Junos OS Release 7.4.
Description	To configure interfaces and logical-systems , specify the destination routing instance that points to the routing table containing the tunnel destination address.
Default	The default Internet routing table is inet.0 .
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Junos OS Services Interfaces Library for Routing Devices</i>

routing-instance (PPPoE Service Name Tables)

Syntax	<code>routing-instance <i>routing-instance-name</i>;</code>
Hierarchy Level	<code>[edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i>],</code> <code>[edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i> agent-specifier</code> <code>aci <i>circuit-id-string</i> ari <i>remote-id-string</i>]</code>
Release Information	Statement introduced in Junos OS Release 10.2.
Description	<p>Use in conjunction with the dynamic-profile statement at the same hierarchy levels to specify the routing instance in which to instantiate a dynamic PPPoE interface. You can associate a routing instance with a named service entry, empty service entry, or any service entry configured in a PPPoE service name table, or with an agent circuit identifier/agent remote identifier (ACI/ARI) pair defined for these services.</p> <p>The routing instance associated with a service entry in a PPPoE service name table overrides the routing instance associated with the PPPoE underlying interface on which the dynamic PPPoE interface is created.</p> <p>If you include the routing-instance statement at the <code>[edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i> agent-specifier aci <i>circuit-id-string</i> ari <i>remote-id-string</i>]</code> hierarchy level, you cannot also include the static-interface statement at this level. The routing-instance and static-interface statements are mutually exclusive for ACI/ARI pair configurations.</p>
Options	<i>routing-instance-name</i> —Name of the routing instance in which the router instantiates the dynamic PPPoE interface.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> <i>Configuring PPPoE Service Name Tables</i> <i>Assigning a Dynamic Profile and Routing Instance to a Service Name or ACI/ARI Pair for Dynamic PPPoE Interface Creation</i>

sa-multicast (100-Gigabit Ethernet)

Syntax	sa-multicast;
Hierarchy Level	[edit chassis fpc slot pic slot forwarding-mode]
Release Information	Statement introduced in Junos OS Release 10.4.
Description	Configure the 100-Gigabit Ethernet PIC or MIC to interoperate with other Juniper Networks 100-Gigabit Ethernet PICs.
	<p> NOTE: The default packet steering mode for PD-1CE-CFP-FPC4 is SA multicast bit mode. No SA multicast configuration is required to enable this mode.</p> <p>sa-multicast supports interoperability between the following PICs and MICs:</p> <ul style="list-style-type: none"> • 100-Gigabit Ethernet Type 5 PIC with CFP (PF-1CGE-CFP) and the 100-Gigabit Ethernet Type 4 PIC with CFP (PD-1CE-CFP-FPC4) . • 100-Gigabit Ethernet MICs and the 100-Gigabit Ethernet Type 4 PIC with CFP (PD-1CE-CFP-FPC4).
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

sa-multicast (PTX Series Packet Transport Routers)

Syntax	sa-multicast;
Hierarchy Level	[edit chassis fpc slot pic slot port port-number forwarding-mode]
Release Information	Statement introduced in Junos OS Release 12.1X48R4.
Description	Configure source address (SA) multicast bit mode on the 100-Gigabit Ethernet PIC P1-PTX-2-100GE-CFP to enable interoperability with 100-Gigabit Ethernet PIC PD-1CE-CFP-FPC4.
	<div>  <p>NOTE: When SA multicast bit steering mode is configured on a PTX Series Packet Transport Router 100-Gigabit Ethernet port, VLANs are not supported for that port.</p> </div>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Interoperability Between the 100-Gigabit Ethernet PICs PD-1CE-CFP-FPC4 and P1-PTX-2-100GE-CFP on page 494 • Configuring the Interoperability Between the 100-Gigabit Ethernet PICs P1-PTX-2-100GE-CFP and PD-1CE-CFP-FPC4 on page 498

secure-authentication (MX Series in Enhanced LAN Mode)

Syntax	<code>secure-authentication (http https);</code>
Hierarchy Level	<code>[edit protocols captive-portal-custom-options]</code>
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	Enable HTTP or HTTPS access on the captive portal interface.
Default	<code>http</code>
Options	<code>http</code> —Enables HTTP access on the captive portal interface. <code>https</code> —Enables HTTPS access on the captive portal interface. HTTPS is recommended.
Required Privilege Level	<code>routing</code> —To view this statement in the configuration. <code>routing-control</code> —To add this statement to the configuration.

secure-channel

Syntax	<pre> secure-channel <i>secure-channel-name</i> { direction (inbound outbound); encryption (MACsec); id { mac-address <i>mac-address</i>; port-id <i>port-id-number</i>; } offset (0 30 50); security-association <i>security-association-number</i> { key <i>key-string</i>; } } </pre>
Hierarchy Level	[edit security macsec connectivity-association <i>connectivity-association-name</i>]
Release Information	Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.
Description	<p>Create and configure a secure channel to enable and configure MACsec when MACsec is enabled using static secure association key (SAK) security mode.</p> <p>You do not need to use this option to enable MACsec using static connectivity association key (CAK) security mode. All configuration for MACsec using static CAK security mode is done inside of the connectivity association but outside of the secure channel. When MACsec is enabled using static CAK security mode, an inbound and an outbound secure channel—neither of which is user-configurable—is automatically created within the connectivity association.</p>
Options	The remaining statements are explained separately.
Required Privilege Level	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <i>Configuring MACsec on MX Series Routers</i>

security-association

Syntax	<pre>security-association <i>security-association-number</i> { key <i>key-string</i>; }</pre>
Hierarchy Level	[edit security macsec connectivity-association <i>connectivity-association-name</i> secure-channel <i>secure-channel-name</i>]
Release Information	Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.
Description	<p>Specifies the number of one of the security associations in the secure channel when MACsec is enabled using static secure association key (SAK) security mode. Because SAKs are created by the key server when MACsec is enabled using static connectivity association key (CAK) security mode, the security-association statement is not used when enabling MACsec using static CAK security mode.</p> <p>You must configure at least two security associations to enable MACsec using static SAK security mode. MACsec initially establishes a secure connection when a security association number and key match on both ends of an Ethernet link. After a certain number of Ethernet frames are securely transmitted across the Ethernet link, MACsec automatically rotates to a new security association with a new security association number and key to maintain the secured Ethernet link. This rotation continues each time a certain number of Ethernet frames are securely transmitted across the secured Ethernet link, so you must always configure MACsec to have at least two security associations.</p>
Default	No security keys are configured, by default.
Options	<p><i>security-association-number</i>—Specifies the security association number and creates the SAK.</p> <p>The security association number is a whole number between 0 and 3. You can configure two security associations in a secure channel when enabling MACsec using static security keys.</p>
Required Privilege Level	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>

server

Syntax	server;
Hierarchy Level	[edit interfaces pp0 unit <i>logical-unit-number</i> pppoe-options], [edit logical-systems <i>logical-system-name</i> interfaces pp0 unit <i>logical-unit-number</i> pppoe-options]
Release Information	Statement introduced in Junos OS Release 8.5.
Description	Configure the router to operate in the PPPoE server mode. Supported on M120 and M320 Multiservice Edge Routers and MX Series 5G Universal Routing Platforms operating as access concentrators.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring the PPPoE Server Mode on page 395

server-fail

Syntax	<code>server-fail (deny permit use-cache <i>vlan-id</i> <i>vlan-name</i>);</code>
Hierarchy Level	<code>[edit protocols authentication-access-control interface (all [<i>interface-names</i>]) dot1x]</code>
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	<p>For EX Series switches configured for 802.1X authentication, specify the server fail fallback action the switch takes when all RADIUS authentication servers are unreachable.</p> <p>When you specify the action <i>vlan-name</i> or <i>vlan-id</i>, the VLAN must already be configured on the switch.</p>
Default	Authentication is denied.
Options	<p>deny—Force fail the supplicant authentication. No traffic will flow through the interface.</p> <p>permit—Force succeed the supplicant authentication. Traffic will flow through the interface as if it were successfully authenticated by the RADIUS server.</p> <p>use-cache—Force succeed the supplicant authentication only if it was previously authenticated successfully. This action ensures that already authenticated supplicants are not affected.</p> <p>vlan-id—Move supplicant on the interface to the VLAN specified by this numeric identifier. This action is allowed only if it is the first supplicant connecting to the interface. If an authenticated supplicant is already connected, then the supplicant is not moved to the VLAN and is not authenticated.</p> <p>vlan-name—Move supplicant on the interface to the VLAN specified by this name. This action is allowed only if it is the first supplicant connecting to an interface. If an authenticated supplicant is already connected, then the supplicant is not moved to the VLAN and is not authenticated.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

server-reject-vlan (MX Series in Enhanced LAN Mode)

Syntax	<pre>server-reject-vlan (<i>vlan-id</i> <i>vlan-name</i>) { eapol-block; block-interval <i>block-interval</i>; }</pre>
Hierarchy Level	[edit protocols authentication-access-control interface (all [<i>interface-names</i>]) dot1x]
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	<p>For EX Series switches configured for 802.1X authentication, specify that when the switch receives an Extensible Authentication Protocol Over LAN (EAPoL) Access-Reject message during the authentication process between the switch and the RADIUS authentication server, supplicants attempting access to the LAN are granted access and moved to a specific VLAN. Any VLAN name or VLAN ID sent by a RADIUS server as part of the EAPoL Access-Reject message is ignored.</p> <p>When you specify the VLAN ID or VLAN name, the VLAN must already be configured on the switch.</p> <p>The remaining statements are explained separately. See CLI Explorer.</p>
Default	None
Options	<p><i>vlan-id</i>—Numeric identifier of the VLAN to which the supplicant is moved.</p> <p><i>vlan-name</i>—Name of the VLAN to which the supplicant is moved.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

server-timeout

Syntax	<code>server-timeout <i>seconds</i>;</code>
Hierarchy Level	<code>[edit protocols dot1x authenticator interface <i>interface-id</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.3.
Description	Sets the number of seconds the port waits for a reply when relaying a response from the client to the authentication server before timing out and invoking the server-fail action.
Options	<p><i>seconds</i>—The number of seconds the port waits for a response when relaying a request from the authentication server to the client before resending the request.</p> <p>Range: 1 through 60 seconds</p> <p>Default: 30 seconds</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

server-timeout (MX Series in Enhanced LAN Mode)

Syntax	<code>server-timeout <i>seconds</i>;</code>
Hierarchy Level	<code>[edit protocols authentication-access-control interface (all [<i>interface-names</i>])]</code>
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	For 802.1X and captive portal authentication, configure the amount of time a port will wait for a reply when relaying a response from the supplicant to the authentication server before timing out and invoking the server-fail action.
Default	30 seconds
Options	<i>seconds</i> —Number of seconds. Range: 1 through 60 seconds Default: 30 seconds
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

service (PPPoE)

Syntax

```

service service-name {
  drop;
  delay seconds;
  terminate;
  dynamic-profile profile-name;
  routing-instance routing-instance-name;
  max-sessions number;
  agent-specifier {
    aci circuit-id-string ari remote-id-string {
      drop;
      delay seconds;
      terminate;
      dynamic-profile profile-name;
      routing-instance routing-instance-name;
      static-interface interface-name;
    }
  }
}

```

Hierarchy Level [edit protocols pppoe [service-name-tables](#) *table-name*]

Release Information Statement introduced in Junos OS Release 10.0.
any, **dynamic-profile**, **routing-instance**, **max-sessions**, and **static-interface** options introduced in Junos OS Release 10.2.

Description Specify the action taken by the interface on receipt of a PPPoE Active Discovery Initiation (PADI) control packet for the specified named service, **empty** service, or **any** service in a PPPoE service name table. You can also specify the dynamic profile and routing instance that the router uses to instantiate a dynamic PPPoE interface, and the maximum number of active PPPoE sessions that the router can establish with the specified service.

Default The default action is terminate.

Options **service-name**—Service entry in the PPPoE service name table:

- **service-name**—Named service entry of up to 32 characters; for example, **premiumService**. You can configure a maximum of 512 named service entries across all PPPoE service name tables on the router.
- **empty**—Service entry of zero length that represents an unspecified service. Each PPPoE service name table includes one **empty** service entry by default.
- **any**—Default service for non-empty service entries that do not match the named or **empty** service entries configured in the PPPoE service name table. Each PPPoE service name table includes one **any** service entry by default.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

session-expiry (MX Series in Enhanced LAN Mode)

Syntax	<code>session-expiry <i>seconds</i>;</code>
Hierarchy Level	<code>[edit protocols authentication-access-control interface (all [<i>interface-names</i>])]</code>
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	Configure the maximum duration in seconds of a session.
Options	<i>seconds</i> —Duration of session. Range: 1 through 65535 Default: 3600
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

source-address-filter

Syntax	<pre>source-address-filter { mac-address; }</pre>
Hierarchy Level	[edit interfaces <i>interface-name</i> aggregated-ether-options], [edit interfaces <i>interface-name</i> fastether-options], [edit interfaces <i>interface-name</i> gigether-options]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.1X48 for PTX Packet Transport Routers.
Description	For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, Gigabit Ethernet IQ interfaces, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), specify the MAC addresses from which the interface can receive packets. For this statement to have any effect, you must include the source-filtering statement in the configuration to enable source address filtering.
Options	<p>mac-address—MAC address filter. You can specify the MAC address as <i>nn:nn:nn:nn:nn:nn</i> or <i>nnnn.nnnn.nnnn</i>, where <i>n</i> is a decimal digit. To specify more than one address, include multiple mac-address options in the source-address-filter statement.</p> <p>If you enable the VRRP on a Fast Ethernet or Gigabit Ethernet interface, as described in “VRRP and VRRP for IPv6 Overview” on page 383, and if you enable MAC source address filtering on the interface, you must include the virtual MAC address in the list of source MAC addresses that you specify in the source-address-filter statement. MAC addresses ranging from 00:00:5e:00:01:00 through 00:00:5e:00:01:ff are reserved for VRRP, as defined in RFC 3768, <i>Virtual Router Redundancy Protocol</i>. When you configure the VRRP group, the group number must be the decimal equivalent of the last hexadecimal byte of the virtual MAC address.</p> <p>On untagged Gigabit Ethernet interfaces, you should not configure the source-address-filter statement and the accept-source-mac statement simultaneously. On tagged Gigabit Ethernet interfaces, you should not configure the source-address-filter statement and the accept-source-mac statement with an identical MAC address specified in both filters.</p>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring MAC Address Filtering for Ethernet Interfaces on page 14 • Configuring MAC Address Filtering on PTX Series Packet Transport Routers on page 16 • source-filtering on page 1465

source-filtering

Syntax	(source-filtering no-source-filtering);
Hierarchy Level	[edit interfaces <i>interface-name</i> aggregated-ether-options], [edit interfaces <i>interface-name</i> fastether-options], [edit interfaces <i>interface-name</i> gigether-options]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.1X48 for PTX Packet Transport Routers.
Description	<p>For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, and Gigabit Ethernet IQ interfaces only, enable the filtering of MAC source addresses, which blocks all incoming packets to that interface. To allow the interface to receive packets from specific MAC addresses, include the source-address-filter statement.</p> <p>If the remote Ethernet card is changed, the interface is no longer able to receive packets from the new card because it has a different MAC address.</p>
Default	Source address filtering is disabled.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

Hierarchy Level (QFX Series, EX4600, OCX Series)	<code>[edit interfaces <i>interface-name</i>]</code>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.</p> <p>Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.</p> <p>Speed option 2.5Gbps introduced in Junos OS Release 18.1R2 for EX2300 switch.</p> <p>Speed option 10Gbps and 5Gbps introduced in Junos OS Release 18.2R1 for EX4300 switch.</p>
Description	<p>Configure the interface speed. This statement applies to the management Ethernet interface (fxp0 or em0), Fast Ethernet 12-port and 48-port PICs, the built-in Fast Ethernet port on the FIC (M7i router), Combo Line Rate DPCs and Tri-Rate Ethernet Copper interfaces on MX Series routers, and Gigabit Ethernet interfaces on EX Series switches.</p>

When you configure the Tri-Rate Ethernet copper interface to operate at 1 Gbps, autonegotiation must be enabled. When you configure 100BASE-FX SFP, you must set the port speed at 100 Mbps.

NOTE: On MX Series routers with Tri-rate Enhanced DPC (DPCE-R-40GE-TX), when you configure the interface speed using the auto-10m-100m option, the speed is negotiated to the highest value possible (100 Mbps), if the same value is configured on both sides of the link. However, when you view the interface speed of the DPC, using the `show interfaces` command, the value of the speed is not accurately displayed. For instance, if you configure the speed of the Tri-rate enhanced DPC, as 100Mbps on both sides of the link, the interface speed of the DPC is negotiated to 100 Mbps. However, the interface speed of the DPC displays 1 bps. This is an issue with the `show interfaces` command only. The actual interface speed is 100 Mbps.

On 10-Gigabit Ethernet SFP interfaces, autonegotiation is enabled by default and auto-detects the speed to be either 1 Gbps or 10 Gbps. On QFX5100-48S, QFX5100-96S, and QFX5100-24Q devices using 10-Gigabit Ethernet SFP interfaces, the speed is set to 10 Gbps by default and cannot be configured to operate in a different speed. On QFX5100-48S and QFX5100-96S devices using 1-Gigabit Ethernet SFP interfaces, the speed is set to 1 Gbps by default and cannot be configured to operate in a different speed.

NOTE: In Junos OS Release 14.1X53-D35 on QFX5100-48T-6Q devices using 10-Gigabit Ethernet Copper interfaces, autonegotiation is disabled by default on the copper ports, and the interfaces operate at a speed of 100M. You can, however, enable auto-negotiation by issuing the `set interface name ether-options auto-negotiation` command on the interface for which you want to change the interface speed. With autonegotiation enabled, the interface auto-detects the speed in which to operate.

NOTE: Only 10 Gbps and 40 Gbps interfaces are supported on OCX Series switches.

NOTE: When displaying interface information with `show interfaces` commands, you might see speed values for 1 Gbps interfaces displayed as 1000mbps.

(For EX2300 only) Starting in Junos OS Release 18.1R2, the multi-rate speed is supported on EX2300-48MP and EX2300-24MP switches. The speed configuration statement is supported on both multi-rate gigabit ethernet interface (mge) and gigabit ethernet (ge) interface. The mge interface is a rate-selectable (multirate) Gigabit Ethernet interface that can support speeds of 10-Gbps, 5-Gbps, and 2.5-Gbps over CAT5e/CAT6/CAT6a cables. In the EX2300, the mge interface supports 100-Mbps, 1-Gbps, and 2.5-Gbps speeds, which can be configured by using the speed configuration statement. Note that 10Mbps speed is supported only on **ge** interfaces of EX2300 switch.

On EX2300-24MP and EX2300-48MP switches, if both Energy Efficient Ethernet (EEE) and 100-Mbps speed are configured on a rate-selectable (or multirate) Gigabit Ethernet (mge) port, the port operates only at 100-Mbps speed but EEE is not enabled on that port. EEE is supported only on mge interfaces that operate at 1-Gbps and 2.5-Gbps speeds.

Default (EX Series) If the [auto-negotiation](#) statement at the `[edit interfaces interface-name ether-options]` hierarchy level is enabled, the auto-negotiation option is enabled by default.

Options You can specify the speed as either **10m** (10 Mbps), **100m** (100 Mbps), and on MX Series routers, **1g** (1 Gbps). You can also specify the **auto** option on MX Series routers.

For Gigabit Ethernet interfaces on EX Series switches, you can specify one of the following options:

Table 107: Options for speed

Platforms	Speed Supported	Auto-negotiation
EX Series Switches	100m —100 Mbps 10m —10 Mbps 1g —1 Gbps	auto-negotiation—Automatically negotiate the speed based on the speed of the other end of the link. This option is available only when the auto-negotiation statement at the [edit interfaces interface-name ether-options] hierarchy level is enabled.
ACX, MX Series	100m —100 Mbps 10m —10 Mbps 1g —1 Gbps	auto —Automatically negotiate the speed (10 Mbps, 100 Mbps, or 1 Gbps) based on the speed of the other end of the link. auto-10m-100m —Automatically negotiate the speed (10 Mbps or 100 Mbps) based on the speed of the other end of the link.
EX4600, QFX Series, QFabric, OCX100, QFX Series	10g —10 Gbps 1g —1 Gbps 100m —100 Mbps	auto-negotiation—Automatically negotiate the speed based on the speed of the other end of the link. This option is available only when the auto-negotiation statement at the [edit interfaces interface-name ether-options] hierarchy level is enabled.
EX2300	10m —10 Mbps (supported on EX series switches and only on ge interfaces of EX2300 switch) 100m —100 Mbps 1g —1 Gbps 2.5g —2.5 Gbps (supported only on mge interfaces of EX2300 switch) 10g —10 Gbps (supported only on mge interfaces for EX4300 switches) 5g —5 Gbps (supported only on mge interfaces for EX4300 switches)	speed —Specify the interface speed. If the auto-negotiation statement at the [edit interfaces interface-name ether-options] hierarchy level is disabled, you must specify a specific value. This value sets the speed that is used on the link. If the auto-negotiation statement is enabled, you might want to configure a specific speed value to advertise the desired speed to the remote end. The Multi-rate gigabit ethernet interface (MGE) on EX2300-24MP and EX2300-48MP switches flaps (becomes unavailable, and then available again) while performing timeout detection and recovery (TDR) test.

Required Privilege interface—To view this statement in the configuration.

Level interface-control—To add this statement to the configuration.

Release History Table

Release	Description
18.2R1	Starting in Junos OS Release 18.1R2, the multi-rate speed is supported on EX2300-48MP and EX2300-24MP switches.

speed (MX Series DPC)

Syntax	<code>speed (auto 1Gbps 100Mbps 10Mbps);</code>
Hierarchy Level	<code>[edit interfaces ge-<i>fpc/pic/port</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.5.
Description	On MX Series routers with Combo Line Rate DPCs and Tri-Rate Copper SFPs you can set auto negotiation of speed. To specify the auto negotiation speed, use the speed (auto 1Gbps 100Mbps 10Mbps) statement under the [edit interface ge-<i>fpc/pic/port</i>] hierarchy level. The auto option will attempt to automatically match the rate of the connected interface. To set port speed negotiation to a specific rate, set the port speed to 1Gbps , 100Mbps , or 10Mbps .
	<div>  <p>NOTE: If the negotiated speed and the interface speed do not match, the link will not be brought up. Half duplex mode is not supported.</p> </div>
Options	You can specify the speed as either auto (autonegotiate), 10Mbps (10 Mbps), 100Mbps (100 Mbps), or 1Gbps (1 Gbps).
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring Gigabit Ethernet Autonegotiation on page 623 • no-auto-mdix on page 1366

stacked-vlan-tagging

Syntax	stacked-vlan-tagging;
Hierarchy Level	[edit interfaces <i>interface-name</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.
Description	<p>For Gigabit Ethernet IQ interfaces, Gigabit Ethernet, 10-Gigabit Ethernet LAN/WAN PIC, and 100-Gigabit Ethernet Type 5 PIC with CFP, enable stacked VLAN tagging for all logical interfaces on the physical interface.</p> <p>For pseudowire subscriber interfaces, enable stacked VLAN tagging for logical interfaces on the pseudowire service.</p>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Stacking and Rewriting Gigabit Ethernet VLAN Tags Overview on page 631

static (Protocols 802.1X)

Syntax	<pre>static <i>mac-address</i> { interface <i>interface-names</i>; vlan-assignment (<i>vlan-id</i> <i>vlan-name</i>); }</pre>
Hierarchy Level	[edit protocols authentication-access-control]
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	<p>Configure MAC addresses to exclude from 802.1X authentication. The static MAC list provides an authentication bypass mechanism for supplicants connecting to a port, permitting devices such as printers that are not 802.1X-enabled to be connected to the network on 802.1X-enabled ports.</p> <p>Using this 802.1X authentication-bypass mechanism, the supplicant connected to the MAC address is assumed to be successfully authenticated and the port is opened for it. No further authentication is done for the supplicant.</p> <p>You can optionally configure the VLAN that the supplicant is moved to or the interfaces on which the MAC address can gain access from.</p>
Options	<p><i>mac-address</i> —The MAC address of the device for which 802.1X authentication should be bypassed and the device permitted access to the port.</p> <p>The remaining statements are explained separately. See CLI Explorer.</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

static-interface

Syntax	<code>static-interface <i>interface-name</i>;</code>
Hierarchy Level	<code>[edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i> agent-specifier aci <i>circuit-id-string</i> ari <i>remote-id-string</i>]</code>
Release Information	Statement introduced in Junos OS Release 10.2.
Description	<p>Reserve the specified static PPPoE interface for use only by the PPPoE client with matching agent circuit identifier (ACI) and agent remote identifier (ARI) information. You can specify only one static interface per ACI/ARI pair configured for a named service entry, empty service entry, or any service entry in the PPPoE service name table.</p> <p>The static interface associated with an ACI/ARI pair takes precedence over the general pool of static interfaces associated with the PPPoE underlying interface.</p> <p>If you include the static-interface statement in the configuration, you cannot also include either the dynamic-profile statement or the routing-instance statement. The dynamic-profile, routing-instance, and static-interface statements are mutually exclusive for ACI/ARI pair configurations.</p>
Options	interface-name —Name of the static PPPoE interface reserved for use by the PPPoE client with matching ACI/ARI information. Specify the interface in the format pp0.logical , where logical is a logical unit number from 0 through 16385 for static interfaces.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> <i>Configuring PPPoE Service Name Tables</i> <i>Reserving a Static PPPoE Interface for Exclusive Use by a PPPoE Client</i>

supplicant

Syntax	<code>supplicant <i>single</i>;</code>
Hierarchy Level	<code>[edit protocols dot1x authenticator interface <i>interface-id</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.3.
Description	<p>Specify the supplicant mode. Only single mode is supported.</p> <p>This option will authenticate only the first client that connects to a port. All other clients that connect later (802.1x compliant or non-compliant) will be allowed free access on that port without any further authentication. If the first authenticated client logs out, all other users are locked out until a client authenticates again.</p>
Options	<code>single</code> —Sets single mode.
Required Privilege Level	<p><code>interface</code>—To view this statement in the configuration.</p> <p><code>interface-control</code>—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • IEEE 802.1x Port-Based Network Access Control Overview on page 35 • authenticator on page 1170 • dot1x on page 1209 • interface (IEEE 802.1x) on page 1293

supplicant (MX Series in Enhanced LAN Mode)

Syntax	supplicant (multiple single single-secure);
Hierarchy Level	[edit protocols authentication-access-control interface (all [<i>interface-names</i>])]
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	Configure the MAC-based method used to authenticate clients for 802.1X or captive portal authentication.
Default	single
Options	<p>single—Authenticates only the first client that connects to an authenticator port. All other clients connecting to the authenticator port after the first are permitted free access to the port without further authentication. If the first authenticated client logs out, all other supplicants are locked out until a client authenticates again.</p> <p>single-secure—Authenticates only one client to connect to an authenticator port. The host must be directly connected to the switch.</p> <p>multiple—Authenticates multiple clients individually on one authenticator port. You can configure the number of clients per port. If you also configure a maximum number of devices that can be connected to a port through port security settings, the lower of the configured values is used to determine the maximum number of clients allowed per port.</p>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

supplicant-timeout

Syntax	<code>supplicant-timeout <i>seconds</i>;</code>
Hierarchy Level	<code>[edit protocols dot1x authenticator interface <i>interface-id</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.3.
Description	Specify the number of seconds the port waits for a response when relaying a request from the authentication server to the client before resending the request.
Options	<p><i>seconds</i>—Specify the number of seconds the port waits for the supplicant timeout.</p> <p>Range: 1 through 60 seconds</p> <p>Default: 30 seconds</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • IEEE 802.1x Port-Based Network Access Control Overview on page 35 • authenticator on page 1170 • dot1x on page 1209 • interface (IEEE 802.1x) on page 1293

supplicant-timeout (MX Series in Enhanced LAN Mode)

Syntax	<code>supplicant-timeout <i>seconds</i>;</code>
Hierarchy Level	<code>[edit protocols authentication-access-control interface (all [<i>interface-names</i>]) dot1x]</code>
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	For 802.1X authentication, configure how long the port waits for a response when relaying a request from the authentication server to the supplicant before resending the request.
Default	30 seconds
Options	<i>seconds</i> —Number of seconds. Range: 1 through 60 seconds Default: 30 seconds
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

swap

Syntax	<code>swap;</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> input-vlan-map],</code> <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> output-vlan-map],</code> <code>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i></code> <code> input-vlan-map],</code> <code>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i></code> <code> output-vlan-map]</code>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X51-D20 for the QFX Series.</p>
Description	<p>Specify the VLAN rewrite operation to replace a VLAN tag. The outer VLAN tag of the frame is overwritten with the user-specified VLAN tag information.</p> <p>On MX Series routers, you can enter this statement on Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces, 10-Gigabit Ethernet LAN/WAN PIC, aggregated Ethernet using Gigabit Ethernet IQ interfaces, and 100-Gigabit Ethernet Type 5 PIC with CFP. On EX Series switches, you can enter this statement on Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Rewriting the VLAN Tag on Tagged Frames on page 645 • Configuring Q-in-Q Tunneling on EX Series Switches with ELS Support

swap-by-poppush

Syntax	swap-by-poppush;
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>]
Release Information	Statement introduced in Junos OS Release 11.2
Description	For Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces, 10-Gigabit Ethernet LAN/WAN PIC, and aggregated Ethernet using Gigabit Ethernet IQ interfaces, specify the VLAN rewrite operation to replace a VLAN tag. Pop original tag, then push an entirely new tag. The swap operation is performed as pop followed by push.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

swap-push

Syntax	swap-push;
Hierarchy Level	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> input-vlan-map], [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> output-vlan-map], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> input-vlan-map], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> output-vlan-map]
Release Information	Statement introduced in Junos OS Release 8.1. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
Description	Specify the VLAN rewrite operation to replace the outer VLAN tag of the frame with a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame. You can use this statement on Gigabit Ethernet IQ, IQ2 and IQ2-E interfaces, 10-Gigabit Ethernet LAN/WAN PIC, and for aggregated Ethernet interfaces using Gigabit Ethernet IQ2 and IQ2-E or 10-Gigabit Ethernet PICs on MX Series routers, and 100-Gigabit Ethernet Type 5 PIC with CFP.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Rewriting a VLAN Tag and Adding a New Tag on page 649

swap-swap

Syntax	<code>swap-swap;</code>
Hierarchy Level	<pre>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> input-vlan-map], [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> output-vlan-map], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> input-vlan-map], [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> output-vlan-map]</pre>
Release Information	<p>Statement introduced in Junos OS Release 8.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
Description	<p>Specify the VLAN rewrite operation to replace both the inner and the outer VLAN tags of the frame with a user-specified VLAN tag value.</p> <p>You can use this statement on Gigabit Ethernet IQ, IQ2 and IQ2-E interfaces, 10-Gigabit Ethernet LAN/WAN PIC, for aggregated Ethernet interfaces using Gigabit Ethernet IQ2 and IQ2-E or 10-Gigabit Ethernet PICs on MX Series routers, and for 100-Gigabit Ethernet Type 5 PIC with CFP.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • Rewriting the Inner and Outer VLAN Tags on page 650

switch-options

Syntax	<pre>switch-options { switch-port <i>port-number</i> { (<i>auto-negotiation</i> no-auto-negotiation); <i>speed</i> (10m 100m 1g); <i>link-mode</i> (full-duplex half-duplex); } }</pre>
---------------	---

Hierarchy Level	[edit interfaces <i>ge-pim</i> /0/0]
------------------------	--------------------------------------

Release Information	Statement introduced in Junos OS Release 8.4.
----------------------------	---

Description	Configuration of the physical port characteristics is done under the single physical interface.
--------------------	---

Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
---------------------------------	---

switch-port

Syntax	<pre>switch-port <i>port-number</i> { (auto-negotiation no-auto-negotiation); speed (10m 100m 1g); link-mode (full-duplex half-duplex); }</pre>
Hierarchy Level	[edit interfaces <i>ge-pim/0/0</i> switch-options]
Release Information	Statement introduced in Junos OS Release 8.4.
Description	Configuration of the physical port characteristics, done under the single physical interface.
Default	Autonegotiation is enabled by default. If the link speed and duplex are also configured, the interfaces use the values configured as the desired values in the negotiation.
Options	<p><i>port-number</i>—Ports are numbered 0 through 5 on the 6-port Gigabit Ethernet uPIM, 0 through 7 on the 8-port Gigabit Ethernet uPIM, and 0 through 15 on the 16-port Gigabit Ethernet uPIM.</p> <p>The remaining statements are explained separately. See CLI Explorer.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

symbol-period

Syntax	<code>symbol-period count;</code>
Hierarchy Level	[edit protocols oam ethernet link-fault-management action-profile event , link-event-rate], [edit protocols oam link-fault-management interface <i>interface-name</i> event-thresholds]
Release Information	Statement introduced in Junos OS Release 8.4.
Description	<p>Configure the threshold for sending symbol period events or taking the action specified in the action profile.</p> <p>A symbol error is any symbol code error on the underlying physical layer. The symbol period threshold is reached when the number of symbol errors reaches the configured value within the period window. The default period window is the number of symbols that can be transmitted on the underlying physical layer in 1 second. The window is not configurable.</p>
Options	<p>count—Threshold count for symbol period events.</p> <p>Range: 0 through 100</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none">• Configuring Threshold Values for Local Fault Events on an Interface on page 767• Configuring Threshold Values for Fault Events in an Action Profile on page 775

syslog (OAM Action)

Syntax	syslog;
Hierarchy Level	[edit protocols oam ethernet link-fault-management action-profile action]
Release Information	Statement introduced in Junos OS Release 8.5 for T, M, MX and ACX Series routers, SRX Series firewalls and EX Series switches. Statement introduced in Junos OS Release 9.4 for EX Series switches and NFX Series devices.
Description	Generate a syslog message for the Ethernet Operation, Administration, and Management (OAM) event. Generate a system log message for the Ethernet Operation, Administration, and Maintenance (OAM) link fault management (LFM) event.
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration. routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Specifying the Actions to Be Taken for Link-Fault Management Events on page 772 • <i>Configuring Ethernet OAM Link Fault Management</i>

system-id

Syntax	<code>system-id <i>system-id</i>;</code>
Hierarchy Level	<code>[edit interfaces aeX aggregated-ether-options lacp]</code>
Release Information	Statement introduced in Junos OS Release 12.2R1 Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.
Description	<p>Define the LACP system identifier at the aggregated Ethernet interface level.</p> <p>The user-defined system identifier in LACP enables two ports from two separate routers (M Series or MX Series routers) to act as though they were part of the same aggregate group.</p> <p>The system identifier is a 48-bit (6-byte) globally unique field. It is used in combination with a 16-bit system-priority value, which results in a unique LACP system identifier.</p>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring LACP for Aggregated Ethernet Interfaces on page 143

system-priority

Syntax	<code>system-priority <i>priority</i>;</code>
Hierarchy Level	<code>[edit interfaces aeX aggregated-ether-options lacp]</code>
Release Information	<p>Statement introduced in Junos OS Release 9.3.</p> <p>Statement introduced in Junos OS Release 11.4 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.</p>
Description	<p>Define LACP system priority at the aggregated Ethernet interface level. This system priority value takes precedence over a system priority value configured at the global [edit chassis] hierarchy level.</p> <p>The device with the lower system priority value determines which links between LACP partner devices are active and which are in standby for each LACP group. The device on the controlling end of the link uses port priorities to determine which ports are bundled into the aggregated bundle and which ports are put in standby mode. Port priorities on the other device (the noncontrolling end of the link) are ignored. In priority comparisons, numerically lower values have higher priority. Therefore, the system with the numerically lower value (higher priority value) for LACP system priority becomes the controlling system. If both devices have the same LACP system priority (for example, they are both configured with the default setting of 127), the device MAC address determines which switch is in control.</p>
Options	<p><i>priority</i>—Priority for the aggregated Ethernet system. A smaller value indicates a higher priority.</p> <p>Range: 0 through 65535</p> <p>Default: 127</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

tag-protocol-id (TPIDs Expected to Be Sent or Received)

Syntax	<code>tag-protocol-id [<i>tpids</i>];</code>
Hierarchy Level	<p>[edit interfaces <i>interface-name</i> gigether-options ethernet-switch-profile],</p> <p>[edit interfaces <i>interface-name</i> aggregated-ether-options ethernet-switch-profile],</p> <p>[edit interfaces <i>interface-name</i> aggregated-ether-options ethernet-switch-profile],</p> <p>[edit interfaces <i>interface-name</i> ether-options ethernet-switch-profile]</p>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 14.1X53-D15 for the QFX Series.</p>
Description	<p>For Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces, aggregated Ethernet with Gigabit Ethernet IQ interfaces, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC, and the built-in Gigabit Ethernet port on the M7i router), define the TPIDs expected to be sent or received on a particular VLAN. For each Gigabit Ethernet port, you can configure up to eight TPIDs using the tag-protocol-id statement; but only the first four TPIDs are supported on IQ2 and IQ2-E interfaces.</p> <p>For 10-Gigabit Ethernet LAN/WAN PIC interfaces on T Series routers only the default TPID value (0x8100) is supported.</p> <p>For Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces on EX Series switches, define the TPIDs expected to be sent or received on a particular VLAN. The default TPID value is 0x8100. Other supported values are 0x88a8, 0x9100, and 0x9200.</p>
Options	<i>tpids</i> —TPIDs to be accepted on the VLAN. Specify TPIDs in hexadecimal.
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> Configuring Frames with Particular TPIDs to Be Processed as Tagged Frames on page 635 Configuring Q-in-Q Tunneling on EX Series Switches with ELS Support

tag-protocol-id (TPID to Rewrite)

Syntax	<code>tag-protocol-id <i>tpid</i>;</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> input-vlan-map],</code> <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> output-vlan-map],</code> <code>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i></code> <code> input-vlan-map],</code> <code>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i></code> <code> output-vlan-map]</code>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
Description	<p>For Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces only, configure the outer TPID value. All TPIDs you include in input and output VLAN maps must be among those you specify at the <code>[edit interfaces <i>interface-name</i> gigether-options ethernet-switch-profile tag-protocol-id [<i>tpids</i>]]</code> hierarchy level.</p> <p>For 10-Gigabit Ethernet LAN/WAN PIC interfaces on T Series routers the default TPID value (0x8100) is supported.</p>
Default	If the <code>tag-protocol-id</code> statement is not configured, the TPID value is 0x8100.
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> Configuring Inner and Outer TPIDs and VLAN IDs on page 638

targeted-options (Grouping Subscribers by Bandwidth Usage)

Syntax	<pre>targeted-options { backup <i>backup</i>; group <i>group</i>; primary <i>primary</i>; weight (\$junos-interface-target-weight <i>weight-value</i>); }</pre>
Hierarchy Level	<pre>[edit dynamic-profiles <i>name</i> interfaces <i>name</i> unit <i>logical-unit-number</i>], [edit dynamic-profiles <i>name</i> logical-systems <i>name</i> interfaces <i>name</i> unit <i>logical-unit-number</i>], [edit interfaces <i>name</i> unit <i>logical-unit-number</i>]</pre>
Release Information	<p>Statement introduced in Junos OS Release 16.1.</p> <p>weight option added in Junos OS Release 17.3 for MX Series and MX Virtual Chassis.</p> <p>\$junos-interface-target-weight option added in Junos OS Release 18.4R1.</p>
Description	<p>Configure primary and backup links, group similar subscribers, and specify a subscriber weight for manual targeting to distribute subscribers across aggregated Ethernet member links.</p>
Options	<p>backup—(Optional) Specify a backup member link per subscriber when you configure manual targeting.</p> <p>group—(Optional) Assign a group name for subscribers with similar bandwidth usage. Subscribers that are configured for targeted distribution without a group name are added to the default group and distributed evenly across member links. Grouping of subscribers is supported only for static subscribers.</p> <p>Default: default</p> <p>primary—Specify a primary member link per subscriber when you configure manual targeting. You must always configure a primary link when you configure manual targeting.</p> <p>weight (\$junos-interface-target-weight <i>weight-value</i>)—Specify the weight for targeted subscribers like PPPoE, demux, and conventional VLANs based on factors such as customer preferences, class of service (CoS), or bandwidth requirement. Member links for logical interfaces of aggregated Ethernet logical interfaces are assigned based on the value of the weight. When a new VLAN is added to the same aggregated Ethernet bundle, then the primary member link selected for targeting is the one with the minimum primary load and the backup link selected for targeting is the one with the minimum overall load.</p> <p>The \$junos-interface-target-weight predefined variable is supported for dynamic configuration only. When you configure this predefined variable, the weight value is sourced from VSA 26-213 in the RADIUS Access-Accept message when a dynamic subscriber is authenticated.</p>

Range: 1 through 1000

Required Privilege interface—To view this statement in the configuration.
Level interface-control—To add this statement to the configuration.

thresholds

Syntax

```
thresholds {
  clear clear-value;
  interval interval-value;
  set set-value;
  warning-clear warning-clear-value;
  warning-set warning-set-value;
}
```

Hierarchy Level [edit interfaces *interfaces-name* link-degrade-monitor]

Release Information Statement introduced in Junos OS Release 15.1.

Description Configure the BER threshold values (such as set and clear thresholds) at which different corrective actions must be triggered on a degraded interface.

Options **clear *clear-value***—The BER threshold value at which the degraded link is considered recovered and the corrective action applied to the interface is reverted. You can configure this value in the 1E-*n* format, where 1 is the mantissa (remains constant) and *n* is the exponent. For example, a threshold value of 1E-3 refers to the BER threshold value of 1×10^{-3} . The supported exponent range is 1 through 16, and the default value is 12.

interval *interval-value*—The number of consecutive link degrade events that are considered before any corrective action is taken. The supported value range for the interval is 1 through 256, and the default interval is 10.

set *set-value*—The BER threshold value at which the link is considered degraded and a corrective action, specified by the user, is triggered. You can configure this value in the 1E-*n* format, where 1 is the mantissa (remains constant) and *n* is the exponent. For example, a threshold value of 1E-3 refers to the BER threshold value of 1×10^{-3} . The supported exponent range is 1 through 16, and the default value is 7.

warning clear *warning-clear-value*—The link clear warning threshold. Every time this threshold value is reached, a system message is logged to indicate that the link degrade condition has been cleared on the interface. You can configure this value in the 1E-*n* format, where 1 is the mantissa (remains constant) and *n* is the exponent. For example, a threshold value of 1E-3 refers to the BER threshold value of 1×10^{-3} . The supported exponent range is 1 through 16, and the default value is 11.

warning set *warning-set-value*—The link degrade warning threshold. Every time this threshold value is reached, a system message is logged to indicate that a link degrade has occurred on the interface. You can configure this value in the 1E-*n* format, where 1 is the mantissa (remains constant) and *n* is the exponent. For example, a threshold value of 1E-3 refers to the BER threshold value of 1×10^{-3} . The supported exponent range is 1 through 16, and the default value is 9.

NOTE: The lower the BER with high confidence level, the longer it takes to estimate it. In such cases, a few packet drops might be noticed (based on the bit error distribution) before a link degrade event is detected.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

traceoptions

Syntax	<pre>traceoptions { file <i>filename</i> <files <i>number</i>> <size <i>maximum-file-size</i>> <world-readable no-world-readable>; flag <i>flag</i> <disable>; }</pre>
Hierarchy Level	[edit protocols lldp], [edit routing-instances <i>routing-instance-name</i> protocols lldp]
Release Information	Statement introduced in Junos OS Release 9.6.
Description	Set LLDP protocol-level tracing options.
Default	The default LLDP protocol-level trace options are inherited from the global traceoptions statement.
Options	<p>disable—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as all.</p> <p>file <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place spanning-tree protocol tracing output in the file <code>/var/log/stp-log</code>.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also specify a maximum file size with the size option.</p> <p>Range: 2 through 1000 files</p> <p>Default: 1 trace file only</p> <p>flag—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. The following are the LLDP-specific tracing options:</p> <ul style="list-style-type: none"> all—Trace all operations. config—Log configuration events. interface—Trace interface update events. protocol—Trace protocol information.

- **rtsock**—Trace socket events.
- **vlan**—Trace vlan update events.

The following are the global tracing options:

- **all**—All tracing operations.
- **config-internal**—Trace configuration internals.
- **general**—Trace general events.
- **normal**—All normal events. This is the default. If you do not specify this option, only unusual or abnormal operations are traced.
- **parse**—Trace configuration parsing.
- **policy**—Trace policy operations and actions.
- **regex-parse**—Trace regular-expression parsing.
- **route**—Trace routing table changes.
- **state**—Trace state transitions.
- **task**—Trace protocol task processing.
- **timer**—Trace protocol task timer processing.

no-world-readable—(Optional) Prevent any user from reading the log file. This is the default. If you do not include this option, tracing output is appended to an existing trace file.

size *maximum-file-size*—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file.0***. When the ***trace-file*** again reaches its maximum size, ***trace-file.0*** is renamed ***trace-file.1*** and ***trace-file*** is renamed ***trace-file.0***. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

Syntax: ***xk*** to specify KB, ***xm*** to specify MB, or ***xg*** to specify GB

Range: 10 KB through the maximum file size supported on your system

Default: 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege	routing—To view this statement in the configuration.
Level	routing-control—To add this statement to the configuration.

traceoptions (LACP)

Syntax	<pre> traceoptions { file <filename> <files number> <size size> <world-readable no-world-readable>; flag flag; no-remote-trace; } </pre>
Hierarchy Level	[edit protocols lacp]
Release Information	<p>Statement introduced in Junos OS Release 7.6.</p> <p>Statement introduced in Junos OS Release 15.1F4 for PTX Series routers.</p>
Description	Define tracing operations for the LACP protocol.
Default	If you do not include this statement, no LACP protocol tracing operations are performed.
Options	<p>filename—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log. By default, interface process tracing output is placed in the file lacpd.</p> <p>files number—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the size option.</p> <p>Range: 2 through 1000</p> <p>Default: 3 files</p> <p>flag—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:</p> <ul style="list-style-type: none"> • all—All LACP tracing operations • configuration—Configuration code • packet—Packets sent and received • process—LACP process events • protocol—LACP protocol state machine • routing-socket—Routing socket events • startup—Process startup events <p>no-world-readable—(Optional) Prevent any user from reading the log file.</p>

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option:

Syntax: **xk** to specify kilobytes, **xm** to specify megabytes, or **xg** to specify gigabytes

Range: 10 KB through the maximum file size supported on your router

Default: 1 MB

world-readable—(Optional) Allow any user to read the log file.

Required Privilege	interface—To view this statement in the configuration.
Level	interface-control—To add this statement to the configuration.

traceoptions (MACsec)

Syntax	<pre> traceoptions { file <i>filename</i> <files <i>number</i>> <size <i>size</i>> <world-readable no-world-readable>; flag <i>flag</i>; } </pre>
Hierarchy Level	[edit security macsec]
Release Information	<p>Statement introduced in Junos OS Release 15.1 for MIC-3D-20GE-SFP-E on MX Series routers.</p> <p>Statement introduced in Junos OS Release 16.1 for MPC7E-10G on MX Series routers.</p> <p>Statement introduced in Junos OS Release 17.3R2 for JNP-MIC1-MACSEC MIC on MX10003 routers.</p>
Description	<p>Define tracing operations at the MACsec level. Tracing operations provide support for debugging protocol-level issues. MACsec is an industry-standard security technology that provides secure communication for almost all types of traffic on Ethernet links. To specify more than one tracing operation, include multiple flag statements.</p> <p>The interfaces traceoptions statement does not support a separate trace file. The logging is done by the kernel, so the tracing information is placed in the syslog file in the directory /var/log/dcd.</p>
Default	If you do not include this statement, no tracing operations are performed.
Options	<p>file <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. By default, interface process tracing output is placed in the directory. If you do not specify the name of the trace file, all files are placed in the directory /var/log/dcd.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files. When a trace file named trace-file reaches the maximum value, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. Values range from 2 through 1000.</p> <p>flag <i>flag</i>—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. The following are the tracing operation options:</p> <p>all—Trace all operations.</p> <p>config—Trace configuration messages.</p> <p>debug—Trace debug messages.</p> <p>normal—Trace normal messages.</p>

no-world-readable—(Optional) Prevent any user from reading the log file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

world-readable—(Optional) Allow any user to read the log file.

Required Privilege	admin—To view this statement in the configuration.
Level	admin-control—To add this statement to the configuration.

traceoptions (MACsec interfaces)

Syntax	<pre> traceoptions { file <i>filename</i> <files <i>number</i>> <size <i>size</i>> <world-readable no-world-readable>; flag <i>flag</i>; } </pre>
Hierarchy Level	[edit security macsec interfaces <i>interface-name</i>]
Release Information	<p>Statement introduced in Junos OS Release 16.1 for MPC7E-10G on MX Series routers.</p> <p>Statement introduced in Junos OS Release 17.3R2 for JNP-MIC1-MACSEC MIC on MX10003 routers.</p>
Description	<p>Define tracing operations for individual MACsec interfaces. Tracing operations provide support for debugging protocol-level issues. MACsec is an industry-standard security technology that provides secure communication for almost all types of traffic on Ethernet links. To specify more than one tracing operation, include multiple flag statements.</p> <p>The interfaces traceoptions statement does not support a separate trace file. The logging is done by the kernel, so the tracing information is placed in the system syslog file in the directory /var/log/dcd.</p>
Default	If you do not include this statement, no tracing operations are performed.
Options	<p>file <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. By default, interface process tracing output is placed in the directory. If you do not specify the name of the tracefile, all files are placed in the directory /var/log/dcd.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files. When a trace file named trace-file reaches the maximum value, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. Values range from 2 through 1000.</p> <p>flag <i>flag</i>—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. The following are the tracing operation options:</p> <p>all—Trace all operations.</p> <p>keys—Trace key creation or generation information.</p> <p>mka-packets—Trace MACsec Key Agreement (MKA) protocol input and output packet information.</p> <p>normal—Trace all normal events and messages.</p> <p>state—Trace MKA protocol state information.</p>

to-secy—Trace MKA to security entity state change information.

no-world-readable—(Optional) Prevent any user from reading the log file.

size size—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

world-readable—(Optional) Allow any user to read the log file.

Required Privilege	admin—To view this statement in the configuration.
Level	admin-control—To add this statement to the configuration.

traceoptions (PPPoE)

Syntax	<pre> traceoptions { file <filename> <files number> <match regular-expression > <size maximum-file-size> <world-readable no-world-readable>; filter { aci regular-expression; ari regular-expression; service-name regular-expression; underlying-interface interface-name; } flag flag; level (all error info notice verbose warning); no-remote-trace; } </pre>
Hierarchy Level	[edit protocols pppoe]
Release Information	<p>Statement introduced in Junos OS Release 9.6.</p> <p>Option filter introduced in Junos OS Release 12.3</p>
Description	Define tracing operations for PPPoE processes.
Options	<p>file <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code>.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the size option.</p> <p>Range: 2 through 1000</p> <p>Default: 3 files</p> <p>disable—Disable this trace flag.</p> <p>filter—Additional filter to refine the output to display particular subscribers. Filtering based on the following subscriber identifiers simplifies troubleshooting in a scaled environment.</p> <hr/> <div>  <p>BEST PRACTICE: Due to the complexity of agent circuit identifiers and agent remote identifiers, we recommend that you do not try an exact match when filtering on these options. For service names, searching on the exact name is appropriate, but you can also use a regular expression with that option.</p> </div> <hr/> <ul style="list-style-type: none"> • aci <i>regular-expression</i>—Regular expression to match the agent circuit identifier provided by PPPoE client.

- **ari *regular-expression***—Regular expression to match the agent remote identifier provided by PPPoE client.
- **service *regular-expression***—Regular expression to match the name of PPPoE service.
- **underlying-interface *interface-name***—Name of a PPPoE underlying interface. You cannot use a regular expression for this filter option.

flag *flag*—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—Trace all operations.
- **config**—Trace configuration events.
- **events**—Trace events.
- **gres**—Trace GRES events.
- **init**—Trace initialization events.
- **interface-db**—Trace interface database operations.
- **memory**—Trace memory processing events.
- **protocol**—Trace protocol events.
- **rtsock**—Trace routing socket events.
- **session-db**—Trace connection events and flow.
- **signal**—Trace signal operations.
- **state**—Trace state handling events.
- **timer**—Trace timer processing.
- **ui**—Trace user interface processing.

level—Level of tracing to perform. You can specify any of the following levels:

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

Default: error

match *regular-expression*—(Optional) Refine the output to include lines that contain the regular expression.

no-remote-trace—Disable remote tracing.

no-world-readable—(Optional) Disable unrestricted file access.

size *maximum-file-size*—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

Syntax: *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

Range: 10240 through 1073741824

Default: 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege	trace—To view this statement in the configuration.
Level	trace-control—To add this statement to the configuration.

traceoptions (802.1X and Captive Portal for MX Series in Enhanced LAN Mode)

Syntax	<pre> traceoptions { file <i>filename</i> <files <i>number</i>> <size <i>size</i>> <world-readable no-world-readable> <match <i>regex</i>>; flag <i>flag</i>; } </pre>
Hierarchy Level	[edit protocols authentication-access-control]
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	Define tracing operations for the 802.1X protocol, LLDP, and captive portal authentication.
Default	Tracing operations are disabled.
Options	<p>file <i>filename</i>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory /var/log.</p> <p>files <i>number</i>—(Optional) Maximum number of trace files. When a trace file named trace-file reaches its maximum size, it is renamed trace-file.0, then trace-file.1, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size by using the size option.</p> <p>Range: 2 through 1000</p> <p>Default: 3 files</p> <p>flag <i>flag</i>—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:</p> <ul style="list-style-type: none"> • all—All tracing operations. • config-internal—Trace internal configuration operations. • dot1x-event—Trace 802.1x events. • dot1x-debug—Trace 802.1x events. • dot1x-ipc—Trace IPC interactions. • eapol—Trace EAPOL packets transmitted and received. • general—Trace general operations. • normal—Trace normal operations. • parse—Trace reading of the configuration. • regex-parse—Trace regular-expression parsing operations.

- **state**—Trace protocol state changes.
- **task**—Trace protocol task operations.
- **timer**—Trace protocol timer operations.
- **vlan**—Trace VLAN transactions.

match *regex*—(Optional) Refine the output to include lines that contain the regular expression.

no-world-readable—(Optional) Restrict file access to the user who created the file.

size *size*—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files with the **files** option, you also must specify a maximum file size.

Syntax: *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

Range: 10 KB through 1 GB

Default: 128 KB

world-readable—(Optional) Enable unrestricted file access.

Required Privilege Level	routing—To view this statement in the configuration.
	routing-control—To add this statement to the configuration.

transmit-delay

Syntax	<code>transmit-delay <i>seconds</i>;</code>
Hierarchy Level	[edit protocols lldp], [edit routing-instances <i>routing-instance-name</i> protocols lldp]
Release Information	Statement introduced in Junos OS Release 9.6.
Description	(MX Series and T Series routers only) Configure a delay between two successive LLDP advertisements.
Options	<i>seconds</i> —Delay between two successive LLDP advertisements. Default: 2 Range: 1 through 8192
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Configuring LLDP on page 376

transmit-interval (MACsec for MX Series)

Syntax	<code>transmit-interval <i>interval</i>;</code>
Hierarchy Level	<code>[edit security macsec connectivity-association <i>connectivity-association-name</i> mka]</code>
Release Information	Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.
Description	<p>Specifies the transmit interval for MACsec Key Agreement (MKA) protocol data units (PDUs).</p> <p>The MKA transmit interval setting sets the frequency for how often the MKA PDU is sent to the directly connected device to maintain MACsec on a point-to-point Ethernet link. A lower <i>interval</i> increases bandwidth overhead on the link; a higher <i>interval</i> optimizes the MKA protocol data unit exchange process.</p> <p>The transmit interval settings must be identical on both ends of the link when MACsec using static connectivity association key (CAK) security mode is enabled.</p> <p>We recommend increasing the interval to 6000 ms in high-traffic load environments.</p>
Default	The default transmit interval is 2000 milliseconds.
Options	<i>interval</i> —Specifies the transmit interval, in milliseconds.
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• <i>Configuring MACsec on MX Series Routers</i>

transmit-period

Syntax	<code>transmit-period <i>seconds</i>;</code>
Hierarchy Level	<code>[edit protocols dot1x authenticator interface <i>interface-id</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.3.
Description	Set the number of seconds the port waits before retransmitting the initial EAPOL PDUs to the client.
Options	<p><i>seconds</i>—The number of seconds the port waits before retransmitting the initial EAPOL PDUs to the client.</p> <p>Range: 1 through 65,535 seconds</p> <p>Default: 30 seconds</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> • IEEE 802.1x Port-Based Network Access Control Overview on page 35 • authenticator on page 1170 • dot1x on page 1209 • interface (IEEE 802.1x) on page 1293

transmit-period (MX Series in Enhanced LAN Mode)

Syntax	<code>transmit-period <i>seconds</i>;</code>
Hierarchy Level	<code>[edit protocols authentication-access-control interface (all [<i>interface-names</i>]) dot1x]</code>
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	For 802.1X authentication, how long the port waits before retransmitting the initial EAPOL PDUs to the supplicant.
Default	30 seconds
Options	<p><i>seconds</i>—Number of seconds the port waits before retransmitting the initial EAPOL PDUs to the supplicant.</p> <p>Range: 1 through 65,535 seconds</p> <p>Default: 30 seconds</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>

uac-policy (MX Series in Enhanced LAN Mode)

Syntax	uac-policy;
Hierarchy Level	[edit protocols authentication-access-control]
Release Information	Statement introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	Configure Junos Pulse Access Control Service as the access policy to authenticate and authorize users connected to the switch for admission to the network and for access to protected network resources.
Default	The Access Control Service access policy is disabled.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	

underlying-interface

Syntax	<code>underlying-interface <i>interface-name</i>;</code>
Hierarchy Level	<pre>[edit interfaces pp0 unit <i>logical-unit-number</i> pppoe-options], [edit interfaces demux0 unit <i>logical-unit-number</i> demux-options], [edit logical-systems <i>logical-system-name</i> interfaces demux0 unit <i>logical-unit-number</i> demux-options], [edit logical-systems <i>logical-system-name</i> interfaces pp0 unit <i>logical-unit-number</i> pppoe-options], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> interfaces demux0 unit <i>logical-unit-number</i> demux-options], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> interfaces pp0 unit <i>logical-unit-number</i> pppoe-options]</pre>
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Support for aggregated Ethernet added in Junos OS Release 9.4.</p>
Description	<p>Configure the interface on which PPP over Ethernet is running.</p> <p>For demux interfaces, configure the underlying interface on which the demultiplexing (demux) interface is running.</p>
Options	<p><i>interface-name</i>—Name of the interface on which PPP over Ethernet or demux is running. For example, at-0/0/1.0 (ATM VC), fe-1/0/1.0 (Fast Ethernet interface), ge-2/0/0.0 (Gigabit Ethernet interface), ae1.0 (for IP demux on an aggregated Ethernet interface), or ae1 (for VLAN demux on an aggregated Ethernet interface).</p>
<div>  <p>NOTE: Demux interfaces are currently supported on Gigabit Ethernet, Fast Ethernet, 10-Gigabit Ethernet interfaces, or aggregated Ethernet devices.</p> </div>

Hierarchy Level [edit interfaces *interface-name*],
[edit logical-systems *logical-system-name* interfaces *interface-name*],
[edit interfaces interface-set *interface-set-name* interface *interface-name*]

Release Information Statement introduced before Junos OS Release 7.4.
Range increased for static pseudowire interfaces to 1,073,741,823 in Junos OS Release 18.3R1.

Description Configure a logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

Options *logical-unit-number*—Number of the logical unit.
Range: 0 through 1,073,741,823 for demux, PPPoE, and pseudowire static interfaces. 0 through 16,385 for all other static interface types.
etree-ac-role (leaf | root)—To configure an interface as either leaf or root.
The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

unnumbered-address (Dynamic Profiles)

Syntax	<code>unnumbered-address <i>interface-name</i> <preferred-source-address <i>address</i>>;</code>
Hierarchy Level	<p>[edit dynamic-profiles <i>profile-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i>],</p> <p>[edit dynamic-profiles <i>profile-name</i> interfaces demux0 unit <i>logical-unit-number</i> family <i>family</i>]</p>
Release Information	<p>Statement introduced in Junos OS Release 9.2.</p> <p>Support for the <code>\$junos-preferred-source-address</code> and <code>\$junos-preferred-source-ipv6-address</code> predefined variables introduced in Junos OS Release 9.6.</p> <p>Support for the <code>\$junos-loopback-interface</code> predefined variable introduced in Junos OS Release 9.6.</p>
Description	<p>For Ethernet interfaces, enable the local address to be derived from the specified interface. Configuring unnumbered Ethernet interfaces enables IP processing on the interface without assigning an explicit IP address to the interface. To configure unnumbered address dynamically, include the <code>\$junos-loopback-interface-address</code> predefined variable.</p> <p>You can configure unnumbered address support on Ethernet interfaces for IPv4 and IPv6 address families.</p>
Options	<p><i>interface-name</i>—Name of the interface from which the local address is derived. The specified interface must have a logical unit number, a configured IP address, and must not be an unnumbered interface. This value can be a specific interface name or the <code>\$junos-loopback-interface</code> predefined variable.</p> <p>When defining the unnumbered-address statement using a static interface, keep the following in mind:</p> <ul style="list-style-type: none"> If you choose to include the routing-instance statement at the [edit dynamic-profiles] hierarchy level, that statement must be configured with a dynamic value by using the <code>\$junos-routing-instance</code> predefined variable. In addition, whatever static unnumbered interface you specify must belong to that routing instance; otherwise, the profile instantiation fails. If you choose to not include the routing-instance statement at the [edit dynamic-profiles] hierarchy level, the unnumbered-address statement uses the default routing instance. The use of the default routing instance requires that the unnumbered interface be configured statically and that it reside in the default routing instance.

NOTE: When you specify a static logical interface for the unnumbered interface in a dynamic profile that includes the `$junos-routing-instance` predefined variable, you must not configure a preferred source address, whether with the `$junos-preferred-source-address` predefined variable, the `$junos-preferred-source-ipv6-address` predefined variable, or the

preferred-source-address statement. Configuring the preferred source address in this circumstance causes a commit failure.

When defining the **unnumbered-address** statement using the **\$junos-loopback-interface** predefined variable, keep the following in mind:

- To use the **\$junos-loopback-interface** predefined variable, the dynamic profile must also contain the **routing-instance** statement configured with the **\$junos-routing-instance** predefined variable at the [edit dynamic-profiles] hierarchy level.
- The applied loopback interface is based on the dynamically obtained routing instance of the subscriber.

address—(Optional) Secondary IP address of the donor interface. Configuring the preferred source address enables you to use an IP address other than the primary IP address on some of the unnumbered Ethernet interfaces in your network. This value can be a static IP address, the **\$junos-preferred-source-address** predefined variable for the inet family, or the **\$junos-preferred-source-ipv6-address** predefined variable for the inet6 family.

When defining the **preferred-source-address** value using a static IP address, keep the following in mind:

- The unnumbered interface must be statically configured.
- The IP address specified as the **preferred-source-address** must be configured in the specified unnumbered interface.

When defining the **preferred-source-address** value using the **\$junos-preferred-source-address** or the **\$junos-preferred-source-ipv6-address** predefined variables, keep the following in mind:

- You must configure the **unnumbered-address** statement using the **\$junos-loopback-interface** predefined variable.
- You must configure the **routing-instance** statement using the **\$junos-routing-instance** predefined variable at the [edit dynamic-profiles] hierarchy level.
- The preferred source address chosen is based on the dynamically applied loopback address which is in turn derived from the dynamically obtained routing instance of the subscriber. The configured loopback address with the closest network match to the user IP address is selected as the preferred source address.

Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 8.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 9.2 for EX Series switches VLAN tagging and Layer 3 subinterfaces.</p> <p>Support for Layer 2 trunk ports added in Junos OS Release 9.2.</p> <p>Support for SRX 5600, and SRX 5800 devices added in Junos OS Release 9.6.</p> <p>Support for logical systems added in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>

Description For VLANs, specify a VLAN identifier (VID) to include in the packets sent to and from the VLAN, or a VPLS routing instance.

NOTE: When configuring a VLAN identifier for provider backbone bridge (PBB) routing instances, dual-tagged VIDs and the none option are not permitted.

For 802.1Q tagging, configure an 802.1Q tag to apply to all traffic that originates on the VLAN.

The number zero is reserved for priority tagging and the number 4095 is also reserved.

For VLAN ID to Rewrite Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2, 10-Gigabit Ethernet LAN/WAN PIC, and IQ2-E interfaces and aggregated Ethernet using Gigabit Ethernet IQ interfaces, specify the line VLAN identifiers to be rewritten at the input or output interface.

You cannot include the **vlan-id** statement with the **swap** statement, **swap-push** statement, **push-push** statement, or **push-swap** statement at the **[edit interfaces *interface-name* unit *logical-unit-number* output-vlan-map]** hierarchy level. If you include any of those statements in the output VLAN map, the VLAN ID in the outgoing frame is rewritten to the **vlan-id** statement that you include at the **[edit interfaces *interface-name* unit *logical-unit-number*]** hierarchy level.

Default For 802.1Q Tagging on EX Series and SRX Series, If you use the default factory configuration, all traffic originating on the VLAN is untagged and has a VLAN identifier of 1.

For VLANs on a QFX3500 and QFX3500 switch, if you use the default factory configuration, all traffic originating on the VLAN is untagged and has a VLAN identifier of 1. The number zero is reserved for priority tagging and the number 4093 is also reserved.

On a QFX5100 switch, if you use the default factory configuration, all traffic originating on the VLAN is untagged and has a VLAN identifier of 1. The number zero is reserved for priority tagging and the number 4093 is also reserved.

NOTE: You can only create up to 4090 VLANs on a QFX5100 switch. If you create more than 4090 VLANs, the interfaces associated with the extra VLANs are not displayed in the `show vlans` command output. For example, if you create 4094 VLANs, the extra VLANs will not have interfaces associated with the VLANs. The order in which you configure the extra VLANs determines which interfaces are missing from the `show vlans` command output.

For VLAN tagging and Layer 3 subinterfaces, bind an 802.1Q VLAN tag ID to a logical interface.

NOTE: The VLAN tag ID cannot be configured on logical interface unit 0. The logical unit number must be 1 or higher.

Options For VLANs:

number—A valid VLAN identifier. If you configure multiple VLANs with a valid VLAN identifier, you must specify a unique VLAN identifier for each. However, you can use the same VLAN identifier for VLANs that belong to different virtual switches. Use this option to send single tagged frames with the specified VLAN identifier over VPLS VT interfaces.

NOTE: If you specify a VLAN identifier, you cannot also use the **all** option. They are mutually exclusive.

all—Specify that the VLAN spans all the VLAN identifiers configured on the member logical interfaces.

NOTE: You cannot specify the **all** option if you include a routing interface in the VLAN.

none—Specify to enable shared VLAN learning or to send untagged frames over VPLS VT interfaces.

NOTE: Multichassis link aggregation (MC-LAG) does not support the **none** option with the **vlan-id** statement with VLANs.

For 802.1Q Tagging:

number —VLAN tag identifier

Range:

- 1 through 4094 (all switches except EX8200 Virtual Chassis)
- 1 through 4092 (EX8200 Virtual Chassis only)

Default: 1

Required Privilege Level

vlan-id-list (Ethernet VLAN Circuit)

Syntax	<code>vlan-id-list [<i>vlan-id</i> <i>vlan-id</i>–<i>vlan-id</i>];</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.5.
Description	Binds a single-tag logical interface to a list of VLAN IDs. Configures a logical interface to receive and forward any tag frame whose VLAN ID tag matches the list of VLAN IDs you specify.

NOTE:

When you create a circuit cross-connect (CCC) using VLAN-bundled single-tag logical interfaces on Layer 2 VPN routing instances, the circuit automatically uses ethernet encapsulation. For Layer 2 VPN, you need to include the `encapsulation-type` statement and specify the value `ethernet` at either of the following hierarchy levels:

- `[edit routing-instances routing-instance-name protocols l2vpn]`
- `[edit logical-systems logical-system-name routing-instances routing-instance-name protocols l2vpn]`

For more information about the `encapsulation-type` configuration statement and the Layer 2 encapsulation types `ethernet` and `ethernet-vlan`, see the *Junos OS VPNs Library for Routing Devices*.

Options `[vlan-id vlan-id–vlan-id]`—A list of valid VLAN ID numbers. Specify the VLAN IDs individually by using a space to separate each ID, as an inclusive list by separating the starting VLAN ID and ending VLAN ID with a hyphen, or as a combination of both.

Range: 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

NOTE: Configuring `vlan-id-list` with the entire `vlan-id` range is an unnecessary waste of system resources and is not best practice. It should be used only when a subset of VLAN IDs (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1-4094), it has the same result as not specifying a range; however, it consumes PFE resources such as VLAN lookup tables entries, and so on.

The following examples illustrate this further:

```
[edit interfaces interface-name]
vlan-tagging;
unit number {
    vlan-id-range 1-4094;
}
```

```
[edit interfaces interface-name]
unit 0;
```

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

SRX Series Interfaces	[edit interfaces <i>interface</i>]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 9.5. Statement introduced in Junos OS Release 11.3 for the QFX Series. Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers. Statement introduced in Junos OS Release 13.2 for PTX Series Routers. Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series.
Description	For Fast Ethernet and Gigabit Ethernet interfaces, aggregated Ethernet interfaces configured for VPLS, and pseudowire subscriber interfaces, enable the reception and transmission of 802.1Q VLAN-tagged frames on the interface.

NOTE: For QFX Series configure VLAN identifier for untagged packets received on the physical interface of a trunk mode interface. Enable VLAN tagging. The platform receives and forwards single-tag frames with 802.1Q VLAN tags.

On EX Series switches except for EX4300 and EX9200 switches, the `vlan-tagging` and `family ethernet-switching` statements cannot be configured on the same interface. Interfaces on EX2200, EX3200, EX3300, EX4200, and EX4500 switches are set to `family ethernet-switching` by the default factory configuration. EX6200 and EX8200 switch interfaces do not have a default family setting.

Default VLAN tagging is disabled by default.

Options **native-vlan-id**— (SRX Series) Configures a VLAN identifier for untagged packets. Enter a number from 0 through 4094.

NOTE: The **native-vlan-id** can be configured only when either **flexible-vlan-tagging mode** or **interface-mode trunk** is configured.

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

vlan-tags

Syntax	<code>vlan-tags outer [<i>tpid</i>].<i>vlan-id</i> [inner [<i>tpid</i>].<i>vlan-id</i>];</code>
Hierarchy Level	<code>[edit dynamic-profiles <i>profile-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i>]</code>
Release Information	Statement introduced in Junos OS Release 9.5. VLAN demux interface support introduced in Junos OS Release 10.2.
Description	For Gigabit Ethernet IQ and IQE interfaces only, binds TPIDs and 802.1Q VLAN tag IDs to a logical interface. You must include the stacked-vlan-tagging statement at the <code>[edit interfaces <i>interface-name</i>]</code> hierarchy level.
<div>  <p>NOTE: The inner-range <i>vid1–vid2</i> option is supported on IQE PICs only.</p> </div>	
Options	<code>inner [<i>tpid</i>].<i>vlan-id</i></code> —A TPID (optional) and a valid VLAN identifier in the format <i>tpid.vlan-id</i> . When used in the dynamic-profiles hierarchy, specify the <code>\$junos-vlan-id</code> predefined variable to dynamically obtain the VLAN ID.
<div>  <p>NOTE: On the network-to-network (NNI) or egress interfaces of provider edge (PE) routers, you cannot configure the inner-range <i>tpid. vid1–vid2</i> option with the <code>vlan-tags</code> statement for ISP-facing interfaces.</p> </div>	
<p>Range: For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.</p> <p><code>outer [<i>tpid</i>].<i>vlan-id</i></code>—A TPID (optional) and a valid VLAN identifier in the format <i>tpid.vlan-id</i>. When used in the dynamic-profiles hierarchy, specify the <code>\$junos-stacked-vlan-id</code> predefined variable.</p> <p>Range: For VLAN ID, 1 through 511 for normal interfaces, and 512 through 4094 for VLAN CCC interfaces. VLAN ID 0 is reserved for tagging the priority of frames.</p>	
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"> • Configuring Dual VLAN Tags on page 637

vlan-tags (Dual-Tagged Logical Interface)

Syntax	<code>vlan-tags inner-list [vlan-id vlan-id–vlan-id] outer <tpid.>vlan-id;</code>
Hierarchy Level	<code>[edit interfaces interface-name unit logical-unit-number],</code> <code>[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number]</code>
Release Information	Statement introduced in Junos OS Release 9.5.
Description	(MX Series routers only) Binds a dual-tag logical interface to a list of VLAN IDs. Configures the logical interface to receive and forward any dual-tag frame whose inner VLAN ID tag matches the list of VLAN IDs you specify.

NOTE:

To create a circuit cross-connect (CCC) using VLAN-bundled dual-tag logical interfaces on Layer 2 VPN routing instances, you must include the `encapsulation-type` statement and specify the value `ethernet-vlan` at the one of the following hierarchy levels:

- `[edit routing-instances routing-instance-name protocols l2vpn]`
- `[edit logical-systems logical-system-name routing-instances routing-instance-name protocols l2vpn]`

For more information about the `encapsulation-type` configuration statement and the Layer 2 encapsulation types `ethernet` and `ethernet-vlan`, see the *Junos OS VPNs Library for Routing Devices*.

Options `inner-list [vlan-id vlan-id vlan-id–vlan-id]`—A list of valid VLAN ID numbers. Specify the VLAN IDs individually by using a space to separate each ID, as an inclusive list by separating the starting VLAN ID and ending VLAN ID with a hyphen, or as a combination of both.

Range: 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

`outer <tpid.>vlan-id`—An optional Tag Protocol ID (TPID) and a valid VLAN ID.

Range: For TPID, specify a hexadecimal value in the format `0xnnnn`.

Range: For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

NOTE: Configuring `inner-list` with the entire `vlan-id` range is an unnecessary waste of system resources and is not best practice. It should be used only when a subset of VLAN IDs of inner tag (not the entire range) needs to be associated with a logical interface. If you specify the entire range (1 through

4094), it has the same result as not specifying a range; however, it consumes PFE resources such as VLAN lookup tables entries, and so on.

The following examples illustrate this further:

```
[edit interfaces interface-name]
vlan-tagging;
unit number {
    vlan-tags outer vid inner-list 1-4094;
}
```

```
[edit interfaces interface-name]
vlan-tagging;
unit number {
    vlan-id vid;
}
```

Required Privilege	interface—To view this statement in the configuration.
Level	interface-control—To add this statement to the configuration.

------------------------------	--

vlan-tags (Stacked VLAN Tags)

Syntax	<code>vlan-tags inner <i>tpid.vlan-id</i> inner-list <i>value</i> inner-range <i>vid1—vid2</i> outer <i>tpid.vlan-id</i>;</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i>]</code>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.
Description	Bind TPIDs and 802.1Q VLAN tag IDs to a logical interface. TPID fields are used to identify the frame as an IEEE 802.1Q-tagged frame.
Options	<p>inner <i>tpid.vlan-id</i>—A TPID and a valid VLAN identifier. TPID is a 16-bit field set to a value of 0x8100 in order to identify the frame as an IEEE 802.1Q-tagged frame.</p> <p>Range: (most routers) For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames. For PTX Series, VLAN ID 0 is not supported.</p> <p>inner-list <i>value</i>— List or a set of VLAN identifiers.</p>

NOTE: This is supported on MX Series routers with Trio-based FPCs.

inner-range *tpid. vid1—vid2*—Specify a TPID and a range of VLAN IDs where vid1 is the start of the range and vid2 is the end of the range.

NOTE: On the network-to-network (NNI) or egress interfaces of provider edge (PE) routers, you cannot configure the inner-range *tpid. vid1—vid2* option with the `vlan-tags` statement for ISP-facing interfaces.

Range: For VLAN ID, 1 through 4094. VLAN ID 0 is reserved for tagging the priority of frames.

outer *tpid.vlan-id*—A TPID and a valid VLAN identifier.

Range: (most routers) For VLAN ID, 1 through 511 for normal interfaces, and 512 through 4094 for VLAN CCC interfaces. VLAN ID 0 is reserved for tagging the priority of frames. For PTX Series, VLAN ID 0 is not supported.

NOTE: Configuring inner-range with the entire `vlan-id` range consumes system resources and is not a best practice. The inner-range must be used only when a subset of VLAN IDs of inner tag (not the entire range) needs to be associated

with a logical interface. If you specify the entire range (1 through 4094), it has the same result as not specifying a range; however, it consumes Packet Forwarding Engine resources such as VLAN lookup table entries, and so on.

The following examples illustrate this further:

```
[edit interfaces interface-name]
stacked-vlan-tagging;
unit number {
    vlan-tags outer vid inner-range 1-4094;
}
```

```
[edit interfaces interface-name]
vlan-tagging;
unit number {
    vlan-id vid;
}
```

Required Privilege	interface—To view this statement in the configuration.
Level	interface-control—To add this statement to the configuration.

------------------------------	---

wait-to-block-interval

Syntax	<code>wait-to-block-interval <i>number</i>;</code>
Hierarchy Level	[edit protocols protection-group ethernet-ring <i>ring-name</i>]
Release Information	Statement introduced in Junos OS Release 14.2.
Description	Enable the Wait to Block (WTB) timer interval when clearing force switch and manual switch commands.
Options	<i>number</i> —Wait-to-block interval, in seconds. Range: 5 through 10 s Default: 5 s
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none">• Ethernet Ring Protection Switching Overview on page 227• Configuring Ethernet Ring Protection Switching on Switches (CLI Procedure) on page 236

west-interface

Syntax

```
west-interface {
  node-id mac-address;
  control-channel channel-name {
    vlan number;
    interface name interface-name
  }
  interface-none
  ring-protection-link-end;
  virtual-control-channel {
    west-interface name;
    east-interface name;
  }
}
```

Hierarchy Level [edit protocols [protection-group ethernet-ring ring-name](#)]

Release Information Statement introduced in Junos OS Release 9.5.
Statement introduced in Junos OS Release 12.1 for EX Series switches.
Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.

Description Define one of the two interface ports for Ethernet ring protection, the other being defined by the **east-interface** statement at the same hierarchy level. The interface must use the control channel's logical interface name. The control channel is a dedicated VLAN channel for the ring port.

NOTE: Always configure this port second, after configuring the **east-interface** statement.

The remaining statements are explained separately. See [CLI Explorer](#).

Required Privilege Level interface—To view this statement in the configuration.
interface-control—To add this statement to the configuration.

clear interfaces interface-set statistics

Syntax	<code>clear interfaces interface-set statistics <i>interface-set-name</i></code>
Release Information	Command introduced in Junos OS Release 8.5.
Description	Set interface set statistics to zero.
Options	<i>interface-set-name</i> —Set statistics on a specified interface set to zero. Wildcard values can be used in the interface set name. This command will not clear the statistics of the member logical interfaces.
Required Privilege Level	clear
List of Sample Output	clear interfaces interface-set statistics on page 1564
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear interfaces interface-set statistics

```
user@host> clear interfaces interface-set statistics
```

clear interfaces interval

Syntax	<code>clear interfaces interval <i>interface-name</i></code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Clear the channel service unit (CSU) alarm and defect counters so that only the current time interval is displayed. This operation affects the show interface interval command, but not an SNMP query.
Options	<i>interface-name</i> —Name of a particular interface.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none"> • show interfaces interval on page 2112

clear interfaces aeX forwarding-options load-balance state

Syntax	<code>clear interfaces aeX unit <i>logical-unit-number</i> aggregate forwarding-options load-balance state</code>
Release Information	Command introduced in Junos OS Release 13.2R1.
Description	<p>Clear the specified aggregate Ethernet interface load balancing state and re-create it newly. If the traffic flows become aged frequently, then the device needs to remove or refresh the load balancing states. As a result, you must configure rebalancing or run the clear command at periodic intervals for proper load-balancing. Otherwise, traffic skewing can occur.</p> <p>If you observe load distribution to be not very effective, you can clear the load-balancing states or use rebalancing functionality to cause an automatic clearance of the hardware states. When you configure the rebalancing facility, traffic flows can get redirected to different links, which can cause packet reordering.</p>
Options	<p>aeX—Name of a particular aggregated Ethernet interface.</p> <p><i>logical-unit-number</i>—Number of the logical unit of the interface.</p> <p>forwarding-options load-balance state—Cause the load-balancing state to be cleared for the specific interface.</p>
Required Privilege Level	clear

maintenance-domain md5 maintenance-association ma5 local-mep 100 remote-mep 102
Continuity measurement restarted.
```

clear oam ethernet connectivity-fault-management linktrace path-database

Syntax	<code>clear oam ethernet connectivity-fault-management linktrace path-database mac-address maintenance-association <i>ma-name</i> maintenance-domain <i>md-name</i></code>
Release Information	Command introduced in Junos OS Release 9.0.
Description	Clear all the linktrace entries and the relevant path information from the database for a particular remote host on M320, MX Series, T320, and T640 routers.
Options	<p>mac-address—Clear connectivity fault management path database information for the specified MAC address of the remote host.</p> <p>maintenance-association <i>ma-name</i>—Clear connectivity fault management path database information for the specified maintenance association.</p> <p>maintenance-domain <i>md-name</i>—Clear connectivity fault management path database information for the specified maintenance domain.</p>
Required Privilege Level	view

Sample Output

clear oam ethernet connectivity-fault-management linktrace path-database

```
user@host> clear oam ethernet connectivity-fault-management linktrace path-database maintenance-domain md1 maintenance-association ma3 00058573e483
```

This command produces no output.

clear oam ethernet connectivity-fault-management loss-statistics

Syntax	<code>clear oam ethernet connectivity-fault-management loss-statistics</code> <code><interface <i>ethernet-interface-name</i>></code> <code><level <i>md-level</i>></code>
Release Information	Command introduced in Junos OS Release 11.1.
Description	<p>For all routers that support IEEE 802.1ag OAM connectivity fault management (CFM), clear all loss statistics maintained by CFM for a given maintenance domain and maintenance association.</p> <p>In addition, for Ethernet interfaces on MX Series routers, clear any ITU-T Y.1731 Ethernet frame loss measurement (ETH-LM) statistics.</p> <p>By default, the command clears ETH-LM statistics for CFM maintenance association end points (MEPs) attached to any interface on the router.</p>
Options	<p><code>interface <i>ethernet-interface-name</i></code>—(Optional) Clear ETH-LM statistics and ETH-LM frame counts only for MEPs attached to the specified Ethernet physical interface.</p> <p><code>level <i>md-level</i></code>—(Optional) Clear ETH-LM statistics and ETH-LM frame counts only for MEPs within CFM maintenance domains (MDs) of the specified level.</p>

Cleared link-fault-management statistics for all interfaces
```

clear protection-group ethernet-ring statistics

Syntax	<code>clear protection-group ethernet-ring statistics</code> <code><group-name group-name></code>
Release Information	Command introduced in Junos OS Release 9.4.
Description	On MX Series routers, clear the statistics for all Ethernet ring protection groups or a specific Ethernet ring protection group.
Options	group-name group-name —(Optional) Clear the Ethernet ring protection statistics for the specified group.
Required Privilege Level	view
List of Sample Output	clear protection-group ethernet-ring statistics on page 1582 clear protection-group ethernet-ring statistics on page 1582
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear protection-group ethernet-ring statistics

To clear all Ethernet ring protection group statistics for all protection groups, use the following command:

```
user@host> clear protection-group ethernet-ring statistics
```

Sample Output

clear protection-group ethernet-ring statistics

To clear Ethernet ring protection group statistics for the group *my_prot_group*, use the following command:

```
user@host> clear protection-group ethernet-ring statistics group-name my_prot_group
```

clear security mka statistics (MX Series)

Syntax clear security mka statistics
 <interface *interface-name*>

Release Information Command introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description Clear—reset to zero (0)—all MACsec Key Agreement (MKA) protocol statistics.

 You are clearing the statistics that are viewed using the **show security mka statistics** when you enter this command.

Options **none**—Clear all MKA counters for all interfaces on the switch.

 interface *interface-name*—(Optional) Clear MKA traffic counters for the specified interface only.

Required Privilege Level clear

Sample Output

clear security mka statistics

```
user@switch> clear security mka statistics
```

clear security mka statistics (MX Series)

Syntax `clear security mka statistics`
 `<interface interface-name>`

Release Information Command introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

Description Clear—reset to zero (0)—all MACsec Key Agreement (MKA) protocol statistics.

You are clearing the statistics that are viewed using the **show security mka statistics** when you enter this command.

Options **none**—Clear all MKA counters for all interfaces on the switch.

interface *interface-name*—(Optional) Clear MKA traffic counters for the specified interface only.

Sample Output

clear security mka statistics

```
user@switch> clear security mka statistics
```

monitor ethernet delay-measurement

Syntax monitor ethernet delay-measurement
 maintenance-domain *md-name*
 maintenance-association *ma-name*
 (one-way | two-way)
 (*remote-mac-address* | mep *remote-mep-id*)
 <count *frame-count*>
 <local-mep *mep-id*>
 <wait *interval-seconds*>
 <priority *802.1p value*>
 <size>
 <no-session-id-tlv>
 <xml>

Release Information Command introduced in Junos OS Release 9.5.
local-mep option introduced in Junos OS Release 15.1.

Description Start an ITU-T Y.1731 Ethernet frame delay measurement session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. Frame delay measurement statistics are stored at one of the MEPs for later retrieval.

NOTE: If you attempt to monitor delays to a nonexistent MAC address, you must type Ctrl +c to explicitly quit the **monitor ethernet delay-measurement** command and return to the CLI command prompt.

To start an Ethernet frame delay measurement session, the router initiates an exchange of frames carrying one-way or two-way frame delay measurement protocol data units (PDUs) between the local and remote MEPs. The frame counts—the types of and number of Ethernet frame delay measurement PDU frames exchanged to measure frame delay times—are displayed as the runtime output of the **monitor ethernet delay-measurement** command and are also stored at both the initiator and receiver MEPs for later retrieval. Ethernet frame delay measurement statistics, described below, are measured and stored at only one of the MEPs:

Frame delay—The difference, in microseconds, between the time a frame is sent and when it is received.

Frame delay variation—The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet frame delay measurement, only the initiator MEP (on the local system) collects statistics.

- Options**
- maintenance-domain *md-name***—Name of an existing CFM maintenance domain.
 - maintenance-association *ma-name***—Name of an existing CFM maintenance association.
 - one-way**—Measurement type is one-way Ethernet frame delay measurement, which is based on the difference between the time at which the initiator MEP sends a one-way delay measurement request (IDM) frame and the time at which the receiver MEP receives the frame.
 - two-way**—Measurement type is two-way Ethernet frame delay measurement, which is based on the difference between the time at which the initiator MEP sends a two-way delay measurement message (DMM) frame and the time at which the initiator MEP receives an associated two-way delay measurement reply (DMR) frame from the responder MEP, subtracting the time elapsed at the responder MEP.
 - mep *remote-mep-id***—Numeric identifier of the peer MEP with which to perform Ethernet frame delay measurement. The discovered MAC address of the peer MEP is used. The range of values is 1 through 8191.
 - remote-mac-address**—Unicast MAC address of the peer MEP with which to perform Ethernet frame delay measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, **0011.2233.4455** or **00:11:22:33:44:55**. Multicast MAC addresses are not supported.
 - count *frame-count***—(Optional) Number of frames to send to the specified peer MEP. The range of values is 1 through 65,535 frames. The default value is 10 frames.
 - local-mep *mep-id***—(Required when multiple MEPs are configured) Identifier for the local maintenance association end point.
 - wait *interval-seconds***—(Optional) Number of seconds to wait between sending frames. The range of values is from 1 through 255 seconds. The default value is 1 second.
 - priority *802.1p value***—(Optional) Priority of the delay measurement request frame supported by both one-way delay measurement and two-way delay measurement. The range of values is from 0 through 7. The default value is zero.
 - size**—(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.
 - no-session-id-tlv**—(Optional) Prevent insertion of the session ID TLV in the request frame.
 - xml**—(Optional) Allow the output of the command to be displayed in XML format supported by both one-way delay measurement and two-way delay measurement. Note that the only way to get output in XML format is to use the **xml** argument. The **display xml** command does not work.

Additional Information To display the frame counts collected at an MEP as the result of this command, see the following command descriptions in the [CLI Explorer](#):

- **show oam ethernet connectivity-fault-management interfaces detail**
- **show oam ethernet connectivity-fault-management mep-database**
- **show oam ethernet connectivity-fault-management mep-statistics**

To display the statistics collected at an MEP as the result of this command, see the following command descriptions in the [CLI Explorer](#).

- **show oam ethernet connectivity-fault-management delay-statistics**
- **show oam ethernet connectivity-fault-management mep-statistics**

To clear both the frame counts and the statistics collected for MEPs, use the **clear oam ethernet connectivity-fault-management statistics** command, described in the [CLI Explorer](#).

For a complete description of Ethernet frame delay measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.

Required Privilege Level trace and maintenance

List of Sample Output [monitor ethernet delay-measurement one-way on page 1588](#)
[monitor ethernet delay-measurement two-way on page 1589](#)
[monitor ethernet delay-measurement two-way \(Invalid DMR Frames Received\) on page 1589](#)

Output Fields The **monitor ethernet delay-measurement** command displays different output at the CLI, depending on whether you start a one-way or two-way frame delay measurement:

- [Table 109 on page 1587](#) lists the run-time output fields for the **monitor ethernet delay-measurement one-way** command.
- [Table 110 on page 1588](#) lists the run-time output fields for the **monitor ethernet delay-measurement two-way** command.

Output fields are listed in the approximate order in which they appear.

Table 109: monitor ethernet delay-measurement one-way Output Fields

Output Field Name	Output Field Description
One-way ETH-DM request to	Unicast MAC address of the remote peer MEP.
Interface	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.
1DM Frames sent	PDU frames sent to the remote MEP in this ETH-DM session.
Packets transmitted	Total number of 1DM PDU frames sent to the remote MEP during this measurement session.

Table 109: monitor ethernet delay-measurement one-way Output Fields (continued)

Output Field Name	Output Field Description
Average delay	Average two-way frame delay measured in this session.
Average delay variation	Average frame jitter measured in this session.
Best case delay	Lowest two-way frame delay measured in this session.
Worst case delay	Highest two-way frame delay measured in this session.

NOTE: For one-way delay measurement, these CLI output fields display **NA** ("not applicable") at the initiator MEP because one-way frame delay measurements occur at the receiver MEP.

Table 110: monitor ethernet delay-measurement two-way Output Fields

Output Field Name	Output Field Description
Two-way Ethernet frame delay measurement request to	Unicast MAC address of the remote peer MEP.
Interface	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.
DMR received from	Unicast MAC address of the remote MEP that transmitted this DMR frame in response to a DMM frame.
Delay	Two-way delay, in microseconds, for the initiator-transmitted DMM frame.
Delay variation	Difference, in microseconds, between the current and previous delay values. This is also known as frame jitter.
Packets transmitted	Total number of DMM PDU frames sent to the remote MEP in this measurement session.
Valid packets received	Total number of DMR PDU frames received from the remote MEP in this measurement session.
Average delay	Average two-way frame delay measured in this session.
Average delay variation	Average frame jitter measured in this session.
Best case delay	Lowest two-way frame delay measured in this session.
Worst case delay	Highest two-way frame delay measured in this session.

```

monitor ethernet loss-measurement

Syntax

```
monitor ethernet loss-measurement
maintenance-domain md-name
maintenance-association ma-name
(remote-mac-address | mep remote-mep-id)
<count frame-count>
<local-mep mep-id>
<wait interval-seconds>
<priority 802.1p value>
<no-session-id-tlv>
<xml>
```

Release Information Command introduced in Junos OS Release 11.1.
local-mep option introduced in Junos OS Release 15.1

Description Start an ITU-T Y.1731 Ethernet frame loss measurement session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a count of transmitted and received data frames between the pair of MEPs. Frame loss measurement statistics are stored at one of the MEPs for later retrieval. For MX Series routers, supports point-to-point down MEPs for Ethernet interfaces (as per IEEE 802.1ag over VPWS).

NOTE: If you attempt to monitor loss to a nonexistent MAC address, you must type Ctrl + c to explicitly quit the **monitor ethernet loss-measurement** command and return to the CLI command prompt.

To start an Ethernet frame loss measurement session, the router first sends frames with ETH-LM information to a peer MEP and similarly receives frames with ETH-LM information from the peer MEP. Frame loss is calculated by collecting the counter values applicable for ingress and egress service frames where the counters maintain a count of transmitted and received data frames between a pair of MEPs. The loss measurement statistics are retrieved as the output of the **monitor ethernet loss-measurement** command and are also stored at the initiator. The frames counts are stored at both the initiator and the receiver MEPs for later retrieval.

Options

- maintenance-domain *md-name***—Name of an existing CFM maintenance domain.
- maintenance-association *ma-name***—Name of an existing CFM maintenance association.
- mep *remote-mep-id***—Numeric identifier of the peer MEP with which to perform Ethernet frame loss measurement. The discovered MAC address of the peer MEP is used. The range of values is from 1 through 8192.
- remote-mac-address***—Unicast MAC address of the peer MEP with which to perform Ethernet frame loss measurement. Specify the MAC address as six hexadecimal

bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn* (for example, **0011.2233.4455** or **00:11:22:33:44:55**). Multicast MAC addresses are not supported.

count *frame-count*—(Optional) Number of frames to send to the specified peer MEP. The range of values is from 1 through 65535 frames. The default value is 10 frames.

local-mep *mep-id*—(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.

wait *interval-seconds*—(Optional) Number of seconds to wait between sending frames. The range of values is from 1 through 255 seconds. The default value is 1 second.

priority *802.1p value*—(Optional) Priority of the delay measurement request frame. The range of values is from 0 through 7. The default value is 1 second.

no-session-id-tlv—(Optional) Disable the **session id TLV** argument set in the request frame.

xml—(Optional) Allow the output of the command to be displayed in XML format.

Additional Information To display the iterator output for an LM session, run the following command:

- **show oam ethernet connectivity-fault-management sla-iterator-statistics sla-iterator <profile> maintenance-association <MA> maintenance-domain <MD> local-mep <MEP> remote-mep <RMEP>**

To display the frame counts collected at an MEP as the result of this command, see the following command descriptions in the [CLI Explorer](#):

- **show oam ethernet connectivity-fault-management loss-statistics**
- **show oam ethernet connectivity-fault-management interfaces detail**
- **show oam ethernet connectivity-fault-management mep-database**
- **show oam ethernet connectivity-fault-management mep-statistics**

To display the statistics collected at an MEP as the result of this command, see the following command descriptions in the [CLI Explorer](#):

- **show oam ethernet connectivity-fault-management delay-statistics**
- **show oam ethernet connectivity-fault-management mep-statistics**

To clear both the frame counts and the statistics collected for MEPs, use the **clear oam ethernet connectivity-fault-management loss-statistics maintenance-domain *md-name* maintenance-association *ma-name*** command, as described in the [CLI Explorer](#).

For a complete description of Ethernet frame loss measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.

Table 111: monitor ethernet loss-measurement output fields

Output Field Name	Output Field Description
Ethernet loss delay measurement request to	Unicast MAC address of the remote peer MEP.
Interface	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.
LMR received from	Unicast MAC address of the remote MEP that transmitted this LMR frame in response to a loss measurement message (LMM) frame.
Near-end frame loss	Count of frame loss associated with ingress data frames.
Far-end frame loss	Count of frame loss associated with egress data frames.
Near-end loss ratio	Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the ingress interface.
Far-end loss ratio	Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the egress interface.
LMM packets transmitted	Total number of LMM PDU frames sent to the remote MEP in this measurement session.
LMR packets received	Total number of LMR PDU frames received from the remote MEP in this measurement session.
Average near-end frame loss	Average frame loss measured in this session associated with ingress data frames.
Average near-end loss ratio	Average frame loss ratio measured in this session associated with ingress data frames.
Average far-end frame loss	Average frame loss measured in this session associated with egress data frames.
Average far-end loss ratio	Average frame loss ratio measured in this session associated with egress data frames.
Near-end best case frame loss	Lowest frame loss measured in this session associated with ingress data frames.

Table 111: monitor ethernet loss-measurement output fields (continued)

Output Field Name	Output Field Description
Near-end best case loss ratio	Lowest frame loss ratio measured in this session associated with ingress data frames.
Near-end worst case frame loss	Highest frame loss measured in this session associated with ingress data frames.
Near-end worst case loss ratio	Highest frame loss ratio measured in this session associated with ingress data frames.
Far-end best case frame loss	Lowest frame loss measured in this session associated with egress data frames.
Far-end best case loss ratio	Lowest frame loss ratio measured in this session associated with egress data frames.
Far-end worst case frame loss	Highest frame loss measured in this session associated with egress data frames.
Far-end worst case loss ratio	Highest frame loss ratio measured in this session associated with egress data frames.

Note that in the preceding table, the term *number of service frames not delivered* is the difference between the number of service frames arriving at the ingress Ethernet flow point and the number of service frames delivered at the egress Ethernet flow point in a point-to-point Ethernet connection.

monitor ethernet synthetic-loss-measurement

Syntax monitor ethernet synthetic-loss-measurement
 maintenance-domain *md-name*
 maintenance-association *ma-name*
 (*remote-mac-address* | mep *remote-mep-id*)
 <count *frame-count*>
 <local-mep *mep-id*>
 <wait *interval-milliseconds*>
 <priority *802.1p value*>
 <size>
 <xml>

Release Information Command introduced in Junos OS Release 13.2 for MX Series routers.
 local-mep option introduced in Junos OS Release 15.1

Description (MX Series routers) Start an ITU-T Y.1731 Ethernet synthetic loss measurement (ETH-SLM) session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. ETH-SLM (also called synthetic frame loss measurement) statistics are stored at one of the MEPs for later retrieval.

NOTE: If you attempt to monitor delays to a nonexistent MAC address, you must press Ctrl +c to explicitly quit the **monitor ethernet synthetic-loss-measurement** command and return to the CLI command prompt.

To start an Ethernet synthetic frame loss measurement session, the router initiates an exchange of frames carrying synthetic frame loss measurement protocol data units (PDUs) between the local and remote MEPs. The frame counts—the types of and number of Ethernet synthetic frame loss measurement PDU frames exchanged to measure frame delay times—are displayed as the run-time output of the **monitor ethernet synthetic-loss-measurement** command and are also stored at both the initiator and receiver MEPs for later retrieval. Ethernet synthetic frame loss measurement statistics, described below, are measured and stored at only one of the MEPs:

Frame delay—The difference, in microseconds, between the time a frame is sent and when it is received.

Frame delay variation—The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

Options **maintenance-domain *md-name***—Name of an existing CFM maintenance domain.
 maintenance-association *ma-name*—Name of an existing CFM maintenance association.

mep remote-mep-id—Numeric identifier of the peer MEP with which to perform Ethernet synthetic frame loss measurement. The discovered MAC address of the peer MEP is used. The range of values is from 1 through 8191.

remote-mac-address—Unicast MAC address of the peer MEP with which to perform Ethernet synthetic frame loss measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, **0011.2233.4455** or **00:11:22:33:44:55**. Multicast MAC addresses are not supported.

count frame-count—(Optional) Number of frames to send to the specified peer MEP. The range of values is from 1 through 65,535 frames. The default value is 10 frames.

local-mep mep-id—(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.

wait interval-milliseconds—(Optional) Number of milliseconds to wait between sending frames. You must specify this value in multiples of 100 milliseconds. The range of values is from 100 through 50000 milliseconds. The default value is 100 milliseconds.

priority 802.1p value—(Optional) Priority of the ETH-SLM request frame supported. The range of values is from 0 through 7. The default value is zero.

size—(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.

xml—(Optional) Allow the output of the command to be displayed in XML format for ETH-SLM. Note that the only way to get output in XML format is to use the **xml** argument. The **display xml** command does not work.

Additional Information To display the frame counts collected at a MEP as the result of this command, use the following commands as described in the [CLI Explorer](#):

- **show oam ethernet connectivity-fault-management interfaces detail**
- **show oam ethernet connectivity-fault-management mep-database**
- **show oam ethernet connectivity-fault-management mep-statistics**

To display the statistics collected at a MEP as the result of this command, use the following commands as described in the [CLI Explorer](#).

- **show oam ethernet connectivity-fault-management synthetic-loss-measurement**
- **show oam ethernet connectivity-fault-management mep-statistics**

To clear both the frame counts and the statistics collected for MEPs, use the **clear oam ethernet connectivity-fault-management statistics** command, described in the [CLI Explorer](#).

For a complete description of Ethernet synthetic frame loss measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.

List of Sample Output [monitor ethernet synthetic-loss-measurement on page 1598](#)

Output Fields The **monitor ethernet synthetic-loss-measurement** command displays different output at the CLI, depending on when you start a synthetic frame loss measurement:

- [Table 112 on page 1597](#) lists the run-time output fields for the **monitor ethernet synthetic-loss-measurement** command.

Output fields are listed in the approximate order in which they appear.

Table 112: monitor ethernet synthetic-loss-measurement Output Fields

Output Field Name	Output Field Description
ETH-SLM request to	Unicast MAC address of the remote peer MEP.
Interface	Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.
SLM packets sent	Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.
SLR packets received	Total number of synthetic loss reply (SLR) PDU frames received by the source MEP from the remote MEP during this measurement session.
Local TXFC1 value	Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.
Local RXFC1 value	Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet.
Last Received SLR frame TXFCf(tc)	Value of the local counter TxFC1 at the time of SLM frame transmission.
Last Received SLR frame TXFCb(t)	Value of the local counter RxFC1 at the time of SLR frame transmission.
Frame loss (near-end)	Count of frame loss associated with ingress data frames.
Frame loss (far-end)	Count of frame loss associated with egress data frames.

request interface link-degrade-recover

Syntax `request interface link-degrade-recover interfaces-name`

Release Information Command introduced in Junos OS Release 15.1.

Description Manually recover a degraded physical link. Manual recovery is used when the interface has any Layer 2 and Layer 3 protocols that prevents autorecovery. This command is applicable only if you have configured the manual link recovery option on the interface.

NOTE: Manual recovery option is recommended for user deployments that have static route configurations causing the remote end of the link to start forwarding packets (as soon as the physical link is up) while auto-recovery is in progress.

Options *interfaces-name*—Name of the interface.

Required Privilege Level View

request interface mc-ae switchover (Multichassis Link Aggregation)

Syntax	request interface mc-ae switchover <immediate> mcae-id <i>mcae-id</i> ; mcae-id <i>mcae-id</i> ;
Release Information	Command introduced in Junos OS Release 13.3.
Description	Manually revert egress traffic from the active node to the designated preferred node of a multichassis aggregated Ethernet interface. You can use this command to manually switch over traffic to the preferred node when the switchover-mode statement for the multichassis aggregated Ethernet interface is configured as non-revertive at the [edit interfaces aeX mc-ae] hierarchy level.
	<div>  <p>NOTE: To run this command successfully, the status-control statement should be configured as active at the [edit interfaces aeX mc-ae] hierarchy level.</p> </div>
Options	<p>immediate—(Optional) Trigger immediate switchover to the preferred node. If this option is not configured, Junos OS waits for the timer configured using the revert-time statement at the [edit interfaces aeX mc-ae] hierarchy level to expire before it triggers the switchover.</p> <p>mcae-id <i>mcae-id</i>—Triggers switchover for the specified mc-ae interface.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • Configuring Multichassis Link Aggregation on MX Series Routers • Configuring Manual and Automatic Link Switchover for MC-LAG Interfaces on MX Series Routers
List of Sample Output	request interface mc-ae switchover immediate mcae-id on page 1606 request interface mc-ae switchover mcae-id on page 1607
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

request interface mc-ae switchover immediate mcae-id

```
user@host >request interface mc-ae switchover immediate mcae-id 2
MCAE: Switchover Done
```

Sample Output

`request interface mc-ae switchover mcae-id`

```
user@host >request interface mc-ae switchover mcae-id 2
```

```
Switchover In Progress: Please check after 1 minutes,
```

```
Use "show interfaces mc-ae revertive-info" to check for the status
```

request interface (revert | switchover) (Aggregated Ethernet Link Protection)

Syntax `request interface (revert | switchover) aex`

Release Information Command introduced in Junos OS Release 8.3.

Description Manually revert egress traffic from the designated backup link to the designated primary link of an aggregated Ethernet interface for which link protection is enabled, or manually switch egress traffic from the primary link to the backup link. This traffic includes transit traffic and local traffic originated on the router itself.

NOTE: When link protection is enabled on an aggregated Ethernet interface, if the primary link fails, the router automatically routes egress traffic to the backup link. However, the router does not automatically route egress traffic back to the primary link when the primary link is subsequently reestablished. Instead, you manually control when to have traffic diverted back to the primary link by issuing the `request interface (revert | switchover) (Aggregated Ethernet Link Protection)` operational command and specifying the `revert` keyword.

On M Series and T Series routers, use the `request interface (revert | switchover) (Adaptive Services)` operational command to manually revert to the primary adaptive services interface or link services interface, or to switch from the primary to the secondary interface. For information about this command, see *request interface (revert | switchover) (Adaptive Services)*.

Options `revert`—Restores egress traffic processing to the primary link.

`switchover`—Transfers egress traffic processing to the secondary (backup) link.

`aex`—Aggregated Ethernet logical interface number: 0 through 15.

Required Privilege Level view

List of Sample Output [request interface revert on page 1608](#)

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

request interface revert

```
user@host >request interface revert ae1
```

request lacp link-switchover

Syntax	<code>request lacp link-switchover aex</code>
Release Information	Command introduced in Junos OS Release 9.3.
Description	Manually switch aggregated Ethernet active or standby LACP links.
	<div>  <p>NOTE: Because this command overrides LACP priority calculations, we strongly recommend that you use this command only when the actor (in this case, the Juniper Networks router) is controlling the active or standby link and the partner (peer) is following. This scenario occurs when you configure only the actor for link protection.</p> </div>
Options	aex —Aggregated Ethernet logical interface number: 0 through 15.
Required Privilege Level	view
List of Sample Output	request lacp link-switchover aeX on page 1609
Output Fields	When you enter this command, you are provided feedback on the status of your request. To view the switchover, use the show lacp interfaces command.

Sample Output

request lacp link-switchover aeX

```
user@host >request lacp link-switchover ae0ae0: Request succeeded
```

Description	<p>Display a list of all Flexible PIC Concentrators (FPCs) and PICs installed in the router or switch chassis, including the hardware version level and serial number.</p> <p>In the EX Series switch command output, FPC refers to the following:</p> <ul style="list-style-type: none"> • On EX2200 switches, EX3200 switches, EX4200 standalone switches, and EX4500 switches—Refers to the switch; FPC <i>number</i> is always 0. • On EX4200 switches in a Virtual Chassis configuration—Refers to the member of a Virtual Chassis; FPC <i>number</i> equals the member ID, from 0 through 9. • On EX8208 and EX8216 switches—Refers to a line card; FPC <i>number</i> equals the slot number for the line card. <p>On QFX3500, QFX5100, and OCX Series standalone switches, and PTX1000 routers both the FPC and FPC <i>number</i> are always 0.</p> <p>On T4000 Type 5 FPCs, there are no top temperature sensor or bottom temperature sensor parameters. Instead, fan intake temperature sensor and fan exhaust temperature sensors parameters are displayed.</p> <p>Starting from Junos OS Release 11.4, the output of the show chassis hardware models operational mode command displays the enhanced midplanes FRU model numbers (CHAS-BP3-MX240-S, CHAS-BP3-MX480-S or CHAS-BP3-MX960-S) based on the router. Prior to release 11.4, the FRU model numbers are left blank when the router has</p>

enhanced midplanes. Note that the enhanced midplanes are introduced through the Junos OS Release 13.3, but can be supported on all Junos OS releases.

Starting with Junos OS Release 14.1, the output of the **show chassis hardware detail | extensive | clei-models | models** operational mode command displays the new DC power supply module (PSM) and power distribution unit (PDU) that are added to provide power to the high-density FPC (FPC2-PTX-P1A) and other components in a PTX5000 Packet Transport Router.

Options **none**—Display information about hardware. For a TX Matrix router, display information about the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display information about the TX Matrix Plus router and its attached routers.

clei-models—(Optional) Display Common Language Equipment Identifier (CLEI) barcode and model number for orderable field-replaceable units (FRUs).

detail—(Optional) Include RAM and disk information in output.

extensive—(Optional) Display ID EEPROM information.

all-members—(MX Series routers only) (Optional) Display hardware-specific information for all the members of the Virtual Chassis configuration.

interconnect-device *name*—(QFabric systems only) (Optional) Display hardware-specific information for the Interconnect device.

lcc *number*—(TX Matrix routers and TX Matrix Plus router only) (Optional) On a TX Matrix router, display hardware information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display hardware information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers only) (Optional) Display hardware-specific information for the local Virtual Chassis members.

member *member-id*—(MX Series routers and EX Series switches) (Optional) Display hardware-specific information for the specified member of the Virtual Chassis configuration. Replace *member-id* variable with a value 0 or 1.

models—(Optional) Display model numbers and part numbers for orderable FRUs and, for components that use ID EEPROM format v2, the CLEI code.

node-device *name*—(QFabric systems only) (Optional) Display hardware-specific information for the Node device.

satellite [*slot-id slot-id* | device-alias *alias-name*]—(Junos Fusion only) (Optional) Display hardware information for the specified satellite device in a Junos Fusion, or for all satellite devices in the Junos Fusion if no satellite devices are specified.

scc—(TX Matrix router only) (Optional) Display hardware information for the TX Matrix router (switch-card chassis).

sfc *number*—(TX Matrix Plus router only) (Optional) Display hardware information for the TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with 0.

Additional Information The **show chassis hardware detail** command now displays DIMM information for the following Routing Engines, as shown in [Table 114 on page 1614](#).

Table 114: Routing Engines Displaying DIMM Information

Routing Engines	Routers
RE-S-1800x2 and RE-S-1800x4	MX240, MX480, and MX960 routers
RE-A-1800x2	M120 and M320 routers

In Junos OS Release 11.4 and later, the output for the **show chassis hardware models** operational mode command for MX Series routers display the enhanced midplanes FRU model numbers—CHAS-BP3-MX240-S, CHAS-BP3-MX480-S, or CHAS-BP3-MX960-S—based on the router. In releases before Junos OS Release 11.4, the FRU model numbers are left blank when the router has enhanced midplanes. Note that the enhanced midplanes are introduced through Junos OS Release 13.3, but can be supported on all Junos OS releases.

Starting with Junos OS Release 17.3R1, the output of the **show chassis hardware** command displays the mode in which vMX is running (performance mode or lite mode) in the part number field for the FPC. **RIOT-PERF** indicates performance mode and **RIOT-LITE** indicates lite mode.

Output Fields [Table 115 on page 1620](#) lists the output fields for the **show chassis hardware** command. Output fields are listed in the approximate order in which they appear.

Table 115: show chassis hardware Output Fields

Field Name	Field Description	Level of Output
Item	<p>Chassis component:</p> <ul style="list-style-type: none"> (EX Series switches)—Information about the chassis, Routing Engine (SRE and Routing Engine modules in EX8200 switches), power supplies, fan trays, and LCD panel. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs). Information about the backplane, midplane, and SIBs (SF modules) is displayed for EX8200 switches. (MX Series routers and EX Series switches)—Information about the backplane, Routing Engine, Power Entry Modules (PEMs), and fan trays. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs), Modular Port Concentrators (MPCs) and associated Modular Interface Cards (MICs), or Dense Port Concentrators (DPCs). MX80 routers have a single Routing Engine and a built-in Packet Forwarding Engine that attaches directly to MICs. The Packet Forwarding Engine has two “pseudo” FPCs (FPC 0 and FPC1). MX80 routers also have a Forwarding Engine Board (FEB). MX104 routers have a built-in Packet forwarding Engine and a Forwarding Engine Board (FEB). The Packet Forwarding Engine of the MX104 router has three “pseudo” FPCs (FPC0, FPC1, and FPC2). (M Series routers, except for the M320 router)—Information about the backplane; power supplies; fan trays; Routing Engine; maxicab (the connection between the Routing Engine and the backplane, for the M40 router only); SCB, SSB, SFM, or FEB; MCS and PCG (for the M160 router only); each FPC and PIC; and each fan, blower, and impeller. (M120, M320, and T Series routers)—Information about the backplane, power supplies, fan trays, midplane, FPM (craft interface), CIP, PEM, SCG, CB, FPC, PIC, SFP, SPMB, and SIB. (QFX Series)—Information about the chassis, Pseudo CB, Routing Engine, power supplies, fan trays, Interconnect devices, and Node devices. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs). (PTX Series)—Information about the chassis, midplane, craft interface (FPM), power distribution units (PDUs) and Power Supply Modules (PSMs), Centralized Clock Generators (CCGs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Flexible PIC Concentrators (FPCs), PICs, Switch Interface Boards (SIBs), and fan trays (vertical and horizontal). (MX2010, MX2020, and MX2008 routers)—Information about the chassis, midplane, craft interface (FPM), power midplane (PMP), Power Supply Modules (PSMs), Power Distribution Modules (PDMs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Switch Fabric Boards (SFBs), Flexible PIC Concentrators (FPCs), PICs, adapter cards (ADCs) and fan trays. (vMX routers)—Information about the chassis, midplane, Routing Engines, and Control Boards (CBs). Also displays information about Flexible PIC Concentrators (FPCs) and associated Modular Interface Cards (MICs) and Physical Interface Cards (PICs). 	All levels
Version	Revision level of the chassis component.	All levels
Part number	Part number of the chassis component.	All levels

Table 115: show chassis hardware Output Fields (continued)

Field Name	Field Description	Level of Output
Serial number	Serial number of the chassis component. The serial number of the backplane is also the serial number of the router chassis. Use this serial number when you need to contact Juniper Networks Customer Support about the router or switch chassis.	All levels
Assb ID or Assembly ID	(extensive keyword only) Identification number that describes the FRU hardware.	extensive
Assembly Version	(extensive keyword only) Version number of the FRU hardware.	extensive
Assembly Flags	(extensive keyword only) Flags.	extensive
FRU model number	(clei-models , extensive , and models keyword only) Model number of the FRU hardware component.	none specified
CLEI code	(clei-models and extensive keyword only) Common Language Equipment Identifier code. This value is displayed only for hardware components that use ID EEPROM format v2. This value is not displayed for components that use ID EEPROM format v1.	none specified
EEPROM Version	ID EEPROM version used by the hardware component: 0x00 (version 0), 0x01 (version 1), or 0x02 (version 2).	extensive
Description	<p>Brief description of the hardware item:</p> <ul style="list-style-type: none"> • Type of power supply. • Type of PIC. If the PIC type is not supported on the current software release, the output states Hardware Not Supported. • Type of FPC: FPC Type 1, FPC Type 2, FPC Type 3, FPC Type 4, or FPC TypeOC192. <p>On EX Series switches, a brief description of the FPC.</p> <p>The following list shows the PIM abbreviation in the output and the corresponding PIM name.</p> <ul style="list-style-type: none"> • 2x FE—Either two built-in Fast Ethernet interfaces (fixed PIM) or dual-port Fast Ethernet PIM • 4x FE—4-port Fast Ethernet ePIM • 1x GE Copper—Copper Gigabit Ethernet ePIM (one 10-Mbps, 100-Mbps, or 1000-Mbps port) • 1x GE SFP—SFP Gigabit Ethernet ePIM (one fiber port) • 2x Serial—Dual-port serial PIM • 2x T1—Dual-port T1 PIM • 2x E1—Dual-port E1 PIM • 2x CT1E1—Dual-port channelized T1/E1 PIM • 1x T3—T3 PIM (one port) • 1x E3—E3 PIM (one port) • 4x BRI S/T—4-port ISDN BRI S/T PIM • 4x BRI U—4-port ISDN BRI U PIM • 1x ADSL Annex A—ADSL 2/2+ Annex A PIM (one port, for POTS) 	All levels

Table 115: show chassis hardware Output Fields (continued)

Field Name	Field Description	Level of Output
	<ul style="list-style-type: none"> • 1x ADSL Annex B—ADSL 2/2+ Annex B PIM (one port, for ISDN) • 2x SHDSL (ATM)—G SHDSL PIM (2-port two-wire module or 1-port four-wire module) • 1x TGM550—TGM550 Telephony Gateway Module (Avaya VoIP gateway module with one console port, two analog LINE ports, and two analog TRUNK ports) • 1x DS1 TIM510—TIM510 E1/T1 Telephony Interface Module (Avaya VoIP media module with one E1 or T1 trunk termination port and ISDN PRI backup) • 4x FXS, 4x FXO, TIM514—TIM514 Analog Telephony Interface Module (Avaya VoIP media module with four analog LINE ports and four analog TRUNK ports) • 4x BRI TIM521—TIM521 BRI Telephony Interface Module (Avaya VoIP media module with four ISDN BRI ports) • Crypto Accelerator Module—For enhanced performance of cryptographic algorithms used in IP Security (IPsec) services • MPC M16x10GE—16-port 10-Gigabit Module Port Concentrator that supports SFP+ optical transceivers. (Not on EX Series switches.) • For hosts, the Routing Engine type. • For small form-factor pluggable transceiver (SFP) modules, the type of fiber: LX, SX, LH, or T. • LCD description for EX Series switches (except EX2200 switches). • MPC2—1-port MPC2 that supports two separate slots for MICs. • MPC3E—1-port MPC3E that supports two separate slots for MICs (MIC-3D-1X100GE-CFP and MIC-3D-20GE-SFP) on MX960, MX480, and MX240 routers. The MPC3E maps one MIC to one PIC (1 MIC, 1 PIC), which differs from the mapping of legacy MPCs. • 100GBASE-LR4, pluggable CFP optics • Supports the Enhanced MX Switch Control Board with fabric redundancy and existing SCBs without fabric redundancy. • Interoperates with existing MX Series line cards, including Flexible Port Concentrators (FPC), Dense Port Concentrators (DPCs), and Modular Port Concentrators (MPCs). • MPC4E—Fixed configuration MPC4E that is available in two flavors: MPC4E-3D-32XGE-SFPP and MPC4E-3D-2CGE-8XGE on MX2020, MX960, MX480, and MX240 routers. • LCD description for MX Series routers

Description	Display status information about the PIC installed in the specified Flexible PIC Concentrator (FPC) and PIC slot.
Options	<p>fpc-slot <i>slot-number</i>—Display information about the PIC in this particular FPC slot:</p> <ul style="list-style-type: none"> On a TX Matrix router, if you specify the number of the T640 router by using the lcc <i>number</i> option (the recommended method), replace <i>slot-number</i> with a value from 0 through 7. Otherwise, replace <i>slot-number</i> with a value from 0 through 31. <p>Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 router by using the lcc <i>number</i> option (the recommended method), replace <i>slot-number</i> with a value from 0 through 7. Otherwise, replace <i>slot-number</i> with a value from 0 through 31. For example, the following commands have the same result:</p> <pre> user@host> show chassis pic fpc-slot 1 lcc 1 pic-slot 1 user@host> show chassis pic fpc-slot 9 pic-slot 1 </pre> <ul style="list-style-type: none"> M120 routers only—Replace <i>slot-number</i> with a value from 0 through 5.

- MX80 routers only—Replace *slot-number* with a value from 0 through 1.
- MX104 routers only—Replace *slot-number* with a value from 0 through 2.
- MX240 routers only—Replace *slot-number* with a value from 0 through 2.
- MX480 routers only—Replace *slot-number* with a value from 0 through 5.
- MX960 routers only—Replace *slot-number* with a value from 0 through 11.
- MX2010 routers only—Replace *slot-number* with a value from 0 through 9.
- MX2020 routers only—Replace *slot-number* with a value from 0 through 19.
- MX2008 routers only—Replace *slot-number* with a value from 0 through 9.
- MX10003 routers only—Replace *slot-number* with a value from 0 through 1.
- Other routers—Replace *slot-number* with a value from 0 through 7.
- EX Series switches:
 - EX3200 switches and EX4200 standalone switches—Replace *slot-number* with 0.
 - EX4200 switches in a Virtual Chassis configuration—Replace *slot-number* with a value from 0 through 9 (switch's member ID).
 - EX8208 switches—Replace *slot-number* with a value from 0 through 7 (line card).
 - EX8216 switches—Replace *slot-number* with a value from 0 through 15 (line card).
- QFX Series:
 - QFX3500, QFX3600, QFX5100, and OCX Series standalone switches—Replace *slot-number* with 0. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.
 - QFabric systems—Replace *slot-number* with any number between 0 and 15. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.

all-members—(MX Series routers and EX Series switches only) (Optional) Display PIC information for all member routers in the Virtual Chassis configuration.

interconnect-device name—(QFabric systems only) (Optional) Display PIC information for a specified Interconnect device.

lcc number—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display PIC information for a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display PIC information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

local—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the local Virtual Chassis member.

member *member-id*—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

node-device *name*—(QFabric systems only) (Optional) Display PIC information for a specified Node device.

pic-slot *slot-number*—Display information about the PIC in this particular PIC slot. For routers, replace *slot-number* with a value from 0 through 3. For EX3200 and EX4200 switches, replace *slot-number* with 0 for built-in network interfaces and 1 for interfaces on uplink modules. For EX8208 and EX8216 switches, replace *slot-number* with 0. For the QFX3500 standalone switch and the QFabric system, replace *slot-number* with 0 or 1.

transport—Display PIC information for optical transport network.

Output Fields [Table 116 on page 1882](#) lists the output fields for the **show chassis pic** command. Output fields are listed in the approximate order in which they appear.

Table 116: show chassis pic Output Fields

Field Name	Field Description
Type	PIC type. NOTE: On the 1-port OC192/STM64 MICs with the SDH framing mode, the type is displayed as MIC-3D-1STM64-XFP and with the SONET framing mode, the type is displayed as MIC-3D-1OC192-XFP . By default, the 1-port OC192/STM64 MICs displays the type as MIC-3D-1OC192-XFP .
Account Layer2 Overhead	(MX Series routers) Indicates whether functionality to count the Layer 2 overhead bytes in the interface statistics at the PIC level is enabled or disabled.
ASIC type	Type of ASIC on the PIC.
State	Status of the PIC. State is displayed only when a PIC is in the slot. <ul style="list-style-type: none"> • Online— PIC is online and running. • Offline—PIC is powered down.
PIC version	PIC hardware version.
Uptime	How long the PIC has been online.
Package	(Multiservices PICs only) Services package supported: Layer-2 or Layer-3 .
Port Number	Port number for the PIC.
Cable Type	Type of cable connected to the port: LH , LX , or SX .

Table 116: show chassis pic Output Fields (continued)

Field Name	Field Description
PIC Port Information (MX480 Router 100-Gigabit Ethernet CFP)	<p>Port-level information for the PIC.</p> <ul style="list-style-type: none"> • Port—Port number • Cable type—Type of optical transceiver installed. • Fiber type—Type of fiber. SM is single-mode. • Xcvr vendor—Transceiver vendor name. • Xcvr vendor part number—Transceiver vendor part number. • Wavelength—Wavelength of the transmitted signal. Uplinks and downlinks are always 1550 nm. There is a separate fiber for each direction • Xcvr Firmware—Transceiver firmware version.
PIC Port Information (MX960 Router Bidirectional Optics)	<p>Port-level information for the PIC.</p> <ul style="list-style-type: none"> • Port—Port number • Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed. Uplink interfaces display -U. Down link interfaces display -D. • Fiber type—Type of fiber. SM is single-mode. • Xcvr vendor—Transceiver vendor name. • Xcvr vendor part number—Transceiver vendor part number. <ul style="list-style-type: none"> • BX10-10-km bidirectional optics. • BX40-40-km bidirectional optics. • SFP-LX-40-km SFP optics. • Wavelength—Wavelength of the transmitted signal. Uplinks are always 1310 nm. Downlinks are either 1490 nm or 1550 nm.
PIC Port Information (Next-Generation SONET/SDH SFP)	<p>Port-level information for the next-generation SONET/SDH SFP PIC.</p> <ul style="list-style-type: none"> • Port—Port number. • Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed. • Fiber type—Type of fiber: SM (single-mode) or MM (multimode). • Xcvr vendor—Transceiver vendor name. • Xcvr vendor part number—Transceiver vendor part number. • Wavelength—Wavelength of the transmitted signal. Next-generation SONET/SDH SFPs use 1310 nm.
PIC port information (MX104 router)	<p>Port-level information for the PIC.</p> <ul style="list-style-type: none"> • Port—Port number • Cable type—Type of optical transceiver installed. • Fiber type—Type of fiber. SM is single-mode. • Xcvr vendor—Transceiver vendor name. • Xcvr vendor part number—Transceiver vendor part number. • Wavelength—Wavelength of the transmitted signal. • Xcvr Firmware—Firmware version of the transceiver.

Table 116: show chassis pic Output Fields (continued)

Field Name	Field Description
Port speed information	Information pertaining to port speed: <ul style="list-style-type: none"> • Port—Port number. • PFE—Packet Forwarding Engine slot number. • Capable Port Speed—Speed supported by each port.
Multirate Mode	Rate-selectability status for the MIC: Enabled or Disabled .
Channelization	Indicates whether channelization is enabled or disabled on the DS3/E3 MIC.
Administrative State	Indicates the administrative state of the PIC. Possible values are: In Service (Default) and Out of Service.
Operational State	Indicates the operational state of the PIC. Possible values are: Normal and Fault.

show ethernet-switching redundancy-groups

Syntax	<pre>show ethernet-switching redundancy-groups <redundancy-group-id [0 to 4294967294]> arp-statistics nd-statistics remote-macs</pre>
Release Information	<p>Command introduced in Junos OS Release 13.2.</p> <p>Command introduced in Junos OS Release 15.1R1 for EX Series switches</p>
Description	<p>Display ARP statistics, Neighbor Discovery statistics, or remote MAC addresses for the Multi-Chassis Aggregated Ethernet (MC-AE) nodes for all or specified redundancy groups on a router or switch. Note that the Redundancy Group ID is inherited by the bridging domain or VLAN from member AE interfaces.</p>
Options	<p>redundancy-group-id—(Optional) The redundancy group identification number. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate the routing or switching devices contained in a redundancy group.</p> <p>arp-statistics—(Optional) Count of ARP packets sent and received by the two MC-AE nodes.</p> <p>nd-statistics—(Optional) Count of Neighbor Discovery packets sent and received by the two MC-AE nodes.</p> <p>remote-macs —(Optional) List of remote MAC addresses in the “Installed” state, as learned from the remote MC-AE node.</p>
Required Privilege Level	view

Output Fields	Output fields are listed in the approximate order in which they appear.

Table 117: show ethernet-switching redundancy-groups arp-statistics Output Fields

Field Name	Field Description
Redundancy Group ID	Redundancy Group to which the following details apply.

Table 117: show ethernet-switching redundancy-groups arp-statistics Output Fields (continued)

Field Name	Field Description
MCLAG ARP Statistics Group ID	ARP statistics for this Multichassis Link Aggregation Group (MC-LAG) instance.
ARP Rx Count From Line	Total number of ARPs received from the Line.
ARP Tx Count To Peer	Total number of ARPs sent to the peer.
ARP Rx Count From Peer	Total number of ARPs received from the peer.
ARP Drop Count received from line	Total number of ARPs sent by the peer that were received.
ARP Drop Count received from peer	Total number of ARPs sent by the peer that were dropped
ARP Install Count	ARP Install Count

Table 118: show ethernet-switching redundancy-groups nd-statistics Output Fields

Field Name	Field Description
Redundancy Group ID	Redundancy Group to which the following details apply.
MCLAG ND Statistics Group ID	Neighbor Discovery statistics for this Multichassis Link Aggregation Group (MC-LAG) instance.
ND Rx Count From Line	Total number of Neighbor Discovery packets received from the Line.
ND Tx Count To Peer	Total number of Neighbor Discovery packets sent to the peer.
ND Rx Count From Peer	Total number of Neighbor Discovery packets received from the peer.
ND Drop Count received from line	Total number of Neighbor Discovery packets sent by the peer that were received.
ND Drop Count received from peer	Total number of Neighbor Discovery packets sent by the peer that were dropped
ND Install Count	ND Install Count

Table 119: show ethernet-switching redundancy-groups remote-macs Output Fields

Field Name	Field Description
Redundancy Group ID	Redundancy Group to which the following details apply.

Table 119: show ethernet-switching redundancy-groups remote-macs Output Fields (continued)

Field Name	Field Description
Service ID	Service ID (configured at the routing instance level).
Peer-Addr	IP address of the remote peer.
VLAN	Virtual LAN identifier associated with the redundancy group.
MAC	Hardware media access control address associated with the redundancy group.
MCAE-ID	ID number of the MC-AE used by the redundancy group.
Flags	Connection state: local connect or Remote connect. If no flag is shown, the redundancy group may not be connected.
Status	Installation state: Installed or Not Installed.

Sample Output

show ethernet-switching redundancy-groups arp-statistics

```

user@host> show ethernet-switching redundancy-groups arp-statistics

Redundancy Group ID : 1      Flags : Local Connect, Remote Connect

MCLAG ARP Statistics
Group ID                  : 1
ARP Rx Count From Line    : 3493
ARP Tx Count To Peer      : 647
ARP Rx Count From Peer    : 0
ARP Install Count         : 0
ARP Drop Count received from line : 2846
ARP Drop Count received from peer : 0

```

show ethernet-switching redundancy-groups nd-statistics

```

user@host> show ethernet-switching redundancy-groups nd-statistics

Redundancy Group ID : 1      Flags : Local Connect, Remote Connect

MCLAG ND Statistics
Group ID                  : 1
ND Rx Count From Line     : 52
ND Tx Count To Peer       : 15
ND Rx Count From Peer     : 39
ND Install Count          : 34
ND Drop Count received from line : 37
ND Drop Count received from peer : 5

```

show ethernet-switching redundancy-groups remote-macs

```
user@host> show ethernet-switching redundancy-groups <redundancy-group-id> remote-macs
```

```
Redundancy Group ID : 1          Flags : Local Connect, Remote Connect
```

Service-id	Peer-Addr	VLAN	MAC	MCAE-ID	Subunit	Opcode
Flags	Status					
10	10.3.3.2	100	80:ac:ac:1f:10:a1	1	0	1
0	Installed					

show ethernet-switching redundancy-groups group-id

```
user@host> show ethernet-switching redundancy-groups 1
```

```
Redundancy Group ID : 1          Flags : Local Connect, Remote Connect
```

show interfaces (Adaptive Services)

Syntax	<pre>show interfaces <i>interface-type</i> <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display status information about the specified adaptive services interface.
Options	<p><i>interface-type</i>—On M Series and T Series routers, the interface type is sp- <i>fpc/pic/port</i>.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p>
Required Privilege Level	view
List of Sample Output	show interfaces (Adaptive Services) on page 1914 show interfaces brief (Adaptive Services) on page 1914 show interfaces detail (Adaptive Services) on page 1914 show interfaces extensive (Adaptive Services) on page 1915
Output Fields	Table 120 on page 1909 lists the output fields for the show interfaces (adaptive services and redundant adaptive services) command. Output fields are listed in the approximate order in which they appear.

Table 120: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .	All levels
Interface index	Physical interface's index number, which reflects its initialization sequence.	detail extensive none

Table 120: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Type	Encapsulation being used on the interface.	All levels
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	Reference clock source: can be Internal or External .	All levels
Speed	Speed at which the interface is running.	All levels
Device flags	Information about the physical device. Possible values are described in the "Device Flags" section under <i>Common Output Fields Description</i> .	All levels
Interface flags	Information about the interface. Possible values are described in the "Interface Flags" section under <i>Common Output Fields Description</i> .	All levels
Link type	Physical interface link type: Full-Duplex or Half-Duplex .	detail extensive none
Link flags	Information about the link. Possible values are described in the "Link Flags" section under <i>Common Output Fields Description</i> .	detail extensive none
Physical info	Information about the physical interface.	detail extensive
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
Current address	Configured MAC address.	detail extensive none
Hardware address	MAC address of the hardware.	detail extensive none
Alternate link address	Backup address of the link.	detail extensive none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output Rate	Output rate in bps and pps.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive

Table 120: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <p>NOTE: With static NAT configured as basic NAT44 or destination NAT44 on MX Series routers with MS-MICs and MS-MPCs, the Input bytes field might show 16 more bytes than the Output bytes field. This is caused by the accounting of 16 bytes of the Juniper Forwarding Module cookie.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Input errors	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Frames received smaller than the runt threshold. • Giants—Frames received larger than the giant threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • Resource errors—Sum of transmit drops. 	extensive
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • MTU errors—Number of packets larger than the MTU threshold. • Resource errors—Sum of transmit drops. 	extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP interface index number.	detail extensive none

Table 120: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Input packets	Number of packets received on the logical interface.	None specified
Output packets	Number of packets transmitted on the logical interface.	None specified
Traffic statistics	Number and rate of bytes and packets received and transmitted on the logical interface. <ul style="list-style-type: none"> Input bytes—Number of bytes received on the interface. Output bytes—Number of bytes transmitted on the interface. Input packets—Number of packets received on the interface. Output packets—Number of packets transmitted on the interface. 	detail extensive
Local statistics	Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	detail extensive
Transit statistics	Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes generally less than 1 second for the counter to stabilize.	detail extensive
<i>protocol-family</i>	Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed.	brief
Protocol	Protocol family configured on the logical interface, such as iso , inet6 , mpls .	detail extensive none
MTU	MTU size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route table	Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0 .	detail extensive
Flags	Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .	detail extensive none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none

Table 120: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Broadcast	Broadcast address.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

show interfaces (Aggregated Ethernet)

Syntax	<pre>show interfaces <i>aenumber</i> <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M Series, T Series, and MX Series routers only) Display status information about the specified aggregated Fast Ethernet or Gigabit Ethernet interface.
Options	<p><i>aenumber</i>—Display standard information about the specified aggregated Fast Ethernet or Gigabit Ethernet interface.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> <i>Ethernet Interfaces Feature Guide for Routing Devices</i>
List of Sample Output	<p>show interfaces (Aggregated Ethernet) on page 1922</p> <p>show interfaces brief (Aggregated Ethernet) on page 1923</p> <p>show interfaces detail (Aggregated Ethernet) on page 1923</p> <p>show interfaces extensive (Aggregated Ethernet) on page 1924</p> <p>show interfaces extensive (Aggregated Ethernet with VLAN Stacking) on page 1925</p>
Output Fields	Table 121 on page 1917 lists the output fields for the show interfaces (Aggregated Ethernet) command. Output fields are listed in the approximate order in which they appear.

Table 121: Aggregated Ethernet show interfaces Output Fields

Field Name	Field Description	Level of Output
------------	-------------------	-----------------

Physical Interface

Table 121: Aggregated Ethernet show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Physical interface	Name of the physical interface and state of the interface.	All levels
Enabled	State of the physical interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	All levels
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface.	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Loopback status: Enabled or Disabled . If loopback is enabled, type of loopback: Local or Remote .	All levels
Source filtering	Source filtering status: Enabled or Disabled .	All levels
Flow control	Flow control status: Enabled or Disabled .	All levels
Minimum links needed	Number of child links that must be operational for the aggregate interface to be operational.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .	All levels
Interface flags	Information about the interface. Possible values are described in the “Interfaces Flags” section under <i>Common Output Fields Description</i> .	All levels
Current address	Configured MAC address.	detail extensive
Hardware address	Hardware MAC address.	detail extensive
Last flapped	Date, time, and how long ago the interface went from down to up or from up to down. The format is Last flapped: year-month-day hours:minutes:seconds timezone (hours:minutes:seconds ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output Rate	Output rate in bps and pps.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive

Table 121: Aggregated Ethernet show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes and rate, in bps, at which bytes are received on the interface. • Output bytes—Number of bytes and rate, in bps, at which bytes are transmitted on the interface. • Input packets—Number of packets and rate, in pps, at which packets are received on the interface. • Output packets—Number of packets and rate, in pps, at which packets are transmitted on the interface. 	detail extensive
Input errors	<p>Input errors on the interface:</p> <ul style="list-style-type: none"> • Errors—Sum of incoming frame aborts and frame check sequence (FCS) errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's random early detection (RED) mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Giants—Number of frames received that are larger than the giant threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or were not of interest. Usually, this field reports protocols that Junos OS does not handle. • Resource errors—Sum of transmit drops. 	detail extensive
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions —Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), then the cable, the far-end system, or the PIC is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	detail extensive

Table 121: Aggregated Ethernet show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
IPv6 transit statistics	<p>Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Queue counters	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. <p>NOTE: In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the show interfaces command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs</p>	detail extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface (which reflects its initialization sequence).	detail extensive none
SNMP ifIndex	SNMP interface index number of the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags Field" section under <i>Common Output Fields Description</i> .	All levels
VLAN-Tag	Tag Protocol Identifier (TPID) and VLAN identifier.	All levels
Demux	<p>IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following:</p> <ul style="list-style-type: none"> • Source Family Inet • Destination Family Inet 	detail extensive none
Encapsulation	Encapsulation on the logical interface.	All levels

Table 121: Aggregated Ethernet show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Statistics	<p>Information about the number of packets, packets per second, number of bytes, and bytes per second on this aggregate interface.</p> <ul style="list-style-type: none"> • Bundle—Information about input and output bundle rates. • Link—(detail and extensive only) Information about specific links in the aggregate, including link state and input and output rates. • Adaptive Statistics—(extensive only) Information about adaptive load balancing counter statistics. <ul style="list-style-type: none"> • Adaptive Adjusts—Number of times traffic flow imbalance was corrected by implementation of adaptive load balancing. • Adaptive Scans—Number of times the link utilization on each member link of the AE bundle was scanned by for adaptive load balancing • Adaptive Tolerance—Tolerance level, in percentage, for load imbalance on link utilization on each member link of the AE bundle. • Adaptive Updates—Number of times traffic flow loads have been updated on an AE bundle. • Marker Statistics—(detail and extensive only) Information about 802.3ad marker protocol statistics on the specified links. <ul style="list-style-type: none"> • Marker Rx—Number of valid marker protocol data units (PDUs) received on this aggregation port. • Resp Tx—Number of marker response PDUs transmitted on this aggregation port. • Unknown Rx—Number of frames received that either carry the slow protocols Ethernet type value (43B.4) but contain an unknown PDU, or are addressed to the slow protocols group MAC address (43B.3) but do not carry the slow protocols Ethernet type. • Illegal Rx—Number of frames received that carry the slow protocols Ethernet type value (43B.4) but contain a badly formed PDU or an illegal value of protocol subtype (43B.4). 	detail extensive none
LACP info	<p>Link Aggregation Control Protocol (LACP) information for each aggregated interface.</p> <ul style="list-style-type: none"> • Role can be one of the following: <ul style="list-style-type: none"> • Actor—Local device participating in LACP negotiation. • Partner—Remote device participating in LACP negotiation. • System priority—Priority assigned to the system (by management or administrative policy), encoded as an unsigned integer. • System identifier—Actor or partner system ID, encoded as a MAC address. • Port priority—Priority assigned to the port by the actor or partner (by management or administrative policy), encoded as an unsigned integer. • Unknown Rx—Number of frames received that either carry the slow protocols Ethernet type value (43B.4) but contain an unknown protocol data unit (PDU), or are addressed to the slow protocols group MAC address (43B.3) but do not carry the slow protocols Ethernet type. • Port key—Operational key value assigned to the port by the actor or partner, encoded as an unsigned integer. 	

Table 121: Aggregated Ethernet show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
LACP Statistics	<p>LACP statistics for each aggregated interface.</p> <ul style="list-style-type: none"> • LACP Rx—LACP received counter that increments for each normal hello. • LACP Tx—Number of LACP transmit packet errors logged. • Unknown Rx—Number of unrecognized packet errors logged. • Illegal Rx—Number of invalid packets received. <p>NOTE: For LACP Rx and LACP Tx, Packet count is updated only on snmp timer expiry (30 secs).</p>	detail extensive none
<i>protocol-family</i>	Protocol family configured on the logical interface. Possible values are described in the "Protocol Field" section under <i>Common Output Fields Description</i> .	brief
Protocol	Protocol family configured on the logical interface. Possible values are described in the "Protocol Field" section under <i>Common Output Fields Description</i> .	detail extensive none
MTU	Maximum transmission unit size on the logical interface.	detail extensive none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route Table	Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	detail extensive
Flags	Information about protocol family flags. Possible values are described in the "Family Flags Field" section under <i>Common Output Fields Description</i> .	detail extensive none
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	detail extensive none
Addresses, Flags	Information about address flags. Possible values are described in the "Addresses Flags" section under <i>Common Output Fields Description</i> .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address of the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

show interfaces demux0 (Demux Interfaces)

Syntax	<pre>show interfaces demux0 <i>logical-interface-number</i> <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre>
Release Information	Command introduced in Junos OS Release 9.0.
Description	(MX Series and M Series routers only) Display status information about the specified demux interface.
Options	<p>none—Display standard information about the specified demux interface.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> Verifying and Managing Agent Circuit Identifier-Based Dynamic VLAN Configuration
List of Sample Output	<p>show interfaces demux0 (Demux) on page 1934</p> <p>show interfaces demux0 (PPPoE over Aggregated Ethernet) on page 1935</p> <p>show interfaces demux0 extensive (Targeted Distribution for Aggregated Ethernet Links) on page 1936</p> <p>show interfaces demux0 (ACI Interface Set Configured) on page 1936</p>
Output Fields	Table 122 on page 1928 lists the output fields for the show interfaces demux0 (Demux Interfaces) command. Output fields are listed in the approximate order in which they appear.

Table 122: show interfaces demux0 (Demux Interfaces) Output Fields

Field Name	Field Description	Level of Output
Physical Interface		

Table 122: *show interfaces demux0 (Demux Interfaces) Output Fields (continued)*

Field Name	Field Description	Level of Output
Physical interface	Name of the physical interface.	brief detail extensive none
Interface index	Index number of the physical interface, which reflects its initialization sequence.	brief detail extensive none
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .	brief detail extensive none
Physical link	Status of the physical link (Up or Down).	detail extensive none
Admin	Administrative state of the interface (Up or Down).	terse
Interface index	Index number of the physical interface, which reflects its initialization sequence.	detail extensive none
Link	Status of the physical link (Up or Down).	terse
Targeting summary	Status of aggregated Ethernet links that are configured with targeted distribution (primary or backup)	extensive
Bandwidth	Bandwidth allocated to the aggregated Ethernet links that are configured with targeted distribution.	extensive
Proto	Protocol family configured on the interface.	terse
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Type	Type of interface. Software-Pseudo indicates a standard software interface with no associated hardware device.	brief detail extensive none
Link-level type	Encapsulation being used on the physical interface.	brief detail extensive
MTU	Maximum transmission unit size on the physical interface.	brief detail extensive
Clocking	Reference clock source: Internal (1) or External (2).	brief detail extensive
Speed	Speed at which the interface is running.	brief detail extensive
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .	brief detail extensive none
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .	brief detail extensive none
Link type	Data transmission type.	detail extensive none

Table 122: *show interfaces demux0 (Demux Interfaces) Output Fields (continued)*

Field Name	Field Description	Level of Output
Link flags	Information about the link. Possible values are described in the “Link Flags” section under <i>Common Output Fields Description</i> .	detail extensive none
Physical info	Information about the physical interface.	detail extensive
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
Current address	Configured MAC address.	detail extensive
Hardware address	Hardware MAC address.	detail extensive
Alternate link address	Backup address of the link.	detail extensive
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. • IPv6 transit statistics—Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled. <p>NOTE: These fields include dropped traffic and exception traffic, as those fields are not separately defined.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive

Table 122: show interfaces demux0 (Demux Interfaces) Output Fields (continued)

Field Name	Field Description	Level of Output
Input errors	Input errors on the interface whose definitions are as follows: <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Giants—Number of frames received that are larger than the giant packet threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • Resource errors—Sum of transmit drops. 	extensive
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	none
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive
Output Rate	Output rate in bps and pps.	none
Logical Interface		
Logical interface	Name of the logical interface.	brief detail extensive none
Index	Index number of the logical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP interface index number for the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under <i>Common Output Fields Description</i> .	brief detail extensive none
Encapsulation	Encapsulation on the logical interface.	brief extensive none

Table 122: *show interfaces demux0 (Demux Interfaces) Output Fields (continued)*

Field Name	Field Description	Level of Output
ACI VLAN: Dynamic Profile	Name of the dynamic profile that defines the agent circuit identifier (ACI) interface set. If configured, the ACI interface set enables the underlying demux interface to create dynamic VLAN subscriber interfaces based on ACI information.	brief detail extensive none
Demux	Specific IP demultiplexing (demux) values: <ul style="list-style-type: none"> • Underlying interface—The underlying interface that the demux interface uses. • Index—Index number of the logical interface. • Family—Protocol family configured on the logical interface. • Source prefixes, total—Total number of source prefixes for the underlying interface. • Destination prefixes, total—Total number of destination prefixes for the underlying interface. • Prefix—inet family prefix. 	detail extensive none
<i>protocol-family</i>	Protocol family configured on the logical interface.	brief
Traffic statistics	Number and rate of bytes and packets received and transmitted on the specified interface set. <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface set. • Input packets, Output packets—Number of packets received and transmitted on the interface set. • IPv6 transit statistics—Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled. <p>NOTE: The packet and byte counts in these fields include traffic that is dropped and does not leave the router.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Local statistics	Number of transit bytes and packets received and transmitted on the local interface. <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive

Table 122: *show interfaces demux0 (Demux Interfaces) Output Fields (continued)*

Field Name	Field Description	Level of Output
Transit statistics	<p>Number and rate of bytes and packets transiting the switch.</p> <p>NOTE: The packet and byte counts in these fields include traffic that is dropped and does not leave the router.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
IPv6 Transit statistics	<p>Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.</p> <p>NOTE: The packet and byte counts in these fields include traffic that is dropped and does not leave the router.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Input packets	Number of packets received on the interface.	none
Output packets	Number of packets transmitted on the interface.	none
Protocol	Protocol family. Possible values are described in the “Protocol Field” section under <i>Common Output Fields Description</i> .	detail extensive none
MTU	Maximum transmission unit size on the logical interface.	detail extensive none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route table	Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	detail extensive
Flags	Information about protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .	detail extensive none
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	detail extensive none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive statistics none

Table 122: *show interfaces demux0 (Demux Interfaces) Output Fields (continued)*

Field Name	Field Description	Level of Output
Local	IP address of the logical interface.	detail extensive terse none
Remote	IP address of the remote interface.	terse
Broadcast	Broadcast address of the logical interlace.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link	Name of the physical interfaces for member links in an aggregated Ethernet bundle for a PPPoE over aggregated Ethernet configuration. PPPoE traffic goes out on these interfaces.	detail extensive none
Dynamic-profile	Name of the PPPoE dynamic profile assigned to the underlying interface.	detail extensive none
Service Name Table	Name of the PPPoE service name table assigned to the PPPoE underlying interface.	detail extensive none
Max Sessions	Maximum number of dynamic PPPoE logical interfaces that the router can activate on the underlying interface.	detail extensive none
Duplicate Protection	State of duplicate protection: On or Off . Duplicate protection prevents the activation of another dynamic PPPoE logical interface on the same underlying interface when a dynamic PPPoE logical interface for a client with the same MAC address is already active on that interface.	detail extensive none
Direct Connect	State of the configuration to ignore DSL Forum VSAs: On or Off . When configured, the router ignores any of these VSAs received from a directly connected CPE device on the interface.	detail extensive none
AC Name	Name of the access concentrator.	detail extensive none

Sample Output

show interfaces demux0 (Demux)

show interfaces diagnostics optics (Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, 100-Gigabit Ethernet, and Virtual Chassis Port)

Syntax `show interfaces diagnostics optics interface-name`

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 12.1 for PTX Series routers.

Description Display diagnostics data, warnings, and alarms for Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, 100-Gigabit Ethernet, or Virtual Chassis port interfaces.

Options *interface-name*—Interface name. For example:

ge-fpc/pic/port

et-fpc/pic/port

et-fpc/pic/port:channel

xe-fpc/pic/port

vcp-fpc/pic/port

Additional Information The transceivers are polled in 1-second intervals for diagnostics data, warnings, and alarms. The alarms do not cause the links to go down or the LEDs to change color, nor generate SNMP traps. Changes in alarm and warning status generate system log messages.

Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transceiver vendors. Generally, a high alarm or low alarm indicates that the optics module is not operating properly. This information can be used to diagnose why a device is not working.

NOTE: Some transceivers do not support all optical diagnostics features described in the output fields.

If optics measures transmit or receive power as zero, then, the measured power is displayed as 0.000 mW / - Inf dBm

You can configure the P2-10G-40G-QSFPP PIC to operate either in 10-Gigabit Ethernet mode or in 40-Gigabit Ethernet mode. When the PIC is in 40-Gigabit Ethernet mode, you must execute the `show interfaces diagnostics optics et-fpc/pic/port` command. The output of this command displays the diagnostic optics information about the corresponding 40-Gigabit Ethernet port of the PIC. However, when the PIC is in 10-Gigabit Ethernet mode, you must execute the `show interfaces diagnostics optics et-fpc/pic/port:channel`

command. The output of this command displays the diagnostic optics information about the corresponding 10-Gigabit Ethernet port of the PIC. For information about the P2-10G-40G-QSFPP PIC, see [“P2-10G-40G-QSFPP PIC Overview” on page 448](#).

Output Fields [Table 123 on page 1939](#) lists the output fields for the **show interfaces diagnostics optics** command for DWDM and DWDM OTN PICs. Output fields are listed in the approximate order in which they appear.

Table 123: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet DWDM and DWDM OTN PICs

Field Name	Field Description
Physical interface	Name of the physical interface.
Laser bias current	Magnitude of the laser bias power setting current, in milliamperes (mA). The laser bias provides direct modulation of laser diodes and modulates currents.
Laser output power	Laser output power, in milliwatts (mW) and decibels, referenced to 1.0 mW (dBm). This is a software equivalent to the LsPOWMON pin in hardware.
Receiver signal average optical power	Average received optical power, in mW and dBm. This indicator is a software equivalent to the RxPOWMON pin in hardware. Average optical power is vendor-specific.

Table 123: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet DWDM and DWDM OTN PICs (continued)

Field Name	Field Description
Laser end-of-life alarm	Laser end-of-life alarm: On or Off .
Laser wavelength alarm	Laser wavelength alarm: On or Off .
Laser bias current alarm	Laser bias current alarm: On or Off .
Laser temperature alarm	Laser temperature alarm: On or Off .
Laser power alarm	Laser power alarm: On or Off .
Modulator temperature alarm	Modulator temperature alarm: On or Off . Transceivers from some vendors do not support this field.
Modulator bias alarm	Modulator bias alarm: On or Off .
Tx multiplexer FIFO error alarm	Transmit multiplexer first in, first out (FIFO) error alarm: On or Off .
Tx loss of PLL lock alarm	Transmit loss of phase-locked loop (PLL) lock alarm: On or Off .
Rx loss of average optical power alarm	Receive loss of average optical power alarm: On or Off .
Rx loss of AC power alarm	Receive loss of AC power alarm: On or Off . Transceivers from some vendors do not support this field.
Rx loss of PLL lock alarm	Receive loss of phase-locked loop (PLL) lock alarm: On or Off .

Table 124 on page 1940 lists the output fields for the **show interfaces diagnostics optics** command when the router is operating with bidirectional SFP optics. Output fields are listed in the approximate order in which they appear.

Table 124: show interfaces diagnostics optics Output Fields for Gigabit Ethernet Bidirectional SFP Optics

Field Name	Field Description
Physical interface	Name of the physical interface.
Laser bias current	Magnitude of the laser bias power setting current, in milliamperes (mA). The laser bias provides direct modulation of laser diodes and modulates currents.
Laser output power	Laser output power, in milliwatts (mW) and decibels, referenced to 1.0 mW (dBm).

Table 124: show interfaces diagnostics optics Output Fields for Gigabit Ethernet Bidirectional SFP Optics (continued)

Field Name	Field Description
Module temperature	Temperature of the optics module, in Celsius and Fahrenheit.
Module voltage	Internally measured module voltage.
Receiver signal average optical power	Average received optical power, in mW and dBm.
Wavelength Channel number	Wavelength channel number set in the optics module.
Wavelength setpoint	Wavelength set in the optics module.
Tx Dither	Transmit dither status. Displays whether transmit dither is enabled or disabled.
Frequency Error	Frequency error reported from optics module.
Wavelength Error	Wavelength error reported from optics module.
Laser bias current high alarm	Laser bias power setting high alarm. Displays on or off .
Laser bias current low alarm	Laser bias power setting low alarm. Displays on or off .
Laser bias current high warning	Laser bias power setting high warning. Displays on or off .
Laser bias current low warning	Laser bias power setting low warning. Displays on or off .
Laser output power high alarm	Laser output power high alarm. Displays on or off .
Laser output power low alarm	Laser output power low alarm. Displays on or off .
Laser output power high warning	Laser output power high warning. Displays on or off .
Laser output power low warning	Laser output power low warning. Displays on or off .
Module temperature high alarm	Module temperature high alarm. Displays on or off .
Module temperature low alarm	Module temperature low alarm. Displays on or off .

Table 124: show interfaces diagnostics optics Output Fields for Gigabit Ethernet Bidirectional SFP Optics (continued)

Field Name	Field Description
Module temperature high warning	Module temperature high warning. Displays on or off .
Module temperature low warning	Module temperature low warning. Displays on or off .
Module voltage high alarm	Module voltage high alarm. Displays on or off .
Module voltage low alarm	Module voltage low alarm. Displays on or off .
Module voltage high warning	Module voltage high warning. Displays on or off .
Module voltage low warning	Module voltage high warning. Displays on or off .
Laser rx power high alarm	Receive laser power high alarm. Displays on or off .
Laser rx power low alarm	Receive laser power low alarm. Displays on or off .
Laser rx power high warning	Receive laser power high warning. Displays on or off .
Laser rx power low warning	Receive laser power low warning. Displays on or off .
TEC fault alarm	TEC fault alarm. Displays on or off .
Wavelength unlocked alarm	Wavelength unlocked alarm. Displays on or off .
TxTune	Optical transmit side status. Displays whether optical transmit side is not ready due to tuning.
Laser bias current high alarm threshold	Vendor-specified threshold for the laser bias current high alarm: 70.000 mA .
Laser bias current low alarm threshold	Vendor-specified threshold for the laser bias current low alarm: 0.0002 mA .
Laser bias current high warning threshold	Vendor-specified threshold for the laser bias current high warning: 65.000 mA .
Laser bias current low warning threshold	Vendor-specified threshold for the laser bias current low warning: 0.0002 mA .

Table 124: show interfaces diagnostics optics Output Fields for Gigabit Ethernet Bidirectional SFP Optics (continued)

Field Name	Field Description
Laser output power high alarm threshold	Vendor-specified threshold for the laser output power high alarm: 1.0000 mW or 0.00 dBm.
Laser output power low alarm threshold	Vendor-specified threshold for the laser output power low alarm: 0.0560 mW or -12.52 dBm.
Laser output power high warning threshold	Vendor-specified threshold for the laser output power high warning: 0.6300 mW or -2.01 dBm.
Laser output power low warning threshold	Vendor-specified threshold for the laser output power low warning: 0.0890 mW or -10.51 dBm.
Module temperature high alarm threshold	Vendor-specified threshold for the module temperature high alarm: 100° C or 212° F.
Module temperature low alarm threshold	Vendor-specified threshold for the module temperature low alarm: -50° C or -58° F.
Module temperature high warning threshold	Vendor-specified threshold for the module temperature high warning: 95 ° C or 203 ° F.
Module temperature low warning threshold	Vendor-specified threshold for the module temperature low warning: -48° C or -54° F.
Module voltage high alarm threshold	Module voltage high alarm threshold: 3.700 v.
Module voltage low alarm threshold	Module voltage low alarm threshold: 2.900 v.
Module voltage high warning threshold	Module voltage high warning threshold: 3.7600 v.
Module voltage low warning threshold	Module voltage low warning threshold: 3.000 v.
Laser rx power high alarm threshold	Vendor-specified threshold for the laser Rx power high alarm: 1.9953 mW or 3.00 dBm.
Laser rx power low alarm threshold	Vendor-specified threshold for the laser Rx power low alarm: 0.0001 mW or -40.00 dBm.
Laser rx power high warning threshold	Vendor-specified threshold for the laser Rx power high warning: 1.0000 mW or 0.00 dBm.
Laser rx power low warning threshold	Vendor-specified threshold for the laser Rx power low warning: 0.0010 mW or -30.00 dBm.

Table 125 on page 1944 lists the output fields for the **show interfaces diagnostics optics** command for SFP transceivers. Output fields are listed in the approximate order in which they appear.

Table 125: show interfaces diagnostics Output Fields for Gigabit Ethernet SFP Transceivers

Field Name	Field Description
Physical interface	Name of the physical interface.
Laser bias current	Measured laser bias current in uA.
Laser output power	Measured laser output power in mW.
Module temperature	Internally measured module temperature.
Module voltage	Internally measured module voltage.
Laser rx power	Measured receive optical power in mW.
Laser bias current high alarm	Laser bias current high alarm: On or Off . Alarm ranges are vendor-specific.
Laser bias current low alarm	Laser bias current low alarm: On or Off . Alarm ranges are vendor-specific.
Laser output power high alarm	Laser output power high alarm: On or Off . Alarm ranges are vendor-specific.
Laser output power low alarm	Laser output power low alarm: On or Off . Alarm ranges are vendor-specific.
Module temp high alarm	Module temperature high alarm: On or Off . Alarm ranges are vendor-specific.
Module temp low alarm	Module temperature low alarm: On or Off . Alarm ranges are vendor-specific.
Laser rx power high alarm	Laser receive power high alarm: On or Off . Alarm ranges are vendor-specific.
Laser rx power low alarm	Laser receive power low alarm: On or Off . Alarm ranges are vendor-specific.
Laser bias current high warning	Laser bias current high warning: On or Off . Warning ranges are vendor-specific.
Laser bias current low warning	Laser bias current low warning: On or Off . Warning ranges are vendor-specific.
Laser output power high warning	Laser output power high warning: On or Off . Warning ranges are vendor-specific.

Table 125: show interfaces diagnostics Output Fields for Gigabit Ethernet SFP Transceivers (continued)

Field Name	Field Description
Laser output power low warning	Laser output power low warning: On or Off . Warning ranges are vendor-specific.
Module temperature high warning	Module temperature high warning: On or Off . Warning ranges are vendor-specific.
Module temperature low warning	Module temperature low warning: On or Off . Warning ranges are vendor-specific.
Laser rx power high warning	Laser receive power high warning: On or Off . Warning ranges are vendor-specific.
Laser rx power low warning	Laser receive power low warning: On or Off . Warning ranges are vendor-specific.
Laser bias current high alarm threshold	Laser bias current high alarm threshold. Alarm threshold ranges are vendor-specific.
Laser bias current low alarm threshold	Laser bias current low alarm threshold. Alarm threshold ranges are vendor-specific.
Laser bias current high warning threshold	Laser bias current high warning threshold. Warning ranges are vendor-specific.
Laser bias current low warning threshold	Laser bias current low warning threshold. Warning ranges are vendor-specific.
Laser output power high alarm threshold	Laser output power high alarm threshold. Alarm threshold ranges are vendor-specific.
Laser output power low alarm threshold	Laser output power low alarm threshold. Alarm threshold ranges are vendor-specific.
Laser output power high warning threshold	Laser output power high warning threshold. Warning ranges are vendor-specific.
Laser output power low warning threshold	Laser output power low warning threshold. Warning ranges are vendor-specific.
Module temperature high alarm threshold	Module temperature high alarm threshold. Alarm threshold ranges are vendor-specific.
Module temperature low alarm threshold	Module temperature low alarm threshold. Alarm threshold ranges are vendor-specific.
Module temperature high warning threshold	Module temperature high warning threshold. Warning ranges are vendor-specific.

Table 125: show interfaces diagnostics Output Fields for Gigabit Ethernet SFP Transceivers (continued)

Field Name	Field Description
Module temperature low warning threshold	Module temperature low warning threshold. Warning ranges are vendor-specific.
Module voltage high alarm threshold	Module voltage high alarm threshold. Alarm ranges are vendor-specific.
Module voltage low alarm threshold	Module voltage low alarm threshold. Alarm ranges are vendor-specific.
Module voltage high warning threshold	Module voltage high warning threshold. Warning ranges are vendor-specific.
Module voltage low warning threshold	Module voltage low warning threshold. Warning ranges are vendor-specific.
Laser rx power high alarm threshold	Laser receive power high alarm threshold. Alarm threshold ranges are vendor-specific.
Laser rx power low alarm threshold	Laser receive power low alarm threshold. Alarm threshold ranges are vendor-specific.
Laser rx power high warning threshold	Laser receive power high warning threshold. Warning threshold ranges are vendor-specific.
Laser rx power high low threshold	Laser receive power high warning threshold. Warning threshold ranges are vendor-specific.

[Table 126 on page 1946](#) lists the output fields for the **show interfaces diagnostics optics** command for 10-Gigabit Ethernet transceivers. Output fields are listed in the approximate order in which they appear.

Table 126: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet Transceivers

Field Name	Field Description
Physical interface	Name of the physical interface.
Laser bias current	Measured laser bias current in mA.

[Table 127 on page 1949](#) lists the output fields for the **show interfaces diagnostics optics** command for XFP transceivers. Output fields are listed in the approximate order in which they appear.

Table 127: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet XFP Transceivers

Field Name	Field Description
Physical interface	Name of the physical interface.
Laser bias current	Magnitude of the laser bias power setting current, in milliamperes (mA). The laser bias provides direct modulation of laser diodes and modulates currents.
Laser output power	Laser output power, in milliwatts (mW) and decibels, referenced to 1.0 mW (dBm). This is a software equivalent to the LsPOWMON pin in hardware.
Module temperature	Temperature of the XFP optics module, in Celsius and Fahrenheit.
Laser rx power	Laser received optical power, in mW and dBm.
Laser bias current high alarm	Laser bias power setting high alarm. Displays on or off .
Laser bias current low alarm	Laser bias power setting low alarm. Displays on or off .
Laser bias current high warning	Laser bias power setting high warning. Displays on or off .
Laser bias current low warning	Laser bias power setting low warning. Displays on or off .
Laser output power high alarm	Laser output power high alarm. Displays on or off .
Laser output power low alarm	Laser output power low alarm. Displays on or off .
Laser output power high warning	Laser output power high warning. Displays on or off .
Laser output power low warning	Laser output power low warning. Displays on or off .
Module temperature high alarm	Module temperature high alarm. Displays on or off .
Module temperature low alarm	Module temperature low alarm. Displays on or off .
Module temperature high warning	Module temperature high warning. Displays on or off .
Module temperature low warning	Module temperature low warning. Displays on or off .

Table 127: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet XFP Transceivers (continued)

Field Name	Field Description
Laser rx power high alarm	Receive laser power high alarm. Displays on or off .
Laser rx power low alarm	Receive laser power low alarm. Displays on or off .
Laser rx power high warning	Receive laser power high warning. Displays on or off .
Laser rx power low warning	Receive laser power low warning. Displays on or off .
Module not ready alarm	Module not ready alarm. When on , indicates the module has an operational fault. Displays on or off .
Module power down alarm	Module power down alarm. When on , module is in a limited power mode, low for normal operation. Displays on or off .
Tx data not ready alarm	Any condition leading to invalid data on the transmit path. Displays on or off .
Tx not ready alarm	Any condition leading to invalid data on the transmit path. Displays on or off .
Tx laser fault alarm	Laser fault condition. Displays on or off .
Tx CDR loss of lock alarm	Transmit clock and data recovery (CDR) loss of lock. Loss of lock on the transmit side of the CDR. Displays on or off .
Rx not ready alarm	Any condition leading to invalid data on the receive path. Displays on or off .
Rx loss of signal alarm	Receive Loss of Signal alarm. When on , indicates insufficient optical input power to the module. Displays on or off .
Rx CDR loss of lock alarm	Receive CDR loss of lock. Loss of lock on the receive side of the CDR. Displays on or off .
Laser bias current high alarm threshold	Vendor-specified threshold for the laser bias current high alarm: 130.000 mA .
Laser bias current low alarm threshold	Vendor-specified threshold for the laser bias current low alarm: 10.000 mA .
Laser bias current high warning threshold	Vendor-specified threshold for the laser bias current high warning: 120.000 mA .
Laser bias current low warning threshold	Vendor-specified threshold for the laser bias current low warning: 12.000 mA .
Laser output power high alarm threshold	Vendor-specified threshold for the laser output power high alarm: 0.8910 mW or -0.50 dBm .

Table 127: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet XFP Transceivers (continued)

Field Name	Field Description
Laser output power low alarm threshold	Vendor-specified threshold for the laser output power low alarm: 0.2230 mW or -6.52 dBm.
Laser output power high warning threshold	Vendor-specified threshold for the laser output power high warning: 0.7940 mW or -100 dBm.
Laser output power low warning threshold	Vendor-specified threshold for the laser output power low warning: 0.2510 mW or -600 dBm.
Module temperature high alarm threshold	Vendor-specified threshold for the module temperature high alarm: 90° C or 194° F.
Module temperature low alarm threshold	Vendor-specified threshold for the module temperature low alarm: -5° C or 23° F.
Module temperature high warning threshold	Vendor-specified threshold for the module temperature high warning: 85 ° C or 185 ° F.
Module temperature low warning threshold	Vendor-specified threshold for the module temperature low warning: 0° C or 32° F.
Laser rx power high alarm threshold	Vendor-specified threshold for the laser Rx power high alarm: 1.2589 mW or 1.00 dBm.
Laser rx power low alarm threshold	Vendor-specified threshold for the laser Rx power low alarm: 0.0323 mW or -14.91 dBm.
Laser rx power high warning threshold	Vendor-specified threshold for the laser Rx power high warning: 1.1220 mW or 0.50 dBm.
Laser rx power low warning threshold	Vendor-specified threshold for the laser Rx power low warning: 0.0363 mW or -14.40 dBm.

[Table 128 on page 1951](#) lists the output fields for the **show interfaces diagnostics optics** command for VCP. Output fields are listed in the approximate order in which they appear.

Table 128: show interfaces diagnostics optics Output for Virtual Chassis Ports

Field Name	Field Description
Physical interface	Name of the physical interface.
Laser bias current	Magnitude of the laser bias power setting current, in milliamperes (mA). The laser bias provides direct modulation of laser diodes and modulates currents.
Laser output power	Laser output power, in milliwatts (mW) and decibels, referenced to 1.0 mW (dBm).
Module temperature	Temperature of the optics module, in Celsius and Fahrenheit.

Table 128: show interfaces diagnostics optics Output for Virtual Chassis Ports (continued)

show interfaces (far-end-interval)

Syntax	<code>show interfaces far-end-interval <i>interface-fpc/pic/port</i></code>
Release Information	Command introduced in Junos OS Release 9.4.
Description	On channelized interfaces, display the far end interval data for the specified interface.
Required Privilege Level	view
List of Sample Output	show interfaces far-end-interval coc12-5/2/0 on page 1973 show interfaces far-end-interval coc1-5/2/1:1 on page 1974

Output Fields Table 129 on page 1973 lists the output fields for the **show interfaces far-end-interval** command. Output fields are listed in the approximate order in which they appear.

Table 129: show interfaces far-end-interval Output Fields

Field Name	Field Description
Physical interface	Interface FPC/PIC/port values.
SNMP ifIndex	SNMP interface index value.
ES-L/P	Error detection—Errored seconds.
SES-L/P	Error detection—Severely errored seconds.
UAS-L/P	Error detection—Unavailable seconds.

Sample Output

show interfaces far-end-interval coc12-5/2/0

```

user@host> show interfaces far-end-interval coc12-5/2/0
Physical interface: coc12-5/2/0, SNMP ifIndex: 121

show interfaces (Fast Ethernet)

Syntax `show interfaces interface-type`
`<brief | detail | extensive | terse>`
`<descriptions>`
`<media>`
`<snmp-index snmp-index>`
`<statistics>`

Release Information Command introduced before Junos OS Release 7.4.

Description Display status information about the specified Fast Ethernet interface.

Options *interface-type*—On M Series and T Series routers, the interface type is *fe-fpc/pic/port*.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level view

List of Sample Output [show interfaces \(Fast Ethernet\) on page 1988](#)
[show interfaces brief \(Fast Ethernet\) on page 1989](#)
[show interfaces detail \(Fast Ethernet\) on page 1989](#)
[show interfaces extensive \(Fast Ethernet\) on page 1989](#)

Output Fields [Table 130 on page 1975](#) lists the output fields for the **show interfaces** (Fast Ethernet) command. Output fields are listed in the approximate order in which they appear.

Table 130: show interfaces Fast Ethernet Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	detail extensive none

Table 130: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface.	All levels
Link-mode	Type of link connection configured for the physical interface: Full-duplex or Half-duplex	extensive
Speed	Speed at which the interface is running.	All levels
Loopback	Loopback status: Enabled or Disabled . If loopback is enabled, type of loopback: Local or Remote .	All levels
Source filtering	Source filtering status: Enabled or Disabled .	All levels
LAN-PHY mode	10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.	All levels
WAN-PHY mode	10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.	All levels
Unidirectional	Unidirectional link mode status for 10-Gigabit Ethernet interface: Enabled or Disabled for parent interface; Rx-only or Tx-only for child interfaces.	All levels
Flow control	Flow control status: Enabled or Disabled .	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: Enabled or Disabled .	All levels
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> • Online—Autonegotiation is manually configured as online. • Offline—Autonegotiation is manually configured as offline. 	All levels
Device flags	Information about the physical device. Possible values are described in the "Device Flags" section under <i>Common Output Fields Description</i> .	All levels
Interface flags	Information about the interface. Possible values are described in the "Interface Flags" section under <i>Common Output Fields Description</i> .	All levels
Link flags	Information about the link. Possible values are described in the "Links Flags" section under <i>Common Output Fields Description</i> .	All levels
Wavelength	(10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).	All levels

Table 130: *show interfaces Fast Ethernet Output Fields (continued)*

Field Name	Field Description	Level of Output
Frequency	(10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).	All levels
CoS queues	Number of CoS queues configured.	detail extensive none
Schedulers	(GigabitEthernet intelligent queuing 2 (IQ2) interfaces only) Number of CoS schedulers configured.	extensive
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
Current address	Configured MAC address.	detail extensive none
Hardware address	Hardware MAC address.	detail extensive none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output Rate	Output rate in bps and pps.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. <p>Gigabit Ethernet and 10-Gigabit Ethernet IQ PICs count the overhead and CRC bytes.</p> <p>For Gigabit Ethernet IQ PICs, the input byte counts vary by interface type. For more information, see Table 31 under the show interfaces command.</p>	detail extensive

Table 130: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Input errors	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the ignore-l3-incompletes statement. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • FIFO errors—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • Resource errors—Sum of transmit drops. 	extensive

Table 130: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive
Egress queues	<p>Total number of egress queues supported on the specified interface.</p> <p>NOTE: In DPCs that are not of the enhanced type, such as DPC 40x1GE R, DPCE 20x1GE + 2x10GE R, or DPCE 40x1GE R, you might notice a discrepancy in the output of the show interfaces command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs</p>	detail extensive
Queue counters (Egress)	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive

Table 130: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Ingress queues	Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.	extensive
Queue counters (Ingress)	CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces. <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	extensive
Active alarms and Active defects	Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the routing device configuration, an alarm can ring the red or yellow alarm bell on the routing device, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value None or Link . <ul style="list-style-type: none"> • None—There are no active defects or alarms. • Link—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning. 	detail extensive none
OTN FEC statistics	The forward error correction (FEC) counters provide the following statistics: <ul style="list-style-type: none"> • Corrected Errors—The count of corrected errors in the last second. • Corrected Error Ratio—The corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits. 	
PCS statistics	(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device. <ul style="list-style-type: none"> • Bit errors—The number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode. • Errored blocks—The number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode. 	detail extensive

Table 130: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
MAC statistics	<p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> • Total octets and total packets—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see Table 31 under the show interfaces command. • Unicast packets, Broadcast packets, and Multicast packets—Number of unicast, broadcast, and multicast packets. • CRC/Align errors—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • FIFO error—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning. • MAC control frames—Number of MAC control frames. • MAC pause frames—Number of MAC control frames with pause operational code. • Oversized frames—Number of frames that exceed 1518 octets. • Jabber frames—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • Fragment frames—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • VLAN tagged frames—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. • Code violations—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error." 	extensive
OTN Received Overhead Bytes	APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08	extensive
OTN Transmitted Overhead Bytes	APS/PCC0: 0x00, APS/PCC1: 0x00, APS/PCC2: 0x00, APS/PCC3: 0x00 Payload Type: 0x08	extensive

Table 130: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Filter statistics	<p>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> • Input packet count—Number of packets received from the MAC hardware that the filter processed. • Input packet rejects—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • Input DA rejects—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting). • Input SA rejects—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • Output packet count—Number of packets that the filter has given to the MAC hardware. • Output packet pad count—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • Output packet error count—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment. • CAM destination filters, CAM source filters—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0. 	extensive
PMA PHY	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • PHY Lock—Phase-locked loop • PHY Light—Loss of optical signal 	extensive

Table 130: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Autonegotiation information	<p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> • Negotiation status: <ul style="list-style-type: none"> • Incomplete—Ethernet interface has the speed or link mode configured. • No autonegotiation—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation. • Complete—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner status—OK when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner: <ul style="list-style-type: none"> • Link mode—Depending on the capability of the attached Ethernet device, either Full-duplex or Half-duplex. • Flow control—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is None. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), and Symmetric/Asymmetric (link partner supports both PAUSE on receive and transmit or only PAUSE receive). • Remote fault—Remote fault information from the link partner—Failure indicates a receive link error. OK indicates that the link partner is receiving. Negotiation error indicates a negotiation error. Offline indicates that the link partner is going offline. • Local resolution—Information from the link partner: <ul style="list-style-type: none"> • Flow control—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), and Symmetric/Asymmetric (link partner supports both PAUSE on receive and transmit or only PAUSE receive). • Remote fault—Remote fault information. Link OK (no error detected on receive), Offline (local interface is offline), and Link Failure (link error detected on receive). 	extensive
Received path trace, Transmitted path trace	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other routing device manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the routing device at the other end of the fiber. The transmitted path trace value is the message that this routing device transmits.</p>	extensive
Packet Forwarding Engine configuration	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> • Destination slot—FPC slot number. 	extensive

Table 130: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
CoS information	Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP interface index number for the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under <i>Common Output Fields Description</i> .	All levels
VLAN-Tag	Rewrite profile applied to incoming or outgoing frames on the outer (Out) VLAN tag or for both the outer and inner (In) VLAN tags. <ul style="list-style-type: none"> • push—An outer VLAN tag is pushed in front of the existing VLAN tag. • pop—The outer VLAN tag of the incoming frame is removed. • swap—The outer VLAN tag of the incoming frame is overwritten with the user specified VLAN tag information. • push-pop—An outer VLAN tag is pushed in front of the existing VLAN tag, and then removed. • push-push—Two VLAN tags are pushed in from the incoming frame. • swap-push—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame. • swap-swap—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user specified VLAN tag value. • pop-swap—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame. • pop-pop—Both the outer and inner VLAN tags of the incoming frame are removed. 	brief detail extensive none

Table 130: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Demux:	IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following: <ul style="list-style-type: none"> Source Family Inet Destination Family Inet 	detail extensive none
Encapsulation	Encapsulation on the logical interface.	All levels
Protocol	Protocol family. Possible values are described in the "Protocol Field" section under <i>Common Output Fields Description</i> .	detail extensive none
MTU	Maximum transmission unit size on the logical interface.	detail extensive none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	detail extensive none
Traffic statistics	Number and rate of bytes and packets received and transmitted on the specified interface set. <ul style="list-style-type: none"> Input bytes, Output bytes—Number of bytes received and transmitted on the interface set Input packets, Output packets—Number of packets received and transmitted on the interface set. 	detail extensive
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.	extensive
Local statistics	Number and rate of bytes and packets destined to the routing device.	extensive
Transit statistics	Number and rate of bytes and packets transiting the switch. <p>NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the Output bytes and Output packets interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.</p>	extensive
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route Table	Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	detail extensive none
Flags	Information about protocol family flags. Possible values are described in the "Family Flags" section under <i>Common Output Fields Description</i> .	detail extensive
Donor interface	(Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.	detail extensive none

Table 130: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Preferred source address	(Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.	detail extensive none
Input Filters	Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	detail extensive
Output Filters	Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	detail extensive
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	detail extensive none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .	detail extensive none
<i>protocol-family</i>	Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed.	brief
Flags	Information about address flag (possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i>).	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address of the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

Release Information Command introduced before Junos OS Release 7.4 for Gigabit interfaces.
 Command introduced in Junos OS Release 8.0 for 10 Gigabit interfaces.
 Command modified in Junos OS Release 9.5 for SRX Series devices.
 Command introduced in Junos OS Release 18.1 for Gigabit interfaces.

Description Display status information about the specified Gigabit Ethernet interface.

(M320, M120, MX Series, and T Series routers only) Display status information about the specified 10-Gigabit Ethernet interface.

Display the IPv6 interface traffic statistics about the specified Gigabit Ethernet interface for MX series routers. The input and output bytes (bps) and packets (pps) rates are not displayed for IFD and local traffic.

Display status information and statistics about interfaces on SRX Series appliance running Junos OS.

NOTE: On SRX Series appliances, on configuring identical IPs on a single interface, you will not see a warning message; instead, you will see a syslog message.

Starting in Junos OS Release 18.4R1, Output fields **Next-hop** and **vpls-status** is displayed in the **show interfaces *interface name* detail** command, only for Layer 2 protocols on MX480 routers.

Options For Gigabit interfaces:

ge-fpc/pic/port—Display standard information about the specified Gigabit Ethernet interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

For 10 Gigabit interfaces:

xe-fpc/pic/port—Display standard information about the specified 10-Gigabit Ethernet interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

For SRX interfaces:

- **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace *pim* with the PIM slot and port with the port number.
 - **at-*pim*/0/*port***—ATM-over-ADSL or ATM-over-SHDSL interface.
 - **ce1-*pim*/0/*port***—Channelized E1 interface.
 - **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
 - **ct1-*pim*/0/*port***—Channelized T1 interface.
 - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
 - **e1-*pim*/0/*port***—E1 interface.
 - **e3-*pim*/0/*port***—E3 interface.
 - **fe-*pim*/0/*port***—Fast Ethernet interface.
 - **ge-*pim*/0/*port***—Gigabit Ethernet interface.
 - **se-*pim*/0/*port***—Serial interface.
 - **t1-*pim*/0/*port***—T1 (also called DS1) interface.
 - **t3-*pim*/0/*port***—T3 (also called DS3) interface.
 - **wx-slot/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).
- **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace *pim* with the PIM slot and port with the port number.
 - **at-*pim*/0/*port***—ATM-over-ADSL or ATM-over-SHDSL interface.
 - **ce1-*pim*/0/*port***—Channelized E1 interface.
 - **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
 - **ct1-*pim*/0/*port***—Channelized T1 interface.
 - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
 - **e1-*pim*/0/*port***—E1 interface.
 - **e3-*pim*/0/*port***—E3 interface.
 - **fe-*pim*/0/*port***—Fast Ethernet interface.
 - **ge-*pim*/0/*port***—Gigabit Ethernet interface.

- **se-pim/0/port**—Serial interface.
- **t1-pim/0/port**—T1 (also called DS1) interface.
- **t3-pim/0/port**—T3 (also called DS3) interface.
- **wx-slot/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).

Additional Information In a logical system, this command displays information only about the logical interfaces and not about the physical interfaces.

Output Fields [Table 131 on page 1997](#) describes the output fields for the **show interfaces** (Gigabit Ethernet) command. Output fields are listed in the approximate order in which they appear. For Gigabit Ethernet IQ and IQE PICs, the traffic and MAC statistics vary by interface type. For more information, see [Table 132 on page 2024](#).

Table 131: show interfaces (Gigabit Ethernet) Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface.	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Loopback status: Enabled or Disabled . If loopback is enabled, type of loopback: Local or Remote .	All levels
Source filtering	Source filtering status: Enabled or Disabled .	All levels
LAN-PHY mode	10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.	All levels
WAN-PHY mode	10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.	All levels
Unidirectional	Unidirectional link mode status for 10-Gigabit Ethernet interface: Enabled or Disabled for parent interface; Rx-only or Tx-only for child interfaces.	All levels
Flow control	Flow control status: Enabled or Disabled .	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: Enabled or Disabled .	All levels
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> • Online—Autonegotiation is manually configured as online. • Offline—Autonegotiation is manually configured as offline. 	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .	All levels

Table 131: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Link flags	Information about the link. Possible values are described in the “Links Flags” section under <i>Common Output Fields Description</i> .	All levels
Wavelength	(10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).	All levels
Frequency	(10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).	All levels
CoS queues	Number of CoS queues configured.	detail extensive none
Schedulers	(Gigabit Ethernet intelligent queuing 2 [IQ2] interfaces only) Number of CoS schedulers configured.	extensive
Hold-times	Current interface hold-time up and hold-time down, in milliseconds (ms).	detail extensive
Current address	Configured MAC address.	detail extensive none
Hardware address	Hardware MAC address.	detail extensive none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Input Rate	Input rate in bits per second (bps) and packets per second (pps). The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None
Output Rate	Output rate in bps and pps. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Egress account overhead	Layer 2 overhead in bytes that is accounted in the interface statistics for egress traffic.	detail extensive
Ingress account overhead	Layer 2 overhead in bytes that is accounted in the interface statistics for ingress traffic.	detail extensive

Table 131: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

Field Name	Field Description	Level of Output
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • Output bytes—Number of bytes transmitted on the interface. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. <p>Gigabit Ethernet and 10-Gigabit Ethernet IQ PICs count the overhead and CRC bytes.</p> <p>For Gigabit Ethernet IQ PICs, the input byte counts vary by interface type. For more information, see Table 31 under the show interfaces command.</p>	detail extensive
Input errors	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the ignore-l3-incompletes statement. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • FIFO errors—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • Resource errors—Sum of transmit drops. 	extensive

Table 131: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. <p>NOTE: Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the Drops field does not always use the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> <ul style="list-style-type: none"> • Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number must always be 0. If it is nonzero, there is a software bug. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field must never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive
Egress queues	<p>Total number of egress queues supported on the specified interface.</p> <p>NOTE: In DPCs that are not of the enhanced type, such as DPC 40x 1GER, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the show interfaces command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs</p>	detail extensive

Table 131: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Queue counters (Egress)	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. <p>NOTE: Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the Dropped packets field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p>	detail extensive
Ingress queues	Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.	extensive
Queue counters (Ingress)	<p>CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	extensive
Active alarms and Active defects	<p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value None or Link.</p> <ul style="list-style-type: none"> • None—There are no active defects or alarms. • Link—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning. 	detail extensive none
Interface transmit statistics	<p>(On MX Series devices) Status of the interface-transmit-statistics configuration: Enabled or Disabled.</p> <ul style="list-style-type: none"> • Enabled—When the interface-transmit-statistics statement is included in the configuration. If this is configured, the interface statistics show the actual transmitted load on the interface. • Disabled—When the interface-transmit-statistics statement is not included in the configuration. If this is not configured, the interface statistics show the offered load on the interface. 	detail extensive
OTN FEC statistics	<p>The forward error correction (FEC) counters provide the following statistics:</p> <ul style="list-style-type: none"> • Corrected Errors—Count of corrected errors in the last second. • Corrected Error Ratio—Corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits. 	detail extensive

Table 131: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
PCS statistics	<p>(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device.</p> <ul style="list-style-type: none"> • Bit errors—Number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode. • Errored blocks—Number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode. 	detail extensive
Link Degrad	<p>Shows the link degrade status of the physical link and the estimated bit error rates (BERs). This field is available only for the PICs supporting the physical link monitoring feature.</p> <ul style="list-style-type: none"> • Link Monitoring—Indicates if physical link degrade monitoring is enabled on the interface. <ul style="list-style-type: none"> • Enable—Indicates that link degrade monitoring has been enabled (using the link-degrade-monitor statement) on the interface. • Disable—Indicates that link degrade monitoring has not been enabled on the interface. If link degrade monitoring has not been enabled, the output does not show any related information, such as BER values and thresholds. • Link Degrad Set Threshold—The BER threshold value at which the link is considered degraded and a corrective action is triggered. • Link Degrad Clear Threshold—The BER threshold value at which the degraded link is considered recovered and the corrective action applied to the interface is reverted. • Estimated BER—The estimated bit error rate. • Link-degrade event—Shows link degrade event information. <ul style="list-style-type: none"> • Seconds—Time (in seconds) elapsed after a link degrade event occurred. • Count—The number of link degrade events recorded. • State—Shows the link degrade status (example: Defect Active). 	detail extensive

Table 131: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
MAC statistics	<p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> • Total octets and total packets—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see Table 31 under the <code>show interfaces</code> command. • Unicast packets, Broadcast packets, and Multicast packets—Number of unicast, broadcast, and multicast packets. • CRC/Align errors—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • FIFO error—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning. • MAC control frames—Number of MAC control frames. • MAC pause frames—Number of MAC control frames with pause operational code. • Oversized frames—There are two possible conditions regarding the number of oversized frames: <ul style="list-style-type: none"> • Packet length exceeds interface MTU, or • Packet length exceeds MRU • Jabber frames—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • Fragment frames—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • VLAN tagged frames—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. <p>NOTE: The 20-port Gigabit Ethernet MIC (MIC-3D-20GE-SFP) does not have hardware counters for VLAN frames. Therefore, the VLAN tagged frames field displays 0 when the <code>show interfaces</code> command is executed on a 20-port Gigabit Ethernet MIC. In other words, the number of VLAN tagged frames cannot be determined for the 20-port Gigabit Ethernet MIC.</p> • Code violations—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error." 	extensive
OTN Received Overhead Bytes	APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08	extensive
OTN Transmitted Overhead Bytes	APS/PCC0: 0x00, APS/PCC1: 0x00, APS/PCC2: 0x00, APS/PCC3: 0x00 Payload Type: 0x08	extensive

Table 131: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Filter statistics	<p>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet may enter the system or be rejected.</p> <ul style="list-style-type: none"> • Input packet count—Number of packets received from the MAC hardware that the filter processed. • Input packet rejects—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • Input DA rejects—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the router from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local router (which the router is rejecting). • Input SA rejects—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field must increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • Output packet count—Number of packets that the filter has given to the MAC hardware. • Output packet pad count—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • Output packet error count—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field must not increment. • CAM destination filters, CAM source filters—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields must be 0. 	extensive
PMA PHY	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • PHY Lock—Phase-locked loop • PHY Light—Loss of optical signal 	extensive

Table 131: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

Field Name	Field Description	Level of Output
WIS section	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B1—Bit interleaved parity for SONET section overhead • SEF—Severely errored framing • LOL—Loss of light • LOF—Loss of frame • ES-S—Errored seconds (section) • SES-S—Severely errored seconds (section) • SEFS-S—Severely errored framing seconds (section) 	extensive
WIS line	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B2—Bit interleaved parity for SONET line overhead • REI-L—Remote error indication (near-end line) • RDI-L—Remote defect indication (near-end line) • AIS-L—Alarm indication signal (near-end line) • BERR-SF—Bit error rate fault (signal failure) • BERR-SD—Bit error rate defect (signal degradation) • ES-L—Errored seconds (near-end line) • SES-L—Severely errored seconds (near-end line) • UAS-L—Unavailable seconds (near-end line) • ES-LFE—Errored seconds (far-end line) • SES-LFE—Severely errored seconds (far-end line) • UAS-LFE—Unavailable seconds (far-end line) 	extensive

Table 131: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
WIS path	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B3—Bit interleaved parity for SONET section overhead • REI-P—Remote error indication • LOP-P—Loss of pointer (path) • AIS-P—Path alarm indication signal • RDI-P—Path remote defect indication • UNEQ-P—Path unequipped • PLM-P—Path payload (signal) label mismatch • ES-P—Errored seconds (near-end STS path) • SES-P—Severely errored seconds (near-end STS path) • UAS-P—Unavailable seconds (near-end STS path) • SES-PFE—Severely errored seconds (far-end STS path) • UAS-PFE—Unavailable seconds (far-end STS path) 	extensive

Table 131: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Autonegotiation information	<p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> • Negotiation status: <ul style="list-style-type: none"> • Incomplete—Ethernet interface has the speed or link mode configured. • No autonegotiation—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation. • Complete—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner status—OK when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner—Information from the remote Ethernet device: <ul style="list-style-type: none"> • Link mode—Depending on the capability of the link partner, either Full-duplex or Half-duplex. • Flow control—Types of flow control supported by the link partner. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), Symmetric/Asymmetric (link partner supports PAUSE on receive and transmit or only PAUSE on transmit), and None (link partner does not support flow control). • Remote fault—Remote fault information from the link partner—Failure indicates a receive link error. OK indicates that the link partner is receiving. Negotiation error indicates a negotiation error. Offline indicates that the link partner is going offline. • Local resolution—Information from the local Ethernet device: <ul style="list-style-type: none"> • Flow control—Types of flow control supported by the local device. For Gigabit Ethernet interfaces, advertised capabilities are Symmetric/Asymmetric (local device supports PAUSE on receive and transmit or only PAUSE on receive) and None (local device does not support flow control). Depending on the result of the negotiation with the link partner, local resolution flow control type will display Symmetric (local device supports PAUSE on receive and transmit), Asymmetric (local device supports PAUSE on receive), and None (local device does not support flow control). • Remote fault—Remote fault information. Link OK (no error detected on receive), Offline (local interface is offline), and Link Failure (link error detected on receive). 	extensive
Received path trace, Transmitted path trace	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.</p>	extensive
Packet Forwarding Engine configuration	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> • Destination slot—FPC slot number. 	extensive

Table 131: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
CoS information	Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP interface index number for the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .	All levels
VLAN-Tag	Rewrite profile applied to incoming or outgoing frames on the outer (Out) VLAN tag or for both the outer and inner (In) VLAN tags. <ul style="list-style-type: none"> • push—An outer VLAN tag is pushed in front of the existing VLAN tag. • pop—The outer VLAN tag of the incoming frame is removed. • swap—The outer VLAN tag of the incoming frame is overwritten with the user-specified VLAN tag information. • push—An outer VLAN tag is pushed in front of the existing VLAN tag. • push-push—Two VLAN tags are pushed in from the incoming frame. • swap-push—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame. • swap-swap—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user-specified VLAN tag value. • pop-swap—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame. • pop-pop—Both the outer and inner VLAN tags of the incoming frame are removed. 	brief detail extensive none

Table 131: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Demux	<p>IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following:</p> <ul style="list-style-type: none"> Source Family Inet Destination Family Inet 	detail extensive none
Encapsulation	Encapsulation on the logical interface.	All levels
ACI VLAN	<p>Information displayed for agent circuit identifier (ACI) interface set configured with the agent-circuit-id autoconfiguration stanza.</p> <p>Dynamic Profile—Name of the dynamic profile that defines the ACI interface set.</p> <p>If configured, the ACI interface set enables the underlying Ethernet interface to create dynamic VLAN subscriber interfaces based on ACI information.</p> <p>NOTE: The ACI VLAN field is replaced with the Line Identity field when an ALI interface set is configured with the line-identity autoconfiguration stanza.</p>	brief detail extensive none
Line Identity	<p>Information displayed for access-line-identifier (ALI) interface sets configured with the line-identity autoconfiguration stanza.</p> <ul style="list-style-type: none"> Dynamic Profile—Name of the dynamic profile that defines the ALI interface set. Trusted option used to create the ALI interface set: Circuit-id, Remote-id, or Accept-no-ids. More than one option can be configured. <p>If configured, the ALI interface set enables the underlying Ethernet interface to create dynamic VLAN subscriber interfaces based on ALI information.</p> <p>NOTE: The Line Identity field is replaced with the ACI VLAN field when an ACI interface set is configured with the agent-circuit-id autoconfiguration stanza.</p>	detail
Protocol	Protocol family. Possible values are described in the "Protocol Field" section under <i>Common Output Fields Description</i> .	detail extensive none
MTU	Maximum transmission unit size on the logical interface.	detail extensive none
Neighbor Discovery Protocol (NDP) Queue Statistics	<p>NDP statistics for protocol inet6 under logical interface statistics.</p> <ul style="list-style-type: none"> Max nh cache—Maximum interface neighbor discovery nexthop cache size. New hold nh limit—Maximum number of new unresolved nexthops. Curr nh cnt—Current number of resolved nexthops in the NDP queue. Curr new hold cnt—Current number of unresolved nexthops in the NDP queue. NH drop cnt—Number of NDP requests not serviced. 	All levels
Dynamic Profile	Name of the dynamic profile that was used to create this interface configured with a Point-to-Point Protocol over Ethernet (PPPoE) family.	detail extensive none
Service Name Table	Name of the service name table for the interface configured with a PPPoE family.	detail extensive none

Table 131: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Max Sessions	Maximum number of PPPoE logical interfaces that can be activated on the underlying interface.	detail extensive none
Duplicate Protection	State of PPPoE duplicate protection: On or Off . When duplicate protection is configured for the underlying interface, a dynamic PPPoE logical interface cannot be activated when an existing active logical interface is present for the same PPPoE client.	detail extensive none
Direct Connect	State of the configuration to ignore DSL Forum VSAs: On or Off . When configured, the router ignores any of these VSAs received from a directly connected CPE device on the interface.	detail extensive none
AC Name	Name of the access concentrator.	detail extensive none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	detail extensive none
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the specified interface set.</p> <ul style="list-style-type: none"> Input bytes, Output bytes—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. Input packets, Output packets—Number of packets received and transmitted on the interface set. 	detail extensive
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.	extensive
Local statistics	Number and rate of bytes and packets destined to the router.	extensive
Transit statistics	<p>Number and rate of bytes and packets transiting the switch.</p> <p>NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the Output bytes and Output packets interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.</p>	extensive
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route Table	Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	detail extensive none
Flags	Information about protocol family flags. Possible values are described in the "Family Flags" section under <i>Common Output Fields Description</i> .	detail extensive

Table 131: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

Field Name	Field Description	Level of Output
Donor interface	(Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.	detail extensive none
Preferred source address	(Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.	detail extensive none
Input Filters	Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parentheses next to all interfaces.	detail extensive
Output Filters	Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parentheses next to all interfaces.	detail extensive
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	detail extensive none
Addresses, Flags	Information about the address flags. Possible values are described in the "Addresses Flags" section under <i>Common Output Fields Description</i> .	detail extensive none
<i>protocol-family</i>	Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed.	brief
Flags	Information about the address flag. Possible values are described in the "Addresses Flags" section under <i>Common Output Fields Description</i> .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address of the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

The following table describes the output fields for the **show interfaces** (10-Gigabit Ethernet) command.

Field Name	Field Description	Level of Output
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the "Enabled Field" section under <i>Common Output Fields Description</i> .	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	detail extensive none

SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface.	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Loopback status: Enabled or Disabled . If loopback is enabled, type of loopback: Local or Remote .	All levels
Source filtering	Source filtering status: Enabled or Disabled .	All levels
LAN-PHY mode	10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.	All levels
WAN-PHY mode	10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.	All levels
Unidirectional	Unidirectional link mode status for 10-Gigabit Ethernet interface: Enabled or Disabled for parent interface; Rx-only or Tx-only for child interfaces.	All levels
Flow control	Flow control status: Enabled or Disabled .	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: Enabled or Disabled .	All levels
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> • Online—Autonegotiation is manually configured as online. • Offline—Autonegotiation is manually configured as offline. 	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .	All levels
Link flags	Information about the link. Possible values are described in the “Links Flags” section under <i>Common Output Fields Description</i> .	All levels
Wavelength	(10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).	All levels
Frequency	(10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).	All levels
CoS queues	Number of CoS queues configured.	detail extensive none

Schedulers	(Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces only) Number of CoS schedulers configured.	extensive
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
Current address	Configured MAC address.	detail extensive none
Hardware address	Hardware MAC address.	detail extensive none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Input Rate	Input rate in bits per second (bps) and packets per second (pps). The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None specified
Output Rate	Output rate in bps and pps. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Egress account overhead	Layer 2 overhead in bytes that is accounted in the interface statistics for egress traffic.	detail extensive
Ingress account overhead	Layer 2 overhead in bytes that is accounted in the interface statistics for ingress traffic.	detail extensive
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • Output bytes—Number of bytes transmitted on the interface. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive

Input errors	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the ignore-l3-incompletes statement. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • FIFO errors—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • Resource errors—Sum of transmit drops. 	extensive
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive

Egress queues	Total number of egress queues supported on the specified interface. NOTE: In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the show interfaces command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs	detail extensive
Queue counters (Egress)	CoS queue number and its associated user-configured forwarding class name. <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive
Ingress queues	Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.	extensive
Queue counters (Ingress)	CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces. <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	extensive
Active alarms and Active defects	Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the routing device configuration, an alarm can ring the red or yellow alarm bell on the routing device, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value None or Link . <ul style="list-style-type: none"> • None—There are no active defects or alarms. • Link—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning. 	detail extensive none
OTN alarms	Active OTN alarms identified on the interface.	detail extensive
OTN defects	OTN defects received on the interface.	detail extensive
OTN FEC Mode	The FECmode configured on the interface. <ul style="list-style-type: none"> • efec—Enhanced forward error correction (EFEC) is configured to detect and correct bit errors. • gfec—G.709 Forward error correction (GFEC) mode is configured to detect and correct bit errors. • none—FEC mode is not configured. 	detail extensive

OTN Rate	<p>OTN mode.</p> <ul style="list-style-type: none"> • fixed-stuff-bytes—Fixed stuff bytes 11.0957 Gbps. • no-fixed-stuff-bytes—No fixed stuff bytes 11.0491 Gbps. • pass-through—Enable OTN passthrough mode. • no-pass-through—Do not enable OTN passthrough mode. 	detail extensive
OTN Line Loopback	Status of the line loopback, if configured for the DWDM OTN PIC. Its value can be: enabled or disabled .	detail extensive
OTN FEC statistics	<p>The forward error correction (FEC) counters for the DWDM OTN PIC.</p> <ul style="list-style-type: none"> • Corrected Errors—The count of corrected errors in the last second. • Corrected Error Ratio—The corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits. 	detail extensive
OTN FEC alarms	<p>OTN FEC excessive or degraded error alarms triggered on the interface.</p> <ul style="list-style-type: none"> • FEC Degrade—OTU FEC Degrade defect. • FEC Excessive—OTU FEC Excessive Error defect. 	detail extensive
OTN OC	<p>OTN OC defects triggered on the interface.</p> <ul style="list-style-type: none"> • LOS—OC Loss of Signal defect. • LOF—OC Loss of Frame defect. • LOM—OC Loss of Multiframe defect. • Wavelength Lock—OC Wavelength Lock defect. 	detail extensive
OTN OTU	<p>OTN OTU defects detected on the interface</p> <ul style="list-style-type: none"> • AIS—OTN AIS alarm. • BDI—OTN OTU BDI alarm. • IAE—OTN OTU IAE alarm. • TTIM—OTN OTU TTIM alarm. • SF—OTN ODU bit error rate fault alarm. • SD—OTN ODU bit error rate defect alarm. • TCA-ES—OTN ODU ES threshold alarm. • TCA-SES—OTN ODU SES threshold alarm. • TCA-UAS—OTN ODU UAS threshold alarm. • TCA-BBE—OTN ODU BBE threshold alarm. • BIP—OTN ODU BIP threshold alarm. • BBE—OTN OTU BBE threshold alarm. • ES—OTN OTU ES threshold alarm. • SES—OTN OTU SES threshold alarm. • UAS—OTN OTU UAS threshold alarm. 	detail extensive
Received DAPI	Destination Access Port Interface (DAPI) from which the packets were received.	detail extensive
Received SAPI	Source Access Port Interface (SAPI) from which the packets were received.	detail extensive
Transmitted DAPI	Destination Access Port Interface (DAPI) to which the packets were transmitted.	detail extensive

Transmitted SAPI	Source Access Port Interface (SAPI) to which the packets were transmitted.	detail extensive
PCS statistics	<p>(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device.</p> <ul style="list-style-type: none"> • Bit errors—The number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode. • Errored blocks—The number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode. 	detail extensive
MAC statistics	<p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> • Total octets and total packets—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. • Unicast packets, Broadcast packets, and Multicast packets—Number of unicast, broadcast, and multicast packets. • CRC/Align errors—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • FIFO error—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning. • MAC control frames—Number of MAC control frames. • MAC pause frames—Number of MAC control frames with pause operational code. • Oversized frames—Number of frames that exceed 1518 octets. • Jabber frames—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • Fragment frames—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • VLAN tagged frames—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. • Code violations—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error." 	extensive
OTN Received Overhead Bytes	APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08	extensive
OTN Transmitted Overhead Bytes	APS/PCC0: 0x00, APS/PCC1: 0x00, APS/PCC2: 0x00, APS/PCC3: 0x00 Payload Type: 0x08	extensive

Filter statistics	<p>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> • Input packet count—Number of packets received from the MAC hardware that the filter processed. • Input packet rejects—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • Input DA rejects—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting). • Input SA rejects—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • Output packet count—Number of packets that the filter has given to the MAC hardware. • Output packet pad count—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • Output packet error count—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment. • CAM destination filters, CAM source filters—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0. 	extensive
PMA PHY	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. 	extensive

WIS section	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information: <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. Subfields are: <ul style="list-style-type: none"> • BIP-B1—Bit interleaved parity for SONET section overhead • SEF—Severely errored framing • LOL—Loss of light • LOF—Loss of frame • ES-S—Errored seconds (section) • SES-S—Severely errored seconds (section) • SEFS-S—Severely errored framing seconds (section) 	extensive
WIS line	(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information. <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. Subfields are: <ul style="list-style-type: none"> • BIP-B2—Bit interleaved parity for SONET line overhead • REI-L—Remote error indication (near-end line) • RDI-L—Remote defect indication (near-end line) • AIS-L—Alarm indication signal (near-end line) • BERR-SF—Bit error rate fault (signal failure) • BERR-SD—Bit error rate defect (signal degradation) • ES-L—Errored seconds (near-end line) • SES-L—Severely errored seconds (near-end line) • UAS-L—Unavailable seconds (near-end line) • ES-LFE—Errored seconds (far-end line) • SES-LFE—Severely errored seconds (far-end line) • UAS-LFE—Unavailable seconds (far-end line) 	extensive

WIS path	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information. extensive</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B3—Bit interleaved parity for SONET section overhead • REI-P—Remote error indication • LOP-P—Loss of pointer (path) • AIS-P—Path alarm indication signal • RDI-P—Path remote defect indication • UNEQ-P—Path unequipped • PLM-P—Path payload label mismatch • ES-P—Errored seconds (near-end STS path) • SES-P—Severely errored seconds (near-end STS path) • UAS-P—Unavailable seconds (near-end STS path) • SES-PFE—Severely errored seconds (far-end STS path) • UAS-PFE—Unavailable seconds (far-end STS path)
Autonegotiation information	<p>Information about link autonegotiation. extensive</p> <ul style="list-style-type: none"> • Negotiation status: <ul style="list-style-type: none"> • Incomplete—Ethernet interface has the speed or link mode configured. • No autonegotiation—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation. • Complete—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner status—OK when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner: <ul style="list-style-type: none"> • Link mode—Depending on the capability of the attached Ethernet device, either Full-duplex or Half-duplex. • Flow control—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is None. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), and Symmetric/Asymmetric (link partner supports both PAUSE on receive and transmit or only PAUSE receive). • Remote fault—Remote fault information from the link partner—Failure indicates a receive link error. OK indicates that the link partner is receiving. Negotiation error indicates a negotiation error. Offline indicates that the link partner is going offline. • Local resolution—Information from the link partner: <ul style="list-style-type: none"> • Flow control—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), and Symmetric/Asymmetric (link partner supports both PAUSE on receive and transmit or only PAUSE receive). • Remote fault—Remote fault information. Link OK (no error detected on receive), Offline (local interface is offline), and Link Failure (link error detected on receive).

Received path trace, Transmitted path trace	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the routing device at the other end of the fiber. The transmitted path trace value is the message that this routing device transmits.	extensive
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: <ul style="list-style-type: none"> • Destination slot—FPC slot number. 	extensive
CoS information	Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP interface index number for the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .	All levels

VLAN-Tag	<p>Rewrite profile applied to incoming or outgoing frames on the outer (Out) VLAN tag or for both the outer and inner (In) VLAN tags.</p> <ul style="list-style-type: none"> • push—An outer VLAN tag is pushed in front of the existing VLAN tag. • pop—The outer VLAN tag of the incoming frame is removed. • swap—The outer VLAN tag of the incoming frame is overwritten with the user specified VLAN tag information. • push—An outer VLAN tag is pushed in front of the existing VLAN tag. • push-push—Two VLAN tags are pushed in from the incoming frame. • swap-push—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame. • swap-swap—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user specified VLAN tag value. • pop-swap—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame. • pop-pop—Both the outer and inner VLAN tags of the incoming frame are removed. 	brief detail extensive none
Demux:	<p>IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following:</p> <ul style="list-style-type: none"> • Source Family Inet • Destination Family Inet 	detail extensive none
Encapsulation	Encapsulation on the logical interface.	All levels
Protocol	Protocol family. Possible values are described in the “Protocol Field” section under <i>Common Output Fields Description</i> .	detail extensive none
MTU	Maximum transmission unit size on the logical interface.	detail extensive none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	detail extensive none
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the specified interface set.</p> <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • Input packets, Output packets—Number of packets received and transmitted on the interface set. 	detail extensive
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.	extensive
Local statistics	Number and rate of bytes and packets destined to the routing device.	extensive

Transit statistics	Number and rate of bytes and packets transiting the switch. NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the Output bytes and Output packets interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.	extensive
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route Table	Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	detail extensive none
Flags	Information about protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .	detail extensive
Donor interface	(Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.	detail extensive none
Preferred source address	(Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.	detail extensive none
Input Filters	Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	detail extensive
Output Filters	Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	detail extensive
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	detail extensive none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .	detail extensive none
<i>protocol-family</i>	Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed.	brief
Flags	Information about address flag (possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address of the logical interlace.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

For Gigabit Ethernet IQ PICs, traffic and MAC statistics output varies. The following table describes the traffic and MAC statistics for two sample interfaces, each of which is sending traffic in packets of 500 bytes (including 478 bytes for the Layer 3 packet, 18 bytes for the Layer 2 VLAN traffic header, and 4 bytes for cyclic redundancy check [CRC] information). The **ge-0/3/0** interface is the inbound physical interface, and the **ge-0/0/0** interface is the outbound physical interface. On both interfaces, traffic is carried on logical unit **.50** (VLAN 50).

Table 132: Gigabit and 10 Gigabit Ethernet IQ PIC Traffic and MAC Statistics by Interface Type

Interface Type	Sample Command	Byte and Octet Counts Include	Comments
Inbound physical interface	show interfaces ge-0/3/0 extensive	Traffic statistics: Input bytes: 496 bytes per packet, representing the Layer 2 packet MAC statistics: Received octets: 500 bytes per packet, representing the Layer 2 packet + 4 bytes	The additional 4 bytes are for the CRC.
Inbound logical interface	show interfaces ge-0/3/0.50 extensive	Traffic statistics: Input bytes: 478 bytes per packet, representing the Layer 3 packet	
Outbound physical interface	show interfaces ge-0/0/0 extensive	Traffic statistics: Input bytes: 490 bytes per packet, representing the Layer 3 packet + 12 bytes MAC statistics: Received octets: 478 bytes per packet, representing the Layer 3 packet	For input bytes, the additional 12 bytes include 6 bytes for the destination MAC address plus 4 bytes for VLAN plus 2 bytes for the Ethernet type.
Outbound logical interface	show interfaces ge-0/0/0.50 extensive	Traffic statistics: Input bytes: 478 bytes per packet, representing the Layer 3 packet	

[Table 133 on page 2025](#) lists the output fields for the **show interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 133: show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface.	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Link-level type	Encapsulation being used on the physical interface.	All levels
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
MTU	Maximum transmission unit size on the physical interface.	All levels
Link mode	Link mode: Full-duplex or Half-duplex.	
Speed	Speed at which the interface is running.	All levels
BPDU error	Bridge protocol data unit (BPDU) error: Detected or None	
Loopback	Loopback status: Enabled or Disabled . If loopback is enabled, type of loopback: Local or Remote .	All levels
Source filtering	Source filtering status: Enabled or Disabled .	All levels
Flow control	Flow control status: Enabled or Disabled .	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: Enabled or Disabled .	All levels
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> • Online—Autonegotiation is manually configured as online. • Offline—Autonegotiation is manually configured as offline. 	All levels
Device flags	Information about the physical device.	All levels
Interface flags	Information about the interface.	All levels
Link flags	Information about the physical link.	All levels
CoS queues	Number of CoS queues configured.	detail extensive none
Current address	Configured MAC address.	detail extensive none

Table 133: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None
Output Rate	Output rate in bps and pps.	None
Active alarms and Active defects	<p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. These fields can contain the value None or Link.</p> <ul style="list-style-type: none"> • None—There are no active defects or alarms. • Link—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning. 	detail extensive none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive

Table 133: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Input errors	<p>Input errors on the interface.</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <code>ignore-l3-incompletes</code>. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • FIFO errors—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • Resource errors—Sum of transmit drops. 	extensive
Output errors	<p>Output errors on the interface.</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation; therefore, for Gigabit Ethernet PICs, this number must always remain 0. If it is nonzero, there is a software bug. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field must never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the interfaces. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive

Table 133: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Ingress queues	Total number of ingress queues supported on the specified interface.	extensive
Queue counters and queue number	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive
MAC statistics	<p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> • Total octets and total packets—Total number of octets and packets. • Unicast packets, Broadcast packets, and Multicast packets—Number of unicast, broadcast, and multicast packets. • CRC/Align errors—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • FIFO error—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning. • MAC control frames—Number of MAC control frames. • MAC pause frames—Number of MAC control frames with pause operational code. • Oversized frames—There are two possible conditions regarding the number of oversized frames: <ul style="list-style-type: none"> • Packet length exceeds 1518 octets, or • Packet length exceeds MRU • Jabber frames—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • Fragment frames—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • VLAN tagged frames—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. • Code violations—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error." 	extensive

Table 133: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Filter statistics	<p>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> • Input packet count—Number of packets received from the MAC hardware that the filter processed. • Input packet rejects—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • Input DA rejects—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local device (which the router is rejecting). • Input SA rejects—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • Output packet count—Number of packets that the filter has given to the MAC hardware. • Output packet pad count—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • Output packet error count—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment. • CAM destination filters, CAM source filters—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields must be 0. 	extensive
Autonegotiation information	<p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> • Negotiation status: <ul style="list-style-type: none"> • Incomplete—Ethernet interface has the speed or link mode configured. • No autonegotiation—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation. • Complete—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. 	extensive
Packet Forwarding Engine configuration	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> • Destination slot—FPC slot number. 	extensive

Table 133: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CoS information	<p>Information about the CoS queue for the physical interface.</p> <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Interface transmit statistics	Status of the interface-transmit-statistics configuration: Enabled or Disabled.	detail extensive
Queue counters (Egress)	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP interface index number for the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface.	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the specified interface set.</p> <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • Input packets, Output packets—Number of packets received and transmitted on the interface set. 	detail extensive

Table 133: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Local statistics	Number and rate of bytes and packets destined to the device.	extensive
Transit statistics	Number and rate of bytes and packets transiting the switch. NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the Output bytes and Output packets interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.	extensive
Security	Security zones that interface belongs to.	extensive
Flow Input statistics	Statistics on packets received by flow module.	extensive
Flow Output statistics	Statistics on packets sent by flow module.	extensive
Flow error statistics (Packets dropped due to)	Statistics on errors in the flow module.	extensive
Protocol	Protocol family.	detail extensive none
MTU	Maximum transmission unit size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics displayed in the **show interfaces** command output might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the interface counters. For detailed information, see the description of the logical interface **Transit statistics** fields in [Table 131 on page 1997](#).

show interfaces (M Series, MX Series, T Series Routers, and PTX Series Management and Internal Ethernet)

List of Syntax	Syntax (M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface) on page 2072 Syntax (M Series, MX Series, T Series, and PTX Series Routers Internal Ethernet Interface) on page 2072
Syntax (M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface)	<pre>show interfaces em0 fxp0 <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre>
Syntax (M Series, MX Series, T Series, and PTX Series Routers Internal Ethernet Interface)	<pre>show interfaces bcm0 em0 em1 fxp1 fxp2 ixgbe0 ixgbe1 <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced on PTX Series Packet Transport Routers for Junos OS Release 12.1.</p>
Description	(M Series, T Series, TX Matrix Plus, and PTX Series devices only) Display status information about the management Ethernet and internal Ethernet interfaces.
Options	<p>em0 fxp0—(M Series, MX Series, T Series, and PTX Series) Display standard information about the management Ethernet interface. For supported Ethernet interface by chassis and Routing Engine, see <i>Supported Routing Engines by Router</i>.</p> <p>bcm0 em0 em1 fxp1 fxp2 ixgbe0 ixgbe1—(M Series, MX Series, T Series, and PTX Series) Display standard information about the internal Ethernet interfaces. See <i>Supported Routing Engines by Router</i> for the internal Ethernet interface names for each Routing Engine by hardware platform.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p>

Output Fields [Table 134 on page 2073](#) lists the output fields for the **show interfaces** (management) command on the M Series routers, T Series routers, TX Matrix Plus routers, and PTX Series. Output fields are listed in the approximate order in which they appear.

Table 134: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .	All levels
Interface index	Physical interface index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Type	Type of interface.	All levels

Table 134: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface (continued)

Field Name	Field Description	Level of Output
Link-level type	Encapsulation type used on the physical interface.	All levels
MTU	Maximum transmission unit (MTU)—Size of the largest packet to be transmitted.	All levels
Clocking	Reference clock source of the interface.	All levels
Speed	Network speed on the interface.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .	All levels
Link type	Data transmission type.	detail extensive none
Link flags	Information about the link. Possible values are described in the “Link Flags” section under <i>Common Output Fields Description</i> .	detail extensive
Physical info	Information about the physical interface.	detail extensive
Hold-times	Current interface hold-time up and hold-time down. Value is in milliseconds.	detail extensive
Current address	Configured MAC address.	detail extensive none
Hardware address	Media access control (MAC) address of the interface.	detail extensive none
Alternate link address	Backup link address.	detail extensive
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Input packets	Number of packets received on the physical interface.	None specified
Output packets	Number of packets transmitted on the physical interface.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the logical and physical interface.</p> <ul style="list-style-type: none"> Input bytes, Output bytes—Number of bytes received and transmitted on the interface. Input packets, Output packets—Number of packets received and transmitted on the interface. 	detail extensive

Table 134: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface (continued)

Field Name	Field Description	Level of Output
Input errors	<ul style="list-style-type: none"> • Errors—Input errors on the interface. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Frames received smaller than the runt threshold. • Giants—Frames received larger than the giant threshold. • Policed Discards—Frames that the incoming packet match code discarded because they were not recognized or were not of interest. Usually, this field reports protocols that Junos does not support. • Resource errors—Sum of transmit drops. 	extensive
Output errors	<ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly, possibly once every 10 seconds, the cable, the remote system, or the interface is malfunctioning. • Errors—Sum of outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet dropped by the ASIC RED mechanism. • Resource errors—Sum of transmit drops. 	extensive
Logical Interface		
Logical interface	Name of the logical interface	All levels
Index	Logical interface index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	Logical interface SNMP interface index number.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface; values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .	All levels
Encapsulation	Encapsulation on the logical interface.	detail extensive none
inet	IP address of the logical interface.	brief
Protocol	Protocol family configured on the logical interface (such as iso or inet6).	detail extensive none
MTU	MTU size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

Table 134: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface (continued)

Field Name	Field Description	Level of Output
Route table	Route table in which this address exists. For example, Route table:0 refers to inet.0.	detail extensive
Flags	Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .	detail extensive none
Addresses, Flags	Information about address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

Sample Output

show interfaces brief (Management Ethernet)

```

user@host> show interfaces fxp0 brief

Physical interface: fxp0, Enabled, Physical link is Up
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Clocking: Unspecified,
  Speed: 100mbps
  Device flags   : Present Running
  Interface flags: SNMP-Traps

Logical interface fxp0.0
  Flags: SNMP-Traps Encapsulation: ENET2
  inet 192.168.70.143/21

show interfaces (PPPoE)

Syntax `show interfaces pp0.logical`
`<brief | detail | extensive | terse>`
`<descriptions>`
`<media>`
`<snmp-index snmp-index>`
`<statistics>`

Release Information Command introduced before Junos OS Release 7.4.

Description (M120 routers, M320 routers, and MX Series routers only). Display status information about the PPPoE interface.

Options `pp0.logical`—Display standard status information about the PPPoE interface.

`brief | detail | extensive | terse`—(Optional) Display the specified level of output.

`descriptions`—(Optional) Display interface description strings.

`media`—(Optional) Display media-specific information about PPPoE interfaces.

`snmp-index snmp-index`—(Optional) Display information for the specified SNMP index of the interface.

`statistics`—(Optional) Display PPPoE interface statistics.

Required Privilege Level view

List of Sample Output [show interfaces \(PPPoE\) on page 2095](#)
[show interfaces \(PPPoE over Aggregated Ethernet\) on page 2095](#)
[show interfaces brief \(PPPoE\) on page 2096](#)
[show interfaces detail \(PPPoE\) on page 2096](#)
[show interfaces extensive \(PPPoE on M120 and M320 Routers\) on page 2097](#)

Output Fields [Table 135 on page 2089](#) lists the output fields for the `show interfaces (PPPoE)` command. Output fields are listed in the approximate order in which they appear.

Table 135: show interfaces (PPPoE) Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .	All levels

Table 135: *show interfaces (PPPoE) Output Fields (continued)*

Field Name	Field Description	Level of Output
Interface index	Physical interface index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Type	Physical interface type (PPPoE).	All levels
Link-level type	Encapsulation on the physical interface (PPPoE).	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	Reference clock source. It can be Internal or External .	All levels
Speed	Speed at which the interface is running.	All levels
Device flags	Information about the physical device. Possible values are described in the "Device Flags" section under <i>Common Output Fields Description</i> .	All levels
Interface flags	Information about the interface. Possible values are described in the "Interface Flags" section under <i>Common Output Fields Description</i> .	All levels
Link type	Physical interface link type: full duplex or half duplex .	All levels
Link flags	Information about the interface. Possible values are described in the "Link Flags" section under <i>Common Output Fields Description</i> .	All levels
Input rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output rate	Output rate in bps and pps.	None specified
Physical Info	Physical interface information.	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
Current address	Configured MAC address.	detail extensive
Hardware address	MAC address of the hardware.	detail extensive
Alternate link address	Backup address of the link.	detail extensive
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive

Table 135: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
IPv6 transit statistics	<p>Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled.</p> <p>NOTE: These fields include dropped traffic and exception traffic, as those fields are not separately defined.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Input errors	<p>Input errors on the interface:</p> <ul style="list-style-type: none"> • Errors—Sum of incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Giants—Number of frames received that are larger than the giant threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • Resource errors—Sum of B chip Tx drops and IXP Tx net transmit drops. 	extensive
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions —Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), then the cable, the far-end system, or the PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of B chip Tx drops and IXP Tx net transmit drops. 	extensive

Logical Interface

Table 135: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number (which reflects its initialization sequence).	detail extensive none
SNMP ifIndex	Logical interface SNMP interface index number.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .	All levels
Encapsulation	Type of encapsulation configured on the logical interface.	All levels
PPP parameters	PPP status: <ul style="list-style-type: none"> • LCP restart timer—Length of time (in milliseconds) between successive Link Control Protocol (LCP) configuration requests. • NCP restart timer—Length of time (in milliseconds) between successive Network Control Protocol (NCP) configuration requests. 	detail
PPPoE	PPPoE status: <ul style="list-style-type: none"> • State—State of the logical interface (up or down). • Session ID—PPPoE session ID. • Service name—Type of service required. Can be used to indicate an Internet service provider (ISP) name or a class or quality of service. • Configured AC name—Configured access concentrator name. • Auto-reconnect timeout—Time after which to try to reconnect after a PPPoE session is terminated, in seconds. • Idle Timeout—Length of time (in seconds) that a connection can be idle before disconnecting. • Underlying interface—Interface on which PPPoE is running. 	All levels
Link	Name of the physical interfaces for member links in an aggregated Ethernet bundle for a PPPoE over aggregated Ethernet configuration. PPPoE traffic goes out on these interfaces.	All levels
Traffic statistics	Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize.	detail extensive

Table 135: *show interfaces (PPPoE) Output Fields (continued)*

Field Name	Field Description	Level of Output
IPv6 transit statistics	<p>Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.</p> <p>NOTE: The packet and byte counts in these fields include traffic that is dropped and does not leave the router.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Local statistics	<p>Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize.</p>	detail extensive
Transit statistics	<p>Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize.</p> <p>NOTE: The packet and byte counts in these fields include traffic that is dropped and does not leave the router.</p>	detail extensive
Keepalive settings	<p>(PPP and HDLC) Configured settings for keepalives.</p> <ul style="list-style-type: none"> • interval seconds—The time in seconds between successive keepalive requests. The range is 10 seconds through 32,767 seconds, with a default of 10 seconds. • down-count number—The number of keepalive packets a destination must fail to receive before the network takes a link down. The range is 1 through 255, with a default of 3. • up-count number—The number of keepalive packets a destination must receive to change a link's status from down to up. The range is 1 through 255, with a default of 1. 	detail extensive
Keepalive statistics	<p>(PPP and HDLC) Information about keepalive packets.</p> <ul style="list-style-type: none"> • Input—Number of keepalive packets received by PPP. <ul style="list-style-type: none"> • (last seen 00:00:00 ago)—Time the last keepalive packet was received, in the format <i>hh:mm:ss</i>. • Output—Number of keepalive packets sent by PPP and how long ago the last keepalive packets were sent and received. <ul style="list-style-type: none"> • (last seen 00:00:00 ago)—Time the last keepalive packet was sent, in the format <i>hh:mm:ss</i>. <p>(MX Series routers with MPCs/MICs) When an MX Series router with MPCs/MICs is using PPP fast keepalive for a PPP link, the display does not include the number of keepalive packets received or sent, or the amount of time since the router received or sent the last keepalive packet.</p>	detail extensive
Input packets	Number of packets received on the logical interface.	None specified
Output packets	Number of packets transmitted on the logical interface.	None specified

Table 135: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
LCP state	(PPP) Link Control Protocol state. <ul style="list-style-type: none"> • Conf-ack-received—Acknowledgement was received. • Conf-ack-sent—Acknowledgement was sent. • Conf-req-sent—Request was sent. • Down—LCP negotiation is incomplete (not yet completed or has failed). • Not-configured—LCP is not configured on the interface. • Opened—LCP negotiation is successful. 	none detail extensive
NCP state	(PPP) Network Control Protocol state. <ul style="list-style-type: none"> • Conf-ack-received—Acknowledgement was received. • Conf-ack-sent—Acknowledgement was sent. • Conf-req-sent—Request was sent. • Down—NCP negotiation is incomplete (not yet completed or has failed). • Not-configured—NCP is not configured on the interface. • Opened—NCP negotiation is successful. 	detail extensive none
CHAP state	(PPP) Displays the state of the Challenge Handshake Authentication Protocol (CHAP) during its transaction. <ul style="list-style-type: none"> • Chap-Chal-received—Challenge was received but response not yet sent. • Chap-Chal-sent—Challenge was sent. • Chap-Resp-received—Response was received for the challenge sent, but CHAP has not yet moved into the Success state. (Most likely with RADIUS authentication.) • Chap-Resp-sent—Response was sent for the challenge received. • Closed—CHAP authentication is incomplete. • Failure—CHAP authentication failed. • Not-configured—CHAP is not configured on the interface. • Success—CHAP authentication was successful. 	none detail extensive
Protocol	Protocol family configured on the logical interface.	detail extensive none
<i>protocol-family</i>	Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed.	brief
MTU	MTU size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route table	Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0 .	detail extensive none
Flags	Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .	detail extensive none

Table 135: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
Addresses, Flags	Information about the addresses configured for the protocol family. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address.	detail extensive none

Sample Output

show interfaces (PPPoE)

```

user@host> show interfaces pp0
Physical interface: pp0, Enabled, Physical link is Up
  Interface index: 128, SNMP ifIndex: 24
  Type: PPPoE, Link-level type: PPPoE, MTU: 1532
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps
  Link type      : Full-Duplex

show interfaces interface-set (Ethernet Interface Set)

Syntax	<code>show interfaces interface-set <i>interface-set-name</i> <detail terse></code>
Release Information	Command introduced in Junos OS Release 8.5.
Description	<p>Display information about the specified gigabit or 10-Gigabit Ethernet interface set.</p> <p>You can also use the show interfaces interface-set command to display information about agent circuit identifier (ACI) interface sets.</p>
Options	<p>interface-set <i>interface-set-name</i>—Display information about the specified Gigabit Ethernet, 10-Gigabit Ethernet, ACI, or ALI interface set.</p> <p>detail terse—(Optional) Display the specified level of output.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> Verifying and Managing Agent Circuit Identifier-Based Dynamic VLAN Configuration Verifying and Managing Configurations for Dynamic VLANs Based on Access-Line Identifiers
List of Sample Output	<p>show interfaces interface-set terse on page 2101</p> <p>show interfaces interface-set detail on page 2101</p> <p>show interfaces interface-set (ACI Interface Set based on ACI) on page 2101</p> <p>show interfaces interface-set (ACI Interface Set based on ACI Trusted Option) on page 2102</p> <p>show interfaces interface-set (ACI Interface Set based on ARI Trusted Option) on page 2102</p> <p>show interfaces interface-set (ACI Interface Set based on ARI Trusted Option when both ACI and ARI are received) on page 2102</p> <p>show interfaces interface-set (ACI Interface Set based on Accept-No-IDs Trusted Option when neither ACI nor ARI is received) on page 2102</p> <p>show interfaces interface-set (L2BSA and PPPoE Subscribers) on page 2103</p>
Output Fields	Table 136 on page 2099 describes the information for the show interfaces interface-set command. Output fields are listed in the approximate order in which they appear.

Table 136: Ethernet show interfaces interface-set Output Fields

Field Name	Field Description	Level of Output
------------	-------------------	-----------------

Physical Interface

Table 136: Ethernet show interfaces interface-set Output Fields (continued)

Field Name	Field Description	Level of Output
Interface set	<p>Name of the interface set or sets.</p> <p>For ACI interface sets, the set name is prefixed with aci-.</p> <p>For ALI interface sets, the set name is prefixed with the trusted option that the interface set is based on:</p> <ul style="list-style-type: none"> • aci— The ACI is configured as the trusted option. • ari— The ARI is configured as the trusted option. • aci+ari— Both ACI and ARI are configured as the trusted option. • no-ids— Neither the ACI nor the ARI is configured as the trusted option and neither ACI nor ARI is received. 	All levels
Interface set index	Index number of the interface set.	detail none
ACI VLAN	<p>For ACI interface sets, the string received in DHCP or PPPoE control packets that uniquely identifies the subscriber's access node and the DSL line on the access node. Only the Agent Circuit ID can be used to create the interface set.</p> <p>NOTE: The ACI VLAN field is replaced with the Line Identity field when an ALI interface set is configured with the line-identity autoconfiguration stanza.</p>	detail none
Line Identity	<p>For ALI interface sets, the trusted option received in DHCP or PPPoE control packets that uniquely identifies the subscriber's access node and the DSL line on the access node. The trusted option can be either or both of the following:</p> <ul style="list-style-type: none"> • Agent Circuit ID—The ACI value • Agent Remote ID—The ARI value. <p>NOTE: When only accept-no-ids is configured as the trusted option, this field is not displayed.</p> <p>NOTE: The Line Identity field is replaced with the ACI VLAN field when an ACI interface set is configured with the agent-circuit-id autoconfiguration stanza.</p>	detail none
PPPoE	Dynamic PPPoE subscriber interface that the router creates using the ACI or ALI interface set.	detail none
Max Sessions	For dynamic PPPoE subscriber interfaces, maximum number of PPPoE logical interfaces that that can be activated on the underlying interface.	detail none
Max Sessions VSA Ignore	For dynamic PPPoE subscriber interfaces, whether the router is configured to ignore (clear) the PPPoE maximum session value returned by RADIUS in the Max-Clients-Per-Interface Juniper Networks VSA [26-143] and restore the PPPoE maximum session value on the underlying interface to the value configured with the max-sessions statement: Off (default) or On .	detail none

Table 136: Ethernet show interfaces interface-set Output Fields (continued)

Field Name	Field Description	Level of Output
Traffic statistics	Number and rate of bytes and packets received and transmitted on the specified interface set. <ul style="list-style-type: none"> Input bytes, Output bytes—Number of bytes and number of bytes per second received and transmitted on the interface set Input packets, Output packets—Number of packets and number of packets per second received and transmitted on the interface set. 	detail
Egress queues supported	Total number of egress queues supported on the specified interface set.	detail
Egress queues in use	Total number of egress queues used on the specified interface set.	detail
Queue counters	Queued packets, Transmitted packets, and Dropped packets statistics for the four forwarding classes.	detail
Members	List of all interface sets or, for ACI interface sets, list of all subscriber interfaces belonging to the specified ACI interface set.	detail none

show interfaces interface-set queue

Syntax	<code>show interfaces interface-set queue <i>interface-set-name</i> <aggregate remaining-traffic> <forwarding-class <i>class-name</i>></code>
Release Information	Command introduced in Junos OS Release 8.5.
Description	Display information about the gigabit or 10-Gigabit Ethernet interface set queue. Supported in MX Series routers with enhanced queuing DPCs.
Options	<p><i>interface-set-name</i>—(Optional) Display information about the specified gigabit or 10-Gigabit Ethernet interface set. Wildcard values can be used in the interface set name.</p> <p>aggregate—(Optional) Display the aggregated queuing statistics of all member logical interfaces for interface sets that have traffic-control profiles configured.</p> <p>both-ingress-egress—(Optional) On Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs, display both ingress and egress queue statistics.</p> <p>egress—(Optional) Display egress queue statistics.</p> <p>forwarding-class <i>class-name</i>—(Optional) Display queuing statistics for the specified forwarding class.</p> <p>ingress—(Optional) On Gigabit Ethernet IQ2 PICs, display ingress queue statistics.</p> <p>remaining-traffic—(Optional) Display the queuing statistics of all member logical interfaces for interface sets that do not have traffic-control profiles configured.</p>
Required Privilege Level	view
List of Sample Output	<p>show interfaces interface-set queue (Gigabit Ethernet) on page 2105</p> <p>show interfaces interface-set queue both-ingress-egress (Enhanced DPC) on page 2106</p> <p>show interfaces interface-set queue egress (Enhanced DPC) on page 2108</p> <p>show interfaces interface-set queue forwarding-class (Gigabit Ethernet) on page 2109</p> <p>show interfaces interface-set queue (Enhanced DPC) on page 2110</p> <p>show interfaces interface-set queue remaining-traffic (Gigabit Ethernet) on page 2111</p>

show interfaces interval

Syntax `show interfaces interval
<interface-name>`

Release Information Command introduced before Junos OS Release 7.4.

Description Display the channel service unit (CSU) interface alarm and error count in 15-minute intervals for the past 24 hours. If the system has been operational for less than 24 hours, the maximum number of intervals available is displayed.

Options *interface-name*—(Optional) Name of a particular interface.

Required Privilege Level view

Output Fields [Table 138 on page 2112](#) lists the output fields for the **show interfaces interval** command. Output fields are listed in the approximate order in which they appear.

Table 138: show interfaces interval Output Fields

Field Name	Field Description
Physical interface	Name of the interface.
SNMP ifIndex	SNMP index number for the physical interface.
hh:mm-current	Time of day (in hours and minutes) at the beginning of the latest counter interval. The value of the latest counter interval is always less than 15 minutes.
hh:mm-hh:mm	Time of day (in hours and minutes) at the beginning and end of each 15-minute interval.
alarm or event: n	Count of alarms and events within each 15-minute interval. The specific alarm or event depends on the interface media type. For a description of the alarm or event listed, see the <i>interface-type media</i> field (for example, T1 media) under the show interfaces command for the particular interface type in which you are interested.
Interval Total	Sum of all the alarm and defect counters for the last 24-hour period.

Table 138: show interfaces interval Output Fields (continued)

Field Name	Field Description
Interval Total	Sum of all the alarm and defect counters for the last 24-hour period.
Current Day Interval Total	Sum of all the alarm and defect counters in the current day. NOTE: The Current Day Interval output field is reset after 24 hours.
Previous Day Interval Total	Sum of all the alarm and defect counters in the previous day.

show interfaces irb

Syntax `show interfaces irb`
`<brief | detail | extensive | terse>`
`<descriptions>`
`<media>`
`<snmp-index snmp-index>`
`<statistics>`

Release Information Command introduced in Junos OS Release 8.4.

Description Display integrated routing and bridging interfaces information.

Options **brief | detail | extensive | terse**—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

mac—Display hardware MAC address

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the interface with the specified SNMP index.

statistics—(Optional) Display static interface statistics.

Additional Information Integrated routing and bridging (IRB) provides simultaneous support for Layer 2 bridging and Layer 3 IP routing on the same interface. IRB enables you to route local packets to another routed interface or to another bridging domain that has a Layer 3 protocol configured.

Required Privilege Level view

List of Sample Output [show interfaces irb extensive on page 2120](#)
[show interfaces irb snmp-index on page 2121](#)

Output Fields [Table 139 on page 2116](#) lists the output fields for the **show interfaces irb** command. Output fields are listed in the approximate order in which they appear.

Table 139: show interfaces irb Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels

Table 139: show interfaces irb Output Fields (continued)

Field Name	Field Description	Level of Output
Enabled	State of the physical interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .	All levels
Proto	Protocol configured on the interface.	terse
Interface index	Physical interface index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Type	Physical interface type.	detail extensive none
Link-level type	Encapsulation being used on the physical interface.	detail extensive brief none
MTU	MTU size on the physical interface.	detail extensive brief none
Clocking	Reference clock source: Internal or External . Always unspecified on IRB interfaces.	detail extensive brief
Speed	Speed at which the interface is running. Always unspecified on IRB interfaces.	detail extensive brief
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .	detail extensive brief none
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .	detail extensive brief none
Link type	Physical interface link type: full duplex or half duplex .	detail extensive none
Link flags	Information about the link. Possible values are described in the “Links Flags” section under <i>Common Output Fields Description</i> .	detail extensive none
Physical Info	Physical interface information.	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
Current address	Configured MAC address.	detail extensive none
Hardware address	MAC address of the hardware.	detail extensive none
Alternate link address	Backup address of the link.	detail extensive
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hours:minutes:seconds timezone (hours:minutes:seconds ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none

Table 139: show interfaces irb Output Fields (continued)

Field Name	Field Description	Level of Output
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface • Output packets—Number of packets transmitted on the interface. 	detail extensive
IPv6 transit statistics	<p>Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Input errors	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Giants—Number of frames received that are larger than the giant threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • Resource errors—Sum of transmit drops. 	detail extensive
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the DPC is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	detail extensive

Table 139: *show interfaces irb* Output Fields (continued)

Field Name	Field Description	Level of Output
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface (which reflects its initialization sequence).	detail extensive none
SNMP ifIndex	SNMP interface index number of the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .	detail extensive
Encapsulation	Encapsulation on the logical interface.	detail extensive
Bandwidth	Dummy value that is ignored by an IRB interface. IRB interfaces are pseudo interfaces and do not have physical bandwidth associated with them.	detail extensive
Routing Instance	Routing instance IRB is configured under.	detail extensive
Bridging Domain	Bridging domain IRB is participating in.	detail extensive
Traffic statistics	Number and rate of bytes and packets received and transmitted on the logical interface. <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface • Output packets—Number of packets transmitted on the interface. 	detail extensive
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled. <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Local statistics	Statistics for traffic received from and transmitted to the Routing Engine.	detail extensive
Transit statistics	Statistics for traffic transiting the router.	detail extensive
Protocol	Protocol family configured on the local interface. Possible values are described in the “Protocol Field” section under <i>Common Output Fields Description</i> .	detail extensive
MTU	Maximum transmission unit size on the logical interface.	detail extensive

Table 139: show interfaces irb Output Fields (continued)

Field Name	Field Description	Level of Output
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route table	Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	detail extensive
Addresses, Flags	Information about address flags. Possible values are described in the "Addresses Flags" section under <i>Common Output Fields Description</i> .	detail extensive
Policer	The policer that is to be evaluated when packets are received or transmitted on the interface.	detail extensive
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under <i>Common Output Fields Description</i> .	detail extensive

show interfaces mac-database

Syntax	<code>show interfaces mac-database (ge-fpc/pic/port ge-fpc/pic/port.n aex xe-fpc/pic/port xe-fpc/pic/port.n et-fpc/pic/port et-fpc/pic/port.n) <mac-address mac-address></code>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced on PTX Series Packet Transport Routers for Junos OS Release 12.1.</p> <p>Support for statement with the aex option introduced in Junos OS Release 15.1.</p>
Description	(M Series, T Series, MX Series routers, and PTX Series Packet Transport Routers only) Display media access control (MAC) address information for the specified interface.
Options	<p>ge-fpc/pic/port—Display MAC addresses that have been learned on all logical interfaces on a particular physical interface.</p> <p>ge-fpc/pic/port.n—Display MAC addresses that have been learned on a particular logical interface.</p> <p>aex—Display MAC addresses that have been learned on a particular aggregated Ethernet interface.</p> <p>xe-fpc/pic/port—Display MAC addresses that have been learned on all logical interfaces on a particular physical interface.</p> <p>xe-fpc/pic/port.n—Display MAC addresses that have been learned on a particular logical interface.</p> <p>et-fpc/pic/port—Display MAC addresses that have been learned on all logical interfaces on a particular physical interface.</p> <p>et-fpc/pic/port.n—Display MAC addresses that have been learned on a particular logical interface.</p> <p>mac-address mac-address—(Optional) Display detailed MAC address statistics, including policer information for ge, xe, and et interfaces.</p>
Additional Information	On IQ2 PIC interfaces, the default value for maximum retention of entries in the MAC address table has changed, for cases in which the table is not full. The new holding time is 12 hours. The previous retention time of 3 minutes is still in effect when the table is full.
Required Privilege Level	view

Output Fields Table 140 on page 2124 lists the output fields for the **show interfaces mac-database** command. Output fields are listed in the approximate order in which they appear.

Table 140: show interfaces mac-database Output Fields

Field Name	Field Description
Physical Interface	
Physical interface	Name of the physical interface.
Enabled	State of the physical interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .
Interface index	Physical interface index number, which reflects its initialization sequence.
SNMP ifIndex	SNMP index number for the physical interface.
Description	Description and name of the interface.
Link-level type	Encapsulation being used on the physical interface.
MTU	MTU size on the physical interface.
Speed	Speed at which the interface is running.
Loopback	Whether loopback is enabled and the type of loopback: local or remote .
Source filtering	Whether source filtering is configured.
Flow control	Whether flow control is enabled or disabled.
Minimum links needed	(Aggregated Ethernet interfaces only) Number of child links that must be operational for the aggregated interface to be operational.
Minimum bandwidth needed	(Aggregated Ethernet interfaces only) Minimum amount of bandwidth of child links that must be operational for the aggregated interface to be operational.
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .
Current address	(Aggregated Ethernet interfaces only) Configured MAC address.
Hardware address	(Aggregated Ethernet interfaces only) Hardware MAC address.
Last flapped	(Aggregated Ethernet interfaces only) Date, time, and how long ago the interface went from down to up or from up to down. The format is Last flapped: year-month-day hours:minutes:seconds timezone (wwksddays hours:minutes ago) . For example, Last flapped: 2013-12-18 04:33:22 PST (1w5d 22:23 ago) .

Table 140: show interfaces mac-database Output Fields (continued)

Field Name	Field Description
Input Rate	(Aggregated Ethernet interfaces only) Input rate in bits per second (bps) and packets per second (pps).
Output Rate	(Aggregated Ethernet interfaces only) Output rate in bps and pps.
Interface flags	Information about the interface. Possible values are described in the “Links Flags” section under <i>Common Output Fields Description</i> .
Link flags	Information about the link. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .
Logical Interface	
Logical interface	Name of the logical interface.
Index	Logical interface index number, which reflects its initialization sequence.
SNMP ifIndex	Logical interface SNMP interface index number.
Flags	Information about the logical interface (possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i>).
Encapsulation	Encapsulation on the logical interface.
MAC address, Input frames, Input bytes, Output frames, Output bytes	MAC address and corresponding number of input frames, input bytes, output frames, and output bytes.
Number of MAC addresses	Number of MAC addresses configured.
Policer Statistics	<p>(Displayed for mac-address option for ge, xe, and et interface types only) Display information about policers applied to a logical interface-MAC pair.</p> <ul style="list-style-type: none"> • Policer type—Type of policer that is out of spec with respect to the configuration. It can be one or more of the following: <ul style="list-style-type: none"> • Input premium—Number of high-priority rating out-of-spec frames or bytes received. • Output premium—Number of high-priority rating out-of-spec frames or bytes sent. • Input aggregate—Total number of out-of-spec frames or bytes received. • Output aggregate—Total number of out-of-spec frames or bytes sent. • Discarded Frames—Number of discarded frames. • Discarded Bytes—Number of discarded bytes.

Sample Output

show interfaces mac-database (All MAC Addresses on a Port)

```
user@host> show interfaces mac-database xe-0/3/3
```

```
Physical interface: xe-0/3/3, Enabled, Physical link is Up
Interface index: 372, SNMP ifIndex: 788

show interfaces mc-ae

Syntax	show interfaces mc-ae extensive revertive-info <id <i>identifier</i> unit <i>number</i> >
Release Information	Command introduced in Junos OS Release 9.6. revertive-info statement introduced in Junos OS Release 13.3 extensive statement introduced in Junos OS Release 16.1R1
Description	On MX Series routers with multichassis aggregated Ethernet (aeX) interfaces, displays information about the aeX interfaces.
Options	extensive —(Optional) Display extensive information for multichassis aggregated Ethernet interface. revertive-info —(Optional) Display revertive mode information for multichassis aggregated Ethernet interface. identifier —(Optional) Identifier of the multichassis aggregated Ethernet interface. number —(Optional) Specify the logical interface by unit number.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • <i>Configuring Multichassis Link Aggregation on MX Series Routers</i>

Output Fields	Table 141 on page 2129 lists the output fields for the show interfaces mc-ae command. Output fields are listed in the approximate order in which they appear.

Table 141: show interfaces mc-ae Output Fields

Output Field Name	Field Description
Member Link	Identifiers of the configured multichassis link aggregate interfaces configured interfaces.

Table 141: show interfaces mc-ae Output Fields (continued)

Output Field Name	Field Description
Local Status	Status of the local link: active or standby .
Peer Status	Status of the peer link: active or standby .
Local State	Up or down state of the local device.
Peer State	<p>Status of the local and peer links in an active/active bridge or VRRP over integrated routing and bridging (IRB) configuration on MX Series routers, including:</p> <p>Logical Interface—Aggregated Ethernet (AE) aggregate number and unit number.</p> <p>Topology Type—The bridge or VRRP topology type configured on the AE.</p> <p>Local State—Up or down state of the local device.</p> <p>Peer State—Up or down state of the peer device.</p> <p>Peer Ip/ICL-PL/State—Address, interface and state of the peer device.</p>
Logical Interface	Identifier and unit of the multichassis aggregated Ethernet interface.
Core Facing Interface	Label: pseudowire interface or Ethernet interface .
ICL-PL	Label: pseudowire interface or Ethernet interface .
switchover mode	The configured switchover mode for the multichassis aggregated Ethernet interface: revertive or non-revertive .
switchover status	Status of the switchover if the revert-time statement is configured at the [edit interfaces aex mc-ae] hierarchy level.
revert time	Revert time configured for the multichassis aggregated Ethernet interface.
switchover time remaining	Seconds left to trigger the switchover if the switchover is in progress.
Configuration Error Status	Reason for the configuration error.

show interfaces transport pm

Syntax	<code>show interfaces transport pm (all optics otn) (all current currentday interval previousday) (all <i>interface-name</i>)</code>
Release Information	Command introduced in Junos OS Release 14.2 on the PTX Series. Command introduced in Junos OS Release 16.1 on the MX Series.
Description	Display diagnostic data, warnings, and alarms for transport performance monitoring interfaces.
Options	<p>(all optics otn)—Display both optics and OTN information or either only optics or only OTN information.</p> <p>(all current currentday interval previousday)—Display information for the current 15-minute interval, the current day, the ninety-six 15-minute intervals, and the previous day; information only for the current 15-minute interval; information only for the current 24 hours; information only for the ninety-six 15-minute intervals; information only for the previous day.</p> <p>(all <i>interface-name</i>)—Display information for all interfaces or only for the specified interface (for example, <i>et-fpc/pic/port</i>).</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • clear interfaces transport pm on page 1570 • tca on page 1054 • transport-monitoring on page 1056
List of Sample Output	<p>show interfaces transport pm on page 2135</p> <p>show interfaces transport (MX960 Router with MPC3E and 100-Gigabit DWDM OTN MIC) on page 2136</p> <p>show interfaces transport pm (MX960 Router with MPC3E and 100-Gigabit DWDM OTN MIC) on page 2136</p> <p>show interfaces transport (PTX3000 router with 5-port 100-Gigabit DWDM OTN PIC) on page 2137</p> <p>show interfaces transport pm optics (PTX3000 router with 5-port 100-Gigabit DWDM OTN PIC) on page 2138</p> <p>show interfaces transport pm otn (PTX3000 router with 5-port 100-Gigabit DWDM OTN PIC) on page 2138</p>
Output Fields	Table 142 on page 2134 lists the output fields for the show interfaces transport pm optics command. Fields are listed in the approximate order in which they appear.

Table 142: show interfaces transport pm Output Fields

Field Name	Field Description
Physical interface	Name of the physical interface.
Interval	The 15 minute interval for performance monitoring.
Suspect Flag	TRUE if the performance monitoring data for the interval appears to
Reason	Reason for setting the suspect flag.
COUNT	Measured value.
THRESHOLD	Threshold value set.
TCA-ENABLED	Threshold crossing alert. Set to TRUE if enabled.
TCA-RAISED	TRUE if enabled and the value crosses the threshold.
Near End PM	Near end threshold crossing defect trigger. For more information abo
Far End PM	Far end threshold crossing defect trigger. For more information abou
FEC PM	Forwarding equivalence class threshold crossing defect trigger. For m see tca .
BER PM	Bit error rate threshold crossing defect trigger. For more information
CURRENT	Current value measured.
PM	Performance monitor.
MIN	Minimum value measured.
MAX	Maximum value measured.
AVG	Average value.
Lane Chromatic dispersion	Residual chromatic dispersion measured.
Lane differential group delay	Measured differential group delay.
q Value	Measured Quality factor value.
SNR	Signal to noise ratio.
Tx output power	The transmit laser output power.

Table 142: show interfaces transport pm Output Fields (continued)

Field Name	Field Description
Rx input power	The laser's received optical power.
Module temperature (Celsius)	The laser's temperature.
Tx Laser bias current (0.1mA)	Magnitude of the laser bias power setting current. The laser bias provides and modulates currents.
Rx Laser bias current (0.1mA)	Magnitude of the laser bias power setting current.
Carrier frequency offset (MHz)	Measured carrier frequency offset.

show l2-learning instance

Syntax	show l2-learning instance
Release Information	(MX Series routers only) Command introduced in Junos OS Release 8.4.
Description	Display Layer 2 learning properties for all the configured routing instances.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show l2-learning instance on page 2140
Output Fields	Table 143 on page 2139 describes the output fields for the show l2-learning instance command. Output fields are listed in the approximate order in which they appear.

Table 143: show l2-learning instance Output Fields

Field Name	Field Description
Routing Instance	Name of routing instance.
Bridging Domain	Name of bridging domain. On MX Series routers you can use the show l2-learning instance <extensive> command option to display the Bridge Service-id information which includes the Config Service ID and the Active Service ID.
Index	Number associated with the routing instance or bridging domain.
Logical System	Name of logical system or Default if no logical system is configured.
Routing instance flags	Status of Layer 2 learning properties for each routing instance: <ul style="list-style-type: none"> DL—MAC learning is disabled. SE—MAC accounting is enabled. AD—Packets are dropped after MAC address limit is reached. LH—The maximum number of MAC addresses has been learned on the routing instance. The routing instance is not able to learn any additional MAC addresses.
MAC limit	Maximum number of MAC addresses that can be learned from each interface in the routing instance or bridging domain.

Sample Output

show l2-learning instance

```
user@host> show l2-learning instance
```

```
Information for routing instance:
```

```
Routing Instance flags (DL -disable learning, SE -stats enabled,  
AD -packet action drop, LH -mac limit hit)
```

Routing Instance	Bridging Domain	Index	Logical System	Routing flags	MAC limit
__juniper_private1__		1	Default		5000
vs1	vlan100	3	Default		5120
vs1	vlan200	4	Default		5120

show l2-learning redundancy-groups

Syntax	<pre>show l2-learning redundancy-groups logical-system [system-name all] <redundancy-group-id [0 to 4294967294]> arp-statistics nd-statistics remote-macs</pre>
Release Information	<p>Command introduced in Junos OS Release 13.2.</p> <p>Support for logical systems added in Junos OS Release 14.1.</p> <p>Command introduced in Junos OS Release 15.1R1 for EX Series switches</p>
Description	<p>(MX Series routers only) Display ARP statistics, Neighbor Discovery statistics, or remote MAC addresses for the Multi-Chassis Aggregated Ethernet (MC-AE) nodes for all or specified redundancy groups on a router or switch or logical systems on a router or switch. Note that the Redundancy Group ID is inherited by the bridging domain or VLAN from member AE interfaces.</p>
Options	<p>logical-system [system-name all]—(Optional) Display information for a specified logical system or all systems.</p> <p>redundancy-group-id—(Optional) The redundancy group identification number. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate the routing or switching devices contained in a redundancy group.</p> <p>arp-statistics—(Optional) Count of ARP packets sent and received by the two MC-AE nodes.</p> <p>nd-statistics—(Optional) Count of Neighbor Discovery packets sent and received by the two MC-AE nodes.</p> <p>remote-macs —(Optional) List of remote MAC addresses in the “Installed” state, as learned from the remote MC-AE node.</p>
Required Privilege Level	view

Output Fields Output fields are listed in the approximate order in which they appear.

Table 144: show l2-learning redundancy-groups arp-statistics Output Fields

Field Name	Field Description
Redundancy Group ID	Redundancy Group to which the following details apply.
MCLAG ARP Statistics Group ID	ARP statistics for this Multichassis Link Aggregation Group (MC-LAG) instance.
ARP Rx Count From Line	Total number of ARPs received from the Line.
ARP Tx Count To Peer	Total number of ARPs sent to the peer.
ARP Rx Count From Peer	Total number of ARPs received from the peer.
ARP Drop Count received from line	Total number of ARPs sent by the peer that were received.
ARP Drop Count received from peer	Total number of ARPs sent by the peer that were dropped
Service-id	Service ID (configured at the routing instance level).

Table 145: show l2-learning redundancy-groups nd-statistics Output Fields

Field Name	Field Description
Redundancy Group ID	Redundancy Group to which the following details apply.
MCLAG ND Statistics Group ID	Neighbor Discovery statistics for this Multichassis Link Aggregation Group (MC-LAG) instance.
ND Rx Count From Line	Total number of Neighbor Discovery packets received from the Line.
ND Tx Count To Peer	Total number of Neighbor Discovery packets sent to the peer.
NDRx Count From Peer	Total number of Neighbor Discovery packets received from the peer.

Table 145: show l2-learning redundancy-groups nd-statistics Output Fields (continued)

Field Name	Field Description
ND Drop Count received from line	Total number of Neighbor Discovery packets sent by the peer that were received.
ND Drop Count received from peer	Total number of Neighbor Discovery packets sent by the peer that were dropped
Service-id	Service ID (configured at the routing instance level).

Table 146: show l2-learning redundancy-groups remote-macs Output Fields

Field Name	Field Description
Redundancy Group ID	Redundancy Group to which the following details apply.
Peer-Addr	IP address of the remote peer.
VLAN	Virtual LAN identifier associated with the redundancy group.
MAC	Hardware media access control address associated with the redundancy group.
MCAE-ID	ID number of the MC-AE used by the redundancy group.
Flags	Connection state: local connect or Remote connect. If no flag is shown, the redundancy group may not be connected.
Status	Installation state: Installed or Not Installed.

Sample Output

show lacp interfaces

Syntax `show lacp interfaces`
`<interface-name>`
extensive

Release Information Command introduced in Junos OS Release 7.6.
extensive statement introduced in Junos OS Release 16.1R1
 Command introduced in Junos OS Release 10.0 for EX Series switches.
 Command introduced in Junos OS Release 11.1 for the QFX Series.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
 Command introduced in Junos OS Release 14.2R3

Description Display Link Aggregation Control Protocol (LACP) information about the specified aggregated Ethernet, Fast Ethernet, or Gigabit Ethernet interface.

Options **none**—Display LACP information for all interfaces.

interface-name—(Optional) Display LACP information for the specified interface:

- Aggregated Ethernet—**aenumber**
- Fast Ethernet—**fe-fpc/pic/port**
- Gigabit Ethernet—**ge-fpc/pic/port**
- 10 Gigabit Ethernet—**xe-fpc/pic/port**

extensive—Display LACP information for the interface in detail.

NOTE: The `show lacp interfaces` command returns the following error message if your system is not configured in either active or passive LACP mode:

“Warning: lacp subsystem not running – not needed by configuration”

Required Privilege Level view

Output Fields [Table 147 on page 2147](#) lists the output fields for the **show lacp interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 147: show lacp interfaces Output Fields

Field Name	Field Description	Level of Output
LACP State	For a child interface configured with the force-up statement, LACP state displays FUP along with the interface name.	All Levels
Aggregated interface	Aggregated interface value.	All Levels
LACP State	<p>LACP state information for each aggregated interface:</p> <ul style="list-style-type: none"> • Role—Role played by the interface. It can be one of the following: <ul style="list-style-type: none"> • Actor—Local device participating in LACP negotiation. • Partner—Remote device participating in LACP negotiation. • Exp—Expired state. Yes indicates the actor or partner is in an expired state. No indicates the actor or partner is not in an expired state. • Def—Default. Yes indicates that the actor's receive machine is using the default operational partner information, administratively configured for the partner. No indicates the operational partner information in use has been received in an LACP PDU. • Dist—Distribution of outgoing frames. No indicates distribution of outgoing frames on the link is currently disabled and is not expected to be enabled. Otherwise, the value is Yes. • Col—Collection of incoming frames. Yes indicates collection of incoming frames on the link is currently enabled and is not expected to be disabled. Otherwise, the value is No. • Syn—Synchronization. If the value is Yes, the link is considered synchronized. It has been allocated to the correct link aggregation group, the group has been associated with a compatible aggregator, and the identity of the link aggregation group is consistent with the system ID and operational key information transmitted. If the value is No, the link is not synchronized. It is currently not in the right aggregation. • Aggr—Ability of aggregation port to aggregate (Yes) or to operate only as an individual link (No). • Timeout—LACP timeout preference. Periodic transmissions of LACP PDUs occur at either a slow or fast transmission rate, depending upon the expressed LACP timeout preference (Long Timeout or Short Timeout). • Activity—Actor or partner's port activity. Passive indicates the port's preference for not transmitting LAC PDUs unless its partner's control value is Active. Active indicates the port's preference to participate in the protocol regardless of the partner's control value. • Core isolation state down (CDN)— LACP interface state. Down indicates the LACP interface is down because all the eBGP sessions for Ethernet VPN (EVPN) are down. 	All Levels

Table 147: show lacp interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
LACP Protocol	<p>LACP protocol information for each aggregated interface:</p> <ul style="list-style-type: none"> Link state (active or standby) indicated in parentheses next to the interface when link protection is configured. Receive State—One of the following values: <ul style="list-style-type: none"> Current—The state machine receives an LACP PDU and enters the Current state. Defaulted—If no LACP PDU is received before the timer for the Current state expires a second time, the state machine enters the Defaulted state. Expired—If no LACP PDU is received before the timer for the Current state expires once, the state machine enters the Expired state. Initialize—When the physical connectivity of a link changes or a Begin event occurs, the state machine enters the Initialize state. LACP Disabled—If the port is operating in half duplex, the operation of LACP is disabled on the port, forcing the state to LACP Disabled. This state is similar to the Defaulted state, except that the port is forced to operate as an individual port. Port Disabled—If the port becomes inoperable and a Begin event has not occurred, the state machine enters the Port Disabled state. Transmit State—Transmit state of state machine. One of the following values: <ul style="list-style-type: none"> Fast Periodic—Periodic transmissions are enabled at a fast transmission rate. No Periodic—Periodic transmissions are disabled. Periodic Timer—Transitory state entered when the periodic timer expires. Slow Periodic—Periodic transmissions are enabled at a slow transmission rate. Mux State—State of the multiplexer state machine for the aggregation port. The state is one of the following values: <ul style="list-style-type: none"> Attached—Multiplexer state machine initiates the process of attaching the port to the selected aggregator. Collecting—Yes indicates that the receive function of this link is enabled with respect to its participation in an aggregation. Received frames are passed to the aggregator for collection. No indicates the receive function of this link is not enabled. Collecting Distributing—Collecting and distributing states are merged together to form a combined state (coupled control). Because independent control is not possible, the coupled control state machine does not wait for the partner to signal that collection has started before enabling both collection and distribution. Detached—Process of detaching the port from the aggregator is in progress. Distributing—Yes indicates that the transmit function of this link is enabled with respect to its participation in an aggregation. Frames may be passed down from the aggregator's distribution function for transmission. No indicates the transmit function of this link is not enabled. Waiting—Multiplexer state machine is in a holding process, awaiting an outcome. 	All Levels

Table 147: show lacp interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
LACP info	<ul style="list-style-type: none"> • Role can be one of the following: <ul style="list-style-type: none"> • Actor—Local device participating in LACP negotiation. • Partner—Remote device participating in LACP negotiation. • System priority—Priority assigned to the system (by management or administrative policy), encoded as an unsigned integer. • System identifier—Actor or partner system ID, encoded as a MAC address. • Port priority—Priority assigned to the port by the actor or partner (by management or administrative policy), encoded as an unsigned integer. • Port number—Port number assigned to the port by the actor or partner, encoded as an unsigned integer. • Port key—Operational key value assigned to the port by the actor or partner, encoded as an unsigned integer. 	Extensive

Sample Output

show lldp

Syntax	<code>show lldp</code> <code><detail></code>
Release Information	Command introduced in Junos OS Release 9.6.
Description	Display information about the Link Layer Discovery Protocol (LLDP).
Options	detail —(Optional) Display the detailed output level.
Required Privilege Level	view
List of Sample Output	show lldp on page 2153 show lldp detail on page 2153
Output Fields	Table 148 on page 2151 describes the output fields for the show lldp command. Output fields are listed in the approximate order in which they appear.

Table 148: show lldp Output Fields

Field Name	Field Description
LLDP	Status of LLDP: Enabled or Disabled .
Advertisement interval	Value of the advertisement interval parameter.
Transmit delay	Value of the transmit delay parameter.
Hold timer	Value of the hold timer parameter.
Notification interval	Value of the notification interval parameter.
Config Trap Interval	Value of the configuration trap parameter.
Connection Hold timer	Value of the connection hold timer parameter.
Port ID TLV subtype	<ul style="list-style-type: none"> <i>interface-name</i>—Indicates the interface name as the port information for the local device. <i>locally-assigned</i>—Indicates that the sub-type for port ID TLV generation is locally assigned value of SNMP index of the interface. <p>For more information about port ID TLV subtype, see port-id-subtype..</p>

Table 148: show lldp Output Fields (continued)

Field Name	Field Description
Port Description TLV type	<p>Following value used for port description TLV:</p> <ul style="list-style-type: none"> interface-alias (ifAlias)—Indicates that the <i>ifAlias</i> MIB object value is used to generate the port description TLV. interface-description (ifDescr)—Indicates that the <i>ifDescr</i> MIB object value is used to generate the port description TLV. <p>For more information about port description TLV type, see port-description-type.</p>
Interface	<p>Name of the interface for which LLDP configuration information is being reported</p> <p>For information about interface names, see <i>Interface Naming Overview</i>. For information about interface names for TX Matrix routers, see <i>TX Matrix Router Chassis and Interface Names</i>. For information about FPC numbering on TX Matrix routers, see <i>Routing Matrix with a TX Matrix Router FPC Numbering</i>.</p>
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the interface belongs.
LLDP	LLDP operating state. The state can be Enabled or Disabled.
LLDP-MED	LLDP-MED operating state. The state can be Enabled or Disabled.
Power Negotiation	LLDP power negotiation operating state. The state can be Enabled or Disabled.
LLDP basic TLVs supported	List of basic LLDP TLVs supported by this device (detail only).
LLDP 802 TLVs supported	List of IEEE 802.1 LLDP TLVs supported by this device (detail only).

Sample Output

show lldp

```
user@host> show lldp
```

```
LLDP : Enabled
Advertisement interval : 30 seconds
Transmit delay : 2 seconds
Hold timer : 120 seconds
Notification interval : 0 Second(s)
Config Trap Interval : 0 seconds
Connection Hold timer : 300 seconds
Port ID TLV subtype : locally-assigned
Port Description TLV type : interface-description (ifDescr)
```

Interface	Parent Interface	LLDP	LLDP-MED	Power Negotiation
all	-	Enabled		

Sample Output

show lldp detail

```
user@host> show lldp detail
```

```
LLDP : Enabled
Advertisement interval : 30 seconds
Transmit delay : 2 seconds
Hold timer : 120 seconds
Notification interval : 0 Second(s)
Config Trap Interval : 0 seconds
Connection Hold timer : 300 seconds
Port ID TLV subtype : locally-assigned
Port Description TLV type : interface-description (ifDescr)
```

Interface	Parent Interface	LLDP	LLDP-MED	Power Negotiation
Neighbor count				
all	-	Enabled		
2				

Interface	Parent Interface	Vlan-id	Vlan-name
xe-0/0/0	-	4080	vlan-4080
xe-0/0/1	-	4080	vlan-4080

Basic Management TLVs supported:

End Of LLDPDU, Chassis ID, Port ID, Time To Live, Port Description, System Name, System Description, System Capabilities, Management Address

Organizationally Specific TLVs supported:

Port VLAN tag, VLAN Name, MAC/PHY Configuration/Status, Link Aggregation, Maximum Frame Size

show lldp local-information

Syntax	show lldp local-information
Release Information	Command introduced in Junos OS Release 9.6.
Description	Display local Link Layer Discovery Protocol (LLDP) information.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show lldp local-information(Management Information Address Subtype is IPv4) on page 2156 show lldp local-information(Management Information Address Subtype is IPv6) on page 2156
Output Fields	Table 149 on page 2154 describes the output fields for the show lldp local-information command. Output fields are listed in the approximate order in which they appear.

Table 149: show lldp local-information Output Fields

Field Name	Field Description
LLDP Local Information details	Information that follows pertains to the local system.
Chassis ID	List of chassis identifiers for local information.
System name	Local system name reported by LLDP.
System descr	Local system description reported by LLDP.
System Capabilities	Capabilities (such as Bridge or Router) that are Supported or Enabled by system on the interface.
Management Information	Listed by Interface Name , Address Subtype (such as ipv4 , ipv6), Address (such as 192.168.168.229 , 1fd::1a10), Interface Number , and Interface Numbering Subtype .
Interface Name	List of local interfaces. For information about interface names, see <i>Interface Naming Overview</i> . For information about interface names for TX Matrix routers, see <i>TX Matrix Router Chassis and Interface Names</i> . For information about FPC numbering on TX Matrix routers, see <i>Routing Matrix with a TX Matrix Router FPC Numbering</i> .
Parent Interface	Name of the ae interface to which the interface belongs

Table 149: show lldp local-information Output Fields (continued)

Field Name	Field Description
Interface ID	List of local interface identifiers.
Interface Description	List of local interface descriptions.
Status	List of interface conditions: UP or DOWN .

Sample Output

show lldp local-information(Management Information Address Subtype is IPv4)

```

user@host> show lldp local-information

LLDP Local Information details

Chassis ID   : 64:87:88:65:37:c0

```

show lldp neighbors

Syntax `show lldp neighbors`
`<interface interface-name>`

Release Information Command introduced in Junos OS Release 9.6.

Description Display information about LLDP neighbors.

For information about interface names, see *Interface Naming Overview*. For information about interface names for TX Matrix routers, see *TX Matrix Router Chassis and Interface Names*. For information about FPC numbering on TX Matrix routers, see *Routing Matrix with a TX Matrix Router FPC Numbering*.

For information about extended port names in the Junos Fusion technology, see *Understanding Junos Fusion Ports*.

Options `interface interface-name`—(Optional) Display the neighbor information about a particular physical interface.

NOTE: Starting with Junos OS Release 14.2, you can also display LLDP neighbor details for management interfaces, such as fxp or me, on MX Series routers.

Required Privilege Level view

Output Fields [Table 150 on page 2157](#) describes the output fields for the **show lldp neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 150: show lldp neighbors Output Fields

Field Name	Field Description
LLDP Remote Devices Information	Information about remote devices.

Table 150: show lldp neighbors Output Fields (continued)

Field Name	Field Description
LocalInterface	List of local interfaces for which neighbor information is available.
ChassisId	List of chassis identifiers for neighbors.
PortInfo	List of port information gathered from neighbors. This could be the port identifier or port description.
SysName	List of system names gathered from neighbors.
LLDP Neighbor Information	Information about both local and neighbor systems on the interface (appears when the interface option is used).
Local Information	Information about local systems on the interface (appears when the interface option is used).
Neighbor Information	Information about both local and neighbor system on the interface (appears when the interface option is used).
Index	Local interface index (appears when the interface option is used).
Time Mark	Date and timestamp of information (appears when the interface option is used).
Time To Live	Number of seconds for which this information is valid (appears when the interface option is used).
Local Interface	Name of the local physical interface (appears when the interface option is used).
Parent Interface	Name of the ae interface to which the interface belongs
Local Port ID	Local port identifier (appears when the interface option is used).
Neighbor Information	Information about neighbor systems on the interface (appears when the interface option is used).
Chassis type	Type of chassis identifier supplied, such as MAC address (appears when the interface option is used).
Chassis ID	Chassis identifier of type listed (appears when the interface option is used).
Port type	Type of port identifier supplied, such as local (appears when the interface option is used).
Port ID	Port identifier of type listed (appears when the interface option is used).
Port description	Port description (appears when the interface option is used).

Table 150: show lldp neighbors Output Fields (continued)

Field Name	Field Description
System name	Name supplied by the system on the interface (appears when the interface option is used).
System Description	Description supplied by the system on the interface (appears when the interface option is used).
System Capabilities	Capabilities (such as bridge or router) that are Supported or Enabled by the system on the interface (appears when the interface option is used).
Management address	Details of the management address: Address Type (such as ipv4 and ipv6), Address (such as 10.204.34.35 , 1fd::1a10), Interface Number , Interface Subtype , and Organization Identifier (OID) (appears when the interface option is used).
Organization Info	One or more entries listing remote information by Organizationally Unique Identifier (OUI), Subtype , Index , and Info (appears when the interface option is used).

Sample Output

show lldp neighbors

```
user@host> show lldp neighbors
```

Local Interface	Parent Interface	Chassis Id	Port info	System Name
ge-2/0/0	ae0	ac:4b:c8:92:67:c0	528	apg-hp

show lldp remote-global-statistics

Syntax	show lldp remote-global-statistics
Release Information	Command introduced in Junos OS Release 9.6.
Description	Display remote Link Layer Discovery Protocol (LLDP) global statistics.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show lldp remote-global-statistics on page 2164
Output Fields	Table 151 on page 2163 describes the output fields for the show lldp remote-global-statistics command. Output fields are listed in the approximate order in which they appear.

Table 151: show lldp remote-global-statistics Output Fields

Field Name	Field Description
LLDP Remote Database Table Counters	Information about remote database table counters.
LastchangeTime	Time elapsed between LLDP agent startup and the last change to the remote database table information.
Inserts	Number of insertions made in the remote database table.
Deletes	Number of deletions made in the remote database table.
Drops	Number of LLDP frames dropped from the remote database table because of errors.
Ageouts	Number of remote database table entries that have aged out of the table.

Sample Output

show lldp remote-global-statistics

```
user@host> show lldp remote-global-statistics
```

```
user@host> show lldp remote-global-statistics
```

```
LLDP Remote Database Table Counters
```

LastchangeTime	Inserts	Deletes	Drops	Ageouts
00:00:76 (76 sec)	192	0	0	0

show lldp statistics

Syntax `show lldp statistics`
`<interface interface-name>`

Release Information Command introduced in Junos OS Release 9.6.

Description Display information about Link Layer Discovery Protocol (LLDP) statistics.

Options `interface interface-name`—(Optional) Display the statistics about a particular physical interface.

NOTE: Starting with Junos OS Release 14.2, you can also display LLDP statistical details for management interfaces, such as `fxp` or `me`, on MX Series routers.

Required Privilege Level view

show oam ethernet connectivity-fault-management delay-statistics

Syntax	<pre>show oam ethernet connectivity-fault-management delay-statistics <count <i>entry-count</i>> <local-mep <i>mep-id</i>> <maintenance-association <i>ma-name</i>> <maintenance-domain <i>md-name</i>> <remote-mep <i>remote-mep-id</i>></pre>
Release Information	<p>Command introduced in Junos OS Release 9.5.</p> <p>Command introduced in Junos OS Release 11.4 for EX Series switches.</p>
Description	<p>On MX Series routers with Ethernet interfaces on Dense Port Concentrators (DPCs), display ETH-DM delay statistics.</p> <p>On EX Series switches, display delay measurement results.</p>
Options	<p>count <i>entry-count</i>—(Optional) Number of entries to display from the statistics table. The range of values is 1 through 100. The default value is 100 entries.</p> <p>local-mep <i>mep-id</i>—(Optional) Numeric identifier of the local MEP. On MX Series routers, the range of values is 1 through 8192. On EX Series switches, the range of values is 1 through 8191.</p> <p>maintenance-association <i>ma-name</i>—Name of an existing CFM maintenance association.</p> <p>maintenance-domain <i>md-name</i>—Name of an existing connectivity fault management (CFM) maintenance domain.</p> <p>remote-mep <i>remote-mep-id</i>—(Optional) Numeric identifier of the remote MEP. On MX Series routers, the range of values is 1 through 8192. On EX Series switches, the range of values is 1 through 8191.</p>

Output Fields Table 153 on page 2169 lists the output fields for the **show oam ethernet connectivity-fault-management delay-statistics** command and the **show oam ethernet connectivity-fault-management mep-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 153: show oam ethernet connectivity-fault-management delay-statistics and mep-statistics Output Fields

Output Field Name	Field Description
MEP identifier	Maintenance association end point (MEP) numeric identifier.
MAC address	Unicast MAC address configured for the MEP.
Remote MEP count	Number of remote MEPs (unless you specify the remote-mep option).
Remote MEP identifier	Numeric identifier of the remote MEP.
Remote MAC address	Unicast MAC address of the remote MEP.
Index	Index number that corresponds to the ETH-DM entry in the CFM database.
One-way delay (usec)	For a one-way ETH-DM session, the frame delay time, in microseconds, measured at the receiver MEP. For a detailed description of one-way Ethernet frame delay measurement, see the <i>ITU-T Y.1731 Ethernet Service OAM</i> topics in the <i>Junos OS Network Interfaces Library for Routing Devices</i> .
Two-way delay (usec)	For a two-way ETH-DM session, the frame delay time, in microseconds, measured at the initiator MEP. For a detailed description of two-way Ethernet frame delay measurement, see the <i>ITU-T Y.1731 Ethernet Service OAM</i> topics in the <i>Junos OS Network Interfaces Library for Routing Devices</i> .
Average one-way delay	Average one-way frame delay for the statistics displayed.
Average one-way delay variation	Average one-way “frame jitter” for the statistics displayed.
Best-case one-way delay	Lowest one-way frame delay for the statistics displayed.
Worst-case one-way delay	Highest one-way frame delay for the statistics displayed.
Average two-way delay	Average two-way frame delay for the statistics displayed.
Average two-way delay variation	Average two-way “frame jitter” for the statistics displayed.
Best-case two-way delay	Lowest two-way frame delay for the statistics displayed.
Worst-case two-way delay	Highest two-way frame delay calculated in this session.

show oam ethernet connectivity-fault-management forwarding-state

Syntax	show oam ethernet connectivity-fault-management forwarding-state interface <i>interface-name</i> instance <i>instance-name</i> <brief detail extensive>
Release Information	Command introduced in Junos OS Release 8.4.
Description	On M7i and M10i with the Enhanced CFEB (CFEB-E), M320, MX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management forwarding state information for Ethernet interfaces.
Options	<p>interface <i>interface-name</i>—Display forwarding state information for the specified Ethernet interface only.</p> <p>instance <i>instance-name</i>—Display forwarding state information for the specified forwarding instance only.</p> <p>brief detail extensive—(Optional) Display the specified level of output.</p>

Output Fields	Table 154 on page 2172 lists the output fields for the show oam ethernet connectivity-fault-management forwarding-state command. Output fields are listed in the approximate order in which they appear.

Table 154: show oam ethernet connectivity-fault-management forwarding-state Output Fields

Field Name	Field Description	Level of Output
Interface name	Interface identifier.	All levels
Link (Status)	Local link status.	All levels
Filter action	Filter action for messages at the level.	All levels
Next hop type	Next-hop type.	All levels

Table 154: show oam ethernet connectivity-fault-management forwarding-state Output Fields (continued)

Field Name	Field Description	Level of Output
Next index	Next-hop index number.	brief
Level	Maintenance domain (MD) level.	detail
Direction	MEP direction configured.	none
Instance name	Forwarding instance name.	All levels
CEs	Number of customer edge (CE) interfaces.	All levels
VEs	Number of VPN endpoint (VE) interfaces.	All levels

Output Fields Table 155 on page 2177 lists the output fields for the **show oam ethernet connectivity-fault-management interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 155: show oam ethernet connectivity-fault-management interfaces Output Fields

Field Name	Field Description	Level of Output
Interface	Interface identifier.	All levels
Interface status	Local interface status.	All levels
Link status	Local link status. Up , down , or oam-down .	All levels
Maintenance domain name	Maintenance domain name.	detail extensive
Format (Maintenance domain)	Maintenance domain name format configured.	detail extensive
Level	Maintenance domain level configured.	All levels
Maintenance association name	Maintenance association name.	detail extensive
Format (Maintenance association)	Maintenance association name format configured.	detail extensive
Continuity-check status	Continuity-check status.	detail extensive
Ethernet-ais status	Status of alarm indication signal (AIS). active or in-active .	detail extensive
Interval	Continuity-check message interval.	detail extensive
Loss-threshold	Lost continuity-check message threshold.	detail extensive
Interface status TLV	Status of the interface status TLV, if configured on the MEP interface: none , up , down , testing , unknown , dormant , notPresent , lowerLayerDown	detail extensive
Port status TLV	Status of the port status TLV, if configured on the MEP interface: none , no , yes	detail extensive

Table 155: show oam ethernet connectivity-fault-management interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Connection Protection TLV	Status of the connection protection TLV if configured on the MEP interface: no , yes If yes , then the transmitted connection protection TLV is decoded and the following three fields are displayed: Prefer me , Protection in use , FRR Flag	detail extensive
Prefer me	If set to yes , the path through which CCM was transmitted is preferred (unless the path fails). It is used for signaling a manual-switch command to the remote side. Its value can be yes or no .	detail extensive
Protection in use	Used for protection decision coordination. Its value is set to yes if the endpoint transmitting the CCM is currently transmitting the user traffic to protection path. Its value can be yes or no .	detail extensive
FRR Flag	LSR/LER forwarding the CCM Frame into a bypass tunnel is set. Its value can be yes or no .	detail extensive
MEP identifier	Maintenance association end point (MEP) identifier.	All levels
Neighbors	Number of MEP neighbors.	All levels
Direction	MEP direction configured.	detail extensive
MAC address	MAC address configured for the MEP.	detail extensive
MEP status	Indicates the status of the connectivity fault management (CFM) protocol running on the MEP: Running , inactive , disabled , or unsupported .	detail extensive
Remote MEP not receiving CCM	Whether the remote MEP is not receiving connectivity check messages (CCMs).	detail extensive
Erroneous CCM received	Whether erroneous CCMs have been received.	detail extensive
Cross-connect CCM received	Whether cross-connect CCMs have been received.	detail extensive
RDI sent by some MEP	Whether the remote defect indication (RDI) bit is set in messages that have been received. The absence of the RDI bit in a CCM indicates that the transmitting MEP is receiving CCMs from all configured MEPs.	detail extensive
Some remote MEP's MAC in error state	Indicates whether the remote MEP's MAC is in error state.	detail extensive
Alarm Indication Signal	Indicates whether the AIS is triggered or is cleared.	detail extensive

Table 155: show oam ethernet connectivity-fault-management interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CCMs sent	Number of CCMs transmitted.	detail extensive
CCMs received out of sequence	Number of CCMs received out of sequence.	detail extensive
LBM sent	Number of loopback request messages (LBMs) sent.	detail extensive
Valid in-order LBRs received	Number of loopback response messages (LBRs) received that were valid messages and in sequence.	detail extensive
Valid out-of-order LBRs received	Number of LBRs received that were valid messages and not in sequence.	detail extensive
LBRs received with corrupted data	Number of LBRs received that were corrupted.	detail extensive
LBRs sent	Number of LBRs transmitted.	detail extensive
LTM sent	Linktrace messages (LTMs) transmitted.	detail extensive
LTM received	Linktrace messages received.	detail extensive
LTR sent	Linktrace responses (LTRs) transmitted.	detail extensive
LTR received	Linktrace responses received.	detail extensive
Sequence number of next LTM request	Sequence number of next LTM request to be transmitted.	detail extensive
1DMs sent	<p>If the interface is attached to an initiator MEP for a one-way ETH-DM session: Number of one-way delay measurement (1DM) PDU frames sent to the peer MEP in this session.</p> <p>For all other cases, this field displays 0.</p>	detail extensive
Valid 1DMs received	<p>If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of valid 1DM frames received.</p> <p>For all other cases, this field displays 0.</p>	detail extensive
Invalid 1DMs received	<p>If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of invalid 1DM frames received.</p> <p>For all other cases, this field displays 0.</p>	detail extensive
Out of sync 1DMs received	<p>If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of out-of-sync one-way delay measurement request packets received.</p>	detail extensive

Table 155: show oam ethernet connectivity-fault-management interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
DMMs sent	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of Delay Measurement Message (DMM) PDU frames sent to the peer MEP in this session. For all other cases, this field displays 0.	detail extensive
Valid DMMs received	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of valid two-way delay measurement request packets received.	detail extensive
Invalid DMMs received	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of invalid two-way delay measurement request packets received.	detail extensive
DMRs sent	If the interface is attached to a responder MEP for a two-way ETH-DM session: Number of delay measurement reply (DMR) frames sent. For all other cases, this field displays 0.	detail extensive
Valid DMRs received	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of valid DMRs received. For all other cases, this field displays 0.	detail extensive
Invalid DMRs received	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of invalid DMRs received. For all other cases, this field displays 0.	detail extensive
LMM sent	If the interface is attached to an initiator MEP for a ETH-LM session: Number of loss measurement message (LMM) PDU frames sent to the peer MEP in this session.	detail extensive
Valid LMM received	If the interface is attached to an initiator MEP for a ETH-LM session: Number of valid loss measurement request packets received.	detail extensive
Invalid LMM received	If the interface is attached to an initiator MEP for a ETH-LM session: Number of invalid loss measurement request packets received.	detail extensive
LMR sent	If the interface is attached to a responder MEP for a ETH-LM session: Number of loss measurement reply (LMR) frames sent.	detail extensive
Valid LMR received	If the interface is attached to an initiator MEP for a ETH-LM session: Number of valid LMR frames received.	detail extensive
Invalid LMR received	If the interface is attached to an initiator MEP for a ETH-LM session: Number of invalid LMR frames received.	detail extensive
Valid AIS frames transmitted	Number of valid AIS frames transmitted to the peer MEPs.	detail extensive
Valid AIS frames received	Number of valid AIS frames received from the peer MEPs.	detail extensive

Table 155: show oam ethernet connectivity-fault-management interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SLM sent	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of synthetic loss measurement (SLM) request packets transmitted from the source MEP to the remote or destination MEP in this session.	detail extensive
Valid SLM received	If the interface is attached to a responder MEP for a ETH-SLM session: Number of valid SLM PDUs transmitted from the source MEP to the remote or destination MEP.	detail extensive
Invalid SLM received	If the interface is attached to a responder MEP for a ETH-SLM session: Number of invalid SLM PDUs transmitted from the source MEP to the remote or destination MEP.	detail extensive
SLR sent	If the interface is attached to a responder MEP for a ETH-SLM session: Number detail extensive of synthetic loss reply (SLR) frames sent.	detail extensive
Valid SLR received	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of valid SLR PDUs that the source MEP received from the remote or destination MEP.	detail extensive
Invalid SLR received	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of invalid SLR PDUs that the source MEP received from the remote or destination MEP.	detail extensive
Remote MEP count	Number of remote MEPs.	extensive
Identifier (remote MEP)	MEP identifier of the remote MEP.	extensive
MAC address (remote MEP)	MAC address of the remote MEP.	extensive
State (remote MEP)	State of the remote MEP.	extensive
Interface (remote MEP)	Interface of the remote MEP.	extensive

show oam ethernet connectivity-fault-management linktrace path-database

Syntax	<code>show oam ethernet connectivity-fault-management linktrace path-database mac-address maintenance-association <i>ma-name</i> maintenance-domain <i>md-name</i></code>
Release Information	Command introduced in Junos OS Release 9.0.
Description	On M320, MX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management maintenance linktrace database information.
Options	<p>mac-address—Display connectivity fault management path database information for the specified MAC address of the remote host.</p> <p>maintenance-association <i>ma-name</i>—Display connectivity fault management path database information for the specified maintenance association.</p> <p>maintenance-domain <i>md-name</i>—Display connectivity fault management path database information for the specified maintenance domain.</p>
Required Privilege Level	view
List of Sample Output	<p>show oam ethernet connectivity-fault-management linktrace path-database on page 2188</p> <p>show oam ethernet connectivity-fault-management linktrace path-database (Two traceroute Commands) on page 2188</p>
Output Fields	Table 156 on page 2187 lists the output fields for the show oam ethernet connectivity-fault-management linktrace path-database command. Output fields are listed in the approximate order in which they appear.

Table 156: show oam ethernet connectivity-fault-management linktrace path-database Output Fields

Field Name	Field Description
Linktrace to	MAC address of the 802.1ag node to which the linktrace message is targeted.
Interface	Interface used by the local MEP to send the linktrace message (LTM).
Maintenance Domain	Maintenance domain identifier specified in the traceroute command.
Maintenance Association	Maintenance association identifier specified in the traceroute command.
Level	Maintenance domain level configured for the maintenance domain.
Local Mep	MEP identifier of the local MEP originating the linktrace.

Table 156: show oam ethernet connectivity-fault-management linktrace path-database Output Fields (continued)

Field Name	Field Description
Hop	Sequential hop count of the linktrace path.
TTL	Number of hops remaining in the linktrace message (LTM). The time to live (TTL) is decremented at each hop.
Source MAC address	MAC address of the 802.1ag node responding to the LTM or the source MAC address of the LTR.
Next hop MAC address	MAC address of the egress interface of the node to which the LTM is forwarded or the next-hop MAC address derived from the next egress identifier in the Egress-ID TLV of the LTR PDU.
Transaction Identifier	4-byte identifier maintained by the MEP. Each LTM uses a transaction identifier. The transaction identifier is maintained globally across all maintenance domains. Use the transaction identifier to match an incoming linktrace responses (LTR), with a previously sent LTM.

show oam ethernet connectivity-fault-management loss-statistics

Syntax	<pre>show oam ethernet connectivity-fault-management loss-statistics maintenance-domain <i>md-name</i> maintenance-association <i>ma-name</i> <count <i>entry-count</i>> <local-mep <i>local-mep-id</i>> <remote-mep <i>remote-mep-id</i>></pre>
Release Information	Command introduced in Junos OS Release 11.1.
Description	On MX Series and ACX series routers with Ethernet interfaces, display ETH-LM statistics for on-demand mode only.
Options	<p>maintenance-domain <i>md-name</i>—Name of an existing CFM maintenance domain.</p> <p>maintenance-association <i>ma-name</i>—Name of an existing CFM maintenance association.</p> <p>count <i>entry-count</i>—(Optional) Number of entries to display from the statistics table. The range of values is from 1 through 100. The default value is 100.</p> <p>local-mep <i>local-mep-id</i>—(Optional) Numeric identifier of the local MEP. The range of values is from 1 through 8191.</p> <p>remote-mep <i>remote-mep-id</i>—(Optional) Numeric identifier of the remote MEP. The range of values is from 1 through 8191.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> show oam ethernet connectivity-fault-management mep-statistics on page 2205
Output Fields	Table 157 on page 2190 lists the output fields for the show oam ethernet connectivity-fault-management loss-statistics command. Output fields are listed in the approximate order in which they appear.

Table 157: show oam ethernet connectivity-fault-management loss-statistics Output Fields

Output Field Name	Field Description
MEP identifier	Maintenance association end point (MEP) numeric identifier.
MAC address	Unicast MAC address configured for the MEP.
Remote MEP count	Number of remote MEPs (unless you specify the remote-mep option).
Remote MEP identifier	Numeric identifier of the remote MEP.

Table 157: show oam ethernet connectivity-fault-management loss-statistics Output Fields (continued)

Output Field Name	Field Description
Remote MAC address	Unicast MAC address of the remote MEP.
Index	Index number that corresponds to the ETH-LM entry in the CFM database.
Near-end frame loss	Count of frame loss associated with ingress data frames.
Far-end frame loss	Count of frame loss associated with egress data frames.
Near-end loss ratio	Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the ingress interface.
Far-end loss ratio	Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the egress interface.
Average near-end frame loss	Average frame loss measured in this session associated with ingress data frames.
Average near-end loss ratio	Average frame loss ratio measured in this session associated with ingress data frames.
Average far-end frame loss	Average frame loss measured in this session associated with egress data frames.
Average far-end loss ratio	Average frame loss ratio measured in this session associated with egress data frames.
Near-end best case loss	Lowest frame loss measured in this session associated with ingress data frames.
Near-end best case loss ratio	Lowest frame loss ratio measured in this session associated with ingress data frames.
Near-end worst case loss	Highest frame loss measured in this session associated with ingress data frames.
Near-end worst case loss ratio	Highest frame loss ratio measured in this session associated with ingress data frames.
Far-end best case frame loss	Lowest frame loss measured in this session associated with egress data frames.
Far-end best case loss ratio	Lowest frame loss ratio measured in this session associated with egress data frames.
Far-end worst case loss	Highest frame loss measured in this session associated with egress data frames.
Far-end worst case loss ratio	Highest frame loss ratio measured in this session associated with egress data frames.

show oam ethernet connectivity-fault-management mep-database

Syntax	<pre>show oam ethernet connectivity-fault-management mep-database maintenance-domain <i>domain-name</i> maintenance-association <i>ma-name</i> <local-mep <i>local-mep-id</i>> <remote-mep <i>remote-mep-id</i>></pre>
Release Information	<p>Command introduced in Junos OS Release 8.4.</p> <p>Support for ITU-T Y.1731 frame delay measurement added in Junos OS Release 9.5.</p> <p>Support for ITU-T Y.1731 synthetic frame loss measurement added in Junos OS Release 13.2 for MX Series routers.</p>
Description	<p>On M7i and M10i routers with Enhanced CFEB (CFEB-E), and on M320, M120, MX Series, ACX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.</p> <p>In addition, on M120, M320, and MX series routers, also display port status TLV, interface status TLV, and action profile information.</p> <p>In addition, for Ethernet interfaces on MX Series routers, also display any ITU-T Y.1731 frame delay measurement (ETH-DM) frame counts.</p> <p>For Ethernet interfaces on MX Series routers, display any ITU-T Y.1731 synthetic frame loss measurement (ETH-SLM) statistics and frame counts.</p>
Options	<p>maintenance-association <i>ma-name</i>—Name of the maintenance association.</p> <p>maintenance-domain <i>domain-name</i>—Name of the maintenance domain.</p> <p><i>local-mep-id</i>—(Optional) Numeric identifier of local MEP.</p> <p><i>remote-mep-id</i>—(Optional) Numeric identifier of the remote MEP.</p>

Output Fields Table 158 on page 2195 lists the output fields for the **show oam ethernet connectivity-fault-management mep-database** command. Output fields are listed in the approximate order in which they appear.

Table 158: show oam ethernet connectivity-fault-management mep-database Output Fields

Field Name	Field Description
Maintenance domain name	Maintenance domain name.
Format (Maintenance domain)	Maintenance domain name format configured.
Level	Maintenance domain level configured.
Maintenance association name	Maintenance association name.
Format (Maintenance association)	Maintenance association name format configured.
Continuity-check status	Continuity-check status.
Interval	Continuity-check message interval.
Loss-threshold	Lost continuity-check message threshold.
Connection Protection TLV	<p>Status of the connection protection TLV, if configured on the MEP interface: no, yes</p> <p>If yes, then the transmitted connection protection TLV is decoded and the following three fields are displayed: Prefer me, Protection in use, FRR Flag</p>
Prefer me	<p>If set to yes, the path through which CCM was transmitted is preferred (unless the path fails). It is used for signaling a manual-switch command to remote side.</p> <p>Its value can be yes or no.</p>
Protection in use	<p>Used for protection decision coordination. Its value is set to yes if the endpoint transmitting the CCM is currently transmitting the user traffic to protection path.</p> <p>Its value can be yes or no.</p>

Table 158: show oam ethernet connectivity-fault-management mep-database Output Fields (continued)

Field Name	Field Description
FRR Flag	LSR/LER forwarding the CCM Frame into a bypass tunnel is set. Its value can be yes or no .
MEP identifier	Maintenance association end point (MEP) identifier.
Direction	MEP direction configured.
MAC address	MAC address configured for the MEP.
Auto-discovery	Whether automatic discovery is enabled or disabled.
Priority	Priority used for CCMs and linktrace messages transmitted by the MEP.
Interface name	Interface identifier.
Interface status	Local interface status.
Link status	Local link status.
Remote MEP not receiving CCM	Whether the remote MEP is not receiving CCMs.
Erroneous CCM received	Whether erroneous CCMs have been received.
Cross-connect CCM received	Whether cross-connect CCMs have been received.
RDI sent by some MEP	Whether the remote defect indication (RDI) bit is set in messages that have been received. The absence of the RDI bit in a CCM indicates that the transmitting MEP is receiving CCMs from all configured MEPs.
CCMs sent	Number of CCMs transmitted.
CCMs received out of sequence	Number of CCMs received out of sequence.
LBMs sent	Number of loopback messages (LBMs) sent.
Valid in-order LBRs received	Number of loopback response messages (LBRs) received that were valid messages and in sequence.
IDMs sent	If the MEP is an initiator for a one-way ETH-DM session: Number of one-way delay measurement (IDM) PDU frames sent to the peer MEP in this session. For all other cases, this field displays 0 .

Table 158: show oam ethernet connectivity-fault-management mep-database Output Fields (continued)

Field Name	Field Description
Valid 1DMs received	If the MEP is a receiver for a one-way ETH-DM session: Number of valid 1DM frames received. For all other cases, this field displays 0.
Invalid 1DMs received	If the MEP is a receiver for a one-way ETH-DM session: Number of invalid 1DM frames received. For all other cases, this field displays 0.
Out of sync 1DMs received	If the MEP is a receiver for a one-way ETH-DM session: Number of out-of-sync one-way delay measurement request packets received.
DMMs sent	If the MEP is an initiator for a two-way ETH-DM session: Number of Delay Measurement Message (DMM) PDU frames sent to the peer MEP in this session. For all other cases, this field displays 0.
Valid DMMs received	If the MEP is an initiator for a two-way ETH-DM session: Number of valid two-way delay measurement packets received.
Invalid DMMs received	If the MEP is an initiator for a two-way ETH-DM session: Number of invalid two-way delay measurement packets received.
DMRs sent	If the MEP is a responder for a ETH-DM session: Number of Delay Measurement Reply (DMR) frames sent. For all other cases, this field displays 0.
Valid DMRs received	If the MEP is an initiator for a two-way ETH-DM session: Number of valid DMRs received. For all other cases, this field displays 0.
Invalid DMRs received	If the MEP is an initiator for a two-way ETH-DM session: Number of invalid DMRs received. For all other cases, this field displays 0.
Valid out-of-order LBRs received	Number of LBRs received that were valid messages and not in sequence.
LBRs received with corrupted data	Number of LBRs received that were corrupted.
LBRs sent	Number of LBRs transmitted.
LTMs sent	Linktrace messages (LTMs) transmitted.
LTMs received	Linktrace messages received.
LTRs sent	Linktrace responses (LTRs) transmitted.
LTRs received	Linktrace responses received.

Table 158: show oam ethernet connectivity-fault-management mep-database Output Fields (continued)

Field Name	Field Description
Sequence number of next LTM request	Sequence number of the next linktrace message request to be transmitted.
LMM sent	If the interface is attached to an initiator MEP for a ETH-LM session: Number of loss measurement message (LMM) PDU frames sent to the peer MEP in this session.
Valid LMM received	If the interface is attached to an initiator MEP for a ETH-LM session: Number of valid loss measurement request packets received.
Invalid LMM received	If the interface is attached to an initiator MEP for a ETH LM session: Number of invalid loss measurement request packets received.
LMR sent	If the interface is attached to a responder MEP for a ETH-LM session: Number of loss measurement reply (LMR) frames sent.
Valid LMR received	If the interface is attached to an initiator MEP for a ETH LM session: Number of valid LMR frames received.
Invalid LMR received	If the interface is attached to an initiator MEP for a ETH-LM session: Number of invalid LMR frames received.
SLM sent	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of synthetic loss measurement (SLM) request packets transmitted from the source MEP to the remote or destination MEP in this session.
Valid SLM received	If the interface is attached to a responder MEP for a ETH-SLM session: Number of valid SLM PDUs transmitted from the source MEP to the remote or destination MEP.
Invalid SLM received	If the interface is attached to a responder MEP for a ETH-SLM session: Number of invalid SLM PDUs transmitted from the source MEP to the remote or destination MEP.
SLR sent	If the interface is attached to a responder MEP for a ETH-SLM session: Number detail extensive of synthetic loss reply (SLR) frames sent.
Valid SLR received	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of valid SLR PDUs that the source MEP received from the remote or destination MEP.
Invalid SLR received	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of invalid SLR PDUs that the source MEP received from the remote or destination MEP.
Remote MEP identifier	MEP identifier of the remote MEP.
State (remote MEP)	State of the remote MEP: idle , start , ok , or failed .
MAC address	MAC address of the remote MEP.
Type	Whether the remote MEP MAC address was learned using automatic discovery or configured.

Table 158: show oam ethernet connectivity-fault-management mep-database Output Fields (continued)

Field Name	Field Description
Interface	Interface of the remote MEP. A seven-digit number is appended if CFM is configured to run on a routing instance of type VPLS.
Last flapped	Date, time, and how long ago the remote MEP interface went from down to up. The format is Last flapped: year-month-day hours:minutes:seconds timezone (hours:minutes:seconds ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .
Remote defect indication	Whether the remote defect indication (RDI) bit is set in messages that have been received or transmitted.
Port status TLV	<ul style="list-style-type: none"> In the Maintenance domain section, displays the last transmitted port status TLV value. In the Remote MEP section, displays the last value of port status TLV received from the remote MEP. <p>In the Action profile section, displays, the last occurred event port-status-tlv blocked event. This event occurred due to the reception of blocked value in the port status TLV from remote MEP.</p>
Interface status TLV	<ul style="list-style-type: none"> In the Maintenance domain section, displays the last transmitted interface status TLV value. In the Remote MEP section, displays the last value of interface status TLV received from the remote MEP. <p>In the Action profile section, if displays, the last occurred event interface-status-tlv event (either lower-layer-down or down). This event occurred due to the reception of either lower or down value in the interface status TLV from remote MEP.</p>
Action profile	Name of the action profile occurrence associated with a remote MEP.
Last event	When an action profile occurs, displays the last event that triggered it.
Last event cleared	When all the configured and occurred events (under action profile) are cleared, then the action taken gets reverted (such as down interface is made up) and the corresponding time is noted and displayed.
Action	Action taken and the corresponding time of the action occurrence.

show oam ethernet connectivity-fault-management mep-database

(Connection Protection TLV Configured)

```
user@host>show oam ethernet connectivity-fault-management mep-database
maintenance-domain md5 maintenance-association ma5
```

If connection-protection is not enabled on down MEPs, but connection-protection TLV is used, MX always sets the protection-in-use flag in connection-protection tlv, while CCMs are sent out. During reversion, this is an indicator to the receiver that protect-path is in use, otherwise the peer (receiver) assumes working is active and reversion does not work as expected. Setting this bit does not affect protection-switching/traffic-loss.

Syntax	<pre>show oam ethernet connectivity-fault-management mep-statistics maintenance-domain <i>md-name</i> maintenance-association <i>ma-name</i> <mep <i>mep-id</i>> <remote-mep <i>remote-mep-id</i>> <count <i>entry-count</i>></pre>
Release Information	<p>Command introduced in Junos OS Release 9.5.</p> <p>Command introduced in Junos OS Release 11.4 for EX Series switches.</p> <p>Support for ITU-T Y.1731 Ethernet synthetic frame loss measurement (ETH-SLM) added in Junos OS Release 13.2 for MX Series routers.</p>
Description	<p>On MX Series and ACX Series routers and EX Series switches with Ethernet interfaces, display ETH-DM statistics and ETH-DM frame counts.</p> <p>For Ethernet interfaces on MX Series routers, display any ITU-T Y.1731 synthetic frame loss measurement (ETH-SLM) statistics and frame counts.</p>
Options	<p>maintenance-domain <i>md-name</i>—Name of an existing CFM maintenance domain.</p> <p>maintenance-association <i>ma-name</i>—Name of an existing CFM maintenance association.</p> <p>mep <i>mep-id</i>—(Optional) Numeric identifier of the local MEP. The range of values is 1 through 8192. On EX Series switches, the range of values is 1 through 8191.</p> <p>remote-mep <i>remote-mep-id</i>—(Optional) Numeric identifier of the remote MEP. The range of values is 1 through 8192. On EX Series switches, the range of values is 1 through 8191.</p> <p>count <i>entry-count</i>—(Optional) Number of entries to display from the statistics table. The range of values is 1 through 100. The default value is 100 entries.</p>

Output Fields [Table 159 on page 2206](#) lists the output fields for the **show oam ethernet connectivity-fault-management mep-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 159: show oam ethernet connectivity-fault-management delay-statistics and mep-statistics Output Fields

Output Field Name	Field Description
MEP identifier	Maintenance association end point (MEP) numeric identifier.
MAC address	Unicast MAC address configured for the MEP.
Remote MEP count	Number of remote MEPs (unless you specify the remote-mep option).
CCMs sent	Number of continuity check messages (CCMs) sent.
CCMs received	Number of continuity check messages (CCMs) received for a specific remote MEP and maintenance association.
CCMs received out of sequence	Number of continuity check messages (CCMs) received that were not in sequence.
Remote MEP identifier	Numeric identifier of the remote MEP.
Remote MAC address	Unicast MAC address of the remote MEP.
Index	Index number that corresponds to the ETH-DM entry in the CFM database.
One-way delay (usec)	<p>For a one-way ETH-DM session, the frame delay time, in microseconds, measured at the receiver MEP.</p> <p>For a detailed description of one-way Ethernet frame delay measurement, see the <i>ITU-T Y.1731 Ethernet Service OAM</i> topics in the <i>Junos OS Network Interfaces Library for Routing Devices</i>.</p>
Two-way delay (usec)	<p>For a two-way ETH-DM session, the frame delay time, in microseconds, measured at the initiator MEP.</p> <p>For a detailed description of two-way Ethernet frame delay measurement, see the <i>ITU-T Y.1731 Ethernet Service OAM</i> topics in the <i>Junos OS Network Interfaces Library for Routing Devices</i>.</p>
Average one-way delay	Average one-way frame delay for the statistics displayed.

Table 159: show oam ethernet connectivity-fault-management delay-statistics and mep-statistics Output Fields (continued)

Output Field Name	Field Description
Average one-way delay variation	Average one-way “frame jitter” for the statistics displayed.
Best-case one-way delay	Lowest one-way frame delay for the statistics displayed.
Worst-case one-way delay	Highest one-way frame delay for the statistics displayed.
Average two-way delay	Average two-way frame delay for the statistics displayed.
Average two-way delay variation	Average two-way “frame jitter” for the statistics displayed.
Best-case two-way delay	Lowest two-way frame delay for the statistics displayed.
Worst-case two-way delay	Highest two-way frame delay calculated in this session.
SLM packets sent	Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.
SLM packets received	Total number of synthetic loss message (SLM) PDU frames that the remote MEP received from the source MEP during this ETH-SLM session.
SLR packets sent	Total number of synthetic loss reply (SLR) PDU frames that the remote MEP sent to the source MEP during this measurement session.
SLR packets received	Total number of synthetic loss reply (SLR) PDU frames that the source MEP received from the remote MEP during this measurement session.
Local TXFC1 value	Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.
Local RXFC1 value	Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet.
Last Received SLR frame TXFCf(tc)	Value of the local counter TxFC1 at the time of SLM frame transmission.
Last Received SLR frame TXFCb(t	Value of the local counter RxFC1 at the time of SLR frame transmission.
Frame loss (near-end)	Count of frame loss associated with ingress data frames.
Frame loss (far-end)	Count of frame loss associated with egress data frames.

show oam ethernet connectivity-fault-management path-database

Syntax `show oam ethernet connectivity-fault-management path-database`
`<host-mac-address>`
`<maintenance-association ma-name>`
`<maintenance-domain domain-name>`

Release Information Command introduced in Junos OS Release 8.4.

Description On M7i and M10i with Enhanced CFEB (CFEB-E), M320, MX Series, ACX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management path database information for a host configured with an MEP.

Options ***host-mac-address***—(Optional) Display connectivity fault management path database information for a specified Ethernet host.

maintenance-association ma-name—(Optional) Display connectivity fault management path database information for the specified maintenance association.

maintenance-domain domain-name—(Optional) Display connectivity fault management path database information for the specified maintenance domain.

Required Privilege Level view

List of Sample Output [show oam ethernet connectivity-fault-management path-database on page 2218](#)

Output Fields [Table 160 on page 2217](#) lists the output fields for the **show oam ethernet connectivity-fault-management path-database** command. Output fields are listed in the approximate order in which they appear.

Table 160: show oam ethernet connectivity-fault-management path-database Output Fields

Field Name	Field Description
Linktrace to	MAC address of the remote MEPs in the path.
Interface	Interface identifier.
Maintenance domain name	Maintenance domain name.
Format (Maintenance domain)	Maintenance domain name format configured.
Level	Maintenance domain level configured.

Table 160: show oam ethernet connectivity-fault-management path-database Output Fields (continued)

Field Name	Field Description
Maintenance association name	Maintenance association name.
Local Mep	Local MEP identifier.

Sample Output

```
show oam ethernet
connectivity-fault
-management
path-database

```

show oam ethernet connectivity-fault-management policer

Syntax	<code>show oam ethernet connectivity-fault-management policer <maintenance-domain <i>md-name</i>> <maintenance-association <i>ma-name</i>></code>
Release Information	Command introduced in Junos OS Release 10.0.
Description	On M120, M320, MX Series, T320, and T640 routers displays connectivity-fault-management policer statistics.
Options	<p>This command has the following options:</p> <p>maintenance-domain <i>md-name</i>—Name of an existing CFM maintenance domain. If this option is not specified, policer statistics are displayed for all maintenance associations for all maintenance domains.</p> <p>maintenance-association <i>ma-name</i>—Name of an existing CFM maintenance association. If this option is not specified, policer statistics are displayed for all maintenance associations for given maintenance domain. This option cannot be specified without specifying maintenance-domain name.</p>

Field Name	Field Description
Legend for Policer	<p>Describes the symbols used under the Scope and Type headings:</p> <ul style="list-style-type: none"> • G - Global scope • S - Service scope • cc - Continuity check (Type)
Maintenance Domain	Displays the maintenance domain name.

Table 161: show oam ethernet connectivity-fault-management policer Output Fields (continued)

Field Name	Field Description
Level	Displays the maintenance domain level configured.
Maintenance association	Displays the maintenance association name.
Policer	Displays the policer name.
Type	Policer type. Value cc means this policer is used only to police continuity check CFM messages. Value other means this policer is used only to police non-continuity check CFM messages. Value all means this policer is used to police all CFM messages.
Scope	Policer scope. Displays whether the <i>global</i> (G) policer configuration is applicable or the session (S) specific policer config is applicable.
Drop count	Displays the number of packets dropped by the indicated policer.

Sample Output

```
show oam ethernet
connectivity-fault
-management
policer
```

Displays the policer information for all maintenance associations and their maintenance domains.

```

Output Fields [Table 162 on page 2223](#) lists the output fields for the **show oam ethernet connectivity-fault-management sla-iterator-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 162: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields

Output Field Name	Output Field Description
Maintenance domain	Name of the maintenance domain.
Level	Level of the maintenance domain level configured.
Maintenance association	Name of the maintenance association.
Local MEP id	Numeric identifier of the local MEP.
Remote MEP id	Numeric identifier of the remote MEP.
Remote MAC address	Unicast MAC address of the remote MEP.
Iterator name	Name of iterator.
Iterator Id	Numeric identifier of the iterator.
Iterator cycle time	Number of cycles (in milliseconds) taken between back-to-back transmission of SLA frames for this connection
Iteration period	Maximum number of cycles per iteration
Iterator status	Current status of iterator whether running or stopped.
Infinite iterations	Status of iteration as infinite or finite.
Counter reset time	Date and time when the counter was reset.
Reset reason	Reason to reset counter.
Delay weight	Calculation weight of delay.

Table 162: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields (continued)

Output Field Name	Output Field Description
Delay variation weight	Calculation weight of delay variation.
DMM sent	Delay measurement message (DMM) PDU frames sent to the peer MEP in this session.
DMM skipped for threshold hit	Number of DMM frames sent to the peer MEP in this session skipped during threshold hit.
DMM skipped for threshold hit window	Number of DMM frames sent to the peer MEP in this session skipped during the last threshold hit window.
DMR received	Number of delay measurement reply (DMR) frames received.
DMR out of sequence	Total number of DMR out of sequence packets received.
DMR received with invalid time stamps	Total number of DMR frames received with invalid timestamps.
Average two-way delay	Average two-way frame delay for the statistics displayed.
Average two-way delay variation	Average two-way "frame jitter" for the statistics displayed.
Average one-way forward delay variation	Average one-way forward delay variation for the statistics displayed in microseconds.
Average one-way backward delay variation	Average one-way backward delay variation for the statistics displayed in microseconds.
Weighted average two-way delay	Weighted average two-way delay for the statistics displayed in microseconds.
Weighted average two-way delay variation	Weighted average two-way delay variation for the statistics displayed in microseconds.
Weighted average one-way backward delay variation	Weighted average one-way backward delay variation for the statistics displayed in microseconds.
Weighted average one-way forward delay variation	Weighted average one-way forward delay variation for the statistics displayed in microseconds.
SLM packets sent	Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.
SLM packets received	Total number of synthetic loss message (SLM) PDU frames that the remote MEP received from the source MEP during this ETH-SLM session.
SLR packets sent	Total number of synthetic loss reply (SLR) PDU frames that the remote MEP sent to the source MEP during this measurement session.

Table 162: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields (continued)

Output Field Name	Output Field Description
SLR packets received	Total number of synthetic loss reply (SLR) PDU frames that the source MEP received from the remote MEP during this measurement session.
Local TXFC1 value	Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.
Local RXFC1 value	Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet.
Last Received SLR frame TXFCf(tc)	Value of the local counter TxFC1 at the time of SLM frame transmission.
Last Received SLR frame TXFCb(t)	Value of the local counter RxFC1 at the time of SLR frame transmission.
Frame loss (near-end)	Count of frame loss associated with ingress data frames.
Frame loss (far-end)	Count of frame loss associated with egress data frames.

  Number of requests rejected by firewall daemon: 0
  Number of requests lost due to disconnection: 0
```

show oam ethernet connectivity-fault-management synthetic-loss-statistics

Syntax	<pre>show oam ethernet connectivity-fault-management synthetic-loss-statistics <local-mep local-mep-id> maintenance-association ma-name <count entry-count> maintenance-domain md-name <remote-mep remote-mep-id></pre>
Release Information	Command introduced in Junos OS Release 13.2 for MX Series routers.
Description	On MX Series routers with Modular Port Concentrators (MPCs) with Ethernet interfaces, display the on-demand ETH-SLM statistics.
Options	<p>count <i>entry-count</i>—(Optional) Number of entries to display from the statistics table. The range of values is from 1 through 100. The default value is 100.</p> <p>local-mep <i>local-mep-id</i>—(Optional) Numeric identifier of the local MEP. The range of values is from 1 through 8192.</p> <p>maintenance-association <i>ma-name</i>—Name of an existing CFM maintenance association.</p> <p>maintenance-domain <i>md-name</i>—Name of an existing connectivity fault management (CFM) maintenance domain.</p> <p>remote-mep <i>remote-mep-id</i>—(Optional) Numeric identifier of the remote MEP. The range of values is from 1 through 8192.</p>

List of Sample Output	show oam ethernet connectivity-fault-management synthetic-loss-statistics on page 2233
Output Fields	Table 163 on page 2233 lists the output fields for the show oam ethernet connectivity-fault-management synthetic-loss-statistics command. Output fields are listed in the approximate order in which they appear.

Table 163: show oam ethernet connectivity-fault-management synthetic-loss-statistics Output Fields

Output Field Name	Field Description
MEP identifier	Maintenance association end point (MEP) numeric identifier.
MAC address	Unicast MAC address configured for the MEP.
Remote MEP count	Number of remote MEPs (unless you specify the remote-mep option).
Remote MEP identifier	Numeric identifier of the remote MEP.
Remote MAC address	Unicast MAC address of the remote MEP.
SLM packets sent	Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.
SLM packets received	Total number of synthetic loss message (SLM) PDU frames that the remote MEP received from the source MEP during this ETH-SLM session.
SLR packets sent	Total number of synthetic loss reply (SLR) PDU frames that the remote MEP sent to the source MEP during this measurement session.
SLR packets received	Total number of synthetic loss reply (SLR) PDU frames that the source MEP received from the remote MEP during this measurement session.
Local TXFCI value	Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.
Local RXFCI value	Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TxFCI is sent in the packet.
Last Received SLR frame TXFCf(tc)	Value of the local counter TxFCI at the time of SLM frame transmission.
Last Received SLR frame TXFCb(t	Value of the local counter RxFCI at the time of SLR frame transmission.
Frame loss (near-end)	Count of frame loss associated with ingress data frames.
Frame loss (far-end)	Count of frame loss associated with egress data frames.

```

show oam ethernet evc

Syntax	show oam ethernet evc <evc-id>
Release Information	Command introduced in Junos OS Release 9.5.
Description	On MX Series routers with OAM Ethernet Virtual Connection (EVC) configurations, displays the EVC configuration and status information.
Options	This command has no options.
Required Privilege Level	View
Output Fields	Table 164 on page 2235 lists the output fields for the show oam ethernet evc command. Output fields are listed in the approximate order in which they appear.

Table 164: show oam ethernet evc Output Fields

Field Name	Field Description
EVC identifier	Header for the EVC information showing the EVC name, configuration, and active/inactive status.
UNI count	Number of configured and active UNIs.
Protocol	Protocol configured between the UNIs.
Local UNIs	Heading for the list of local UNIs
UNI Identifier	Name of the UNI.
Interface	Interface type-dpc/pic/port.unit-number.
Status	Status operational or not operational.

Sample Output

show oam ethernet evc

```

user@host> show oam ethernet evc

EVC identifier: evc1, Point-to-Point, Active
UNI count: Configured(2), Active(2)
Protocol: cfm, Management domain: md, Management association: ma
Local UNIs:
  UNI Identifier    Interface    Status
  uni1             ge-1/1/1    Operational
  uni2             ge-1/1/1    Not Operational

```

show oam ethernet fnp interface

Syntax `show oam ethernet fnp interface`
`<ethernet-interface-name>`
`<routing-instance routing-instance-name>`

Release Information Command introduced in Junos OS Release 11.4.

Description On MX Series routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet PICs, displays OAM Ethernet Failure Notification Protocol (FNP) information for Ethernet interfaces.

Options *interface-name*—(Optional) Display Ethernet FNP information for the specified Ethernet interface only.

routing-instance-name—(Optional) Display FNP for the specified routing instance.

Required Privilege Level view

List of Sample Output [show oam ethernet fnp interface on page 2237](#)

Output Fields [Table 165 on page 2237](#) lists the output fields for the `show oam ethernet fnp interface` command. Output fields are listed in the approximate order in which they appear.

Table 165: show oam ethernet fnp interface Output Fields

Field Name	Field Description
Interface	Name of the interface for the displayed information.
VLAN	Name of the VLAN.
State	Displays state of the interface.
FNP Message Interface	Displays the message interface type.
FNP Message Source MAC	Displays the source MAC address.

Sample Output

show oam ethernet fnp interface

```
user@host> show oam ethernet fnp interface

The FNP controlled interfaces are:
Interface  VLAN   State  FNP message  FNP message
Interface  Source MAC
```

ge-0/0/0.30	30	down	lsi.1054976	a0:aa:aa:aa:aa:aa

List of Sample Output [show oam ethernet fnp messages on page 2240](#)

Output Fields [Table 166 on page 2239](#) lists the output fields for the `show oam ethernet fnp messages` command. Output fields are listed in the approximate order in which they appear.

Table 166: show oam ethernet fnp messages Output Fields

Field Name	Field Description
Message from source MAC address	The source MAC address of the message.
Originating port number	Port number of the original message.
Time since last message	Elapsed time in hours, minutes, and seconds since the last message was received.
Time since last message update	Elapsed time in hours, minutes, and seconds since the last message was updated.
Total messages received	Number of messages received.
Domain ID	Domain ID of the message.
STP Root ID	The spanning tree Root ID of the message.
Trigger Reason	The reason why the message was triggered.

Table 166: show oam ethernet fnp messages Output Fields (continued)

Field Name	Field Description
Effectuated VLANs	Number of VLANs that are affected.
Disabled interfaces	Name of the interfaces that are disabled.

Sample Output

show oam ethernet fnp messages

```
user@host> show oam ethernet fnp messages
Active FNP messages on interface lsi.1054465
Message source MAC: a0:aa:aa:aa:aa:aa
Originating port number: 141077
Time since last message: 00:00:00
Time since last message update: 00:00:00
Total messages received: 1
Domain ID: 0
STP Root ID: 0.f0:ff:ff:ff:ff:ff
Trigger reason: todo
Effectuated VLANs: 10
Disabled interfaces:
  Interface VLAN
  ge-0/0/0.10 10
```

show oam ethernet fnp status

Syntax `show oam ethernet fnp status`
`<interface interface-name>`
`<routing instance routing-instance-name>`

Release Information Command introduced in Junos OS Release 11.4

Description On MX Series routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet PICs, displays OAM Ethernet Failure Notification Protocol (FNP) status.

Options *interface-name*—(Optional) Display Ethernet FNP information for the specified Ethernet interface only.

routing-instance-name—(Optional) Display FNP for the specified routing instance.

Required Privilege Level view

List of Sample Output [show oam ethernet fnp status on page 2241](#)

Output Fields [Table 167 on page 2241](#) lists the output fields for the `show oam ethernet fnp status` command. Output fields are listed in the approximate order in which they appear.

Table 167: show oam ethernet fnp status Output Fields

Field Name	Field Description
FNP interval	The time interval between messages.
Loss threshold	The number of messages that can be lost before FNP is marked as down.
FNP enabled interfaces	Displays interfaces that are enabled.
Interface	The name of the interface.
Domain ID	Domain ID of the message.
STP Root ID	The spanning tree Root ID of the message.
FNP Messages	The total number of messages received.

Sample Output

show oam ethernet link-fault-management

Syntax `show oam ethernet link-fault-management`
 `<brief | detail>`
 `<interface-name>`

Release Information Command introduced in Junos OS Release 8.2.

Description On EX Series switches and M320, M120, MX Series, T320, and T640 routers, display Operation, Administration, and Management (OAM) link fault management information for Ethernet interfaces.

Options **brief | detail**—(Optional) Display the specified level of output.

interface-name—(Optional) Display link fault management information for the specified Ethernet interface only.

Required Privilege Level view

List of Sample Output [show oam ethernet link-fault-management brief on page 2248](#)
 [show oam ethernet link-fault-management brief \(Loopback tracking\) on page 2248](#)
 [show oam ethernet link-fault-management detail on page 2248](#)
 [show oam ethernet link-fault-management detail \(backup Routing Engine\) on page 2249](#)

Output Fields [Table 168 on page 2243](#) lists the output fields for the **show oam ethernet link-fault-management** command. Output fields are listed in the approximate order in which they appear.

Table 168: show oam ethernet link-fault-management Output Fields

Field Name	Field Description	Level of Output
Status	Indicates the status of the OAM discovery state mechanism . <ul style="list-style-type: none"> • Down—Discovery mechanism is not running.. • Running—Discovery mechanism is running. 	All levels
Discovery state	State of the discovery mechanism. If the status of the discovery mechanism is Down then the state of discovery mechanism is Fault. However, if the status of the discovery mechanism is Running then the state can be any one of the following: <ul style="list-style-type: none"> • Passive Wait • Active Send Local • Send Any • Send Local Remote • Send Local Remote Ok • Fault 	All levels

Table 168: show oam ethernet link-fault-management Output Fields (continued)

Field Name	Field Description	Level of Output
ISSU	Specifies that the local end is undergoing a unified in-service software upgrade (ISSU).	All levels
Peer address	Address of the OAM peer.	All levels
Flags	<p>Information about the interface. Possible values are described in the “Link Flags” section under <i>Common Output Fields Description</i>.</p> <ul style="list-style-type: none"> • Remote-Stable—Indicates remote OAM client acknowledgment of and satisfaction with local OAM state information. False indicates that remote DTE either has not seen or is unsatisfied with local state information. True indicates that remote DTE has seen and is satisfied with local state information. • Local-Stable—Indicates local OAM client acknowledgment of and satisfaction with remote OAM state information. False indicates that local DTE either has not seen or is unsatisfied with remote state information. True indicates that local DTE has seen and is satisfied with remote state information. • Remote-State-Valid—Indicates the OAM client has received remote state information found within Local Information TLVs of received Information OAM PDUs. False indicates that OAM client has not seen remote state information. True indicates that the OAM client has seen remote state information. 	All levels
Remote loopback status	Indicates the remote loopback status. An OAM entity can put its remote peer into loopback mode using the Loopback control OAM PDU. In loopback mode, every frame received is transmitted back on the same port (except for OAM PDUs, which are needed to maintain the OAM session).	All levels
Remote entity information	<p>Remote entity information.</p> <ul style="list-style-type: none"> • Remote MUX action—Indicates the state of the multiplexer functions of the OAM sublayer. Device is forwarding non-OAM PDUs to the lower sublayer or discarding non-OAM PDUs. • Remote parser action—Indicates the state of the parser function of the OAM sublayer. Device is forwarding non-OAM PDUs to higher sublayer, looping back non-OAM PDUs to the lower sublayer, or discarding non-OAM PDUs. • Discovery mode—Indicates whether discovery mode is active or inactive. • Unidirectional mode—Indicates the ability to operate a link in a unidirectional mode for diagnostic purposes. • Remote loopback mode—Indicates whether remote loopback is supported or unsupported. • Link events—Indicates whether interpreting link events is supported or unsupported on the remote peer. • Variable requests—Indicates whether variable requests are supported. The Variable Request OAM PDU, is used to request one or more MIB variables from the remote peer. • Remote in ISSU—Indicates that the remote end is undergoing a unified in-service software upgrade (ISSU). 	All levels
Loopback Tracking	Indicates that loopback detection is enabled or disabled.	All levels

Table 168: show oam ethernet link-fault-management Output Fields (continued)

Field Name	Field Description	Level of Output
Loop Status	Indicates that a loopback issue is either found, not found, or unknown when loopback tracking is enabled.	All levels
Detect LOC	Indicates that loss-of-continuity (LOC) detection is enabled or disabled.	All levels
LOC status	Indicates that a LOC issue is either found, not found, or unknown when Detect LOC is enabled. Status is unknown when LOC detection is disabled.	All levels
OAM Receive Statistics		
Information	The total number of information PDUs received.	detail
Event	The total number of loopback control PDUs received.	detail
Variable request	The total number of variable request PDUs received.	detail
Variable response	The total number of variable response PDUs received.	detail
Loopback control	The total number of loopback control PDUs received.	detail
Organization specific	The total number of vendor organization specific PDUs received.	detail
OAM Transmit Statistics		
Information	The total number of information PDUs transmitted.	detail
Event	The total number of event notification PDUs transmitted.	detail
Variable request	The total number of variable request PDUs transmitted.	detail
Variable response	The total number of variable response PDUs transmitted.	detail
Loopback control	The total number of loopback control PDUs transmitted.	detail
Organization specific	The total number of vendor organization specific PDUs transmitted.	detail
OAM Received Symbol Error Event information		
Events	The number of symbol error event TLVs that have been received since the OAM sublayer was reset.	detail
Window	The symbol error event window in the received PDU. The protocol default value is the number of symbols that can be received in one second on the underlying physical layer.	detail
Threshold	The number of errored symbols in the period required for the event to be generated.	detail

Table 168: show oam ethernet link-fault-management Output Fields (continued)

Field Name	Field Description	Level of Output
Errors in period	The number of symbol errors in the period reported in the received event PDU.	detail
Total errors	The number of errored symbols that have been reported in received event TLVs since the OAM sublayer was reset. Symbol errors are coding symbol errors.	detail
OAM Received Frame Error Event Information		
Events	The number of errored frame event TLVs that have been received since the OAM sublayer was reset.	detail
Window	The duration of the window in terms of the number of 100 ms period intervals.	detail
Threshold	The number of detected errored frames required for the event to be generated.	detail
Errors in period	The number of detected errored frames in the period.	detail
Total errors	The number of errored frames that have been reported in received event TLVs since the OAM sublayer was reset. A frame error is any frame error on the underlying physical layer.	detail
OAM Received Frame Period Error Event Information		
Events	The number of frame seconds errors event TLVs that have been received since the OAM sublayer was reset.	detail
Window	The duration of the frame seconds window.	detail
Threshold	The number of frame seconds errors in the period.	detail
Errors in period	The number of frame seconds errors in the period.	detail
Total errors	The number of frame seconds errors that have been reported in received event TLVs since the OAM sublayer was reset.	detail
OAM Transmitted Symbol Error Event Information		
Events	The number of symbol error event TLVs that have been transmitted since the OAM sublayer was reset.	detail
Window	The symbol error event window in the transmitted PDU.	detail
Threshold	The number of errored symbols in the period required for the event to be generated.	detail
Errors in period	The number of symbol errors in the period reported in the transmitted event PDU.	detail

Table 168: show oam ethernet link-fault-management Output Fields (continued)

Field Name	Field Description	Level of Output
Total errors	The number of errored symbols reported in event TLVs that have been transmitted since the OAM sublayer was reset.	detail
OAM Current Symbol Error Event Information		
Events	The number of symbol error TLVs that have been generated regardless of whether the threshold for sending event TLVs has been crossed.	detail
Window	The symbol error event window in the transmitted PDU.	detail
Threshold	The number of errored symbols in the period required for the event to be generated.	detail
Errors in period	The total number of symbol errors in the period reported.	detail
Total errors	The number of errored symbols reported in event TLVs that have been generated regardless of whether the threshold for sending event TLVs has been crossed.	detail
OAM Transmitted Frame Error Event Information		
Events	The number of errored frame event TLVs that have been transmitted since the OAM sublayer was reset.	detail
Window	The duration of the window in terms of the number of 100 ms period intervals.	detail
Threshold	The number of detected errored frames required for the event to be generated.	detail
Errors in period	The number of detected errored frames in the period.	detail
Total errors	The number of errored frames that have been detected since the OAM sublayer was reset.	detail
OAM Current Frame Error Event Information		
Events	The number of errored frame event TLVs that have been generated regardless of whether the threshold for sending event TLVs has been crossed.	detail
Window	The duration of the window in terms of the number of 100 ms period intervals.	detail
Threshold	The number of detected errored frames required for the event to be generated.	detail
Errors in period	The number of errored frames in the period.	detail
Total errors	The number of errored frames detected regardless of whether the threshold for transmitting event TLVs has been crossed.	detail

show oam ethernet lmi

Syntax `show oam ethernet lmi (interface <interface-name>)`

Release Information Command introduced in Junos OS Release 9.5.

Description On routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet, and OAM Ethernet Local Management Interface (E-LMI) configuration, display the LMI information for the configured interfaces or optionally for a specified interface.

NOTE: On MX Series routers, E-LMI is supported on Gigabit Ethernet (ge), 10-Gigabit Ethernet (xe), and Aggregated Ethernet (ae) interfaces configured on MX Series routers with DPC only.

Options **interface**—(Optional) Display LMI information for a specified interface.

interface-name—(Optional) Display Ethernet LMI information for the specified interface only.

Required Privilege Level View

Output Fields [Table 169 on page 2251](#) lists the output fields for the **show oam ethernet lmi** command. Output fields are listed in the approximate order in which they appear.

Table 169: show oam ethernet lmi Output Fields

Field Name	Field Description
Physical Interface	Header for the EVC information showing the Ethernet virtual circuit (EVC) name, configuration, and active/inactive status.
UNI Identifier	Name of the UNI.
EVC map type	EVC configuration.
Polling verification timer	Polling verification timer status.
E-LMI state	Operational status of the E-LMI configuration in the interfaces or specified interface.
Priority/Untagged VLAN ID	To be provided.
Default EVC	The EVC set as the default EVC.

Table 169: show oam ethernet lmi Output Fields (continued)

Field Name	Field Description
Associated EVCs	Heading for the list of configured EVCs.
EVC Identifier	EVC name.
Reference ID	To be provided.
Status	Status active or not active.
CE VLAN IDs	Customer edge VLAN ID numbers.

Sample Output

show oam ethernet lmi interface

```

user@host> show oam ethernet lmi interface ge-1/1/1
Physical interface: ge-1/1/1, Physical link is Up
UNI identifier: uni-ce1, EVC map type: Bundling
Polling verification timer: Enabled, E-LMI state: Operational
Priority/Untagged VLAN ID: 20, Default EVC: evc1
Associated EVCs:
  EVC      Reference   Status      CE VLAN IDs
  Identifier ID
  evc1      1      Active (New)  1-2048
  evc2      2      Not Active   2049-4096

```

show oam ethernet lmi statistics

Syntax `show oam ethernet lmi statistics <interface interface-name>`

Release Information Command introduced in Junos OS Release 9.5.

Description On MX Series routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet PICs, displays OAM Ethernet Local Management Interface (LMI) statistics.

Options **interface**—(Optional) Display LMI statistics for a specified interface.

interface-name—(Optional) Display Ethernet LMI information for the specified Ethernet interface only.

Required Privilege Level view

List of Sample Output [show oam ethernet lmi statistics on page 2254](#)

Output Fields [Table 170 on page 2253](#) lists the output fields for the **show oam ethernet lmi statistics** command. Output fields are listed in the approximate order in which they appear.

Table 170: show oam ethernet lmi statistics Output Fields

Field Name	Field Description
Physical interface	Name of the interface for the displayed statistics.
Reliability errors	Number of E-LMI reliability errors logged.
Protocol errors	Number of E-LMI protocol errors.
Status check received	Number of E-LMI status check receive errors.
Status check sent	Number of E-LMI status check sent errors.
Full status received	Number of E-LMI full status receive errors.
Full status sent	Number of E-LMI full status sent errors.
Full status continued received	Number of E-LMI status continued received errors.
Full status continued sent	Number of E-LMI full status continued sent errors.
Asynchronous status sent	Number of E-LMI asynchronous status sent errors.

Sample Output

show oam ethernet lmi statistics

```
user@host> show oam ethernet lmi statistics interface ge-1/1/1

Physical interface: ge-1/1/1
Reliability errors          4  Protocol errors
0
Status check received      0  Status check sent
0
Full status received       694 Full status sent
694
Full status continued received 0  Full status continued sent
0
Asynchronous status sent   0
```

show pppoe interfaces

Syntax	show pppoe interfaces <brief detail <pp0.logical>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display session-specific information about PPPoE interfaces.
Options	<p>none—Display interface information for all PPPoE interfaces.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>pp0.logical—(Optional) Name of an interface. The logical unit number for static interfaces can be a value from 0 through 16385. The logical unit number for dynamic interfaces can be a value from 1073741824 through the maximum number of logical interfaces supported on your router.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> <i>Verifying and Managing Agent Circuit Identifier-Based Dynamic VLAN Configuration</i>
List of Sample Output	show pppoe interfaces on page 2257 show pppoe interfaces (Status for the Specified Interface) on page 2257 show pppoe interfaces brief on page 2257 show pppoe interfaces detail on page 2258 show pppoe interfaces (PPPoE Subscriber Interface with ACI Interface Set) on page 2258
Output Fields	<p>Table 171 on page 2255 lists the output fields for the show pppoe interfaces command. Output fields are listed in the approximate order in which they appear. Not all fields are displayed for PPPoE interfaces on M120 and M320 routers in server mode.</p>

Table 171: show pppoe interfaces Output Fields

Field Name	Field Description	Level of Output
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	detail extensive none
State	State of the logical interface: up or down .	All levels
Session ID	Session ID.	All levels

Table 171: show pppoe interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Type	Origin of the logical interface: Static or Dynamic . Indicates whether the interface was statically or dynamically created.	detail extensive none
Service name	Type of service required (can be used to indicate an ISP name or a class or quality of service).	detail extensive none
Configured AC name	Configured access concentrator name.	detail extensive none
Session AC name	Name of the access concentrator.	detail extensive none
Remote MAC address or Remote MAC	MAC address of the remote side of the connection, either the access concentrator or the PPPoE client.	All levels
Session uptime	Length of time the session has been up, in <i>hh:mm:ss</i> .	detail extensive none
Dynamic Profile	Name of the dynamic profile that was used to create this interface. If the interface was statically created, this field is not displayed.	detail extensive none
Underlying interface	Interface on which PPPoE is running.	All levels
Agent Circuit ID	Agent circuit identifier (ACI) that corresponds to the DSLAM interface that initiated the client service request. An asterisk is interpreted as a wildcard character and can appear at the beginning, the end, or both the beginning and end of the string. If the agent circuit ID is not configured, this field is not displayed.	detail extensive none
Agent Remote ID	Agent remote identifier that corresponds to the subscriber associated with the DSLAM interface that initiated the service request. An asterisk is interpreted as a wildcard character and can appear at the beginning, the end, or both at the beginning and end of the string. If the agent remote ID is not configured, this field is not displayed.	detail extensive none
ACI Interface Set	Internally-generated name of the dynamic ACI interface set, if configured, and the set index number of the ACI entry in the session database.	detail extensive none

Table 171: show pppoe interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Packet Type	<p>Number of packets sent and received during the PPPoE session, categorized by packet type and packet errors:</p> <ul style="list-style-type: none"> • PADI—PPPoE Active Discovery Initiation packets. • PADO—PPPoE Active Discovery Offer packets. • PADR—PPPoE Active Discovery Request packets. • PADS—PPPoE Active Discovery Session-Confirmation packets. • PADT—PPPoE Active Discovery Termination packets. • Service name error—Packets for which the Service-Name request could not be honored. • AC system error—Packets for which the access concentrator experienced an error in performing the host request. For example, the host had insufficient resources to create a virtual circuit. • Generic error—Packets that indicate an unrecoverable error occurred. • Malformed packets—Malformed or short packets that caused the packet handler to discard the frame as unreadable. • Unknown packets—Unrecognized packets. 	extensive

Table 172: show pppoe service-name-tables Output Fields

Field Name	Field Description	Level of Output
Service Name Table	Name of the PPPoE service name table.	none
Service Name	Name of a configured service in the PPPoE service name table: <ul style="list-style-type: none"> • <empty>—Service of zero length that represents an unspecified service • <any>—Default service for non-empty service entries that do not match the configured empty or named service entries • service-name—Named service entry 	none
Action	Action taken when the PPPoE underlying interface receives a PPPoE Active Discovery Initiation (PADI) packet with the specified named service, empty service, any service, or ACI/ARI pair: <ul style="list-style-type: none"> • Delay seconds—Number of seconds that the interface delays before responding with a PPPoE Active Discovery Offer (PADO) packet • Drop—Interface drops (ignores) the packet. • Terminate—Interface responds immediately with a PADO packet 	none

Table 172: show pppoe service-name-tables Output Fields (continued)

Field Name	Field Description	Level of Output
Dynamic Profile	Name of the dynamic profile with which the router creates a dynamic PPPoE subscriber interface. A dynamic profile can be assigned to a named service, empty service, any service, or ACI/ARI pair.	none
Routing Instance	Name of the routing instance in which to instantiate the dynamic PPPoE subscriber interface. A routing instance can be assigned to a named service, empty service, any service, or ACI/ARI pair.	none
Max Sessions	Maximum number of active PPPoE sessions that the router can establish with the specified named service, empty service, or any service.	none
Active Sessions	Current count of active PPPoE sessions created using the specified named service, empty service, or any service. The Active Sessions value cannot exceed the Max Sessions value.	none
ACI	Agent circuit identifier (ACI) that corresponds to the DSLAM interface that initiated the client service request. An asterisk is interpreted as a wildcard character and can appear at the beginning, the end, or both the beginning and end of the string. An ACI can be configured as part of an ACI/ARI pair for a named service, empty service, or any service.	none
ARI	Agent remote identifier (ARI) that corresponds to the subscriber associated with the DSLAM interface that initiated the service request. An asterisk is interpreted as a wildcard character and can appear at the beginning, the end, or both at the beginning and end of the string. An ARI can be configured as part of an ACI/ARI pair for a named service, empty service, or any service.	none
Static Interface	Name of the static PPPoE interface reserved for exclusive use by the PPPoE client with matching ACI/ARI information. A static interface can be configured only for an ACI/ARI pair.	none

Sample Output

show pppoe sessions

Syntax `show pppoe sessions`
`<aci circuit-id-string>`
`<ari remote-id-string>`
`<service service-name>`

Release Information Command introduced in Junos OS Release 10.2.

Description Display information about all active PPPoE sessions on the router, or about the active PPPoE sessions established for a specified service name, agent circuit identifier (ACI), or agent remote identifier (ARI).

Options **none**—Display information for all active PPPoE sessions on the router.

aci circuit-id-string—(Optional) Display information only for active PPPoE sessions established with the specified agent circuit identifier. The agent circuit identifier corresponds to the DSLAM interface that initiated the service request.

ari remote-id-string—(Optional) Display information only for active PPPoE sessions established with the specified agent remote identifier. The agent remote identifier corresponds to the subscriber associated with the DSLAM interface that initiated the service request.

service service-name—(Optional) Display information only for active PPPoE sessions established with the specified service, where *service-name* can be **empty**, **any**, or a named service.

Output Fields	Table 174 on page 2264 lists the output fields for the show pppoe statistics command. Output fields are listed in the approximate order in which they appear.

Table 174: show pppoe statistics Output Fields

Field Name	Field Description
Active PPPoE sessions	<p>Total number of active PPPoE sessions and the number of packets sent and received during the PPPoE session, categorized by packet type and packet errors:</p> <ul style="list-style-type: none"> PADI—PPPoE Active Discovery Initiation packets. PADO—PPPoE Active Discovery Offer packets. PADR—PPPoE Active Discovery Request packets. PADS—PPPoE Active Discovery Session-Confirmation packets. PADT—PPPoE Active Discovery Termination packets. Service name error—Packets for which the Service-Name request could not be honored. AC system error—Packets for which the access concentrator experienced an error in performing the host request. For example, the host had insufficient resources to create a virtual circuit. Generic error—Packets that indicate an unrecoverable error occurred. Malformed packets—Malformed or short packets that caused the packet handler to discard the frame as unreadable. Unknown packets—Unrecognized packets.

Table 174: show pppoe statistics Output Fields (continued)

Field Name	Field Description
Timeouts	<p>Information about timeouts that occurred during the PPPoE session (not displayed for M120, M320, and MX Series routers):</p> <ul style="list-style-type: none"> • PADI—No PADR packet has been received within the timeout period. (This value is always zero and is not supported.) • PADO—No PPPoE Active Discovery Offer packet has been received within the timeout period. • PADR—No PADS packet has been received within the timeout period.

show pppoe underlying-interfaces

Syntax	<pre>show pppoe underlying-interfaces <brief detail extensive> <lockout> <logical-interface-name></pre>
Release Information	<p>Command introduced in Junos OS Release 10.0.</p> <p>lockout option added in Junos OS Release 11.4.</p>
Description	Display information about PPPoE underlying interfaces.
Options	<p>brief detail extensive—(Optional) Display the specified level of output.</p> <p>lockout—(Optional) Display summary information about the lockout condition and the lockout grace period for PPPoE clients on the PPPoE underlying interface.</p> <p>logical-interface-name—(Optional) Name of a PPPoE underlying logical interface.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • <i>Verifying and Managing Dynamic PPPoE Configuration</i> • <i>Configuring an Underlying Interface for Dynamic PPPoE Subscriber Interfaces</i> • <i>Configuring the PPPoE Family for an Underlying Interface</i> • <i>Verifying and Managing Agent Circuit Identifier-Based Dynamic VLAN Configuration</i> • <i>Verifying and Managing Configurations for Dynamic VLANs Based on Access-Line Identifiers</i>
List of Sample Output	<p>show pppoe underlying-interfaces brief on page 2269</p> <p>show pppoe underlying-interfaces detail on page 2269</p> <p>show pppoe underlying-interfaces extensive on page 2270</p> <p>show pppoe underlying-interfaces extensive (PPPoE client in lockout condition) on page 2270</p> <p>show pppoe underlying-interfaces lockout on page 2271</p> <p>show pppoe underlying-interfaces detail (Autosensing Configured for ACI-based Dynamic VLANs) on page 2271</p> <p>show pppoe underlying-interfaces detail (Autosensing Configured for ALI-based Dynamic VLANs) on page 2271</p>
Output Fields	<p>Table 175 on page 2267 lists the output fields for the show pppoe underlying-interfaces command. Output fields are listed in the approximate order in which they appear.</p>

Table 175: show pppoe underlying-interfaces Output Fields

Field Name	Field Description	Level of Output
Underlying Interface	Name of the PPPoE underlying logical interface.	All levels
Service Name Table	Name of the service name table.	All levels
Dynamic Profile	Name of the dynamic profile that was used to create this interface. If the interface was statically created, then the value is none .	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	detail extensive
State	Origin of the logical interface: Static or Dynamic . Indicates whether the interface was statically or dynamically created.	detail extensive
Operational States	Fields in this block are actual operational values rather than simply the configured values. The operational values can be the result of RADIUS-initiated changes.	detail extensive
Max Sessions	Maximum number of PPPoE logical interfaces that can be activated on the underlying interface. When this number of logical interfaces has been established, all subsequent PPPoE Active Discovery Initiation (PADI) packets are dropped and all subsequent PPPoE Active Discovery Request (PADR) packets trigger PPPoE Active Discovery Session (PADS) error responses.	detail extensive
Max Sessions VSA Ignore	Whether the router is configured to ignore (clear) the PPPoE maximum session value returned by RADIUS in the Max-Clients-Per-Interface Juniper Networks VSA [26-143] and restore the PPPoE maximum session value on the underlying interface to the value configure with the max-sessions statement: Off (default) or On .	detail extensive none
Active Sessions	Number of active PPPoE sessions on the underlying interface. If a dynamic profile is listed, then it is the number of active PPPoE sessions on the underlying interface that are using this profile. The Active Sessions value must not exceed the Max Sessions value.	detail extensive
Agent Circuit Identifier	<p>Whether the underlying interface is configured with the agent-circuit-identifier statement to enable creation of autosensed dynamic VLAN subscriber interfaces based on agent circuit identifier (ACI) information.</p> <p>Autosensing indicates that creation of ACI-based dynamic VLAN interfaces is enabled on the underlying interface. If creation of ACI-based dynamic VLANs is not configured on the underlying interface, this field does not appear.</p> <p>NOTE: The Agent Circuit Identifier field is replaced with the Line Identity field when an ALI interface set is configured with the line-identity autoconfiguration stanza.</p>	detail extensive none

Table 175: show pppoe underlying-interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Line Identity	<p>Whether the underlying interface is configured with the line-identity statement to enable creation of autosensed dynamic VLAN subscriber interfaces based on the specified trusted option: ACI, ARI, both, or neither.</p> <p>Autosensing indicates that creation of ALI-based dynamic VLAN interfaces is enabled on the underlying interface. If creation of ALI dynamic VLANs based on trusted options is not configured on the underlying interface, this field does not appear.</p> <p>NOTE: The Line Identity field is replaced with the ACI VLAN field when an ACI interface set is configured with the agent-circuit-id autoconfiguration stanza.</p>	detail extensive none
Duplicate Protection	State of PPPoE duplicate protection: On or Off . When duplicate protection is configured for the underlying interface, a dynamic PPPoE logical interface cannot be activated when an existing active logical interface is present for the same PPPoE client. The uniqueness of the PPPoE client is determined by the client's MAC address.	detail extensive
Short Cycle Protection	State of PPPoE short cycle protection: mac-address , circuit-id , or Off . Enabling short cycle protection, also known as PPPoE lockout, on the PPPoE underlying interface temporarily prevents (locks out) a failed or short-lived (short-cycle) PPPoE subscriber session from reconnecting to the router for a default or configurable period of time. PPPoE client sessions are identified by their unique media access control (MAC) source address or agent circuit identifier (ACI) value.	detail extensive
Direct Connect	State of the configuration to ignore DSL Forum VSAs: On or Off . When configured, the router ignores any of these VSAs received from a directly connected CPE device on the interface.	detail extensive none
AC Name	Name of the access concentrator.	detail extensive
PacketType	<p>Number of packets sent and received during the PPPoE session, categorized by packet type and packet errors:</p> <ul style="list-style-type: none"> • PADI—PPPoE Active Discovery Initiation packets. • PADO—PPPoE Active Discovery Offer packets. • PADR—PPPoE Active Discovery Request packets. • PADS—PPPoE Active Discovery Session-Confirmation packets. • PADT—PPPoE Active Discovery Termination packets. • Service name error—Packets for which the Service-Name request could not be honored. • AC system error—Packets for which the access concentrator experienced an error in performing the host request. For example, the host had insufficient resources to create a virtual circuit. • Generic error—Packets that indicate an unrecoverable error occurred. • Malformed packets—Malformed or short packets that caused the packet handler to discard the frame as unreadable. • Unknown packets—Unrecognized packets. 	detail extensive

Table 175: show pppoe underlying-interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Lockout Time (sec)	The PPPoE lockout time range, the number of PPPoE clients in lockout condition, and the number of PPPoE clients in a lockout grace period if Short Cycle Protection is enabled (On): <ul style="list-style-type: none"> Min—Minimum lockout time, in seconds, configured on the PPPoE underlying interface. Max—Maximum lockout time, in seconds, configured on the PPPoE underlying interface. Total clients in lockout—Number of PPPoE clients currently undergoing lockout. Total clients in lockout grace period—Number of PPPoE clients currently in a lockout grace period. A <i>lockout grace period</i> occurs when the time between lockout events is greater than either 15 minutes or the maximum lockout time. 	extensive
Client Address	MAC source address of the PPPoE client.	extensive
Current	Current lockout time, in seconds; displays 0 (zero) if the PPPoE client is not undergoing lockout.	extensive
Elapsed	Time elapsed into the lockout period, in seconds; displays 0 if the PPPoE client is not undergoing lockout	extensive
Next	Lockout time, in seconds, that the router uses for the next lockout event; displays a nonzero value if the PPPoE client is currently in a lockout grace period.	extensive

show pppoe version

Syntax	show pppoe version
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M120 routers and M320 routers only) Display version information about PPPoE.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show pppoe version on page 2273
Output Fields	Table 176 on page 2273 lists the output fields for the show pppoe version command. Output fields are listed in the approximate order in which they appear.

Table 176: show pppoe version Output Fields

Field Name	Field Description
version <i>n</i>	PPPoE version number and RFC. For example, version 1, rfc 2516 .
PPPoE protocol	State of the PPPoE protocol: enabled or disabled .
Maximum Sessions	Maximum active sessions supported per router. The default is 256 sessions.
PADI resend timeout	Initial time, in seconds, that the router waits to receive a PPoE Active Discovery Offer (PADO) packet for the PPoE Active Discovery Initiation (PADI) packet sent. This timeout doubles for each successive PADI packet sent. Not displayed for M120 and M320 routers.
PADR resend timeout	Initial time, in seconds, that the router waits to receive a PPoE Active Discovery Session Confirmation (PADS) packet for the PPoE Active Discovery Request (PADR) packet sent. This timeout doubles for each successive PADR packet sent. Not displayed for M120 and M320 routers.
Max resend timeout	Maximum value, in seconds, that the PADI or PADR resend timer can accept. The maximum value is 64. Not displayed for M120 and M320 routers.
Max Configured AC timeout	Time, in seconds, during which the configured access concentrator must respond. Not displayed for M120 and M320 routers.

Sample Output

show pppoe version

```
user@host> show pppoe version
```

Point-to-Point Protocol Over Ethernet, version 1. rfc2516

PPPoE protocol	= Enabled
Maximum Sessions	= 256
PADI resend timeout	= 2 seconds
PADR resend timeout	= 16 seconds
Max resend timeout	= 64 seconds
Max Configured AC timeout	= 4 seconds

Output Fields	Table 177 on page 2276 lists the output fields for the show protection-group ethernet-ring aps command. Output fields are listed in the approximate order in which they appear.

Table 177: show protection-group ethernet-ring aps Output Fields

Field Name	Field Description
Ethernet Ring	Name configured for the Ethernet ring.
Request/State	<p>Status of the Ethernet ring RAPS messages.</p> <ul style="list-style-type: none"> NR—Indicates that there is no request for APS on the ring. SF—Indicates that there is a signal failure on the ring. FS—Indicates that there are active forced-switch requests in the ring. MS—Indicates that there are active manual-switch requests in the ring. <p>NOTE: Both FS and MS values are valid only when G.8032v2 is supported.</p>
Ring Protection Link Blocked	Blocking on the ring protection link: Yes or No .
No Flush	Indicates the value of the Do Not Flush (DNF) flag in the received RAPS PDU. If the value is Yes, then FDB flush is not triggered as part of processing of the received RAPS PDU.
Blocked Port Reference	This parameter is the reference to the blocked ring port. If the east ring port is blocked, the Blocked Port Reference (BPR) value is 0. If the west ring port is blocked, the BPR value is 1. If both ring ports are blocked, this parameter can take any value. If both east and west ports are blocked or not blocked, the value would be 0. This field is valid only when G.8032v2 is supported.
Blocked Port Reference	Reference of the ring port on which traffic is blocked.
Originator	Indicates whether the node is the originator of the RAPS messages.
Remote Node ID	Identifier (in MAC address format) of the remote node.

show protection-group ethernet-ring configuration

Syntax	show protection-group ethernet-ring configuration
Release Information	Command introduced in Junos OS Release 12.1 for EX Series switches. Command introduced in Junos OS Release 14.1 for MX Series routers. Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.
Description	Display the configuration of Ethernet ring protection group on EX Switches and MX Series routers.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show protection-group ethernet-ring aps on page 2275 • show protection-group ethernet-ring data-channel on page 2286 • show protection-group ethernet-ring interface on page 2291 • show protection-group ethernet-ring node-state on page 2295 • show protection-group ethernet-ring statistics on page 2300 • show protection-group ethernet-ring vlan on page 2306
List of Sample Output	show protection-group ethernet-ring configuration (EX Switch) on page 2281 show protection-group ethernet-ring configuration detail (MX Series Router) on page 2282 show protection-group ethernet-ring configuration (MX Series Router) on page 2282 show protection-group ethernet-ring configuration detail (MX Series Router) on page 2282 show protection-group ethernet-ring configuration detail (MX Series Router) on page 2283 show protection-group ethernet-ring configuration (MX Series Router) on page 2283 show protection-group ethernet-ring configuration detail (MX Series Router) on page 2284
Output Fields	Table 178 on page 2279 lists the output fields for the show protection-group ethernet-ring configuration command. Output fields are listed in the approximate order in which they appear.

Table 178: show protection-group ethernet-ring configuration Output Fields

Output Fields	Field Description
G8032 Compatability Version	This is the compatibility version mode of ERP. This parameter always takes the value 1 in the case of G8032v1. This parameter is valid only for MX Series routers.
East Interface	One of the two switch interfaces that participates in a ring link. When Junos supports G8032v2, this interface is treated as interface 0.
West Interface	One of the two interfaces in a switch that participates in a ring link. When Junos supports G8032v2, this interface is treated as interface 1.

Table 178: show protection-group ethernet-ring configuration Output Fields (continued)

Output Fields	Field Description
Restore Interval	<p>Configured interval of wait time after a link is restored. When a link goes down, the RPL link is activated. When the down link becomes active again, the RPL owner receives a notification. The RPL owner waits for the restore interval before issuing a block on the RPL link. The configured restore interval can be 5 through 12 minutes for ERIPv1 and 1 through 12 minutes for ERIPv2. This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value.</p> <p>NOTE: Wait to Restore (WTR) configuration values on EX2300 and EX3400 switches must be 5-12 minutes.</p>
Wait to Block Interval	<p>Configured interval of wait time for link restoration when a manual command (manual switch or force switch) is cleared. On clearing the manual command, the RPL owner receives NR messages, which starts a timer with interval 'Wait to Block' to restore the RPL link after its expiration. This delay timer is set to be 5 seconds longer than the guard timer. The configured number can be from 5 seconds through 10 seconds. The parameter is valid only for G.8032v2.</p> <p>NOTE: The Wait To Block Timer (WTB) is always disabled on EX2300 and EX3400 switches because it is not supported in ERPSv1. Any configuration you make to the WTB setting has no effect. The output from the CLI command 'show protection-group ethernet-ring node-state detail' lists a WTB setting but that setting has no effect.</p>
Guard Interval	<p>Configured number of milliseconds (in 10 millisecond intervals, 10 milliseconds through 2000 milliseconds) that the node does not process any Ethernet ring protection protocol data units (PDUs). This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value.</p>
Hold off interval	<p>This is the interval at which the link is held down even before declaring that the link is down. Because the parameter is not supported at present, its value is always considered 0. This parameter is valid only for MX Series routers.</p>
Node ID	<p>Node ID for the switch or router. If the node ID is not configured, it is assigned by default. For EX Series switches, the Node ID value cannot be configured, whereas for MX Series routers, it can be configured.</p>
Ring ID	<p>In G8032v2, the ring ID can be within the range 1–239. All the nodes in a ring should have the same ring ID. In the case of G8032v1, the value of the ring ID is always 1. This parameter is valid only for MX Series routers.</p>
Node Role	<p>Indicates whether the ring node is operating as a normal ring-node or RPL-owner or RPL-neighbor. For G8032v1 RPL-neighbor role is not supported. This parameter is valid only for MX Series routers.</p>

Table 178: show protection-group ethernet-ring configuration Output Fields (continued)

Output Fields	Field Description
Revertive Mode of Operation	This parameter indicates whether the ring is operating in revertive mode or nonrevertive mode. In nonrevertive mode of operation, when all links in the ring and Ethernet Ring Nodes have recovered and no external requests are active, the Ethernet Ring does not automatically revert. G8032v1 supports only revertive mode of operation. This parameter is valid only for MX Series routers.
RAPS Tx Dot1p priority	The RAPS Tx Dot1p priority is a parameter with which the RAPS is transmitted from the ring node. For G8032v1, the value of this parameter is always 0. For G8032v2, the value of this parameter can be within the range 0–7. This parameter is valid only for MX Series routers.
Node type	Indicates whether ring node is a normal ring node having two ring-links or a open ring-node having only a single ring-link or a interconnection ring-node. An interconnection ring node can be connected to major ring in non virtual-channel mode or in virtual channel mode. Ring interconnection is not supported for G8032v1. This parameter is valid only for MX Series routers.
Major ring name	If the node type is interconnection in the ring, this parameter takes the name of the major ring to which the sub-ring node is connected. This parameter is valid only for MX Series routers.
Interconnection mode	Indicates the interconnection mode if the type of the node is interconnection. An interconnection ring node can be connected to major ring in non-virtual channel mode or in virtual channel mode. This parameter is valid only for MX Series routers.
Propagate Topology Change event	When Propagate Topology Change event is set to 1, the change in the topology of sub-ring is propagated to the major ring, enabling the transmission of EVENT FLUSH RAPS PDU in the major ring. When the parameter is set to 0, the topology change in the sub-ring is not propagated to the major ring blocking EVENT FLUSH RAPS PDU transmission in the major ring. This parameter is valid only for MX Series routers.
Control Vlan	The VLAN that transfers ERP PDUs from one node to another.
Physical Ring	Physical ring if the east and west interfaces are nontrunk ports. For MX Series routers, the ring is termed a physical ring if no data channels are defined for the ring and the entire physical port forwarding is controlled by ERP.
Data Channel VLAN(s)	Data VLANs for which forwarding behavior is controlled by the ring instance.

Sample Output

show protection-group ethernet-ring configuration (EX Switch)

```

show protection-group ethernet-ring data-channel

Syntax `show protection-group ethernet-ring data-channel`
`<brief | detail>`
`<group-name group-name>`

Release Information Command introduced in Junos OS Release 10.2.
 Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.

Description Display the configuration of Ethernet ring protection group on EX Switches and MX Series routers.

Options **brief | detail**—(Optional) Display the specified level of output.
group-name—(Optional) Protection group for which to display statistics. If you omit this optional field, all protection group statistics for configured groups will be displayed.

Required Privilege Level view

Output Fields [Table 179 on page 2286](#) lists the output fields for the **show protection-group ethernet-ring data-channel** command. Output fields are listed in the approximate order in which they appear.

Table 179: show protection-group ethernet-ring data-channel Output Fields

Field Name	Field Description
Interface	Name of the interface configured for the Ethernet ring.

Table 179: show protection-group ethernet-ring data-channel Output Fields (continued)

Field Name	Field Description
STP Index	The Spanning Tree Protocol (STP) index number used by each interface in an Ethernet ring. The STP index controls the forwarding behavior for a set of VLANs on a data channel on an Ethernet ring port. For multiple Ethernet ring instances on an physical ring port, there are multiple STP index numbers. Different ring instances will have different STP index numbers and may have different forwarding behavior.
Forward State	Forwarding state on the Ethernet ring. <ul style="list-style-type: none"> • forwarding—Indicates packets are being forwarded. • discarding—Indicates packets are being discarded.

Sample Output

Forward State	: forwarding

show protection-group ethernet-ring flush-info

Syntax	<code>show protection-group ethernet-ring flush-info</code>
Release Information	Command introduced in Junos OS Release 14.2.
Description	Display information about flush ports in an Ethernet ring.
Options	This command has no options.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show protection-group ethernet-ring data-channel on page 2286 • show protection-group ethernet-ring aps on page 2275 • show protection-group ethernet-ring node-state on page 2295 • show protection-group ethernet-ring statistics on page 2300 • show protection-group ethernet-ring vlan on page 2306
List of Sample Output	show protection-group ethernet-ring flush-info (ACX and MX Series Routers) on page 2290 show protection-group ethernet-ring flush-info detail (ACX and MX Series Routers) on page 2290
Output Fields	<p>Table 180 on page 2289 lists the output fields for the show protection-group ethernet-ring flush-info command. Output fields are listed in the approximate order in which they appear.</p>

Table 180: show protection-group ethernet-ring flush-info Output Fields

Field Name	Field Description
Interface	Physical interface configured for the Ethernet ring. This can be an aggregated Ethernet link also.
Originating Node	Node from which RAPS protocol data units originates on the Ethernet Ring.
Blocked Port Reference	Reference of the ring port on which traffic is blocked.

Sample Output

show protection-group ethernet-ring flush-info (ACX and MX Series Routers)

```
user@host> show protection-group ethernet-ring flush-info

Ethernet ring flush port information for protection group pg100

Interface      Originating Node  Blocked Port Reference
xe-5/0/2.4001  00:00:00:00:00:00  0
xe-2/2/0.4001  00:00:00:00:00:00  0
```

show protection-group ethernet-ring flush-info detail (ACX and MX Series Routers)

```
user@host> show protection-group ethernet-ring flush-info detail

Ethernet ring flush port information for protection group pg100

Output Fields	<p>Table 181 on page 2292 lists the output fields for both the EX Series switch, and the ACX Series and MX Series router show protection-group ethernet-ring interface commands. Output fields are listed in the approximate order in which they appear.</p>

Table 181: MX Series Routers show protection-group ethernet-ring interface Output Fields

Field Name	Field Description
Ethernet ring port parameters for protection group <i>group-name</i>	Output is organized by configured protection group.
Interface	Physical interfaces configured for the Ethernet ring. This can be an aggregated Ethernet link also.
Control Channel	(MX Series router only) Logical unit configured on the physical interface.
Direction	Direction of the traffic.
Forward State	State of the ring forwarding on the interface: discarding or forwarding .
Ring Protection Link End	Whether this interface is the end of the ring: Yes or No .
Signal Failure	Whether there a signal failure exists on the link: Clear or Set .
Admin State	State of the interface: For EX switches, ready , ifl ready , or waiting . For MX routers, IFF ready or IFF disabled .

Sample Output

show protection-group ethernet-ring interface (EX Series Switch Owner Node)

```
user@host> show protection-group ethernet-ring interface
Ethernet ring port parameters for protection group pg101
```

Interface	Forward State	RPL End	Signal Failure	Admin State
ge-0/0/3.0	discarding	Yes	Clear	ready
ge-0/0/9.0	forwarding	No	Clear	ready

Output Fields	Table 182 on page 2296 lists the output fields for the show protection-group ethernet-ring node-state command. Output fields are listed in the approximate order in which they appear.

Table 182: show protection-group ethernet-ring node-state Output Fields

Field Name	Field Description
Ring Name/Ethernet Ring	Name configured for the Ethernet ring.
APS State	<p>State of the Ethernet ring APS.</p> <ul style="list-style-type: none"> • idle—Indicates that the ring is working in normal condition and there is no active or pending protection-switching request in the ring. When the ring is in idle state, it is blocked at the RPL link. • protected—Indicates that there is a protection switch on the ring because of a signal failure condition on the ring link. • MS—Indicates that the manual switch command is active in the ring. • FS—Indicates that the forced switch command is active in the ring. • pending—Indicates that the ring is in pending state.
Event	<p>Events on the ring.</p> <ul style="list-style-type: none"> • NR-RB—Indicates that there is no APS request and the ring link is blocked on the ring owner node. • NR—Indicates that there is no APS request pending in the ring. • local SF—Indicates that there is signal failure on one or both of the ring links of the node. • remote SF—Indicates that there is signal failure on one or more ring links of any other node of the ring. • local FS—Indicates that there is a forced switched command active on one or both of the ring links of the node. • remote FS—Indicates that there is a forced switch command active on one or more ring links of any other node of the ring. • local MS—Indicates that there is a manual switch command active on one of the ring links of the node. • remote MS—Indicates that there is a manual switch command active on one or more ring links of any other node of the ring. • WTR running—Indicates that the wait to restore timer is running on the RPL owner. • WTB running—Indicates that the wait to block timer is running on the RPL owner.
RPL Owner / Ring Protection Link Owner	Whether this node is the ring owner: Yes or No .
WTR Timer / Restore Timer	Restoration timer: running or disabled .
WTB Timer / Wait to block timer	<p>Wait to block timer: running or disabled.</p> <p>NOTE: The Wait To Block Timer (WTB) is always disabled on EX2300 and EX3400 switches because it is not supported in ERPSv1. Any configuration you make to the WTB setting has no effect. The output from the CLI command 'show protection-group ethernet-ring node-state detail' lists a WTB setting but that setting has no effect.</p>

Table 182: show protection-group ethernet-ring node-state Output Fields (continued)

Field Name	Field Description
Wait to block timer (WTB Timer)	Wait to block interval. NOTE: The Wait To Block Timer (WTB) is always disabled on EX2300 and EX3400 switches because it is not supported in ERPSv1. Any configuration you make to the WTB setting has no effect. The output from the CLI command 'show protection-group ethernet-ring node-state detail' lists a WTB setting but that setting has no effect.
Guard Timer	Guard timer: running or disabled .
Op State / Operational State	State of the node: Operational or any internal wait state ..

Sample Output

show protection-group ethernet-ring node-state (MX Series Router - RPL Owner Node, Normal Operation)

```
user@host> show protection-group ethernet-ring node-state
```

Ethernet ring	APS State	Event	RPL Owner	WTR Timer	WTB Timer	Guard
pg101	idle	NR-RB	Yes	disabled	disabled	disabled
operational						
pg102	idle	NR-RB	No	disabled	disabled	disabled
operational						

show protection-group ethernet-ring node-state (MX Series Router - Normal Ring Node, Normal Operation)

```
user@host> show protection-group ethernet-ring node-state
```

Ethernet ring	APS State	Event	RPL Owner
pg102	idle	NR-RB	No

WTR Timer	WTB Timer	Guard Timer	Operation state
disabled	disabled	disabled	operational

show protection-group ethernet-ring node-state (MX Series Router - RPL Owner Node, Remote Failure Condition)

```
user@host> show protection-group ethernet-ring node-state
```

Ethernet ring	APS State	Event	RPL Owner
pg101	protected	remote SF	Yes

WTR Timer	WTB Timer	Guard Timer	Operation state
disabled	disabled	disabled	operational

show protection-group ethernet-ring node-state detail (ACX Series and MX Series Router)

```

Output Fields	Table 183 on page 2301 lists the output fields for the show protection-group ethernet-ring statistics command.

Table 183: show protection-group ethernet-ring statistics Output Fields

Field Name	Field Description
Ethernet Ring Statistics for PG	Name of the protection group for which statistics are displayed.
RAPS event sent	Number of times Ring Automatic Protection Switching (RAPS) message transmission event occurred locally. This field is applicable only to MX Series routers.
RAPS event received	Number of RAPS messages received and processed by ERP state-machine and which resulted in state transition. This field is applicable only to MX Series routers.
Local SF	Number of times a signal failure has occurred locally.
Remote SF	Number of times a signal failure has occurred anywhere else on the ring.
NR event	Number of times a No Request event has occurred on the ring. This field is applicable only to EX Series switches.
NR event sent	Number of times a No Request event has occurred locally. This field is applicable only to MX Series routers.
NR event received	Number of times a No Request event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.
NR-RB event	Number of times a No Request, Ring Blocked event has occurred on the ring. This field is applicable only to EX Series switches.
NR-RB event sent	Number of times a No Request, Ring Blocked event has occurred locally. This field is applicable only to MX Series routers.
NR-RB event received	Number of times a No Request, Ring Blocked event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.
Flush event sent	Number of times flush-event RAPS message transmission event occurred locally. This field is applicable only to MX Series routers.
Flush event received	Number of flush-event RAPS messages received and processed by the ring instance control process. This field is applicable only to MX Series routers.
Local FS event sent	Number of times a forced switch event has occurred locally. This field is applicable only to MX Series routers.
Remote FS event received	Number of times a forced switch event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.
Local MS event sent	Number of times a manual switch event has occurred locally. This field is applicable only to MX Series routers.

Table 183: show protection-group ethernet-ring statistics Output Fields (continued)

Field Name	Field Description
Remote MS event received	Number of times a manual switch event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.

Table 184 on page 2302 lists the output fields for the **show protection-group ethernet-ring statistics** command when the **detail** option is used. These fields are valid only for MX Series routers.

Table 184: show protection-group ethernet-ring statistics detail Output Fields (for MX Series Routers)

Field Name	Field Description
Total number of FDB flush	Number of times forwarding database (FDB) flush has happened for the ring instance.
Flush-logic triggered flush	Number of times FDB flush has happened because of flush-logic based on node ID and Blocked Port Reference (BPR).
Remote RAPS PDU received	Number of valid RAPS PDU messages received. This counter counts only RAPS messages generated by other devices on the ring.
Remote RAPS dropped due to guard-timer	Number of RAPS messages dropped by the device because the guard timer is running.
Invalid remote RAPS PDU dropped	Number of RAPS messages dropped by the device because the messages are invalid.
RAPS dropped due to miscellaneous errors	Number of RAPS messages dropped because of any other reason. For example, messages dropped because of unsupported functionality.
Local received RAPS PDU dropped	Number of self-generated RAPS messages received and dropped.

Sample Output

show protection-group ethernet-ring statistics (EX Series Switch)

```
user@switch> show protection-group ethernet-ring statistics

Ring Name Local SF Remote SF NR Event NR-RB Event
erp1      2      1      2      3
```

show protection-group ethernet-ring statistics (MX Series Router)

```
user@host> show protection-group ethernet-ring statistics

Ethernet Ring statistics for PG Pg-1
RAPS event sent           : 1
RAPS event received       : 1152
```

```

Local SF happened:           : 0
Remote SF happened:          : 428
NR event sent:               : 1
NR event received:           : 133
NR-RB event sent:            : 0
NR-RB event received:        : 591
Flush event sent             : 0
Flush event received:         : 0
Local FS event sent:          : 0
Remote FS event received:     : 0
Local MS event sent:          : 0
Remote MS event received:     : 0

```

show protection-group ethernet-ring statistics detail (Specific Group)(MX Series Router)

```

show protection-group ethernet-ring vlan

Syntax	<pre>show protection-group ethernet-ring vlan <brief detail> <group-name group-name></pre>				
Release Information	<p>Command introduced in Junos OS Release 10.2.</p> <p>Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.</p>				
Description	On MX Series routers, display all data channel logical interfaces and the VLAN IDs controlled by a ring instance data channel.				
Options	<p>brief detail—(Optional) Display the specified level of output.</p> <p>group-name—(Optional) Protection group for which to display details such as data channel interfaces, vlan, and bridge-domain. If you omit this optional field, details for all configured protection groups will be displayed.</p>				
Required Privilege Level	view				
Related Documentation	<ul style="list-style-type: none"> • show protection-group ethernet-ring aps on page 2275 • show protection-group ethernet-ring data-channel on page 2286 • show protection-group ethernet-ring interface on page 2291 • show protection-group ethernet-ring node-state on page 2295 • show protection-group ethernet-ring statistics on page 2300

Field Name	Field Description				
Interface	Name of the interface configured for the Ethernet protection ring.				

Table 185: show protection-group ethernet-ring vlan Output Fields (continued)

Field Name	Field Description
Vlan	Name of the VLAN associated with the interface configured for the Ethernet protection ring.
STP Index	The Spanning Tree Protocol (STP) index number used by each interface in an Ethernet ring. The STP index controls the forwarding behavior for a set of VLANs on a data channel on an Ethernet ring port. For multiple Ethernet ring instances on an physical ring port, there are multiple STP index numbers. Different ring instances will have different STP index numbers and may have different forwarding behavior.
Bridge Domain	Name of the bridge domain that is associated with the VLAN configured for the Ethernet protection ring.

Sample Output

show security macsec connections (MX Series)

Syntax	show security macsec connections <interface <i>interface-name</i> >
Release Information	Command introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers. Support for MPC7E-10G introduced in Junos OS Release 16.1R1 for MX240, MX480, and MX960 routers.
Description	Display the status of the active MACsec connections on the router.
Options	<p>none—Display MACsec connection information for all interfaces on the switch.</p> <p>interface <i>interface-name</i>—(Optional) Display MACsec connection information for the specified interface only.</p>
Required Privilege Level	view
List of Sample Output	<p>show security macsec connections on page 2312</p> <p>show security macsec connections (MX480 routers with MPC7E-10G) on page 2312</p> <p>show security macsec connections (MX480 routers with MPC7E-10G) on page 2313</p>
Output Fields	Table 186 on page 2311 lists the output fields for the show security macsec connections command. Output fields are listed in the approximate order in which they appear.

Table 186: show security macsec connections Output Fields

Field Name	Field Description
Fields for Interface	
Interface name	Name of the interface.
CA name	<p>Name of the connectivity association.</p> <p>A connectivity association is named using the connectivity-association statement when you are enabling MACsec.</p>
Cipher suite	Name of the cipher suite used for encryption.
Encryption	<p>Encryption setting. Encryption is enabled when this output is on and disabled when this output is off.</p> <p>The encryption setting is set using the no-encryption statement in the connectivity association when using static connectivity association key (CAK) security mode and is set using the encryption statement in the secure channel when using static secure association key (SAK) or dynamic security mode.</p>

Table 186: show security macsec connections Output Fields (continued)

Field Name	Field Description
Key server offset	<p>The offset value in a packet from which encryption can be performed.</p> <p>The offset is set using the offset statement when configuring the connectivity association when using static connectivity association key (CAK) or dynamic security mode or the secure channel when using static secure association key (SAK) security mode.</p>
Include SCI	<p>SCI tagging. The SCI tag is included on packets in a secure channel when this output is yes, and not included on packets in a secure channel when this output is no. SCI tagging is automatically enabled on MX Series routers.</p> <p>By default, include SCI tag is disabled. You can enable SCI tagging using the include-sci statement in the connectivity association configuration.</p>
Replay protect	<p>By default, replay protection is disabled. Replay protection ensures that a snooped packet is not replayed or a packet number is reused. Replay protection is enabled when this output is on and disabled when this output is off.</p> <p>You can enable replay protection using the replay-protect statement in the connectivity association configuration.</p>
Replay window	<p>Number of packets that can be replayed. Must be configured with replay protection. This output is set to 0 when replay protection is disabled, and is the size of the replay window, in number of packets, when replay protection is enabled.</p> <p>The size of the replay window is configured using the replay-window-size statement in the connectivity association configuration.</p>

Sample Output

show security macsec connections

```

user@host> show security macsec connections
Interface name: xe-0/1/0
  CA name: CA1
  Cipher suite: GCM-AES-128   Encryption: on
  Key server offset: 0        Include SCI: no

show security macsec statistics (MX Series)

Syntax `show security macsec statistics
<brief | detail>
<interface interface-name>`

Release Information Command introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers. Support for MPC7E-10G introduced in Junos OS Release 16.1R1 for MX240, MX480, and MX960 routers.

Description Display Media Access Control Security (MACsec) statistics.

Options **none**—Display MACsec statistics in brief form for all interfaces on the router.

brief | detail—(Optional) Display the specified level of output. Using the **brief** option is equivalent to entering the command with no options (the default). The **detail** option displays additional fields that are not visible in the **brief** output.

NOTE: The field names that only appear in this command output when you enter the **detail** option are mostly useful for debugging purposes by Juniper Networks support personnel.

interface *interface-name*—(Optional) Display MACsec statistics for the specified interface only.

Required Privilege Level view

List of Sample Output [show security macsec statistics interface detail on page 2316](#)
[show security macsec statistics \(MX480 router with MPC7E-10G\) on page 2317](#)
[show security macsec statistics \(MX480 router with MPC7E-10G\) on page 2317](#)
[show security macsec statistics detail \(MX480 router with MPC7E-10G\) on page 2318](#)

Output Fields [Table 187 on page 2314](#) lists the output fields for the **show security macsec statistics** command. Output fields are listed in the approximate order in which they appear.

The field names that appear in this command's output only when you enter the **detail** option are mostly useful for debugging purposes by Juniper Networks support personnel. Those field names are, therefore, not included in this table.

Table 187: show security macsec statistics Output Fields

Field Name	Field Description	Level of Output
Interface name	Name of the interface.	All levels

Table 187: show security macsec statistics Output Fields (continued)

Field Name	Field Description	Level of Output
Fields for Secure Channel transmitted		
Encrypted packets	<p>Total number of packets transmitted out of the interface in the secure channel that were secured and encrypted using MACsec.</p> <p>Data packets are sent in the secure channel when MACsec is enabled, and are secured using a secure association key (SAK).</p>	All levels
Encrypted bytes	<p>Total number of bytes transmitted out of the interface in the secure channel that were secured and encrypted using MACsec.</p> <p>Data packets are sent in the secure channel when MACsec is enabled, and are secured using a secure association key (SAK).</p>	All levels
Protected packets	<p>Total number of packets transmitted out of the interface in the secure channel that were secured but not encrypted using MACsec.</p> <p>Data packets are sent in the secure channel when MACsec is enabled, and are secured using a secure association key (SAK).</p>	All levels
Protected bytes	<p>Total number of bytes transmitted out of the interface in the secure channel that were secured but not encrypted using MACsec.</p> <p>Data packets are sent in the secure channel when MACsec is enabled, and are secured using a secure association key (SAK).</p>	All levels
Fields for Secure Association transmitted		
Encrypted packets	<p>Total number of packets transmitted out of the interface in the connectivity association that were secured and encrypted using MACsec.</p> <p>The total includes the data packets transmitted in the secure channel and secured using a SAK and the control packets secured using a connectivity association key (CAK).</p>	All levels
Protected packets	<p>Total number of packets transmitted out of the interface in the connectivity association that were secured but not encrypted using MACsec.</p> <p>The total includes the data packets transmitted in the secure channel and secured using a SAK and the control packets secured using a connectivity association key (CAK).</p>	All levels
Fields for Secure Channel received		
Accepted packets	<p>The number of received packets that have been accepted by the secure channel on the interface. The secure channel is used to send all data plane traffic on a MACsec-enabled link.</p> <p>A packet is considered accepted for this counter when it has been received by this interface and it has passed the MACsec integrity check.</p> <p>This counter increments for traffic that is and is not encrypted using MACsec.</p>	All levels

Table 187: show security macsec statistics Output Fields (continued)

Field Name	Field Description	Level of Output
Validated bytes	<p>The number of bytes that have been validated by the MACsec integrity check and received on the secure channel on the interface. The secure channel is used to send all data plane traffic on a MACsec-enabled link.</p> <p>This counter does not increment when MACsec encryption is disabled.</p>	All levels
Decrypted bytes	<p>The number of bytes received in the secure channel on the interface that have been decrypted. The secure channel is used to send all data plane traffic on a MACsec-enabled link.</p> <p>An encrypted byte has to be decrypted before it can be received on the receiving interface. The decrypted bytes counter is incremented for received traffic that was encrypted using MACsec.</p>	All levels
Fields for Secure Association received		
Accepted packets	<p>The number of received packets that have been accepted in the connectivity association on the interface. The counter includes all control and data plane traffic accepted on the interface.</p> <p>A packet is considered accepted for this counter when it has been received by this interface and it has passed the MACsec integrity check.</p>	All levels
Validated bytes	<p>The number of bytes that have been validated by the MACsec integrity check and received on the connectivity association on the interface. The counter includes all control and data plane traffic accepted on the interface.</p> <p>This counter does not increment when MACsec encryption is disabled.</p>	All levels
Decrypted bytes	<p>The number of bytes received in the connectivity association on the interface that have been decrypted. The counter includes all control and data plane traffic accepted on the interface.</p> <p>An encrypted byte has to be decrypted before it can be received on the receiving interface. The decrypted bytes counter is incremented for received traffic that was encrypted using MACsec.</p>	All levels

Sample Output

show security mka sessions (MX Series)

Syntax	<code>show security mka sessions</code> <code><interface <i>interface-name</i>></code>
Release Information	Command introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers. Support for MPC7E-10G introduced in Junos OS Release 16.1R1 for MX240, MX480, and MX960 routers.
Description	Display MACsec Key Agreement (MKA) session information for all interfaces. The MKA protocol is responsible for maintaining MACsec on the link, and decides which router on the point-to-point link becomes the key server.
Options	<ul style="list-style-type: none"> interface <i>interface-name</i>—(Optional) Display the MKA session information for the specified interface only. none—Display the MKA session information for all interfaces.
Required Privilege Level	view
List of Sample Output	show security mka sessions on page 2320 show security mka sessions (MX480 with MPC7E-10G) on page 2320 show security mka sessions (MX480 with MPC7E-10G) on page 2321
Output Fields	Table 188 on page 2319 lists the output fields for the <code>show security mka sessions</code> command. Output fields are listed in the approximate order in which they appear.

Table 188: show security mka sessions Output Fields

Field Name	Field Description
Interface name	Name of the interface.
Member identifier	Name of the member identifier.
CAK name	Name of the connectivity association key (CAK). The CAK is configured using the <code>cak</code> keyword when configuring the pre-shared key.
Transmit interval	The transmit interval. Both ends of the point-to-point link should be configured to the same value. Default value is 2000 seconds. Possible values: 2000 through 10000 milliseconds.
Outbound SCI	Name of the outbound secure channel identifier.
Message number	Number of the last data message.
Key number	Key number.

Table 188: show security mka sessions Output Fields (continued)

Field Name	Field Description
Key server	Key server status. The router is the key server when this output is yes . The router is not the key server when this output is no .
Key server priority	Displays the priority of the key server. Lower value indicates higher priority. Use the key-server-priority statement to set the priority. Possible values: 0 through 255.
Latest SAK AN	Name of the latest secure association key (SAK) association number.
Latest SAK KI	Name of the latest secure association key (SAK) key identifier.
Fields for Peer list	
Member identifier	Name of the member identifier.
Hold time	Hold time, in seconds.
Message number	Number of the last data message
SCI	Name of the secure channel identifier.
Lowest acceptable PN	Number of the lowest acceptable packet number (PN).

show security mka statistics (MX Series)

Syntax	<code>show security mka statistics</code> <code><interface <i>interface-name</i>></code>
Release Information	Command introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers. Support for MPC7E-10G introduced in Junos OS Release 16.1R1 for MX240, MX480, and MX960 routers.
Description	Display MACsec Key Agreement (MKA) protocol statistics. The output for this command does not include statistics for MACsec data traffic. For MACsec data traffic statistics, see <i>show security macsec statistics</i> .
Options	<ul style="list-style-type: none"> interface <i>interface-name</i>—(Optional) Display the MKA information for the specified interface only. none—Display the MKA information for all interfaces.
Required Privilege Level	view
List of Sample Output	show security mka statistics on page 2323 show security mka statistics (MX480 routers with MPC7E-10G) on page 2323 show security mka statistics (MX480 routers with MPC7E-10G) on page 2324
Output Fields	Table 189 on page 2322 lists the output fields for the show security mka statistics command. Output fields are listed in the approximate order in which they appear.

Table 189: show security mka statistics Output Fields

Field Name	Field Description
Received packets	<p>Number of received MKA control packets.</p> <p>This counter increments for received MKA control packets only. This counter does not increment when data packets are received.</p>
Transmitted packets	<p>Number of transmitted MKA packets</p> <p>This counter increments for transmitted MKA control packets only. This counter does not increment when data packets are transmitted.</p>
Version mismatch packets	Number of version mismatch packets.
CAK mismatch packets	<p>Number of Connectivity Association Key (CAK) mismatch packets.</p> <p>This counter increments when the connectivity association key (CAK) and connectivity association key name (CKN), which are user-configured values that have to match to enable MACsec, do not match for an MKA control packet.</p>

Table 189: show security mka statistics Output Fields (continued)

Field Name	Field Description
ICV mismatch packets	Number of ICV mismatched packets. This counter increments when the connectivity association key (CAK) value does not match on both ends of a MACsec-secured Ethernet link.
Duplicate message identifier packets	Number of duplicate message identifier packets.
Duplicate message number packets	Number of duplicate message number packets.
Duplicate address packets	Number of duplicate source MAC address packets.
Invalid destination address packets	Number of invalid destination MAC address packets.
Formatting error packets	Number of formatting error packets.
Old Replayed message number packets	Number of old replayed message number packets.

Sample Output

show security mka statistics

```
user@host> show security mka statistics
```

```

Received packets:          1525844
Transmitted packets:      1525841
Version mismatch packets: 0
CAK mismatch packets:     0
ICV mismatch packets:     0
Duplicate message identifier packets: 0
Duplicate message number packets: 0
Duplicate address packets: 0
Invalid destination address packets: 0
Formatting error packets: 0
Old Replayed message number packets: 0
```

show security mka statistics (MX480 routers with MPC7E-10G)

```
user@host> show security mka statistics
```

```

Interface name: xe-4/0/18
Received packets:          73009
Transmitted packets:      73011
Version mismatch packets: 0
CAK mismatch packets:     1
ICV mismatch packets:     0
Duplicate message identifier packets: 0

```

show vrrp

Syntax	<pre>show vrrp <brief detail extensive summary> <interface <i>interface-name</i> <group number>> <logical-system <i>logical-system-name</i> > <nsr></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>nsr option added in Junos OS Release 13.2.</p>
Description	Display status information about Virtual Router Redundancy Protocol (VRRP) groups.
Options	<p>none—(Same as brief) Display brief status information about all VRRP interfaces.</p> <p>brief detail extensive summary—(Optional) Display the specified level of output.</p> <p>interface <i>interface-name</i> <group number>—(Optional) Display information and status about the specified VRRP interface and, optionally, the group number.</p> <p>logical-system <i>logical-system-name</i>—(Optional) Perform this operation on a particular logical system.</p> <p>nsr—(Optional) Display state replication information when graceful Routing Engine switchover (GRES) with nonstop active routing (NSR) is configured. Use only on the backup Routing Engine.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • <i>show vrrp track</i> • <i>clear vrrp</i>
List of Sample Output	<p>show vrrp on page 2331</p> <p>show vrrp brief on page 2331</p> <p>show vrrp detail (IPv6) on page 2331</p> <p>show vrrp detail (Route Track) on page 2332</p> <p>show vrrp detail (Route Track) on page 2332</p> <p>show vrrp extensive on page 2333</p> <p>show vrrp interface on page 2333</p> <p>show vrrp nsr on page 2334</p> <p>show vrrp summary on page 2335</p>
Output Fields	<p>Table 190 on page 2326 lists the output fields for the show vrrp command. Output fields are listed in the approximate order in which they appear</p>

Table 190: show vrrp Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the logical interface.	brief extensive none summary
Interface index	Physical interface index number, which reflects its initialization sequence.	extensive
Groups	Total number of VRRP groups configured on the interface.	extensive
Active	Total number of VRRP groups that are active (that is, whose interface state is either up or down).	extensive
Interface VRRP PDU statistics	Non-errored statistics for the logical interface: <ul style="list-style-type: none"> • Advertisement sent—Number of VRRP advertisement protocol data units (PDUs) that the interface has transmitted. • Advertisement received—Number of VRRP advertisement PDUs received by the interface. • Packets received—Number of VRRP packets received for VRRP groups on the interface. • No group match received—Number of VRRP packets received for VRRP groups that do not exist on the interface. 	extensive
Interface VRRP PDU error statistics	Errored statistics for the logical interface: <ul style="list-style-type: none"> • Invalid IPAH next type received—Number of packets received that use the IP Authentication Header protocol (IPAH) and that do not encapsulate VRRP packets. • Invalid VRRP ttl value received—Number of packets received whose IP time-to-live (TTL) value is not 255. • Invalid VRRP version received—Number of packets received whose VRRP version is not 2. • Invalid VRRP pdu type received—Number of packets received whose VRRP PDU type is not 1. • Invalid VRRP authentication type received—Number of packets received whose VRRP authentication is not none, simple, or md5. • Invalid VRRP IP count received—Number of packets received whose VRRP IP count exceeds 8. • Invalid VRRP checksum received—Number of packets received whose VRRP checksum does not match the calculated one. 	extensive
Physical interface	Name of the physical interface.	detail extensive
Unit	Logical unit number.	All levels
Address	Address of the physical interface.	brief detail extensive none
Index	Physical interface index number, which reflects its initialization sequence.	detail extensive
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive

Table 190: show vrrp Output Fields (continued)

Field Name	Field Description	Level of Output
VRRP-Traps	Status of VRRP traps: Enabled or Disabled .	detail extensive
VRRP-Version	VRRP version: 2 or 3 .	detail extensive
Type and Address	Identifier for the address and the address itself: <ul style="list-style-type: none"> lcl—Configured local interface address. mas—Address of the master virtual router. This address is displayed only when the local interface is acting as a backup router. vip—Configured virtual IP addresses. 	brief none summary
Interface state/Int state/State	State of the physical interface: <ul style="list-style-type: none"> down—The device is present and the link is unavailable. not present—The interface is configured, but no physical device is present. unknown—The VRRP process has not had time to query the kernel about the state of the interface. up—The device is present and the link is established. 	brief extensive none summary
Group	VRRP group number.	brief extensive none summary
State	The state of the interface on which VRRP is running: <ul style="list-style-type: none"> backup—The interface is acting as the backup router interface. bringup—VRRP is just starting and the physical device is not yet present. idle—VRRP is configured on the interface and is disabled. This can occur when VRRP is first enabled on an interface whose link is established. init—VRRP is initializing. master—The interface is acting as the master router interface. master(ISSU)—The master router interface is going through a unified in-service software upgrade. transition—The interface is changing between being the backup and being the master router. 	extensive
VRRP Mode	If the interface inherits its state and configuration from the active VRRP group, or if it is part of the active VRRP group. <ul style="list-style-type: none"> Active—Part of the active VRRP group Inherit—Inherits state and configuration from the active VRRP group. 	detail extensive
Priority	Configured VRRP priority for the interface.	detail extensive
Advertisement interval	Configured VRRP advertisement interval.	detail extensive
Authentication type	Configured VRRP authentication type: none , simple , or md5 .	detail extensive

Table 190: show vrrp Output Fields (continued)

Field Name	Field Description	Level of Output
Advertisement Threshold	A value from 1 through 15, used for setting the time when a peer should be considered down. <ul style="list-style-type: none"> The time a peer is considered down is equal to the advertisement-threshold multiplied by the advertisement-interval. (advertisement-threshold *advertisement-interval) = Peer down. 	detail extensive
Computed Send Rate	How many protocol data units (PDUs) are generated per second. Based on the number of instances and the advertisement interval.	detail extensive
Preempt	Whether preemption is allowed on the interface: yes or no .	detail extensive
Accept-data mode	Whether the interface is configured to accept packets destined for the virtual IP address: yes or no .	detail extensive
VIP count	Number of virtual IP addresses that have been configured on the interface.	detail extensive
VIP	List of virtual IP addresses configured on the interface.	detail extensive
Advertisement timer	How long, in seconds, until the advertisement timer expires.	detail extensive
Master router	IP address of the interface that is acting as the master. If the VRRP interface is down, the output is N/A .	detail extensive
Virtual router uptime	How long, in seconds, that the virtual router has been up.	detail extensive
Master router uptime	How long, in seconds, that the master route has been up.	detail extensive
Virtual MAC	MAC address associated with the virtual IP address.	detail extensive
Tracking	Whether tracking is enabled or disabled .	detail extensive
Current priority	Current operational priority for being the VRRP master.	detail extensive
Configured priority	Configured base priority for being the VRRP master.	detail extensive
Priority hold-time	Minimum time interval, in seconds, between successive changes to the current priority. Disabled indicates no minimum interval.	detail extensive
Remaining-time	(track option only) Displays the time remaining in the priority hold-time interval.	detail
Interface tracking	Whether interface tracking is enabled or disabled. When enabled, the output also displays the number of tracked interfaces.	detail extensive
Interface/Tracked interface/Track Int	Name of the tracked interface.	detail extensive

Table 190: show vrrp Output Fields (continued)

Field Name	Field Description	Level of Output
Int state/Interface state/State	Current operational state of the tracked interface: up or down .	detail extensive
Int speed/Speed	Current operational speed, in bits per second, of the tracked interface.	detail extensive
Incurred priority cost	Operational priority cost incurred due to the state and speed of this tracked interface. This cost is applied to the configured priority to obtain the current priority.	detail extensive
Threshold	Speed below which the corresponding priority cost is incurred. In other words, when the speed of the interface drops below the threshold speed, the corresponding priority cost is incurred. An entry of down means that the corresponding priority cost is incurred when the interface is down.	detail extensive
Route tracking	Whether route tracking is enabled or disabled. When enabled, the output also displays the number of tracked routes.	detail extensive
Route count	The number of routes being tracked.	detail extensive
Route	The IP address of the route being tracked.	detail extensive
VRF name	The VPN routing and forwarding (VRF) routing instance that the tracked route is in.	detail extensive
Route state	The state of the route being tracked: up , down , or unknown .	detail extensive
Priority cost	Configured priority cost. This value is incurred when the interface speed drops below the corresponding threshold or when the tracked route goes down.	detail extensive
Active	Whether the threshold is active (*). If the threshold is active, the corresponding priority cost is incurred.	detail extensive
Group VRRP PDU statistics	Number of VRRP advertisements sent and received by the group.	extensive

Table 190: show vrrp Output Fields (continued)

Field Name	Field Description	Level of Output
Group VRRP PDU error statistics	<p>Errored statistics for the VRRP group:</p> <ul style="list-style-type: none"> • Bad authentication type received—Number of VRRP PDUs received with an invalid authentication type. The received authentication can be none, simple, or md5 and must be the same for all routers in the VRRP group. • Bad password received—Number of VRRP PDUs received with an invalid key (password). The password for simple authentication must be the same for all routers in the VRRP group • Bad MD5 digest received—Number of VRRP PDUs received for which the MD5 digest computed from the VRRP PDU differs from the digest expected by the VRRP instance configured on the router. • Bad advertisement timer received—Number of VRRP PDUs received with an advertisement time interval that is inconsistent with the one in use among the routers in the VRRP group. • Bad VIP count received—Number of VRRP PDUs whose virtual IP address counts differ from the count that has been configured on the VRRP instance. • Bad VIPADDR received—Number of VRRP PDUs whose virtual IP addresses differ from the list of virtual IP addresses configured on the VRRP instance. 	extensive
Group state transition statistics	<p>State transition statistics for the VRRP group:</p> <ul style="list-style-type: none"> • Idle to master transitions—Number of times that the VRRP instance transitioned from the idle state to the master state. • Idle to backup transitions—Number of times that the VRRP instance transitioned from the idle state to the backup state. • Backup to master transitions—Number of times that the VRRP instance transitioned from the backup state to the master state. • Master to backup transitions—Number of times that the VRRP instance transitioned from the master state to the backup state. 	extensive
VR state	<p>The state of the VRRP:</p> <ul style="list-style-type: none"> • backup—The interface is acting as the backup router interface. • bringup—VRRP is just starting, and the physical device is not yet present. • idle—VRRP is configured on the interface and is disabled. This can occur when VRRP is first enabled on an interface whose link is established. • init—VRRP is initializing. • master—The interface is acting as the master router interface. • transition—The interface is changing between being the backup and being the master router. <p>NOTE: When show vrrp nsr is used on the backup Routing Engine, it displays the current VRRP state on the master Routing Engine, which is the future VRRP state for the backup Routing Engine. Do not use on the master Routing Engine.</p>	brief none summary

Table 190: show vrrp Output Fields (continued)

Field Name	Field Description	Level of Output
NSR	<p>VRRP nonstop active routing is enabled for the configured VRRP group: yes or no.</p> <p>NOTE: A yes value means that the new master Routing Engine will immediately start with the VRRP State value from the original master Routing Engine.</p> <p>A no value means that the VRRP session will:</p> <ul style="list-style-type: none"> • Start afresh. • Go through asilent startup period. • Move to a backup state. • Wait for the D Timer to run out before becoming the master (only if the master has not been configured already). 	brief none
RPD-NSR	The routing options have been set to nonstop active routing: yes or no .	brief none
Timer	<p>VRRP timer information:</p> <ul style="list-style-type: none"> • A—How long, in seconds, until the advertisement timer expires. • D—How long, in seconds, until the Master is Down timer expires. 	brief none

show vrrp nsr

This command is similar to **show vrrp**. Here, the **VR state** column displays the current VRRP state on the master Routing Engine, which is the future VRRP state for the backup Routing Engine. Do not use on the master Routing Engine.

NSR is yes if VRRP nonstop active routing is enabled for the configured VRRP group.

RPD-NSR is yes if the routing options have been set to nonstop active routing.

```
user@host>show vrrp nsr
```

traceroute ethernet

Syntax	<pre> traceroute ethernet local-mep <i>mep-id</i> maintenance-association <i>ma-name</i> maintenance-domain <i>md-name</i> <ttl <i>value</i>> <wait <i>seconds</i>> <i>mac-address</i> <i>mep-id</i> <detail> </pre>
Release Information	<p>Command introduced in Junos OS Release 9.0.</p> <p>mep-id option introduced in Junos OS Release 9.1.</p> <p>local-mep option introduced in Junos OS Release 15.1</p>
Description	<p>Triggers the linktrace protocol to trace the route between two maintenance points. The result of the traceroute protocol is stored in the path database. To display the path database, use the show oam ethernet connectivity-fault-management path-database command.</p> <p>Before using the traceroute command, you can verify the remote MEP's MAC address using the show oam ethernet connectivity-fault-management path-database command.</p>
Options	<p>local-mep <i>mep-id</i>—(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.</p> <p>detail—(Optional) Provide detailed information of the responder hostname, ingress port name, egress port name, TTL, and relay action.</p> <p>mac-address—Destination unicast MAC address of the remote maintenance point.</p> <p>mep-id—MEP identifier of the remote maintenance point. The range of values is 1 through 8191.</p> <p>maintenance-association <i>ma-name</i>—Specifies an existing maintenance association from the set of configured maintenance associations.</p> <p>maintenance-domain <i>md-name</i>—Specifies an existing maintenance domain from the set of configured maintenance domains.</p> <p>ttl <i>value</i>—Number of hops to use in the linktrace request. The range is 1 to 255 hops. The default is 4.</p> <p>wait <i>seconds</i>—(Optional) Maximum time to wait for a response to the traceroute request. The range is 1 to 255 seconds. The default is 5.</p>
Required Privilege Level	network

List of Sample Output [traceroute ethernet on page 2338](#)
[traceroute ethernet detail on page 2338](#)

Output Fields [Table 191 on page 2337](#) lists the output fields for the **traceroute ethernet** command. Output fields are listed in the approximate order in which they appear.

Table 191: traceroute ethernet Output Fields

Field Name	Field Description
Linktrace to	MAC address of the destination maintenance point.
Interface	Local interface used to send the linktrace message (LTM).
Maintenance Domain	Maintenance domain specified in the traceroute command.
Level	Maintenance domain level configured.
Maintenance Association	Maintenance association specified in the traceroute command.
Local Mep	The local maintenance end point identifier.
Transaction Identifier	4-byte identifier maintained by the MEP. Each LTM uses a transaction identifier. The transaction identifier is maintained globally across all Maintenance Domains. Use the transaction identifier to match an incoming linktrace response (LTR), with a previously sent LTM.
Hop	Sequential hop count of the linktrace path.
TTL	Number of hops remaining in the linktrace message. The time to live (TTL) is decremented at each hop.
Source MAC address	MAC address of the 802.1ag node responding to the LTM or the source MAC address of the LTR.
Next-hop MAC address	MAC address of the egress interface of the node to which the LTM is forwarded or the next-hop MAC address derived from the next egress identifier in the Egress-ID TLV of the LTR PDU.
Responder Hostname	The hostname of the responding router. A valid hostname is received only when the responding system is a Juniper Networks router.
Ingress port name	The port name for ingress connections.
Egress port name	The port name for egress connections.

Table 191: traceroute ethernet Output Fields (continued)

Field Name	Field Description
Flags	<p>The configurable flags can include:</p> <ul style="list-style-type: none"> • H— Hardware only, incoming LT frame has hardware bit set. • T— Terminal MEP, responder is a terminating MEP. • F— FWD yes, LTM frame is relayed further.
Relay Action	<p>The associated relay action. Relay action can be one of the following:</p> <ul style="list-style-type: none"> • RlyHit— Relay hit; target MAC address matches the MP mac address. • RlyFDB— Relay FDB; output port decided by consulting forwarding database. • RlyMPDB— Relay MIP; output port decided by consulting MIP database.

Sample Output

traceroute ethernet

```
user@host> traceroute ethernet maintenance-domain md1 maintenance-association ma1
00:01:02:03:04:05
```

```
Linktrace to 00:01:02:03:04:05, Interface : ge-5/0/0.0
Maintenance Domain: MD1, Level: 7
Maintenance Association: MA1, Local Mep: 1
```

Hop	TTL	Source MAC address	Next hop MAC address
Transaction Identifier:100001			
1	63	00:00:aa:aa:aa:aa	00:00:ab:ab:ab:ab
2	62	00:00:bb:bb:bb:bb	00:00:bc:bc:bc:bc
3	61	00:00:cc:cc:cc:cc	00:00:cd:cd:cd:cd
4	60	00:01:02:03:04:05	00:00:00:00:00:00

traceroute ethernet detail

```
user@host> run traceroute ethernet maintenance-domain md6 maintenance-association ma6
mep 101 detail
```

```
Linktrace to 00:00:5E:00:53:CC, Interface : ge-1/0/0.1
Maintenance Domain: md6, Level: 6
Maintenance Association: ma6, Local Mep: 201
Transaction Identifier: 2077547465
```

Legend for RelayAction:

```
RlyHit -- Relay hit, Target MAC address matches the MP mac address
RlyFDB -- Relay FDB, output port decided by consulting FDB database
RlyMPDB -- Relay MIP, output port decided by consulting MIP database
```

Legend for Flags:

```
H -- Hardware only,incoming LT frame has hardware bit set
T -- Terminal MEP, responder is a terminating MEP
F -- FWD yes, LTM frame is relayed further
```
