ATM Statistics	<p>ATM statistics for the interface:</p> <ul style="list-style-type: none"> • Uncorrectable HCS errors—Number of cells dropped because the cell delineation failed. These errors most likely indicate that a SONET/SDH layer problem has occurred. • Correctable HCS errors—Number of correctable HCS errors that occurred. The cell delineation process can recover from these errors and locate the ATM cell boundary, although the framing process is not quite stable. The ATM cell is not dropped. This counter increases when the cell delineation process changes its state from present to sync (for example, when a cable is plugged into the interface). <p>The following error statistics are from the framer:</p> <ul style="list-style-type: none"> • Tx cell FIFO overruns—Number of overruns in the transmit FIFO. • Rx cell FIFO overruns—Number of overruns in the receive FIFO. • Rx cell FIFO underruns—Number of underruns in the receive FIFO. • Input cell count—Number of ATM cells received by the interface (not including idle cells). • Output cell count—Number of ATM cells transmitted by the interface (including idle cells). • Output idle cell count—Number of idle cells sent by the port. When ATM has nothing to send, it sends idle cells to fill the time slot. • Output VC queue drops—Number of packets dropped by a port on the PIC. Packets are dropped because of queue limits on the VCs. <p>The following error statistics are from the SAR:</p> <ul style="list-style-type: none"> • Input no buffers—Number of AAL5 packets dropped because no channel blocks or buffers were available to handle them. • Input length errors—Number of AAL5 packets dropped because their length was incorrect. Usually, these errors occur because a cell has been corrupted or lost, or because the length field was corrupted. They can also mean the AAL5 length field was zero. • Input timeouts—Number of AAL5 packets dropped because of a reassembly timeout. • Input invalid VCs—Number of AAL5 packets dropped because the header was unrecognized (because the VC was not correct or not configured). • Input bad CRCs—Number of AAL5 packets dropped because of frame check sequence errors. • Input OAM cell no buffers—Number of received OAM cells or raw cells dropped because no buffers were available to handle them. • L2 circuit out-of-sequence packets—(Layer 2 AAL5 mode) Number of AAL5 packets that are out of sequential order. • Denied packets count—The number of packets dropped due to VLAN priority deny packets or due to an error forwarding configuration that might cause a negative frame length, that is, the stripping size is larger than the packet size. 	extensive
Packet Forwarding Engine configuration	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> • Destination slot—FPC slot number. 	extensive

Table 59: ATM show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CoS information	<p>Information about the CoS queue for the physical interface.</p> <ul style="list-style-type: none">• CoS transmit queue—Queue number and its associated user-configured forwarding class name.• Bandwidth %—Percentage of bandwidth allocated to the queue.• Bandwidth bps—Bandwidth allocated to the queue (in bps).• Buffer %—Percentage of buffer space allocated to the queue.• Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time.• Priority—Queue priority: low or high.• Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.	extensive

Table 59: ATM show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
VPI	<p>(ATM2) Virtual path identifier information:</p> <ul style="list-style-type: none"> • Flags—VPI flags can be one or more of the following: <ul style="list-style-type: none"> • Active (virtual path is up) • OAM (operation and maintenance is enabled) • Shaping (shaping is configured) • CBR, Peak • OAM, Period—Interval at which OAM F4 loopback cells are sent. • Up count—Number of F4 OAM cells required to consider the virtual path up; the range is 1 through 255. • Down count—Number of F4 OAM cells required to consider the virtual path down; the range is 1 through 255. • Total down time—Total number of seconds the VPI has been down since it was opened, using the format Total down time: hh:mm:ss or Never. • Last down—Time of last Down transition, using the format Last down: hh:mm:ss ago or Never. • OAM F4 cell statistics—(Nonpromiscuous mode) OAM F4 statistics: <ul style="list-style-type: none"> • Total received—Number of OAM F4 cells received. • Total sent—Number of OAM F4 cells sent. • Loopback received—Number of OAM F4 loopback cells received. • Loopback sent—Number of OAM F4 loopback cells sent. • Last received—Time at which the last OAM F4 cell was received. • Last sent—Time at which the last OAM F4 cell was sent. • RDI received—Number of OAM F4 cells received with the remote defect indication bit set. • RDI sent—Number of OAM F4 cells sent with the RDI bit set. • AIS received—Number of OAM F4 cells received with the alarm indication signal bit set. • AIS sent—Number of OAM F4 cells sent with the AIS bit set. <p>Traffic statistics:</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the VPI. • Output bytes—Number of bytes transmitted on the VPI. • Input packets—Number of packets received on the VPI. • Output packets—Number of packets transmitted on the VPI. 	detail extensive none
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	Logical interface SNMP interface index number.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

Table 59: ATM show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Input packets	Number of packets received on the logical interface.	None specified
Output packets	Number of packets transmitted on the logical interface.	None specified
Encapsulation	Encapsulation on the logical interface.	All levels
Traffic statistics	Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes a while (generally, less than 1 second) for this counter to stabilize.	detail extensive
Local statistics	Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes a while (generally, less than 1 second) for this counter to stabilize.	detail extensive
Transit statistics	Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes a while (generally, less than 1 second) for this counter to stabilize.	detail extensive
Input packets	Number of packets received on the logical interface.	None specified
Output packets	Number of packets transmitted on the logical interface.	None specified
protocol-family	Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed.	brief
Protocol	Protocol family configured on the logical interface.	detail extensive none
MTU	MTU size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route table	Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0 .	detail extensive
Flags	Information about the protocol family flags. Possible values are described in the “Family Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none

Table 59: ATM show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
VCI	Virtual circuit identifier number and information: <ul style="list-style-type: none"> • Flags—VCI flags: <ul style="list-style-type: none"> • Active—VCI is up and in working condition. • CCC down—VCI CCC is not in working condition. • Closed—VCI is closed because the user disabled the logical or physical interface from the CLI. • Configured—VCI is configured. • Down—VCI is not in working condition. The VCI might have alarms, defects, F5 AIS/RDI, or no response to OAM loopback cells. • ILMI—VCI is up and in working condition. • OAM—OAM loopback is enabled. • Multicast—VCI is a multicast VCI or DLCI. • Multipoint destination—VCI is configured as a multipoint destination. • None—No VCI flags. • Passive-OAM—Passive OAM is enabled. • Shaping—Shaping is enabled. • Sustained—Shaping rate is set to Sustained. • Unconfigured—VCI is not configured. • Total down time—Total number of seconds the VCI has been down, using the format Total down time: hh:mm:ss or Never. • Last down—Time of last Down transition, using the format Last down: hh:mm:ss. • EPD threshold—(ATM2 only) Threshold at which a packet is dropped when the queue size (in number of cells) exceeds the early packet-discard (EPD) value. 	All levels

Table 59: ATM show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
VCI (continued)	<ul style="list-style-type: none"> • Transmit weight cells—(ATM2 only) Amount of bandwidth assigned to this queue. • ATM per-VC transmit statistics: <ul style="list-style-type: none"> • Tail queue packet drops—Number of packets dropped because of bandwidth constraints. This value indicates that packets are queued to send out at a rate faster than allowed. • OAM F4 cell statistics—(Nonpromiscuous mode) OAM F4 statistics: <ul style="list-style-type: none"> • Total received—Number of OAM F4 cells received. • Total sent—Number of OAM F4 cells sent. • Loopback received—Number of OAM F4 loopback cells received. • Loopback sent—Number of OAM F4 loopback cells sent. • Last received—Time at which the last OAM F4 cell was received. • Last sent—Time at which the last OAM F4 cell was sent. • RDI received—Number of OAM F4 cells received with the remote defect indication bit set. • RDI sent—Number of OAM F4 cells sent with the RDI bit set. • AIS received—Number of OAM F4 cells received with the alarm indication signal bit set. • AIS sent—Number of OAM F4 cells sent with the AIS bit set. • Traffic statistics—Number and rate of bytes and packets received and transmitted on the physical interface. <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface • Output packets—Number of packets transmitted on the interface. 	All levels
IMA group properties	<ul style="list-style-type: none"> • Version—The specified IMA specification version, either IMA 1.0 or IMA 1.1. • Frame length—The specified frame size, which can be 32, 64, 128, or 256. • Differential delay—Maximum differential delay among links in milliseconds. • Symmetry—Either Common Transmit Clock or Independent Transmit Clock timing mode. • Transmit clock—The specified IMA clock mode, either common or independent. • Minimum links—The number of minimum active links specified in both transmit and receive directions. <ul style="list-style-type: none"> • Transmit—The per-PIC limit on the number of minimum active links in the transmit direction. • Receive—The per-PIC limit on the number of minimum active links in the receive direction. • Frame synchronization—The specified IMA frame synchronization state transition variables (Alpha, Beta, and Gamma) and their specified values. <ul style="list-style-type: none"> • Alpha—The number of consecutive invalid ICP cells for IFSM. • Beta—The number of consecutive errored ICP cells for IFSM. • Gamma—The number of consecutive valid ICP cells for IFSM. • Links—The number of IMA links assigned to the IMA group. 	detail extensive none

Table 59: ATM show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
IMA group alarms	<ul style="list-style-type: none"> • Start-up-FE—Far-end group alarm status • Config-Aborted—Near-end configuration aborted group alarm status • Config-Aborted-FE—Far-end configuration aborted group alarm status • Insufficient-Links—Near-end insufficient links group alarm status • Insufficient-Links-FE—Far-end insufficient links group alarm status • Blocked-FE—Far-end blocked group alarm status • GR-Timing-Mismatch—Group timing mismatch alarm status 	detail extensive none

show interfaces (Channelized DS3-to-DS0)

Syntax `show interfaces ds-fpc/pic/port:t1channel:ds0channel`
`<brief | detail | extensive>`
`<descriptions>`
`<media>`
`<snmp-index snmp-index>`
`<statistics>`

Release Information Command introduced before Junos OS Release 7.4.

Description (M Series and T Series routers only) Display status information about the specified channelized DS3-to-DS0 interface.

Options `ds-fpc/pic/port:t1channel:ds0channel`—Display standard information about the specified channelized DS3-to-DS0 interface.

`brief | detail | extensive`—(Optional) Display the specified level of output interface.

`descriptions`—(Optional) Display interface description strings.

`media`—(Optional) Display media-specific information about network interfaces.

`snmp-index snmp-index`—(Optional) Display information for the specified SNMP index of the interface.

`statistics`—(Optional) Display static interface statistics.

Required Privilege Level view

List of Sample Output [show interfaces extensive \(Channelized DS3-to-DS0\) on page 1302](#)

Output Fields [Table 60 on page 1294](#) lists the output fields for the **show interfaces** (all Channelized DS3 interfaces) command. Output fields are listed in the approximate order in which they appear.

Table 60: Channelized DS3 show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “ Common Output Fields Description ” on page 1168.	All levels
Interface index	Physical interface's index number, which reflects its initialization sequence.	detail extensive none

Table 60: Channelized DS3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	Reference clock source. It can be Internal or External .	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Whether loopback is enabled and the type of loopback (local or remote).	All levels
FCS	Frame check sequence on the interface (either 16 or 32). The default is 16 bits.	All levels
Mode	Whether C-bit parity mode or M13 mode is enabled.	All levels
Framing	Physical layer framing format used on the link. It can be ESF or SF . The default is ESF .	All levels
Parent	(Channelized IQ interfaces only) Name and interface index of the interface to which a particular child interface belongs. None indicates that this interface is the top level.	All levels
Device flags	Information about the physical device. Possible values are described in the "Device Flags" section under " Common Output Fields Description " on page 1168.	All levels
Interface flags	Information about the interface. Possible values are described in the "Interface Flags" section under " Common Output Fields Description " on page 1168.	All levels
Link flags	Information about the link. Possible values are described in the "Link Flags" section under " Common Output Fields Description " on page 1168.	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
Keepalive settings	(PPP and HDLC) Configured settings for keepalives. <ul style="list-style-type: none"> interval seconds—The time in seconds between successive keepalive requests. The range is 10 seconds through 32,767 seconds, with a default of 10 seconds. down-count number—The number of keepalive packets that a destination must fail to receive before the network takes a link down. The range is 1 through 255, with a default of 3. up-count number—The number of keepalive packets a destination must receive to change a link's status from down to up. The range is 1 through 255, with a default of 1. 	detail extensive none

Table 60: Channelized DS3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Keepalive statistics	<p>(PPP and HDLC) Information about keepalive packets.</p> <ul style="list-style-type: none"> Input—Number of keepalive packets received by PPP. <ul style="list-style-type: none"> (last seen 00:00:00 ago)—Time since the last keepalive packet was received, in the format <i>hh:mm:ss</i>. Output—Number of keepalive packets sent by PPP and how long ago the last keepalive packets were sent and received. <ul style="list-style-type: none"> (last seen 00:00:00 ago)—Time since the last keepalive packet was sent, in the format <i>hh:mm:ss</i>. 	detail extensive none
LMI settings	<p>(Frame Relay) Settings for Local Management Interface (LMI) can be either ANSI LMI settings or ITU LMI settings. ANSI LMI settings is the default. The format is (ANSI or ITU) LMI settings: value, value, value...xx seconds, where <i>value</i> can be:</p> <ul style="list-style-type: none"> n391dte—DTE full status polling interval (1–255) n392dce—DCE error threshold (1–10) n392dte—DTE error threshold (1–10) n393dce—DCE monitored event count (1–10) n393dte—DTE monitored event count (1–10) t391dte—DTE polling timer (5–30 seconds) t392dce—DCE polling verification timer (5–30 seconds) 	detail extensive none
LMI	<p>(Frame Relay) LMI packet statistics:</p> <ul style="list-style-type: none"> Input—Number of packets coming in on the interface (<i>nn</i>) and how much time has passed since the last packet arrived. The format is Input: nn (last seen hh:mm:ss ago). Output—Number of packets sent out on the interface (<i>nn</i>) and how much time has passed since the last packet was sent. The format is Output: nn (last seen hh:mm:ss ago). 	detail extensive none
LCP state	<p>(PPP) Link Control Protocol state.</p> <ul style="list-style-type: none"> Conf-ack-received—Acknowledgement was received. Conf-ack-sent—Acknowledgement was sent. Conf-req-sent—Request was sent. Down—LCP negotiation is incomplete (not yet completed or has failed). Not-configured—LCP is not configured on the interface. Opened—LCP negotiation is successful. 	detail extensive none
NCP state	<p>(PPP) Network Control Protocol state.</p> <ul style="list-style-type: none"> Conf-ack-received—Acknowledgement was received. Conf-ack-sent—Acknowledgement was sent. Conf-req-sent—Request was sent. Down—NCP negotiation is incomplete (not yet completed or has failed). Not-configured—NCP is not configured on the interface. Opened—NCP negotiation is successful. 	detail extensive none

Table 60: Channelized DS3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CHAP state	<p>(PPP) Displays the state of the Challenge Handshake Authentication Protocol (CHAP) during its transaction.</p> <ul style="list-style-type: none"> • Chap-Chal-received—Challenge was received but response not yet sent. • Chap-Chal-sent—Challenge was sent. • Chap-Resp-received—Response was received for the challenge sent, but CHAP has not yet moved into the Success state. (Most likely with RADIUS authentication). • Chap-Resp-sent—Response was sent for the challenge received. • Closed—CHAP authentication is incomplete. • Failure—CHAP authentication failed. • Not-configured—CHAP is not configured on the interface. • Success—CHAP authentication was successful. 	detail extensive none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: <i>year-month-day hour:minute:second timezone hh:mm:ss ago</i> . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface. • Input packets, Output packets—Number of packets received and transmitted on the interface. 	detail extensive

Table 60: Channelized DS3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Input errors	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Giants—Number of frames received that are larger than the giant threshold. • Runts—Number of frames received that are smaller than the runt threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. • L2 channel errors—Counter increments when the software could not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Count of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • SRAM errors—Number of hardware errors that occurred in the static RAM (SRAM) on the PIC. If the value in this field increments, the PIC is malfunctioning. • HS link CRC errors—Count of errors on the high-speed links between the ASICs responsible for handling the router interfaces. 	extensive
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly, (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. 	extensive

Table 60: Channelized DS3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
DS1 alarms	Media-specific defects that can render the interface unable to pass packets. When a defect persists for a certain amount of time, it is promoted to an alarm.	detail extensive none
DS1 defects	Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. <ul style="list-style-type: none"> • LOS—Loss of signal. • LOF—Loss of frame. • AIS—Alarm indication signal. • YLW—Yellow alarm. Indicates errors at the remote site receiver. 	
T1 media	Counts of T1 media-specific errors. <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>The T1 media-specific error types can be:</p> <ul style="list-style-type: none"> • SEF—Severely errored framing • BEE—Bit error event • AIS—Alarm indication signal • LOF—Loss of frame • LOS—Loss of signal • YELLOW—Errors at the remote site receiver • BPV—Bipolar violation • EXZ—Excessive zeros • LCV—Line code violation • PCV—Pulse code violation • CS—Carrier state • LES—Line error seconds • ES—Errored seconds • SEFS—Severely errored framing seconds (section) • SES—Severely errored seconds • BES—Bit error seconds • UAS—Unavailable seconds 	extensive

Table 60: Channelized DS3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
DS3 media	<p>Counts of T3 media-specific errors. For detailed definitions of the T3 (DS-3) error events (BPV, EXZ, LCV, PCV, and CCV) and performance parameters (LES, PES, PSES, CES, CSES, SEFS, and UAS), see RFC 2496.</p> <ul style="list-style-type: none"> • PLL Lock—Phase-locked loop out of lock • Reframing—Frame alignment recovery time • AIS—Alarm indication signal • LOF—Loss of frame • LOS—Loss of signal • IDLE—Idle code detected • YELLOW—Remote defect indication • BPV—Bipolar violation • EXZ—Excessive zeros • LCV—Line code violation • PCV—Pulse code violation • CCV—C-bit coding violation • LES—Line error seconds • PES—P-bit errored seconds • PSES—P-bit errored seconds (section) • CES—C-bit errored seconds • CSES—C-bit severely errored seconds • SEFS—Severely errored framing seconds • UAS—Unavailable seconds 	extensive
HDLC configuration	<p>Information about the HDLC configuration.</p> <ul style="list-style-type: none"> • Giant threshold—Giant threshold programmed into the hardware. • Runt threshold—Runt threshold programmed into the hardware. • Timeslots—Configured time slots for the interface. • Byte encoding—Byte encoding used: Nx64K or Nx56K. • Data inversion—HDLC data inversion setting: Enabled or Disabled 	extensive
Interface transmit queues	<p>Name of the transmit queues and their associated statistics for each DS1 channel on the Channelized DS3-to-DS1 PIC.</p> <ul style="list-style-type: none"> • B/W—Queue bandwidth as a percentage of the total interface bandwidth. • WRR—Weighted round-robin (in percent). • Packets—Number of packets transmitted. • Bytes—Number of bytes transmitted. • Drops—Number of packets dropped. • Errors—Number of packet errors. 	extensive

Table 60: Channelized DS3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
DS1 or DS3 BERT configuration	<p>BERT (bit error rate test) checks the quality of the line. This output appears only when a BERT is run on the interface.</p> <ul style="list-style-type: none"> • BERT time period—Configured total time period that the BERT is to run. • Elapsed—Actual time elapsed since the start of the BERT (in seconds). • Induced error rate—Configured rate at which the bit errors are induced in the BERT pattern. • Algorithm—Type of algorithm selected for the BERT. 	detail extensive none
Packet Forwarding Engine configuration	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> • Destination slot—FPC slot number. • PLP byte—Packet Level Protocol byte. 	extensive
CoS information	<p>Information about the CoS queue for the physical interface.</p> <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	Logical interface SNMP interface index number.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface; values are described in the “Logical Interface Flags” section under “ Common Output Fields Description ” on page 1168.	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Bandwidth	Bandwidth configured on the interface.	All levels
Protocol	Protocol family configured on the logical interface, such as iso , inet6 , mpls .	detail extensive none

Table 60: Channelized DS3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
MTU	MTU size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route table	Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	detail extensive
Flags	Information about the protocol family flags. Possible values are described in the “Family Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive none
Redundant Link	(LSQ redundancy) Backup link for Link Services IQ redundancy.	detail extensive none

show interfaces (Channelized E1 IQ)

Syntax	<pre>show interfaces (ce1-fpc/pic/port type-fpc/pic/port<:channel>) <brief detail extensive terse> <descriptions> <media> <snmp-index snmp-index> <statistics></pre>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M Series and T Series routers only) Display status information about the specified channelized E1 IQ interface.
Options	<p>type-fpc/pic/port:<channel>—Interface type with optional corresponding channel levels. For the physical channelized E1 IQ interface, type is ce. For the clear channel, type is e1. At the first level of channelization, type is ds.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>snmp-index snmp-index—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p>
Required Privilege Level	view
List of Sample Output	<p>show interfaces (Channelized E1 IQ) (Physical) on page 1308</p> <p>show interfaces extensive (Channelized E1 IQ Multilink PPP Encapsulation) on page 1309</p> <p>show interfaces extensive (Channelized E1 IQ MLFR Encapsulation) on page 1310</p> <p>show interfaces detail (Clear Channel E1) on page 1311</p>
Output Fields	For information about output fields, see the output field table for the show interfaces (Channelized E1) command. Output fields are listed in the approximate order in which they appear.

Sample Output

show interfaces (Channelized E1 IQ) (Physical)

```
user@host> show interfaces ce1-1/2/3
Physical interface: ce1-1/2/3, Enabled, Physical link is Up

show interfaces (Channelized E1)

Syntax `show interfaces ds-fpc/pic/port:ds0channel`
`<brief | detail | extensive | terse>`
`<descriptions>`
`<media>`
`<snmp-index snmp-index>`
`<statistics>`

Release Information Command introduced before Junos OS Release 7.4.

Description (M Series and T Series routers only) Display status information the specified channelized E1 interface.

Options `ds-fpc/pic/port:ds0channel`—Display standard information about the specified channelized E1 interface.

`brief | detail | extensive | terse`—(Optional) Display the specified level of output.

`descriptions`—(Optional) Display interface description strings.

`media`—(Optional) Display media-specific information about network interfaces.

`snmp-index snmp-index`—(Optional) Display information for the specified SNMP index of the interface.

`statistics`—(Optional) Display static interface statistics.

Required Privilege Level view

List of Sample Output [show interfaces extensive \(Channelized E1\) on page 1321](#)

Output Fields [Table 61 on page 1312](#) lists the output fields for the **show interfaces** (Channelized E1 and Channelized E1 IQ) command. Output fields are listed in the approximate order in which they appear.

Table 61: Channelized E1 and Channelized E1 IQ show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1168 .	All levels
Interface index	Physical interface's index number, which reflects its initialization sequence.	detail extensive none

Table 61: Channelized E1 and Channelized E1 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	Reference clock source: Internal or External .	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Whether loopback is enabled and the type of loopback (local or remote).	All levels
FCS	Frame check sequence on the interface (either 16 or 32). The default is 16 bits.	All levels
Framing	Physical layer framing format used on the link. It can be G704 , G704-NO-CRC4 , or Unframed . The default is G704 .	All levels
Parent	(Channelized E1 IQ interfaces only) Name and interface index of the interface to which a particular child interface belongs. None indicates that this interface is the top level.	All levels
Device flags	Information about the physical device. Possible values are described in the "Device Flags" section under " Common Output Fields Description " on page 1168.	All levels
Interface flags	Information about the interface. Possible values are described in the "Interface Flags" section under " Common Output Fields Description " on page 1168.	All levels
Link flags	Information about the link. Possible values are described in the "Link Flags" section under " Common Output Fields Description " on page 1168.	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
Keepalive settings	(PPP and HDLC) Configured settings for keepalives. <ul style="list-style-type: none"> Interval seconds—Time in seconds between successive keepalive requests. The range is 10 seconds through 32,767 seconds, with a default of 10 seconds. Down-count number—Number of keepalive packets a destination must fail to receive before the network takes a link down. The range is 1 through 255, with a default of 3. Up-count number—Number of keepalive packets a destination must receive to change a link's status from down to up. The range is 1 through 255, with a default of 1. 	detail extensive none

Table 61: Channelized E1 and Channelized E1 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Keepalive statistics	<p>(PPP and HDLC) Information about keepalive packets.</p> <ul style="list-style-type: none"> Input—Number of keepalive packets received by PPP. <ul style="list-style-type: none"> (last seen 00:00:00 ago)—Time since the last keepalive packet was received, in the format <i>hh:mm:ss</i>. Output—Number of keepalive packets sent by PPP and how long ago the last keepalive packets were sent and received. <ul style="list-style-type: none"> (last seen 00:00:00 ago)—Time since the last keepalive packet was sent, in the format <i>hh:mm:ss</i>. 	detail extensive none
LMI settings	<p>(Frame Relay) Settings for link management can be either ANSI LMI settings or ITU LMI settings. ANSI LMI settings is the default. The format is (ANSI or ITU) LMI settings: value, value...xx seconds, where <i>value</i> can be:</p> <ul style="list-style-type: none"> n391dte—DTE full status polling interval (1–255) n392dce—DCE error threshold (1–10) n392dte—DTE error threshold (1–10) n393dce—DCE monitored event count (1–10) n393dte—DTE monitored event count (1–10) t391dte—DTE polling timer (5–30 seconds) t392dce—DCE polling verification timer (5–30 seconds) 	detail extensive none
LMI	<p>(Frame Relay) Statistics about the link management.</p> <ul style="list-style-type: none"> Input—Number of packets coming in on the interface (<i>nn</i>) and how much time has passed since the last packet arrived. The format is Input: nn (last seen hh:mm:ss ago) Output—Number of packets sent out on the interface (<i>nn</i>) and how much time has passed since the last packet was sent. The format is Output: nn (last sent hh:mm:ss ago). 	detail extensive none
DTE statistics	<p>(Frame Relay) Statistics about messages transmitted from the data terminal equipment (DTE) to the data circuit-terminating equipment (DCE):</p> <ul style="list-style-type: none"> Enquiries sent—Number of link status enquiries sent from the DTE to the DCE. Full enquiries sent—Number of full enquiries sent from the DTE to the DCE. Enquiry responses received—Number of enquiry responses received by the DTE from the DCE. Full enquiry responses received—Number of full enquiry responses sent from the DTE to the DCE. 	detail extensive none
DCE statistics	<p>(Frame Relay) Statistics about messages transmitted from the DCE to the DTE:</p> <ul style="list-style-type: none"> Enquiries received—Number of enquiries received by the DCE from the DTE. Full enquiries received—Number of full enquiries received by the DCE from the DTE. Enquiry responses sent—Number of enquiry responses sent from the DCE to the DTE. Full enquiry responses sent—Number of full enquiry responses sent from the DCE to the DTE. 	detail extensive none

Table 61: Channelized E1 and Channelized E1 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Common statistics	<p>(Frame Relay) Statistics about messages sent between the DTE and the DCE:</p> <ul style="list-style-type: none"> • Unknown messages received—Number of received packets that do not fall into any category. • Asynchronous updates received—Number of link status peer changes received. • Out-of-sequence packets received—Number of packets for which the sequence of the packets received is different from the expected sequence. • Keepalive responses timedout—Number of keepalive responses that timed out when no LMI packet was reported for <code>n392dte</code> or <code>n393dce</code> intervals. (See LMI settings). 	detail extensive none
Nonmatching DCE-end DLCIs	(Frame Relay, displayed only from the DTE) Number of DLCIs configured from the DCE.	detail extensive none
LCP state	<p>(PPP) Link Control Protocol state.</p> <ul style="list-style-type: none"> • Conf-ack-received—Acknowledgement was received. • Conf-ack-sent—Acknowledgement was sent. • Conf-req-sent—Request was sent. • Down—LCP negotiation is incomplete (not yet completed or has failed). • Not-configured—LCP is not configured on the interface. • Opened—LCP negotiation is successful. 	detail extensive none
CHAP state	<p>(PPP) Displays the state of the Challenge Handshake Authentication Protocol (CHAP) during its transaction.</p> <ul style="list-style-type: none"> • Chap-Chal-received—Challenge was received but response not yet sent. • Chap-Chal-sent—Challenge was sent. • Chap-Resp-received—Response was received for the challenge sent, but CHAP has not yet moved into the Success state. (Most likely with RADIUS authentication.) • Chap-Resp-sent—Response was sent for the challenge received. • Closed—CHAP authentication is incomplete. • Failure—CHAP authentication failed. • Not-configured—CHAP is not configured on the interface. • Success—CHAP authentication was successful. 	detail extensive none
Last flapped	Date, time, and how long ago the interface went down to up. The format is Last flapped: <i>year-month-day hour:minute:second timezone (hour:minute:second ago)</i> . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
CoS Queues	Number of CoS queues configured.	detail extensive none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output Rate	Output rate in bps and pps.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive

Table 61: Channelized E1 and Channelized E1 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Traffic statistics	<p>Number of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Input errors	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Giants—Number of frames received that are larger than the giant threshold. • Runts—Number of frames received that are smaller than the runt threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • Resource errors—Sum of transmit drops. 	extensive

Table 61: Channelized E1 and Channelized E1 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), then either the cable, the far-end system, or the PIC is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • MTU errors—Number of packets larger than the MTU threshold. • Resource errors—Sum of transmit drops. 	extensive
DS1 alarms	E1 media-specific defects that can render the interface unable to pass packets. When a defect persists for a certain amount of time, it is promoted to an alarm.	detail extensive none
DS1 defects	<p>Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. The following lists all possible alarms and defects. For complete explanations of most of these alarms and defects, see <i>Bellcore Telcordia GR-499-CORE</i>.</p> <ul style="list-style-type: none"> • LOS—Loss of signal. • LOF—Loss of frame. • AIS—Alarm indication signal. • YLW—Yellow alarm. Indicates errors at the remote site receiver. 	

Table 61: Channelized E1 and Channelized E1 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
E1 media	<p>Active alarms and defects, plus counts of specific E1 errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>The E1 media-specific error types can be:</p> <ul style="list-style-type: none"> • SEF—Severely errored framing • BEE—Bit error • AIS—Alarm indication signal • LOF—Loss of frame • LOS—Loss of signal • YELLOW—Errors at the remote site receiver • BPV—Bipolar violation • EXZ—Excessive zeros • LCV—Line code violation • PCV—Pulse code violation • CS—Carrier state • FEBS—Far-end block error • LES—Line error seconds • ES—Errored seconds • BES—Bursty errored seconds • SES—Severely errored seconds • SEFS—Severely errored framing seconds • UAS—Unavailable seconds 	extensive
HDLC configuration	<p>Information about the HDLC configuration.</p> <ul style="list-style-type: none"> • Giant threshold—Giant threshold programmed into the hardware. • Runt threshold—Runt threshold programmed into the hardware. • Timeslots—Configured time slots for the interface. • Line encodingHDB3—Line encoding used. 	extensive
Interface transmit queues	<p>Names of the transmit queues and their associated statistics for each DSO channel on the Channelized E1 to DSO PIC.</p> <ul style="list-style-type: none"> • B/W—Queue bandwidth as a percentage of the total interface bandwidth. • WRR—Weighted round robin (in percent). • Packets—Number of packets transmitted. • Bytes—Number of bytes transmitted. • Drops—Number of packets dropped. • Errors—Number of packet errors. 	extensive

Table 61: Channelized E1 and Channelized E1 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
DSx BERT configuration	<p>BERT (bit error rate test) checks the quality of the line. This output appears only when a BERT is run on the interface.</p> <ul style="list-style-type: none"> • BERT time period—Configured total time period that the BERT is to run. • Elapsed—Actual time elapsed since the start of the BERT (in seconds). • Induced error rate—Configured rate at which the bit errors are induced in the BERT pattern. • Algorithm—Type of algorithm selected for the BERT. 	detail extensive none
Packet Forwarding Engine configuration	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> • Destination slot—FPC slot number. • PLP byte—Packet Level Protocol byte. 	extensive
CoS information	<p>Information about the CoS queue for the physical interface.</p> <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	Logical interface SNMP interface index number.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Input packets	Number of packets received on the logical interface.	None specified

Table 61: Channelized E1 and Channelized E1 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Output packets	Number of packets transmitted on the logical interface.	None specified
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the logical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Local statistics	(Frame Relay) Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than one second) for this counter to stabilize.	detail extensive
Transit statistics	(Frame Relay) Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	detail extensive
Protocol	Protocol family configured on the logical interface, such as iso , inet6 , mpls .	detail extensive none
Multilink bundle	(Multilink) Interface name for the multilink bundle, if configured.	detail extensive none
MTU	MTU size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route table	Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0 .	detail extensive
DLCI	<p>(Frame Relay) DLCI number of the logical interface. The following DLCI information is displayed: Flags, Total down time, Last down, and Traffic statistics. Flags is one or more of the following:</p> <ul style="list-style-type: none"> • Active—Set when the link is active and the DTE and DCE are exchanging information. • Down—Set when link is active, but no information is received from the DCE. • Unconfigured—Set when the corresponding DLCI in the DCE is not configured. • Configured—Set when the corresponding DLCI in the DCE is configured. • Dce-configured—Displayed when the command is issued from the DTE. 	detail extensive none
DLCI statistics	<p>(Frame Relay) Data-link connection identifier (DLCI) statistics.</p> <ul style="list-style-type: none"> • Active DLCI—Number of active DLCIs. • Inactive DLCI—Number of inactive DLCIs. 	detail extensive none

show interfaces (Channelized OC12 IQ and IQE)

Syntax `show interfaces (type-fpc/pic/port<:channel><:channel><:channel>)
<brief | detail | extensive | terse>
<descriptions>
<media>
<snmp-index snmp-index>
<statistics>`

Release Information Command introduced before Junos OS Release 7.4.

Description Display status information about the specified channelized OC12 IQ and IQE interface.

Options *type-fpc/pic/port:channel:channel:channel*—Interface type with optional corresponding channel levels.

For SONET mode, the interface type can be one of the following:

- *type-fpc/pic/port*—For the physical channelized OC12 IQ or IQE interface, *type* is *coc12*. For the clear channel, *type* is *so* (for OC12).
- *type-fpc/pic/port:channel*—At the first level of channelization, *type* can be *coc1* (channelized OC1), *ct3* (from *coc1*), *so* (for OC3), or *t3*.
- *type-fpc/pic/port:channel:channel*—At the second level of channelization, *type* can be *ct1* (from *ct3* or *coc1*) or *t1* (from *ct3* or *coc1*).
- *type-fpc/pic/port:channel:channel:channel*—At the third level of channelization, *type* is *ds* (from *ct1*).

For SDH mode, the interface type can be one of the following:

- *type-fpc/pic/port*—For the physical channelized OC12 IQ or IQE interface, *type* is *cstm4*. For the clear channel, *type* is *so* (for SONET/SDH (vc-4-4c)).
- *type-fpc/pic/port:channel*—At the first level of channelization, *type* can be *so* (from *cstm4*) or *cau4* (from *cstm4*).
- *type-fpc/pic/port:channel:channel*—At the second level of channelization, *type* can be *ct3* or *t3* (from or *cau4*).
- *type-fpc/pic/port:channel:channel:channel*—At the third level of channelization, *type* is *ct1* or *t1* (from *ct3*).
- *type-fpc/pic/port:channel:channel:channel*—At the fourth level of channelization, *type* is *ds* (from *ct1*).

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level view

Output Fields Table 62 on page 1332 lists the output fields for the **show interfaces** (all Channelized OC interfaces) command. Output fields are listed in the approximate order in which they appear.

Table 62: Channelized OC show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “ Common Output Fields Description ” on page 1168.	All levels
Interface index	Physical interface's index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Description	Interface description.	All levels
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	SONET/SDH reference clock source. It can be Internal or External . Clocking is configured and displayed only for channel 0.	All levels
Framing mode	Framing mode: SONET or SDH .	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Whether loopback is enabled and the type of loopback (local or remote).	All levels
SONET loopback	Whether loopback is enabled on a SONET/SDH interface, and the type of loopback (local or remote).	All levels
FCS	Frame check sequence on the interface (either 16 or 32). The default is 16-bit .	All levels
Payload scrambler	Whether payload scrambling is enabled.	All levels
Parent	Name and interface index of the interface to which a particular child interface belongs. None indicates that this interface is the top level.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “ Common Output Fields Description ” on page 1168.	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “ Common Output Fields Description ” on page 1168.	All levels

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Link flags	Information about the link. Possible values are described in the “Link Flags” section under “ Common Output Fields Description ” on page 1168.	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
ANSI or ITU LMI settings	<p>(Frame Relay) Settings for Local Management Interface (LMI). The format is (ANSI or ITU) LMI settings: <i>value, value... nn</i> seconds, where <i>value</i> can be:</p> <ul style="list-style-type: none"> • n391dte—DTE full status polling interval (1–255) • n392dce—DCE error threshold (1–10) • n392dte—DTE error threshold (1–10) • n393dce—DCE monitored event count (1–10) • n393dte—DTE monitored event count (1–10) • t391dte—DTE polling timer (5–30 seconds) • t392dce—DCE polling verification timer (5–30 seconds) 	All levels
LMI statistics	<p>(Frame Relay) Statistics about the link management.</p> <ul style="list-style-type: none"> • Input—Number of packets coming in on the interface (<i>nn</i>) and how much time has passed since the last packet arrived. The format is Input: <i>nn</i> (last sent <i>hh:mm:ss</i> ago). • Output—Number of packets sent out on the interface (<i>nn</i>) and how much time has passed since the last packet was sent. The format is Output: <i>nn</i> (last sent <i>hh:mm:ss</i> ago). 	detail extensive
DTE statistics	<p>(Frame Relay) Statistics about messages transmitted from the data terminal equipment (DTE) to the data circuit-terminating equipment (DCE):</p> <ul style="list-style-type: none"> • Enquiries sent—Number of link status enquiries sent from the DTE to the DCE. • Full enquiries sent—Number of full enquiries sent from the DTE to the DCE. • Enquiry responses received—Number of enquiry responses received by the DTE from the DCE. • Full enquiry responses received—Number of full enquiry responses sent from the DTE to the DCE. 	detail extensive none
DCE statistics	<p>(Frame Relay) Statistics about messages transmitted from the DCE to the DTE:</p> <ul style="list-style-type: none"> • Enquiries received—Number of enquiries received by the DCE from the DTE. • Full enquiries received—Number of full enquiries received by the DCE from the DTE. • Enquiry responses sent—Number of enquiry responses sent from the DCE to the DTE. • Full enquiry responses sent—Number of full enquiry responses sent from the DCE to the DTE. 	detail extensive none

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Common statistics	(Frame Relay) Statistics about messages sent between the DTE and the DCE: <ul style="list-style-type: none"> • Unknown messages received—Number of received packets that do not fall into any category. • Asynchronous updates received—Number of link status peer changes received. • Out-of-sequence packets received—Number of packets for which the sequence of the packets received is different from the expected sequence. • Keepalive responses timedout—Number of keepalive responses that timed out when no LMI packet was reported for n392dte or n393dce intervals. (See LMI settings.) 	detail extensive none
Nonmatching DCE-end DLCIs	(Frame Relay) Number of DLCIs configured from the DCE, displayed only from the DTE.	detail extensive none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hh:mm:ss timezone year-month-day (hh:mm:ss ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
CoS Queues	Number of CoS queues configured.	detail extensive none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
DS1 alarms DS1 defects	E1 or T1 media-specific defects that can prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. See the following list for all possible alarms and defects. For complete explanations of most of these alarms and defects, see <i>Bellcore Telcordia GR-499-CORE</i> . <ul style="list-style-type: none"> • LOS—Loss of signal. • LOF—Loss of frame. • AIS—Alarm indication signal. • YLW—Yellow alarm. Indicates errors at the remote site receiver. 	detail extensive none

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
T1 media	<p>Counts of T1 or E1 media-specific errors.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>The T1 or E1 media-specific error types are:</p> <ul style="list-style-type: none"> • SEF—Severely errored framing • BEE—Bit error • AIS—Alarm indication signal • LOF—Loss of frame • LOS—Loss of signal • YELLOW—Errors at the remote site receiver • BPV—Bipolar violation • EXZ—Excessive zeros • LCV—Line code violation • PCV—Pulse code violation • CS—Carrier state • FEBE—Far-end block error (E1 only) • LES—Line error seconds • ES—Errored seconds • BES—Bit error seconds • SES—Severely errored seconds • SEFS—Severely errored framing seconds • UAS—Unavailable seconds 	extensive
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Input errors	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Giants—Number of frames received that are larger than the giant threshold. • Bucket Drops—Drops caused by traffic load exceeding the interface transmit/receive leaky bucket configuration. The default is off. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • SRAM errors—Number of hardware errors that occurred in the static RAM (SRAM) on the PIC. If the value of this field increments, the PIC is malfunctioning. • HS link FIFO overflows—Number of FIFO overflows on the high-speed links between the ASICs responsible for handling the router interfaces. • Resource errors—Sum of transmit drops. 	extensive

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • HS link FIFO underflows—Number of FIFO underflows on the high-speed links between the ASICs responsible for handling the router interfaces. • MTU errors—Number of packets whose size exceeds the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive
Egress queues	Total number of egress queues supported on the specified interface.	detail extensive
Queue counters	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive
Active alarms	Defects that can prevent the interface from passing packets:	detail extensive
Active defects	<ul style="list-style-type: none"> • None—There are no active defects or alarms. • LOF—Loss of frame. 	
SONET alarms	Media-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm.	All levels
SONET defects	Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: SONET PHY , SONET section , SONET line , and SONET path .	

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SONET vt	<p>SONET virtual-tributary (VT) alarms and defects:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B2—Bit interleaved parity for SONET line overhead • REI-V—Remote error indication (near-end VT) • LOP-V—Loss of pointer (near-end VT) • AIS-V—Alarm indication signal (near-end VT) • RDI-V—Remote defect indication (near-end VT) • UNEQ-V—Unequipped (near-end VT) • PLM-V—Payload label mismatch (near-end VT) • ES-V—Errored seconds (near-end VT) • SES-V—Severely errored seconds (near-end VT) • UAS-V—Unavailable seconds (near-end VT) • ES-VFE—Errored seconds (far-end VT) • SES-VFE—Severely errored seconds (far-end VT) • UAS-VFE—Unavailable seconds (far-end VT) 	extensive
SONET PHY	<p>Counts of specific SONET errors with detailed information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • PLL Lock—Phase-locked loop • PHY Light—Loss of optical signal 	extensive
SONET section	<p>Counts of specific SONET errors with detailed information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B1—Bit interleaved parity for SONET section overhead • SEF—Severely errored framing • LOS—Loss of signal • LOL—Loss of light • LOF—Loss of frame • ES-S—Errored seconds (section) • SES-S—Severely errored seconds (section) • SEFS-S—Severely errored framing seconds (section) 	extensive

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SONET line	<p>Active alarms and defects, plus counts of specific SONET errors with detailed information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B2—Bit interleaved parity for SONET line overhead • REI-L—Remote error indication (near-end line) • RDI-L—Remote defect indication (near-end line) • AIS-L—Alarm indication signal (near-end line) • BERR-SF—Bit error rate fault (signal failure) • BERR-SD—Bit error rate defect (signal degradation) • ES-L—Errored seconds (near-end line) • SES-L—Severely errored seconds (near-end line) • UAS-L—Unavailable seconds (near-end line) • ES-LFE—Errored seconds (far-end line) • SES-LFE—Severely errored seconds (far-end line) • UAS-LFE—Unavailable seconds (far-end line) 	extensive
SONET path	<p>Active alarms and defects, plus counts of specific SONET errors with detailed information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B3—Bit interleaved parity for SONET section overhead • REI-P—Remote error indication • LOP-P—Loss of pointer (path) • AIS-P—Path alarm indication signal • RDI-P—Path remote defect indication • UNEQ-P—Path unequipped • PLM-P—Path payload (signal) label mismatch • ES-P—Errored seconds (near-end STS path) • SES-P—Severely errored seconds (near-end STS path) • UAS-P—Unavailable seconds (near-end STS path) • ES-PFE—Errored seconds (far-end STS path) • SES-PFE—Severely errored seconds (far-end STS path) • UAS-PFE—Unavailable seconds (far-end STS path) 	extensive

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Received SONET overhead	Values of the received and transmitted SONET/SDH overhead:	extensive
Transmitted SONET overhead	<p>F1—Section user channel byte. This byte is set aside for the purposes of users.</p> <p>S1—Synchronization Status (S1). The S1 byte is located in the first STS-1 of an STS-N. Bits 5 through 8 convey the synchronization status of the network element.</p> <p>Z3 and Z4—Path overhead.</p> <p>V5—Virtual Tributary (VT) path overhead byte.</p>	
SDH alarms SDH defects	<p>SDH media-specific defects that can prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: SDH PHY, SDH regenerator section, SDH multiplex section, and SDH path.</p> <p>NOTE: For controller based SONET PICs, the SDH alarms and SDH defects output in the show interface coc3 extensive command output only shows the section and line level defects. The path level defects can be found under the SONET (so) interface output.</p>	All levels
SDH PHY	<p>Active alarms and defects, plus counts of specific SDH errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • PLL Lock—Phase-locked loop • PHY Light—Loss of optical signal 	extensive
SDH regenerator section	<p>Active alarms and defects, plus counts of specific SDH errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • RS-BIP8—24-bit BIP for multiplex section overhead (B2 bytes) • OOF—Out of frame • LOS—Loss of signal • LOF—Loss of frame • RS-ES—Errored seconds (near-end regenerator section) • RS-SES—Severely errored seconds (near-end regenerator section) • RS-SEFS—Severely errored framing seconds (regenerator section) 	extensive

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SDH multiplex section	<p>Active alarms and defects, plus counts of specific SDH errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • MS-BIP24—8-bit BIP for high-order path overhead (B3 byte) • MS-FEBE—Far-end block error (multiplex section) • MS-FERF—Far-end remote fail (multiplex section) • MS-AIS—alarm indication signal (multiplex section) • BERR-SF—Bit error rate fault (signal failure) • BERR-SD—Bit error rate defect (signal degradation) • MS-ES—Errored seconds (near-end multiplex section) • MS-SES—Severely errored seconds (near-end multiplex section) • MS-UAS—Unavailable seconds (near-end multiplex section) • MS-ES-FE—Errored seconds (far-end multiplex section) • MS-SES-FE—Severely errored seconds (far-end multiplex section) • MS-UAS-FE—Unavailable seconds (far-end multiplex section) 	extensive
SDH path	<p>Active alarms and defects, plus counts of specific SDH errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • HP-BIP8—8-bit BIP for regenerator section overhead (B1 byte) • HP-FEBE—Far-end block error (high-order path) • HP-LOP—Loss of pointer (high-order path) • HP-AIS—High-order-path alarm indication signal • HP-FERF—Far-end remote fail (high-order path) • HP-UNEQ—Unequipped (high-order path) • HP-PLM—Payload label mismatch (high-order path) • HP-ES—Errored seconds (near-end high-order path) • HP-SES—Severely errored seconds (near-end high-order path) • HP-UAS—Unavailable seconds (near-end high-order path) • HP-ES-FE—Errored seconds (far-end high-order path) • HP-SES-FE—Severely errored seconds (far-end high-order path) • HP-UAS-FE—Unavailable seconds (far-end high-order path) 	extensive

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Received SDH overhead	Values of the received and transmitted SONET overhead:	extensive
Transmitted SDH overhead	<ul style="list-style-type: none"> • C2—Signal label. Allocated to identify the construction and content of the STS-level SPE and for PDI-P. • F1—Section user channel byte. This byte is set aside for the purposes of users. • K1 and K2—These bytes are allocated for APS signaling for the protection of the multiplex section. • J0—Section trace. This byte is defined for STS-1 number 1 of an STS-<i>N</i> signal. Used to transmit a 1-byte fixed-length string or a 16-byte message so that a receiving terminal in a section can verify its continued connection to the intended transmitter. • S1—Synchronization status. The S1 byte is located in the first STS-1 of an STS-<i>N</i>. • Z3 and Z4—Allocated for future use. 	
Received path trace	Channelized OC12 interfaces allow path trace bytes to be sent inband across the SONET/SDH link. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits. This information is specific to each of the 12 channelized OC12 interfaces.	extensive
Transmitted path trace		
DS3 media	<p>Counts of T3 media-specific errors. For detailed definitions of the T3 (DS-3) error events (BPV, EXZ, LCV, PCV, and CCV) and performance parameters (LES, PES, PSES, CES, CSES, SEFS, and UAS), see RFC 2496.</p> <p>The DS3 or E3 media-specific error types can be:</p> <ul style="list-style-type: none"> • PLL Lock—Phase-locked loop out of lock • Reframing—Frame alignment recovery time • AIS—Alarm indication signal • LOF—Loss of frame • LOS—Loss of signal • IDLE—Idle code detected • YELLOW—Errors at the remote site receiver • BPV—Bipolar violation • EXZ—Excessive zeros • LCV—Line code violation • PCV—(DS3 only) Pulse code violation • CCV—(DS3 only) C-bit coding violation • FEBE—(DS3 only) Far-end block error • LES—Line error seconds • PES—(DS3 only) P-bit errored seconds • PSES—(DS3 only) P-bit errored seconds (section) • CES—(DS3 only) C-bit errored seconds • CSES—(DS3 only) C-bit severely errored seconds • SEFS—Severely errored framing seconds • UAS—Unavailable seconds 	extensive

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
HDLC configuration	<p>Information about the HDLC configuration.</p> <ul style="list-style-type: none"> • Policing bucket—Configured state of the receiving policer. • Shaping bucket—Configured state of the transmitting shaper. • Giant threshold—Giant threshold programmed into the hardware. • Runt threshold—Runt threshold programmed into the hardware. • Timeslots—Configured time slots for the interface. • Line encoding—Line encoding used. It is always HDB3. • Byte encoding—(T1 only) Byte encoding used: Nx64K or Nx56K. • Line encoding—Line encoding used. For T1, the value can be B8ZS or AMI. For E1, the value is HDB3. • Data inversion—HDLC data inversion setting: Enabled or Disabled. • Idle cycle flag—Idle cycle flags. • Start end flag—Start and end flag. 	extensive
Interface transmit queues	<p>Name of the transmit queues and their associated statistics for each DS3 channel on the Channelized OC12 PIC.</p> <ul style="list-style-type: none"> • B/W—Queue bandwidth as a percentage of the total interface bandwidth. • WRR—Weighted round-robin (in percent). • Packets—Number of packets transmitted. • Bytes—Number of bytes transmitted. • Drops—Number of packets dropped. • Errors—Number of packet errors. 	extensive
DSU configuration	<p>Information about the DSU configuration. The last three lines (Bit count, Error bit count, and LOS information) are displayed only if a BERT has ever been run on the interface.</p> <ul style="list-style-type: none"> • Compatibility mode—CSU/DSU compatibility mode: None, Larscom, Kentrox, or Digital-Link. • Scrambling—Payload scrambling. It can be Enabled or Disabled. • Subrate—Configured subrate setting. Applies only when Digital-Link compatibility mode is used. It can be Disabled or display units in kbps. • FEAC loopback—(T3) Whether a far-end alarm and control (FEAC) loopback is Active or Inactive. This feature is used to send alarm or status information from the far-end terminal back to the near-end terminal and to initiate T3 loopbacks at the far-end terminal from the near-end terminal. • Response—Whether the FEAC signal is Enabled or Disabled. • Count—Number of FEAC loopbacks. 	extensive
BERT configuration	<p>(DS interfaces) BERT (bit error rate test) checks the quality of the line. This output appears only when a BERT is run on the interface.</p> <ul style="list-style-type: none"> • BERT time period—Configured total time period that the BERT is to run. • Elapsed—Actual time elapsed since the start of the BERT (in seconds). • Induced error rate—Configured rate at which the bit errors are induced in the BERT pattern. • Algorithm—Type of algorithm selected for the BERT. 	detail extensive none

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: <ul style="list-style-type: none"> • Destination slot—FPC slot number. • PLP byte—Packet Level Protocol byte. 	extensive
CoS information	Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	Logical interface SNMP interface index number.	detail extensive none
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Traffic statistics	Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize. <ul style="list-style-type: none"> • Input rate—Rate of bits and packets received on the interface. • Output rate—Rate of bits and packets transmitted on the interface. 	detail extensive
Local statistics	Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	detail extensive

Table 62: Channelized OC show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Transit statistics	Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	detail extensive
Protocol	Protocol family configured on the logical interface, such as iso , inet6 , or mpls .	detail extensive none
Multilink bundle	(If the logical interface is configured as part of a multilink bundle.) Interface name for the multilink bundle.	detail extensive none
MTU	MTU size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route table	Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0 .	detail extensive
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address.	detail extensive none
DLCI	(Frame Relay) DLCI number of the logical interface. The following DLCI information is displayed: Flags , Total down time , Last down , and Traffic statistics . Flags is one or more of the following: <ul style="list-style-type: none"> • Active—Set when the link is active and the DTE and DCE are exchanging information. • Down—Set when the link is active, but no information is received from the DCE. • Unconfigured—Set when the corresponding DLCI in the DCE is not configured. • Configured—Set when the corresponding DLCI in the DCE is configured. • Dce-configured—Displayed when the command is issued from the DTE. 	detail extensive none
DLCI statistics	(Frame Relay) Data-link connection identifier (DLCI) statistics. <ul style="list-style-type: none"> • Active DLCI—Number of active DLCIs. • Inactive DLCI—Number of inactive DLCIs. 	detail extensive none

Sample Output

show interfaces extensive (Channelized OC3 IQ) (Physical)

```

show interfaces (Channelized STM1 IQ)

Syntax	<pre>show interfaces (<i>type-fpc/pic/port</i> <:<i>channel</i>><:<i>channel</i>>) <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M Series and T Series routers only) Display status information about the specified channelized STM1 IQ interface.
Options	<p><i>type-fpc/pic/port:channel:channel</i>—Interface type with optional corresponding channel levels. The interface type can be one of the following types:</p> <ul style="list-style-type: none"> • <i>type-fpc/pic/port:channel</i>—For the physical channelized STM1 IQ interface, <i>type</i> is <i>cstm1</i>. For the clear channel, <i>type</i> is <i>so</i>. For channelization, the STM1 IQ interface must be converted to interface type <i>cau4</i>. • <i>type-fpc/pic/port:channel</i>—At the first level of channelization, <i>type</i> can be <i>ce1</i> or <i>e1</i> (clear channel or fractional channel from <i>cau4</i>). • <i>type-fpc/pic/port:channel:channel</i>—At the second level of channelization, <i>type</i> is <i>ds</i> (from <i>ce1</i>). <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p>

show interfaces (Channelized STM1)

Syntax `show interfaces e1-fpc/pic/port:elchannel`
`<brief | detail | extensive | terse>`
`<descriptions>`
`<media>`
`<snmp-index snmp-index>`
`<statistics>`

Release Information Command introduced before Junos OS Release 7.4.

Description (M Series and T Series routers only) Display status information about the specified channelized STM1 interface.

Options `e1-fpc/pic/port:elchannel`—Display standard status information about the specified channelized STM1 interface.

`brief | detail | extensive | terse`—(Optional) Display the specified level of output.

`descriptions`—(Optional) Display interface description strings.

`media`—(Optional) Display media-specific information about network interfaces.

`snmp-index snmp-index`—(Optional) Display information for the specified SNMP index of the interface.

`statistics`—(Optional) Display static interface statistics.

Required Privilege Level view

List of Sample Output [show interfaces extensive \(Channelized STM1, SDH\) on page 1365](#)

Output Fields [Table 63 on page 1354](#) lists the output fields for the **show interfaces** (all Channelized STM1 interfaces) command. Output fields are listed in the approximate order in which they appear.

Table 63: Channelized STM1 show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1168 .	All levels
Interface index	Physical interface's index number, which reflects its initialization sequence.	detail extensive none

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	Reference clock source. It can be Internal or External .	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Whether loopback is enabled and the type of loopback (local or remote).	All levels
FCS	Frame check sequence on the interface (either 16 or 32). The default is 16 bits.	All levels
Framing	Physical layer framing format used on the link. It can be G704 , G704-NO-CRC4 , or Unframed . The default is G704 .	All levels
Parent	(Channelized STM1 IQ interfaces only) Name and interface index of the interface to which a particular child interface belongs. None indicates that this interface is the top level.	All levels
Device flags	Information about the physical device. Possible values are described in the "Device Flags" section under " Common Output Fields Description " on page 1168.	All levels
Interface flags	Information about the interface. Possible values are described in the "Interface Flags" section under " Common Output Fields Description " on page 1168.	All levels
Link flags	Information about the link. Possible values are described in the "Link Flags" section under " Common Output Fields Description " on page 1168.	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
Keepalive settings	(PPP and HDLC) Configured settings for keepalives. <ul style="list-style-type: none"> intervalseconds—The time in seconds between successive keepalive requests. The range is 10 seconds through 32,767 seconds, with a default of 10 seconds. down-count number—The number of keepalive packets a destination must fail to receive before the network takes a link down. The range is 1 through 255, with a default of 3. up-count number—The number of keepalive packets a destination must receive to change a link's status from down to up. The range is 1 through 255, with a default of 1. 	detail extensive none

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Keepalive statistics	<p>(PPP and HDLC) Information about keepalive packets.</p> <ul style="list-style-type: none"> Input—Number of keepalive packets received by PPP. <ul style="list-style-type: none"> (last seen 00:00:00 ago)—Time since the last keepalive packet was received, in the format <i>hh:mm:ss</i>. Output—Number of keepalive packets sent by PPP and how long ago the last keepalive packets were sent and received. <ul style="list-style-type: none"> (last seen 00:00:00 ago)—Time since the last keepalive packet was sent, in the format <i>hh:mm:ss</i>. 	detail extensive none
ANSI LMI settings or ITU LMI settings	<p>(Frame Relay) Local Management Interface settings. The format is (ANSI or ITU) LMI settings: <i>value, value...xx</i> seconds, where <i>value</i> can be:</p> <ul style="list-style-type: none"> n391dte—DTE full status polling interval (1- 255) n392dce—DCE error threshold (1-10) n392dte—DTE error threshold (1-10) n393dce—DCE monitored event count (1-10) n393dte—DTE monitored event count (1-10) t391dte—DTE polling timer (5-30 seconds) t392dce—DCE polling verification timer (5-30 seconds) 	detail extensive none
LMI	<p>(Frame Relay) Statistics about the link management.</p> <ul style="list-style-type: none"> Input—Number of packets coming in on the interface (<i>nn</i>) and how much time has passed since the last packet arrived. The format is Input: <i>nn</i> (last seen <i>hh:mm:ss</i> ago). Output—Number of packets sent out on the interface (<i>nn</i>) and how much time has passed since the last packet was sent. The format is Output: <i>nn</i> (last seen <i>hh:mm:ss</i> ago). 	detail extensive none
DTE statistics	<p>(Frame Relay) Statistics about messages transmitted from the data terminal equipment (DTE) to the data circuit-terminating equipment (DCE):</p> <ul style="list-style-type: none"> Enquiries sent—Number of link status enquiries sent from the DTE to the DCE. Full enquiries sent—Number of full enquiries sent from the DTE to the DCE. Enquiry responses received—Number of enquiry responses received by the DTE from the DCE. Full enquiry responses received—Number of full enquiry responses sent from the DTE to the DCE. 	detail extensive none
DCE statistics	<p>(Frame Relay) Statistics about messages transmitted from the DCE to the DTE:</p> <ul style="list-style-type: none"> Enquiries received—Number of enquiries received by the DCE from the DTE. Full enquiries received—Number of full enquiries received by the DCE from the DTE. Enquiry responses sent—Number of enquiry responses sent from the DCE to the DTE. Full enquiry responses sent—Number of full enquiry responses sent from the DCE to the DTE. 	detail extensive none

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Common statistics	(Frame Relay) Statistics about messages sent between the DTE and the DCE: <ul style="list-style-type: none"> Unknown messages received—Number of received packets that do not fall into any category. Asynchronous updates received—Number of link status peer changes received. Out-of-sequence packets received—Number of packets for which the sequence of the packets received is different from the expected sequence. Keepalive responses timedout—Number of keepalive responses that timed out when no LMI packet was reported for n392dte or n393dce intervals. (See LMI settings.) 	detail extensive none
Nonmatching DCE-end DLCIs	(Frame Relay, displayed only from the DTE) Number of DLCIs configured from the DCE.	detail extensive none
LCP state	(PPP) Link Control Protocol state. <ul style="list-style-type: none"> Conf-ack-received—Acknowledgment was received. Conf-ack-sent—Acknowledgment was sent. Conf-req-sent—Request was sent. Down—LCP negotiation is incomplete (not yet completed or has failed). Not-configured—LCP is not configured on the interface. Opened—LCP negotiation is successful. 	detail extensive none
NCP state	(PPP) Network Control Protocol state. <ul style="list-style-type: none"> Conf-ack-received—Acknowledgment was received. Conf-ack-sent—Acknowledgment was sent. Conf-req-sent—Request was sent. Down—NCP negotiation is incomplete (not yet completed or has failed). Not-configured—NCP is not configured on the interface. Opened—NCP negotiation is successful. 	detail extensive none
CHAP state	(PPP) Displays the state of the Challenge Handshake Authentication Protocol (CHAP) during its transaction. <ul style="list-style-type: none"> Chap-Chal-received—Challenge was received but response not yet sent. Chap-Chal-sent—Challenge was sent. Chap-Resp-received—Response was received for the challenge sent, but CHAP has not yet moved into the Success state. (Most likely with RADIUS authentication.) Chap-Resp-sent—Response was sent for the challenge received. Closed—CHAP authentication is incomplete. Failure—CHAP authentication failed. Not-configured—CHAP is not configured on the interface. Success—CHAP authentication was successful. 	detail extensive none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Input errors	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • SRAM errors—Number of hardware errors that occurred in the static RAM (SRAM) on the PIC. If the value of this field increments, the PIC is malfunctioning. 	extensive

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. 	extensive
DS1 alarms DS1 defects	<p>E1 media-specific defects that can prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. The following lists all possible alarms and defects. For complete explanations of most of these alarms and defects, see <i>Bellcore Telcordia GR-499-CORE</i>.</p> <ul style="list-style-type: none"> • LOS—Loss of signal. • LOF—Loss of frame. • AIS—Alarm indication signal. • YLW—Yellow alarm. Indicates errors at the remote site receiver. 	detail extensive none
SDH alarms SDH defects	<p>SDH media-specific defects that can prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: SDH PHY, SDH regenerator section, SDH multiplex section, and SDH path.</p> <p>NOTE: For controller-based SONET PICs, the SDH alarms and SDH defects output in the show interface cstm1 extensive command output only shows the section and line level defects. The path level defects can be found under the SONET (so) interface output.</p>	All levels

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
E1 media	<p>Active alarms and defects, plus counts of specific E1 errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Error types can be:</p> <ul style="list-style-type: none"> • AIS—Alarm indication signal • BEE—Bit error • BES—Bit error seconds • BPV—Bipolar violation • CS—Carrier state • ES—Errored seconds • EXZ—Excessive zeros • FEBE—Far-end block error • LCV—Line code violation • LES—Line error seconds • LOF—Loss of frame • LOS—Loss of signal • PCV—Pulse code violation • SEF—Severely errored framing • SEFS-S—Severely errored framing seconds (section) • SES—Severely errored seconds • UAS—Unavailable seconds • YELLOW—Errors at the remote site receiver 	extensive
Interface transmit queues	<p>Names of the transmit queues and their associated statistics for each E1 channel on the Channelized STM1-to-E1 PIC.</p> <ul style="list-style-type: none"> • B/W—Queue bandwidth as a percentage of the total interface bandwidth. • WRR—Weighted round-robin (in percent). • Packets—Number of packets transmitted. • Bytes—Number of bytes transmitted. • Drops—Number of packets dropped. • Errors—Number of packet errors. 	extensive
HDLC configuration	<p>Information about the HDLC configuration.</p> <ul style="list-style-type: none"> • Giant threshold—Giant threshold programmed into the hardware. • Runt threshold—Runt threshold programmed into the hardware. • Timeslots—Configured time slots for the interface. • Line encoding—Line encoding used. It is always HDB3. 	extensive

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
DS1 BERT configuration	<p>BERT (bit error rate test) checks the quality of the line. This output appears only when a BERT is run on the interface.</p> <ul style="list-style-type: none"> • BERT time period—Configured total time period that the BERT is to run. • Elapsed—Actual time elapsed since the start of the BERT (in seconds). • Induced error rate—Configured rate at which the bit errors are induced in the BERT pattern. • Algorithm—Type of algorithm selected for the BERT. 	detail extensive none
SDH PHY	<p>Active alarms and defects, plus counts of specific SDH errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • PLL Lock—Phase-locked loop • PHY Light—Loss of optical signal 	extensive
SDH regenerator section	<p>Active alarms and defects, plus counts of specific SDH errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • RS-BIP8—24-bit BIP for multiplex section overhead (B2 bytes) • OOF—Out of frame • LOS—Loss of signal • LOF—Loss of frame • RS-ES—Errored seconds (near-end regenerator section) • RS-SES—Severely errored seconds (near-end regenerator section) • RS-SEFS—Severely errored framing seconds (regenerator section) 	extensive

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SDH multiplex section	<p>Active alarms and defects, plus counts of specific SDH errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • MS-BIP24—8-bit BIP for high-order path overhead (B3 byte) • MS-FEBE—Far-end block error (multiplex section) • MS-FERF—Far-end remote fail (multiplex section) • MS-AIS—alarm indication signal (multiplex section) • BERR-SF—Bit error rate fault (signal failure) • BERR-SD—Bit error rate defect (signal degradation) • MS-ES—Errored seconds (near-end multiplex section) • MS-SES—Severely errored seconds (near-end multiplex section) • MS-UAS—Unavailable seconds (near-end multiplex section) • MS-ES-FE—Errored seconds (far-end multiplex section) • MS-SES-FE—Severely errored seconds (far-end multiplex section) • MS-UAS-FE—Unavailable seconds (far-end multiplex section) 	extensive
SDH path	<p>Active alarms and defects, plus counts of specific SDH errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • HP-BIP8—8-bit BIP for regenerator section overhead (B1 byte) • HP-FEBE—Far-end block error (high-order path) • HP-LOP—Loss of pointer (high-order path) • HP-AIS—High-order-path alarm indication signal • HP-FERF—Far-end remote fail (high-order path) • HP-UNEQ—Unequipped (high-order path) • HP-PLM—Payload label mismatch (high-order path) • HP-ES—Errored seconds (near-end high-order path) • HP-SES—Severely errored seconds (near-end high-order path) • HP-UAS—Unavailable seconds (near-end high-order path) • HP-ES-FE—Errored seconds (far-end high-order path) • HP-SES-FE—Severely errored seconds (far-end high-order path) • HP-UAS-FE—Unavailable seconds (far-end high-order path) 	extensive

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SDH tu	<p>Active alarms and defects, plus counts of specific SDH tributary unit (TU) errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • TU-BIP-2—Bit interleaved parity for SONET line overhead • TU-FEBE—(near-end TU) • TU-LOP—Loss of pointer (near-end TU) • TU-AIS—Alarm indication signal (near-end TU) • TU-FERF—(near-end TU) • TU-UNEQ—Unequipped (near-end TU) • TU-PLM—Payload label mismatch (near-end TU) • TU-ES—Errored seconds (near-end TU) • TU-SES—Severely errored seconds (near-end TU) • TU-UAS—Unavailable seconds (near-end TU) • TU-ES-FE—Errored seconds (far-end TU) • TU-SES-FE—Severely errored seconds (far-end TU) • TU-UAS-FE—Unavailable seconds (far-end TU) 	extensive
Received SDH overhead	Values of the received and transmitted SONET overhead:	extensive
Transmitted SDH overhead	<ul style="list-style-type: none"> • C2—Signal label. Allocated to identify the construction and content of the STS-level SPE and for PDI-P. • F1—Section user channel byte. This byte is set aside for the purposes of users. • K1 and K2—These bytes are allocated for APS signaling for the protection of the multiplex section. • J0—Section trace. This byte is defined for STS-1 number 1 of an STS-<i>N</i> signal. Used to transmit a 1-byte fixed-length string or a 16-byte message so that a receiving terminal in a section can verify its continued connection to the intended transmitter. • S1—Synchronization status. The S1 byte is located in the first STS-1 of an STS-<i>N</i> signal. • Z3 and Z4—Allocated for future use. 	
Received path trace	Channelized OC12 interfaces allow path trace bytes to be sent inband across the SONET/SDH link. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits. This information is specific to each of the 12 channelized OC12 interfaces.	extensive
Transmitted path trace		
Packet Forwarding Engine configuration	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> • Destination slot—FPC slot number. • PLP byte—Packet Level Protocol byte. 	extensive

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CoS information	<p>Information about the CoS queue for the physical interface.</p> <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1168 .	All levels
Index	Logical interface index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	Logical interface SNMP interface index number.	detail extensive none
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Protocol	Protocol family configured on the logical interface, such as iso , inet6 , or mpls .	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route table	Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	detail extensive
Flags	Information about the protocol family flags. Possible values are described in the “Family Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive none

Table 63: Channelized STM1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address.	detail extensive none
DLCI	(Frame Relay) DLCI number of the logical interface. The following DLCI information is displayed: Flags , Total down time , Last down , and Traffic statistics . Flags is one or more of the following: <ul style="list-style-type: none"> • Active—Set when the link is active and the DTE and DCE are exchanging information. • Down—Set when the link is active, but no information is received from the DCE. • Unconfigured—Set when the corresponding DLCI in the DCE is not configured. • Configured—Set when the corresponding DLCI in the DCE is configured. • Dce-configured—Displayed when the command is issued from the DTE. 	detail extensive none
DLCI statistics	(Frame Relay) Data-link connection identifier (DLCI) statistics. <ul style="list-style-type: none"> • Active DLCI—Number of active DLCIs. • Inactive DLCI—Number of inactive DLCIs. 	detail extensive none

show interfaces (Channelized T1 IQ)

Syntax	<pre>show interfaces (ct1-fpc/pic/port type-fpc/pic/port<:channel><:channel>) <brief detail extensive terse> <descriptions> <media> <snmp-index snmp-index> <statistics></pre>
Release Information	Command introduced in Junos OS Release 7.4.
Description	(M Series and T Series routers only) Display status information about the specified channelized T1 IQ interface.
Options	<p>type-fpc/pic/port:channel—Interface type. With optional corresponding channel levels, the interface type can be one of the following:</p> <ul style="list-style-type: none"> • type-fpc/pic/port—For the physical channelized T1 IQ interface, type is ct1. • type-fpc/pic/port:channel—For the clear channel, type is t1. At the first level of channelization, type can be ct1 or t1. • type-fpc/pic/port:channel:channel—At the second level of channelization, type can be ds. <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>snmp-index snmp-index—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p>
Required Privilege Level	view
List of Sample Output	<p>show interfaces extensive (CT1) on page 1377</p> <p>show interfaces extensive (T1) on page 1378</p> <p>show interfaces extensive (DS0) on page 1379</p>
Output Fields	Table 64 on page 1370 lists the output fields for the show interfaces (Channelized T1 IQ and T3 IQ interfaces) command. Output fields are listed in the approximate order in which they appear.

Table 64: Channelized T1 IQ and T3 IQ show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1168 .	All levels
Interface index	Physical interface's index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	Reference clock source. It can be Internal or External .	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Whether loopback is enabled and the type of loopback (local or remote).	All levels
FCS	Frame check sequence on the interface (either 16 or 32). The default is 16 bits.	All levels
Framing	Physical layer framing format used on the link. It can be ESF or SF . The default is ESF .	All levels
Parent	Name and interface index of the interface to which a particular child interface belongs. None indicates that this interface is the top level.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Link flags	Information about the link. Possible values are described in the “Link Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive

Table 64: Channelized T1 IQ and T3 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Keepalive settings	Configured settings for keepalives. <ul style="list-style-type: none"> interval <i>seconds</i>—The time in seconds between successive keepalive requests. The range is 10 seconds through 32,767 seconds, with a default of 10 seconds. down-count <i>number</i>—The number of keepalive packets a destination must fail to receive before the network takes a link down. The range is 1 through 255, with a default of 3. up-count <i>number</i>—The number of keepalive packets a destination must receive to change a link's status from down to up. The range is 1 through 255, with a default of 1. 	detail extensive none
Keepalive statistics	Information about keepalive packets. <ul style="list-style-type: none"> Input—Number of keepalive packets received by PPP. <ul style="list-style-type: none"> (last seen 00:00:00 ago)—Time since the last keepalive packet was received, in the format <i>hh:mm:ss</i>. Output—Number of keepalive packets sent by PPP and how long ago the last keepalive packets were sent and received. <ul style="list-style-type: none"> (last seen 00:00:00 ago)—Time since the last keepalive packet was sent, in the format <i>hh:mm:ss</i>. 	detail extensive none
LMI settings	(Frame Relay) Settings for Local Management Interface (LMI) can be either ANSI LMI settings or ITU LMI settings. ANSI LMI settings is the default. The format is (ANSI or ITU) LMI settings: <i>value, value... xx seconds</i> , where <i>value</i> can be: <ul style="list-style-type: none"> n391dte—DTE full status polling interval (1–255) n392dce—DCE error threshold (1–10) n392dte—DTE error threshold (1–10) n393dce—DCE monitored event count (1–10) n393dte—DTE monitored event count (1–10) t391dte—DTE polling timer (5–30 seconds) t392dce—DCE polling verification timer (5–30 seconds) 	detail extensive none
LMI	(Frame Relay) LMI packet statistics: <ul style="list-style-type: none"> Input—Number of packets coming in on the interface (<i>nn</i>) and how much time has passed since the last packet arrived. The format is Input: <i>nn</i> (last seen <i>hh:mm:ss</i> ago). Output—Number of packets sent out on the interface (<i>nn</i>) and how much time has passed since the last packet was sent. The format is Output: <i>nn</i> (last sent <i>hh:mm:ss</i> ago). 	detail extensive none
DTE statistics	(Frame Relay) Statistics about messages transmitted from the data terminal equipment (DTE) to the data communication equipment (DCE): <ul style="list-style-type: none"> Enquiries sent—Number of link status enquiries sent from the DTE to the DCE. Full enquiries sent—Number of full enquiries sent from the DTE to the DCE. Enquiry responses received—Number of enquiry responses received by the DTE from the DCE. Full enquiry responses received—Number of full enquiry responses sent from the DTE to the DCE. 	detail extensive none

Table 64: Channelized T1 IQ and T3 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
DCE statistics	(Frame Relay) Statistics about messages transmitted from the DCE to the DTE: <ul style="list-style-type: none"> • Enquiries received—Number of enquiries received by the DCE from the DTE. • Full enquiries received—Number of full enquiries received by the DCE from the DTE. • Enquiry responses sent—Number of enquiry responses sent from the DCE to the DTE. • Full enquiry responses sent—Number of full enquiry responses sent from the DCE to the DTE. 	detail extensive none
Common statistics	(Frame Relay) Statistics about messages sent between the DTE and the DCE: <ul style="list-style-type: none"> • Unknown messages received—Number of received packets that do not fall into any category. • Asynchronous updates received—Number of link status peer changes received. • Out-of-sequence packets received—Number of packets for which the sequence of the packets received is different from the expected sequence. • Keepalive responses timedout—Number of keepalive responses that timed out when no LMI packet was reported for n392dte or n393dce intervals. (See LMI settings.) 	detail extensive none
Nonmatching DCE-end DLCIs	(Frame Relay) Number of DLCIs configured from the DCE, displayed only from the DTE.	detail extensive none
LCP state	(PPP) Link Control Protocol state. <ul style="list-style-type: none"> • Conf-ack-received—Acknowledgement was received. • Conf-ack-sent—Acknowledgement was sent. • Conf-req-sent—Request was sent. • Down—LCP negotiation is incomplete (not yet completed or has failed). • Not-configured—LCP is not configured on the interface. • Opened—LCP negotiation is successful. 	detail extensive none
NCP state	(PPP) Network Control Protocol state. <ul style="list-style-type: none"> • Conf-ack-received—Acknowledgement was received. • Conf-ack-sent—Acknowledgement was sent. • Conf-req-sent—Request was sent. • Down—NCP negotiation is incomplete (not yet completed or has failed). • Not-configured—NCP is not configured on the interface. • Opened—NCP negotiation is successful. 	detail extensive none

Table 64: Channelized T1 IQ and T3 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CHAP state	<p>(PPP) Displays the state of the Challenge Handshake Authentication Protocol (CHAP) during its transaction.</p> <ul style="list-style-type: none"> • Chap-Chal-received—Challenge was received but response not yet sent. • Chap-Chal-sent—Challenge was sent. • Chap-Resp-received—Response was received for the challenge sent, but CHAP has not yet moved into the Success state. (Most likely with RADIUS authentication.) • Chap-Resp-sent—Response was sent for the challenge received. • Closed—CHAP authentication is incomplete. • Failure—CHAP authentication failed. • Not-configured—CHAP is not configured on the interface. • Success—CHAP authentication was successful. 	detail extensive none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
CoS queues	Number of CoS queues configured.	detail extensive none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface. • Input packets, Output packets—Number of packets received and transmitted on the interface. 	detail extensive

Table 64: Channelized T1 IQ and T3 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Input errors	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Giants—Number of frames received that are larger than the giant threshold. • Runts—Number of frames received that are smaller than the runt threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. • L2 channel errors—Counter increments when the software could not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Count of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • HS link CRC errors—Count of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • SRAM errors—Number of hardware errors that occurred in the static RAM (SRAM) on the PIC. If the value in this field increments, the PIC is malfunctioning. • Resource errors—Sum of transmit drops. 	extensive
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly, (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • MTU errors—Number of packets whose size exceeds the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive

Table 64: Channelized T1 IQ and T3 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Queue counters	CoS queue number and its associated user-configured forwarding class name. <ul style="list-style-type: none"> Queued packets—Number of queued packets. Transmitted packets—Number of transmitted packets. Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive
DS1 alarms DS1 defects	Media-specific defects that can render the interface unable to pass packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. <ul style="list-style-type: none"> LOS—Loss of signal. LOF—Loss of frame. AIS—Alarm indication signal. YLW—Yellow alarm. Indicates errors at the remote site receiver. 	detail extensive none
T1 media	Counts of T1 media-specific errors. <ul style="list-style-type: none"> Seconds—Number of seconds the defect has been active. Count—Number of times that the defect has gone from inactive to active. State—State of the error. State other than OK indicates a problem. <p>The T1 media-specific error types can be:</p> <ul style="list-style-type: none"> AIS—Alarm indication signal BEE—Bit error event BES—Bit error seconds BPV—Bipolar violation CS—Carrier state ES—Errored seconds EXZ—Excessive zeros FEBE—Far-end block error LCV—Line code violation LES—Line error seconds LOF—Loss of frame LOS—Loss of signal PCV—Pulse code violation SEF—Severely errored framing SEFS—Severely errored framing seconds (section) SES—Severely errored seconds UAS—Unavailable seconds YELLOW—Errors at the remote site receiver 	extensive
Line encoding	Line encoding used: B8ZS or AMI .	All levels
Buildout	Buildout setting.	All levels

Table 64: Channelized T1 IQ and T3 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
HDLC configuration	Information about the HDLC configuration. <ul style="list-style-type: none"> • Policing bucket—Configured state of the receiving policer. • Shaping bucket—Configured state of the transmitting shaper. • Giant threshold—Giant threshold programmed into the hardware. • Runt threshold—Runt threshold programmed into the hardware. • Timeslots—Configured time slots for the interface. • Line encoding—Line encoding used: B8ZS or AMI. • Byte encoding—Byte encoding used: Nx64K or Nx56K. • Data inversion—HDLC data inversion setting: Enabled or Disabled. • Idle cycle Flag—Idle cycle flags. • Start end Flag—Start and end flag. 	extensive
DSO or DS1 BERT configuration	BERT (bit error rate test) checks the quality of the line. This output appears only when a BERT is run on the interface. <ul style="list-style-type: none"> • BERT time period—Configured total time period that the BERT is to run. • Elapsed—Actual time elapsed since the start of the BERT (in seconds). • Induced error rate—Configured rate at which the bit errors are induced in the BERT pattern. • Algorithm—Type of algorithm selected for the BERT. 	detail extensive none
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: <ul style="list-style-type: none"> • Destination slot—FPC slot number. • PLP byte—Packet Level Protocol byte. 	extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	Logical interface SNMP interface index number.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface; values are described in the “Logical Interface Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Protocol	Protocol family configured on the logical interface, such as iso , inet6 , or mpls .	detail extensive none
MTU	MTU size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

Table 64: Channelized T1 IQ and T3 IQ show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Route table	Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	detail extensive
Flags	Information about the protocol family flags. Possible values are described in the “Family Flags” section under “ Common Output Fields Description ” on page 1168.	detail extensive none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under “ Common Output Fields Description ” on page 1168.	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
DLCI	(Frame Relay) DLCI number of the logical interface. The following DLCI information is displayed: Flags , Total down time , Last down , and Traffic statistics . Flags is one or more of the following: <ul style="list-style-type: none"> • Active—Set when the link is active and the DTE and DCE are exchanging information. • Down—Set when the link is active, but no information is received from the DCE. • Unconfigured—Set when the corresponding DLCI in the DCE is not configured. • Configured—Set when the corresponding DLCI in the DCE is configured. • Dce-configured—Displayed when the command is issued from the DTE. 	detail extensive none
DLCI statistics	(Frame Relay) Data-link connection identifier (DLCI) statistics. <ul style="list-style-type: none"> • Active DLCI—Number of active DLCIs. • Inactive DLCI—Number of inactive DLCIs. 	detail extensive none

show interfaces (Channelized T3 IQ)

Syntax	<pre>show interfaces (ct3-<i>fpc/pic/port</i> <i>type-fpc/pic/port</i><:<i>channel</i>><:<i>channel</i>>) <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M Series and T Series routers only) Display status information about the specified channelized T3 IQ interface.
Options	<p><i>type-fpc/pic/port:channel</i>—Interface type. With optional corresponding channel levels, the interface type can be one of the following:</p> <ul style="list-style-type: none"> • <i>type-fpc/pic/port</i>—For the physical channelized T3 IQ interface, <i>type</i> is ct3. • <i>type-fpc/pic/port:channel</i>—For the clear channel, <i>type</i> is t3. At the first level of channelization, <i>type</i> can be ct1 or t1. • <i>type-fpc/pic/port:channel:channel</i>—At the second level of channelization, <i>type</i> is ds. <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p>
Required Privilege Level	view
List of Sample Output	<p>show interfaces extensive (Channelized T3 IQ) (Physical) on page 1383</p> <p>show interfaces extensive (Channelized T1 on Channelized T3 IQ) on page 1383</p> <p>show interfaces extensive (DSO on Channelized T3 IQ) on page 1383</p>
Output Fields	See the output field table for the show interfaces (Channelized T1 IQ) command.

Sample Output

show interfaces extensive (Channelized T3 IQ) (Physical)

```
user@host> show interfaces extensive ct3-0/0/1

Physical interface: ct3-0/0/1, Enabled, Physical link is Up
  Interface index: 30, SNMP ifIndex: 317, Generation: 29
  Link-level type: Controller, MTU: 4474, Clocking: Internal, Speed: T3,
  Loopback: None, FCS: 16, Mode: C/Bit parity, Parent: None
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps
  Link flags     : None
...
```

show interfaces extensive (Channelized T1 on Channelized T3 IQ)

```
user@host> show interfaces extensive ct1-0/0/1:2

Physical interface: ct1-0/0/1:2, Enabled, Physical link is Up
  Interface index: 175, SNMP ifIndex: 1505, Generation: 174
  Link-level type: Controller, MTU: 1504, Clocking: Internal, Speed: T1,
  Loopback: None, FCS: 16, Framing: ESF, Parent: ct3-0/0/1 (Index 32)
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps
  Link flags     : None
...
```

show interfaces extensive (DSO on Channelized T3 IQ)

```
user@host> show interfaces extensive ds-0/0/1:2:1

Physical interface: ds-0/0/1:2:1, Enabled, Physical link is Up
  Interface index: 176, SNMP ifIndex: 1563, Generation: 175
  Link-level type: PPP, MTU: 1504, Clocking: Internal, Speed: 640kbps,
  Loopback: None, FCS: 16, Parent: ct1-0/0/1:2(Index 175)
  Device flags   : Present Running
  Interface flags: Point-To-Point SNMP-Traps
  Link flags     : Keepalives
...
```

show interfaces (Discard)

Syntax	<pre>show interfaces dsc <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display status information about the specified discard interface.
Options	<p>dsc—Display standard information about the specified discard interface.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—This option is not relevant for the discard interface and always shows a value of 0.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) This option is not relevant for the discard interface and always shows a value of 0.</p>
Required Privilege Level	view

Output Fields	<p>Table 65 on page 1384 lists the output fields for the show interfaces (discard) command. Output fields are listed in the approximate order in which they appear.</p>

Table 65: Discard show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		

Table 65: Discard show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Physical interface	Name of the physical interface, whether the interface is enabled, and the state of the physical interface: Up or Down .	All levels
Interface index	Physical interface's index number, which reflects its initialization sequence.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Type	Type of interface. Software-Pseudo indicates a standard software interface with no associated hardware device.	All levels
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	Reference clock source. It can be Internal or External .	brief detail extensive
Speed	Speed at which the interface is running.	brief detail extensive
Device flags	Information about the physical device. Possible values are described in the "Device Flags" section under " Common Output Fields Description " on page 1168.	All levels
Interface flags	Information about the interface. Possible values are described in the "Interface Flags" section under " Common Output Fields Description " on page 1168.	All levels
Link type	Encapsulation being used on the physical interface.	detail extensive
Link flags	Information about the link. Possible values are described in the "Link Flags" section under " Common Output Fields Description " on page 1168.	detail extensive
Physical info	Information about the physical interface.	detail extensive
Hold-times	Current interface hold-time up and hold-time down. Value is in milliseconds.	detail extensive
Current address, Hardware address	Configured MAC address and hardware MAC address.	detail extensive
Alternate link address	Backup address of the link.	detail extensive
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive

Table 65: Discard show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface. • Input packets, Output packets—Number of packets received and transmitted on the interface. 	detail extensive
Input errors	<p>Input errors on the interface:</p> <ul style="list-style-type: none"> • Errors—Sum of incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Giants—Number of frames received that are larger than the giant threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • Resource errors—Sum of transmit drops. 	detail extensive
Output errors	<p>(Extensive only) Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	detail extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	detail extensive
SNMP ifIndex	Logical interface SNMP interface index number.	detail extensive
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

Table 65: Discard show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Protocol	Protocol family configured on the logical interface, such as iso , inet6 , or mpls .	All levels
MTU	MTU size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route Table	Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0 .	detail extensive

show interfaces (Fast Ethernet)

Syntax	<pre>show interfaces <i>interface-type</i> <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display status information about the specified Fast Ethernet interface.
Options	<p><i>interface-type</i>—On M Series and T Series routers, the interface type is <i>fe-fpc/pic/port</i>.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p>
Required Privilege Level	view
List of Sample Output	show interfaces (Fast Ethernet) on page 1404 show interfaces brief (Fast Ethernet) on page 1404 show interfaces detail (Fast Ethernet) on page 1404 show interfaces extensive (Fast Ethernet) on page 1405
Output Fields	Table 66 on page 1390 lists the output fields for the show interfaces (Fast Ethernet) command. Output fields are listed in the approximate order in which they appear.

Table 66: show interfaces Fast Ethernet Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “ Common Output Fields Description ” on page 1168.	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	detail extensive none

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface.	All levels
Link-mode	Type of link connection configured for the physical interface: Full-duplex or Half-duplex	extensive
Speed	Speed at which the interface is running.	All levels
Loopback	Loopback status: Enabled or Disabled . If loopback is enabled, type of loopback: Local or Remote .	All levels
Source filtering	Source filtering status: Enabled or Disabled .	All levels
LAN-PHY mode	10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.	All levels
WAN-PHY mode	10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.	All levels
Unidirectional	Unidirectional link mode status for 10-Gigabit Ethernet interface: Enabled or Disabled for parent interface; Rx-only or Tx-only for child interfaces.	All levels
Flow control	Flow control status: Enabled or Disabled .	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: Enabled or Disabled .	All levels
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> • Online—Autonegotiation is manually configured as online. • Offline—Autonegotiation is manually configured as offline. 	All levels
Device flags	Information about the physical device. Possible values are described in the "Device Flags" section under "Common Output Fields Description" on page 1168 .	All levels
Interface flags	Information about the interface. Possible values are described in the "Interface Flags" section under "Common Output Fields Description" on page 1168 .	All levels
Link flags	Information about the link. Possible values are described in the "Links Flags" section under "Common Output Fields Description" on page 1168 .	All levels
Wavelength	(10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).	All levels

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Frequency	(10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).	All levels
CoS queues	Number of CoS queues configured.	detail extensive none
Schedulers	(GigabitEthernet intelligent queuing 2 (IQ2) interfaces only) Number of CoS schedulers configured.	extensive
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
Current address	Configured MAC address.	detail extensive none
Hardware address	Hardware MAC address.	detail extensive none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output Rate	Output rate in bps and pps.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. <p>Gigabit Ethernet and 10-Gigabit Ethernet IQ PICs count the overhead and CRC bytes.</p> <p>For Gigabit Ethernet IQ PICs, the input byte counts vary by interface type. For more information, see Table 31 under the show interfaces command.</p>	detail extensive

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Input errors	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the ignore-l3-incompletes statement. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • FIFO errors—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • Resource errors—Sum of transmit drops. 	extensive

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive
Egress queues	<p>Total number of egress queues supported on the specified interface.</p> <p>NOTE: In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the show interfaces command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs</p>	detail extensive
Queue counters (Egress)	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Ingress queues	Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.	extensive
Queue counters (Ingress)	CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces. <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	extensive
Active alarms and Active defects	Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the routing device configuration, an alarm can ring the red or yellow alarm bell on the routing device, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value None or Link . <ul style="list-style-type: none"> • None—There are no active defects or alarms. • Link—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning. 	detail extensive none
OTN FEC statistics	The forward error correction (FEC) counters provide the following statistics: <ul style="list-style-type: none"> • Corrected Errors—The count of corrected errors in the last second. • Corrected Error Ratio—The corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits. 	
PCS statistics	(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device. <ul style="list-style-type: none"> • Bit errors—The number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode. • Errored blocks—The number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode. 	detail extensive

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
MAC statistics	<p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> • Total octets and total packets—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see Table 31 under the show interfaces command. • Unicast packets, Broadcast packets, and Multicast packets—Number of unicast, broadcast, and multicast packets. • CRC/Align errors—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • FIFO error—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning. • MAC control frames—Number of MAC control frames. • MAC pause frames—Number of MAC control frames with pause operational code. • Oversized frames—Number of frames that exceed 1518 octets. • Jabber frames—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • Fragment frames—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • VLAN tagged frames—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. • Code violations—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error." 	extensive
OTN Received Overhead Bytes	APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08	extensive
OTN Transmitted Overhead Bytes	APS/PCC0: 0x00, APS/PCC1: 0x00, APS/PCC2: 0x00, APS/PCC3: 0x00 Payload Type: 0x08	extensive

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Filter statistics	<p>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> • Input packet count—Number of packets received from the MAC hardware that the filter processed. • Input packet rejects—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • Input DA rejects—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting). • Input SA rejects—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • Output packet count—Number of packets that the filter has given to the MAC hardware. • Output packet pad count—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • Output packet error count—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment. • CAM destination filters, CAM source filters—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0. 	extensive
PMA PHY	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • PHY Lock—Phase-locked loop • PHY Light—Loss of optical signal 	extensive

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Autonegotiation information	<p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> • Negotiation status: <ul style="list-style-type: none"> • Incomplete—Ethernet interface has the speed or link mode configured. • No autonegotiation—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation. • Complete—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner status—OK when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner: <ul style="list-style-type: none"> • Link mode—Depending on the capability of the attached Ethernet device, either Full-duplex or Half-duplex. • Flow control—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is None. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), and Symmetric/Asymmetric (link partner supports both PAUSE on receive and transmit or only PAUSE receive). • Remote fault—Remote fault information from the link partner—Failure indicates a receive link error. OK indicates that the link partner is receiving. Negotiation error indicates a negotiation error. Offline indicates that the link partner is going offline. • Local resolution—Information from the link partner: <ul style="list-style-type: none"> • Flow control—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), and Symmetric/Asymmetric (link partner supports both PAUSE on receive and transmit or only PAUSE receive). • Remote fault—Remote fault information. Link OK (no error detected on receive), Offline (local interface is offline), and Link Failure (link error detected on receive). 	extensive
Received path trace, Transmitted path trace	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other routing device manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the routing device at the other end of the fiber. The transmitted path trace value is the message that this routing device transmits.</p>	extensive
Packet Forwarding Engine configuration	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> • Destination slot—FPC slot number. 	extensive

Table 66: *show interfaces Fast Ethernet Output Fields (continued)*

Field Name	Field Description	Level of Output
CoS information	<p>Information about the CoS queue for the physical interface.</p> <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP interface index number for the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “ Common Output Fields Description ” on page 1168.	All levels

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
VLAN-Tag	<p>Rewrite profile applied to incoming or outgoing frames on the outer (Out) VLAN tag or for both the outer and inner (In) VLAN tags.</p> <ul style="list-style-type: none"> • push—An outer VLAN tag is pushed in front of the existing VLAN tag. • pop—The outer VLAN tag of the incoming frame is removed. • swap—The outer VLAN tag of the incoming frame is overwritten with the user specified VLAN tag information. • push—An outer VLAN tag is pushed in front of the existing VLAN tag. • push-push—Two VLAN tags are pushed in from the incoming frame. • swap-push—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame. • swap-swap—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user specified VLAN tag value. • pop-swap—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame. • pop-pop—Both the outer and inner VLAN tags of the incoming frame are removed. 	brief detail extensive none
Demux:	<p>IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following:</p> <ul style="list-style-type: none"> • Source Family Inet • Destination Family Inet 	detail extensive none
Encapsulation	Encapsulation on the logical interface.	All levels
Protocol	Protocol family. Possible values are described in the “Protocol Field” section under “ Common Output Fields Description ” on page 1168.	detail extensive none
MTU	Maximum transmission unit size on the logical interface.	detail extensive none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	detail extensive none
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the specified interface set.</p> <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface set • Input packets, Output packets—Number of packets received and transmitted on the interface set. 	detail extensive
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.	extensive
Local statistics	Number and rate of bytes and packets destined to the routing device.	extensive

Table 66: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
Transit statistics	Number and rate of bytes and packets transiting the switch. NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the Output bytes and Output packets interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.	extensive
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route Table	Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	detail extensive none
Flags	Information about protocol family flags. Possible values are described in the “Family Flags” section under “ Common Output Fields Description ” on page 1168.	detail extensive
Donor interface	(Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.	detail extensive none
Preferred source address	(Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.	detail extensive none
Input Filters	Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	detail extensive
Output Filters	Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	detail extensive
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	detail extensive none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under “ Common Output Fields Description ” on page 1168.	detail extensive none
protocol-family	Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed.	brief
Flags	Information about address flag (possible values are described in the “Addresses Flags” section under “ Common Output Fields Description ” on page 1168.	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address of the logical interlace.	detail extensive none

Release Information Command introduced before Junos OS Release 7.4 for Gigabit interfaces.
Command introduced in Junos OS Release 8.0 for 10 Gigabit interfaces.
Command modified in Junos OS Release 9.5 for SRX Series devices.
Command introduced in Junos OS Release 18.1 for Gigabit interfaces.

Description Display status information about the specified Gigabit Ethernet interface.

(M320, M120, MX Series, and T Series routers only) Display status information about the specified 10-Gigabit Ethernet interface.

Display the IPv6 interface traffic statistics about the specified Gigabit Ethernet interface for MX series routers. The input and output bytes (bps) and packets (pps) rates are not displayed for IFD and local traffic.

Display status information and statistics about interfaces on SRX Series appliance running Junos OS.

NOTE: On SRX Series appliances, on configuring identical IPs on a single interface, you will not see a warning message; instead, you will see a syslog message.

Starting in Junos OS Release 18.4R1, Output fields **Next-hop** and **vpls-status** is displayed in the **show interfaces *interface name* detail** command, only for Layer 2 protocols on MX480 routers.

Options For Gigabit interfaces:

ge-fpc/pic/port—Display standard information about the specified Gigabit Ethernet interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

For 10 Gigabit interfaces:

xe-fpc/pic/port—Display standard information about the specified 10-Gigabit Ethernet interface.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

For SRX interfaces:

- **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace *pim* with the PIM slot and port with the port number.
 - **at-*pim*/0/*port***—ATM-over-ADSL or ATM-over-SHDSL interface.
 - **ce1-*pim*/0/*port***—Channelized E1 interface.
 - **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
 - **ct1-*pim*/0/*port***—Channelized T1 interface.
 - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
 - **e1-*pim*/0/*port***—E1 interface.
 - **e3-*pim*/0/*port***—E3 interface.
 - **fe-*pim*/0/*port***—Fast Ethernet interface.
 - **ge-*pim*/0/*port***—Gigabit Ethernet interface.
 - **se-*pim*/0/*port***—Serial interface.
 - **t1-*pim*/0/*port***—T1 (also called DS1) interface.
 - **t3-*pim*/0/*port***—T3 (also called DS3) interface.
 - **wx-slot/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).
- **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace *pim* with the PIM slot and port with the port number.
 - **at-*pim*/0/*port***—ATM-over-ADSL or ATM-over-SHDSL interface.
 - **ce1-*pim*/0/*port***—Channelized E1 interface.
 - **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
 - **ct1-*pim*/0/*port***—Channelized T1 interface.
 - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
 - **e1-*pim*/0/*port***—E1 interface.
 - **e3-*pim*/0/*port***—E3 interface.
 - **fe-*pim*/0/*port***—Fast Ethernet interface.
 - **ge-*pim*/0/*port***—Gigabit Ethernet interface.

- **se-pim/0/port**—Serial interface.
- **t1-pim/0/port**—T1 (also called DS1) interface.
- **t3-pim/0/port**—T3 (also called DS3) interface.
- **wx-slot/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).

Additional Information In a logical system, this command displays information only about the logical interfaces and not about the physical interfaces.

Output Fields [Table 56 on page 1182](#) describes the output fields for the **show interfaces** (Gigabit Ethernet) command. Output fields are listed in the approximate order in which they appear. For Gigabit Ethernet IQ and IQE PICs, the traffic and MAC statistics vary by interface type. For more information, see [Table 57 on page 1210](#).

Table 67: show interfaces (Gigabit Ethernet) Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1168 .	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface.	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Loopback status: Enabled or Disabled . If loopback is enabled, type of loopback: Local or Remote .	All levels
Source filtering	Source filtering status: Enabled or Disabled .	All levels
LAN-PHY mode	10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.	All levels
WAN-PHY mode	10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.	All levels
Unidirectional	Unidirectional link mode status for 10-Gigabit Ethernet interface: Enabled or Disabled for parent interface; Rx-only or Tx-only for child interfaces.	All levels
Flow control	Flow control status: Enabled or Disabled .	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: Enabled or Disabled .	All levels
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> • Online—Autonegotiation is manually configured as online. • Offline—Autonegotiation is manually configured as offline. 	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1168 .	All levels

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Link flags	Information about the link. Possible values are described in the “Links Flags” section under “ Common Output Fields Description ” on page 1168.	All levels
Wavelength	(10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).	All levels
Frequency	(10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).	All levels
CoS queues	Number of CoS queues configured.	detail extensive none
Schedulers	(Gigabit Ethernet intelligent queuing 2 [IQ2] interfaces only) Number of CoS schedulers configured.	extensive
Hold-times	Current interface hold-time up and hold-time down, in milliseconds (ms).	detail extensive
Current address	Configured MAC address.	detail extensive none
Hardware address	Hardware MAC address.	detail extensive none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Input Rate	Input rate in bits per second (bps) and packets per second (pps). The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None
Output Rate	Output rate in bps and pps. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Egress account overhead	Layer 2 overhead in bytes that is accounted in the interface statistics for egress traffic.	detail extensive
Ingress account overhead	Layer 2 overhead in bytes that is accounted in the interface statistics for ingress traffic.	detail extensive

Table 67: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

Field Name	Field Description	Level of Output
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • Output bytes—Number of bytes transmitted on the interface. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. <p>Gigabit Ethernet and 10-Gigabit Ethernet IQ PICs count the overhead and CRC bytes.</p> <p>For Gigabit Ethernet IQ PICs, the input byte counts vary by interface type. For more information, see Table 31 under the show interfaces command.</p>	detail extensive
Input errors	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the ignore-l3-incompletes statement. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • FIFO errors—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • Resource errors—Sum of transmit drops. 	extensive

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. <p>NOTE: Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the Drops field does not always use the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> <ul style="list-style-type: none"> • Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number must always be 0. If it is nonzero, there is a software bug. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field must never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive
Egress queues	<p>Total number of egress queues supported on the specified interface.</p> <p>NOTE: In DPCs that are not of the enhanced type, such as DPC 40x 1GER, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the show interfaces command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs</p>	detail extensive

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Queue counters (Egress)	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. <p>NOTE: Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the Dropped packets field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p>	detail extensive
Ingress queues	Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.	extensive
Queue counters (Ingress)	<p>CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	extensive
Active alarms and Active defects	<p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value None or Link.</p> <ul style="list-style-type: none"> • None—There are no active defects or alarms. • Link—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning. 	detail extensive none
Interface transmit statistics	<p>(On MX Series devices) Status of the interface-transmit-statistics configuration: Enabled or Disabled.</p> <ul style="list-style-type: none"> • Enabled—When the interface-transmit-statistics statement is included in the configuration. If this is configured, the interface statistics show the actual transmitted load on the interface. • Disabled—When the interface-transmit-statistics statement is not included in the configuration. If this is not configured, the interface statistics show the offered load on the interface. 	detail extensive
OTN FEC statistics	<p>The forward error correction (FEC) counters provide the following statistics:</p> <ul style="list-style-type: none"> • Corrected Errors—Count of corrected errors in the last second. • Corrected Error Ratio—Corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits. 	detail extensive

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
PCS statistics	<p>(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device.</p> <ul style="list-style-type: none"> • Bit errors—Number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode. • Errored blocks—Number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode. 	detail extensive
Link Degrad	<p>Shows the link degrade status of the physical link and the estimated bit error rates (BERs). This field is available only for the PICs supporting the physical link monitoring feature.</p> <ul style="list-style-type: none"> • Link Monitoring—Indicates if physical link degrade monitoring is enabled on the interface. <ul style="list-style-type: none"> • Enable—Indicates that link degrade monitoring has been enabled (using the link-degrade-monitor statement) on the interface. • Disable—Indicates that link degrade monitoring has not been enabled on the interface. If link degrade monitoring has not been enabled, the output does not show any related information, such as BER values and thresholds. • Link Degrad Set Threshold—The BER threshold value at which the link is considered degraded and a corrective action is triggered. • Link Degrad Clear Threshold—The BER threshold value at which the degraded link is considered recovered and the corrective action applied to the interface is reverted. • Estimated BER—The estimated bit error rate. • Link-degrade event—Shows link degrade event information. <ul style="list-style-type: none"> • Seconds—Time (in seconds) elapsed after a link degrade event occurred. • Count—The number of link degrade events recorded. • State—Shows the link degrade status (example: Defect Active). 	detail extensive

Table 67: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

Field Name	Field Description	Level of Output
MAC statistics	<p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> • Total octets and total packets—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see Table 31 under the show interfaces command. • Unicast packets, Broadcast packets, and Multicast packets—Number of unicast, broadcast, and multicast packets. • CRC/Align errors—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • FIFO error—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning. • MAC control frames—Number of MAC control frames. • MAC pause frames—Number of MAC control frames with pause operational code. • Oversized frames—There are two possible conditions regarding the number of oversized frames: <ul style="list-style-type: none"> • Packet length exceeds interface MTU, or • Packet length exceeds MRU • Jabber frames—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • Fragment frames—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • VLAN tagged frames—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. <p>NOTE: The 20-port Gigabit Ethernet MIC (MIC-3D-20GE-SFP) does not have hardware counters for VLAN frames. Therefore, the VLAN tagged frames field displays 0 when the show interfaces command is executed on a 20-port Gigabit Ethernet MIC. In other words, the number of VLAN tagged frames cannot be determined for the 20-port Gigabit Ethernet MIC.</p> • Code violations—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error." 	extensive
OTN Received Overhead Bytes	APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08	extensive
OTN Transmitted Overhead Bytes	APS/PCC0: 0x00, APS/PCC1: 0x00, APS/PCC2: 0x00, APS/PCC3: 0x00 Payload Type: 0x08	extensive

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Filter statistics	<p>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet may enter the system or be rejected.</p> <ul style="list-style-type: none"> • Input packet count—Number of packets received from the MAC hardware that the filter processed. • Input packet rejects—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • Input DA rejects—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the router from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local router (which the router is rejecting). • Input SA rejects—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field must increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • Output packet count—Number of packets that the filter has given to the MAC hardware. • Output packet pad count—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • Output packet error count—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field must not increment. • CAM destination filters, CAM source filters—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields must be 0. 	extensive
PMA PHY	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • PHY Lock—Phase-locked loop • PHY Light—Loss of optical signal 	extensive

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
WIS section	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B1—Bit interleaved parity for SONET section overhead • SEF—Severely errored framing • LOL—Loss of light • LOF—Loss of frame • ES-S—Errored seconds (section) • SES-S—Severely errored seconds (section) • SEFS-S—Severely errored framing seconds (section) 	extensive
WIS line	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B2—Bit interleaved parity for SONET line overhead • REI-L—Remote error indication (near-end line) • RDI-L—Remote defect indication (near-end line) • AIS-L—Alarm indication signal (near-end line) • BERR-SF—Bit error rate fault (signal failure) • BERR-SD—Bit error rate defect (signal degradation) • ES-L—Errored seconds (near-end line) • SES-L—Severely errored seconds (near-end line) • UAS-L—Unavailable seconds (near-end line) • ES-LFE—Errored seconds (far-end line) • SES-LFE—Severely errored seconds (far-end line) • UAS-LFE—Unavailable seconds (far-end line) 	extensive

Table 67: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

Field Name	Field Description	Level of Output
WIS path	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B3—Bit interleaved parity for SONET section overhead • REI-P—Remote error indication • LOP-P—Loss of pointer (path) • AIS-P—Path alarm indication signal • RDI-P—Path remote defect indication • UNEQ-P—Path unequipped • PLM-P—Path payload (signal) label mismatch • ES-P—Errored seconds (near-end STS path) • SES-P—Severely errored seconds (near-end STS path) • UAS-P—Unavailable seconds (near-end STS path) • SES-PFE—Severely errored seconds (far-end STS path) • UAS-PFE—Unavailable seconds (far-end STS path) 	extensive

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Autonegotiation information	<p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> • Negotiation status: <ul style="list-style-type: none"> • Incomplete—Ethernet interface has the speed or link mode configured. • No autonegotiation—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation. • Complete—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner status—OK when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner—Information from the remote Ethernet device: <ul style="list-style-type: none"> • Link mode—Depending on the capability of the link partner, either Full-duplex or Half-duplex. • Flow control—Types of flow control supported by the link partner. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), Symmetric/Asymmetric (link partner supports PAUSE on receive and transmit or only PAUSE on transmit), and None (link partner does not support flow control). • Remote fault—Remote fault information from the link partner—Failure indicates a receive link error. OK indicates that the link partner is receiving. Negotiation error indicates a negotiation error. Offline indicates that the link partner is going offline. • Local resolution—Information from the local Ethernet device: <ul style="list-style-type: none"> • Flow control—Types of flow control supported by the local device. For Gigabit Ethernet interfaces, advertised capabilities are Symmetric/Asymmetric (local device supports PAUSE on receive and transmit or only PAUSE on receive) and None (local device does not support flow control). Depending on the result of the negotiation with the link partner, local resolution flow control type will display Symmetric (local device supports PAUSE on receive and transmit), Asymmetric (local device supports PAUSE on receive), and None (local device does not support flow control). • Remote fault—Remote fault information. Link OK (no error detected on receive), Offline (local interface is offline), and Link Failure (link error detected on receive). 	extensive
Received path trace, Transmitted path trace	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.</p>	extensive
Packet Forwarding Engine configuration	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> • Destination slot—FPC slot number. 	extensive

Table 67: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

Field Name	Field Description	Level of Output
CoS information	<p>Information about the CoS queue for the physical interface.</p> <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP interface index number for the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “ Common Output Fields Description ” on page 1168.	All levels

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
VLAN-Tag	<p>Rewrite profile applied to incoming or outgoing frames on the outer (Out) VLAN tag or for both the outer and inner (In) VLAN tags.</p> <ul style="list-style-type: none"> push—An outer VLAN tag is pushed in front of the existing VLAN tag. pop—The outer VLAN tag of the incoming frame is removed. swap—The outer VLAN tag of the incoming frame is overwritten with the user-specified VLAN tag information. push—An outer VLAN tag is pushed in front of the existing VLAN tag. push-push—Two VLAN tags are pushed in from the incoming frame. swap-push—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame. swap-swap—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user-specified VLAN tag value. pop-swap—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame. pop-pop—Both the outer and inner VLAN tags of the incoming frame are removed. 	brief detail extensive none
Demux	<p>IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following:</p> <ul style="list-style-type: none"> Source Family Inet Destination Family Inet 	detail extensive none
Encapsulation	Encapsulation on the logical interface.	All levels
ACI VLAN	<p>Information displayed for agent circuit identifier (ACI) interface set configured with the agent-circuit-id autoconfiguration stanza.</p> <p>Dynamic Profile—Name of the dynamic profile that defines the ACI interface set.</p> <p>If configured, the ACI interface set enables the underlying Ethernet interface to create dynamic VLAN subscriber interfaces based on ACI information.</p> <p>NOTE: The ACI VLAN field is replaced with the Line Identity field when an ALI interface set is configured with the line-identity autoconfiguration stanza.</p>	brief detail extensive none
Line Identity	<p>Information displayed for access-line-identifier (ALI) interface sets configured with the line-identity autoconfiguration stanza.</p> <ul style="list-style-type: none"> Dynamic Profile—Name of the dynamic profile that defines the ALI interface set. Trusted option used to create the ALI interface set: Circuit-id, Remote-id, or Accept-no-ids. More than one option can be configured. <p>If configured, the ALI interface set enables the underlying Ethernet interface to create dynamic VLAN subscriber interfaces based on ALI information.</p> <p>NOTE: The Line Identity field is replaced with the ACI VLAN field when an ACI interface set is configured with the agent-circuit-id autoconfiguration stanza.</p>	detail

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Protocol	Protocol family. Possible values are described in the “Protocol Field” section under “Common Output Fields Description” on page 1168 .	detail extensive none
MTU	Maximum transmission unit size on the logical interface.	detail extensive none
Neighbor Discovery Protocol (NDP) Queue Statistics	NDP statistics for protocol inet6 under logical interface statistics. <ul style="list-style-type: none"> • Max nh cache—Maximum interface neighbor discovery nexthop cache size. • New hold nh limit—Maximum number of new unresolved nexthops. • Curr nh cnt—Current number of resolved nexthops in the NDP queue. • Curr new hold cnt—Current number of unresolved nexthops in the NDP queue. • NH drop cnt—Number of NDP requests not serviced. 	All levels
Dynamic Profile	Name of the dynamic profile that was used to create this interface configured with a Point-to-Point Protocol over Ethernet (PPPoE) family.	detail extensive none
Service Name Table	Name of the service name table for the interface configured with a PPPoE family.	detail extensive none
Max Sessions	Maximum number of PPPoE logical interfaces that can be activated on the underlying interface.	detail extensive none
Duplicate Protection	State of PPPoE duplicate protection: On or Off . When duplicate protection is configured for the underlying interface, a dynamic PPPoE logical interface cannot be activated when an existing active logical interface is present for the same PPPoE client.	detail extensive none
Direct Connect	State of the configuration to ignore DSL Forum VSAs: On or Off . When configured, the router ignores any of these VSAs received from a directly connected CPE device on the interface.	detail extensive none
AC Name	Name of the access concentrator.	detail extensive none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	detail extensive none
Traffic statistics	Number and rate of bytes and packets received and transmitted on the specified interface set. <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • Input packets, Output packets—Number of packets received and transmitted on the interface set. 	detail extensive
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.	extensive
Local statistics	Number and rate of bytes and packets destined to the router.	extensive

Table 67: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Transit statistics	Number and rate of bytes and packets transiting the switch. NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the Output bytes and Output packets interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.	extensive
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route Table	Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	detail extensive none
Flags	Information about protocol family flags. Possible values are described in the "Family Flags" section under "Common Output Fields Description" on page 1168 .	detail extensive
Donor interface	(Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.	detail extensive none
Preferred source address	(Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.	detail extensive none
Input Filters	Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parentheses next to all interfaces.	detail extensive
Output Filters	Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parentheses next to all interfaces.	detail extensive
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	detail extensive none
Addresses, Flags	Information about the address flags. Possible values are described in the "Addresses Flags" section under "Common Output Fields Description" on page 1168 .	detail extensive none
<i>protocol-family</i>	Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed.	brief
Flags	Information about the address flag. Possible values are described in the "Addresses Flags" section under "Common Output Fields Description" on page 1168 .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none

Table 67: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

Field Name	Field Description	Level of Output
Broadcast	Broadcast address of the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

The following table describes the output fields for the **show interfaces** (10-Gigabit Ethernet) command.

Field Name	Field Description	Level of Output
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1168.	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface.	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Loopback status: Enabled or Disabled . If loopback is enabled, type of loopback: Local or Remote .	All levels
Source filtering	Source filtering status: Enabled or Disabled .	All levels
LAN-PHY mode	10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.	All levels
WAN-PHY mode	10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.	All levels
Unidirectional	Unidirectional link mode status for 10-Gigabit Ethernet interface: Enabled or Disabled for parent interface; Rx-only or Tx-only for child interfaces.	All levels
Flow control	Flow control status: Enabled or Disabled .	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: Enabled or Disabled .	All levels

Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none">• Online—Autonegotiation is manually configured as online.• Offline—Autonegotiation is manually configured as offline.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “ Common Output Fields Description ” on page 1168.	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “ Common Output Fields Description ” on page 1168.	All levels
Link flags	Information about the link. Possible values are described in the “Links Flags” section under “ Common Output Fields Description ” on page 1168.	All levels
Wavelength	(10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).	All levels
Frequency	(10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).	All levels
CoS queues	Number of CoS queues configured.	detail extensive none
Schedulers	(Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces only) Number of CoS schedulers configured.	extensive
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
Current address	Configured MAC address.	detail extensive none
Hardware address	Hardware MAC address.	detail extensive none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Input Rate	Input rate in bits per second (bps) and packets per second (pps). The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None specified
Output Rate	Output rate in bps and pps. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Egress account overhead	Layer 2 overhead in bytes that is accounted in the interface statistics for egress traffic.	detail extensive
Ingress account overhead	Layer 2 overhead in bytes that is accounted in the interface statistics for ingress traffic.	detail extensive

Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • Output bytes—Number of bytes transmitted on the interface. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Input errors	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the ignore-l3-incompletes statement. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • FIFO errors—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • Resource errors—Sum of transmit drops. 	extensive

Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive
Egress queues	<p>Total number of egress queues supported on the specified interface.</p> <p>NOTE: In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the show interfaces command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs</p>	detail extensive
Queue counters (Egress)	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive
Ingress queues	<p>Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.</p>	extensive

Queue counters (Ingress)	CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces. <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	extensive
Active alarms and Active defects	Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the routing device configuration, an alarm can ring the red or yellow alarm bell on the routing device, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value None or Link . <ul style="list-style-type: none"> • None—There are no active defects or alarms. • Link—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning. 	detail extensive none
OTN alarms	Active OTN alarms identified on the interface.	detail extensive
OTN defects	OTN defects received on the interface.	detail extensive
OTN FEC Mode	The FECmode configured on the interface. <ul style="list-style-type: none"> • efec—Enhanced forward error correction (EFEC) is configured to detect and correct bit errors. • gfec—G.709 Forward error correction (GFEC) mode is configured to detect and correct bit errors. • none—FEC mode is not configured. 	detail extensive
OTN Rate	OTN mode. <ul style="list-style-type: none"> • fixed-stuff-bytes—Fixed stuff bytes 11.0957 Gbps. • no-fixed-stuff-bytes—No fixed stuff bytes 11.0491 Gbps. • pass-through—Enable OTN passthrough mode. • no-pass-through—Do not enable OTN passthrough mode. 	detail extensive
OTN Line Loopback	Status of the line loopback, if configured for the DWDM OTN PIC. Its value can be: enabled or disabled .	detail extensive
OTN FEC statistics	The forward error correction (FEC) counters for the DWDM OTN PIC. <ul style="list-style-type: none"> • Corrected Errors—The count of corrected errors in the last second. • Corrected Error Ratio—The corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits. 	detail extensive
OTN FEC alarms	OTN FEC excessive or degraded error alarms triggered on the interface. <ul style="list-style-type: none"> • FEC Degrade—OTU FEC Degrade defect. • FEC Excessive—OTU FEC Excessive Error defect. 	detail extensive

OTN OC	OTN OC defects triggered on the interface. <ul style="list-style-type: none">• LOS—OC Loss of Signal defect.• LOF—OC Loss of Frame defect.• LOM—OC Loss of Multiframe defect.• Wavelength Lock—OC Wavelength Lock defect.	detail extensive
OTN OTU	OTN OTU defects detected on the interface <ul style="list-style-type: none">• AIS—OTN AIS alarm.• BDI—OTN OTU BDI alarm.• IAE—OTN OTU IAE alarm.• TTIM—OTN OTU TTIM alarm.• SF—OTN ODU bit error rate fault alarm.• SD—OTN ODU bit error rate defect alarm.• TCA-ES—OTN ODU ES threshold alarm.• TCA-SES—OTN ODU SES threshold alarm.• TCA-UAS—OTN ODU UAS threshold alarm.• TCA-BBE—OTN ODU BBE threshold alarm.• BIP—OTN ODU BIP threshold alarm.• BBE—OTN OTU BBE threshold alarm.• ES—OTN OTU ES threshold alarm.• SES—OTN OTU SES threshold alarm.• UAS—OTN OTU UAS threshold alarm.	detail extensive
Received DAPI	Destination Access Port Interface (DAPI) from which the packets were received.	detail extensive
Received SAPI	Source Access Port Interface (SAPI) from which the packets were received.	detail extensive
Transmitted DAPI	Destination Access Port Interface (DAPI) to which the packets were transmitted.	detail extensive
Transmitted SAPI	Source Access Port Interface (SAPI) to which the packets were transmitted.	detail extensive
PCS statistics	(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device. <ul style="list-style-type: none">• Bit errors—The number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode.• Errored blocks—The number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode.	detail extensive

MAC statistics	<p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> • Total octets and total packets—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. • Unicast packets, Broadcast packets, and Multicast packets—Number of unicast, broadcast, and multicast packets. • CRC/Align errors—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • FIFO error—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning. • MAC control frames—Number of MAC control frames. • MAC pause frames—Number of MAC control frames with pause operational code. • Oversized frames—Number of frames that exceed 1518 octets. • Jabber frames—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • Fragment frames—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • VLAN tagged frames—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. • Code violations—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error." 	extensive
OTN Received Overhead Bytes	APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08	extensive
OTN Transmitted Overhead Bytes	APS/PCC0: 0x00, APS/PCC1: 0x00, APS/PCC2: 0x00, APS/PCC3: 0x00 Payload Type: 0x08	extensive

Filter statistics	<p>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> • Input packet count—Number of packets received from the MAC hardware that the filter processed. • Input packet rejects—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • Input DA rejects—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting). • Input SA rejects—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • Output packet count—Number of packets that the filter has given to the MAC hardware. • Output packet pad count—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • Output packet error count—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment. • CAM destination filters, CAM source filters—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0. 	extensive
PMA PHY	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. 	extensive

WIS section	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B1—Bit interleaved parity for SONET section overhead • SEF—Severely errored framing • LOL—Loss of light • LOF—Loss of frame • ES-S—Errored seconds (section) • SES-S—Severely errored seconds (section) • SEFS-S—Severely errored framing seconds (section) 	extensive
WIS line	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B2—Bit interleaved parity for SONET line overhead • REI-L—Remote error indication (near-end line) • RDI-L—Remote defect indication (near-end line) • AIS-L—Alarm indication signal (near-end line) • BERR-SF—Bit error rate fault (signal failure) • BERR-SD—Bit error rate defect (signal degradation) • ES-L—Errored seconds (near-end line) • SES-L—Severely errored seconds (near-end line) • UAS-L—Unavailable seconds (near-end line) • ES-LFE—Errored seconds (far-end line) • SES-LFE—Severely errored seconds (far-end line) • UAS-LFE—Unavailable seconds (far-end line) 	extensive

WIS path	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. Any state other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B3—Bit interleaved parity for SONET section overhead • REI-P—Remote error indication • LOP-P—Loss of pointer (path) • AIS-P—Path alarm indication signal • RDI-P—Path remote defect indication • UNEQ-P—Path unequipped • PLM-P—Path payload label mismatch • ES-P—Errored seconds (near-end STS path) • SES-P—Severely errored seconds (near-end STS path) • UAS-P—Unavailable seconds (near-end STS path) • SES-PFE—Severely errored seconds (far-end STS path) • UAS-PFE—Unavailable seconds (far-end STS path) 	extensive
Autonegotiation information	<p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> • Negotiation status: <ul style="list-style-type: none"> • Incomplete—Ethernet interface has the speed or link mode configured. • No autonegotiation—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation. • Complete—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner status—OK when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner: <ul style="list-style-type: none"> • Link mode—Depending on the capability of the attached Ethernet device, either Full-duplex or Half-duplex. • Flow control—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is None. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), and Symmetric/Asymmetric (link partner supports both PAUSE on receive and transmit or only PAUSE receive). • Remote fault—Remote fault information from the link partner—Failure indicates a receive link error. OK indicates that the link partner is receiving. Negotiation error indicates a negotiation error. Offline indicates that the link partner is going offline. • Local resolution—Information from the link partner: <ul style="list-style-type: none"> • Flow control—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), and Symmetric/Asymmetric (link partner supports both PAUSE on receive and transmit or only PAUSE receive). • Remote fault—Remote fault information. Link OK (no error detected on receive), Offline (local interface is offline), and Link Failure (link error detected on receive). 	extensive

Received path trace, Transmitted path trace	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the routing device at the other end of the fiber. The transmitted path trace value is the message that this routing device transmits.	extensive
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: <ul style="list-style-type: none"> • Destination slot—FPC slot number. 	extensive
CoS information	Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP interface index number for the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “Common Output Fields Description” on page 1168 .	All levels

VLAN-Tag	<p>Rewrite profile applied to incoming or outgoing frames on the outer (Out) VLAN tag or for both the outer and inner (In) VLAN tags.</p> <ul style="list-style-type: none"> • push—An outer VLAN tag is pushed in front of the existing VLAN tag. • pop—The outer VLAN tag of the incoming frame is removed. • swap—The outer VLAN tag of the incoming frame is overwritten with the user specified VLAN tag information. • push—An outer VLAN tag is pushed in front of the existing VLAN tag. • push-push—Two VLAN tags are pushed in from the incoming frame. • swap-push—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame. • swap-swap—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user specified VLAN tag value. • pop-swap—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame. • pop-pop—Both the outer and inner VLAN tags of the incoming frame are removed. 	brief detail extensive none
Demux:	<p>IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following:</p> <ul style="list-style-type: none"> • Source Family Inet • Destination Family Inet 	detail extensive none
Encapsulation	Encapsulation on the logical interface.	All levels
Protocol	Protocol family. Possible values are described in the “Protocol Field” section under “Common Output Fields Description” on page 1168 .	detail extensive none
MTU	Maximum transmission unit size on the logical interface.	detail extensive none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	detail extensive none
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the specified interface set.</p> <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • Input packets, Output packets—Number of packets received and transmitted on the interface set. 	detail extensive
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.	extensive
Local statistics	Number and rate of bytes and packets destined to the routing device.	extensive

Transit statistics	Number and rate of bytes and packets transiting the switch. NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the Output bytes and Output packets interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.	extensive
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route Table	Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	detail extensive none
Flags	Information about protocol family flags. Possible values are described in the “Family Flags” section under “ Common Output Fields Description ” on page 1168.	detail extensive
Donor interface	(Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.	detail extensive none
Preferred source address	(Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.	detail extensive none
Input Filters	Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	detail extensive
Output Filters	Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	detail extensive
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	detail extensive none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under “ Common Output Fields Description ” on page 1168.	detail extensive none
<i>protocol-family</i>	Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed.	brief
Flags	Information about address flag (possible values are described in the “Addresses Flags” section under “ Common Output Fields Description ” on page 1168.	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address of the logical interlace.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

For Gigabit Ethernet IQ PICs, traffic and MAC statistics output varies. The following table describes the traffic and MAC statistics for two sample interfaces, each of which is sending traffic in packets of 500 bytes (including 478 bytes for the Layer 3 packet, 18 bytes for the Layer 2 VLAN traffic header, and 4 bytes for cyclic redundancy check [CRC] information). The **ge-0/3/0** interface is the inbound physical interface, and the **ge-0/0/0** interface is the outbound physical interface. On both interfaces, traffic is carried on logical unit **.50** (VLAN 50).

Table 68: Gigabit and 10 Gigabit Ethernet IQ PIC Traffic and MAC Statistics by Interface Type

Interface Type	Sample Command	Byte and Octet Counts Include	Comments
Inbound physical interface	show interfaces ge-0/3/0 extensive	Traffic statistics: Input bytes: 496 bytes per packet, representing the Layer 2 packet MAC statistics: Received octets: 500 bytes per packet, representing the Layer 2 packet + 4 bytes	The additional 4 bytes are for the CRC.
Inbound logical interface	show interfaces ge-0/3/0.50 extensive	Traffic statistics: Input bytes: 478 bytes per packet, representing the Layer 3 packet	
Outbound physical interface	show interfaces ge-0/0/0 extensive	Traffic statistics: Input bytes: 490 bytes per packet, representing the Layer 3 packet + 12 bytes MAC statistics: Received octets: 478 bytes per packet, representing the Layer 3 packet	For input bytes, the additional 12 bytes include 6 bytes for the destination MAC address plus 4 bytes for VLAN plus 2 bytes for the Ethernet type.
Outbound logical interface	show interfaces ge-0/0/0.50 extensive	Traffic statistics: Input bytes: 478 bytes per packet, representing the Layer 3 packet	

[Table 58 on page 1211](#) lists the output fields for the **show interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 69: show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface.	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Link-level type	Encapsulation being used on the physical interface.	All levels
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
MTU	Maximum transmission unit size on the physical interface.	All levels
Link mode	Link mode: Full-duplex or Half-duplex.	
Speed	Speed at which the interface is running.	All levels
BPDU error	Bridge protocol data unit (BPDU) error: Detected or None	
Loopback	Loopback status: Enabled or Disabled . If loopback is enabled, type of loopback: Local or Remote .	All levels
Source filtering	Source filtering status: Enabled or Disabled .	All levels
Flow control	Flow control status: Enabled or Disabled .	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: Enabled or Disabled .	All levels
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> • Online—Autonegotiation is manually configured as online. • Offline—Autonegotiation is manually configured as offline. 	All levels
Device flags	Information about the physical device.	All levels
Interface flags	Information about the interface.	All levels
Link flags	Information about the physical link.	All levels
CoS queues	Number of CoS queues configured.	detail extensive none
Current address	Configured MAC address.	detail extensive none

Table 69: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None
Output Rate	Output rate in bps and pps.	None
Active alarms and Active defects	<p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. These fields can contain the value None or Link.</p> <ul style="list-style-type: none"> • None—There are no active defects or alarms. • Link—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning. 	detail extensive none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive

Table 69: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Input errors	<p>Input errors on the interface.</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <code>ignore-l3-incompletes</code>. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • FIFO errors—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • Resource errors—Sum of transmit drops. 	extensive
Output errors	<p>Output errors on the interface.</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation; therefore, for Gigabit Ethernet PICs, this number must always remain 0. If it is nonzero, there is a software bug. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field must never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the interfaces. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive

Table 69: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Ingress queues	Total number of ingress queues supported on the specified interface.	extensive
Queue counters and queue number	CoS queue number and its associated user-configured forwarding class name. <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive
MAC statistics	<p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> • Total octets and total packets—Total number of octets and packets. • Unicast packets, Broadcast packets, and Multicast packets—Number of unicast, broadcast, and multicast packets. • CRC/Align errors—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • FIFO error—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning. • MAC control frames—Number of MAC control frames. • MAC pause frames—Number of MAC control frames with pause operational code. • Oversized frames—There are two possible conditions regarding the number of oversized frames: <ul style="list-style-type: none"> • Packet length exceeds 1518 octets, or • Packet length exceeds MRU • Jabber frames—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • Fragment frames—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • VLAN tagged frames—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. • Code violations—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error." 	extensive

Table 69: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Filter statistics	<p>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> • Input packet count—Number of packets received from the MAC hardware that the filter processed. • Input packet rejects—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • Input DA rejects—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local device (which the router is rejecting). • Input SA rejects—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • Output packet count—Number of packets that the filter has given to the MAC hardware. • Output packet pad count—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • Output packet error count—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment. • CAM destination filters, CAM source filters—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields must be 0. 	extensive
Autonegotiation information	<p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> • Negotiation status: <ul style="list-style-type: none"> • Incomplete—Ethernet interface has the speed or link mode configured. • No autonegotiation—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation. • Complete—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. 	extensive
Packet Forwarding Engine configuration	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> • Destination slot—FPC slot number. 	extensive

Table 69: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CoS information	Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Interface transmit statistics	Status of the interface-transmit-statistics configuration: Enabled or Disabled.	detail extensive
Queue counters (Egress)	CoS queue number and its associated user-configured forwarding class name. <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP interface index number for the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface.	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Traffic statistics	Number and rate of bytes and packets received and transmitted on the specified interface set. <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level. • Input packets, Output packets—Number of packets received and transmitted on the interface set. 	detail extensive

Table 69: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Local statistics	Number and rate of bytes and packets destined to the device.	extensive
Transit statistics	<p>Number and rate of bytes and packets transiting the switch.</p> <p>NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the Output bytes and Output packets interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.</p>	extensive
Security	Security zones that interface belongs to.	extensive

```

NOTE: For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics displayed in the **show interfaces** command output might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the interface counters. For detailed information, see the description of the logical interface **Transit statistics** fields in [Table 56 on page 1182](#).

Output Fields [Table 70 on page 1489](#) lists the output fields for the **show interfaces** (management) command on the M Series routers, T Series routers, TX Matrix Plus routers, and PTX Series. Output fields are listed in the approximate order in which they appear.

Table 70: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1168 .	All levels
Interface index	Physical interface index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Type	Type of interface.	All levels

Table 70: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface (continued)

Field Name	Field Description	Level of Output
Link-level type	Encapsulation type used on the physical interface.	All levels
MTU	Maximum transmission unit (MTU)—Size of the largest packet to be transmitted.	All levels
Clocking	Reference clock source of the interface.	All levels
Speed	Network speed on the interface.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Link type	Data transmission type.	detail extensive none
Link flags	Information about the link. Possible values are described in the “Link Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive
Physical info	Information about the physical interface.	detail extensive
Hold-times	Current interface hold-time up and hold-time down. Value is in milliseconds.	detail extensive
Current address	Configured MAC address.	detail extensive none
Hardware address	Media access control (MAC) address of the interface.	detail extensive none
Alternate link address	Backup link address.	detail extensive
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Input packets	Number of packets received on the physical interface.	None specified
Output packets	Number of packets transmitted on the physical interface.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Traffic statistics	Number and rate of bytes and packets received and transmitted on the logical and physical interface. <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface. • Input packets, Output packets—Number of packets received and transmitted on the interface. 	detail extensive

Table 70: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface (continued)

Field Name	Field Description	Level of Output
Input errors	<ul style="list-style-type: none"> • Errors—Input errors on the interface. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Frames received smaller than the runt threshold. • Giants—Frames received larger than the giant threshold. • Policed Discards—Frames that the incoming packet match code discarded because they were not recognized or were not of interest. Usually, this field reports protocols that Junos does not support. • Resource errors—Sum of transmit drops. 	extensive
Output errors	<ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly, possibly once every 10 seconds, the cable, the remote system, or the interface is malfunctioning. • Errors—Sum of outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet dropped by the ASIC RED mechanism. • Resource errors—Sum of transmit drops. 	extensive
Logical Interface		
Logical interface	Name of the logical interface	All levels
Index	Logical interface index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	Logical interface SNMP interface index number.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface; values are described in the “Device Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Encapsulation	Encapsulation on the logical interface.	detail extensive none
inet	IP address of the logical interface.	brief
Protocol	Protocol family configured on the logical interface (such as iso or inet6).	detail extensive none
MTU	MTU size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

Table 70: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface (continued)

Field Name	Field Description	Level of Output
Route table	Route table in which this address exists. For example, Route table:0 refers to inet.0.	detail extensive
Flags	Information about the protocol family flags. Possible values are described in the “Family Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive none
Addresses, Flags	Information about address flags. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

show interfaces (PPPoE)

Syntax `show interfaces pp0.logical`
`<brief | detail | extensive | terse>`
`<descriptions>`
`<media>`
`<snmp-index snmp-index>`
`<statistics>`

Release Information Command introduced before Junos OS Release 7.4.

Description (M120 routers, M320 routers, and MX Series routers only). Display status information about the PPPoE interface.

Options `pp0.logical`—Display standard status information about the PPPoE interface.

`brief | detail | extensive | terse`—(Optional) Display the specified level of output.

`descriptions`—(Optional) Display interface description strings.

`media`—(Optional) Display media-specific information about PPPoE interfaces.

`snmp-index snmp-index`—(Optional) Display information for the specified SNMP index of the interface.

`statistics`—(Optional) Display PPPoE interface statistics.

Required Privilege Level view

List of Sample Output [show interfaces \(PPPoE\) on page 1511](#)
[show interfaces \(PPPoE over Aggregated Ethernet\) on page 1511](#)
[show interfaces brief \(PPPoE\) on page 1512](#)
[show interfaces detail \(PPPoE\) on page 1512](#)
[show interfaces extensive \(PPPoE on M120 and M320 Routers\) on page 1513](#)

Output Fields [Table 71 on page 1505](#) lists the output fields for the **show interfaces (PPPoE)** command. Output fields are listed in the approximate order in which they appear.

Table 71: show interfaces (PPPoE) Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1168 .	All levels

Table 71: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
Interface index	Physical interface index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Type	Physical interface type (PPPoE).	All levels
Link-level type	Encapsulation on the physical interface (PPPoE).	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	Reference clock source. It can be Internal or External .	All levels
Speed	Speed at which the interface is running.	All levels
Device flags	Information about the physical device. Possible values are described in the "Device Flags" section under "Common Output Fields Description" on page 1168 .	All levels
Interface flags	Information about the interface. Possible values are described in the "Interface Flags" section under "Common Output Fields Description" on page 1168 .	All levels
Link type	Physical interface link type: full duplex or half duplex .	All levels
Link flags	Information about the interface. Possible values are described in the "Link Flags" section under "Common Output Fields Description" on page 1168 .	All levels
Input rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output rate	Output rate in bps and pps.	None specified
Physical Info	Physical interface information.	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
Current address	Configured MAC address.	detail extensive
Hardware address	MAC address of the hardware.	detail extensive
Alternate link address	Backup address of the link.	detail extensive
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive

Table 71: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
IPv6 transit statistics	<p>Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled.</p> <p>NOTE: These fields include dropped traffic and exception traffic, as those fields are not separately defined.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Input errors	<p>Input errors on the interface:</p> <ul style="list-style-type: none"> • Errors—Sum of incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Giants—Number of frames received that are larger than the giant threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • Resource errors—Sum of B chip Tx drops and IXP Tx net transmit drops. 	extensive
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions —Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), then the cable, the far-end system, or the PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of B chip Tx drops and IXP Tx net transmit drops. 	extensive

Logical Interface

Table 71: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number (which reflects its initialization sequence).	detail extensive none
SNMP ifIndex	Logical interface SNMP interface index number.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Encapsulation	Type of encapsulation configured on the logical interface.	All levels
PPP parameters	PPP status: <ul style="list-style-type: none"> • LCP restart timer—Length of time (in milliseconds) between successive Link Control Protocol (LCP) configuration requests. • NCP restart timer—Length of time (in milliseconds) between successive Network Control Protocol (NCP) configuration requests. 	detail
PPPoE	PPPoE status: <ul style="list-style-type: none"> • State—State of the logical interface (up or down). • Session ID—PPPoE session ID. • Service name—Type of service required. Can be used to indicate an Internet service provider (ISP) name or a class or quality of service. • Configured AC name—Configured access concentrator name. • Auto-reconnect timeout—Time after which to try to reconnect after a PPPoE session is terminated, in seconds. • Idle Timeout—Length of time (in seconds) that a connection can be idle before disconnecting. • Underlying interface—Interface on which PPPoE is running. 	All levels
Link	Name of the physical interfaces for member links in an aggregated Ethernet bundle for a PPPoE over aggregated Ethernet configuration. PPPoE traffic goes out on these interfaces.	All levels
Traffic statistics	Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize.	detail extensive

Table 71: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
IPv6 transit statistics	<p>Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.</p> <p>NOTE: The packet and byte counts in these fields include traffic that is dropped and does not leave the router.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Local statistics	<p>Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize.</p>	detail extensive
Transit statistics	<p>Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize.</p> <p>NOTE: The packet and byte counts in these fields include traffic that is dropped and does not leave the router.</p>	detail extensive
Keepalive settings	<p>(PPP and HDLC) Configured settings for keepalives.</p> <ul style="list-style-type: none"> • interval seconds—The time in seconds between successive keepalive requests. The range is 10 seconds through 32,767 seconds, with a default of 10 seconds. • down-count number—The number of keepalive packets a destination must fail to receive before the network takes a link down. The range is 1 through 255, with a default of 3. • up-count number—The number of keepalive packets a destination must receive to change a link's status from down to up. The range is 1 through 255, with a default of 1. 	detail extensive
Keepalive statistics	<p>(PPP and HDLC) Information about keepalive packets.</p> <ul style="list-style-type: none"> • Input—Number of keepalive packets received by PPP. <ul style="list-style-type: none"> • (last seen 00:00:00 ago)—Time the last keepalive packet was received, in the format <i>hh:mm:ss</i>. • Output—Number of keepalive packets sent by PPP and how long ago the last keepalive packets were sent and received. <ul style="list-style-type: none"> • (last seen 00:00:00 ago)—Time the last keepalive packet was sent, in the format <i>hh:mm:ss</i>. <p>(MX Series routers with MPCs/MICs) When an MX Series router with MPCs/MICs is using PPP fast keepalive for a PPP link, the display does not include the number of keepalive packets received or sent, or the amount of time since the router received or sent the last keepalive packet.</p>	detail extensive
Input packets	Number of packets received on the logical interface.	None specified
Output packets	Number of packets transmitted on the logical interface.	None specified

Table 71: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
LCP state	(PPP) Link Control Protocol state. <ul style="list-style-type: none"> • Conf-ack-received—Acknowledgement was received. • Conf-ack-sent—Acknowledgement was sent. • Conf-req-sent—Request was sent. • Down—LCP negotiation is incomplete (not yet completed or has failed). • Not-configured—LCP is not configured on the interface. • Opened—LCP negotiation is successful. 	none detail extensive
NCP state	(PPP) Network Control Protocol state. <ul style="list-style-type: none"> • Conf-ack-received—Acknowledgement was received. • Conf-ack-sent—Acknowledgement was sent. • Conf-req-sent—Request was sent. • Down—NCP negotiation is incomplete (not yet completed or has failed). • Not-configured—NCP is not configured on the interface. • Opened—NCP negotiation is successful. 	detail extensive none
CHAP state	(PPP) Displays the state of the Challenge Handshake Authentication Protocol (CHAP) during its transaction. <ul style="list-style-type: none"> • Chap-Chal-received—Challenge was received but response not yet sent. • Chap-Chal-sent—Challenge was sent. • Chap-Resp-received—Response was received for the challenge sent, but CHAP has not yet moved into the Success state. (Most likely with RADIUS authentication.) • Chap-Resp-sent—Response was sent for the challenge received. • Closed—CHAP authentication is incomplete. • Failure—CHAP authentication failed. • Not-configured—CHAP is not configured on the interface. • Success—CHAP authentication was successful. 	none detail extensive
Protocol	Protocol family configured on the logical interface.	detail extensive none
<i>protocol-family</i>	Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed.	brief
MTU	MTU size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route table	Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0 .	detail extensive none
Flags	Information about the protocol family flags. Possible values are described in the “Family Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive none

Table 71: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
Addresses, Flags	Information about the addresses configured for the protocol family. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 1168.	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address.	detail extensive none

Sample Output

show interfaces (PPPoE)

```

user@host> show interfaces pp0
Physical interface: pp0, Enabled, Physical link is Up

show interfaces (PTX Series Packet Transport Routers)

Syntax	<pre>show interfaces et-<i>fpc/pic/port</i> <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre>
Release Information	<p>Command introduced in Junos OS Release 8.0.</p> <p>Command introduced in Junos OS Release 12.1 for PTX Series Packet Transport Routers.</p>
Description	(PTX Series Packet Transport Routers only) Display status information about the specified Ethernet interface.
Options	<p>et-<i>fpc/pic/port</i>—Display standard information about the specified Ethernet interface.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media —(Optional) Display media-specific information about network interfaces.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p>
Required Privilege Level	view
List of Sample Output	<p>show interfaces brief (PTX5000 Packet Transport Router) on page 1525</p> <p>show interfaces extensive (PTX5000 Packet Transport Router) on page 1525</p> <p>show interfaces terse (PTX5000 Packet Transport Router) on page 1526</p>
Output Fields	See Table 72 on page 1516 for the output fields for the show interfaces (PTX Series Packet Transport Routers) command.

Table 72: show interfaces PTX Series Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1168 .	All levels
Interface index	Index number of the physical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface.	All levels
Speed	Speed at which the interface is running.	All levels
BPDU Error	Bridge protocol data unit (BPDU) errors (if any).	All levels
MAC-Rewrite	MAC Rewrite errors (if any).	All levels
Loopback	Loopback status: Enabled or Disabled . If loopback is enabled, type of loopback: Local or Remote .	All levels
Source filtering	Source filtering status: Enabled or Disabled .	All levels
Flow control	Flow control status: Enabled or Disabled .	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Link flags	Information about the link. Possible values are described in the “Links Flags” section under “Common Output Fields Description” on page 1168 .	All levels
CoS queues	Number of CoS queues configured.	detail extensive none
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
Current address	Configured MAC address.	detail extensive none
Hardware address	Hardware MAC address.	detail extensive none

Table 72: show interfaces PTX Series Output Fields (continued)

Field Name	Field Description	Level of Output
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. <p>NOTE: Input bytes and output bytes are counted as Layer 3 packet length.</p>	detail extensive
Input errors	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the ignore-l3-incompletes statement. <p>NOTE: The L3 incompletes field is <i>not</i> supported on PTX Series Packet Transport Routers.</p> <ul style="list-style-type: none"> • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • FIFO errors—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • Resource errors—Sum of transmit drops. 	extensive

Table 72: show interfaces PTX Series Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive
Egress queues	Total number of egress queues supported on the specified interface.	detail extensive
Queue counters (Egress)	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive
Ingress queues	Total number of ingress queues supported on the specified interface.	extensive
Queue counters (Ingress)	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	extensive

Table 72: show interfaces PTX Series Output Fields (continued)

Field Name	Field Description	Level of Output
Active alarms and Active defects	<p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value None or Link.</p> <ul style="list-style-type: none"> • None—There are no active defects or alarms. • Link—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning. • LOCAL-FAULT—Link fault signaling operates between the remote PHY RS (Reconciliation sub-layer) and the local RS. A Local Fault is used to signal a detected fault between the remote RS and the local RS to the local Ethernet interface. • REMOTE-FAULT—When the Local Fault status reaches an RS, the RS stops sending MAC data and continuously generates the Remote Fault status on the transmit data path . 	detail extensive none
MAC statistics	<p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> • Total octets and total packets—Total number of octets and packets. • Unicast packets, Broadcast packets, and Multicast packets—Number of unicast, broadcast, and multicast packets. • CRC/Align errors—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error). • FIFO error—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning. • MAC control frames—Number of MAC control frames. • MAC pause frames—Number of MAC control frames with pause operational code. • Oversized frames—Number of frames that exceed 1518 octets. • Jabber frames—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms. • Fragment frames—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted. • VLAN tagged frames—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. • Code violations—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error." 	extensive

Table 72: show interfaces PTX Series Output Fields (continued)

Field Name	Field Description	Level of Output
Filter statistics	<p>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> • Input packet count—Number of packets received from the MAC hardware that the filter processed. • Input packet rejects—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address. • Input DA rejects—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the router from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local router (which the router is rejecting). • Input SA rejects—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect. • Output packet count—Number of packets that the filter has given to the MAC hardware. • Output packet pad count—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured. • Output packet error count—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment. • CAM destination filters, CAM source filters—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0. 	extensive

Table 72: show interfaces PTX Series Output Fields (continued)

Field Name	Field Description	Level of Output
Autonegotiation information	<p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> • Negotiation status: <ul style="list-style-type: none"> • Incomplete—Ethernet interface has the speed or link mode configured. • No autonegotiation—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation. • Complete—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner status—OK when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful. • Link partner: <ul style="list-style-type: none"> • Link mode—Depending on the capability of the attached Ethernet device, either Full-duplex or Half-duplex. • Flow control—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is None. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), and Symmetric/Asymmetric (link partner supports both PAUSE on receive and transmit or only PAUSE receive). • Remote fault—Remote fault information from the link partner—Failure indicates a receive link error. OK indicates that the link partner is receiving. Negotiation error indicates a negotiation error. Offline indicates that the link partner is going offline. • Local resolution—Information from the link partner: <ul style="list-style-type: none"> • Flow control—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are Symmetric (link partner supports PAUSE on receive and transmit), Asymmetric (link partner supports PAUSE on transmit), and Symmetric/Asymmetric (link partner supports both PAUSE on receive and transmit or only PAUSE receive). • Remote fault—Remote fault information. Link OK (no error detected on receive), Offline (local interface is offline), and Link Failure (link error detected on receive). 	extensive
Packet Forwarding Engine configuration	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> • Destination slot—FPC slot number. 	extensive

Table 72: show interfaces PTX Series Output Fields (continued)

Field Name	Field Description	Level of Output
CoS information	<p>Information about the CoS queue for the physical interface.</p> <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP interface index number for the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “Common Output Fields Description” on page 1168 .	All levels

Table 72: show interfaces PTX Series Output Fields (continued)

Field Name	Field Description	Level of Output
VLAN-Tag	<p>Rewrite profile applied to incoming or outgoing frames on the outer (Out) VLAN tag or for both the outer and inner (In) VLAN tags.</p> <ul style="list-style-type: none"> • push—An outer VLAN tag is pushed in front of the existing VLAN tag. • pop—The outer VLAN tag of the incoming frame is removed. • swap—The outer VLAN tag of the incoming frame is overwritten with the user-specified VLAN tag information. • push—An outer VLAN tag is pushed in front of the existing VLAN tag. • push-push—Two VLAN tags are pushed in from the incoming frame. • swap-push—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame. • swap-swap—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user-specified VLAN tag value. • pop-swap—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame. • pop-pop—Both the outer and inner VLAN tags of the incoming frame are removed. 	brief detail extensive none
Demux	<p>IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following:</p> <ul style="list-style-type: none"> • Source Family Inet • Destination Family Inet 	detail extensive none
Encapsulation	Encapsulation on the logical interface.	All levels
Protocol	Protocol family. Possible values are described in the “Protocol Field” section under “ Common Output Fields Description ” on page 1168.	detail extensive none
MTU	Maximum transmission unit size on the logical interface.	detail extensive none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	detail extensive none
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the specified interface set.</p> <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface set • Input packets, Output packets—Number of packets received and transmitted on the interface set. <p>NOTE: Input bytes and output bytes are counted as Layer 3 packet length.</p>	detail extensive
IPv6 transit statistics	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.	extensive
Local statistics	Number and rate of bytes and packets destined to the router.	extensive

Table 72: show interfaces PTX Series Output Fields (continued)

Field Name	Field Description	Level of Output
Transit statistics	Number and rate of bytes and packets transiting the switch.	extensive
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route Table	Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	detail extensive none
Flags	Information about protocol family flags. Possible values are described in the "Family Flags" section under "Common Output Fields Description" on page 1168 .	detail extensive
Donor interface	(Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.	detail extensive none
Preferred source address	(Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.	detail extensive none
Input Filters	Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parentheses next to all interfaces.	detail extensive
Output Filters	Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parentheses next to all interfaces.	detail extensive
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	detail extensive none
Addresses, Flags	Information about the address flags. Possible values are described in the "Addresses Flags" section under "Common Output Fields Description" on page 1168 .	detail extensive none
<i>protocol-family</i>	Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed.	brief
Flags	Information about flags (possible values are described in the "Addresses Flags" section under "Common Output Fields Description" on page 1168 .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address of the logical interlace.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

show interfaces (SONET/SDH)

Syntax	<pre>show interfaces so-<i>fpc/pic/port</i> <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre>
Release Information	Command introduced before Junos OS Release 7.4.
Description	(M Series and T Series routers only) Display status information about the specified SONET/SDH interface.
Options	<p>so-<i>fpc/pic/port</i>—Display standard information about the specified SONET/SDH interface.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • SONET/SDH Interfaces Overview
List of Sample Output	<p>show interfaces (SDH Mode, PPP) on page 1543</p> <p>show interfaces brief (SDH Mode, PPP) on page 1544</p> <p>show interfaces detail (SDH Mode, PPP) on page 1544</p> <p>show interfaces extensive (SDH Mode, PPP) on page 1545</p> <p>show interfaces brief (SONET Mode, Frame Relay) on page 1547</p> <p>show interfaces (SONET Mode, Frame Relay) on page 1548</p> <p>show interfaces detail (SONET Mode, Frame Relay) on page 1548</p> <p>show interfaces extensive (SONET Mode, Frame Relay) on page 1550</p> <p>show interfaces extensive (OC768-over-4xOC192 Mode) on page 1553</p> <p>show interfaces detail (IPv6 Tracking) on page 1556</p> <p>show interfaces (Shared Interface) on page 1557</p>
Output Fields	Table 73 on page 1531 lists the output fields for the show interfaces (SONET/SDH) command. Output fields are listed in the approximate order in which they appear.

Table 73: SONET/SDH show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “ Common Output Fields Description ” on page 1168.	All levels
Interface index	Physical interface's index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	SONET/SDH reference clock source: Internal or External . Clocking is configured and displayed only for channel 0.	All levels
Framing mode	Framing mode: SONET or SDH .	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Whether loopback is enabled and the type of loopback (local or remote).	All levels
FCS	Frame check sequence on the interface (either 16 or 32). The default is 16 bits.	All levels
Payload scrambler	Whether payload scrambling is enabled.	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “ Common Output Fields Description ” on page 1168.	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “ Common Output Fields Description ” on page 1168.	All levels
Shared-interface	Indicates whether the routing domain is the owner or non-owner of the shared interface. If the routing domain is the Root System Domain (RSD), the value is Owner . If the routing domain is a Protected System Domain (PSD) under the RSD, the value is Non-owner .	All levels
Link flags	Information about the link. Possible values are described in the “Link Flags” section under “ Common Output Fields Description ” on page 1168.	All levels

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
ANSI or ITU LMI settings	<p>(Frame Relay) Settings for Local Management Interface (LMI). The format is (ANSI or ITU) LMI settings: value, value... xx seconds, where <i>value</i> can be:</p> <ul style="list-style-type: none"> • n391dte—DTE full status polling interval (1-255) • n392dce—DCE error threshold (1-10) • n392dte—DTE error threshold (1-10) • n393dce—DCE monitored event count (1-10) • n393dte—DTE monitored event count (1-10) • t391dte—DTE polling timer (5-30 seconds) • t392dce—DCE polling verification timer (5-30 seconds) 	All levels
LMI	Input: value (hh:mm:ss ago), Output: value (hh:mm:ss ago)	brief none
LMI statistics	<p>(Frame Relay) LMI packet statistics:</p> <ul style="list-style-type: none"> • Input—Number of packets coming in on the interface (<i>nn</i>) and how much time has passed since the last packet arrived. The format is Input: nn (last seen hh:mm:ss ago). • Output—Number of packets sent out on the interface (<i>nn</i>) and how much time has passed since the last packet was sent. The format is Output: nn (last sent hh:mm:ss ago). 	detail extensive
DTE statistics	<p>(Frame Relay) Statistics about messages transmitted from the data terminal equipment (DTE) to the data circuit-terminating equipment (DCE):</p> <ul style="list-style-type: none"> • Enquiries sent—Number of link status enquiries sent from the DTE to the DCE. • Full enquiries sent—Number of full enquiries sent from the DTE to the DCE. • Enquiry responses received—Number of enquiry responses received by the DTE from the DCE. • Full enquiry responses received—Number of full enquiry responses sent from the DTE to the DCE. 	detail extensive none
DCE statistics	<p>(Frame Relay) Statistics about messages transmitted from the DCE to the DTE:</p> <ul style="list-style-type: none"> • Enquiries received—Number of enquiries received by the DCE from the DTE. • Full enquiries received—Number of full enquiries received by the DCE from the DTE. • Enquiry responses sent—Number of enquiry responses sent from the DCE to the DTE. • Full enquiry responses sent—Number of full enquiry responses sent from the DCE to the DTE. 	detail extensive none

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Common statistics	(Frame Relay) Statistics about messages sent between the DTE and the DCE: <ul style="list-style-type: none"> • Unknown messages received—Number of received packets that do not fall into any category. • Asynchronous updates received—Number of link status peer changes received. • Out-of-sequence packets received—Number of packets for which the sequence of the packets received is different from the expected sequence. • Keepalive responses timedout—Number of keepalive responses that timed out when no LMI packet was reported for n392dte or n393dce intervals. (See LMI settings.) 	detail extensive none
Nonmatching DCE-end DLCIs	(Frame Relay. Displayed only from the DTE) Number of DLCIs configured from the DCE.	detail extensive
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
Keepalive settings	(PPP and HDLC) Configured settings for keepalives. <ul style="list-style-type: none"> • interval seconds—The time in seconds between successive keepalive requests. The range is 10 seconds through 32,767 seconds, with a default of 10 seconds. • down-count number—The number of keepalive packets a destination must fail to receive before the network takes a link down. The range is 1 through 255, with a default of 3. • up-count number—The number of keepalive packets a destination must receive to change a link's status from down to up. The range is 1 through 255, with a default of 1. 	All levels
Keepalive or Keepalive statistics	(PPP and HDLC) Information about keepalive packets. <ul style="list-style-type: none"> • Input—Number of keepalive packets received by PPP. <ul style="list-style-type: none"> • (last seen 00:00:00 ago)—Time since the last keepalive packet was received, in the format hh:mm:ss. • Output—Number of keepalive packets sent by PPP and how long ago the last keepalive packets were sent and received. <ul style="list-style-type: none"> • (last seen 00:00:00 ago)—Time since the last keepalive packet was sent, in the format hh:mm:ss. 	All levels
LCP state	(PPP) Link Control Protocol state. <ul style="list-style-type: none"> • Conf-ack-received—Acknowledgement was received. • Conf-ack-sent—Acknowledgement was sent. • Conf-req-sent—Request was sent. • Down—LCP negotiation is incomplete (not yet completed or has failed). • Not-configured—LCP is not configured on the interface. • Opened—LCP negotiation is successful. 	detail extensive none

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
NCP state	(PPP) Network Control Protocol state. <ul style="list-style-type: none"> • Conf-ack-received—Acknowledgement was received. • Conf-ack-sent—Acknowledgement was sent. • Conf-req-sent—Request was sent. • Down—NCP negotiation is incomplete (not yet completed or has failed). • Not-configured—NCP is not configured on the interface. • Opened—NCP negotiation is successful. 	detail extensive none
CHAP state	(PPP) Displays the state of the Challenge Handshake Authentication Protocol (CHAP) during its transaction. <ul style="list-style-type: none"> • Chap-Chal-received—Challenge was received but response not yet sent. • Chap-Chal-sent—Challenge was sent. • Chap-Resp-received—Response was received for the challenge sent, but CHAP has not yet moved into the Success state. (Most likely with RADIUS authentication.) • Chap-Resp-sent—Response was sent for the challenge received. • Closed—CHAP authentication is incomplete. • Failure—CHAP authentication failed. • Not-configured—CHAP is not configured on the interface. • Success—CHAP authentication was successful. 	detail extensive none
CoS queues	Number of CoS queues configured.	detail extensive none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Input rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output rate	Output rate in bps and pps.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Traffic statistics	Number of bytes and packets received and transmitted on the physical interface, and the traffic rate in bits per seconds (bps). <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Label-switched interface (LSI) traffic statistics	(Frame Relay) LSI traffic statistics: <ul style="list-style-type: none"> • Input bytes—Number of bytes and speed, in bits per second (bps), received on the interface. • Output packets—Number of packets and speed, in bps, transmitted on the interface. 	extensive
Input errors	Input errors on the interface whose definitions are as follows: <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Giants—Number of frames received that are larger than the giant threshold. • Bucket Drops—Drops resulting from the traffic load exceeding the interface transmit/receive leaky bucket configuration. The default is off. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • HS link FIFO overflows—Number of FIFO overflows on the high-speed links between the ASICs responsible for handling the router interfaces. 	extensive

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • HS link FIFO underflows—Number of FIFO underflows on the high-speed links between the ASICs responsible for handling the router interfaces. • MTU errors—Number of packets whose size exceeds the MTU of the interface. 	extensive
IPv6 transit statistics	<p>Number of transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Egress queues	Total number of egress queues supported on the specified interface.	detail extensive
Queue counters	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	extensive
SONET alarms SONET defects	(SONET) SONET media-specific alarms and defects that prevents the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: SONET PHY , SONET section , SONET line , and SONET path .	All levels
Link	(For 4-port OC192c PIC operating in OC768-over-4xOC192 mode) The link number. Errors and alarms are displayed for each link.	extensive

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SONET PHY	<p>Counts of specific SONET errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • PLL Lock—Phase-locked loop • PHY Light—Loss of optical signal 	extensive
SONET section	<p>Counts of specific SONET errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B1—Bit interleaved parity for SONET section overhead • SEF—Severely errored framing • LOL—Loss of light • LOF—Loss of frame • ES-S—Errored seconds (section) • SES-S—Severely errored seconds (section) • SEFS-S—Severely errored framing seconds (section) 	extensive
SONET line	<p>Active alarms and defects, plus counts of specific SONET errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B2—Bit interleaved parity for SONET line overhead • REI-L—Remote error indication (near-end line) • RDI-L—Remote defect indication (near-end line) • AIS-L—Alarm indication signal (near-end line) • BERR-SF—Bit error rate fault (signal failure) • BERR-SD—Bit error rate defect (signal degradation) • ES-L—Errored seconds (near-end line) • SES-L—Severely errored seconds (near-end line) • UAS-L—Unavailable seconds (near-end line) • ES-LFE—Errored seconds (far-end line) • SES-LFE—Severely errored seconds (far-end line) • UAS-LFE—Unavailable seconds (far-end line) 	extensive

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SONET path	<p>Active alarms and defects, plus counts of specific SONET errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • BIP-B3—Bit interleaved parity for SONET section overhead • REI-P—Remote error indication • LOP-P—Loss of pointer (path) • AIS-P—Path alarm indication signal • RDI-P—Path remote defect indication • UNEQ-P—Path unequipped • PLM-P—Path payload (signal) label mismatch • ES-P—Errored seconds (near-end STS path) • SES-P—Severely errored seconds (near-end STS path) • UAS-P—Unavailable seconds (near-end STS path) • ES-PFE—Errored seconds (far-end STS path) • SES-PFE—Severely errored seconds (far-end STS path) • UAS-PFE—Unavailable seconds (far-end STS path) 	extensive
Received SONET overhead Transmitted SONET overhead	<p>Values of the received and transmitted SONET overhead:</p> <ul style="list-style-type: none"> • C2—Signal label. Allocated to identify the construction and content of the STS-level SPE and for PDI-P. • F1—Section user channel byte. This byte is set aside for the purposes of users. • K1 and K2—These bytes are allocated for APS signaling for the protection of the multiplex section. • J0—Section trace. This byte is defined for STS-1 number 1 of an STS-<i>N</i> signal. Used to transmit a 1-byte fixed-length string or a 16-byte message so that a receiving terminal in a section can verify its continued connection to the intended transmitter. • S1—Synchronization status. The S1 byte is located in the first STS-1 of an STS-<i>N</i>. • Z3 and Z4—Allocated for future use. 	extensive
SDH alarms SDH defects	<p>SDH media-specific defects that can prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: SDH PHY, SDH regenerator section, SDH multiplex section, and SDH path.</p>	All levels

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SDH PHY	<p>Active alarms and defects, plus counts of specific SDH errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • PLL Lock—Phase-locked loop • PHY Light—Loss of optical signal 	extensive
SDH regenerator section	<p>Active alarms and defects, plus counts of specific SDH errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • RS-BIP8—24-bit BIP for multiplex section overhead (B2 bytes) • OOF—Out of frame • LOS—Loss of signal • LOF—Loss of frame • RS-ES—Errored seconds (near-end regenerator section) • RS-SES—Severely errored seconds (near-end regenerator section) • RS-SEFS—Severely errored framing seconds (regenerator section) 	extensive
SDH multiplex section	<p>Active alarms and defects, plus counts of specific SDH errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • MS-BIP24—8-bit BIP for high-order path overhead (B3 byte) • MS-FEBE—Far-end block error (multiplex section) • MS-FERF—Far-end remote fail (multiplex section) • MS-AIS—Alarm indication signal (multiplex section) • BERR-SF—Bit error rate fault (signal failure) • BERR-SD—Bit error rate defect (signal degradation) • MS-ES—Errored seconds (near-end multiplex section) • MS-SES—Severely errored seconds (near-end multiplex section) • MS-UAS—Unavailable seconds (near-end multiplex section) • MS-ES-FE—Errored seconds (far-end multiplex section) • MS-SES-FE—Severely errored seconds (far-end multiplex section) • MS-UAS-FE—Unavailable seconds (far-end multiplex section) 	extensive

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SDH path	<p>Active alarms and defects, plus counts of specific SDH errors with detailed information.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>Subfields are:</p> <ul style="list-style-type: none"> • HP-BIP8—8-bit BIP for regenerator section overhead (B1 byte) • HP-FEBE—Far-end block error (high-order path) • HP-LOP—Loss of pointer (high-order path) • HP-AIS—High-order-path alarm indication signal • HP-FERF—Far-end remote fail (high-order path) • HP-UNEQ—Unequipped (high-order path) • HP-PLM—Payload label mismatch (high-order path) • HP-ES—Errored seconds (near-end high-order path) • HP-SES—Severely errored seconds (near-end high-order path) • HP-UAS—Unavailable seconds (near-end high-order path) • HP-ES-FE—Errored seconds (far-end high-order path) • HP-SES-FE—Severely errored seconds (far-end high-order path) • HP-UAS-FE—Unavailable seconds (far-end high-order path) 	extensive
Received SDH overhead Transmitted SDH overhead	<p>Values of the received and transmitted SONET overhead:</p> <ul style="list-style-type: none"> • C2—Signal label. Allocated to identify the construction and content of the STS-level SPE and for PDI-P. • F1—Section user channel byte. This byte is set aside for the purposes of users. • K1 and K2—These bytes are allocated for APS signaling for the protection of the multiplex section. • J0—Section trace. This byte is defined for STS-1 number 1 of an STS-<i>N</i> signal. Used to transmit a 1-byte fixed-length string or a 16-byte message so that a receiving terminal in a section can verify its continued connection to the intended transmitter. • S1—Synchronization status. The S1 byte is located in the first STS-1 of an STS-<i>N</i>. • Z3 and Z4—Allocated for future use. 	extensive
Received path trace Transmitted path trace	<p>SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.</p>	extensive

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
HDLC configuration	Information about the HDLC configuration. <ul style="list-style-type: none"> • Policing bucket—Configured state of the receiving policer. • Shaping bucket—Configured state of the transmitting shaper. • Giant threshold—Giant threshold programmed into the hardware. • Runt threshold—Runt threshold programmed into the hardware. 	extensive
CoS information	Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: <ul style="list-style-type: none"> • Destination slot—FPC slot number. • PLP byte—Packet Level Protocol byte. 	extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	Logical interface SNMP interface index number.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under "Common Output Fields Description" on page 1168 .	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
PPP parameters	The PPP loopback clear timer value.	extensive

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Shared interface	Provides the following information: <ul style="list-style-type: none"> shared with—(RSD only) Indicates which PSD owns the logical shared interface. For example, psd3. peer interface—(PSD only) Lists the logical tunnel interface that peers with the logical shared interface. For example, ut-2/1/0.2. tunnel token—Specifies the receive (RX) and transmit (TX) tunnel tokens. For example, Rx: 5.519, Tx: 13.514. 	All levels
Input packets	Number of packets received on the logical interface.	None specified
Output packets	Number of packets transmitted on the logical interface.	None specified
Traffic statistics	Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	detail extensive
Local statistics	Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	detail extensive
Transit statistics	Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	detail extensive
Protocol	Protocol family configured on the logical interface, such as iso , inet6 , or mpls .	detail extensive none
protocol-family	Protocol family configured on the logical interface. If the protocol is inet , the IP address of the interface is also displayed.	brief
Multilink bundle	(If the logical interface is configured as part of a multilink bundle.) Interface name for the multilink bundle.	detail extensive none
AS bundle	(If the logical interface is configured as part of an aggregated SONET bundle.) AS bundle number.	detail extensive
MTU	MTU size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route table	Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0 .	detail extensive
Flags	Information about the protocol family flags. Possible values are described in the “Family Flags” section under “ Common Output Fields Description ” on page 1168 .	detail extensive none

Table 73: SONET/SDH show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address of the interface.	detail extensive none
DLCI	(Frame Relay) DLCI number of the logical interface. The following DLCI information is displayed: Flags , Total down time , Last down , and Traffic statistics . Flags is one or more of the following: <ul style="list-style-type: none"> • Active—Set when the link is active and the DTE and DCE are exchanging information. • Down—Set when the link is active, but no information is received from the DCE. • Unconfigured—Set when the corresponding DLCI in the DCE is not configured. • Configured—Set when the corresponding DLCI in the DCE is configured. • Dce-configured—Displayed when the command is issued from the DTE. 	detail extensive
DLCI statistics	(Frame Relay) Data-link connection identifier (DLCI) statistics. <ul style="list-style-type: none"> • Active DLCI—Number of active DLCIs. • Inactive DLCI—Number of inactive DLCIs. 	detail extensive none

show interfaces (Serial)

Syntax	<pre>show interfaces <i>interface-type</i> <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display status information about serial interfaces, including RS-232, RS-422/449, EIA-530, X.21, and V.35.
Options	<p><i>interface-type</i>—On M Series and T Series routers, the interface type is <i>se-fpc/pic/port</i>.</p> <p><i>brief detail extensive terse</i>—(Optional) Display the specified level of output.</p> <p><i>descriptions</i>—(Optional) Display interface description strings.</p> <p><i>media</i>—(Optional) Display media-specific information about network interfaces.</p> <p><i>snmp-index snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p><i>statistics</i>—(Optional) Display static interface statistics.</p>
Required Privilege Level	view
List of Sample Output	<p>show interfaces (Serial, EIA-530) on page 1564</p> <p>show interfaces brief (Serial, EIA-530) on page 1564</p> <p>show interfaces detail (Serial, EIA-530) on page 1565</p> <p>show interfaces extensive (Serial, EIA-530) on page 1565</p> <p>show interfaces (Serial, V.35) on page 1567</p> <p>show interfaces brief (Serial, V.35) on page 1567</p> <p>show interfaces detail (Serial, V.35) on page 1567</p> <p>show interfaces extensive (Serial, V.35) on page 1568</p> <p>show interfaces statistics detail (RS 449) on page 1569</p>
Output Fields	Table 74 on page 1558 lists the output fields for the show interfaces (Serial) command. Output fields are listed in the approximate order in which they appear.

Table 74: show interfaces (Serial) Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels

Table 74: *show interfaces (Serial) Output Fields (continued)*

Field Name	Field Description	Level of Output
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1168 .	All levels
Interface index	Physical interface's index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Type	Type of interface.	All levels
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit (MTU) size on the physical interface.	All levels
Maximum speed	Maximum speed. The nonconfigurable value is 16,384 kbps.	detail extensive none
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Link flags	Information about the link. Possible values are described in the “Link Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
Keepalive settings	(PPP and HDLC) Configured settings for keepalive packets. <ul style="list-style-type: none"> Interval <i>seconds</i>—Time between successive keepalive requests. The range of values, in seconds, is 10 to 32,767. The default value is 10. Up-count <i>number</i>—Number of keepalive packets a destination must receive to change a link's status from down to up. The range of values is 1 to 255. The default value is 1. Down-count <i>number</i>—Number of keepalive packets a destination must fail to receive before the network takes a link down. The range is 1 to 255. The default value is 3. 	All levels
Keepalive	(PPP and HDLC) Information about keepalive packets. <ul style="list-style-type: none"> Input: <i>number (hh:mm:ss ago)</i>—Number of keepalive packets received by PPP and the time since the last keepalive packet was received. Output: <i>number (hh:mm:ss ago)</i>—Number of keepalive packets sent by PPP and the time since the last keepalive packet was sent. 	brief none

Table 74: show interfaces (Serial) Output Fields (continued)

Field Name	Field Description	Level of Output
Keepalive statistics	(PPP and HDLC) Information about keepalive packets. <ul style="list-style-type: none"> • Input: <i>number</i> (last seen <i>hh:mm:ss</i> ago)—Number of keepalive packets received by PPP and the time since the last keepalive packet was received. • Output: <i>number</i> (last seen <i>hh:mm:ss</i> ago)—Number of keepalive packets sent by PPP and the time since the last keepalive packet was sent. 	detail extensive
LCP state	(PPP) Link Control Protocol state. <ul style="list-style-type: none"> • Conf-ack-received—Acknowledgement was received. • Conf-ack-sent—Acknowledgement was sent. • Conf-req-sent—Request was sent. • Down—LCP negotiation is incomplete (not yet completed or has failed). • Not-configured—LCP is not configured on the interface. • Opened—LCP negotiation is successful. 	detail extensive none
NCP state	(PPP) Network Control Protocol state. <ul style="list-style-type: none"> • Conf-ack-received—Acknowledgement was received. • Conf-ack-sent—Acknowledgement was sent. • Conf-req-sent—Request was sent. • Down—NCP negotiation is incomplete (not yet completed or has failed). • Not-configured—NCP is not configured on the interface. • Opened—NCP negotiation is successful. 	detail extensive none
CHAP state	(PPP) Displays the state of the Challenge Handshake Authentication Protocol (CHAP) during its transaction. <ul style="list-style-type: none"> • Chap-Chal-received—Challenge was received but response not yet sent. • Chap-Chal-sent—Challenge was sent. • Chap-Resp-received—Response was received for the challenge sent, but CHAP has not yet moved into the Success state. (Most likely with RADIUS authentication.) • Chap-Resp-sent—Response was sent for the challenge received. • Closed—CHAP authentication is incomplete. • Failure—CHAP authentication failed. • Not-configured—CHAP is not configured on the interface. • Success—CHAP authentication was successful. 	detail extensive none
CoS queues	Number of CoS queues configured.	detail extensive none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: <i>year-month-day hour:minute:second timezone</i> (<i>hour:minute:second</i> ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output Rate	Output rate in bps and pps.	None specified

Table 74: show interfaces (Serial) Output Fields (continued)

Field Name	Field Description	Level of Output
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Input errors	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Giants—Number of frames received that are larger than the giant threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • Resource errors—Sum of transmit drops. 	extensive
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • MTU errors—Number of packets whose size exceeds the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive
Egress queues supported	Total number of egress queues supported on the specified interface. Displayed with the statistics option.	detail extensive
Egress queues in use	Total number of egress queues in use on the specified interface. Displayed with the statistics option.	detail extensive

Table 74: *show interfaces (Serial) Output Fields (continued)*

Field Name	Field Description	Level of Output
Queue counters	CoS queue number and its associated user-configured forwarding class name. Displayed with the statistics option. <ul style="list-style-type: none"> Queued packets—Number of queued packets. Transmitted packets—Number of transmitted packets. Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive
Serial media information	Information about the physical media: <ul style="list-style-type: none"> Line protocol—eia530, eia530a, rs232, rs449, v.35, or x.21. Resync history—Information about resynchronization events: <ul style="list-style-type: none"> Sync loss count—Number of times the synchronization was lost. Data signal—(X.21 and V.35) Information about the data signal: <ul style="list-style-type: none"> Rx Clock—Receive clock status: OK (DTE is receiving the receive clock signal) or Not detected (receive clock signal is not being received). Control signals—Information about modem control signals: <ul style="list-style-type: none"> Local mode: DCE (data communication equipment) or DTE (data terminal equipment) To DCE—Control signals that the Serial PIC sent to the DCE: DTR (Data Terminal Ready: up or down) or RTS (Request To Send: up or down.) From DC—Control signals that the Serial PIC received from the DCE: CTS (Clear To Send: up or down), DCD (Data Carrier Detect: up or down), DSR (Data Set Ready: up or down), or TM (Test Mode: up or down). Clocking mode—Clocking used for the transmit clock: <ul style="list-style-type: none"> dte—Transmit clock is generated by DTE. dce—Transmit clock is generated by the DCE and is looped back as the transmit clock. loop-timed—Receive clock from the DCE is looped back as the transmit clock. Clock rate—Rate, in megahertz (MHz), at which the clock is configured. Loopback—Configured loopback mode for the interface: dce-remote, dce-local, liu, local, or none. Tx clock—Clocking phase of the transmit clock: invert (transmit clock polarity is inverted) or non-invert (transmit clock polarity is not inverted). Line encoding—Type of line encoding used: nrz (nonreturn to zero) or nrzi (return to zero inverted). 	detail extensive
Packet Forwarding Engine configuration	Information about the configuration of the Packet Forwarding Engine: <ul style="list-style-type: none"> Destination slot—FPC slot number. PLP byte—Packet Level Protocol byte. 	extensive

Table 74: *show interfaces (Serial) Output Fields (continued)*

Field Name	Field Description	Level of Output
CoS information	Information about the CoS queue for the physical interface: <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	Logical interface SNMP interface index number.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
<i>protocol-family</i>	Protocol family configured on the logical interface. If the protocol is inet , the source and destination address are also displayed.	brief
Protocol	Protocol family configured on the logical interface, such as iso , inet6 , mpls .	detail extensive none
MTU	MTU size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route Table	Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0 .	detail extensive
Flags	Information about protocol family flags. Possible values are described in the “Family Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive

Table 74: show interfaces (Serial) Output Fields (continued)

Field Name	Field Description	Level of Output
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address of the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

show interfaces (T1, E1, or DS)

Syntax	<pre>show interfaces <i>interface-type</i> <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display status information about the specified T1, E1, or DS interface.
Options	<p><i>interface-type</i>—On ACX Series, M Series, MX Series, and T Series routers, the T1 interface type is t1-<i>fpc/pic/port</i>, whereas the E1 interface type is e1-<i>fpc/pic/port</i>, and DS interface type is ds-<i>fpc/pic/port:channel</i>.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p>
Required Privilege Level	view

Output Fields	<p>Table 75 on page 1572 lists the output fields for the show interfaces (T1 or E1) command. Output fields are listed in the approximate order in which they appear.</p>

Table 75: T1 or E1 show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1168 .	All levels
Interface index	Physical interface's index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	Reference clock source: Internal or External .	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Whether loopback is enabled and the type of loopback (local or remote).	All levels
FCS	Frame check sequence on the interface (either 16 or 32). The default is 16 bits.	All levels
Framing	Physical layer framing format used for the E1 interface on the link: G704 , G704-NO-CRC4 , or Unframed . The default is G704 . Physical layer framing format used for the T1 interface on the link: SF and ESF . The default is ESF .	All levels
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Link flags	Information about the link. Possible values are described in the “Link Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
IMA Link alarms	Current active IMA link alarms, including the following: <ul style="list-style-type: none"> • LIF • LODS • RFI-IMA • Tx-Mis-Connected • Tx-Unusable-FE • Rx-Unusable-FE • Link Fault 	detail extensive none
IMA Link defects	Current active IMA link defects, including the following: <ul style="list-style-type: none"> • LIF • LODS • RFI-IMA • Tx-Mis-Connected • Tx-Unusable-FE • Rx-Unusable-FE • Link Fault 	detail extensive none
IMA Link state	Current active IMA link status, including the following: <ul style="list-style-type: none"> • Line: synchronized or not synchronized • Near end:—Status of near-end receive and transmit links <ul style="list-style-type: none"> • Rx: Usable or Unusable • Tx: Usable or Unusable • Far end:—Status of far-end receive and transmit links <ul style="list-style-type: none"> • Rx: Usable or Unusable • Tx: Usable or Unusable 	detail extensive none

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
IMA link media	<p>IMA Link Media Status, which provides the seconds and count state for the following link media parameters:</p> <ul style="list-style-type: none"> • LIF • LODS • Err-ICP • IV • Rx-FC • Tx-FC • FE-Defects • FE-Rx-FC • FE-Tx-FC • Rx-ICP • Rx-Stuff • Tx-ICP • Tx-Stuff • Rx-SES • Rx-UAS • Rx-UUS • Tx-UUS • FE-Rx-SES • FE-Rx-UAS • FE-Rx-UUS • FE-Tx-UUS 	detail extensive none
Keepalive settings	<p>(PPP and HDLC) Configured settings for keepalives.</p> <ul style="list-style-type: none"> • interval seconds—The time in seconds between successive keepalive requests. The range is 10 seconds through 32,767 seconds, with a default of 10 seconds. • down-count number—The number of keepalive packets a destination must fail to receive before the network takes a link down. The range is 1 through 255, with a default of 3. • up-count number—The number of keepalive packets a destination must receive to change a link's status from down to up. The range is 1 through 255, with a default of 1. 	detail extensive none
Keepalive statistics	<p>(PPP and HDLC) Information about keepalive packets. (When no level of output is specified, the word statistics is not part of the field name and the last seen text is not displayed.)</p> <ul style="list-style-type: none"> • Input—Number of keepalive packets received by PPP. <ul style="list-style-type: none"> • (last seen 00:00:00 ago)—Time since the last keepalive packet was received, in the format <i>hh:mm:ss</i>. • Output—Number of keepalive packets sent by PPP and how long ago the last keepalive packets were sent and received. <ul style="list-style-type: none"> • (last seen 00:00:00 ago)—Time since the last keepalive packet was sent, in the format <i>hh:mm:ss</i>. 	detail extensive none

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
LMI settings	<p>(Frame Relay) Settings for Local Management Interface (LMI) which can be either ANSI LMI settings or ITU LMI settings. ANSI LMI settings is the default. The format is (ANSI or ITU) LMI settings: value, value... xx seconds, where <i>value</i> can be:</p> <ul style="list-style-type: none"> • n391dte—DTE full status polling interval (1–255) • n392dce—DCE error threshold (1–10) • n392dte—DTE error threshold (1–10) • n393dce—DCE monitored event count (1–10) • n393dte—DTE monitored event count (1–10) • t391dte—DTE polling timer (5–30 seconds) • t392dce—DCE polling verification timer (5–30 seconds) 	detail extensive none
LMI	<p>(Frame Relay) Local Management Interface (LMI) packet statistics:</p> <ul style="list-style-type: none"> • Input—Number of packets coming in on the interface (<i>nn</i>) and how much time has passed since the last packet arrived. The format is Input: nn (last seen hh:mm:ss ago). • Output—Number of packets sent out on the interface (<i>nn</i>) and how much time has passed since the last packet was sent. The format is Output: nn (last sent hh:mm:ss ago). 	detail extensive none
DTE statistics	<p>(Frame Relay) Statistics about messages transmitted from the data terminal equipment (DTE) to the data communications equipment (DCE):</p> <ul style="list-style-type: none"> • Enquiries sent—Number of link status enquiries sent from the DTE to the DCE. • Full enquiries sent—Number of full enquiries sent from the DTE to the DCE. • Enquiry responses received—Number of enquiry responses received by the DTE from the DCE. • Full enquiry responses received—Number of full enquiry responses sent from the DTE to the DCE. 	detail extensive none
DCE statistics	<p>(Frame Relay) Statistics about messages transmitted from the DCE to the DTE:</p> <ul style="list-style-type: none"> • Enquiries received—Number of enquiries received by the DCE from the DTE. • Full enquiries received—Number of full enquiries received by the DCE from the DTE. • Enquiry responses sent—Number of enquiry responses sent from the DCE to the DTE. • Full enquiry responses sent—Number of full enquiry responses sent from the DCE to the DTE. 	detail extensive none

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Common statistics	(Frame Relay) Statistics about messages sent between the DTE and the DCE: <ul style="list-style-type: none"> • Unknown messages received—Number of received packets that do not fall into any category. • Asynchronous updates received—Number of link status peer changes received. • Out-of-sequence packets received—Number of packets for which the sequence of the packets received is different from the expected sequence. • Keepalive responses timedout—Number of keepalive responses that timed out when no Local Management Interface (LMI) packet was reported for n392dte or n393dce intervals. (See LMI settings.) 	detail extensive none
Nonmatching DCE-end DLCIs	(Frame Relay. Displayed only from the DTE.) Number of DLCIs configured from the DCE.	detail extensive none
LCP state	(PPP) Link Control Protocol state. <ul style="list-style-type: none"> • Conf-ack-received—Acknowledgement was received. • Conf-ack-sent—Acknowledgement was sent. • Conf-req-sent—Request was sent. • Down—LCP negotiation is incomplete (not yet completed or has failed). • Not configured—LCP is not configured on the interface. • Opened—LCP negotiation is successful. 	detail extensive none
NCP state	(PPP) Network Control Protocol state. <ul style="list-style-type: none"> • Conf-ack-received—Acknowledgement was received. • Conf-ack-sent—Acknowledgement was sent. • Conf-req-sent—Request was sent. • Down—NCP negotiation is incomplete (not yet completed or has failed). • Not configured—NCP is not configured on the interface. • Opened—NCP negotiation is successful. 	detail extensive none
CHAP state	(PPP) State of the Challenge Handshake Authentication Protocol (CHAP) during its transaction. <ul style="list-style-type: none"> • Chap-Chal-received—Challenge was received but response is not yet sent. • Chap-Chal-sent—Challenge was sent. • Chap-Resp-received—Response was received for the challenge sent, but CHAP has not yet moved into the Success state. (Most likely with RADIUS authentication.) • Chap-Resp-sent—Response was sent for the challenge received. • Down—CHAP authentication is incomplete (not yet completed or has failed). • Not-configured—CHAP is not configured on the interface. • Opened—CHAP authentication was successful. 	detail extensive none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CoS Queues	Number of CoS queues configured.	detail extensive none
Input rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output rate	Output rate in bps and pps.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface • Output packets—Number of packets transmitted on the interface. 	detail extensive
Input errors	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • SRAM errors—Number of hardware errors that occurred in the static RAM (SRAM) on the PIC or PIM. If the value of this field increments, the PIC or PIM is malfunctioning. • Resource errors—Sum of transmit drops. 	extensive

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive
Queue counters	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive
DS1 alarms DS1 defects	<p>E1 media-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. The following lists all possible alarms and defects. For complete explanations of most of these alarms and defects, see <i>Belcore Telcordia GR-499-CORE</i>.</p> <ul style="list-style-type: none"> • AIS—Alarm indication signal. • LOF—Loss of frame. • LOS—Loss of signal. • YLW—Yellow alarm. Indicates errors at the remote site receiver. 	detail extensive none

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
T1 media or E1 media	<p>Counts of T1 or E1 media-specific errors.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. The T1 or E1 media-specific error types are: • SEF—Severely errored framing • BEE—Bit error • AIS—Alarm indication signal • LOF—Loss of frame • LOS—Loss of signal • YELLOW—Errors at the remote site receiver • CRC Major—Cyclic redundancy check major alarm threshold exceeded • CRC Minor—Cyclic redundancy check minor alarm threshold exceeded • BPV—Bipolar violation • EXZ—Excessive zeros • LCV—Line code violation • PCV—Pulse code violation • CS—Carrier state • CRC—Cyclic redundancy check • FEBE—Far-end block error (E1 only) • LES—Line error seconds • ES—Errored seconds • BES—Bursty errored seconds • SES—Severely errored seconds • SEFS—Severely errored framing seconds • UAS—Unavailable seconds 	extensive
SAToP Configuration	<p>Information about the SAToP configuration.</p> <ul style="list-style-type: none"> • payload-size—Configure the payload size, in bytes (from 32 through 1024 bytes). • idle-pattern—An 8-bit hexadecimal pattern to replace TDM data in a lost packet (from 0 through 255). • jitter-buffer-packets—Number of packets in the jitter buffer (from 1 through 64 packets). • jitter-buffer-latency—Time delay in the jitter buffer (from 1 through 1000 milliseconds). • excessive-packet-loss-rate—Set packet loss options. The options are groups, sample-period, and threshold. • sample-period—Time required to calculate excessive packet loss rate (from 1000 through 65,535 milliseconds). • threshold—Percentile designating the threshold of excessive packet loss rate (1–100 percent). 	extensive

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CESoPSN Configuration	<p>Information about the CESoPSN configuration.</p> <ul style="list-style-type: none"> • packetization-latency—Time required to create packets (from 1000 through 8000 microseconds). • idle-pattern—An 8-bit hexadecimal pattern to replace TDM data in a lost packet (from 0 through 255). • jitter-buffer-packets—Number of packets in the jitter buffer (from 1 through 64 packets). • jitter-buffer-latency—Time delay in the jitter buffer (from 1 through 1000 milliseconds). • excessive-packet-loss-rate—Set packet loss options. The options are sample-period and threshold. • sample-period—Time required to calculate excessive packet loss rate (from 1000 through 65,535 milliseconds). • threshold—Percentile designating the threshold of excessive packet loss rate (1–100 percent). 	extensive
HDLC configuration	<p>Information about the HDLC configuration.</p> <ul style="list-style-type: none"> • Policing bucket—Configured state of the receiving policer. • Shaping bucket—Configured state of the transmitting shaper. • Giant threshold—Giant threshold programmed into the hardware. • Runt threshold—Runt threshold programmed into the hardware. • Timeslots—Time slots configured on the interface. • Buildout—(T1 only) Buildout setting: 0-132, 133-265, 266-398, 399-531, or 532-655 feet. • Timeslots—Configured time slots for the interface. • Byte encoding—(T1 only) Byte encoding used: Nx64K or Nx56K. • Line encoding—Line encoding used. For T1, the value can be B8ZS or AMI. For E1, the value is HDB3. • Data inversion—HDLC data inversion setting: Enabled or Disabled. • Idle cycle flag—Idle cycle flags. • Start end flag—Start and end flag. 	extensive
DS1 BERT configuration	<p>BERT (bit error rate test) checks the quality of the line. This output appears only when a BERT is run on the interface.</p> <ul style="list-style-type: none"> • BERT time period—Configured total time period that the BERT is to run. • Elapsed—Actual time elapsed since the start of the BERT (in seconds). • Induced error rate—Configured rate at which the bit errors are induced in the BERT pattern. • Algorithm—Type of algorithm selected for the BERT. 	detail extensive none
Packet Forwarding Engine configuration	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> • Destination slot—FPC slot number. • PLP byte—Packet Level Protocol byte. 	extensive

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CoS information	Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	Logical interface SNMP interface index number.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Input packets	Number of packets received on the logical interface.	None specified
Output packets	Number of packets transmitted on the logical interface.	None specified
Traffic statistics	(Frame Relay) Number and rate of bytes and packets received and transmitted on the logical interface. <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Local statistics	(Frame Relay) Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes a while (generally, less than 1 second) for this counter to stabilize.	detail extensive

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Transit statistics	(Frame Relay) Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter normally stabilizes in less than 1 second.	detail extensive
Protocol	Protocol family configured on the logical interface, such as iso , inet6 , mlfr , or mpls .	detail extensive none
Multilink bundle	Interface name for the multilink bundle, if configured.	detail extensive none
MTU	MTU size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route table	Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0 .	detail extensive
Flags	Information about the protocol family flags. Possible values are described in the “Family Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive none
DLCI	<p>(Frame Relay) DLCI number of the logical interface. The following DLCI information is displayed: Flags, Total down time, Last down, and Traffic statistics or (Input packets, Output packets). Flags can be one or more of the following:</p> <ul style="list-style-type: none"> • Active—Set when the link is active and the DTE and DCE are exchanging information. • Down—Set when the link is active, but no information is received from the DCE. • DCE-Unconfigured—Set when the corresponding DLCI in the DCE is not configured. • Configured—Set when the corresponding DLCI in the DCE is configured. • DCE-configured—Displayed when the command is issued from the DTE. 	detail extensive none
DLCI statistics	<p>(Frame Relay) Data-link connection identifier (DLCI) statistics.</p> <ul style="list-style-type: none"> • Active DLCI—Number of active DLCIs. • Inactive DLCI—Number of inactive DLCIs. 	detail extensive none

Table 75: T1 or E1 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CE Info	<p>Information related to the circuit emulation statistics.</p> <ul style="list-style-type: none"> • CE Tx—Number of transmitted packets and bytes (TDM to PSN flow). • CE Rx—Number of received packets and bytes and forward bytes (PSN to TDM flow). • CE Rx Forwarded—Number of forwarded bytes. • CE Strayed—Number of stray packets. • CE Lost—Number of lost packets. • CE Malformed—Number of malformed packets • CE Misinserted—Number of misinserted packets. • CE AIS dropped—Number of dropped bytes due to buffer overrun (PSN to TDM). • CE Dropped—Number of dropped packets during resynchronization • CE Overrun Events—Number of overrun events. • CE Underrun Events—Number of underrun events. 	extensive

show interfaces (T3 or E3)

Syntax	<pre>show interfaces <i>interface-type</i> <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display status information about the specified T3 or E3 interface.
Options	<p><i>interface-type</i>—On M Series and T Series routers, the T3 interface type is t3-<i>fpc/pic/port</i>, whereas the E3 interface type is e3-<i>fpc/pic/port</i>.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p>
Required Privilege Level	view
List of Sample Output	show interfaces (T3, PPP) on page 1605 show interfaces detail (T3, PPP) on page 1606 show interfaces extensive (T3, PPP) on page 1607 show interfaces (E3, Frame Relay) on page 1608 show interfaces detail (E3, Frame Relay) on page 1609 show interfaces extensive (E3, Frame Relay) on page 1611
Output Fields	<p>Table 76 on page 1596 lists the output fields for the show interfaces (T3 or E3) command. Output fields are listed in the approximate order in which they appear.</p>

Table 76: T3 or E3 show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1168 .	All levels

Table 76: T3 or E3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Interface index	Physical interface's index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	Reference clock source. It can be Internal or External .	All levels
Speed	Speed at which the interface is running.	All levels
Loopback	Whether loopback is enabled and the type of loopback (local or remote).	All levels
FCS	Frame check sequence on the interface (either 16 or 32). The default is 16 bits.	All levels
Mode	(T3 only) Whether C-bit parity mode or M13 mode is enabled.	All levels
Long buildout	(T3 only) Buildout setting: less than 255 feet (68 meters) or greater than 255 feet and shorter than 450 feet (137 meters).	All levels
Framing	(E3 only) Physical layer framing format used on the link. It can be G751 or Unframed . The default is G751 .	All levels
Device flags	Information about the physical device. Possible values are described in the "Device Flags" section under "Common Output Fields Description" on page 1168 .	All levels
Interface flags	Information about the interface. Possible values are described in the "Interface Flags" section under "Common Output Fields Description" on page 1168 .	All levels
Link flags	Information about the link. Possible values are described in the "Link Flags" section under "Common Output Fields Description" on page 1168 .	All levels
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
Keepalive settings	(PPP and HDLC) Configured settings for keepalives. <ul style="list-style-type: none"> interval seconds—Time in seconds between successive keepalive requests. The range is 10 seconds through 32,767 seconds, with a default of 10 seconds. down-count number—Number of keepalive packets a destination must fail to receive before the network takes a link down. The range is 1 through 255, with a default of 3. up-count number—Number of keepalive packets a destination must receive to change a link's status from down to up. The range is 1 through 255, with a default of 1. 	detail extensive none

Table 76: T3 or E3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Keepalive statistics or Keepalive	<p>(PPP and HDLC) Information about keepalive packets.</p> <ul style="list-style-type: none"> • Input—Number of keepalive packets received by PPP. <ul style="list-style-type: none"> • (last seen 00:00:00 ago)—Time since the last keepalive packet was received, in the format <i>hh:mm:ss</i>. • Output—Number of keepalive packets sent by PPP and how long ago the last keepalive packets were sent and received. <ul style="list-style-type: none"> • (last seen 00:00:00 ago)—Time since the last keepalive packet was sent, in the format <i>hh:mm:ss</i>. 	detail extensive none
LMI settings	<p>(Frame Relay) Local Management Interface (LMI) settings (ANSI or ITU). ANSI LMI settings is the default. The format is LMI settings: value, value... xx seconds, where <i>value</i> can be:</p> <ul style="list-style-type: none"> • n391dte—DTE full status polling interval (1–255) • n392dce—DCE error threshold (1–10) • n392dte—DTE error threshold (1–10) • n393dce—DCE monitored event count (1–10) • n393dte—DTE monitored event count (1–10) • t391dte—DTE polling timer (5–30 seconds) • t392dce—DCE polling verification timer (5–30 seconds) 	detail extensive none
LMI	<p>(Frame Relay) LMI statistics:</p> <ul style="list-style-type: none"> • Input—Number of packets coming in on the interface (<i>nn</i>) and how much time has passed since the last packet arrived. The format is Input: nn (last seen hh:mm:ss ago). • Output—Number of packets sent out on the interface (<i>nn</i>) and how much time has passed since the last packet was sent. The format is Output: nn (last sent hh:mm:ss ago). 	detail extensive none
DTE statistics	<p>(Frame Relay) Statistics about messages transmitted from the data terminal equipment (DTE) to the data communications equipment (DCE):</p> <ul style="list-style-type: none"> • Enquiries sent—Number of link status enquiries sent from the DTE to the DCE. • Full enquiries sent—Number of full enquiries sent from the DTE to the DCE. • Enquiry responses received—Number of enquiry responses received by the DTE from the DCE. • Full enquiry responses received—Number of full enquiry responses sent from the DTE to the DCE. 	detail extensive none
DCE statistics	<p>(Frame Relay) Statistics about messages transmitted from the DCE to the DTE:</p> <ul style="list-style-type: none"> • Enquiries received—Number of enquiries received by the DCE from the DTE. • Full enquiries received—Number of full enquiries received by the DCE from the DTE. • Enquiry responses sent—Number of enquiry responses sent from the DCE to the DTE. • Full enquiry responses sent—Number of full enquiry responses sent from the DCE to the DTE. 	detail extensive none

Table 76: T3 or E3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Common statistics	(Frame Relay) Statistics about messages sent between the DTE and the DCE: <ul style="list-style-type: none"> • Unknown messages received—Number of received packets that do not fall into any category. • Asynchronous updates received—Number of link status peer changes received. • Out-of-sequence packets received—Number of packets for which the sequence of the packets received is different from the expected sequence. • Keepalive responses timedout—Number of keepalive responses that timed out when no LMI packet was reported for n392dte or n393dce intervals. (See LMI settings.) 	detail extensive none
Nonmatching DCE-end DLCIs	(Frame Relay. Displayed only from the DTE.) Number of DLCIs configured from the DCE.	detail extensive none
LCP state	(PPP) Link Control Protocol state. <ul style="list-style-type: none"> • Conf-ack-received—Acknowledgement was received. • Conf-ack-sent—Acknowledgement was sent. • Conf-req-sent—Request was sent. • Down—LCP negotiation is incomplete (not yet completed or has failed). • Opened—LCP negotiation is successful. 	detail extensive none
NCP state	(PPP) Network Control Protocol state. <ul style="list-style-type: none"> • Conf-ack-received—Acknowledgement was received. • Conf-ack-sent—Acknowledgement was sent. • Conf-req-sent—Request was sent. • Down—NCP negotiation is incomplete (not yet completed or has failed). • Opened—NCP negotiation is successful. 	detail extensive none
CHAP state	(PPP) Displays the state of the Challenge Handshake Authentication Protocol (CHAP) during its transaction. <ul style="list-style-type: none"> • Chap-Resp-received—Response received for the challenge sent, but CHAP not yet moved into the Success state. (Most likely with RADIUS authentication.) • Chap-Resp-sent—Response sent for the challenge received. • Chap-Chal-sent—Challenge sent. • Chap-Chal-received—Challenge received but response not yet sent. • Down—CHAP authentication is incomplete (not yet completed or has failed). • Not-configured—CHAP is not configured on the interface. • Opened—CHAP authentication was successful. 	detail extensive none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second timezone (year-month-day hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
CoS queues	Number of CoS queues configured.	detail extensive none

Table 76: T3 or E3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Input rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output rate	Output rate in bps and pps.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface • Output packets—Number of packets received on the interface. 	detail extensive
Input errors	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—(T3 only) Number of frames received that are smaller than the runt threshold. • Giants—(T3 only) Number of frames received that are larger than the giant threshold. • Bucket Drops—Drops resulting from the traffic load exceeding the interface transmit/receive leaky bucket configuration. The default is off. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • L3 incompletes—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. • L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame. • L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable. • HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces. • SRAM errors—Number of hardware errors that occurred in the static RAM (SRAM) on the PIC or PIM. If the value of this field increments, the PIC or PIM is malfunctioning. • Resource errors—Sum of transmit drops. 	extensive

Table 76: T3 or E3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Output errors	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive
Queue counters	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> • Queued packets—Number of queued packets. • Transmitted packets—Number of transmitted packets. • Dropped packets—Number of packets dropped by the ASIC's RED mechanism. 	detail extensive
Active alarms Active defects	<p>E3 media-specific defects that can render the interface unable to pass packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface.</p> <ul style="list-style-type: none"> • AIS—Alarm indication signal • EXZ—Excessive zeros • FERF—Far-end receive failures • IDLE—Idle code detected • LCD—Loss of cell delineation • LCV—Line code violation • LOF—Loss of frame • LOS—Loss of signal • PLL—Phase-locked loop • YLW—Remote defect indication 	detail extensive none

Table 76: T3 or E3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
DS3 media or E3 media	<p>Counts of DS3 (T3) or E3 media-specific errors.</p> <ul style="list-style-type: none"> • Seconds—Number of seconds the defect has been active. • Count—Number of times that the defect has gone from inactive to active. • State—State of the error. State other than OK indicates a problem. <p>The DS3 or E3 media-specific error types can be:</p> <ul style="list-style-type: none"> • PLL Lock—Phase-locked loop out of lock • Reframing—Frame alignment recovery time • AIS—Alarm indication signal • LOF—Loss of frame • LOS—Loss of signal • IDLE—Idle code detected • YELLOW—Errors at the remote site receiver • BPV—Bipolar violation • EXZ—Excessive zeros • LCV—Line code violation • PCV—(DS3 only) Pulse code violation • CCV—(DS3 only) C-bit coding violation • FEBE—(DS3 only) Far-end block error • LES—Line error seconds • PES—(DS3 only) P-bit errored seconds • PSSES—(DS3 only) P-bit errored seconds (section) • CES—(DS3 only) C-bit errored seconds • CSES—(DS3 only) C-bit severely errored seconds • SEFS—Severely errored framing seconds • UAS—Unavailable seconds 	extensive
HDLC configuration	<p>Information about the HDLC configuration.</p> <ul style="list-style-type: none"> • Policing bucket—Configured state of the receiving policer. • Shaping bucket—Configured state of the transmitting shaper. • Giant threshold—Giant threshold programmed into the hardware. • Runt threshold—Runt threshold programmed into the hardware. • Idle cycle flag—Idle cycle flags. • Start end flag—Start and end flag. 	extensive

Table 76: T3 or E3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
DSU configuration	<p>Information about the DSU configuration. The last three lines (Bit count, Error bit count, and LOS information) are displayed only if a BERT has ever been run on the interface.</p> <ul style="list-style-type: none"> • Compatibility mod—CSU/DSU compatibility mode: None, Larscom, Kentrox, or Digital-Link. • Scrambling—Payload scrambling: Enabled or Disabled. • Subrate—Configured subrate setting. Applies only when Digital-Link compatibility mode is used. The subrate can be Disabled or display units in Kbps. • FEAC loopbac—(T3) Whether a far-end alarm and control (FEAC) loopback is Active or Inactive. This feature is used to send alarm or status information from the far-end terminal back to the near-end terminal and to initiate T3 loopbacks at the far-end terminal from the near-end terminal. • Response—Whether the FEAC signal is Enabled or Disabled. • Count—Number of FEAC loopbacks. 	extensive
DS3 (or E3) BERT configuration	<p>BERT (bit error rate test) checks the quality of the line. This output appears only when a BERT is run on the interface.</p> <ul style="list-style-type: none"> • BERT time period—Configured total time period that the BERT is to run. • Elapsed—Actual time elapsed since the start of the BERT (in seconds). • Induced error rate—Configured rate at which the bit errors are induced in the BERT pattern. • Algorithm—Type of algorithm selected for the BERT. 	detail extensive none
Packet Forwarding Engine configuration	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> • Destination slot—FPC slot number. • PLP byte—Packet Level Protocol byte. 	extensive
CoS information	<p>Information about the CoS queue for the physical interface.</p> <ul style="list-style-type: none"> • CoS transmit queue—Queue number and its associated user-configured forwarding class name. • Bandwidth %—Percentage of bandwidth allocated to the queue. • Bandwidth bps—Bandwidth allocated to the queue (in bps). • Buffer %—Percentage of buffer space allocated to the queue. • Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time. • Priority—Queue priority: low or high. • Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available. 	extensive

Logical Interface

Table 76: T3 or E3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Logical interface	Name of the logical interface.	detail extensive none
Index	Logical interface index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	Logical interface SNMP interface index number.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	extensive
Flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive none
Encapsulation	Encapsulation on the logical interface.	detail extensive none
Input packets	Number of packets received on the logical interface.	None specified
Output packets	Number of packets transmitted on the logical interface.	None specified
Traffic statistics	(Frame Relay) Number and rate of bytes and packets received and transmitted on the logical interface. <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Local statistics	(Frame Relay) Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	detail extensive
Transit statistics	(Frame Relay) Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter normally stabilizes in less than 1 second.	detail extensive
Protocol	Protocol family configured on the logical interface, such as iso , inet6 , mlfr , or mpls .	detail extensive none
Multilink bundle	(Multilink) Interface name for the multilink bundle.	detail extensive none
MTU	MTU size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route table	Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	detail extensive
Flags	Information about the protocol family flags. Possible values are described in the “Family Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive none

Table 76: T3 or E3 show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive none
DLCI	(Frame Relay) DLCI number of the logical interface. The following DLCI information is displayed: Flags , Total down time , Last down , and Traffic statistics (or Input packets , Output packets). Flags is one or more of the following: <ul style="list-style-type: none"> • Active—Set when the link is active and the DTE and DCE are exchanging information. • Down—Set when the link is active, but no information is received from the DCE. • DCE Unconfigured—Set when the corresponding DLCI in the DCE is not configured. • Configured—Set when the corresponding DLCI in the DCE is configured. • DCE-configured—Displayed when the command is issued from the DTE. 	detail extensive none
DLCI statistics	(Frame Relay) Data-link connection identifier (DLCI) statistics. <ul style="list-style-type: none"> • Active DLCI—Number of active DLCIs. • Inactive DLCI—Number of inactive DLCIs. 	detail extensive none

show interfaces demux0 (Demux Interfaces)

Syntax	<pre>show interfaces demux0 <i>logical-interface-number</i> <brief detail extensive terse> <descriptions> <media> <snmp-index <i>snmp-index</i>> <statistics></pre>
Release Information	Command introduced in Junos OS Release 9.0.
Description	(MX Series and M Series routers only) Display status information about the specified demux interface.
Options	<p>none—Display standard information about the specified demux interface.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>descriptions—(Optional) Display interface description strings.</p> <p>media—(Optional) Display media-specific information about network interfaces.</p> <p>snmp-index <i>snmp-index</i>—(Optional) Display information for the specified SNMP index of the interface.</p> <p>statistics—(Optional) Display static interface statistics.</p>

Output Fields	Table 77 on page 1614 lists the output fields for the show interfaces demux0 (Demux Interfaces) command. Output fields are listed in the approximate order in which they appear.

Table 77: show interfaces demux0 (Demux Interfaces) Output Fields

Field Name	Field Description	Level of Output
Physical Interface		

Table 77: show interfaces demux0 (Demux Interfaces) Output Fields (continued)

Field Name	Field Description	Level of Output
Physical interface	Name of the physical interface.	brief detail extensive none
Interface index	Index number of the physical interface, which reflects its initialization sequence.	brief detail extensive none
Enabled	State of the interface. Possible values are described in the “Enabled Field” section under “Common Output Fields Description” on page 1168 .	brief detail extensive none
Physical link	Status of the physical link (Up or Down).	detail extensive none
Admin	Administrative state of the interface (Up or Down).	terse
Interface index	Index number of the physical interface, which reflects its initialization sequence.	detail extensive none
Link	Status of the physical link (Up or Down).	terse
Targeting summary	Status of aggregated Ethernet links that are configured with targeted distribution (primary or backup)	extensive
Bandwidth	Bandwidth allocated to the aggregated Ethernet links that are configured with targeted distribution.	extensive
Proto	Protocol family configured on the interface.	terse
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Type	Type of interface. Software-Pseudo indicates a standard software interface with no associated hardware device.	brief detail extensive none
Link-level type	Encapsulation being used on the physical interface.	brief detail extensive
MTU	Maximum transmission unit size on the physical interface.	brief detail extensive
Clocking	Reference clock source: Internal (1) or External (2).	brief detail extensive
Speed	Speed at which the interface is running.	brief detail extensive
Device flags	Information about the physical device. Possible values are described in the “Device Flags” section under “Common Output Fields Description” on page 1168 .	brief detail extensive none
Interface flags	Information about the interface. Possible values are described in the “Interface Flags” section under “Common Output Fields Description” on page 1168 .	brief detail extensive none
Link type	Data transmission type.	detail extensive none

Table 77: show interfaces demux0 (Demux Interfaces) Output Fields (continued)

Field Name	Field Description	Level of Output
Link flags	Information about the link. Possible values are described in the “Link Flags” section under “ Common Output Fields Description ” on page 1168.	detail extensive none
Physical info	Information about the physical interface.	detail extensive
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
Current address	Configured MAC address.	detail extensive
Hardware address	Hardware MAC address.	detail extensive
Alternate link address	Backup address of the link.	detail extensive
Last flapped	Date, time, and how long ago the interface went from down to up. The format is Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago) . For example, Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago) .	detail extensive none
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive
Traffic statistics	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. • IPv6 transit statistics—Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled. <p>NOTE: These fields include dropped traffic and exception traffic, as those fields are not separately defined.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive

Table 77: show interfaces demux0 (Demux Interfaces) Output Fields (continued)

Field Name	Field Description	Level of Output
Input errors	Input errors on the interface whose definitions are as follows: <ul style="list-style-type: none"> • Errors—Sum of the incoming frame aborts and FCS errors. • Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • Framing errors—Number of packets received with an invalid frame checksum (FCS). • Runts—Number of frames received that are smaller than the runt threshold. • Giants—Number of frames received that are larger than the giant packet threshold. • Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle. • Resource errors—Sum of transmit drops. 	extensive
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	none
Output errors	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: <ul style="list-style-type: none"> • Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning. • Errors—Sum of the outgoing frame aborts and FCS errors. • Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism. • MTU errors—Number of packets whose size exceeded the MTU of the interface. • Resource errors—Sum of transmit drops. 	extensive
Output Rate	Output rate in bps and pps.	none
Logical Interface		
Logical interface	Name of the logical interface.	brief detail extensive none
Index	Index number of the logical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP interface index number for the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under "Common Output Fields Description" on page 1168 .	brief detail extensive none

Table 77: show interfaces demux0 (Demux Interfaces) Output Fields (continued)

Field Name	Field Description	Level of Output
Encapsulation	Encapsulation on the logical interface.	brief extensive none
ACI VLAN: Dynamic Profile	Name of the dynamic profile that defines the agent circuit identifier (ACI) interface set. If configured, the ACI interface set enables the underlying demux interface to create dynamic VLAN subscriber interfaces based on ACI information.	brief detail extensive none
Demux	Specific IP demultiplexing (demux) values: <ul style="list-style-type: none"> • Underlying interface—The underlying interface that the demux interface uses. • Index—Index number of the logical interface. • Family—Protocol family configured on the logical interface. • Source prefixes, total—Total number of source prefixes for the underlying interface. • Destination prefixes, total—Total number of destination prefixes for the underlying interface. • Prefix—inet family prefix. 	detail extensive none
protocol-family	Protocol family configured on the logical interface.	brief
Traffic statistics	Number and rate of bytes and packets received and transmitted on the specified interface set. <ul style="list-style-type: none"> • Input bytes, Output bytes—Number of bytes received and transmitted on the interface set. • Input packets, Output packets—Number of packets received and transmitted on the interface set. • IPv6 transit statistics—Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled. <p>NOTE: The packet and byte counts in these fields include traffic that is dropped and does not leave the router.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Local statistics	Number of transit bytes and packets received and transmitted on the local interface. <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive

Table 77: *show interfaces demux0 (Demux Interfaces) Output Fields (continued)*

Field Name	Field Description	Level of Output
Transit statistics	<p>Number and rate of bytes and packets transiting the switch.</p> <p>NOTE: The packet and byte counts in these fields include traffic that is dropped and does not leave the router.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
IPv6 Transit statistics	<p>Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.</p> <p>NOTE: The packet and byte counts in these fields include traffic that is dropped and does not leave the router.</p> <ul style="list-style-type: none"> • Input bytes—Number of bytes received on the interface. • Output bytes—Number of bytes transmitted on the interface. • Input packets—Number of packets received on the interface. • Output packets—Number of packets transmitted on the interface. 	detail extensive
Input packets	Number of packets received on the interface.	none
Output packets	Number of packets transmitted on the interface.	none
Protocol	Protocol family. Possible values are described in the “Protocol Field” section under “Common Output Fields Description” on page 1168 .	detail extensive none
MTU	Maximum transmission unit size on the logical interface.	detail extensive none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route table	Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	detail extensive
Flags	Information about protocol family flags. Possible values are described in the “Family Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive none
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	detail extensive none
Addresses, Flags	Information about the address flags. Possible values are described in the “Addresses Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive statistics none

Table 77: show interfaces demux0 (Demux Interfaces) Output Fields (continued)

Field Name	Field Description	Level of Output
Local	IP address of the logical interface.	detail extensive terse none
Remote	IP address of the remote interface.	terse
Broadcast	Broadcast address of the logical interlace.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link	Name of the physical interfaces for member links in an aggregated Ethernet bundle for a PPPoE over aggregated Ethernet configuration. PPPoE traffic goes out on these interfaces.	detail extensive none
Dynamic-profile	Name of the PPPoE dynamic profile assigned to the underlying interface.	detail extensive none
Service Name Table	Name of the PPPoE service name table assigned to the PPPoE underlying interface.	detail extensive none
Max Sessions	Maximum number of dynamic PPPoE logical interfaces that the router can activate on the underlying interface.	detail extensive none
Duplicate Protection	State of duplicate protection: On or Off . Duplicate protection prevents the activation of another dynamic PPPoE logical interface on the same underlying interface when a dynamic PPPoE logical interface for a client with the same MAC address is already active on that interface.	detail extensive none
Direct Connect	State of the configuration to ignore DSL Forum VSAs: On or Off . When configured, the router ignores any of these VSAs received from a directly connected CPE device on the interface.	detail extensive none
AC Name	Name of the access concentrator.	detail extensive none

show interfaces extensive

Syntax	show interfaces extensive
---------------	---------------------------

Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers. Command introduced in Junos OS Release 17.2 for PT1000 and PTX10008 Packet Transport Routers.
----------------------------	---

Description	Display extensive information about all interfaces configured on the router.
--------------------	--

NOTE:

- At some times, the cumulative byte counters displayed with the `show interfaces extensive` command on the 10-Gigabit Ethernet MPC with SFP+ is not always increasing and cumulative and does not give the correct results. There is a time lag in collecting these statistics, during which the display might decrease or go from a nonzero number to zero. Eventually, the counter will display the correct result.
- When the `show interfaces extensive` command is executed on a router with an MPC or a T4000 Type 5 FPC, the Input packet rejects counter of the Filter statistics field also displays statistics related to the following packet errors:
 - Invalid VLAN range
 - Tagged packet received on an untagged interface
- When the `show interfaces extensive` command is executed on an interface that is configured on a T4000 Type 5 FPC, the IPv6 transit statistics field displays:
 - Total statistics (sum of transit and local statistics) at the physical interface level
 - Transit statistics at the logical interface level
- When the `show interfaces extensive` command is executed on an aggregate interface in a T1600 Core Router, the IPv6 Input bytes is displayed for an aggregate interface. However, the IPv6 Input bytes is always zero on a member link of an aggregated bundle even when there is IPv6 transit traffic on the member link. This is because the logical interface index of the aggregate logical interface is updated but not the logical interface of the member links in the channel lookup table.
- The Output packets field under the Traffic statistics section in the output of the `show interfaces extensive` command includes both IPv4 and IPv6 packets. For example, in a scenario in which both IPv4 and IPv6 packets are being mirrored on the same interface and when you deactivate an IPv4 port-mirroring instance on the chassis, the output of the `show interfaces extensive` command shows a value in the Output packets field of the Traffic statistics section, which is the value of IPv6 packets that are mirrored and not of the IPv4 packets. This behavior is expected.
- For IQ2 PIC interfaces, the output of the `show interfaces extensive` command displays byte statistics that includes Layer 2 headers.
- If there are active OTN defects when an ISSU is performed, and the defect persists after the upgrade completes, the OTN alarm count is incremented by 1. For example, if an OTN alarm is active with a count of 1 and the defect remains after ISSU, the alarm count is incremented to 2. This behavior is expected.

Options This command has no options.

show interfaces lsi (Label-Switched Interface)

Syntax `show interfaces interface-type`
`<brief | detail | extensive | terse>`
`<descriptions>`
`<media>`
`<routing-instance instance-name>`
`<snmp-index snmp-index>`
`<statistics>`

Release Information Command introduced before Junos OS Release 7.4.

Description Display status information about the specified label-switched interface (LSI).

Options *interface-type*—On most routers, the interface type is *lt-fpc/pic/port*.

brief | detail | extensive | terse—(Optional) Display the specified level of output.

descriptions—(Optional) Display interface description strings.

media—(Optional) Display media-specific information about network interfaces.

routing-instance *instance-name*—(Optional) Display information for the specified routing instance.

snmp-index *snmp-index*—(Optional) Display information for the specified SNMP index of the interface.

statistics—(Optional) Display static interface statistics.

Required Privilege Level view

Output Fields [Table 78 on page 1669](#) lists the output fields for the **show interfaces** (logical tunnel) command. Output fields are listed in the approximate order in which they appear.

Table 78: Logical Tunnel show interfaces Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
Physical interface	Name of the physical interface.	All levels

Table 78: Logical Tunnel show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Logical interface index number, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP interface index number.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under “Common Output Fields Description” on page 1168 .	All levels
Encapsulation	Encapsulation on the logical interface.	All levels
Traffic statistics	<p>Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.</p> <ul style="list-style-type: none"> • Input bytes—Rate of bytes received on the interface. • Output bytes—Rate of bytes transmitted on the interface. • Input packets—Rate of packets received on the interface. • Output packets—Rate of packets transmitted on the interface. 	detail extensive
Local statistics	Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	detail extensive
Transit statistics	Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	detail extensive
Protocol	Protocol family configured on the logical interface, such as iso , inet6 , mpls .	detail extensive none
MTU	MTU size on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the protocol family flags. Possible values are described in the “Family Flags” section under “Common Output Fields Description” on page 1168 .	detail extensive none

show interfaces media

Syntax	show interfaces media
Release Information	Command introduced before Junos OS Release 7.4. Command introduced on PTX Series Packet Transport Routers for Junos OS Release 12.1.
Description	Display media-specific information about all configured network interfaces.
	<div> NOTE: <code>show interfaces media</code> lists details for all interfaces, whereas <code>show interfaces media interface-name</code> lists details only for the specified interface.</div>
Options	This command has no options.
Additional Information	Output from both the <code>show interfaces interface-name detail</code> and the <code>show interfaces interface-name extensive</code> commands includes all the information displayed in the output from the <code>show interfaces media</code> command.
Required Privilege Level	view
List of Sample Output	show interfaces media (SONET/SDH) on page 1673 show interfaces media (MX Series Routers) on page 1673 show interfaces media (PTX Series Packet Transport Routers) on page 1674
Output Fields	<p>The output from the <code>show interfaces media</code> command includes fields that display interface media-specific information. These fields are also included in the <code>show interfaces interface-name</code> command for each particular interface type, and the information provided in the fields is unique to each interface type.</p> <p>One field unique to the <code>show interfaces media</code> command is interface-type errors (for example, SONET errors). This field appears for channelized E3, channelized T3, channelized OC, E1, E3, SONET, T1, and T3 interfaces. The information provided in this output field is also provided in the output from the <code>show interfaces interface-name</code> command. (For example, for SONET interfaces, these fields are SONET section, SONET line, and SONET path). For a description of errors, see the chapter with the particular interface type in which you are interested.</p>

Sample Output

show interfaces media (SONET/SDH)

The following example displays the output fields unique to the **show interfaces media** command for a SONET interface (with no level of output specified):

```
user@host> show interfaces media so-4/1/2
```

```
Physical interface: so-4/1/2, Enabled, Physical link is Up
Interface index: 168, SNMP ifIndex: 495
Link-level type: PPP, MTU: 4474, Clocking: Internal, SONET mode, Speed: OC48,
Loopback: None, FCS: 16, Payload scrambler: Enabled
Device flags   : Present Running
Interface flags: Point-To-Point SNMP-Traps 16384
Link flags     : Keepalives
Keepalive settings: Interval 10 seconds, Up-count 1, Down-count 3
Keepalive: Input: 1783 (00:00:00 ago), Output: 1786 (00:00:08 ago)
LCP state: Opened
NCP state: inet: Not-configured, inet6: Not-configured, iso: Not-configured,
mpls: Not-configured
CHAP state: Not-configured
CoS queues    : 8 supported
Last flapped  : 2005-06-15 12:14:59 PDT (04:31:29 ago)

  Link type      : Full-Duplex  
  Current address: 00:80:f9:25:00:1b, Hardware address: 00:80:f9:25:00:1b  
  Last flapped   : Never  
  Input packets  : 215151  
  Output packets: 72
```

show interfaces terse

Syntax	show interfaces terse
Release Information	Command introduced before Junos OS Release 7.4. Command introduced on PTX Series Packet Transport Routers for Junos OS Release 12.1.
Description	Display summary information about interfaces.
Options	This command has no options.
Additional Information	Interfaces are always displayed in numerical order, from the lowest to the highest FPC slot number. Within that slot, the lowest PIC slot is shown first. On an individual PIC, the lowest port number is always first.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • <i>Examples: Using Logical Systems</i>
List of Sample Output	show interfaces terse on page 1676 show interfaces terse (TX Matrix Plus Router) on page 1676 show interfaces terse (PTX Series Packet Transport Routers) on page 1677
Output Fields	Table 79 on page 1675 lists the output fields for the show interfaces terse command. Output fields are listed in the approximate order in which they appear.

Table 79: show interfaces terse Output Fields

Field Name	Field Description
Interface	Interface name.
Admin	Whether the interface is turned on (up) or off (down).
Link	Link state: up or down .
Proto	Protocol family configured on the logical interface. A logical interface on a router that supports Ethernet OAM always shows the multiservice protocol.
Local	Local IP address of the logical interface.
Remote	Remote IP address of the logical interface.

clear ancp neighbor

Syntax	<pre>clear ancp neighbor <ip-address <i>ip-address</i>> <system-name <i>mac-address</i>></pre>
Release Information	Command introduced in Junos OS Release 9.4.
Description	<p>Clear the ANCP agent connection with all ANCP neighbors or with the specified ANCP neighbor. This command deletes information for subscribers associated with the neighbor, causing the adjusted traffic rates to revert to the configured rate for the subscriber interfaces. The neighbor remains configured (its administrative state is <i>enabled</i>) and can reestablish adjacencies.</p> <p>This command initiates logout of ANCP-triggered dynamic VLAN sessions on the physical interface associated with the specified neighbor; conventionally autosensed dynamic VLAN sessions and their associated logical interfaces are not affected.</p>
Options	<p>none—Clear all ANCP neighbors.</p> <p>ip-address <i>ip-address</i>—(Optional) Clear the ANCP neighbor specified by the IP address.</p> <p>system-name <i>mac-address</i>—(Optional) Clear the ANCP neighbor specified by the MAC address.</p>
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• show ancp neighbor on page 1696
List of Sample Output	clear ancp neighbor on page 1680 show ancp neighbor on page 1681
Output Fields	When you enter this command, you are provided no feedback on the status of your request. You can enter the show ancp neighbor command before and after clearing the ANCP neighbors to verify the clear operation.

Sample Output

clear ancp neighbor

```
user@host> clear ancp neighbor
```

show ancp neighbor

The following sample output displays the connections with ANCP neighbors before and after the **clear ancp neighbor** command was issued.

```
user@host> show ancp neighbor
```

IP Address	MAC Address	State	Subscriber Count	Capabilities

clear ancp statistics

Syntax	<pre>clear ancp statistics <ip-address <i>ip-address</i>> <system-name <i>mac-address</i>></pre>
Release Information	Command introduced in Junos OS Release 13.3.
Description	Clear current statistics accumulated by the ANCP agent for all ANCP neighbors or the specified neighbor.
Options	<p>none—Clear all ANCP statistics.</p> <p>ip-address <i>ip-address</i>—(Optional) Clear statistics for the ANCP neighbor specified by the IP address.</p> <p>system-name <i>mac-address</i>—(Optional) Clear statistics for the ANCP neighbor specified by the MAC address.</p>
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• show ancp neighbor on page 1696

clear ancp subscriber

Syntax

```
clear ancp subscriber
<identifier identifier>
<ip-address ip-address>
<system-name mac-address>
```

Release Information Command introduced in Junos OS Release 11.4.

Description Clear the ANCP agent connection with all ANCP subscribers or with the specified ANCP subscriber. This command deletes information for the subscribers, causing the adjusted traffic rate to revert to the configured rate for the subscriber interface, but otherwise has no affect on ANCP neighbors.

Options **none**—Clear all ANCP subscribers.

identifier *identifier-string*—(Optional) Clear the ANCP subscriber identified by the access loop ID.

ip-address *ip-address*—(Optional) Clear all ANCP subscribers on the neighbor specified by the IP address.

system-name *mac-address*—(Optional) Clear all ANCP subscribers on the neighbor specified by the MAC address.

Required Privilege Level clear

clear ancp subscriber

```
user@host> clear ancp subscriber
```

request ancp oam interface

Syntax	request ancp oam interface <i>(interface-name interface-set set-name)</i> <count <i>count</i> > <timeout <i>duration</i> >
Release Information	Command introduced in Junos OS Release 11.4.
Description	Trigger the access node to run a loopback test on the local loop between the access node and the customer premises equipment. You must specify either an ANCP interface or an ANCP interface set. The access node responds to the NAS with the results of the test.
Options	<p>interface-name—Name of the ANCP interface on whose local loop the loopback test is run.</p> <p>interface-set set-name—Name of the ANCP interface set on whose local loop the loopback test is run.</p> <p>count count—(Optional) Number of times a loopback message is sent on the local loop. Range: 1 through 32. Default: 1.</p> <p>timeout duration—(Optional) Period of time in seconds that the NAS waits for a response to the OAM request. Range: 0 through 255. Default: 5.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • <i>Triggering ANCP OAM to Test the Local Loop</i>

show ancp cos

Syntax `show ancp cos`
`<identifier identifier>`
`<last-update>`
`<pending-update>`

Release Information Command introduced in Junos OS Release 9.4.

Description Display information about the CoS state for subscriber traffic.

Options `identifier identifier`—(Optional) Display information about the local loops for the specified access identifier.

`last-update`—(Optional) Display the most recently updated CoS information.

`pending-update`—(Optional) Display the pending update of CoS information.

Required Privilege Level view

Output Fields [Table 80 on page 1691](#) lists the output fields for the **show ancp cos** command. Output fields are listed in the approximate order in which they appear.

Table 80: show ancp cos Output Fields

Field Name	Field Description
Per-DSL CoS adjustment	Adjustment values applied by the ANCP agent to the actual downstream rates and frame overhead for frame-mode DSL types. The agent then reports the adjusted rates to CoS to establish a shaping rate for the CoS node that corresponds to the subscriber access line.
QoS Adjust Flag	State of QoS adjust: <ul style="list-style-type: none"> • TRUE—The ANCP agent is enabled to adjust the actual downstream data rates and frame overhead and report the adjusted values to CoS. • FALSE—The ANCP agent is not enabled to adjust and report values to CoS.

Table 80: show ancp cos Output Fields (continued)

Field Name	Field Description
ADSL bytes	Number of bytes by which the actual ADSL downstream cell overhead is adjusted before reporting it to CoS.
ADSL2 bytes	Number of bytes by which the actual ADSL2 downstream cell overhead is adjusted before reporting it to CoS.
ADSL2-PLUS bytes	Number of bytes by which the actual ADSL2+ downstream cell overhead is adjusted before reporting it to CoS.
SDSL overhead adjusted	Percentage by which the actual SDSL downstream rate is adjusted before reporting it to CoS.
SDSL bytes	Number of bytes by which the actual SDSL downstream frame overhead is adjusted before reporting it to CoS.
OTHER overhead adjusted	Percentage by which the actual OTHER downstream rate is adjusted before reporting it to CoS.
OTHER bytes	Number of bytes by which the actual OTHER downstream frame overhead is adjusted before reporting it to CoS.
VDSL overhead adjusted	Percentage by which the actual VDSL downstream rate is adjusted before reporting it to CoS.
VDSL bytes	Number of bytes by which the actual VDSL downstream frame overhead is adjusted before reporting it to CoS.
VDSL2 overhead adjusted	Percentage by which the actual VDSL2 downstream rate is adjusted before reporting it to CoS.
VDSL2 bytes	Number of bytes by which the actual VDSL2 downstream frame overhead is adjusted before reporting it to CoS.
Per-DSL adjustment for reporting	Adjustment values applied by the ANCP agent to the actual downstream rates for individual DSL types to account for traffic overhead. The agent then reports the adjusted rates to AAA.
ADSL adjustment factor	Percentage by which the actual ADSL downstream rate is adjusted before reporting it to AAA.
ADSL2 adjustment factor	Percentage by which the actual ADSL2 downstream rate is adjusted before reporting it to AAA.
ADSL2+ adjustment factor	Percentage by which the actual ADSL2+ downstream rate is adjusted before reporting it to AAA.
VDSL adjustment factor	Percentage by which the actual VDSL downstream rate is adjusted before reporting it to AAA.

Table 80: show ancp cos Output Fields (continued)

Field Name	Field Description
VDSL2 adjustment factor	Percentage by which the actual VDSL2 downstream rate is adjusted before reporting it to AAA.
SDSL adjustment factor	Percentage by which the actual SDSL downstream rate is adjusted before reporting it to AAA.
OTHER adjustment factor	Percentage by which the actual OTHER downstream rate is adjusted before reporting it to AAA.
Keepalive Timer	Interval between the keepalive messages that the ANCP agent sends to CoS.
Cos State	State of the interaction between the ANCP agent and CoS: <ul style="list-style-type: none"> • ANCPD_COS_CONNECT_NEEDED • ANCPD_COS_CONNECT_PENDING • ANCPD_COS_CONNECT_DONE • ANCPD_COS_SESSION_SENT • ANCPD_COS_WRITE_READY
Connect Time	Time at which the ANCP agent connected to CoS; useful for debugging.
Session Time	Time at which the ANCP agent sent a session connect message to CoS; useful for debugging.
Routing Instance Time	Time at which the ANCP agent sent the routing instance to CoS; useful for debugging.
Keepalive Time	Time at which the last keepalive message was sent.
Update Time	Time at which the shaping rate was last updated.
Type	Subscriber access type: ifl indicates that a single VLAN carries subscriber traffic and iflset indicates that a set of VLANs carries subscriber traffic.
Name	System-wide name of the particular subscriber access.
Index	Access identifier.
Pending Update	Actual downstream data rate to be applied next to this local loop, in Kbps.
Last Update	Adjusted downstream data rate last reported to CoS by the ANCP agent for this local loop, in Kbps.

show ancp neighbor

Syntax	<pre>show ancp neighbor <brief detail> <ip-address <i>ip-address</i> <system-name <i>mac-address</i>></pre>
Release Information	Command introduced in Junos OS Release 9.4.
Description	Display information about all ANCP neighbors or the specified ANCP neighbor, regardless of operational state.
Options	<p>brief detail—(Optional) Display the specified level of detail.</p> <p>ip-address <i>ip-address</i> —(Optional) Display information about the neighbor (access node) specified by the IP address.</p> <p>system-name <i>mac-address</i>—(Optional) Display information about the neighbor (access node) specified by the MAC address.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show ancp cos on page 1691 • show ancp subscriber on page 1709
List of Sample Output	show ancp neighbor on page 1699 show ancp neighbor detail on page 1700 show ancp neighbor ip-address on page 1701 show ancp neighbor system-name on page 1702
Output Fields	Table 81 on page 1696 lists the output fields for the show ancp neighbor command. Output fields are listed in the approximate order in which they appear.

Table 81: show ancp neighbor Output Fields

Field Name	Field Description	Level of Output
Version	<p>Version of the ANCP implementation:</p> <ul style="list-style-type: none"> • 0x31—General Switch Management Protocol (GSMP) version 3, sub-version 1; ANCP version before <i>RFC 6320, Protocol for Access Node Control Mechanism in Broadband Networks</i>. • 0x32—ANCP version 1, defined in <i>RFC 6320, Protocol for Access Node Control Mechanism in Broadband Networks</i>. 	brief detail none

Table 81: show ancp neighbor Output Fields (continued)

Field Name	Field Description	Level of Output
IP Address	IP address of the ANCP neighbor.	brief detail none
PartId	Number that associates the ANCP message with a specific partition.	brief none
State	Operational state of the ANCP adjacency: <ul style="list-style-type: none"> Configured—The neighbor has been configured, but has never been in the Established state. An asterisk (*) is prefixed to the neighbor entry for this state. Establishing—Adjacency negotiations are in progress for the neighbor. An asterisk (*) is prefixed to the neighbor entry for this state. This state is rarely seen because the adjacency is established so quickly. Established—Adjacency negotiations have succeeded for the neighbor and an ANCP session has been established. Not Estblshed—Not Established; adjacency negotiations are ready to begin. Indicates that this neighbor previously had been in the Established state; that is, it has lost a previously established adjacency. An asterisk (*) is prefixed to the neighbor entry for this state. 	All levels
Time	How long the adjacency has been up in one of the following formats: <ul style="list-style-type: none"> <i>nwndnh</i>—number of weeks, days, and hours <i>nd hh:mm:ss</i>—number of days, hours, minutes, and seconds 	brief detail none
Subscriber Count	Number of subscribers associated with the ANCP neighbor (access local loop).	brief none
Capabilities	Negotiated ANCP capability: <ul style="list-style-type: none"> Topo—Topology discovery. OAM—Performance of local Operations Administration Maintenance (OAM) procedures on an access loop controlled by the router. 	All levels
System Name	MAC address of the ANCP neighbor.	detail
TCP Port	TCP port on which ANCP messages are exchanged.	detail
System Instance	Number identifying the ANCP link instance from the edge device's perspective.	detail
Peer Instance	Number identifying the ANCP instance from the access node's perspective. This number is unique and changes when the node or link comes back up after going down.	detail
Timer	Adjacency timer value advertised by the ANCP peer in 100 ms increments; the interval between ANCP ACK messages. This value remains constant for the duration of an ANCP session.	detail

Table 81: show ancp neighbor Output Fields (continued)

Field Name	Field Description	Level of Output
Partition Type	Number that identifies whether partitions are used and how the ID is negotiated: <ul style="list-style-type: none"> 0—No partition. 1—Fixed partition requested. 2—Fixed partition assigned. 	detail
Partition Flag	Number that specifies the type of partition requested: 1 (new adjacency) or 2 (recovered adjacency).	detail
Partition Identifier	Number that identifies a logical partition of an access node with which the ANCP agent has formed an adjacency. A value of zero indicates that the agent supports each neighbor on an IP address over a single TCP session with a partition ID of zero. This is the default support case. A nonzero value indicates that the agent supports each neighbor on an IP address over a single TCP session with a nonzero partition ID.	detail
Partition Adjacencies	Number of adjacencies that share the partition.	detail
Dead Timer	Remaining period that the edge device waits for adjacency packets from a neighbor before declaring the neighbor to be down. The maximum dead time value is three times the configured adjacency timer value. This field displays the current value based on the time that the last adjacency packet was received.	detail
Received Syn Count	Number of synchronization messages received from neighbors to maintain adjacencies.	detail
Received Synack Count	Number of synchronization acknowledgment messages received from neighbors in response to the node's synchronization messages.	detail
Received Rstack Count	Number of messages received from neighbors indicating that the link to the neighbor needs to be reset.	detail
Received Ack Count	Number of acknowledgment messages periodically received from neighbors after an adjacency has been established.	detail
Received Port Up Count	Number of status messages received from neighbors indicating that a port has transitioned to the up state.	detail
Received Port Down Count	Number of status messages received from neighbors indicating that a port has transitioned to the down state.	detail
Received Generic Resp Count	Number of generic response messages received from neighbors.	detail
Received Adjacency Update Count	Number of adjacency update messages received from neighbors.	detail
Received OAM Count	Number of OAM responses received from neighbors in reply to request commands.	detail

Table 81: show ancp neighbor Output Fields (continued)

Field Name	Field Description	Level of Output
Received Other Count	Number of all other ANCP message packets received from neighbors that do not fit into one of the other categories.	detail
Sent Syn Count	Number of synchronization messages sent to neighbors to maintain adjacencies.	detail
Sent Synack Count	Number of synchronization acknowledgment messages sent to neighbors in response to the their synchronization messages.	detail
Sent Rstack Count	Number of messages sent to neighbors indicating that the link to the neighbor needs to be reset.	detail
Sent Ack Count	Number of acknowledgment messages periodically sent to neighbors after an adjacency has been established.	detail
Sent Generic Resp Count	Number of generic response messages sent to neighbors.	detail
Sent OAM Count	Number of OAM request commands sent to neighbors.	detail
Max Discovery Limit Exceed Count	Number of times that the maximum number of discovery table entries accepted from the neighbor has been exceeded.	detail
Result Codes	<p>Number of generic response messages sent to neighbors that include each of the following result codes:</p> <ul style="list-style-type: none"> • Invalid Request Message Count—A properly formed request message violated the protocol because of timing (such as a race condition) or direction of transmission. • Specified Port(s) Down Count—One or more of the specified ports are down because of a state mismatch between the router and an ANCP control application. • Out of Resources Count—ANCP is out of resources, probably not related to the access lines. This result code is sent only by an access node. • Request Msg Not Implemented Count— • Malformed Msg Count—Message is malformed because it was corrupted in transit or there was an implementation error at either end of the connection. • TLV Missing Count—One or more mandatory TLVs was missing from a request. • Invalid TLV Contents Count—The contents of one or more TLVs in the request do not match its required specification. • Non-Existent Port(s) Count—One or more of the ports specified in a request do not exist, possibly because of a configuration mismatch between the access node and the router or AAA. 	detail

show ancp statistics

Syntax `show ancp statistics`
`<ip-address ip-address>`
`<system-name mac-address>`

Release Information Command introduced in Junos OS Release 13.3.

Description Display statistics for all ANCP neighbors (access nodes) or the specified ANCP neighbor.

Options **none**—Display statistics for all ANCP neighbors, including global statistics not show for individual neighbors.

ip-address *ip-address*—(Optional) Display statistics for only the neighbor with the specified IP address.

system-name *mac-address*—(Optional) Display statistics for only the neighbor with the specified MAC address.

Required Privilege Level view

List of Sample Output [show ancp statistics on page 1706](#)
[show ancp statistics ip-address on page 1707](#)
[show ancp statistics system-name on page 1707](#)

Output Fields [Table 82 on page 1704](#) lists the output fields for the **show ancp statistics** command. Output fields are listed in the approximate order in which they appear.

Table 82: show ancp statistics Output Fields

Field Name	Field Description
Number of neighbors	Total count of ANCP neighbors.
Number of subscribers	Total count of ANCP subscribers.
Accept Count	Number of neighbor TCP/IP sessions accepted on listener socket.

Table 82: show ancp statistics Output Fields (continued)

Field Name	Field Description
Accept Fail Count	Number of neighbor TCP/IP sessions that failed due to one of the following causes: session already exists, maximum number of ANCP connections exceeded, creation of session or neighbor failed, or protocol start failed.
No Config Accept Deny Count	Number of neighbor TCP/IP sessions that failed because the neighbor was not configured.
Received Syn Count	Number of synchronization messages received from neighbors to maintain adjacencies.
Received Synack Count	Number of synchronization acknowledgment messages received from neighbors in response to the node's synchronization messages.
Received Rstack Count	Number of messages received from neighbors indicating that the link to the neighbor needs to be reset.
Received Ack Count	Number of acknowledgment messages periodically received from neighbors after an adjacency has been established.
Received Port Up Count	Number of status messages received from neighbors indicating that a port has transitioned to the up state.
Received Port Down Count	Number of status messages received from neighbors indicating that a port has transitioned to the down state.
Received Generic Resp Count	Number of generic response messages received from neighbors.
Received Adjacency Update Count	Number of adjacency update messages received from neighbors.
Received OAM Count	Number of OAM responses received from neighbors in reply to request commands.
Received Other Count	Number of all other ANCP message packets received from neighbors that do not fit into one of the other categories.
Sent Syn Count	Number of synchronization messages sent to neighbors to maintain adjacencies.
Sent Synack Count	Number of synchronization acknowledgment messages sent to neighbors in response to the their synchronization messages.
Sent Rstack Count	Number of messages sent to neighbors indicating that the link to the neighbor needs to be reset.
Sent Ack Count	Number of acknowledgment messages periodically sent to neighbors after an adjacency has been established.
Sent Generic Resp Count	Number of generic response messages sent to neighbors.

Table 82: show ancpl statistics Output Fields (continued)

Field Name	Field Description
Sent OAM Count	Number of OAM request commands sent to neighbors.
Result Codes	<p>Number of generic response messages sent to neighbors that include each of the following result codes:</p> <ul style="list-style-type: none"> • Invalid Request Message Count—A properly formed request messages violated the protocol because of timing (such as a race condition) or direction of transmission. • Specified Port(s) Down Count—One or more of the specified ports are down because of a state mismatch between the router and an ANCP control application. • Out of Resources Count—the ANCP agent is out of resources, probably not related to the access lines. This result code is sent only by an access node. • Request Msg Not Implemented Count— • Malformed Msg Count—Message is malformed because it was corrupted in transit or there was an implementation error at either end of the connection. • TLV Missing Count—One or more mandatory TLVs was missing from a request. • Invalid TLV Contents Count—The contents of one or more TLVs in the request do not match its required specification. • Non-Existent Port(s) Count—One or more of the ports specified in a request do not exist, possibly because of a configuration mismatch between the access node and the router or AAA.

show ancp subscriber

Syntax `show ancp subscriber`
`<brief | detail>`
`<access-aggregation-circuit-id circuit-identifier>`
`<identifier identifier>`
`<ip-address ip-address>`
`<system-name mac-address>`

Release Information Command introduced in Junos OS Release 9.4.
neighbor option replaced with **ip-address** in Junos OS Release 16.1.
system-name option introduced in Junos OS Release 16.1.
access-aggregation-circuit-id option introduced in Junos OS Release 18.4R1.

Description Display information about active subscribers regardless of the subscriber's operational state, for all subscribers (local access loops), the subscriber associated with the access line specified by an ACI, or the subscriber associated with the specified ANCP neighbor (access node).

After an ancpd restart, this command displays orphaned entries (marked with an **o**) for subscriber sessions that were established before the restart but which have not yet been reestablished. As sessions are reestablished, the number of orphaned entries displayed by the command decreases. The number reaches zero when all sessions are reestablished or when the orphaned-interface timer expires.

Options **none**—Display information about all subscribers.

brief | detail—(Optional) Display the specified level of detail.

access-aggregation-circuit-id *circuit-identifier*—(Optional) Display information about ANCP subscribers whose Access-Aggregation-Circuit-ID-ASCII attribute (TLV 0x0003) matches the specified value.

A *circuit-identifier* that begins with the **#** character indicates a backhaul line identifier. You can specify a wildcard (*) anywhere in the string.

identifier *identifier*—(Optional) Display information about the subscriber associated with the access line (ACI) specified by the access identifier.

ip-address *ip-address*—(Optional) Display information about the subscribers connected to the access node specified by the IP address.

system-name *mac-address*—(Optional) Display information about the subscribers connected to the access node specified by the MAC address.

Output Fields Table 83 on page 1710 lists the output fields for the **show ancp subscriber** command. Output fields are listed in the approximate order in which they appear.

Table 83: show ancp subscriber Output Fields

Field Name	Field Description	Level of Output
Loop Identifier	<p>Access loop identifier as sent by the access node and configured to map the subscriber to an interface.</p> <p>An asterisk (*) indicates that the information might be stale due to receiving a Port Down message with a DSL Line State of Idle.</p> <p>Two asterisks (**) indicate that the neighbor associated with the subscriber has lost its adjacency. In this case, the DSL Line State might be Established.</p> <p>An o indicates that the entry is for an orphaned interface and represents a previously established subscriber session that has not been reestablished after an ancpd restart.</p> <p>The number of orphaned entries decreases as the ANCP neighbors reestablish adjacencies and the protocol subscriber sessions are reestablished. The command output indicates this by removing the o marker.</p> <p>Eventually the number of orphaned entries reaches zero, because either all the adjacencies and subscriber sessions have been reestablished or any remaining orphaned entries are removed when the orphaned-interface timer expires.</p>	brief none
DSL Line State	State of the DSL line: Idle , Showtime , or Silent .	brief detail
Access Type	Type of access line employed by the access node: ADSL1 , ADSL2 , ADSL2+ , VDSL1 , VDSL2 , SDSL , G.fast , VDSL2 Annex Q , SDSL bonded , VDSL2 bonded , G.fast bonded VDSL2 Annex Q bonded or OTHER .	brief detail none
Interface	Name of the interface set or logical interface.	brief detail none

Table 83: show ancp subscriber Output Fields (continued)

Field Name	Field Description	Level of Output
Rate Kbps	Actual downstream data rate for this local loop.	brief none
Neighbor	IP address of ANCP neighbor (access node).	brief none
Access Loop Circuit Identifier	<p>Access loop circuit identifier as sent by the access node and configured to map the subscriber to an interface.</p> <p>An asterisk (*) indicates that the information might be stale due to receiving a Port Down message with a DSL Line State of Idle.</p> <p>Two asterisks (**) indicate that the neighbor associated with the subscriber has lost its adjacency. In this case, the DSL Line State might be Established.</p>	detail
Neighbor IP Address	IP address of the ANCP neighbor (access node).	detail
Aggregate Circuit Identifier	ASCII identifier for the subscriber access loop; value of the Access-Aggregation-Circuit-ID-ASCII attribute (TLV 0x0003).	detail
Aggregate Circuit Identifier Binary	Binary identifier for the VLAN circuit ID.	detail
Tech Type	Type of technology employed by the subscriber. Currently Junos OS supports DSL technology type only.	detail
DSL Line Data Link	Data link protocol employed on the access loop: AAL5 or Ethernet .	detail
DSL Line Encapsulation	<p>Encapsulation type on the access loop, for Ethernet only:</p> <ul style="list-style-type: none"> • 0—NA, type not conveyed • 1—Untagged Ethernet • 2—Single-tagged Ethernet 	detail
DSL Line Encapsulation Payload	<p>Payload carried across the access loop:</p> <ul style="list-style-type: none"> • 0—NA, type not conveyed • 1—PPPoA LLC • 2—PPPoA null • 3—IPoA LLC • 4—IPoA null • 5—Ethernet over AAL5 LLC with FCS • 6—Ethernet over AAL5 LLC without FCS • 7—Ethernet over AAL5 null with FCS • 8—Ethernet over AAL5 null without FCS 	detail

Table 83: show ancp subscriber Output Fields (continued)

Field Name	Field Description	Level of Output
Interface Type	Type of interface employed for subscriber traffic: ifl for a single VLAN or interface-set for a configured group of VLANs.	detail
Actual Net Data Upstream	Actual upstream data rate for this local loop, in Kbps.	detail
Actual Net Data Downstream	Actual downstream data rate for this local loop, in Kbps.	detail
Minimum Net Data Upstream	Minimum upstream data rate desired by the operator for this local loop, in Kbps.	detail
Minimum Net Data Downstream	Minimum downstream data rate desired by the operator for this local loop, in Kbps.	detail
Maximum Net Data Upstream	Maximum upstream data rate desired by the operator for this local loop, in Kbps.	detail
Maximum Net Data Downstream	Maximum downstream data rate desired by the operator for this local loop, in Kbps.	detail
Attainable Net Data Upstream	Maximum attainable upstream data rate for this local loop, in Kbps.	detail
Attainable Net Data Downstream	Maximum attainable downstream data rate for this local loop, in Kbps.	detail
Minimum Low Power Data Downstream	Minimum downstream data rate desired by the operator for this local loop in low power state, in Kbps.	detail
Minimum Low Power Data Upstream	Minimum upstream data rate desired by the operator for this local loop in low power state, in Kbps.	detail
Maximum Interleave Delay Downstream	Maximum interleaving delay for downstream data, in milliseconds.	detail
Maximum Interleave Delay Upstream	Maximum interleaving delay for upstream data, in milliseconds.	detail
Actual Interleave Delay Downstream	Actual interleaving delay for downstream data, in milliseconds.	detail
Actual Interleave Delay Upstream	Actual interleaving delay for upstream data, in milliseconds.	detail

show ancp summary

Syntax	show ancp summary
Release Information	Command introduced in Junos OS Release 13.1.
Description	Display a summary of the counts and states for all ANCP neighbors and subscribers.
Options	This command has no options.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show ancp neighbor on page 1696 • show ancp summary neighbor on page 1718 • show ancp subscriber on page 1709 • show ancp summary subscriber on page 1720
List of Sample Output	show ancp summary on page 1717
Output Fields	Table 84 on page 1716 lists the output fields for the show ancp summary command. Output fields are listed in the approximate order in which they appear.

Table 84: show ancp summary Output Fields

Field Name	Field Description
Configured	Number of ANCP neighbors in the Configured state; that is, that have been configured but never established.
Establishing	Number of ANCP neighbors in the Establishing state; that is, where negotiations are in progress.
Established	Number of ANCP neighbors in the Established state; that is, where negotiations have succeeded and the ANCP session has been established.
Not Estblshd	Number of ANCP neighbors in the Not Estblshd state; that is, that have lost a previously established adjacency and are ready to begin negotiations.
Total	Total number of ANCP neighbors; sum of neighbors in the Configured , Establishing , Established , and Not Estblshd states.
Showtime	Number of DSL lines in Showtime state.
Idle	Number of DSL lines in Idle state.

Table 84: show ancp summary Output Fields (continued)

Field Name	Field Description
Silent	Number of DSL lines in Silent state.
Unknown	Number of DSL lines where the state is not Showtime , Idle , or Silent .
Total	Total number of DSL lines (ANCP subscribers); sum of DSL lines in the Showtime , Idle , Silent , and Unknown states.

Sample Output

show ancp summary

```
user@host> show ancp summary
```

Neighbors Summary:

Configured	Establishing	Established	Not Established	Total
22	0	2	0	24

Subscribers Summary:

Showtime	Idle	Silent	Unknown	Total
4	0	0	0	4

show ancp summary neighbor

Syntax	<code>show ancp summary neighbor</code> <code><ip-address <i>ip-address</i> system-name <i>mac-address</i>></code>
Release Information	Command introduced in Junos OS Release 13.1.
Description	Display a summary of the counts and states for all ANCP neighbors and of the neighbor's subscribers when you specify a particular neighbor.
Options	ip-address <i>ip-address</i> —(Optional) IP address of the ANCP neighbor (access node). system-name <i>mac-address</i> —(Optional) MAC address of the ANCP neighbor (access node).
Required Privilege Level	view

CHAPTER 16

BFD Operational Commands

- `clear bfd adaptation`
- `clear bfd session`
- `show bfd session`

clear bfd adaptation

Syntax	<pre>clear bfd adaptation <all> <address session-address> <discriminator discr-number></pre>
Release Information	Command introduced before Junos OS Release 7.4.
Description	<p>Clear adaptation for Bidirectional Forwarding Detection (BFD) sessions. BFD is a simple hello mechanism that detects failures in a network. Configured BFD interval timers can change, adapting to network situations. Use this command to return BFD interval timers to their configured values.</p> <p>The clear bfd adaptation command is hitless, meaning that the command does not affect traffic flow on the routing device.</p>
Options	<p>all—Clear adaptation for all BFD sessions.</p> <p>address session-address—(Optional) Clear adaptation for all BFD sessions matching the specified address.</p> <p>discriminator discr-number—(Optional) Clear adaptation for the local BFD session matching the specified discriminator.</p>
Additional Information	For more information, see the description of the bfd-liveness-detection configuration statement in the <i>Junos Routing Protocols Configuration Guide</i> .
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• show bfd session on page 1727
List of Sample Output	clear bfd adaptation on page 1724
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear bfd adaptation

```
user@host> clear bfd adaptation
```

clear bfd session

List of Syntax	Syntax on page 1725 Syntax (EX Series Switch and QFX Series) on page 1725
Syntax	<pre>clear bfd session <all> <address session-address> <discriminator discr-number> <logical-system (all logical-system-name)></pre>
Syntax (EX Series Switch and QFX Series)	<pre>clear bfd session <all> <address session-address> <discriminator discr-number></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 12.1 for the QFX Series.</p>
Description	Drop one or more Bidirectional Forwarding Detection (BFD) sessions.
Options	<p>all—Drop all BFD sessions.</p> <p>address session-address—(Optional) Drop all BFD sessions matching the specified address.</p> <p>discriminator discr-number—(Optional) Drop the local BFD session matching the specified discriminator.</p> <p>logical-system (all logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none"> • show bfd session on page 1727
List of Sample Output	clear bfd session all on page 1725
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear bfd session all

```
user@host> clear bfd session all
```

show bfd session

List of Syntax [Syntax on page 1727](#)
 [Syntax \(EX Series Switch and QFX Series\) on page 1727](#)

Syntax show bfd session
 <brief | detail | extensive | summary>
 <address *address*>
 <client rsvp-oam (brief | detail | extensive | summary) | vpls-oam (brief | detail | extensive |
 instance *instance-name* | summary)>
 <discriminator *discriminator*>
 <logical-system (all | *logical-system-name*)>
 <prefix *address*>
 <subscriber (address *destination-address* | discriminator *discriminator* | extensive)>

Syntax (EX Series Switch and QFX Series) show bfd session
 <brief | detail | extensive | summary>
 <address *address*>
 <client rsvp-oam (brief | detail | extensive | summary) | vpls-oam (brief | detail | extensive |
 instance *instance-name* | summary)>
 <discriminator *discriminator*>
 <prefix *address*>

Release Information Command introduced before Junos OS Release 7.4.
 Options **discriminator** and **address** introduced in Junos OS Release 8.2.
 Option **prefix** introduced in Junos OS Release 9.0.
 Command introduced in Junos OS Release 12.1 for the QFX Series.
 Option **client** introduced in Junos OS Release 12.3R3.
 Option **subscriber** introduced in Junos OS Release 15.1 for the MX Series.

Description Display information about active Bidirectional Forwarding Detection (BFD) sessions.

Options **none**—(Same as **brief**) Display information about active BFD sessions.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

address *address*—(Optional) Display information about the BFD session for the specified neighbor address.

client rsvp-oam
 (brief | detail | extensive | summary)
 | vpls-oam
 (brief | detail | extensive | instance *instance-name* | summary)—(Optional) Display information about RSVP-OAM or VPLS-OAM BFD sessions in the specified level of output. For VPLS-OAM, display the specified level of output or display information about all of the BFD sessions for the specified VPLS routing instance.

discriminator *discriminator*—(Optional) Display information about the BFD session using the specified local discriminator.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

<subscriber (address *destination-address* | discriminator *discriminator* | extensive)>—(Optional) Display information about all BFD sessions for subscribers, or for a single BFD subscriber session with a particular destination address, or with a particular denominator.

Output Fields

[Table 87 on page 1729](#) describes the output fields for the **show bfd session** command. Output fields are listed in the approximate order in which they appear.

Table 87: show bfd session Output Fields

Field Name	Field Description	Level of Output
Address	Address on which the BFD session is active.	brief detail extensive none
State	State of the BFD session: Up , Down , Init (initializing), or Failing .	brief detail extensive none
Interface	Interface on which the BFD session is active.	brief detail extensive none
Detect Time	Negotiated time interval, in seconds, used to detect BFD control packets.	brief detail extensive none
Transmit Interval	Time interval, in seconds, used by the transmitting system to send BFD control packets.	brief detail extensive none
Multiplier	Negotiated multiplier by which the time interval is multiplied to determine the detection time for the transmitting system.	detail extensive
Session up time	How long a BFD session has been established.	detail extensive
Client	Protocol or process for which the BFD session is active: ISIS , OSPF , DHCP , Static , or VGD .	detail extensive
TX interval	Time interval, in seconds, used by the host system to transmit BFD control packets.	brief detail extensive none
RX interval	Time interval, in seconds, used by the host system to receive BFD control packets.	brief detail extensive none
Authenticate	Indicates that BFD authentication is configured.	detail extensive
keychain	Name of the security authentication keychain being used by a specific client. BFD authentication information for a client is provided in a single line and includes the keychain , algo , and mode parameters. Multiple clients can be configured on a BFD session.	extensive
algo	BFD authentication algorithm being used for a specific client: keyed-md5 , keyed-sha-1 , meticulous-keyed-md5 , meticulous-keyed-sha-1 , or simple-password . BFD authentication information for a client is provided in a single line and includes the keychain , algo , and mode parameters. Multiple clients can be configured on a BFD session.	extensive

Table 87: show bfd session Output Fields (continued)

Field Name	Field Description	Level of Output
mode	<p>Level of BFD authentication enforcement being used by a specific client: strict or loose. Strict enforcement indicates that authentication is configured at both ends of the session (the default). Loose enforcement indicates that one end of the session might not be authenticated.</p> <p>BFD authentication information for a client is provided in a single line and includes the keychain, algo, and mode parameters. Multiple clients can be configured on a BFD session.</p>	extensive
Local diagnostic	<p>Local diagnostic information about failing BFD sessions.</p> <p>Following are the expected values for Local Diagnostic output field:</p> <ul style="list-style-type: none"> • None—No diagnostic • CtlExpire—Control detection time expired • EchoExpire—Echo detection time expired • NbrSignal—Neighbor signalled session down • FwdPlaneReset—Forwarding plane reset • PathDown—Path down • ConcatPathDown—Concatenated path down • AdminDown—Administratively down 	detail extensive
Remote diagnostic	<p>Remote diagnostic information about failing BFD sessions.</p> <p>Following are the expected values for Remote Diagnostic output field:</p> <ul style="list-style-type: none"> • None—No diagnostic • CtlExpire—Control detection time expired • EchoExpire—Echo detection time expired • NbrSignal—Neighbor signalled session down • FwdPlaneReset—Forwarding plane reset • PathDown—Path down • ConcatPathDown—Concatenated path down • AdminDown—Administratively down 	detail extensive
Remote state	Reports whether the remote system's BFD packets have been received and whether the remote system is receiving transmitted control packets.	detail extensive
Version	BFD version: 0 or 1 .	extensive
Replicated	The replicated flag appears when nonstop routing or graceful Routing Engine switchover is configured and the BFD session has been replicated to the backup Routing Engine.	detail extensive
Min async interval	Minimum amount of time, in seconds, between asynchronous control packet transmissions across the BFD session.	extensive
Min slow interval	Minimum amount of time, in seconds, between synchronous control packet transmissions across the BFD session.	extensive

Table 87: show bfd session Output Fields (continued)

Field Name	Field Description	Level of Output
Adaptive async TX interval	Transmission interval being used because of adaptation.	extensive
RX interval	Minimum required receive interval.	extensive
Local min TX interval	Minimum amount of time, in seconds, between control packet transmissions on the local system.	extensive
Local min RX interval	Minimum amount of time, in seconds, between control packet detections on the local system.	extensive
Remote min TX interval	Minimum amount of time, in seconds, between control packet transmissions on the remote system.	extensive
Remote min RX interval	Minimum amount of time, in seconds, between control packet detections on the remote system.	extensive
Threshold transmission interval	Threshold for notification if the transmission interval increases.	extensive
Threshold for detection time	Threshold for notification if the detection time increases.	extensive
Local discriminator	Authentication code used by the local system to identify that BFD session.	extensive
Remote discriminator	Authentication code used by the remote system to identify that BFD session.	extensive
Echo mode	Information about the state of echo transmissions on the BFD session.	extensive
Prefix	LDP FEC address associated with the BFD session.	All levels
Egress, Destination	Displays the LDP FEC destination address. This field is displayed only on a router at the egress of an LDP FEC, where the BFD session has an LDP Operation, Administration, and Maintenance (OAM) client.	All levels
Remote is control-plane independent	<p>The BFD session on the remote peer is running on its Packet Forwarding Engine. In this case, when the remote node undergoes a graceful restart, the local peer can help the remote peer with the graceful restart.</p> <p>The following BFD sessions are not distributed to the Packet Forwarding Engine: tunnel-encapsulated sessions, and sessions over integrated routing and bridging (IRB) interfaces.</p>	extensive

Table 87: show bfd session Output Fields (continued)

Field Name	Field Description	Level of Output
Authentication	<p>Summary status of BFD authentication:</p> <ul style="list-style-type: none"> status—enabled/active indicates authentication is configured and active. enabled/inactive indicates authentication is configured but not active. This only occurs when the remote end of the session does not support authentication and loose checking is configured. keychain—Name of the security authentication keychain associated with the specified BFD session. algo—BFD authentication algorithm being used: keyed-md5, keyed-sha-1, meticulous-keyed-md5, meticulous-keyed-sha-1, or simple-password. mode—Level of BFD authentication enforcement: strict or loose. Strict enforcement indicates authentication is configured at both ends of the session (the default). Loose enforcement indicates that one end of the session might not be authenticated. <p>This information is only shown if BFD authentication is configured.</p>	extensive
Session ID	The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA).	detail extensive
sessions	Total number of active BFD sessions.	All levels
clients	Total number of clients that are hosting active BFD sessions.	All levels
Cumulative transmit rate	Total number of BFD control packets transmitted per second on all active sessions.	All levels
Cumulative receive rate	Total number of BFD control packets received per second on all active sessions.	All levels
Multi-hop, min-recv-TTL	Minimum time to live (TTL) accepted if the session is configured for multihop.	extensive
route table	Route table used if the session is configured for multihop.	extensive
local address	<p>Local address of the source used if the session is configured for multihop.</p> <p>The source IP address for outgoing BFD packets from the egress side of an MPLS BFD session is based on the outgoing interface IP address.</p>	extensive

Sample Output

show bfd session

```
user@host> show bfd session
```

CHAPTER 17

BGP Operational Commands

- `clear bgp damping`
- `clear bgp neighbor`
- `clear bgp table`
- `show bgp bmp`
- `show bgp group`
- `show bgp group traffic-statistics`
- `show bgp neighbor`
- `show bgp replication`
- `show bgp summary`
- `show policy damping`

clear bgp damping

List of Syntax	Syntax on page 1740 Syntax (EX Series Switch and QFX Series) on page 1740
Syntax	<pre>clear bgp damping <logical-system (all <i>logical-system-name</i>)> <prefix></pre>
Syntax (EX Series Switch and QFX Series)	<pre>clear bgp damping <prefix></pre>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Clear BGP route flap damping information.
Options	none —Clear all BGP route flap damping information. logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system. prefix —(Optional) Clear route flap damping information for only the specified destination prefix.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• show policy damping on page 1788• show route damping on page 2305
List of Sample Output	clear bgp damping on page 1740
Output Fields	This command produces no output.

Sample Output

clear bgp damping

```
user@host> clear bgp damping
```

clear bgp neighbor

List of Syntax [Syntax on page 1741](#)
 [Syntax \(EX Series Switch and QFX Series\) on page 1741](#)

Syntax

```
clear bgp neighbor
<all>
<as as-number>
<gracefully>
<instance instance-name>
<logical-system (all | logical-system-name)>
<malformed-route>
<neighbor>
<soft | soft-inbound>
<soft-minimum-igp>
<stale-routes>
```

Syntax (EX Series Switch and QFX Series)

```
clear bgp neighbor
<all>
<as as-number>
<instance instance-name>
<malformed-route>
<neighbor>
<soft | soft-inbound>
<soft-minimum-igp>
```

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Command introduced in Junos OS Release 11.3 for the QFX Series.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
 malformed-route option introduced in Junos OS Release 13.2.
 all option introduced in Junos OS Release 14.2.
 gracefully and **stale-routes** options introduced in Junos OS Release 15.1.

Description Perform one of the following tasks:

- Change the state of one or more BGP neighbors to **IDLE**. For neighbors in the **ESTABLISHED** state, this command drops the TCP connection to the neighbors and then reestablishes the connection.
- (**soft** keyword only) Reapply export policies and send refresh updates to one or more BGP neighbors without changing their state.
- (**soft-inbound** keyword only) Send a route-refresh message to one or more BGP neighbors without changing their state, and reapply import policies on the received updates.

Options **all**—Change the state of all BGP neighbors to **IDLE**.

as *as-number*—(Optional) Apply this command only to neighbors in the specified autonomous system (AS).

gracefully—(Optional) Enable the BGP peer to start graceful-restart receiving-speaker mode. The receiving speaker also sends its own routes to the restarted speaker, and sends an End-of-RIB marker when it completes the update. The **clear bgp neighbor *neighbor-address* gracefully** command is the same as **clear bgp neighbor hard** (the default for **clear bgp neighbor**), but it does not use the new Hard Reset subcode on the Notify and Cease messages that are sent. This allows the neighbor to enter GR or LLGR helper mode, if negotiated. The session is still cleared on this router, and this router does not enter GR or LLGR helper mode.

instance *instance-name*—(Optional) Apply this command only to neighbors for the specified routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

malformed-route—(Optional) Remove malformed routes. If a specific neighbor is provided, Junos OS removes malformed routes for that particular neighbor. Otherwise, Junos OS removes malformed routes for all BGP neighbors. To find routes that have malformed attributes, run the **show route hidden** command, and look for routes marked with **MalformedAttr** in the AS path field.

neighbor—(Optional) IP address of a BGP peer. Apply this command only to the specified neighbor.

soft—(Optional) Reapply any export policies and send refresh updates to neighbors without clearing the state.

soft-inbound—(Optional) Send a route-refresh message to BGP neighbors and reapply import policies on the route updates received from the BGP neighbors without clearing the BGP state.

soft-minimum-igp—(Optional) Provide soft refresh of the outbound state when the interior gateway protocol (IGP) metric is reset.

stale-routes—(Optional) Any stale route currently being held for the specified neighbor because of BGP graceful restart (GR) or long-lived graceful restart (LLGR) receiver mode operations.

When you enter this command, you are provided feedback on the status of your request.

Sample Output

`clear bgp neighbor`

```
user@host> clear bgp neighbor
```

clear bgp table

Syntax	<code>clear bgp table <i>table-name</i></code> <code><logical-system (all <i>logical-system-name</i>)></code>
Syntax (EX Series Switch and QFX Series)	<code>clear bgp table <i>table-name</i></code>
Release Information	Command introduced in Junos OS Release 9.0. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Request that BGP refresh routes in a specified routing table.
Options	logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system. <i>table-name</i> —Request that BGP refresh routes in the specified table.
Additional Information	In some cases, a prefix limit is associated with a routing table for a VPN instance. When this limit is exceeded (for example, because of a network misconfiguration), some routes might not be inserted in the table. Such routes need to be added to the table after the network issue is resolved. Use the clear bgp table command to request that BGP refresh routes in a VPN instance table.
Required Privilege Level	clear
List of Sample Output	clear bgp table private.inet.0 on page 1744 clear bgp table inet.6 logical-system all on page 1744 clear bgp table private.inet.6 logical-system ls1 on page 1745 clear bgp table logical-system all inet.0 on page 1745 clear bgp table logical-system ls2 private.inet.0 on page 1745
Output Fields	This command produces no output.

Sample Output

`clear bgp table private.inet.0`

```
user@host> clear bgp table private.inet.0
```

`clear bgp table inet.6 logical-system all`

```
user@host> clear bgp table inet.6 logical-system all

```
user@host> clear bgp table logical-system ls2 private.inet.0
```

show bgp bmp

Syntax	show bgp bmp
Release Information	<p>Command introduced in Junos OS Release 9.5.</p> <p>Command introduced in Junos OS Release 9.5 for EX Series switches.</p> <p>Command introduced in Junos OS Release 13.2X51-D15 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	Display information about the BGP Monitoring Protocol (BMP).
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show bgp bmp on page 1746
Output Fields	Table 88 on page 1746 lists the output fields for the show bgp bmp command. Output fields are listed in the approximate order in which they appear.

Table 88: show bgp bmp Output Fields

Field Name	Field Description
BMP station address/port	IP address and port number of the monitoring station to which BGP Monitoring Protocol (BMP) statistics are sent.
BMP session state	Status of the BMP session: UP or DOWN .
Memory consumed by BMP	Memory used by the active BMP session.
Statistics timeout	Amount of time, in seconds, between transmissions of BMP data to the monitoring station.
Memory limit	Threshold, in bytes, at which the routing device stops collecting BMP data.
Memory-connect retry timeout	Amount of time, in seconds, after which the routing device attempts to resume a BMP session that was ended after the configured memory threshold was exceeded.

Sample Output

show bgp bmp

```
user@host> show bgp bmp
```

```
BMP station address/port: 172.24.24.157+5454
BMP session state: DOWN
Memory consumed by BMP: 0
Statistics timeout: 15
Memory limit: 10485760
Memory connect retry timeout: 600
```

show bgp group

List of Syntax [Syntax on page 1748](#)
[Syntax \(EX Series Switch and QFX Series\) on page 1748](#)

Syntax

```
show bgp group
<brief | detail | summary>
<group-name>
<exact-instance instance-name>
<instance instance-name>
<logical-system (all | logical-system-name)>
<rtf>
```

Syntax (EX Series Switch and QFX Series)

```
show bgp group
<brief | detail | summary>
<group-name>
<exact-instance instance-name>
<instance instance-name>
```

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Command introduced in Junos OS Release 11.3 for the QFX Series.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
exact-instance option introduced in Junos OS Release 11.4.
 From Junos OS release 18.4 onwards, **show bgp group group-name** does an exact match and displays groups with names matching exactly with that of the specified group-name. For all Junos OS releases preceding 18.4, the implementation was performed using the prefix matches (example: if there are two groups grp1, grp2 and the CLI command **show bgp group grp** was issued, then both grp1, grp2 were displayed).

Description Display information about the configured BGP groups.

Options **none**—Display group information about all BGP groups.

brief | detail | summary—(Optional) Display the specified level of output.

group-name—(Optional) Display group information for the specified group.

exact-instance instance-name—(Optional) Display information for the specified instance only.

instance instance-name—(Optional) Display information about BGP groups for all routing instances whose name begins with this string (for example, **cust1**, **cust11**, and **cust111** are all displayed when you run the **show bgp group instance cust1** command). The instance name can be master for the main instance, or any valid configured instance name or its prefix.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

rtf—(Optional) Display BGP group route targeting information.

Required Privilege Level view

Output Fields [Table 89 on page 1749](#) describes the output fields for the **show bgp group** command. Output fields are listed in the approximate order in which they appear.

Table 89: show bgp group Output Fields

Field Name	Field Description	Level of Output
Group Type or Group	Type of BGP group: Internal or External .	All levels
group-index	Index number for the BGP peer group. The index number differentiates between groups when a single BGP group is split because of different configuration options at the group and peer levels.	rtf detail
AS	AS number of the peer. For internal BGP (IBGP), this number is the same as Local AS .	brief detail none
Local AS	AS number of the local routing device.	brief detail none
Name	Name of a specific BGP group.	brief detail none
Options	The Network Layer Reachability Information (NLRI) format used for BGP VPN multicast.	none none
Index	Unique index number of a BGP group.	brief detail none
Flags	Flags associated with the BGP group. This field is used by Juniper Networks customer support.	brief detail none
BGP-Static Advertisement Policy	Policies configured for the BGP group with the advertise-bgp-static policy statement.	brief none

Table 89: show bgp group Output Fields (continued)

Field Name	Field Description	Level of Output
Remove-private options	Options associated with the remove-private statement.	brief detail none
Holdtime	Maximum number of seconds allowed to elapse between successive keepalive or update messages that BGP receives from a peer in the BGP group, after which the connection to the peer is closed and routing devices through that peer become unavailable.	brief detail none
Export	Export policies configured for the BGP group with the export statement.	brief detail none
Optimal Route Reflection	Client nodes (primary and backup) configured in the BGP group.	brief detail none
MED tracks IGP metric update delay	Time, in seconds, that updates to multiple exit discriminator (MED) are delayed. Also displays the time remaining before the interval is set to expire	All levels
Traffic Statistics Interval	Time between sample periods for labeled-unicast traffic statistics, in seconds.	brief detail none
Total peers	Total number of peers in the group.	brief detail none
Established	Number of peers in the group that are in the established state.	All levels
Active/Received/Accepted/Damped	<p>Multipurpose field that displays information about BGP peer sessions. The field's contents depend upon whether a session is established and whether it was established in the main routing device or in a routing instance.</p> <ul style="list-style-type: none"> • If a peer is not established, the field shows the state of the peer session: Active, Connect, or Idle. • If a BGP session is established in the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the inet.0 (main) and inet.2 (multicast) routing tables. For example, 8/10/10/2 and 2/4/4/0 indicate the following: <ul style="list-style-type: none"> • 8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the inet.0 routing table. • 2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the inet.2 routing table. 	summary
ip-addresses	List of peers who are members of the group. The address is followed by the peer's port number.	All levels

Table 89: show bgp group Output Fields (continued)

Field Name	Field Description	Level of Output
Route Queue Timer	Number of seconds until queued routes are sent. If this time has already elapsed, this field displays the number of seconds by which the updates are delayed.	detail
Route Queue	Number of prefixes that are queued up for sending to the peers in the group.	detail
<i>inet.number</i>	Number of active, received, accepted, and damped routes in the routing table. For example, inet.0: 7/10/9/0 indicates the following: <ul style="list-style-type: none"> 7 active routes, 10 received routes, 9 accepted routes, and no damped routes from a BGP peer appear in the inet.0 routing table. 	none
Table <i>inet.number</i>	Information about the routing table. <ul style="list-style-type: none"> Received prefixes—Total number of prefixes from the peer, both active and inactive, that are in the routing table. Active prefixes—Number of prefixes received from the peer that are active in the routing table. Suppressed due to damping—Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols. Advertised prefixes—Number of prefixes advertised to a peer. Received external prefixes—Total number of prefixes from the external BGP (EBGP) peers, both active and inactive, that are in the routing table. Active external prefixes—Number of prefixes received from the EBGP peers that are active in the routing table. Externals suppressed—Number of routes received from EBGP peers currently inactive because of damping or other reasons. Received internal prefixes—Total number of prefixes from the IBGP peers, both active and inactive, that are in the routing table. Active internal prefixes—Number of prefixes received from the IBGP peers that are active in the routing table. Internals suppressed—Number of routes received from IBGP peers currently inactive because of damping or other reasons. RIB State—Status of the graceful restart process for this routing table: BGP restart is complete, BGP restart in progress, VPN restart in progress, or VPN restart is complete. 	detail
Groups	Total number of groups.	All levels
Peers	Total number of peers.	All levels
External	Total number of external peers.	All levels
Internal	Total number of internal peers.	All levels
Down peers	Total number of unavailable peers.	All levels

Table 89: show bgp group Output Fields (continued)

Field Name	Field Description	Level of Output
Flaps	Total number of flaps that occurred.	All levels
Table	Name of a routing table.	brief, none
Tot Paths	Total number of routes.	brief, none
Act Paths	Number of active routes.	brief, none
Suppressed	Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.	brief, none
History	Number of withdrawn routes stored locally to keep track of damping history.	brief, none
Damp State	Number of active routes with a figure of merit greater than zero, but lower than the threshold at which suppression occurs.	brief, none
Pending	Routes being processed by the BGP import policy.	brief, none
Group	Group the peer belongs to in the BGP configuration.	detail
Receive mask	Mask of the received target included in the advertised route.	detail
Entries	Number of route entries received.	detail
Target	Route target that is to be passed by route-target filtering. If a route advertised from the provider edge (PE) routing device matches an entry in the route-target filter, the route is passed to the peer.	detail
Mask	Mask which specifies that the peer receive routes with the given route target.	detail

show bgp group traffic-statistics

Syntax show bgp group traffic-statistics
 <brief | detail>
 <group-name>
 <labeled-path label label>
 <logical-system (all | logical-system-name)>

Release Information Command introduced before Junos OS Release 7.4.
 labeled-path option introduced in Junos OS Release 18.1R1 for the MX Series.

Description Display the traffic statistics for configured Border Gateway Protocol (BGP) groups.

Options none—Display traffic statistics for all BGP groups.

brief | detail—(Optional) Display the specified level of output.

group-name—(Optional) Display BGP traffic statistics for only the specified group.

label-path—(Optional) Display labeled unicast traffic statistics at the ingress.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output [show bgp group traffic-statistics \(Per-Group-Label Not Configured\) on page 1757](#)
[show bgp group traffic-statistics \(Per-Group-Label Configured\) on page 1757](#)
[show bgp group traffic-statistics labeled-path \(Labeled Unicast\) on page 1758](#)

Output Fields [Table 90 on page 1756](#) describes the output fields for the **show bgp group traffic-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 90: show bgp group traffic-statistics Output Fields

Field Name	Field Description
Group name	Name of a specific BGP group.
Group Index	Index number for the BGP group.
NLRI	Network layer reachability information (NLRI) indicating the source of the traffic statistics for the BGP group.
FEC	Forwarding equivalence classes (FECs) associated with the BGP group.
Packets	Number of packets sent through each FEC.

Table 90: show bgp group traffic-statistics Output Fields (continued)

Field Name	Field Description
Bytes	Number of bytes transmitted through each FEC.
EgressAS	Autonomous system (AS) number of the egress router.
AdvLabel	Label associated with each FEC.

List of Syntax [Syntax on page 1759](#)
 [Syntax \(EX Series Switch, QFX Series, and OCX Series\) on page 1759](#)

Syntax `show bgp neighbor`
 `<exact-instance instance-name>`
 `<instance instance-name>`
 `<logical-system (all | logical-system-name)>`
 `<neighbor-address>`
 `<output-queue>`
 `<orf (detail | neighbor-address)>`

Syntax (EX Series Switch, QFX Series, and OCX Series) `show bgp neighbor`
 `<instance instance-name>`
 `<exact-instance instance-name>`
 `<neighbor-address>`
 `<orf (neighbor-address | detail)`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Command introduced in Junos OS Release 11.3 for the QFX Series.
 Command introduced in Junos OS Release 14.1x53-D20 for the OCX Series.
 orf option introduced in Junos OS Release 9.2.
 exact-instance option introduced in Junos OS Release 11.4.
 output-queue option introduced in Junos OS Release 16.1
 DontGRHelpFateSharingBfdDown is added to the **options** field of the command output in Junos OS Release 18.3R1.

Description Display information about BGP peers.

Options **none**—Display information about all BGP peers.

exact-instance *instance-name*—(Optional) Display information for the specified instance only.

instance *instance-name*—(Optional) Display information about BGP peers for all routing instances whose name begins with this string (for example, **cust1**, **cust11**, and **cust111** are all displayed when you run the **show bgp neighbor instance cust1** command).

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor-address—(Optional) Display information for only the BGP peer at the specified IP address.

orf (detail | neighbor-address)—(Optional) Display outbound route-filtering information for all BGP peers or only for the BGP peer at the specified IP address. The default is to display brief output. Use the **detail** option to display detailed output.

output-queue—(Optional) Display information regarding the number of routes currently queued in the 17 prioritized BGP output queues.

Additional Information For information about the **local-address**, **nlri**, **hold-time**, and **preference** statements, see the *Junos OS Routing Protocols Library*.

Output Fields [Table 91 on page 1760](#) describes the output fields for the **show bgp neighbor** command. Output fields are listed in the approximate order in which they appear.

Table 91: show bgp neighbor Output Fields

Field Name	Field Description
Peer	Address of the BGP neighbor. The address is followed by the neighbor port number.
AS	AS number of the peer.
Local	Address of the local routing device. The address is followed by the peer port number.
Type	Type of peer: Internal or External .

Table 91: show bgp neighbor Output Fields (continued)

Field Name	Field Description
State	<p>Current state of the BGP session:</p> <ul style="list-style-type: none"> • Active—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message. • Connect—BGP is waiting for the transport protocol connection to be completed. • Established—The BGP session has been established, and the peers are exchanging update messages. • Idle—This is the first stage of a connection. BGP is waiting for a Start event. • OpenConfirm—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message. • OpenSent—BGP has sent an open message and is waiting to receive an open message from the peer. • route reflector client—The BGP session is established with a route reflector client.
Flags	<p>Internal BGP flags:</p> <ul style="list-style-type: none"> • Aggregate Label—BGP has aggregated a set of incoming labels (labels received from the peer) into a single forwarding label. • CleanUp—The peer session is being shut down. • Delete—This peer has been deleted. • Idled—This peer has been permanently idled. • ImportEval—At the last commit operation, this peer was identified as needing to reevaluate all received routes. • Initializing—The peer session is initializing. • SendRtn—Messages are being sent to the peer. • Sync—This peer is synchronized with the rest of the peer group. • RSync—This peer in the backup Routing Engine is synchronized with the BGP peer in the master Routing Engine for nonstop active routing. • TryConnect—Another attempt is being made to connect to the peer. • Unconfigured—This peer is not configured. • WriteFailed—An attempt to write to this peer failed.
Last state	<p>Previous state of the BGP session:</p> <ul style="list-style-type: none"> • Active—BGP is initiating a transport protocol connection in an attempt to connect to a peer. If the connection is successful, BGP sends an Open message. • Connect—BGP is waiting for the transport protocol connection to be completed. • Established—The BGP session has been established, and the peers are exchanging update messages. • Idle—This is the first stage of a connection. BGP is waiting for a Start event. • OpenConfirm—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message. • OpenSent—BGP has sent an open message and is waiting to receive an open message from the peer.

Table 91: show bgp neighbor Output Fields (continued)

Field Name	Field Description
Last event	<p>Last activity that occurred in the BGP session:</p> <ul style="list-style-type: none"> • Closed—The BGP session closed. • ConnectRetry—The transport protocol connection failed, and BGP is trying again to connect. • HoldTime—The session ended because the hold timer expired. • KeepAlive—The local routing device sent a BGP keepalive message to the peer. • Open—The local routing device sent a BGP open message to the peer. • OpenFail—The local routing device did not receive an acknowledgment of a BGP open message from the peer. • RecvKeepAlive—The local routing device received a BGP keepalive message from the peer. • RecvNotify—The local routing device received a BGP notification message from the peer. • RecvOpen—The local routing device received a BGP open message from the peer. • RecvUpdate—The local routing device received a BGP update message from the peer. • Start—The peering session started. • Stop—The peering session stopped. • TransportError—A TCP error occurred.
Last error	<p>Last error that occurred in the BGP session:</p> <ul style="list-style-type: none"> • Cease—An error occurred, such as a version mismatch, that caused the session to close. • Finite State Machine Error—In setting up the session, BGP received a message that it did not understand. • Hold Time Expired—The session's hold time expired. • Message Header Error—The header of a BGP message was malformed. • Open Message Error—A BGP open message contained an error. • None—No errors occurred in the BGP session. • Update Message Error—A BGP update message contained an error.
Export	Name of the export policy that is configured on the peer.
Import	Name of the import policy that is configured on the peer.

Table 91: show bgp neighbor Output Fields (continued)

Field Name	Field Description
Options	<p>Configured BGP options:</p> <ul style="list-style-type: none"> • AddressFamily—Configured address family: inet or inet-vpn. • AdvertiseBGPStatic—Configured BGP static routes are advertised. • AuthKeyChain—Authentication key change is enabled. • BfdEnabled—Status of BFD. • DontGRHelpFateSharingBfdDown—Status of the dont-help-shared-fate-bfd-down option. If this option is configured the device does not go into graceful restart helper mode. • DropPathAttributes—Certain path attributes are configured to be dropped from neighbor updates during inbound processing. • GracefulRestart—Graceful restart is configured. • HoldTime—Hold time configured with the hold-time statement. The hold time is three times the interval at which keepalive messages are sent. • IgnorePathAttributes—Certain path attributes are configured to be ignored in neighbor updates during inbound processing. • Local Address—Address configured with the local-address statement. • LLGR—BGP long-lived graceful restart capability is configured. • LLGRHelperDisabled—BGP long-lived graceful restart is completely disabled for a neighbor. • Multihop—Allow BGP connections to external peers that are not on a directly connected network. • NLRI—Configured MBGP state for the BGP group: multicast, unicast, or both if you have configured nlri any. • Peer AS—Configured peer autonomous system (AS). • Preference—Preference value configured with the preference statement. • Refresh—Configured to refresh automatically when the policy changes. • Rib-group—Configured routing table group. • RFC6514CompliantSafi129—Configured SAFI 129 according to RFC 6514 (BGP VPN multicast used to use SAFI 128).
Path-attributes dropped	Path attribute codes that are dropped from neighbor updates.
Path-attributes ignored	Path attribute codes that are ignored during neighbor updates.
Peer does not support LLGR Restarter or Receiver functionality	BGP neighbor does not support long-lived graceful restart (LLGR) restarter mode completely.
Peer does not support LLGR Restarter functionality	BGP neighbor does not support long-lived graceful restart (LLGR) restarter mode for any family.
Authentication key change	(Appears only if the authentication-keychain statement has been configured) Name of the authentication keychain enabled.
Authentication algorithm	(Appears only if the authentication-algorithm statement has been configured) Type of authentication algorithm enabled: hmac or md5 .

Table 91: show bgp neighbor Output Fields (continued)

Field Name	Field Description
Address families configured	Names of configured address families for the VPN.
BGP-Static Advertisement Policy	Name of the BGP static policy that is configured on the peer.
Local Address	Address of the local routing device.
Remove-private options	Options associated with the remove-private statement.
Holdtime	Hold time configured with the hold-time statement. The hold time is three times the interval at which keepalive messages are sent.
Flags for NLRI inet-label-unicast	Flags related to labeled-unicast: <ul style="list-style-type: none"> • TrafficStatistics—Collection of statistics for labeled-unicast traffic is enabled.
Traffic statistics	Information about labeled-unicast traffic statistics: <ul style="list-style-type: none"> • Options—Options configured for collecting statistics about labeled-unicast traffic. • File—Name and location of statistics log files. • size—Size of all the log files, in bytes. • files—Number of log files.
Traffic Statistics Interval	Time between sample periods for labeled-unicast traffic statistics, in seconds.
Preference	Preference value configured with the preference statement.
Outbound Timer	Time for which the route is available in Junos OS routing table before it is exported to BGP. This field is displayed in the output only if the out-delay parameter is configured to a non-zero value.
Number of flaps	Number of times the BGP session has gone down and then come back up.
Peer ID	Router identifier of the peer.
Group index	Index number for the BGP peer group. The index number differentiates between groups when a single BGP group is split because of different configuration options at the group and peer levels.
Peer index	Index that is unique within the BGP group to which the peer belongs.
Local ID	Router identifier of the local routing device.
Local Interface	Name of the interface on the local routing device.
Active holdtime	Hold time that the local routing device negotiated with the peer.
Keepalive Interval	Keepalive interval, in seconds.

Table 91: show bgp neighbor Output Fields (continued)

Field Name	Field Description
BFD	Status of BFD failure detection.
Local Address	Name of directly connected interface over which direct EBGP peering is established.
NLRI and times for LLGR configured on peer	<p>Names of address families and stale time for BGP long-lived graceful restart configured on the BGP peer or neighbor.</p> <p>Times are displayed using the routing protocol daemon (rpd) %#OT format:</p> <p><weeks>w<days>d <hours>:<minutes>:<seconds></p> <p>Zero leading elements are omitted, for example, a value less than one week do not include the weeks.</p>
NLRI and times that peer supports LLGR Restarter for	<p>Names of address families and stale time that the BGP peer supports for restarter mode for BGP long-lived graceful restart.</p> <p>Times are displayed using the routing protocol daemon (rpd) %#OT format:</p> <p><weeks>w<days>d <hours>:<minutes>:<seconds></p> <p>Zero leading elements are omitted, for example, a value less than one week do not include the weeks.</p>
NLRI that peer saved LLGR forwarding for	Name of the address family for which the BGP peer saved BGP long-lived graceful restart forwarding.
Graceful Restart Details	Amount of time that is remaining until LLGR expires and the time remaining on the GR stale timer, along with RIB details, are displayed while LLGR receiver mode is active (a peer that negotiated LLGR has disconnected and not yet reconnected).
NLRI we are holding stale routes for	Names of address families (NLRIs) for which that stale routes are held or preserved when BGP graceful restart receiver mode is active for a neighbor.
Time until end-of-rib is assumed for stale routes	<p>Amount of time remaining on the stale timer until which end-of-RIB (EoR) markers are assumed when BGP graceful restart receiver mode is active for a neighbor.</p> <p>Time is displayed in Coordinated Universal Time (UTC) format (YYYY-MM-DD-HH:MM:SS). Note that the stale timer display ('Time until end-of-rib is assumed') is also present when a session is active, but the neighbor as not yet sent all of the end-of-rib indications.</p>
Time until stale routes are deleted or become long-lived stale	Amount of time up to which stale routes are deleted or become long-lived stale routes when BGP graceful restart receiver mode is active for a neighbor.
NLRI for restart configured on peer	Names of address families configured for restart.
NLRI advertised by peer	Address families supported by the peer: unicast or multicast .
NLRI for this session	Address families being used for this session.
Peer supports Refresh capability	Remote peer's ability to send and request full routing table readvertisement (route refresh capability). For more information, see RFC 2918, <i>Route Refresh Capability for BGP-4</i> .

Table 91: show bgp neighbor Output Fields (continued)

Field Name	Field Description
Restart time configured on peer	Configured time allowed for restart on the neighbor.
Stale routes from peer are kept for	When graceful restart is negotiated, the maximum time allowed to hold routes from neighbors after the BGP session has gone down.
Peer does not support Restarter functionality	Graceful restart restarter-mode is disabled on the peer.
Peer does not support Receiver functionality	Graceful restart helper-mode is disabled on the peer.
Restart time requested by this peer	Restart time requested by this neighbor during capability negotiation.
Restart flag received from the peer	When this field appears, the BGP speaker has restarted (Restarting), and this peer should not wait for the end-of-rib marker from the speaker before advertising routing information to the speaker.
NLRI that peer supports restart for	Neighbor supports graceful restart for this address family.
NLRI peer can save forwarding state	Neighbor supporting this address family saves all forwarding states.
NLRI that peer saved forwarding for	Neighbor saves all forwarding states for this address family.
NLRI that restart is negotiated for	Router supports graceful restart for this address family.
NLRI of received end-of-rib markers	Address families for which end-of-routing-table markers are received from the neighbor.
NLRI of all end-of-rib markers sent	Address families for which end-of-routing-table markers are sent to the neighbor.
Peer supports 4 byte AS extension (peer-as 1)	Peer understands 4-byte AS numbers in BGP messages. The peer is running Junos OS Release 9.1 or later.
NLRIs for which peer can receive multiple paths	Appears in the command output of the local router if the downstream peer is configured to receive multiple BGP routes to a single destination, instead of only receiving the active route. Possible value is inet-unicast.
NLRIs for which peer can send multiple paths: inet-unicast	Appears in the command output of the local router if the upstream peer is configured to send multiple BGP routes to a single destination, instead of only sending the active route. Possible value is inet-unicast.

Table 91: show bgp neighbor Output Fields (continued)

Field Name	Field Description
Table inet.number	<p>Information about the routing table:</p> <ul style="list-style-type: none"> • RIB State—BGP is in the graceful restart process for this routing table: restart is complete or restart in progress. • Bit—Number that represents the entry in the routing table for this peer. • Send state—State of the BGP group: in sync, not in sync, or not advertising. • Active prefixes—Number of prefixes received from the peer that are active in the routing table. • Received prefixes—Total number of prefixes from the peer, both active and inactive, that are in the routing table. • Accepted prefixes—Total number of prefixes from the peer that have been accepted by a routing policy. • Suppressed due to damping—Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.
Last traffic (seconds)	Last time any traffic was received from the peer or sent to the peer, and the last time the local routing device checked.
Input messages	Messages that BGP has received from the receive socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.
Output messages	Messages that BGP has written to the transmit socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.
Input dropped path attributes	<p>Information about dropped path attributes:</p> <ul style="list-style-type: none"> • Code—Path attribute code. • Count—Path attribute count.
Input ignored path attributes	<p>Information about ignored path attributes:</p> <ul style="list-style-type: none"> • Code—Path attribute code. • Count—Path attribute count.
Output queue	<p>Number of BGP packets that are queued to be transmitted to a particular neighbor for a particular routing table. Output queue 0 is for unicast NLRIs, and queue 1 is for multicast NLRIs.</p> <p>It also specifies the routing table name and the NLRI that the table was advertised through, in the format (<i>routing table name, NLRI</i>).</p> <p>NOTE: The output queue of routing tables that are not advertised, will only show up at extensive output level.</p>
Trace options	Configured tracing of BGP protocol packets and operations.
Trace file	Name of the file to receive the output of the tracing operation.

Table 91: show bgp neighbor Output Fields (continued)

Field Name	Field Description
Filter Updates rcv	(orf option only) Number of outbound-route filters received for each configured address family. NOTE: The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.
Immediate	(orf option only) Number of route updates received with the immediate flag set. The immediate flag indicates that the BGP peer should readvertise the updated routes. NOTE: The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.
Filter	(orf option only) Type of prefix filter received: prefix-based or extended-community .
Received filter entries	(orf option only) List of received filters displayed.
seq	(orf option only) Numerical order assigned to this prefix entry among all the received outbound route filter prefix entries.
prefix	(orf option only) Address for the prefix entry that matches the filter.
minlength	(orf option only) Minimum prefix length, in bits, required to match this prefix.
maxlength	(orf option only) Maximum prefix length, in bits, required to match this prefix.
match	(orf option only) For this prefix match, whether to permit or deny route updates.

Sample Output

show bgp neighbor

```
user@host > show bgp neighbor
```

For M Series, MX Series, and T Series routers running Junos OS Release 16.1 or later, the **show bgp neighbor** output includes the BGP group the peer belongs to, the routing instance (if any) that the peer is configured in, and the routing instance that the peer is using for the forwarding context (if applicable). An example follows.

```
Peer: 10.255.7.250+179 AS 10    Local: 10.255.7.248+63740 AS 10
  Group: toAsbr2                Routing-Instance: master

show bgp replication

Syntax	<code>show bgp replication</code>
Release Information	<p>Command introduced in Junos OS Release 8.5.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Command introduced in Junos OS Release 17.4R2 for SRX5400, SRX5600, and SRX5800 devices.</p> <p>Support for logical-system option introduced in Junos OS Release 13.3.</p>
Description	<p>Displays the status of BGP state replication between the master and backup Routing Engines on devices that have nonstop active routing configured on them.</p>
	<div>  <p>CAUTION: Before attempting nonstop active routing switchover, check the output of <code>show bgp replication</code> to confirm that BGP routing table synchronization has completed on the backup Routing Engine. The complete status in the output of <code>show task replication</code> only indicates that the socket replication has completed and the BGP synchronization is in progress.</p> <p>To determine whether BGP synchronization is complete, you must check the Protocol state and Synchronization state fields in the output of <code>show bgp replication</code> on the master Routing Engine. The Protocol state must be idle and the Synchronization state must be complete. If you perform NSR switchover before the BGP synchronization has completed, the BGP session might flap.</p> </div>
	<div>  <p>NOTE: The <code>commit synchronize</code> statement at the <code>[edit system]</code> hierarchy level is not supported on SRX Series devices. Hence, the status of nonstop active routing synchronization is not displayed on the master Routing Engine when you issue the command <code>show bgp replication</code>.</p> </div>
Options	This command has no options.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> show bgp replication logical-system
List of Sample Output	<p>show bgp replication (for Master) on page 1781</p> <p>show bgp replication (for Backup) on page 1781</p>

Output Fields Table 92 on page 1780 lists the output fields for the **show bgp replication** command. Output fields are listed in the approximate order in which they appear.

Table 92: show bgp replication Output Fields

Field Name	Field Description
Precision timer registration	<p>State of BGP precision timer feature in the kernel.</p> <ul style="list-style-type: none"> • Registered—BGP registers with the precision-timer feature in the kernel for auto keepalive generation after switchover. • NotRegistered—Keepalive format of BGP is not registered.
session state	State of the current internal BGP state replication session, Up or Down, and the duration for which the session has been in the indicated state.
flaps	Total number of flaps that occurred.
protocol state	Current state of the protocol operation, Active, Connect, Idle, and the duration for which the protocol has been in the indicated state.
synchronization state	<p>Synchronization state at the time of executing the command. The states can be:</p> <ul style="list-style-type: none"> • Idle • Neighbor—Indicates that the neighbor state synchronization is in progress. • AckWait—Indicates that the request processing is over. • ORF—Indicates that the outbound routing filter synchronization is in progress. • RIB—Indicates that the routing table synchronization is in progress. • Complete
number of peers waiting	<p>Total number of peers waiting for various messages:</p> <ul style="list-style-type: none"> • AckWait—Number of peers waiting for a connection establishment or completed acknowledgment messages. • SoWait—Number of peers waiting for TCP socket-related operations. • Scheduled—Number of peers being synchronized.
messages sent	<p>Number of various types of messages that have been sent since internal replication session became active:</p> <ul style="list-style-type: none"> • Open—Number of Open messages sent. • Establish—Number of connection establishment acknowledgment messages sent. • Update—Number of update messages sent. • Error—Number of error messages sent. • Complete—Number of connection complete acknowledgment messages sent.

Table 92: show bgp replication Output Fields (continued)

Field Name	Field Description
messages received	<p>Total number of messages received:</p> <ul style="list-style-type: none"> • Open—Number of Open messages received. • Request—Number of request messages received: <ul style="list-style-type: none"> • Wildcard—Number of requests received that used wildcards in the target address. • Targeted—Number of requests received that used a specific address. • EstablishAck—Number of connection establishment acknowledgement messages received. • CompleteAck—Number of connection completed acknowledgement messages received.

Output Fields Table 93 on page 1783 describes the output fields for the **show bgp summary** command. Output fields are listed in the approximate order in which they appear.

Table 93: show bgp summary Output Fields

Field Name	Field Description
Groups	Number of BGP groups.
Peers	Number of BGP peers.
Down peers	Number of down BGP peers.
Table	Name of routing table.
Tot Paths	Total number of paths.
Act Paths	Number of active routes.
Suppressed	Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.
History	Number of withdrawn routes stored locally to keep track of damping history.
Damp State	Number of routes with a figure of merit greater than zero, but still active because the value has not reached the threshold at which suppression occurs.
Pending	Routes in process by BGP import policy.
Peer	Address of each BGP peer. Each peer has one line of output.
AS	Peer's AS number.
InPkt	Number of packets received from the peer.
OutPkt	Number of packets sent to the peer.
OutQ	Number of BGP packets that are queued to be transmitted to a particular neighbor. It normally is 0 because the queue usually is emptied quickly.
Flaps	Number of times the BGP session has gone down and then come back up.
Last Up/Down	Last time since the neighbor transitioned to or from the established state.

Table 93: show bgp summary Output Fields (continued)

Field Name	Field Description
State #Active /Received/Accepted /Damped	<p>Multipurpose field that displays information about BGP peer sessions. The field's contents depend upon whether a session is established and whether it was established on the main routing device or in a routing instance.</p> <ul style="list-style-type: none"> If a peer is not established, the field shows the state of the peer session: Active, Connect, or Idle. In general, the Idle state is the first stage of a connection. BGP is waiting for a Start event. A session can be idle for other reasons as well. The reason that a session is idle is sometimes displayed. For example: Idle (Removal in progress) or Idle (LicenseFailure). If a BGP session is established on the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the inet.0 (main) and inet.2 (multicast) routing tables. For example, 8/10/10/2 and 2/4/4/0 indicate the following: <ul style="list-style-type: none"> 8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the inet.0 routing table. 2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the inet.2 routing table. If a BGP session is established in a routing instance, the field indicates the established (Establ) state, identifies the specific routing table that receives BGP updates, and shows the number of active, received, and damped routes that are received from a neighbor. For example, Establ VPN-AB.inet.0: 2/4/0 indicates the following: <ul style="list-style-type: none"> The BGP session is established. Routes are received in the VPN-AB.inet.0 routing table. The local routing device has two active routes, four received routes, and no damped routes from a BGP peer. <p>When a BGP session is established, the peers are exchanging update messages.</p> <p>NOTE: When graceful restart or LLGR helper mode is active, the RIB information is now displayed by the show bgp summary command. If a BGP session is established on the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the inet.0 (main) and inet.2 (multicast) routing tables. For example, 8/10/10/2 and 2/4/4/0 indicate the following:</p> <ul style="list-style-type: none"> 8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the inet.0 routing table. 2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the inet.2 routing table.

show policy damping

List of Syntax	Syntax on page 1788 Syntax (EX Series Switch and QFX Series) on page 1788
Syntax	<pre>show policy damping <logical-system (all <i>logical-system-name</i>)></pre>
Syntax (EX Series Switch and QFX Series)	<pre>show policy damping</pre>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.3 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display information about BGP route flap damping parameters.
Options	none —Display information about BGP route flap damping parameters. logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system.
Additional Information	In the output from this command, figure-of-merit values correlate with the probability of future instability of a routing device. Routes with higher figure-of-merit values are suppressed for longer periods of time. The figure-of-merit value decays exponentially over time. A figure-of-merit value of zero is assigned to each new route. The value is increased each time the route is withdrawn or readvertised, or when one of its path attributes changes.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• “Configuring BGP Flap Damping Parameters” in the <i>Routing Policies, Firewall Filters, and Traffic Policers Feature Guide</i>• clear bgp damping on page 1740• show route damping on page 2305
List of Sample Output	show policy damping on page 1789
Output Fields	Table 94 on page 1789 describes the output fields for the show policy damping command. Output fields are listed in the approximate order in which they appear.

Table 94: show policy damping Output Fields

Field Name	Field Description
Halflife	Decay half-life, in minutes. The value represents the period during which the accumulated figure-of-merit value is reduced by half if the route remains stable. If a route has flapped, but then becomes stable, the figure-of-merit value for the route decays exponentially. For example, for a route with a figure-of-merit value of 1500, if no incidents occur, its figure-of-merit value is reduced to 750 after 15 minutes and to 375 after another 15 minutes.
Reuse merit	Figure-of-merit value below which a suppressed route can be used again. A suppressed route becomes reusable when its figure-of-merit value decays to a value below a reuse threshold, and the route once again is considered usable and can be installed in the forwarding table and exported from the routing table.
Suppress/cutoff merit	Figure-of-merit value above which a route is suppressed for use or inclusion in advertisements. When a route's figure-of-merit value reaches a particular level, called the cutoff or suppression threshold, the route is suppressed. When a route is suppressed, the routing table no longer installs the route into the forwarding table and no longer exports this route to any of the routing protocols.
Maximum suppress time	Maximum hold-down time, in minutes. The value represents the maximum time that a route can be suppressed no matter how unstable it has been before this period of stability.
Computed values	<ul style="list-style-type: none"> • Merit ceiling—Maximum merit that a flapping route can collect. • Maximum decay—Maximum decay half-life, in minutes.

Sample Output

show policy damping

```

user@host> show policy damping

Default damping information:
  Halflife: 15 minutes
  Reuse merit: 750 Suppress/cutoff merit: 3000
  Maximum suppress time: 60 minutes
  Computed values:
    Merit ceiling: 12110
    Maximum decay: 6193
Damping information for "standard-damping":
  Halflife: 10 minutes
  Reuse merit: 4000 Suppress/cutoff merit: 8000
  Maximum suppress time: 30 minutes
  Computed values:
    Merit ceiling: 32120
    Maximum decay: 12453

```

CHAPTER 18

ES-IS Operational Commands

- `clear esis adjacency`
- `clear esis statistics`
- `show esis adjacency`
- `show esis interface`
- `show esis statistics`

clear esis adjacency

Syntax `clear esis adjacency`
 `<instance instance-name>`
 `<interface interface-name>`
 `<neighbor>`

Release Information Command introduced before Junos OS Release 7.4.

Description Clear End System-to-Intermediate System (ES-IS) adjacencies.

Options **none**—Clear all ES-IS adjacencies.

instance *instance-name*—(Optional) Clear adjacencies for the specified routing instance only.

interface *interface-name*—(Optional) Clear adjacencies for the specified interface only.

neighbor—(Optional) Clear adjacencies for the specified neighbor only.

Required Privilege Level clear

Related Documentation

- [show esis adjacency on page 1794](#)

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

`clear esis adjacency`

```
user@host> clear esis adjacency
```

clear esis statistics

Syntax	<code>clear esis statistics</code> <code><instance <i>instance-name</i>></code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Clear End System-to-Intermediate System (ES-IS) packet statistics.
Options	none —Clear ES-IS packet statistics for all routing instances. instance <i>instance-name</i> —(Optional) Clear ES-IS packet statistics for the specified routing instance only.
Required Privilege Level	clear

Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear esis statistics

```
user@host> clear esis statistics
```

show esis adjacency

Syntax `show esis adjacency`
`<brief | detail | extensive>`
`<esis-neighbor-id>`
`<instance instance-name>`
`<interface interface-name>`

Release Information Command introduced before Junos OS Release 7.4.

Description Display End System-to-Intermediate System (ES-IS) adjacencies.

Options **none**—(Same as **brief**) Display all ES-IS adjacencies.

brief | detail | extensive—(Optional) Display the specified level of output.

esis-neighbor-id—(Optional) Display adjacencies for the specified neighbor's network service access point (NSAP) only.

instance instance-name—(Optional) Display adjacencies for the specified routing instance only.

interface interface-name—(Optional) Display adjacencies for the specified interface only.

Required Privilege Level view

When	State	Event	Down reason
Sun Nov 26 22:07:35	Up	Received ISH	

show esis interface

Syntax `show esis interface`
`<brief | detail | extensive>`
`<instance instance-name>`
`<interface interface-name>`

Release Information Command introduced before Junos OS Release 7.4.

Description Display End System-to-Intermediate System (ES-IS) interface information.

Options **none**—(Same as **brief**) Display information for all configured ES-IS interfaces.

brief | detail | extensive—(Optional) Display the specified level of output.

instance *instance-name*—(Optional) Display configured interfaces for the specified routing instance only.

interface *interface-name*—(Optional) Display information about the specified interface only.

Required Privilege Level view

List of Sample Output [show esis interface on page 1798](#)
[show esis interface brief on page 1798](#)
[show esis interface detail on page 1798](#)
[show esis interface extensive on page 1798](#)

Output Fields [Table 96 on page 1797](#) describes the output fields for the **show esis interface** command. Output fields are listed in the approximate order in which they appear.

Table 96: show esis interface Output Fields

Field Name	Field Description	Level of Output
Interface	Interface through which the adjacency is made.	All levels
Receives	Types of hello messages that are received.	All levels
Sends	Types of hello messages that are sent.	All levels
Hello interval	Interface's hello interval, in seconds.	All levels
Adjacencies or Num Adj	Number of adjacencies established on this interface.	All levels
Holdtime	Interface's hold time, in seconds.	detail extensive

Table 96: show esis interface Output Fields (continued)

Field Name	Field Description	Level of Output
State	Internal implementation information.	detail extensive
End system configuration timer	Time, in seconds, for the end system to configure itself for ES-IS.	detail extensive
Interface index	Index value.	detail extensive
NET used in hello	Network entity title used in hello messages.	detail extensive

Sample Output

show esis interface

```
user@host> show esis interface
```

Interface	Receives	Sends	Hello Interval	Num Adj
fe-0/0/0.0	ISH	ISH	60.00	1
lo0.0	ISH	-	60.00	0

show esis interface brief

The output for the **show esis interface brief** command is identical to that for the **show esis interface** command. For sample output, see [show esis interface on page 1798](#).

show esis interface detail

```
user@host> show esis interface detail
```

```
Interface: fe-0/0/0.0
  Receives: ISH, Sends: ISH, Hello interval: 60.00
  Adjacencies: 1, Holdtime: 180, End system configuration timer: 180
  Interface index: 68, State: 0x2
  NET used in hello: 47.0005.80ff.f800.0000.0108.0001.0102.5501.6007

Interface: lo0.0
  Receives: ISH, Sends: - , Hello interval: 60.00
  Adjacencies: 0, Holdtime: 180, End system configuration timer: 180
  Interface index: 64, State: 0x2
  NET used in hello: 47.0005.80ff.f800.0000.0108.0001.0102.5501.6007
```

show esis interface extensive

The output for the **show esis interface extensive** command is identical to that for the **show esis interface detail** command. For sample output, see [show esis interface detail on page 1798](#).

show esis statistics

Syntax `show esis statistics`
`<instance instance-name>`

Release Information Command introduced before Junos OS Release 7.4.

Description Display End System-to-Intermediate System (ES-IS) packet statistics.

Options **none**—Display ES-IS packet statistics for all routing instances.

instance *instance-name*—(Optional) Display ES-IS statistics for the specified routing instance only.

Required Privilege Level view

Related Documentation

clear multicast bandwidth-admission

Syntax clear multicast bandwidth-admission
 <group *group-address*>
 <inet | inet6>
 <instance *instance-name*>
 <interface *interface-name*>
 <source *source-address*>

Release Information Command introduced in Junos OS Release 8.3.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.
 Command introduced in Junos OS Release 11.3 for the QFX Series.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Reapply IP multicast bandwidth admissions.

Options **none**—Reapply multicast bandwidth admissions for all IPv4 forwarding entries in the master routing instance.

group *group-address*—(Optional) Reapply multicast bandwidth admissions for the specified group.

inet—(Optional) Reapply multicast bandwidth admission settings for IPv4 flows.

inet6—(Optional) Reapply multicast bandwidth admission settings for IPv6 flows.

instance *instance-name*—(Optional) Reapply multicast bandwidth admission settings for the specified instance. If you do not specify an instance, the command applies to the master routing instance.

interface *interface-name*—(Optional) Examines the corresponding outbound interface in the relevant entries and acts as follows:

- If the interface is congested, and it was admitted previously, it is removed.
- If the interface was rejected previously, the **clear multicast bandwidth-admission** command enables the interface to be admitted as long as enough bandwidth exists on the interface.
- If you do not specify an interface, issuing the **clear multicast bandwidth-admission** command readmits any previously rejected interface for the relevant entries as long as enough bandwidth exists on the interface.

To manually reject previously admitted outbound interfaces, you must specify the interface.

source *source-address*—(Optional) Use with the **group** option to reapply multicast bandwidth admission settings for the specified (source, group) entry.

Required Privilege Level clear

clear pim join

List of Syntax [Syntax on page 1828](#)
[Syntax \(EX Series Switch and the QFX Series\) on page 1828](#)

Syntax

```
clear pim join
<all>
<group-address>
<bidirectional | dense | sparse>
<exact>
<inet | inet6>
<instance instance-name>
<logical-system (all | logical-system-name)>
<rp ip-address/prefix | source ip-address/prefix>
<sg | star-g>
```

Syntax (EX Series Switch and the QFX Series)

```
clear pim join
<all>
<group-address>
<dense | sparse>
<exact>
<inet | inet6>
<instance instance-name>
<rp ip-address/prefix | source ip-address/prefix>
<sg | star-g>
```

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.
 Command introduced in Junos OS Release 11.3 for the QFX Series.
 Multiple new filter options introduced in Junos OS Release 13.2.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Clear the Protocol Independent Multicast (PIM) join and prune states.

Options

- all**—To clear PIM join and prune states for all groups and family addresses in the master instance, you must specify “all”.
- group-address**—(Optional) Clear the PIM join and prune states for a group address.
- bidirectional | dense | sparse**—(Optional) Clear PIM bidirectional mode, dense mode, or sparse and source-specific multicast (SSM) mode entries.
- exact**—(Optional) Clear only the group that exactly matches the specified group address.
- inet | inet6**—(Optional) Clear the PIM entries for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Clear the entries for a specific PIM-enabled routing instance.

logical-system (**all** | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

rp *ip-address/prefix* | **source** *ip-address/prefix*—(Optional) Clear the PIM entries with a specified rendezvous point (RP) address and prefix or with a specified source address and prefix. You can omit the prefix.

sg | **star-g**—(Optional) Clear PIM (S,G) or (*,G) entries.

Additional Information The **clear pim join** command cannot be used to clear the PIM join and prune state on a backup Routing Engine when nonstop active routing is enabled.

Required Privilege Level clear

Cleared 4 Join/Prune states
```

clear pim join inet6 star-g all

```
user@host> clear pim join inet6 star-g all
Cleared 1 Join/Prune states
```

clear pim join-distribution

Syntax	<pre>clear pim join-distribution <all> <instance <i>instance-name</i>> <logical-system (all <i>logical-system-name</i>)></pre>
Release Information	Command introduced in Junos OS Release 10.0.
Description	<p>Clear the PIM join-redistribute states.</p> <p>Use the show pim source command to find out if there are multiple paths available for a source (for example, an RP).</p> <p>When you include the join-load-balance statement in the configuration, the PIM join states are distributed evenly on available equal-cost multipath links. When an upstream neighbor link fails, Junos OS redistributes the PIM join states to the remaining links. However, when new links are added or the failed link is restored, the existing PIM joins are not redistributed to the new link. New flows will be distributed to the new links. However, in a network without new joins and prunes, the new link is not used for multicast traffic. The clear pim join-distribution command redistributes the existing flows to the new upstream neighbors. Redistributing the existing flows causes traffic to be disrupted, so we recommend that you run the clear pim join-distribution command during a maintenance window.</p>
Options	<p>all— (Optional) Clear the PIM join-redistribute states for all groups and family addresses in the master instance.</p> <p>none— Automatically clear all PIM join/prune states.</p> <p>instance <i>instance-name</i>—(Optional) Redistribute the join states for a specific PIM-enabled routing instance.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Additional Information	The clear pim join-distribution command cannot be used to redistribute the PIM join states on a backup Routing Engine when nonstop active routing is enabled.
Required Privilege Level	clear

clear pim register

- List of Syntax** [Syntax on page 1832](#)
 [Syntax \(EX Series Switch and the QFX Series\) on page 1832](#)
 [Syntax \(PTX Series\) on page 1832](#)

Syntax clear pim register
 <all>
 <inet | inet6>
 <instance *instance-name*>
 <interface *interface-name*>
 <logical-system (all | *logical-system-name*)>

Syntax (EX Series Switch and the QFX Series) clear pim register
 <inet | inet6>
 <instance *instance-name*>
 <interface *interface-name*>

Syntax (PTX Series) clear pim register
 <inet | inet6>
 <instance *instance-name*>
 <logical-system (all | *logical-system-name*)>

Release Information Command introduced in Junos OS Release 7.6.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.
 Command introduced in Junos OS Release 11.3 for the QFX Series.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Clear Protocol Independent Multicast (PIM) register message counters.

Options **all**—Required to clear the PIM register message counters for all groups and family addresses in the master instance.

inet | inet6—(Optional) Clear PIM register message counters for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Clear register message counters for a specific PIM-enabled routing instance.

interface *interface-name*—(Optional) Clear PIM register message counters for a specific interface.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information The `clear pim register` command cannot be used to clear the PIM register state on a backup Routing Engine when nonstop active routing is enabled.

Required Privilege Level clear

request pim multicast-tunnel rebalance

List of Syntax [Syntax on page 1841](#)
 [Syntax \(EX Series Switches\) on page 1841](#)

Syntax request pim multicast-tunnel rebalance
 <instance *instance-name*>
 <logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches) request pim multicast-tunnel rebalance
 <instance *instance-name*>

Release Information Command introduced in Junos OS Release 10.2.
 Command introduced in Junos OS Release 10.2 for EX Series switches.

Description Rebalance the assignment of multicast tunnel encapsulation interfaces across available tunnel-capable PICs or across a configured list of tunnel-capable PICs. You can determine whether a rebalance is necessary by running the **show pim interfaces instance *instance-name*** command.

Options **none**—Re-create and rebalance all tunnel interfaces for all routing instances.
 instance *instance-name*—Re-create and rebalance all tunnel interfaces for a specific instance.
 logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level maintenance

Related Documentation • [show pim interfaces on page 1971](#)
 • *Load Balancing Multicast Tunnel Interfaces Among Available PICs*

Output Fields This command produces no output. To verify the operation of the command, run the **show pim interface instance *instance-name*** before and after running the **request pim multicast-tunnel rebalance** command.

show amt statistics

Syntax `show amt statistics`
`<instance instance-name>`
`<logical-system (all | logical-system-name)>`

Release Information Command introduced in JUNOS Release 10.2.

Description Display information about the Automatic Multicast Tunneling (AMT) protocol tunnel statistics.

Options **none**—Display summary information about all AMT Protocol tunnels.

instance *instance-name*—(Optional) Display information for the specified instance only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output [show amt statistics on page 1843](#)

Output Fields [Table 98 on page 1842](#) describes the output fields for the **show amt statistics** command. Output fields are listed in the approximate order in which they appear.

Table 98: show amt statistics Output Fields

Field Name	Field Description
AMT receive message count	<p>Summary of AMT statistics for messages received on all interfaces.</p> <ul style="list-style-type: none"> • AMT relay discovery—Number of AMT relay discovery messages received. • AMT membership request—Number of AMT membership request messages received. • AMT membership update—Number of AMT membership update messages received.
AMT send message count	<p>Summary of AMT statistics for messages sent on all interfaces.</p> <ul style="list-style-type: none"> • AMT relay advertisement—Number of AMT relay advertisement messages sent. • AMT membership query—Number of AMT membership query messages sent.

Table 98: show amt statistics Output Fields (continued)

Field Name	Field Description
AMT error message count	<p>Summary of AMT statistics for error messages received on all interfaces.</p> <ul style="list-style-type: none"> • AMT incomplete packet—Number of messages received with length errors so severe that further classification could not occur. • AMT invalid mac—Number of messages received with an invalid message authentication code (MAC). • AMT unexpected type—Number of messages received with an unknown message type specified. • AMT invalid relay discovery address—Number of AMT relay discovery messages received with an address other than the configured anycast address. • AMT invalid membership request address—Number of AMT membership request messages received with an address other than the configured AMT local address. • AMT invalid membership update address—Number of AMT membership update messages received with an address other than the configured AMT local address. • AMT incomplete relay discovery messages—Number of AMT relay discovery messages received that are not fully formed. • AMT incomplete membership request messages—Number of AMT membership request messages received that are not fully formed. • AMT incomplete membership update messages—Number of AMT membership update messages received that are not fully formed. • AMT no active gateway—Number of AMT membership update messages received for a tunnel that does not exist for the gateway that sent the message. • AMT invalid inner header checksum—Number of AMT membership update messages received with an invalid IP checksum. • AMT gateways timed out—Number of gateways that timed out because of inactivity.

Sample Output

show amt statistics

```
user@host> show amt statistics
```

```

AMT receive message count
AMT relay advertisement           :           2
AMT membership request           :           5
AMT membership update            :           5

AMT send message count
AMT relay advertisement           :           2
AMT membership query             :           5

AMT error message count
AMT incomplete packet             :           0
AMT invalid mac                   :           0
AMT unexpected type               :           0
AMT invalid relay discovery address :           0
AMT invalid membership request address :           0
AMT invalid membership update address :           0
AMT incomplete relay discovery messages :           0
AMT incomplete membership request messages :           0
AMT incomplete membership update messages :           0
AMT no active gateway             :           0

```

AMT invalid inner header checksum	:	0
AMT gateways timed out	:	0

show amt summary

Syntax `show amt summary`
 `<instance instance-name>`
 `<logical-system (all | logical-system-name)>`

Release Information Command introduced in Junos OS Release 10.2.

Description Display summary information about the Automatic Multicast Tunneling (AMT) protocol.

Options **none**—Display summary information about all AMT protocol instances.

instance *instance-name*—(Optional) Display information for the specified instance only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

List of Sample Output [show amt summary on page 1846](#)

Output Fields [Table 99 on page 1845](#) describes the output fields for the **show amt summary** command. Output fields are listed in the approximate order in which they appear.

Table 99: show amt summary Output Fields

Field Name	Field Description	Level of Output
AMT anycast prefix	Prefix advertised by unicast routing protocols to route AMT discovery messages to the router from nearby AMT gateways.	All levels
AMT anycast address	Anycast address configured from which the anycast prefix is derived.	All levels
AMT local address	Local unique AMT relay IP address configured. Used to send AMT relay advertisement messages, it is the IP source address of AMT control messages and the source address of the data tunnel encapsulation.	All levels
AMT tunnel limit	Maximum number of AMT tunnels that can be created.	All levels
active tunnels	Number of active AMT tunnel interfaces.	All levels

Sample Output

show amt summary

```
user@host> show amt summary
AMT anycast prefix : 20.0.0.4/32
AMT anycast address : 20.0.0.4
AMT local address : 20.0.0.4
AMT tunnel limit : 1000, active tunnels : 2
```

show amt tunnel

Syntax	<pre>show amt tunnel <brief detail> <gateway-address gateway-ip-address> <port port-number> <instance instance-name> <logical-system (all logical-system-name)> <tunnel-interface interface-name></pre>
Release Information	Command introduced in Junos OS Release 10.2.
Description	Display information about the Automatic Multicast Tunneling (AMT) dynamic tunnels.
Options	<p>none—Display summary information about all AMT protocol instances.</p> <p>brief detail—(Optional) Display the specified level of detail.</p> <p>gateway-address gateway-ip-address port port-number—(Optional) Display information for the specified AMT gateway only. If no port is specified, display information for all AMT gateways with the given IP address.</p> <p>instance instance-name—(Optional) Display information for the specified instance only.</p> <p>logical-system (all logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>tunnel-interface interface-name—(Optional) Display information for the specified AMT tunnel interface only.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • clear amt tunnel on page 1805 • show amt statistics on page 1842 • show amt summary on page 1845
List of Sample Output	<p>show amt tunnel on page 1848</p> <p>show amt tunnel detail on page 1849</p> <p>show amt tunnel tunnel-interface on page 1849</p> <p>show amt tunnel gateway-address on page 1849</p> <p>show amt tunnel gateway-address detail on page 1849</p>
Output Fields	Table 100 on page 1848 describes the output fields for the show amt tunnel command. Output fields are listed in the approximate order in which they appear.

Table 100: show amt tunnel Output Fields

Field Name	Field Description	Level of Output
AMT gateway address	Address of the AMT gateway that is being connected by the AMT tunnel.	All levels
port	Client port used by the AMT tunnel.	All levels
AMT tunnel interface	Dynamically created AMT logical interfaces used by the AMT tunnel in the format ud-FPC/PIC/Port.unit .	All levels
AMT tunnel state	State of the AMT tunnel. The state is normally Active . <ul style="list-style-type: none"> • Active—The tunnel is active. • Pending—The tunnel creation is pending. This is a transient state. • Down—The tunnel is in the down state. • Graceful restart pending—Graceful restart is in progress. • Reviving—The routing protocol daemon or Routing Engine was restarted (not gracefully). The tunnel remains in the reviving state until the AMT gateway sends a control message. When the message is received the tunnel is moved to the Active state. If no message is received before the AMT tunnel inactivity timer expires, the tunnel is deleted. 	All levels
AMT tunnel inactivity timeout	Number of seconds since the most recent control message was received from an AMT gateway. If no message is received before the AMT tunnel inactivity timer expires, the tunnel is deleted.	All levels
Number of groups	Number of multicast groups using the tunnel.	All levels
Group	Multicast group address or addresses using the tunnel.	detail
Include Source	Multicast source address for each IGMPv3 group using the tunnel.	detail
AMT message count	Statistics for AMT messages: <ul style="list-style-type: none"> • AMT Request—Number of AMT relay tunnel request messages received. • AMT membership update—Number of AMT membership update messages received. 	All levels

show dvmrp interfaces

Syntax `show dvmrp interfaces`
`<logical-system (all | logical-system-name)>`

Release Information

NOTE: Distance Vector Multicast Routing Protocol (DVMRP) was deprecated in Junos OS Release 16.1. Although DVMRP commands continue to be available and configurable in the CLI, they are no longer visible and are scheduled for removal in a subsequent release.

Command introduced before Junos OS Release 7.4.

Description Display information about Distance Vector Multicast Routing Protocol (DVMRP)–enabled interfaces.

Options **none**—(Same as **logical-system all**) Display information about DVMRP-enabled interfaces.
logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output [show dvmrp interfaces on page 1853](#)

Output Fields [Table 101 on page 1851](#) describes the output fields for the **show dvmrp interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 101: show dvmrp interfaces Output Fields

Field Name	Field Description
Interface	Name of the interface.
State	State of the interface: up or down .
Leaf	Whether the interface is a leaf (that is, whether it has no neighbors) or whether it has neighbors.
Metric	Interface metric: a value from 1 through 31.
Announce	Number of routes the interface is announcing.

Table 101: show dvmrp interfaces Output Fields (continued)

Field Name	Field Description
Mode	DVMRP mode: <ul style="list-style-type: none">• Forwarding—DVMRP does both the routing and the multicast data forwarding.• Unicast-routing—DVMRP does only the routing. Forwarding of the multicast data packets can be done by enabling PIM on the interface.

Sample Output

show dvmrp interfaces

```
user@host> show dvmrp interfaces
```

Interface	State	Leaf	Metric	Announce	Mode
fxp0.0	Up	N	1	4	Forwarding
fxp1.0	Up	N	1	4	Forwarding
fxp2.0	Up	N	1	3	Forwarding
lo0.0	Up	Y	1	0	Unicast-routing

show dvmrp neighbors

Syntax `show dvmrp neighbors`
`<logical-system (all | logical-system-name)>`

Release Information

NOTE: Distance Vector Multicast Routing Protocol (DVMRP) was deprecated in Junos OS Release 16.1. Although DVMRP commands continue to be available and configurable in the CLI, they are no longer visible and are scheduled for removal in a subsequent release.

Command introduced before Junos OS Release 7.4.

Description Display information about Distance Vector Multicast Routing Protocol (DVMRP) neighbors.

Options **none**—(Same as **logical-system all**) Display information about DVMRP neighbors.
logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output [show dvmrp neighbors on page 1855](#)

Output Fields [Table 102 on page 1854](#) describes the output fields for the **show dvmrp neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 102: show dvmrp neighbors Output Fields

Field Name	Field Description
Neighbor	Address of the neighboring DVMRP router.
Interface	Interface through which the neighbor is reachable.
Version	Version of DVMRP that the neighbor is running, in the format <i>major</i> minor .

Table 102: *show dvmrp neighbors* Output Fields (continued)

Field Name	Field Description
Flags	Information about the neighbor: <ul style="list-style-type: none"> • 1—One way. The local router has seen the neighbor, but the neighbor has not seen the local router. • G—Neighbor supports generation ID. • L—Neighbor is a leaf router. • M—Neighbor supports mtrace. • N—Neighbor supports netmask in prune messages and graft messages. • P—Neighbor supports pruning. • S—Neighbor supports SNMP.
Routes	Number of routes learned from the neighbor.
Timeout	How long until the DVMRP neighbor information times out, in seconds.
Transitions	Number of generation ID changes that have occurred since the local router learned about the neighbor.

Sample Output

show dvmrp neighbors

```
user@host> show dvmrp neighbors
```

Neighbor	Interface	Version	Flags	Routes	Timeout	Transitions
192.168.1.1	ipip.0	3.255	PGM	3	28	1

show dvmrp prefix

Syntax `show dvmrp prefix`
`<brief | detail>`
`<logical-system (all | logical-system-name)>`
`<prefix>`

Release Information

NOTE: Distance Vector Multicast Routing Protocol (DVMRP) was deprecated in Junos OS Release 16.1. Although DVMRP commands continue to be available and configurable in the CLI, they are no longer visible and are scheduled for removal in a subsequent release.

Command introduced before Junos OS Release 7.4.

Description Display information about Distance Vector Multicast Routing Protocol (DVMRP) prefixes.

Options **none**—Display standard information about all DVMRP prefixes.

brief | detail—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

prefix—(Optional) Display information about specific prefixes.

Required Privilege Level view

List of Sample Output [show dvmrp prefix on page 1858](#)
[show dvmrp prefix brief on page 1858](#)
[show dvmrp prefix detail on page 1858](#)

Output Fields [Table 103 on page 1856](#) describes the output fields for the **show dvmrp prefix** command. Output fields are listed in the approximate order in which they appear.

Table 103: show dvmrp prefix Output Fields

Field Name	Field Description	Level of Output
Prefix	DVMRP route.	All levels
Next hop	Next hop from which the route was learned.	All levels
Age	Last time that the route was refreshed.	All levels
<i>multicast-group</i>	Multicast group address.	detail

Table 103: show dvmrp prefix Output Fields (continued)

Field Name	Field Description	Level of Output
Prunes sent	Number of prune messages sent to the multicast group.	detail
Grafts sent	Number of grafts sent to the multicast group.	detail
Cache lifetime	Lifetime of the group in the multicast cache, in seconds.	detail
Prune lifetime	Lifetime remaining and total lifetime of prune messages, in seconds.	detail

Sample Output

show dvmrp prefix

```
user@host> show dvmrp prefix
```

Prefix	Next hop	Age
10.38.0.0	/30 10.38.0.1	00:06:17
10.38.0.4	/30 10.38.0.5	00:06:13
10.38.0.8	/30 10.38.0.2	00:00:04
10.38.0.12	/30 10.38.0.6	00:00:04

show dvmrp prunes

Syntax `show dvmrp prunes`
`<all | rx | tx>`
`<logical-system (all | logical-system-name)>`

Release Information

NOTE: Distance Vector Multicast Routing Protocol (DVMRP) was deprecated in Junos OS Release 16.1. Although DVMRP commands continue to be available and configurable in the CLI, they are no longer visible and are scheduled for removal in a subsequent release.

Command introduced before Junos OS Release 7.4.

Description Display information about active Distance Vector Multicast Routing Protocol (DVMRP) prune messages.

Options **none**—Display received and transmitted DVMRP prune information.

all—(Optional) Display information about all received and transmitted prune messages.

rx—(Optional) Display information about received prune messages.

tx—(Optional) Display information about transmitted prune messages.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields	<p>Table 106 on page 1866 describes the output fields for the show igmp interface command. Output fields are listed in the approximate order in which they appear.</p>

Table 106: show igmp interface Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the interface.	All levels
Querier	Address of the routing device that has been elected to send membership queries.	All levels
State	State of the interface: Up or Down .	All levels
SSM Map Policy	Name of the source-specific multicast (SSM) map policy that has been applied to the IGMP interface.	All levels
Timeout	How long until the IGMP querier is declared to be unreachable, in seconds.	All levels
Version	IGMP version being used on the interface: 1, 2, or 3.	All levels
Groups	Number of groups on the interface.	All levels
Group limit	Maximum number of groups allowed on the interface. Any joins requested after the limit is reached are rejected.	All levels
Group threshold	Configured threshold at which a warning message is generated. This threshold is based on a percentage of groups received on the interface. If the number of groups received reaches the configured threshold, the device generates a warning message.	All levels
Group log-interval	Time (in seconds) between consecutive log messages.	All levels
Immediate Leave	State of the immediate leave option: <ul style="list-style-type: none"> • On—Indicates that the router removes a host from the multicast group as soon as the router receives a leave group message from a host associated with the interface. • Off—Indicates that after receiving a leave group message, instead of removing a host from the multicast group immediately, the router sends a group query to determine if another receiver responds. 	All levels
Promiscuous Mode	State of the promiscuous mode option: <ul style="list-style-type: none"> • On—Indicates that the router can accept IGMP reports from subnetworks that are not associated with its interfaces. • Off—Indicates that the router can accept IGMP reports only from subnetworks that are associated with its interfaces. 	All levels
Distributed	State of IGMP, which, by default, takes place on the Routing Engine for MX Series routers but can be distributed to the Packet Forwarding Engine to provide faster processing of join and leave events. <ul style="list-style-type: none"> • On—distributed IGMP is enabled. 	All levels

Table 106: show igmp interface Output Fields (continued)

Field Name	Field Description	Level of Output
Passive	<p>State of the passive mode option:</p> <ul style="list-style-type: none"> • On—Indicates that the router can run IGMP on the interface but not send or receive control traffic such as IGMP reports, queries, and leaves. • Off—Indicates that the router can run IGMP on the interface and send or receive control traffic such as IGMP reports, queries, and leaves. <p>The passive statement enables you to selectively activate up to two out of a possible three available query or control traffic options. When enabled, the following options appear after the on state declaration:</p> <ul style="list-style-type: none"> • send-general-query—The interface sends general queries. • send-group-query—The interface sends group-specific and group-source-specific queries. • allow-receive—The interface receives control traffic. 	All levels
OIF map	Name of the OIF map (if configured) associated with the interface.	All levels
SSM map	Name of the source-specific multicast (SSM) map (if configured) used on the interface.	All levels
Configured Parameters	<p>Information configured by the user:</p> <ul style="list-style-type: none"> • IGMP Query Interval—Interval (in seconds) at which this router sends membership queries when it is the querier. • IGMP Query Response Interval—Time (in seconds) that the router waits for a report in response to a general query. • IGMP Last Member Query Interval—Time (in seconds) that the router waits for a report in response to a group-specific query. • IGMP Robustness Count—Number of times the router retries a query. 	All levels
Derived Parameters	<p>Derived information:</p> <ul style="list-style-type: none"> • IGMP Membership Timeout—Timeout period (in seconds) for group membership. If no report is received for these groups before the timeout expires, the group membership is removed. • IGMP Other Querier Present Timeout—Time (in seconds) that the router waits for the IGMP querier to send a query. 	All levels

Sample Output

show igmp interface

```

user@host> show igmp interface
Interface: at-0/3/1.0
  Querier: 203.0.3.113.31
  State:      Up Timeout:  None Version:  2 Groups:    4
  SSM Map Policy: ssm-policy-A
Interface: so-1/0/0.0

Table 107: show igmp snooping interface Output Fields

Field Name	Field Description	Level of Output
Routing-instance or Instance	Routing instance for IGMP snooping.	All levels
Bridge Domain or Vlan	Bridge domain or VLAN for which IGMP snooping is enabled.	All levels
Learning Domain	Learning domain for snooping.	All levels
interface	Interfaces that are being snooped in this learning domain.	All levels
Groups	Number of groups on the interface.	All levels
State	State of the interface: Up or Down .	All levels
Up Groups	Number of active multicast groups attached to the logical interface.	All levels
immediate-leave	State of immediate leave: On or Off .	All levels
router-interface	Router interfaces that are part of this learning domain.	All levels
Group limit	Maximum number of (source,group) pairs allowed per interface. When a group limit is not configured, this field is not shown.	All levels
Data-forwarding receiver: yes	VLAN associated with the interface is configured as a data-forwarding multicast receiver VLAN using multicast VLAN registration (MVR) on EX Series switches with Enhanced Layer 2 Software (ELS).	All levels
IGMP Query Interval	Frequency (in seconds) with which this router sends membership queries when it is the querier.	All levels
IGMP Query Response Interval	Time (in seconds) that the router waits for a response to a general query.	All levels
IGMP Last Member Query Interval	Time (in seconds) that the router waits for a report in response to a group-specific query.	All levels
IGMP Robustness Count	Number of times the router retries a query.	All levels
IGMP Membership Timeout	Timeout for group membership. If no report is received for these groups before the timeout expires, the group membership is removed.	All levels
IGMP Other Querier Present Timeout	Time that the router waits for the IGMP querier to send a query.	All levels

Sample Output

show igmp snooping interface

```

user@host> show igmp snooping interface ge-0/1/4
Instance: default-switch

Bridge-Domain: sample

Learning-Domain: default
Interface: ge-0/1/4.0
State: Up Groups: 0
Immediate leave: Off
Router interface: no

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

Derived Parameters:
IGMP Membership Timeout: 260.0
IGMP Other Querier Present Timeout: 255.0

```

show igmp snooping interface (logical systems)

```

user@host> show igmp snooping interface logical-system all

logical-system: default
Instance: VPLS-6
Learning-Domain: default
Interface: ge-0/2/2.601
  State:          Up Groups:      10
  Immediate leave: Off
  Router interface: no

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

Instance: VS-4
Bridge-Domain: VS-4-BD-1
Learning-Domain: vlan-id 1041
Interface: ae2.3

show igmp snooping membership

Syntax show igmp snooping membership
 <brief | detail>
 <instance *routing-instance-name*>
 <interface *interface-name*>
 <vlan (*vlan-id* | *vlan-name*)>
 <bridge-domain *bridge-domain-name*>
 <group *group-name*>
 <logical-system *logical-system-name*>
 <virtual-switch *virtual-switch-name*>
 <vlan-id *vlan-identifier*>

Release Information Command introduced in Junos OS Release 8.5.
 Command introduced in Junos OS Release 18.1R1 for the SRX1500 devices.

Description Display the multicast group membership information maintained by IGMP snooping.

Options **none**—Display the multicast group membership information about all VLANs on which IGMP snooping is enabled.

brief | detail—(Optional) Display the specified level of output. The default is **brief**.

NOTE: On QFX Series switches, the output is the same for either **brief** or **detail** levels.

instance *routing-instance-name*—(Optional) Display the multicast group membership information about the specified routing instance.

interface *interface-name*—(Optional) Display the multicast group membership information about the specified interface.

vlan (*vlan-id* | *vlan-name*)—(Optional) Display the multicast group membership for the specified VLAN.

bridge-domain *bridge-domain-name*—(Optional) Display information about a particular bridge domain.

group *group-name* —(Optional) Display information about this group address.

logical-system *logical-system-name*—(Optional) Display information about a particular logical system, or type 'all'.

virtual-switch *virtual-switch-name*—(Optional) Display information about a particular virtual switch.

vlan-id *vlan-identifier*—(Optional) Display information about a particular VLAN.

Output Fields Table 108 on page 1876 lists the output fields for the **show igmp snooping membership** command. Output fields are listed in the approximate order in which they appear.

Table 108: show igmp snooping membership Output Fields

Field Name	Field Description	Level of Output
VLAN	Name of the VLAN.	All
Instance	Routing instance for IGMP snooping.	All levels
Learning Domain	Learning domain for snooping.	All levels
Interface	Interface on which this router is a proxy.	detail
Data-forwarding receiver: yes	(EX Series switches with Enhanced Layer 2 Software (ELS) only) VLAN associated with the interface is configured as a data-forwarding multicast receiver VLAN using multicast VLAN registration (MVR). NOTE: Interfaces configured on MVR receiver VLANs are listed under the associated MVR <i>source</i> VLAN (MVLAN) for which the interface forwards multicast streams.	All levels
Up Groups or Groups	Number of active multicast groups attached to the logical interface.	All levels

Table 108: show igmp snooping membership Output Fields (continued)

Field Name	Field Description	Level of Output
Group	<p>(Not displayed on QFX Series switches) IP multicast address of the multicast group.</p> <p>The following information is provided for the multicast group:</p> <ul style="list-style-type: none"> • Last reporter—Last host to report membership for the multicast group. • Receiver count—Number of hosts on the interface that are members of the multicast group (field appears only if immediate-leave is configured on the VLAN), or number of interfaces that have membership in a multicast group. • Uptime—Length of time (in hours, minutes, and seconds) a multicast group has been active on the interface. • timeout—Time (in seconds) left until the entry for the multicast group is removed from the multicast group if no membership reports are received on the interface. This counter is reset to its maximum value when a membership report is received. • Flags—The lowest IGMP version in use by a host that is a member of the group on the interface. • Include source—Source addresses from which multicast streams are allowed based on IGMPv3 reports. 	detail
Group Mode	Mode the SSM group is operating in: Include or Exclude .	All levels
Source	Source address used on queries.	All levels
Last reported by	Address of source last replying to the query.	All levels
Group Timeout	Time remaining until a group in exclude mode moves to include mode. The timer is refreshed when a listener in exclude mode sends a report. A group in include mode or configured as a static group displays a zero timer.	All levels
Timeout	Length of time (in seconds) left until the entry is purged.	detail
Type	<p>Way that the group membership information was learned:</p> <ul style="list-style-type: none"> • Dynamic—Group membership was learned by the IGMP protocol. • Static—Group membership was learned by configuration. 	All levels
Include receiver	Source address of receiver included in membership with timeout (in seconds).	detail

Table 109: show igmp snooping statistics Output Fields

Field Name	Field Description	Level of Output
Routing-instance	Routing instance for IGMP snooping.	All levels
IGMP packet statistics	Heading for IGMP snooping statistics for all interfaces or for the specified interface.	All levels
learning-domain	Appears at end of “IGMP packets statistics” line.	All levels
IGMP Message type	Summary of IGMP statistics: <ul style="list-style-type: none"> • Membership Query—Number of membership queries sent and received. • V1 Membership Report—Number of version 1 membership reports sent and received. • DVMRP—Number of DVMRP messages sent or received. • PIM V1—Number of PIM version 1 messages sent or received. • Cisco Trace—Number of Cisco trace messages sent or received. • V2 Membership Report—Number of version 2 membership reports sent or received. • Group Leave—Number of group leave messages sent or received. • Domain Wide Report—Number of domain-wide reports sent or received. • V3 Membership Report—Number of version 3 membership reports sent or received. • Other Unknown types—Number of unknown message types received. • IGMP v3 unsupported type—Number of messages received with unknown and unsupported IGMP version 3 message types. • IGMP v3 source required for SSM—Number of IGMP version 3 messages received that contained no source. • IGMP v3 mode not applicable for SSM—Number of IGMP version 3 messages received that did not contain a mode applicable for source-specific multicast (SSM). 	All levels
Received	Number of messages received.	All levels
Sent	Number of messages sent.	All levels
Rx errors	Number of received packets that contained errors.	All levels
IGMP Global Statistics	Summary of IGMP snooping statistics for all interfaces. <ul style="list-style-type: none"> • Bad Length—Number of messages received with length errors so severe that further classification could not occur. • Bad Checksum—Number of messages received with a bad IP checksum. No further classification was performed. • Rx non-local—Number of messages received from senders that are not local. 	All levels

show igmp statistics

List of Syntax [Syntax on page 1886](#)
 [Syntax \(EX Series Switch and the QFX Series\) on page 1886](#)

Syntax show igmp statistics
 <brief | detail>
 <interface *interface-name*>
 <logical-system (all | *logical-system-name*)>

Syntax (EX Series Switch and the QFX Series)	show igmp statistics <brief detail> <interface <i>interface-name</i> >
--	--

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
----------------------------	---

Description Display Internet Group Management Protocol (IGMP) statistics.

Options **none**—Display IGMP statistics for all interfaces.

brief | detail—(Optional) Display the specified level of output.

interface *interface-name*—(Optional) Display IGMP statistics about the specified interface only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level

Documentation

List of Sample Output [show igmp statistics on page 1888](#)
[show igmp statistics interface on page 1888](#)

Output Fields [Table 110 on page 1887](#) describes the output fields for the **show igmp statistics** command. Output fields are listed in the approximate order in which they appear.

Table 110: show igmp statistics Output Fields

Field Name	Field Description
IGMP packet statistics	Heading for IGMP packet statistics for all interfaces or for the specified interface name.
IGMP Message type	<p>Summary of IGMP statistics:</p> <ul style="list-style-type: none"> • Membership Query—Number of membership queries sent and received. • V1 Membership Report—Number of version 1 membership reports sent and received. • DVMRP—Number of DVMRP messages sent or received. • PIM V1—Number of PIM version 1 messages sent or received. • Cisco Trace—Number of Cisco trace messages sent or received. • V2 Membership Report—Number of version 2 membership reports sent or received. • Group Leave—Number of group leave messages sent or received. • Mtrace Response—Number of Mtrace response messages sent or received. • Mtrace Request—Number of Mtrace request messages sent or received. • Domain Wide Report—Number of domain-wide reports sent or received. • V3 Membership Report—Number of version 3 membership reports sent or received. • Other Unknown types—Number of unknown message types received. • IGMP v3 unsupported type—Number of messages received with unknown and unsupported IGMP version 3 message types. • IGMP v3 source required for SSM—Number of IGMP version 3 messages received that contained no source. • IGMP v3 mode not applicable for SSM—Number of IGMP version 3 messages received that did not contain a mode applicable for source-specific multicast (SSM). Beginning with certain releases, this type includes records received for groups in the SSM range of addresses and in which the mode is <code>MODE_IS_EXCLUDE</code> or <code>CHANGE_TO_EXCLUDE_MODE</code>. This includes records with a non-empty source list.
Received	Number of messages received.
Sent	Number of messages sent.
Rx errors	Number of received packets that contained errors.
Max Rx rate (pps)	Maximum number of IGMP packets received during 1 second interval.
IGMP Global Statistics	<p>Summary of IGMP statistics for all interfaces.</p> <ul style="list-style-type: none"> • Bad Length—Number of messages received with length errors so severe that further classification could not occur. • Bad Checksum—Number of messages received with a bad IP checksum. No further classification was performed. • Bad Receive If—Number of messages received on an interface not enabled for IGMP. • Rx non-local—Number of messages received from senders that are not local. • Timed out—Number of groups that timed out as a result of not receiving an explicit leave message. • Rejected Report—Number of reports dropped because of the IGMP group policy. • Total Interfaces—Number of interfaces configured to support IGMP.

Sample Output

show igmp statistics

```
user@host> show igmp statistics

IGMP packet statistics for all interfaces
IGMP Message type      Received      Sent  Rx errors
Membership Query       8883         459    0
V1 Membership Report   0            0      0

Membership Query        0            230    0
V1 Membership Report    0            0      0
```

show mld group

Syntax `show mld group`
`<brief | detail>`
`<group-name>`
`<logical-system (all | logical-system-name)>`

Release Information Command introduced before Junos OS Release 7.4.

Description Display information about Multicast Listener Discovery (MLD) group membership.

Options **none**—Display standard information about all MLD groups.

brief | detail—(Optional) Display the specified level of output.

group-name—(Optional) Display MLD information about the specified group.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

Table 111: show mld group Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the interface that received the MLD membership report; local means that the local router joined the group itself.	All levels
Group	Group address.	All levels
Source	Source address.	All levels
Group Mode	Mode the SSM group is operating in: Include or Exclude .	All levels

Table 111: show mld group Output Fields (continued)

Field Name	Field Description	Level of Output
Last reported by	Address of the host that last reported membership in this group.	All levels
Source timeout	Time remaining until the group traffic is no longer forwarded. The timer is refreshed when a listener in include mode sends a report. A group in exclude mode or configured as a static group displays a zero timer.	detail
Timeout	Time remaining until the group membership is removed.	brief none
Group timeout	Time remaining until a group in exclude mode moves to include mode. The timer is refreshed when a listener in exclude mode sends a report. A group in include mode or configured as a static group displays a zero timer.	detail
Type	Type of group membership: <ul style="list-style-type: none"> • Dynamic—Host reported the membership. • Static—Membership is configured. 	All levels

Sample Output

Output Fields [Table 112 on page 1893](#) describes the output fields for the **show mld interface** command. Output fields are listed in the approximate order in which they appear.

Table 112: show mld interface Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the interface.	All levels
Querier	Address of the router that has been elected to send membership queries.	All levels
State	State of the interface: Up or Down .	All levels
SSM Map Policy	Name of the source-specific multicast (SSM) map policy that has been applied to the interface.	All levels
SSM Map Policy	Name of the source-specific multicast (SSM) map policy at the MLD interface.	All levels

Table 112: show mld interface Output Fields (continued)

Field Name	Field Description	Level of Output
Timeout	How long until the MLD querier is declared to be unreachable, in seconds.	All levels
Version	MLD version being used on the interface: 1 or 2.	All levels
Groups	Number of groups on the interface.	All levels
Passive	<p>State of the passive mode option:</p> <ul style="list-style-type: none"> • On—Indicates that the router can run IGMP or MLD on the interface but not send or receive control traffic such as IGMP or MLD reports, queries, and leaves. • Off—Indicates that the router can run IGMP or MLD on the interface and send or receive control traffic such as IGMP or MLD reports, queries, and leaves. <p>The passive statement enables you to selectively activate up to two out of a possible three available query or control traffic options. When enabled, the following options appear after the on state declaration:</p> <ul style="list-style-type: none"> • send-general-query—The interface sends general queries. • send-group-query—The interface sends group-specific and group-source-specific queries. • allow-receive—The interface receives control traffic 	All levels
OIF map	Name of the OIF map associated to the interface.	All levels
SSM map	Name of the source-specific multicast (SSM) map used on the interface, if configured.	All levels
Group limit	Maximum number of groups allowed on the interface. Any memberships requested after the limit is reached are rejected.	All levels
Group threshold	<p>Configured threshold at which a warning message is generated.</p> <p>This threshold is based on a percentage of groups received on the interface. If the number of groups received reaches the configured threshold, the device generates a warning message.</p>	All levels
Group log-interval	Time (in seconds) between consecutive log messages.	All levels
Immediate Leave	<p>State of the immediate leave option:</p> <ul style="list-style-type: none"> • On—Indicates that the router removes a host from the multicast group as soon as the router receives a multicast listener done message from a host associated with the interface. • Off—Indicates that after receiving a multicast listener done message, instead of removing a host from the multicast group immediately, the router sends a group query to determine if another receiver responds. 	All levels

Table 112: show mld interface Output Fields (continued)

Field Name	Field Description	Level of Output
Distributed	State of MLD, which, by default, takes place on the Routing Engine for MX Series routers but can be distributed to the Packet Forwarding Engine to provide faster processing of join and leave events. <ul style="list-style-type: none"> • On—distributed MLD is enabled. 	All levels
Configured Parameters	Information configured by the user. <ul style="list-style-type: none"> • MLD Query Interval (.1 secs)—Interval at which this router sends membership queries when it is the querier. • MLD Query Response Interval (.1 secs)—Time that the router waits for a report in response to a general query. • MLD Last Member Query Interval (.1 secs)—Time that the router waits for a report in response to a group-specific query. • MLD Robustness Count—Number of times the router retries a query. 	All levels
Derived Parameters	Derived information. <ul style="list-style-type: none"> • MLD Membership Timeout (.1 secs)—Timeout period for group membership. If no report is received for these groups before the timeout expires, the group membership will be removed. • MLD Other Querier Present Timeout (.1 secs)—Time that the router waits for the IGMP querier to send a query. 	All levels

Sample Output

show mld interface

```

user@host> show mld interface

Interface: fe-0/0/0

show msdp

Syntax	<pre>show msdp <brief detail> <instance <i>instance-name</i>> <logical-system (all <i>logical-system-name</i>)> <peer <i>peer-address</i>></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 12.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	Display Multicast Source Discovery Protocol (MSDP) information.
Options	<p>none—Display standard MSDP information for all routing instances.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>instance <i>instance-name</i>—(Optional) Display information for the specified instance only.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>peer <i>peer-address</i>—(Optional) Display information about the specified peer only.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show msdp source on page 1903 • show msdp source-active on page 1905 • show msdp statistics on page 1908
List of Sample Output	<p>show msdp on page 1901</p> <p>show msdp brief on page 1901</p> <p>show msdp detail on page 1901</p>
Output Fields	<p>Table 114 on page 1900 describes the output fields for the show msdp command. Output fields are listed in the approximate order in which they appear.</p>

Table 114: show msdp Output Fields

Field Name	Field Description	Level of Output
Peer address	IP address of the peer.	All levels
Local address	Local address of the peer.	All levels

Table 114: *show msdp* Output Fields (continued)

Field Name	Field Description	Level of Output
State	Status of the MSDP connection: Listen , Established , or Inactive .	All levels
Last up/down	Time at which the most recent peer-state change occurred.	All levels
Peer-Group	Peer group name.	All levels
SA Count	Number of source-active cache entries advertised by each peer that were accepted, compared to the number that were received, in the format <i>number-accepted/number-received</i> .	All levels
Peer Connect Retries	Number of peer connection retries.	detail
State timer expires	Number of seconds before another message is sent to a peer.	detail
Peer Times out	Number of seconds to wait for a response from the peer before the peer is declared unavailable.	detail
SA accepted	Number of entries in the source-active cache accepted from the peer.	detail
SA received	Number of entries in the source-active cache received by the peer.	detail

Sample Output

show msdp

```
user@host> show msdp
```

Peer address	Local address	State	Last up/down	Peer-Group	SA Count
198.32.8.193	198.32.8.195	Established	5d 19:25:44	North23	120/150
198.32.8.194	198.32.8.195	Established	3d 19:27:27	North23	300/345
198.32.8.196	198.32.8.195	Established	5d 19:39:36	North23	10/13
198.32.8.197	198.32.8.195	Established	5d 19:32:27	North23	5/6
198.32.8.198	198.32.8.195	Established	3d 19:33:04	North23	2305/3000

show msdp brief

The output for the **show msdp brief** command is identical to that for the **show msdp** command. For sample output, see [show msdp on page 1901](#).

show msdp detail

```
user@host> show msdp detail
```

```
Peer: 10.255.70.15
Local address: 10.255.70.19
State: Established
Peer Connect Retries: 0
State timer expires: 22
Peer Times out: 49
```

```
SA accepted: 0  
SA received: 0
```

show msdp source

Syntax	<pre>show msdp source <instance <i>instance-name</i>> <logical-system (all <i>logical-system-name</i>)> <source-address></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 12.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	Display multicast sources learned from Multicast Source Discovery Protocol (MSDP).
Options	<p>none—Display standard MSDP source information for all routing instances.</p> <p>instance <i>instance-name</i>—(Optional) Display information for the specified instance only.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>source-address—(Optional) IP address and optional prefix length. Output Fields Table 115 on page 1904 describes the output fields for the **show msdp source** command. Output fields are listed in the approximate order in which they appear.

Table 115: show msdp source Output Fields

Field Name	Field Description
Source address	IP address of the source.
/Len	Length of the prefix for this IP address.
Type	Discovery method for this multicast source: <ul style="list-style-type: none"> • Configured—Source-active limit explicitly configured for this source. • Dynamic—Source-active limit established when this source was discovered.
Maximum	Source-active limit applied to this source.
Threshold	Source-active threshold applied to this source.
Exceeded	Number of source-active messages received from this source exceeding the established maximum.

Sample Output

show msdp source

```
user@host> show msdp source
```

Source address	/Len	Type	Maximum	Threshold	Exceeded
0.0.0.0	/0	Configured	5	none	0
10.1.0.0	/16	Configured	500	none	0
10.1.1.1	/32	Configured	10000	none	0
10.1.1.2	/32	Dynamic	6936	none	0
10.1.5.5	/32	Dynamic	500	none	123
10.2.1.1	/32	Dynamic	2	none	0

show msdp source-active

Syntax	<pre>show msdp source-active <brief detail> <group <i>group</i>> <instance <i>instance-name</i>> <local> <logical-system (all <i>logical-system-name</i>)> <originator <i>originator</i>> <peer <i>peer-address</i>> <source <i>source-address</i>></pre>

Output Fields Table 116 on page 1906 describes the output fields for the **show msdp source-active** command. Output fields are listed in the approximate order in which they appear.

Table 116: show msdp source-active Output Fields

Field Name	Field Description
Global active source limit exceeded	Number of times all peers have exceeded configured active source limits.
Global active source limit maximum	Configured number of active source messages accepted by the device.
Global active source limit threshold	Configured threshold for applying random early discard (RED) to drop some but not all MSDP active source messages.
Global active source limit log-warning	Threshold at which a warning message is logged (percentage of the number of active source messages accepted by the device).
Global active source limit log interval	Time (in seconds) between consecutive log messages.
Group address	Multicast address of the group.
Source address	IP address of the source.
Peer address	IP address of the peer.
Originator	Router ID configured on the source of the rendezvous point (RP) that originated the message, or the loopback address when the router ID is not configured.
Flags	Flags: Accept , Reject , or Filtered .

Sample Output

show msdp source-active

```
user@host> show msdp source-active
```

Group address	Source address	Peer address	Originator	Flags
230.0.0.0	192.168.195.46	local	10.255.14.30	Accept
230.0.0.1	192.168.195.46	local	10.255.14.30	Accept
230.0.0.2	192.168.195.46	local	10.255.14.30	Accept

show msdp statistics

Syntax `show msdp statistics`
`<instance instance-name>`
`<logical-system (all | logical-system-name)>`
`<peer peer-address>`

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Display statistics about Multicast Source Discovery Protocol (MSDP) peers.

Options **none**—Display statistics about all MSDP peers for all routing instances.

instance *instance-name*—(Optional) Display statistics about a specific MSDP instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

peer *peer-address*—(Optional) Display statistics about a particular MSDP peer.

Required Privilege Level view

Related Documentation • [clear msdp statistics on page 1818](#)

List of Sample Output [show msdp statistics on page 1910](#)
[show msdp statistics peer on page 1910](#)

Output Fields [Table 117 on page 1908](#) describes the output fields for the **show msdp statistics** command. Output fields are listed in the approximate order in which they appear.

Table 117: show msdp statistics Output Fields

Field Name	Field Description
Global active source limit exceeded	Number of times all peers have exceeded configured active source limits.
Global active source limit maximum	Configured number of active source messages accepted by the device.
Global active source limit threshold	Configured threshold for applying random early discard (RED) to drop some but not all MSDP active source messages.
Global active source limit log-warning	Threshold at which a warning message is logged (percentage of the number of active source messages accepted by the device).

Table 117: show msdp statistics Output Fields (continued)

Field Name	Field Description
Global active source limit log interval	Time (in seconds) between consecutive log messages.
Peer	Address of peer.
Last State Change	How long ago the peer state changed.
Last message received from the peer	How long ago the last message was received from the peer.
RPF Failures	Number of reverse path forwarding (RPF) failures.
Remote Closes	Number of times the remote peer closed.
Peer Timeouts	Number of peer timeouts.
SA messages sent	Number of source-active messages sent.
SA messages received	Number of source-active messages received.
SA request messages sent	Number of source-active request messages sent.
SA request messages received	Number of source-active request messages received.
SA response messages sent	Number of source-active response messages sent.
SA response messages received	Number of source-active response messages received.
SA messages with zero Entry Count received	Entry Count is a field within SA message that defines how many source/group tuples are present in the SA message. The counter is incremented each time an SA with an Entry Count of zero is received.
Active source exceeded	Number of times this peer has exceeded configured source-active limits.
Active source Maximum	Configured number of active source messages accepted by this peer.
Active source threshold	Configured threshold on this peer for applying random early discard (RED) to drop some but not all MSDP active source messages.
Active source log-warning	Configured threshold on this peer at which a warning message is logged (percentage of the number of active source messages accepted by the device).
Active source log-interval	Time (in seconds) between consecutive log messages on this peer.

Table 117: show msdp statistics Output Fields (continued)

Field Name	Field Description
Keepalive messages sent	Number of keepalive messages sent.
Keepalive messages received	Number of keepalive messages received.
Unknown messages received	Number of unknown messages received.
Error messages received	Number of error messages received.

Sample Output

show msdp statistics

```

show multicast backup-pe-groups

Syntax `show multicast backup-pe-groups`
`<address pe-address>`
`<group group-name>`
`<instance instance-name>`
`<logical-system (all | logical-system-name)>`

Release Information Command introduced in Junos OS Release 9.0.

Description Display backup PE router group information when ingress PE redundancy is configured. Ingress PE redundancy provides a backup resource when point-to-multipoint LSPs are configured for multicast distribution.

Options **none**—Display standard information about all backup PE groups.

address *pe-address*—(Optional) Display the groups that a PE address is associated with.

group *group*—(Optional) Display the backup PE group information for a particular group.

instance *instance-name*—(Optional) Display backup PE group information for a specific multicast instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

Output Fields [Table 118 on page 1912](#) describes the output fields for the **show multicast backup-pe-groups** command. Output fields are listed in the approximate order in which they appear.

Table 118: show multicast backup-pe-groups Output Fields

Field Name	Field Description
Backup PE Group	Group name.
Designated PE	Primary PE router. Address of the PE router that is currently forwarding traffic on the static route.
Transitions	Number of times that the designated PE router has transitioned from the most eligible PE router to a backup PE router and back again to the most eligible PE router.
Last Transition	Time of the most recent transition.
Local Address	Address of the local PE router.

Table 118: show multicast backup-pe-groups Output Fields (continued)

Field Name	Field Description
Backup PE List	List of PE routers that are configured to be backups for the group.

Sample Output

show multicast backup-pe-groups

```
user@host> show multicast backup-pe-groups
```

```
Instance: master
```

```
Backup PE group: b1
```

```
  Designated PE: 10.255.165.7
```

```

```

show multicast forwarding-cache statistics

Syntax	<pre>show multicast forwarding-cache statistics <inet inet6> <instance <i>instance-name</i>> <logical-system (all <i>logical-system-name</i>)></pre>
Release Information	<p>Command introduced in Junos OS Release 12.2.</p> <p>Starting in Junos OS Release 16.1, output includes general and rendezvous-point tree (RPT) suppression states.</p>
Description	Display IP multicast forwarding cache statistics.
Options	<p>none—Display multicast forwarding cache statistics for all supported address families for all routing instances.</p> <p>inet inet6—(Optional) Display multicast forwarding cache statistics for IPv4 or IPv6 family addresses, respectively.</p> <p>instance <i>instance-name</i>—(Optional) Display multicast forwarding cache statistics for a specific routing instance.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • clear multicast forwarding-cache on page 1821 • <i>threshold</i>
List of Sample Output	<p>show multicast forwarding cache statistics instance on page 1917</p> <p>show multicast forwarding cache statistics instance (Forwarding-cache suppression is disabled) on page 1917</p>
Output Fields	<p>Table 120 on page 1916 describes the output fields for the show multicast forwarding-cache statistics command. Output fields are listed in the approximate order in which they appear.</p>

Table 120: show multicast forwarding-cache statistics Output Fields

Field Name	Field Description
Instance	Name of the routing instance for which multicast forwarding cache statistics are displayed.
Family	Protocol family for which multicast forwarding cache statistics are displayed: ALL , INET , or INET6 .

Table 120: show multicast forwarding-cache statistics Output Fields (continued)

Field Name	Field Description
General (or MVPN RPT) Suppression Active	Indicates whether suppression is configured.
General (or MVPN RPT) Entries Used	Number of currently used multicast forwarding cache entries.
General (or MVPN RPT) Suppress Threshold	Maximum number of multicast forwarding cache entries that can be added to the cache. When the number of entries reaches the configured threshold, the device suspends adding new multicast forwarding cache entries.
General (or MVPN RPT) Reuse Value	Number of multicast forwarding cache entries that must be reached before the device creates new multicast forwarding cache entries. When the total number of multicast forwarding cache entries is below the reuse value, the device resumes adding new multicast forwarding cache entries.

Sample Output

show multicast forwarding cache statistics instance

```

user@host> show multicast forwarding-cache statistic instance mvpn1 inet6

Instance: mvpn1 Family: INET6
General Suppression Active           Yes
General Entries Used                 0
General Suppress Threshold           200
General Reuse Value                  200
MVPN RPT Suppression Active          Yes
MVPN RPT Entries Used                0
MVPN RPT Suppress Threshold          200
MVPN RPT Reuse Value                 200

```

show multicast forwarding cache statistics instance (Forwarding-cache suppression is disabled)

```

user@host> show multicast forwarding-cache statistic instance mvpn1

Instance: mvpn1 Family: ALL
Forwarding-cache suppression disabled Not enabled by configuration

```

show multicast interface

List of Syntax [Syntax on page 1918](#)
[Syntax \(EX Series Switch and the QFX Series\) on page 1918](#)

Syntax `show multicast interface`
`<logical-system (all | logical-system-name)>`

Syntax (EX Series Switch and the QFX Series) `show multicast interface`

Release Information Command introduced in Junos OS Release 8.3.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Display bandwidth information about IP multicast interfaces.

Options **none**—Display all interfaces that have multicast configured.
logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output [show multicast interface on page 1919](#)

Output Fields [Table 121 on page 1918](#) describes the output fields for the **show multicast interface** command. Output fields are listed in the approximate order in which they appear.

Table 121: show multicast interface Output Fields

Field Name	Field Description
Interface	Name of the multicast interface.
Maximum bandwidth (bps)	Maximum bandwidth setting, in bits per second, for this interface.
Remaining bandwidth (bps)	Amount of bandwidth, in bits per second, remaining on the interface.

Table 121: show multicast interface Output Fields (continued)

Field Name	Field Description
Mapped bandwidth deduction (bps)	<p>Amount of bandwidth, in bits per second, used by any flows that are mapped to the interface.</p> <p>NOTE: Adding the mapped bandwidth deduction value to the local bandwidth deduction value results in the total deduction value for the interface.</p> <p>This field does not appear in the output when the no QoS adjustment feature is disabled.</p>
Local bandwidth deduction (bps)	<p>Amount of bandwidth, in bits per second, used by any mapped flows that are traversing the interface.</p> <p>NOTE: Adding the mapped bandwidth deduction value to the local bandwidth deduction value results in the total deduction value for the interface.</p> <p>This field does not appear in the output when the no QoS adjustment feature is disabled.</p>
Reverse OIF mapping	<p>State of the reverse OIF mapping feature (on or off).</p> <p>NOTE: This field does not appear in the output when the no QoS adjustment feature is disabled.</p>
Reverse OIF mapping no QoS adjustment	<p>State of the no QoS adjustment feature (on or off) for interfaces that are using reverse OIF mapping.</p> <p>NOTE: This field does not appear in the output when the no QoS adjustment feature is disabled.</p>
Leave timer	<p>Amount of time a mapped interface remains active after the last mapping ends.</p> <p>NOTE: This field does not appear in the output when the no QoS adjustment feature is disabled.</p>
No QoS adjustment	<p>State (on) of the no QoS adjustment feature when this feature is enabled.</p> <p>NOTE: This field does not appear in the output when the no QoS adjustment feature is disabled.</p>

Sample Output

show multicast interface

```
user@host> show multicast interface
```

Interface	Maximum bandwidth (bps)	Remaining bandwidth (bps)
fe-0/0/3	10000000	0
fe-0/0/3.210	10000000	-2000000
fe-0/0/3.220	10000000	10000000

fe-0/0/3.230	20000000	18000000
fe-0/0/2.200	100000000	100000000

show multicast mrinfo

Syntax	<code>show multicast mrinfo</code> <code><host></code>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	Display configuration information about IP multicast networks, including neighboring multicast router addresses.
Options	<p>none—Display configuration information about all multicast networks.</p> <p>host—(Optional) Display configuration information about a particular host. Replace <i>host</i> with a hostname or IP address.</p>
Required Privilege Level	view
List of Sample Output	show multicast mrinfo on page 1922
Output Fields	<p>Table 122 on page 1921 describes the output fields for the show multicast mrinfo command. Output fields are listed in the approximate order in which they appear.</p>

Table 122: show multicast mrinfo Output Fields

Field Name	Field Description
<i>source-address</i>	Query address, hostname (DNS name or IP address of the source address), and multicast protocol version or the software version of another vendor.
<i>ip-address-1</i> —> <i>ip-address-2</i>	Queried router interface address and directly attached neighbor interface address, respectively.
(<i>name</i> or <i>ip-address</i>)	Name or IP address of neighbor.
[<i>metric/threshold/type/flags</i>]	<p>Neighbor's multicast profile:</p> <ul style="list-style-type: none"> metric—Always has a value of 1, because mrinfo queries the directly connected interfaces of a device. threshold—Multicast threshold time-to-live (TTL). The range of values is 0 through 255. type—Multicast connection type: pim or tunnel. flags—Flags for this route: <ul style="list-style-type: none"> querier—Queried router is the designated router for the neighboring session. leaf—Link is a leaf in the multicast network. down—Link status indicator.

Sample Output

show multicast mrinfo

```
user@host> show multicast mrinfo 10.35.4.1
10.35.4.1 (10.35.4.1) [version 12.0]:
  192.168.195.166 -> 0.0.0.0 (local) [1/0/pim/querier/leaf]
  10.38.20.1 -> 0.0.0.0 (local) [1/0/pim/querier/leaf]
  10.47.1.1 -> 10.47.1.2 (10.47.1.2) [1/5/pim]
  0.0.0.0 -> 0.0.0.0 (local) [1/0/pim/down]
```

show multicast next-hops

List of Syntax [Syntax on page 1923](#)
 [Syntax \(EX Series Switch and the QFX Series\) on page 1923](#)

Syntax `show multicast next-hops`
 `<brief | detail | terse>`
 `<identifier-number>`
 `<inet | inet6>`
 `<logical-system (all | logical-system-name)>`

Syntax (EX Series Switch and the QFX Series) `show multicast next-hops`
 `<brief | detail>`
 `<identifier-number>`
 `<inet | inet6>`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 inet6 option introduced in Junos OS Release 10.0 for EX Series switches.
 detail option display of next-hop ID number introduced in Junos OS Release 11.1 for M Series and T Series routers and EX Series switches.
 Command introduced in Junos OS Release 11.3 for the QFX Series.
 Support for bidirectional PIM added in Junos OS Release 12.1.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
 terse option introduced in Junos OS Release 16.1 for the MX Series.

Description Display the entries in the IP multicast next-hop table.

Options **none**—Display standard information about all entries in the multicast next-hop table for all supported address families.

brief | detail | terse—(Optional) Display the specified level of output. Use **terse** to display the total number of outgoing interfaces (as opposed to listing them) When you include the **detail** option on M Series and T Series routers and EX Series switches, the downstream interface name includes the next-hop ID number in parentheses, in the form **fe-0/1/2.0-(1048574)**, where **1048574** is the next-hop ID number.

Starting in Junos OS release 16.1, the **show multicast next-hops** statement shows the hierarchical next hops contained in the top-level next hop.

identifier-number—(Optional) Show a particular next hop by ID number. The range of values is 1 through 65,535.

inet | inet6—(Optional) Display entries for IPv4 or IPv6 family addresses, respectively.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields [Table 123 on page 1924](#) describes the output fields for the **show multicast next-hops** command. Output fields are listed in the approximate order in which they appear.

Table 123: show multicast next-hops Output Fields

Field Name	Field Description
Family	Protocol family (such as INET).
ID	Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine.
Refcoun	Number of cache entries that are using this next hop.
KRefcoun	Kernel reference count for the next hop.
Downstream interface	Interface names associated with each multicast next-hop ID.
Incoming interface list	List of interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.

Sample Output

show multicast next-hops

```
user@host> show multicast next-hops
```

```
Family: INET
ID      Refcount  KRefcoun Downstream interface
262142      4          2  so-1/0/0.0

<source-prefix source-prefix>
```

Syntax (EX Series Switch and the QFX Series)

```
show multicast route
<brief | detail | extensive | summary>
<active | all | inactive>
<group group>
<inet | inet6>
<instance instance name>
<regular-expression>
<source-prefix source-prefix>
```

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.
 Command introduced in Junos OS Release 11.3 for the QFX Series.
 Support for bidirectional PIM added in Junos OS Release 12.1.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
 oif-count option introduced in Junos OS Release 16.1 for the MX Series.
 xxxSupport for PIM NSR support for VXLAN added in Junos OS Release 16.2.

Description Display the entries in the IP multicast forwarding table. You can display similar information with the **show route table inet.1** command.

NOTE: On all SRX Series devices, when a multicast route is not available, pending sessions are not torn down, and subsequent packets are queued. If no multicast route resolve comes back, then the traffic flow has to wait for the pending session to timed out. Then packets can trigger new pending session create and route resolve.

Options **none**—Display standard information about all entries in the multicast forwarding table for all routing instances.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

active | all | inactive—(Optional) Display all active entries, all entries, or all inactive entries, respectively, in the multicast forwarding table.

group group—(Optional) Display the cache entries for a particular group.

inet | inet6—(Optional) Display multicast forwarding table entries for IPv4 or IPv6 family addresses, respectively.

instance instance-name—(Optional) Display entries in the multicast forwarding table for a specific multicast instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

oif-count —(Optional) Display a count of outgoing interfaces rather than listing them.

regular-expression—(Optional) Display information about the multicast forwarding table entries that match a UNIX OS-style regular expression.

source-prefix source-prefix—(Optional) Display the cache entries for a particular source prefix.

Output Fields

[Table 126 on page 1933](#) describes the output fields for the **show multicast route** command. Output fields are listed in the approximate order in which they appear.

Table 126: show multicast route Output Fields

Field Name	Field Description	Level of Output
family	IPv4 address family (INET) or IPv6 address family (INET6).	All levels
Group	Group address. For any-source multicast routes, for example for bidirectional PIM, the group address includes the prefix length.	All levels
Source	Prefix and length of the source as it is in the multicast forwarding table.	All levels
Incoming interface list	List of interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.	All levels
Upstream interface	Name of the interface on which the packet with this source prefix is expected to arrive.	All levels
Upstream rpf interface list	When multicast-only fast reroute (MoFRR) is enabled, a PIM router propagates join messages on two upstream RPF interfaces to receive multicast traffic on both links for the same join request.	All levels
Downstream interface list	List of interface names to which the packet with this source prefix is forwarded. distributed-gmp — Added in Junos OS Release 17.4R1 to indicate that line cards with <i>distributed</i> IGMP interfaces are receiving multicast traffic for a given (s,g).	All levels
Number of outgoing interfaces	Total number of outgoing interfaces for each (S,G) entry.	extensive
Session description	Name of the multicast session.	detail extensive
Statistics	Rate at which packets are being forwarded for this source and group entry (in Kbps and pps), and number of packets that have been forwarded to this prefix. If one or more of the kilobits per second packet forwarding statistic queries fails or times out, the statistics field displays Forwarding statistics are not available . NOTE: On QFX Series switches and OCX Series switches, this field does not report valid statistics.	detail extensive
Next-hop ID	Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine and is also displayed in the output of the show multicast nexthops command.	detail extensive
Incoming interface list ID	For bidirectional PIM, incoming interface list identifier. Identifiers for interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.	detail extensive

Table 126: show multicast route Output Fields (continued)

Field Name	Field Description	Level of Output
Upstream protocol	The protocol that maintains the active multicast forwarding route for this group or source. When the show multicast route extensive command is used with the display-origin-protocol option, the field name is only Protocol and not Upstream Protocol . However, this field also displays the protocol that installed the active route.	detail extensive
Route type	Type of multicast route. Values can be (S,G) or (*,G).	summary
Route state	Whether the group is Active or Inactive .	summary extensive
Route count	Number of multicast routes.	summary
Forwarding state	Whether the prefix is pruned or forwarding.	extensive
Cache lifetime/timeout	Number of seconds until the prefix is removed from the multicast forwarding table. A value of never indicates a permanent forwarding entry. A value of forever indicates routes that do not have keepalive times.	extensive
Wrong incoming interface notifications	Number of times that the upstream interface was not available.	extensive
Uptime	Time since the creation of a multicast route.	extensive

Sample Output

Starting in Junos OS Release 16.1, **show multicast route** displays the top-level hierarchical next hop.

show multicast route

```

user@host> show multicast route
Family: INET

show multicast rpf

List of Syntax	Syntax on page 1943 Syntax (EX Series Switch and the QFX Series) on page 1943
Syntax	<pre>show multicast rpf <inet inet6> <instance <i>instance-name</i>> <logical-system (all <i>logical-system-name</i>)> <prefix> <summary></pre>
Syntax (EX Series Switch and the QFX Series)	<pre>show multicast rpf <inet inet6> <instance <i>instance-name</i>> <prefix> <summary></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>inet6 and instance options introduced in Junos OS Release 10.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	Display information about multicast reverse-path-forwarding (RPF) calculations.
Options	<p>none—Display RPF calculation information for all supported address families.</p> <p>inet inet6—(Optional) Display the RPF calculation information for IPv4 or IPv6 family addresses, respectively.</p> <p>instance <i>instance-name</i>—(Optional) Display information about multicast RPF calculations for a specific multicast instance.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>prefix—(Optional) Display the RPF calculation information for the specified prefix.</p> <p>summary—(Optional) Display a summary of all multicast RPF information.</p>
Required Privilege Level	view
List of Sample Output	show multicast rpf on page 1944 show multicast rpf inet6 on page 1945 show multicast rpf prefix on page 1946 show multicast rpf summary on page 1946

Output Fields Table 127 on page 1944 describes the output fields for the **show multicast rpf** command. Output fields are listed in the approximate order in which they appear.

Table 127: show multicast rpf Output Fields

Field Name	Field Description
Instance	Name of the routing instance. (Displayed when multicast is configured within a routing instance.)
Source prefix	Prefix and length of the source as it exists in the multicast forwarding table.
Protocol	How the route was learned.
Interface	Upstream RPF interface. NOTE: The displayed interface information does not apply to bidirectional PIM RP addresses. This is because the show multicast rpf command does not take into account equal-cost paths or the designated forwarder. For accurate upstream RPF interface information, always use the show pim join extensive command when bidirectional PIM is configured.
Neighbor	Upstream RPF neighbor. NOTE: The displayed neighbor information does not apply to bidirectional PIM. This is because the show multicast rpf command does not take into account equal-cost paths or the designated forwarder. For accurate upstream RPF neighbor information, always use the show pim join extensive command when bidirectional PIM is configured.

Sample Output

show multicast snooping next-hops

Syntax show multicast snooping next-hops
 <brief | detail>
 <identifier *next-hop-ID*>
 <inet>
 <inet6>
 <logical-system *logical-system-name*>

Release Information Command introduced in Junos OS Release 11.2.

Description Display information about the IP multicast snooping next-hops.

Options **brief | detail**—(Optional) Display the specified level of output.

inet—(Optional) Display information for IPv4 multicast next hops only. If a family is not specified, both IPv4 and IPv6 results will be shown.

inet6—(Optional) Display information for IPv6 multicast next hops only. If a family is not specified, both IPv4 and IPv6 results will be shown.

logical-system *logical-system-name*—(Optional) Display information about a particular logical system, or type 'all'.

Required Privilege Level view

List of Sample Output [show multicast snooping next-hops on page 1951](#)
[show multicast snooping next-hops \(IGMP snooping enabled on a VPLS\) on page 1951](#)

Output Fields [Table 129 on page 1949](#) describes the output fields for the **show multicast snooping next-hops** command. Output fields are listed in the approximate order in which they appear.

Table 129: show multicast snooping next-hops Output Fields

Field Name	Field Description
Family	Protocol family for which multicast snooping next hops are displayed: INET or INET6 .
RefCount	Number of cache entries that are using this next hop.
KRefCount	Kernel reference count for the next hop.
Downstream interface	Interface names associated with each multicast next-hop ID.

Table 129: show multicast snooping next-hops Output Fields (continued)

Field Name	Field Description
Nexthop Id	Identifier for the next-hop. NOTE: To see the next-hop ID for a given PE mesh group, igmp-snooping must be enabled for the relevant VPLS routing instance. (Junos OS creates a default CE and VE mesh groups for each VPLS routing instance. The next hop of the VE mesh group is the set of VE mesh-group interfaces of the remaining PEs in the same VPLS routing instance.)

Sample Output

show multicast snooping next-hops

```
user@host> show multicast snooping next-hops

Family: INET
ID          Refcount KRefCount Downstream interface Nexthop Id
1048574      4          1 ge-0/1/0.1000
               ge-0/1/2.1000
               ge-0/1/3.1000
1048574      4          1 ge-0/1/0.1000-(2000)
               1048575
               1048576
1048575      2          0 ge-0/1/2.1000-(2001)
               ge-0/1/3.1000-(2002)
1048576      2          0 lsi.1048578-(2003)
               lsi.1048579-(2004)
```

show multicast snooping next-hops (IGMP snooping enabled on a VPLS)

In this example, ID 1048585 is the VE next-hop ID created for the VE next hop that is holding VE interfaces for the routing instance. It only appears if igmp snooping is enabled on the VPLS.

```
user@host> show multicast snooping next-hops

Family: INET
ID          Refcount KRefCount Downstream interface Addr
1048588      2          1 1048585

show multicast sessions

List of Syntax [Syntax on page 1953](#)
 [Syntax \(EX Series Switch and the QFX Series\) on page 1953](#)

Syntax show multicast sessions
 <brief | detail | extensive>
 <logical-system (all | *logical-system-name*)>
 <*regular-expression*>

Syntax (EX Series Switch and the QFX Series) show multicast sessions
 <brief | detail | extensive>
 <*regular-expression*>

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Command introduced in Junos OS Release 11.3 for the QFX Series.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Display information about announced IP multicast sessions.

NOTE: On all SRX Series devices, only 100 packets can be queued during pending (S, G) route. However, when multiple multicast sessions enter the route resolve process at the same time, buffer resources are not sufficient to queue 100 packets for each session.

Options **none**— Display standard information about all multicast sessions for all routing instances.
 brief | detail | extensive—(Optional) Display the specified level of output.
 logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.
 regular-expression—(Optional) Display information about announced sessions that match a UNIX-style regular expression.

Required Privilege Level view

`<inet6>`
`<instance instance-name>`
`<logical-system logical-system-name>`
`<mesh-group mesh-group-name>`
`<qualified-vlan vlan-id>`
`<source-prefix source-prefix>`
`<vlan vlan-id>`

Release Information Command introduced in Junos OS Release 8.5.
 Support for **control**, **data**, **qualified-vlan** and **vlan** options introduced in Junos OS Release 13.3 for EX Series switches.

Description Display the entries in the IP multicast snooping forwarding table. You can display some of this information with the **show route table inet.1** command.

Options **none**—Display standard information about all entries in the multicast snooping table for all virtual switches and all bridge domains.

active | all | inactive —(Optional) Display all active entries, all entries, or all inactive entries, respectively, in the multicast snooping table.

bridge-domain *bridge-domain*—(Optional) Display the entries for a particular bridge domain.

brief | detail | extensive—(Optional) Display the specified level of output.

control—(Optional) Display control route entries.

data—(Optional) Display data route entries.

group *group*—(Optional) Display the entries for a particular group.

inet—(Optional) Display IPv4 information.

inet6—(Optional) Display IPv6 information.

instance *instance-name*—(Optional) Display the entries for a multicast instance.

logical-system *logical-system-name*—(Optional) Display information about a particular logical system, or type 'all'.

mesh-group *mesh-group-name*—(Optional) Display the entries for a particular mesh group.

qualified-vlan *vlan-id*—(Optional) Display the entries for a particular qualified VLAN.

regex *regex*—(Optional) Display information about the multicast forwarding table entries that match a UNIX-style regular expression.

source-prefix *source-prefix*—(Optional) Display the entries for a particular source prefix.

vlan *vlan-id*—(Optional) Display the entries for a particular VLAN.

[show multicast snooping route instance vs on page 1959](#)
[show multicast snooping route extensive on page 1959](#)
[show multicast snooping route extensive group on page 1960](#)

Output Fields [Table 131 on page 1958](#) describes the output fields for the **show multicast snooping route** command. Output fields are listed in the approximate order in which they appear.

Table 131: show multicast snooping route Output Fields

Field Name	Field Description	Level of Output
Nexthop Bulking	Displays whether next-hop bulk updating is ON or OFF (only for routing-instance type of virtual switch or vpls).	All levels
Family	IPv4 address family (INET) or IPv6 address family (INET6).	All levels
Group	Group address.	All levels
Source	Prefix and length of the source as it is in the multicast forwarding table. For (*G) entries, this field is set to "*".	All levels
Routing-instance	Name of the routing instance to which this routing information applies. (Displayed when multicast is configured within a routing instance.)	All levels
Learning Domain	Name of the learning domain to which this routing information applies.	detail extensive
Statistics	Rate at which packets are being forwarded for this source and group entry (in Kbps and pps), and number of packets that have been forwarded to this prefix.	detail extensive
Next-hop ID	Next-hop identifier of the prefix. The identifier is returned by the router's Packet Forwarding Engine and is also displayed in the output of the show multicast nexthops command.	detail extensive

Table 131: show multicast snooping route Output Fields (continued)

Field Name	Field Description	Level of Output
Route state	Whether the group is Active or Inactive .	extensive
Forwarding state	Whether the prefix is Pruned or Forwarding .	extensive
Cache lifetime/timeout	Number of seconds until the prefix is removed from the multicast forwarding table. A value of never indicates a permanent forwarding entry.	extensive

show multicast statistics

Syntax	<pre>show multicast statistics <inet inet6> <instance <i>instance-name</i>> <interface <i>interface-name</i>> <logical-system (all <i>logical-system-name</i>)></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>interface option introduced in Junos OS Release 16.1 for the MX Series.</p>
Description	Display IP multicast statistics.
Options	<p>none—Display multicast statistics for all supported address families for all routing instances.</p> <p>inet inet6—(Optional) Display multicast statistics for IPv4 or IPv6 family addresses, respectively.</p> <p>instance <i>instance-name</i>—(Optional) Display statistics for a specific routing instance.</p> <p>interface <i>interface-name</i>—(Optional) Display statistics for a specific interface.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Additional Information	The input and output interface multicast statistics are consistent, but not timely. They are constructed from the forwarding statistics, which are gathered at 30-second intervals. Therefore, the output from this command always lags the true count by up to 30 seconds.

Related Documentation	<ul style="list-style-type: none"> clear multicast statistics on page 1826
List of Sample Output	show multicast statistics on page 1964 show multicast statistics interface on page 1964
Output Fields	Table 132 on page 1961 describes the output fields for the show multicast statistics command. Output fields are listed in the approximate order in which they appear.

Table 132: show multicast statistics Output Fields

Field Name	Field Description
Family	Protocol family for which multicast statistics are displayed: INET or INET6 .

Table 132: show multicast statistics Output Fields (continued)

Field Name	Field Description
Interface	Name of the interface for which statistics are being reported.
Routing Protocol	Primary multicast protocol on the interface: PIM , DVMRP for INET , or PIM for INET6 .
Mismatch	Number of multicast packets that did not arrive on the correct upstream interface.
Kernel Resolve	Number of resolve requests processed by the primary multicast protocol on the interface.
Resolve No Route	Number of resolve requests that were ignored because there was no route to the source.
In Kbytes	Total accumulated incoming packets (in KB) since the last time the clear multicast statistics command was issued.
Out Kbytes	Total accumulated outgoing packets (in KB) since the last time the clear multicast statistics command was issued.
Mismatch error	Number of mismatches that were ignored because of internal errors.
Mismatch No Route	Number of mismatches that were ignored because there was no route to the source.
Routing Notify	Number of times that the multicast routing system has been notified of a new multicast source by a multicast routing protocol .
Resolve Error	Number of resolve requests that were ignored because of internal errors.
In Packets	Total number of incoming packets since the last time the clear multicast statistics command was issued.
Out Packets	Total number of outgoing packets since the last time the clear multicast statistics command was issued.
Resolve requests on interfaces not enabled for multicast <i>n</i>	Number of resolve requests on interfaces that are not enabled for multicast that have accumulated since the clear multicast statistics command was last issued.
Resolve requests with no route to source <i>n</i>	Number of resolve requests with no route to the source that have accumulated since the clear multicast statistics command was last issued.
Routing notifications on interfaces not enabled for multicast <i>n</i>	Number of routing notifications on interfaces not enabled for multicast that have accumulated since the clear multicast statistics command was last issued.
Routing notifications with no route to source <i>n</i>	Number of routing notifications with no route to the source that have accumulated since the clear multicast statistics command was last issued.
Interface Mismatches on interfaces not enabled for multicast <i>n</i>	Number of interface mismatches on interfaces not enabled for multicast that have accumulated since the clear multicast statistics command was last issued.

Table 132: show multicast statistics Output Fields (continued)

Field Name	Field Description
Group Membership on interfaces not enabled for multicast <i>n</i>	Number of group memberships on interfaces not enabled for multicast that have accumulated since the clear multicast statistics command was last issued.

Output Fields [Table 133 on page 1967](#) describes the output fields for the **show multicast usage** command. Output fields are listed in the approximate order in which they appear.

Table 133: show multicast usage Output Fields

Field Name	Field Description
Instance	Name of the routing instance. (Displayed when multicast is configured within a routing instance.)
Group	Group address.
Sources	Number of sources.
Packets	Number of packets that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the packets field displays unavailable .
Bytes	Number of bytes that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the bytes field displays unavailable .
Prefix	IP address.
/len	Prefix length.
Groups	Number of multicast groups.

Sample Output

show multicast usage

```

show pim bootstrap

List of Syntax [Syntax on page 1969](#)
[Syntax \(EX Series Switch and the QFX Series\) on page 1969](#)

Syntax `show pim bootstrap`
`<instance instance-name>`
`<logical-system (all | logical-system-name)>`

Syntax (EX Series Switch and the QFX Series) `show pim bootstrap`
`<instance instance-name>`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
instance option introduced in Junos OS Release 10.0 for EX Series switches.
 Command introduced in Junos OS Release 11.3 for the QFX Series.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description For sparse mode only, display information about Protocol Independent Multicast (PIM) bootstrap routers.

Options **none**—Display PIM bootstrap router information for all routing instances.

instance *instance-name*—(Optional) Display information about bootstrap routers for a specific PIM-enabled routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output [show pim bootstrap on page 1970](#)
[show pim bootstrap instance on page 1970](#)

Output Fields [Table 134 on page 1969](#) describes the output fields for the **show pim bootstrap** command. Output fields are listed in the approximate order in which they appear.

Table 134: show pim bootstrap Output Fields

Field Name	Field Description
Instance	Name of the routing instance.
BSR	Bootstrap router.
Pri	Priority of the routing device as elected to be the bootstrap router.

Table 134: show pim bootstrap Output Fields (continued)

Field Name	Field Description
Local address	Local routing device address.
Pri	Local routing device address priority to be elected as the bootstrap router.
State	Local routing device election state: Candidate , Elected , or Ineligible .
Timeout	How long until the local routing device declares the bootstrap router to be unreachable, in seconds.

Sample Output

show pim bootstrap

```
user@host> show pim bootstrap
```

```
Instance: PIM.master
```

BSR	Pri	Local address	Pri	State	Timeout
None	0	10.255.71.46	0	InEligible	0
2001:db8:1:1:1:0:aff:785c	34	2001:db8:1:1:1:0:aff:7c12	0	InEligible	0

show pim bootstrap instance

```
user@host> show pim bootstrap instance VPN-A
```

```
Instance: PIM.VPN-A
```

BSR	Pri	Local address	Pri	State	Timeout
None	0	192.168.196.105	0	InEligible	0

show pim interfaces

List of Syntax	Syntax on page 1971 Syntax (EX Series Switch and the QFX Series) on page 1971

List of Sample Output	show pim interfaces on page 1973
Output Fields	<p>Table 135 on page 1972 describes the output fields for the show pim interfaces command. Output fields are listed in the approximate order in which they appear.</p>

Table 135: show pim interfaces Output Fields

Field Name	Field Description
Instance	Name of the routing instance.
Name	Interface name.
State	State of the interface. The state also is displayed in the show interfaces command.
Mode	<p>PIM mode running on the interface:</p> <ul style="list-style-type: none"> • B—In bidirectional mode, multicast groups are carried across the network over bidirectional shared trees. This type of tree minimizes PIM routing state, which is especially important in networks with numerous and dispersed senders and receivers. • S—In sparse mode, routing devices must join and leave multicast groups explicitly. Upstream routing devices do not forward multicast traffic to this routing device unless this device has sent an explicit request (using a join message) to receive multicast traffic. • Dense—Unlike sparse mode, where data is forwarded only to routing devices sending an explicit request, dense mode implements a flood-and-prune mechanism, similar to DVMRP (the first multicast protocol used to support the multicast backbone). (Not supported on QFX Series.) • Sparse-Dense—Sparse-dense mode allows the interface to operate on a per-group basis in either sparse or dense mode. A group specified as dense is not mapped to a rendezvous point (RP). Instead, data packets destined for that group are forwarded using PIM-Dense Mode (PIM-DM) rules. A group specified as sparse is mapped to an RP, and data packets are forwarded using PIM-Sparse Mode (PIM-SM) rules. <p>When sparse-dense mode is configured, the output includes both S and D. When bidirectional-sparse mode is configured, the output includes S and B. When bidirectional-sparse-dense mode is configured, the output includes B, S, and D.</p>
IP	Version number of the address family on the interface: 4 (IPv4) or 6 (IPv6).
V	PIM version running on the interface: 1 or 2.
State	<p>State of PIM on the interface:</p> <ul style="list-style-type: none"> • Active—Bidirectional mode is enabled on the interface and on all PIM neighbors. • DR—Designated router. • NotCap—Bidirectional mode is not enabled on the interface. This can happen when bidirectional PIM is not configured locally, when one of the neighbors is not configured for bidirectional PIM, or when one of the neighbors has not implemented the bidirectional PIM protocol. • NotDR—Not the designated router. • P2P—Point to point.
NbrCnt	Number of neighbors that have been seen on the interface.
JoinCnt(sg)	Number of (s,g) join messages that have been seen on the interface.
JointCnt(*g)	Number of (*g) join messages that have been seen on the interface.
DR address	Address of the designated router.

Sample Output

show pim interfaces

```
user@host> show pim interfaces
```

Stat = Status, V = Version, NbrCnt = Neighbor Count,

S = Sparse, D = Dense, B = Bidirectional,

DR = Designated Router, P2P = Point-to-point link,

Active = Bidirectional is active, NotCap = Not Bidirectional Capable

Name	Stat	Mode	IP	V	State	NbrCnt	JoinCnt(sg/*g)	DR address
ge-0/3/0.0	Up	S	4	2	NotDR,NotCap	1	0/0	40.0.0.3
ge-0/3/3.50	Up	S	4	2	DR,NotCap	1	9901/100	50.0.0.2
ge-0/3/3.51	Up	S	4	2	DR,NotCap	1	0/0	51.0.0.2
pe-1/2/0.32769	Up	S	4	2	P2P,NotCap	0	0/0	

show pim join

List of Syntax [Syntax on page 1974](#)
[Syntax \(EX Series Switch and the QFX Series\) on page 1974](#)

Syntax

```
show pim join
<brief | detail | extensive | summary>
<bidirectional | dense | sparse>
<downstream-count>
<exact>
<inet | inet6>
<instance instance-name>
<logical-system (all | logical-system-name)>
<range>
<rp ip-address/prefix | source ip-address/prefix>
<sg | star-g>
```

Syntax (EX Series Switch and the QFX Series)

```
show pim join
<brief | detail | extensive | summary>
<dense | sparse>
<exact>
<inet | inet6>
<instance instance-name>
<range>
<rp ip-address/prefix | source ip-address/prefix>
<sg | star-g>
```

Release Information

Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
summary option introduced in Junos OS Release 9.6.
inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.
 Support for bidirectional PIM added in Junos OS Release 12.1.
 Command introduced in Junos OS Release 11.3 for the QFX Series.
 Multiple new filter options introduced in Junos OS Release 13.2.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
downstream-count option introduced in Junos OS Release 16.1.
 Support for PIM NSR support for VXLAN added in Junos OS Release 16.2
 Support for RFC 5496 (via **rpf-vector**) added in Junos OS Release 17.3R1.

Description Display information about Protocol Independent Multicast (PIM) groups for all PIM modes.

For bidirectional PIM, display information about PIM group ranges (*G-range) for each active bidirectional RP group range, in addition to each of the joined (*G) routes.

Options **none**—Display the standard information about PIM groups for all supported family addresses for all routing instances.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

bidirectional | dense | sparse—(Optional) Display information about PIM bidirectional mode, dense mode, or sparse and source-specific multicast (SSM) mode entries.

downstream-count—(Optional) Display the downstream count instead of a list.

exact—(Optional) Display information about only the group that exactly matches the specified group address.

inet | inet6—(Optional) Display PIM group information for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display information about groups for the specified PIM-enabled routing instance only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

range—(Optional) Address range of the group, specified as *prefix/prefix-length*.

rp *ip-address/prefix* | source *ip-address/prefix*—(Optional) Display information about the PIM entries with a specified rendezvous point (RP) address and prefix or with a specified source address and prefix. You can omit the prefix.

sg | star-g—(Optional) Display information about PIM (S,G) or (*,G) entries.

Output Fields [Table 136 on page 1976](#) describes the output fields for the **show pim join** command. Output fields are listed in the approximate order in which they appear.

Table 136: show pim join Output Fields

Field Name	Field Description	Level of Output
Instance	Name of the routing instance.	brief detail extensive summary none
Family	Name of the address family: inet (IPv4) or inet6 (IPv6).	brief detail extensive summary none
Route type	Type of multicast route: (S,G) or (*,G).	summary
Route count	Number of (S,G) routes and number of (*,G) routes.	summary
R	Rendezvous Point Tree.	brief detail extensive none
S	Sparse.	brief detail extensive none
W	Wildcard.	brief detail extensive none
Group	Group address.	brief detail extensive none
Bidirectional group prefix length	For bidirectional PIM, length of the IP prefix for RP group ranges.	All levels
Source	Multicast source: <ul style="list-style-type: none"> • * (wildcard value) • <i>ipv4-address</i> • <i>ipv6-address</i> 	brief detail extensive none
RP	Rendezvous point for the PIM group.	brief detail extensive none
Flags	PIM flags: <ul style="list-style-type: none"> • bidirectional—Bidirectional mode entry. • dense—Dense mode entry. • rptree—Entry is on the rendezvous point tree. • sparse—Sparse mode entry. • spt—Entry is on the shortest-path tree for the source. • wildcard—Entry is on the shared tree. 	brief detail extensive none

Table 136: show pim join Output Fields (continued)

Field Name	Field Description	Level of Output
Upstream interface	<p>RPF interface toward the source address for the source-specific state (S,G) or toward the rendezvous point (RP) address for the non-source-specific state (*,G).</p> <p>For bidirectional PIM, RP Link means that the interface is directly connected to a subnet that contains a phantom RP address.</p> <p>A pseudo multipoint LDP (M-LDP) interface appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.</p>	brief detail extensive none
Upstream neighbor	<p>Information about the upstream neighbor: Direct, Local, Unknown, or a specific IP address.</p> <p>For bidirectional PIM, Direct means that the interface is directly connected to a subnet that contains a phantom RP address.</p> <p>The multipoint LDP (M-LDP) root appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.</p>	extensive
Upstream rpf-vector	Information about the upstream Reverse Path Forwarding (RPF) vector; appears in conjunction with the rpf-vector command.	extensive
Active upstream interface	When multicast-only fast reroute (MoFRR) is configured in a PIM domain, the upstream interface for the active path. A PIM router propagates join messages on two upstream RPF interfaces to receive multicast traffic on both links for the same join request. Preference is given to two paths that do not converge to the same immediate upstream router. PIM installs appropriate multicast routes with upstream neighbors as RPF next hops with two (primary and backup) interfaces.	extensive
Active upstream neighbor	On the MoFRR primary path, the IP address of the neighbor that is directly connected to the active upstream interface.	extensive
MoFRR Backup upstream interface	<p>The MoFRR upstream interface that is used when the primary path fails.</p> <p>When the primary path fails, the backup path is upgraded to primary, and traffic is forwarded accordingly. If there are alternate paths available, a new backup path is calculated and the appropriate multicast route is updated or installed.</p>	extensive
MoFRR Backup upstream neighbor	IP address of the MoFRR upstream neighbor.	extensive

Table 136: show pim join Output Fields (continued)

Field Name	Field Description	Level of Output
Upstream state	<p>Information about the upstream interface:</p> <ul style="list-style-type: none"> • Join to RP—Sending a join to the rendezvous point. • Join to Source—Sending a join to the source. • Local RP—Sending neither join messages nor prune messages toward the RP, because this routing device is the rendezvous point. • Local Source—Sending neither join messages nor prune messages toward the source, because the source is locally attached to this routing device. • No Prune to RP—Automatically sent to RP when SPT and RPT are on the same path. • Prune to RP—Sending a prune to the rendezvous point. • Prune to Source—Sending a prune to the source. <p>NOTE: RP group range entries have None in the Upstream state field because RP group ranges do not trigger actual PIM join messages between routing devices.</p>	extensive
Downstream neighbors	<p>Information about downstream interfaces:</p> <ul style="list-style-type: none"> • Interface—Interface name for the downstream neighbor. A pseudo PIM-SM interface appears for all IGMP-only interfaces. A pseudo multipoint LDP (Pseudo-MLDP) interface appears on ingress root nodes in M-LDP point-to-multipoint LSPs with inband signaling. • Interface address—Address of the downstream neighbor. • State—Information about the downstream neighbor: join or prune. • Flags—PIM join flags: R (RPtree), S (Sparse), W (Wildcard), or zero. • Uptime—Time since the downstream interface joined the group. • Time since last Join—Time since the last join message was received from the downstream interface. • Time since last Prune—Time since the last prune message was received from the downstream interface. • rpf-vector—IP address of the RPF vector TLV . 	extensive
Number of downstream interfaces	Total number of outgoing interfaces for each (S,G) entry.	extensive
Assert Timeout	Length of time between assert cycles on the downstream interface. Not displayed if the assert timer is null.	extensive
Keepalive timeout	Time remaining until the downstream join state is updated (in seconds). If the downstream join state is not updated before this keepalive timer reaches zero, the entry is deleted. If there is a directly connected host, Keepalive timeout is Infinity .	extensive
Uptime	Time since the creation of (S,G) or (*G) state. The uptime is not refreshed every time a PIM join message is received for an existing (S,G) or (*G) state.	extensive

Table 136: show pim join Output Fields (continued)

Field Name	Field Description	Level of Output
Bidirectional accepting interfaces	<p>Interfaces on the routing device that forward bidirectional PIM traffic.</p> <p>The reasons for forwarding bidirectional PIM traffic are that the interface is the winner of the designated forwarder election (DF Winner), or the interface is the reverse path forwarding (RPF) interface toward the RP (RPF).</p>	extensive

show pim mdt

Syntax `show pim mdt instance instance-name`
 `<brief | detail | extensive>`
 `data-mdt-joins`
 `data-mdt-limit`
 `inet`
 `inet6`
 `<incoming | outgoing>`
 `<logical-system (all | logical-system-name)>`
 `<range>`

Release Information Command introduced before Junos OS Release 7.4.
 Support for IPv6 added in Junos OS Release 17.3R1.

Description Display information about Protocol Independent Multicast (PIM) default multicast distribution tree (MDT) and the data MDTs in a Layer 3 VPN environment for a routing instance.

Options **instance *instance-name***—Display information about data-MDTs for a specific PIM-enabled routing instance.

brief | detail | extensive—(Optional) Display the specified level of output.

data-mdt-joins— Show received PIM data-mdt-joins.

data-mdt-limits— Show received PIM data-mdt-limits.

incoming | outgoing—(Optional) Display incoming or outgoing multicast data tunnels, respectively.

inet | inet6—Display IPv4 or IPv6 multicast data tunnels.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

range—(Optional) Display information about an IP address with optional prefix length representing a particular multicast group.

Required Privilege Level view

List of Sample Output [show pim mdt <variables> instance on page 1991](#)
 [show pim mdt instance detail on page 1992](#)
 [show pim mdt instance extensive on page 1992](#)
 [show pim mdt instance incoming on page 1993](#)
 [show pim mdt instance outgoing on page 1993](#)
 [show pim mdt instance \(SSM Mode\) on page 1993](#)

Output Fields Table 137 on page 1991 describes the output fields for the **show pim mdt** command. Output fields are listed in the approximate order in which they appear.

Table 137: show pim mdt Output Fields

Field Name	Field Description	Level of Output
Instance	Name of the routing instance.	All levels
Tunnel direction	Direction the tunnel faces, from the router's perspective: Outgoing or Incoming .	All levels
Tunnel mode	Mode the tunnel is operating in: PIM-SSM or PIM-ASM .	All levels
Default group address	Default multicast group address using this tunnel.	All levels
Default source address	Default multicast source address using this tunnel.	All levels
Default tunnel interface	Default multicast tunnel interface.	All levels
Default tunnel source	Address used as the source address for outgoing PIM control messages.	All levels
C-Group	Customer-facing multicast group address using this tunnel. If you enable dynamic reuse of data MDT group addresses, more than one group address can use the same data MDT.	detail
C-Source	IP address of the multicast source in the customer's address space. If you enable dynamic reuse of data MDT group addresses, more than one source address can use the same data MDT.	detail
P-Group	Service provider-facing multicast group address using this tunnel.	detail
Data tunnel interface	Multicast data tunnel interface that set up the data-MDT tunnel.	detail
Last known forwarding rate	Last known rate, in kilobits per second, at which the tunnel was forwarding traffic.	detail
Configured threshold rate	Rate, in kilobits per second, above which a data-MDT tunnel is created and below which it is deleted.	detail
Tunnel uptime	Time that this data-MDT tunnel has existed. The format is <i>hours:minutes:seconds</i> .	detail

Sample Output

show pim mdt <variables> instance

Use this command to display MDT information for default MDT and data-MDT for IPv4 and/or IPv6 traffic.)

```
user@host> show pim mdt inet | inet6 instance VPN-A
```

```
Instance: PIM.VPN-A Family: INET

```

show pim mdt data-mdt-joins

Syntax **show pim mdt data-mdt-joins**
 <logical-system (all | *logical-system-name*)> instance *instance-name*

Release Information Command introduced in Junos OS Release 11.2.

Description In a draft-rosen Layer 3 multicast virtual private network (MVPN) configured with service provider tunnels, display the advertisements of new multicast distribution tree (MDT) group addresses cached by the provider edge (PE) routers in the specified VPN routing and forwarding (VRF) instance that is configured to use the Protocol Independent Multicast (PIM) protocol.

Options **instance *instance-name***—Display data MDT join packets cached by PE routers in a specific PIM instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

NOTE: Draft-rosen multicast VPNs are not supported in a logical system environment even though the configuration statements can be configured under the logical-systems hierarchy.

Required Privilege Level view

List of Sample Output [show pim mdt data-mdt-joins on page 1995](#)

Output Fields [Table 138 on page 1995](#) describes the output fields for the **show pim mdt data-mdt-joins** command. Output fields are listed in the approximate order in which they appear.

Table 138: show pim mdt data-mdt-joins Output Fields

Field Name	Field Description
C-Group	IPv4 group address in the address space of the customer's VPN-specific PIM-enabled routing instance of the multicast traffic destination. This 32-bit value is carried in the C-group field of the MDT join TLV packet.
C-Source	IPv4 address in the address space of the customer's VPN-specific PIM-enabled routing instance of the multicast traffic source. This 32-bit value is carried in the C-source field of the MDT join TLV packet.
P-Group	IPv4 group address in the service provider's address space of the new data MDT that the PE router will use to encapsulate the VPN multicast traffic flow (C-Source, C-Group). This 32-bit value is carried in the P-group field of the MDT join TLV packet.
P-Source	IPv4 address of the PE router.
Timeout	Timeout, in seconds, remaining for this cache entry. When the cache entry is created, this field is set to 180 seconds. After an entry times out, the PE router deletes the entry from its cache and prunes itself off the data MDT.

Sample Output

show pim mdt data-mdt-joins

```
user@host show pim mdt data-mdt-joins instance VPN-A
```

C-Source	C-Group	P-Source	P-Group	Timeout
20.2.15.9	225.1.1.2	20.0.0.5	239.10.10.0	172
20.2.15.9	225.1.1.3	20.0.0.5	239.10.10.1	172

show pim mdt data-mdt-limit

Syntax `show pim mdt data-mdt-limit instance instance-name`
`<logical-system (all | logical-system-name)>`

Release Information Command introduced in Junos OS Release 12.2.

Description Display the maximum number configured and the currently active data multicast distribution trees (MDTs) for a specific VPN routing and forwarding (VRF) instance.

Options **instance *instance-name***—Display data MDT information for the specified VRF instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

NOTE: Draft-rosen multicast VPNs are not supported in a logical system environment even though the configuration statements can be configured under the logical-systems hierarchy.

Required Privilege Level view

List of Sample Output [show pim mdt data-mdt-limit on page 1997](#)

Output Fields [Table 139 on page 1996](#) describes the output fields for the **show pim mdt data-mdt-limit** command. Output fields are listed in the approximate order in which they appear.

Table 139: show pim mdt data-mdt-limit Output Fields

Field Name	Field Description
Maximum Data Tunnels	Maximum number of data MDTs created in this VRF instance. If the number is 0, no data MDTs are created for this VRF instance.
Active Data Tunnels	Active number of data MDTs in this VRF instance.

Sample Output

show pim mdt data-mdt-limit

```
user@host show pim mdt data-mdt-limit instance VPN-A
```

Maximum Data Tunnels	10
Active Data Tunnels	2

[show pim neighbors detail \(With BFD\) on page 2001](#)

Output Fields [Table 140 on page 1999](#) describes the output fields for the **show pim neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 140: show pim neighbors Output Fields

Field Name	Field Description	Level of Output
Instance	Name of the routing instance.	All levels
Interface	Interface through which the neighbor is reachable.	All levels
Neighbor addr	Address of the neighboring PIM routing device.	All levels
IP	IP version: 4 or 6.	All levels
V	PIM version running on the neighbor: 1 or 2.	All levels
Mode	PIM mode of the neighbor: Sparse , Dense , SparseDense , or Unknown . When the neighbor is running PIM version 2, this mode is always Unknown .	All levels
Option	Can be one or more of the following: <ul style="list-style-type: none"> • B—Bidirectional Capable. • G—Generation Identifier. • H—Hello Option Holdtime. • L—Hello Option LAN Prune Delay. • P—Hello Option DR Priority. • T—Tracking bit. • A—Join attribute; used in conjunction with pim rpf-vector. 	brief none
Uptime	Time the neighbor has been operational since the PIM process was last initialized. Starting in Junos OS release 17.3R1, uptime is not reset during ISSU. The time format is as follows: dd:hh:mm:ss ago for less than a week and nwnd:hh:mm:ss ago for more than a week.	All levels
Address	Address of the neighboring PIM routing device.	detail
BFD	Status and operational state of the Bidirectional Forwarding Detection (BFD) protocol on the interface: Enabled , Operational state is up , or Disabled .	detail
Hello Option Holdtime	Time for which the neighbor is available, in seconds. The range of values is 0 through 65,535.	detail
Hello Default Holdtime	Default holdtime and the time remaining if the holdtime option is not in the received hello message.	detail
Hello Option DR Priority	Designated router election priority. The range of values is 0 through 255.	detail

Table 140: show pim neighbors Output Fields (continued)

Field Name	Field Description	Level of Output
Hello Option Join Attribute	Appears in conjunction with the rpf-vector command. The Join attribute is included in the PIM join messages of PIM routers that can receive type 1 Encoded-Source Address.	detail
Hello Option Generation ID	9-digit or 10-digit number used to tag hello messages.	detail
Hello Option Bi-Directional PIM supported	Neighbor can process bidirectional PIM messages.	detail
Hello Option LAN Prune Delay	Time to wait before the neighbor receives prune messages, in the format delay nnn ms override nnnn ms .	detail
Join Suppression supported	Neighbor is capable of join suppression.	detail
Rx Join	Information about joins received from the neighbor. <ul style="list-style-type: none"> Group—Group addresses in the join message. Source—Address of the source in the join message. Timeout—Time for which the join is valid. 	detail

```

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.
 Command introduced in Junos OS Release 11.3 for the QFX Series.
 Support for bidirectional PIM added in Junos OS Release 12.1.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Display information about Protocol Independent Multicast (PIM) rendezvous points (RPs).

Options **none**—Display standard information about PIM RPs for all groups and family addresses for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

group-address—(Optional) Display the RPs for a particular group. If you specify a group address, the output lists the routing device that is the RP for that group.

inet | inet6—(Optional) Display information for IPv4 or IPv6 family addresses, respectively.

instance instance-name—(Optional) Display information about RPs for a specific PIM-enabled routing instance.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Output Fields [Table 141 on page 2004](#) describes the output fields for the **show pim rps** command. Output fields are listed in the approximate order in which they appear.

Table 141: show pim rps Output Fields

Field Name	Field Description	Level of Output
Instance	Name of the routing instance.	All levels
Family or Address family	Name of the address family: inet (IPv4) or inet6 (IPv6).	All levels
RP address	Address of the rendezvous point.	All levels
Type	Type of RP: <ul style="list-style-type: none"> • auto-rp—Address of the RP known through the Auto-RP protocol. • bootstrap—Address of the RP known through the bootstrap router protocol (BSR). • embedded—Address of the RP known through an embedded RP (IPv6). • static—Address of RP known through static configuration. 	brief none
Holdtime	How long to keep the RP active, with time remaining, in seconds.	All levels
Timeout	How long until the local routing device determines the RP to be unreachable, in seconds.	All levels
Groups	Number of groups currently using this RP.	All levels
Group prefixes	Addresses of groups that this RP can span.	brief none

Table 141: show pim rps Output Fields (continued)

Field Name	Field Description	Level of Output
Learned via	Address and method by which the RP was learned.	detail extensive
Mode	The PIM mode of the RP: bidirectional or sparse. If a sparse and bidirectional RPs are configured with the same RP address, they appear as separate entries in both formats.	All levels
Time Active	How long the RP has been active, in the format <i>hh:mm:ss</i> .	detail extensive
Device Index	Index value of the order in which Junos OS finds and initializes the interface. For bidirectional RPs, the Device Index output field is omitted because bidirectional RPs do not require encapsulation and de-encapsulation interfaces.	detail extensive
Subunit	Logical unit number of the interface. For bidirectional RPs, the Subunit output field is omitted because bidirectional RPs do not require encapsulation and de-encapsulation interfaces.	detail extensive
Interface	Either the encapsulation or the de-encapsulation logical interface, depending on whether this routing device is a designated router (DR) facing an RP router, or is the local RP, respectively. For bidirectional RPs, the Interface output field is omitted because bidirectional RPs do not require encapsulation and de-encapsulation interfaces.	detail extensive
Group Ranges	Addresses of groups that this RP spans.	detail extensive <i>group-address</i>
Active groups using RP	Number of groups currently using this RP.	detail extensive
total	Total number of active groups for this RP.	detail extensive

Table 141: show pim rps Output Fields (continued)

Field Name	Field Description	Level of Output
Register State for RP	<p>Current register state for each group:</p> <ul style="list-style-type: none"> • Group—Multicast group address. • Source—Multicast source address for which the PIM register is sent or received, depending on whether this router is a designated router facing an RP router, or is the local RP, respectively: • First Hop—PIM-designated routing device that sent the Register message (the source address in the IP header). • RP Address—RP to which the Register message was sent (the destination address in the IP header). • State: <ul style="list-style-type: none"> On the designated router: <ul style="list-style-type: none"> • Send—Sending Register messages. • Probe—Sent a null register. If a Register-Stop message does not arrive in 5 seconds, the designated router resumes sending Register messages. • Suppress—Received a Register-Stop message. The designated router is waiting for the timer to resume before changing to Probe state. On the RP: <ul style="list-style-type: none"> • Receive—Receiving Register messages. 	extensive
Anycast-PIM rpset	If anycast RP is configured, the addresses of the RPs in the set.	extensive
Anycast-PIM local address used	If anycast RP is configured, the local address used by the RP.	extensive
Anycast-PIM Register State	<p>If anycast RP is configured, the current register state for each group:</p> <ul style="list-style-type: none"> • Group—Multicast group address. • Source—Multicast source address for which the PIM register is sent or received, depending on whether this routing device is a designated router facing an RP router, or is the local RP, respectively. • Origin—How the information was obtained: <ul style="list-style-type: none"> • DIRECT—From a local attachment • MSDP—From the Multicast Source Discovery Protocol (MSDP) • DR—From the designated router 	extensive
RP selected	For sparse mode and bidirectional mode, the identity of the RP for the specified group address.	<i>group-address</i>

show pim snooping join

Syntax	<pre>show pim snooping join <brief detail extensive> <instance <i>instance-name</i>> <logical-system <i>logical-system-name</i>> <vlan-id <i>vlan-id</i>></pre>
Release Information	<p>Command introduced in Junos OS Release 12.3 for MX Series 5G Universal Routing Platforms.</p> <p>Command introduced in Junos OS Release 13.2 for M Series Multiservice Edge devices.</p>
Description	Display information about Protocol Independent Multicast (PIM) snooping joins.
Options	<p>none—Display detailed information.</p> <p>brief detail extensive—(Optional) Display the specified level of output.</p> <p>instance <i>instance-name</i>—(Optional) Display PIM snooping join information for the specified routing instance.</p> <p>logical-system <i>logical-system-name</i>—(Optional) Display information about a particular logical system, or type 'all'.</p> <p>vlan-id <i>vlan-identifier</i>—(Optional) Display PIM snooping join information for the specified VLAN.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> <i>PIM Snooping for VPLS</i>
List of Sample Output	<p>show pim snooping join on page 2016</p> <p>show pim snooping join extensive on page 2016</p> <p>show pim snooping join instance on page 2016</p> <p>show pim snooping join vlan-id on page 2017</p>
Output Fields	<p>Table 143 on page 2014 lists the output fields for the show pim snooping join command. Output fields are listed in the approximate order in which they appear.</p>

Table 143: show pim snooping join Output Fields

Field Name	Field Description	Level of Output
Instance	Routing instance for PIM snooping.	All levels
Learning-Domain	Learning domain for PIM snooping.	All levels

Table 143: show pim snooping join Output Fields (continued)

Field Name	Field Description	Level of Output
Group	Multicast group address.	All levels
Source	Multicast source address: <ul style="list-style-type: none"> • * (wildcard value) • <ipv4-address> • <ipv6-address> 	All levels
Flags	PIM flags: <ul style="list-style-type: none"> • bidirectional—Bidirectional mode entry. • dense—Dense mode entry. • rptree—Entry is on the rendezvous point tree. • sparse—Sparse mode entry. • spt—Entry is on the shortest-path tree for the source. • wildcard—Entry is on the shared tree. 	All levels
Upstream state	Information about the upstream interface: <ul style="list-style-type: none"> • Join to RP—Sending a join to the rendezvous point. • Join to Source—Sending a join to the source. • Local RP—Sending neither join messages nor prune messages toward the RP, because this router is the rendezvous point. • Local Source—Sending neither join messages nor prune messages toward the source, because the source is locally attached to this routing device. • Prune to RP—Sending a prune to the rendezvous point. • Prune to Source—Sending a prune to the source. <p>NOTE: RP group range entries have None in the Upstream state field because RP group ranges do not trigger actual PIM join messages between routers.</p>	All levels
Upstream neighbor	Information about the upstream neighbor: Direct , Local , Unknown , or a specific IP address. For bidirectional PIM, Direct means that the interface is directly connected to a subnet that contains a phantom RP address.	All levels
Upstream port	RPF interface toward the source address for the source-specific state (S,G) or toward the rendezvous point (RP) address for the non-source-specific state (*G). For bidirectional PIM, RP Link means that the interface is directly connected to a subnet that contains a phantom RP address.	All levels
Downstream port	Information about downstream interfaces.	extensive
Downstream neighbors	Address of the downstream neighbor.	extensive
Timeout	Time remaining until the downstream join state is updated (in seconds).	extensive

Output Fields Table 144 on page 2019 lists the output fields for the `show pim snooping neighbors` command. Output fields are listed in the approximate order in which they appear.

Table 144: `show pim snooping neighbors` Output Fields

Field Name	Field Description	Level of Output
Instance	Routing instance for PIM snooping.	All levels
Learning-Domain	Learning domain for PIM snooping.	All levels
Interface	Router interface for which PIM snooping neighbor details are displayed.	All levels
Option	PIM snooping options available on the specified interface: <ul style="list-style-type: none"> • H = Hello Option Holdtime • P = Hello Option DR Priority • L = Hello Option LAN Prune Delay • G = Generation Identifier • T = Tracking Bit 	All levels
Uptime	Time the neighbor has been operational since the PIM process was last initialized, in the format dd:hh:mm:ss ago for less than a week and nwnd:hh:mm:ss ago for more than a week.	All levels
Neighbor addr	IP address of the PIM snooping neighbor connected through the specified interface.	All levels
Address	IP address of the specified router interface.	All levels
Hello Option Holdtime	Time for which the neighbor is available, in seconds. The range of values is 0 through 65,535.	detail
Hello Option DR Priority	Designated router election priority. The range of values is 0 through 4294967295. NOTE: By default, every PIM interface has an equal probability (priority 1) of being selected as the DR.	detail
Hello Option Generation ID	9-digit or 10-digit number used to tag hello messages.	detail
Hello Option LAN Prune Delay	Time to wait before the neighbor receives prune messages, in the format delay nnn ms override nnnn ms .	detail

show pim source

List of Syntax [Syntax on page 2028](#)
[Syntax \(EX Series Switch and the QFX Series\) on page 2028](#)

Syntax

```
show pim source
<brief | detail>
<inet | inet6>
<instance instance-name>
<logical-system (all | logical-system-name)>
<source-prefix>
```

Syntax (EX Series Switch and the QFX Series)

```
show pim source
<brief | detail>
<inet | inet6>
<instance instance-name>
<source-prefix>
```

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Display information about the Protocol Independent Multicast (PIM) source reverse path forwarding (RPF) state.

Options **none**—Display standard information about the PIM RPF state for all supported family addresses for all routing instances.

brief | detail—(Optional) Display the specified level of output.

inet | inet6—(Optional) Display information for IPv4 or IPv6 family addresses, respectively.

instance *instance-name*—(Optional) Display information about the RPF state for a specific PIM-enabled routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

source-prefix—(Optional) Display the state for source RPF states in the given range.

Output Fields [Table 146 on page 2029](#) describes the output fields for the **show pim source** command. Output fields are listed in the approximate order in which they appear.

Table 146: show pim source Output Fields

Field Name	Field Description
Instance	Name of the routing instance.
Source	Address of the source or reverse path.
Prefix/length	Prefix and prefix length for the route used to reach the RPF address.
Upstream Protocol	Protocol toward the source address.
Upstream interface	RPF interface toward the source address. A pseudo multipoint LDP (M-LDP) interface appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.
Upstream Neighbor	Address of the RPF neighbor used to reach the source address. The multipoint LDP (M-LDP) root appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.

Sample Output

[show pim source](#)

```
user@host> show pim source
Instance: PIM.master Family: INET

Source 10.255.14.144
  Prefix 10.255.14.144/32
  Upstream interface Local
  Upstream neighbor Local

Source 10.255.70.15
  Prefix 10.255.70.15/32
  Upstream interface so-1/0/0.0
  Upstream neighbor 10.111.10.2

Instance: PIM.master Family: INET6
```

[show pim source brief](#)

The output for the **show pim source brief** command is identical to that for the **show pim source** command. For sample output, see [show pim source on page 2029](#).

show pim source detail

```
user@host> show pim source detail

Instance: PIM.master Family: INET

Source 10.255.14.144
  Prefix 10.255.14.144/32
  Upstream interface Local
  Upstream neighbor Local
  Active groups:233.252.0.0
    233.252.0.1
    233.252.0.1

Source 10.255.70.15
  Prefix 10.255.70.15/32
  Upstream interface so-1/0/0.0
  Upstream neighbor 10.111.10.2
  Active groups:233.252.0.1

Instance: PIM.master Family: INET6
```

show pim source (Egress Node with Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs)

```
user@host> show pim source

Instance: PIM.master Family: INET

Source 10.1.1.1
  Prefix 10.1.1.1/32
  Upstream interface Local
  Upstream neighbor Local

Source 10.2.7.7
  Prefix 10.2.7.0/24

Output Fields [Table 147 on page 2032](#) describes the output fields for the **show pim statistics** command. Output fields are listed in the approximate order in which they appear.

Table 147: show pim statistics Output Fields

Field Name	Field Description
Instance	<p>Name of the routing instance.</p> <p>This field only appears if you specify an interface, for example:</p> <ul style="list-style-type: none"> • inet interface <i>interface-name</i> • inet6 interface <i>interface-name</i> • interface <i>interface-name</i>
Family	<p>Output is for IPv4 or IPv6 PIM statistics. INET indicates IPv4 statistics, and INET6 indicates IPv6 statistics.</p> <p>This field only appears if you specify an interface, for example:</p> <ul style="list-style-type: none"> • inet interface <i>interface-name</i> • inet6 interface <i>interface-name</i> • interface <i>interface-name</i>
PIM statistics	PIM statistics for all interfaces or for the specified interface.
PIM message type	Message type for which statistics are displayed.
Received	Number of received statistics.
Sent	Number of messages sent of a certain type.
Rx errors	Number of received packets that contained errors.
V2 Hello	PIM version 2 hello packets.
V2 Register	PIM version 2 register packets.
V2 Register Stop	PIM version 2 register stop packets.
V2 Join Prune	PIM version 2 join and prune packets.
V2 Bootstrap	PIM version 2 bootstrap packets.
V2 Assert	PIM version 2 assert packets.
V2 Graft	PIM version 2 graft packets.
V2 Graft Ack	PIM version 2 graft acknowledgment packets.
V2 Candidate RP	PIM version 2 candidate RP packets.

Table 147: show pim statistics Output Fields (continued)

Field Name	Field Description
V2 State Refresh	PIM version 2 control messages related to PIM dense mode (PIM-DM) state refresh. State refresh is an extension to PIM-DM. It not supported in Junos OS.
V2 DF Election	PIM version 2 send and receive messages associated with bidirectional PIM designated forwarder election.
V1 Query	PIM version 1 query packets.
V1 Register	PIM version 1 register packets.
V1 Register Stop	PIM version 1 register stop packets.
V1 Join Prune	PIM version 1 join and prune packets.
V1 RP Reachability	PIM version 1 RP reachability packets.
V1 Assert	PIM version 1 assert packets.
V1 Graft	PIM version 1 graft packets.
V1 Graft Ack	PIM version 1 graft acknowledgment packets.
AutoRP Announce	Auto-RP announce packets.
AutoRP Mapping	Auto-RP mapping packets.
AutoRP Unknown type	Auto-RP packets with an unknown type.
Anycast Register	Auto-RP announce packets.
Anycast Register Stop	Auto-RP announce packets.
Global Statistics	Summary of PIM statistics for all interfaces.
Hello dropped on neighbor policy	Number of hello packets dropped because of a configured neighbor policy.
Unknown type	Number of PIM control packets received with an unknown type.
V1 Unknown type	Number of PIM version 1 control packets received with an unknown type.
Unknown Version	Number of PIM control packets received with an unknown version. The version is not version 1 or version 2.

Table 147: show pim statistics Output Fields (continued)

Field Name	Field Description
Neighbor unknown	Number of PIM control packets received (excluding PIM hello) without first receiving the hello packet.
Bad Length	Number of PIM control packets received for which the packet size does not match the PIM length field in the packet.
Bad Checksum	Number of PIM control packets received for which the calculated checksum does not match the checksum field in the packet.
Bad Receive If	Number of PIM control packets received on an interface that does not have PIM configured.
Rx Bad Data	Number of PIM control packets received that contain data for TCP Bad register packets.
Rx Intf disabled	Number of PIM control packets received on an interface that has PIM disabled.
Rx V1 Require V2	Number of PIM version 1 control packets received on an interface configured for PIM version 2.
Rx V2 Require V1	Number of PIM version 2 control packets received on an interface configured for PIM version 1.
Rx Register not RP	Number of PIM register packets received when the routing device is not the RP for the group.
Rx Register no route	Number of PIM register packets received when the RP does not have a unicast route back to the source.
Rx Register no decap if	Number of PIM register packets received when the RP does not have a de-encapsulation interface.
Null Register Timeout	Number of NULL register timeout packets.
RP Filtered Source	Number of PIM packets received when the routing device has a source address filter configured for the RP.
Rx Unknown Reg Stop	Number of register stop messages received with an unknown type.
Rx Join/Prune no state	Number of join and prune messages received for which the routing device has no state.
Rx Join/Prune on upstream if	Number of join and prune messages received on the interface used to reach the upstream routing device, toward the RP.
Rx Join/Prune for invalid group	Number of join or prune messages received for invalid multicast group addresses.

Table 147: show pim statistics Output Fields (continued)

Field Name	Field Description
Rx Join/Prune messages dropped	Number of join and prune messages received and dropped.
Rx sparse join for dense group	Number of PIM sparse mode join messages received for a group that is configured for dense mode.
Rx Graft/Graft Ack no state	Number of graft and graft acknowledgment messages received for which the router or switch has no state.
Rx Graft on upstream if	Number of graft messages received on the interface used to reach the upstream routing device, toward the RP.
Rx CRP not BSR	Number of BSR messages received in which the PIM message type is Candidate-RP-Advertisement, not Bootstrap.
Rx BSR when BSR	Number of BSR messages received in which the PIM message type is Bootstrap.
Rx BSR not RPF if	Number of BSR messages received on an interface that is not the RPF interface.
Rx unknown hello opt	Number of PIM hello packets received with options that Junos OS does not support.
Rx data no state	Number of PIM control packets received for which the routing device has no state for the data type.
Rx RP no state	Number of PIM control packets received for which the routing device has no state for the RP.
Rx aggregate	Number of PIM aggregate MDT packets received.
Rx malformed packet	Number of PIM control packets received with a malformed IP unicast or multicast address family.
No RP	Number of PIM control packets received with no RP address.
No register encaps if	Number of PIM register packets received when the first-hop routing device does not have an encapsulation interface.
No route upstream	Number of PIM control packets received when the routing device does not have a unicast route to the the interface used to reach the upstream routing device, toward the RP.
Nexthop Unusable	Number of PIM control packets with an unusable nexthop. A path can be unusable if the route is hidden or the link is down.
RP mismatch	Number of PIM control packets received for which the routing device has an RP mismatch.

Table 147: show pim statistics Output Fields (continued)

Field Name	Field Description
RP mode mismatch	RP mode (sparse or bidirectional) mismatches encountered when processing join and prune messages.
RPF neighbor unknown	Number of PIM control packets received for which the routing device has an unknown RPF neighbor for the source.
Rx Joins/Prunes filtered	The number of join and prune messages filtered because of configured route filters and source address filters.
Tx Joins/Prunes filtered	The number of join and prune messages filtered because of configured route filters and source address filters.
Embedded-RP invalid addr	Number of packets received with an invalid embedded RP address in PIM join messages and other types of messages sent between routing domains.
Embedded-RP limit exceed	Number of times the limit configured with the maximum-rps statement is exceeded. The maximum-rps statement limits the number of embedded RPs created in a specific routing instance. The range is from 1 through 500. The default is 100.
Embedded-RP added	<p>Number of packets in which the embedded RP for IPv6 is added.</p> <p>The following receive events trigger extraction of an IPv6 embedded RP address on the routing device:</p> <ul style="list-style-type: none"> • Multicast Listener Discovery (MLD) report for an embedded RP multicast group address • PIM join message with an embedded RP multicast group address • Static embedded RP multicast group address associated with an interface • Packets sent to an embedded RP multicast group address received on the DR <p>An embedded RP node discovered through these receive events is added if it does not already exist on the routing platform.</p>
Embedded-RP removed	Number of packets in which the embedded RP for IPv6 is removed. The embedded RP is removed whenever all PIM join states using this RP are removed or the configuration changes to remove the embedded RP feature.
Rx Register msgs filtering drop	Number of received register messages dropped because of a filter configured for PIM register messages.
Tx Register msgs filtering drop	Number of register messages dropped because of a filter configured for PIM register messages.
Rx Bidir Join/Prune on non-Bidir if	Error counter for join and prune messages received on non-bidirectional PIM interfaces.

Table 147: show pim statistics Output Fields (continued)

Field Name	Field Description
Rx Bidir Join/Prune on non-DF if	Error counter for join and prune messages received on non-designated forwarder interfaces.
V4 (S,G) Maximum	Maximum number of (S,G) IPv4 multicast routes accepted for the VPN routing and forwarding (VRF) routing instance. If this number is met, additional (S,G) entries are not accepted.
V4 (S,G) Accepted	Number of accepted (S,G) IPv4 multicast routes.
V4 (S,G) Threshold	Threshold at which a warning message is logged (percentage of the maximum number of (S,G) IPv4 multicast routes accepted by the device).
V4 (S,G) Log Interval	Time (in seconds) between consecutive log messages.
V6 (S,G) Maximum	Maximum number of (S,G) IPv6 multicast routes accepted for the VPN routing and forwarding (VRF) routing instance. If this number is met, additional (S,G) entries are not accepted.
V6 (S,G) Accepted	Number of accepted (S,G) IPv6 multicast routes.
V6 (S,G) Threshold	Threshold at which a warning message is logged (percentage of the maximum number of (S,G) IPv6 multicast routes accepted by the device).
V6 (S,G) Log Interval	Time (in seconds) between consecutive log messages.
V4 (grp-prefix, RP) Maximum	Maximum number of group-to-rendezvous point (RP) IPv4 multicast mappings accepted for the VRF routing instance. If this number is met, additional mappings are not accepted.
V4 (grp-prefix, RP) Accepted	Number of accepted group-to-RP IPv4 multicast mappings.
V4 (grp-prefix, RP) Threshold	Threshold at which a warning message is logged (percentage of the maximum number of group-to-RP IPv4 multicast mappings accepted by the device).
V4 (grp-prefix, RP) Log Interval	Time (in seconds) between consecutive log messages.
V6 (grp-prefix, RP) Maximum	Maximum number of group-to RP IPv6 multicast mappings accepted for the VRF routing instance. If this number is met, additional mappings are not accepted.
V6 (grp-prefix, RP) Accepted	Number of accepted group-to-RP IPv6 multicast mappings.

Table 147: show pim statistics Output Fields (continued)

Field Name	Field Description
V6 (grp-prefix, RP) Threshold	Threshold at which a warning message is logged (percentage of the maximum number of group-to-RP IPv6 multicast mappings accepted by the device).
V6 (grp-prefix, RP) Log Interval	Time (in seconds) between consecutive log messages.
V4 Register Maximum	Maximum number of IPv4 PIM registers accepted for the VRF routing instance. If this number is met, additional PIM registers are not accepted. You configure the register limits on the RP.
V4 Register Accepted	Number of accepted IPv4 PIM registers.
V4 Register Threshold	Threshold at which a warning message is logged (percentage of the maximum number of IPv4 PIM registers accepted by the device).
V4 Register Log Interval	Time (in seconds) between consecutive log messages.
V6 Register Maximum	Maximum number of IPv6 PIM registers accepted for the VRF routing instance. If this number is met, additional PIM registers are not accepted. You configure the register limits on the RP.
V6 Register Accepted	Number of accepted IPv6 PIM registers.
V6 Register Threshold	Threshold at which a warning message is logged (percentage of the maximum number of IPv6 PIM registers accepted by the device).
V6 Register Log Interval	Time (in seconds) between consecutive log messages.
(*G) Join drop due to SSM range check	PIM join messages that are dropped because the multicast addresses are outside of the SSM address range of 232.0.0.0 through 232.255.255.255. You can extend the accepted SSM address range by configuring the ssm-groups statement.

show sap listen

Syntax `show sap listen`
 `<brief | detail>`
 `<logical-system (all | logical-system-name)>`

Release Information Command introduced before Junos OS Release 7.4.

Description Display the addresses that the router is listening to in order to receive multicast Session Announcement Protocol (SAP) session announcements.

Options **none**—Display standard information about the addresses that the router is listening to in order to receive multicast SAP session announcements.

brief | detail—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output [show sap listen on page 2044](#)
 [show sap listen brief on page 2045](#)
 [show sap listen detail on page 2045](#)

Output Fields [Table 148 on page 2044](#) describes the output fields for the **show sap listen** command. Output fields are listed in the approximate order in which they appear.

Table 148: show sap listen Output Fields

Field Name	Field Description
Group address	Address of the group that the local router is listening to for SAP messages.
Port	UDP port number used for SAP.

Sample Output

show sap listen

```
user@host> show sap listen
Group address  Port
224.2.127.254  9875
239.255.255.255 9875
```

`show sap listen brief`

The output for the **show sap listen brief** command is identical to that for the **show sap listen** command. For sample output, see [show sap listen on page 2044](#).

`show sap listen detail`

The output for the **show sap listen detail** command is identical to that for the **show sap listen** command. For sample output, see [show sap listen on page 2044](#).

test msdp

Syntax	<code>test msdp (dependent-peers <i>prefix</i> rpf-peer <i>originator</i>) <instance <i>instance-name</i>> <logical-system (all <i>logical-system-name</i>)></code>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 12.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Find Multicast Source Discovery Protocol (MSDP) peers.
Options	dependent-peers <i>prefix</i> —Find downstream dependent MSDP peers. rpf-peer <i>originator</i> —Find the MSDP reverse-path-forwarding (RPF) peer for the originator. instance <i>instance-name</i> —(Optional) Find MDSP peers for the specified routing instance. logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system.
Required Privilege Level	view
List of Sample Output	test msdp dependent-peers on page 2046
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

test msdp dependent-peers

```
user@host> test msdp dependent-peers 10.0.0.1/24
```

CHAPTER 20

IPv6 Operational Commands

- `clear ipv6 neighbors`
- `clear ipv6 router-advertisement`
- `show ipv6 neighbors`
- `show ipv6 router-advertisement`

clear ipv6 neighbors

Syntax	<pre>clear ipv6 neighbors <all> <host <i>host-name</i>> <interface <i>interface-name</i>> <logical-system <i>logical-system-name</i>> <tenant <i>name</i>> <vpn <i>vpn-name</i>></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.3 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.2 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p> <p>interface, logical-system, tenant, and vpn options added in Junos OS Release 18.3.</p>
Description	Clear IPv6 neighbor cache information.
Options	<p>none—Clear all IPv6 neighbor cache information.</p> <p>all—(Optional) Clear all IPv6 neighbor cache information.</p> <p>host <i>hostname</i>—(Optional) Clear the information for the specified IPv6 neighbors.</p> <p>interface <i>interface-name</i>—(Optional) Clear information about IPv6 for the specified logical interface</p> <p>logical-system <i>logical-system-name</i>—(Optional) Clear the IPv6 entries for the specified logical system; only available on the main router context.</p> <p>tenant <i>name</i>—(Optional) Clear the name of the tenant.</p> <p>vpn <i>vpn-name</i>—(Optional) Clear entries in the IPv6 table for the specified virtual private network's (VPN) routing table.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• show ipv6 neighbors on page 2051
List of Sample Output	clear ipv6 neighbors on page 2049
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear ipv6 neighbors

```
user@host> clear ipv6 neighbors
```

clear ipv6 router-advertisement

Syntax	<pre>clear ipv6 router-advertisement <interface <i>interface</i>> <logical-system (all <i>logical-system-name</i>)></pre>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Clear IPv6 router advertisement counters.
Options	<p>none—Clear IPv6 router advertisement counters for all interfaces.</p> <p>interface <i>interface</i>—(Optional) Clear IPv6 router advertisement counters for the specified interface.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• show ipv6 router-advertisement on page 2054
List of Sample Output	clear ipv6 router-advertisement on page 2050
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear ipv6 router-advertisement

```
user@host> clear ipv6 router-advertisement
```

show ipv6 neighbors

Syntax `show ipv6 neighbors`
 `<flags>`
 `<hostname host-name>`
 `<interface interface-name>`
 `<logical-system logical-system-name>`
 `<reference-count count>`
 `<tenant name>`
 `<vpn vpn-name>`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.3 for EX Series switches.
 Command introduced in Junos OS Release 12.2 for the QFX Series.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
 flags, **hostname**, **interface**, **logical-system**, **reference-count**, **tenant**, and **vpn** options added in Junos OS Release 18.3.

Description Display information about the IPv6 neighbor cache.

NOTE: Starting with Junos OS Release 16.1, `show ipv6 neighbors` command does not display the underlying ifl information if `enhanced-convergence` statement at `[edit irb unit unit-number]` hierarchy level and `enhanced-ip` statement at `[edit chassis network-services]` hierarchy level is configured for the destination interface IRB.

Options **none**—Display the entries in the IPv6 table.

flags—(Optional) Display the flags set, if any.

hostname *host-name*—(Optional) Display the hostname.

interface *interface-name*—(Optional) Display information about IPv6 for the specified logical interface

logical-system *logical-system-name*—(Optional) Display the IPv6 entries for the specified logical system; only available on the main router context.

reference-count *count*—(Optional) Display the IPv6 next-hop reference count.

tenant *name*—(Optional) Display the name of the tenant.

vpn *vpn-name*—(Optional) Display entries in the IPv6 table for the specified virtual private network's (VPN) routing table.

Required Privilege Level view

List of Sample Output [show ipv6 neighbors on page 2052](#)
[show ipv6 neighbors on page 2052](#)

Output Fields [Table 149 on page 2052](#) describes the output fields for the **show ipv6 neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 149: show ipv6 neighbors Output Fields

Field Name	Field Description
IPv6 Address	Name of the IPv6 interface.
Linklayer Address	Link-layer address.
State	State of the link: up , down , incomplete , reachable , stale , or unreachable .
Exp	Number of seconds until the entry expires.
Rtr	Whether the neighbor is a routing device: yes or no .
Secure	Whether this entry was created using the Secure Neighbor Discovery (SEND) protocol: yes or no .
Interface	Name of the interface.

Sample Output

show ipv6 neighbors

```
user@host> show ipv6 neighbors
```

IPv6 Address	Linklayer Address	State	Exp	Rtr	Secure
Interface					
2001:db8:0:1:2a0:a514:0:24c	00:05:85:8f:c8:bd	stale	546	yes	no
fe-1/2/0.1					
fe80::2a0:a514:0:24c	00:05:85:8f:c8:bd	stale	258	yes	no
fe-1/2/0.1					
fe80::2a0:a514:0:64c	00:05:85:8f:c8:bd	stale	111	yes	no
fe-1/2/1.5					
fe80::2a0:a514:0:a4c	00:05:85:8f:c8:bd	stale	327	yes	no
fe-1/2/2.9					

show ipv6 neighbors

The command displaying the underlying L2 ifl information when **enhanced-convergence** statement and **enhanced-ip** statement is not configured.

IPv6 Address Interface	Linklayer Address	State	Exp	Rtr	Secure	
23::23:0:0:2 [xe-2/2/0.0]	00:00:23:00:00:02	reachab1e	0	no	no	irb.0

The command not displaying the underlying l2 ifl information when **enhanced-convergence** statement and **enhanced-ip** statement is configured.

IPv6 Address Interface	Linklayer Address	State	Exp	Rtr	Secure	
23::23:0:0:2	00:00:23:00:00:02	reachab1e	0	no	no	irb.0

show ipv6 router-advertisement

Syntax	<pre>show ipv6 router-advertisement <conflicts> <interface <i>interface</i>> <logical-system (all <i>logical-system-name</i>)> <prefix <i>prefix/prefix length</i>></pre>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 12.2 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display information about IPv6 router advertisements, including statistics about messages sent and received on interfaces, and information received from advertisements from other routers.
Options	<p>none—Display all IPv6 router advertisement information for all interfaces.</p> <p>conflicts—(Optional) Display only the IPv6 router advertisement information that is conflicting.</p> <p>interface <i>interface</i>—(Optional) Display IPv6 router advertisement information for the specified interface.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>prefix <i>prefix/prefix length</i>—(Optional) Display IPv6 router advertisement information for the specified prefix.</p>
Additional Information	The display identifies conflicting information by enclosing the value the router is advertising in brackets.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• clear ipv6 router-advertisement on page 2050
List of Sample Output	show ipv6 router-advertisement on page 2055 show ipv6 router-advertisement conflicts on page 2056 show ipv6 router-advertisement prefix on page 2056
Output Fields	Table 150 on page 2055 describes the output fields for the show ipv6 router-advertisement command. Output fields are listed in the approximate order in which they appear.

Table 150: show ipv6 router-advertisement Output Fields

Field Name	Field Description
Interface	Name of the interface.
Advertisements sent	Number of router advertisements sent and the elapsed time since they were sent.
Solicits received	Number of solicitation messages received.
Advertisements received	Number of router advertisements received.
Advertisements from	Names of interfaces from which router advertisements have been received and the elapsed time since the last one was received.
Managed	Managed address configuration flag: 0 (stateless) or 1 (stateful).
Other configuration	Other stateful configuration flag: 0 (stateless) or 1 (stateful).
Reachable time	Time that a node identifies a neighbor as reachable after receiving a reachability confirmation, in milliseconds.
Default lifetime	Default lifetime, in seconds: from 0 seconds to 18.2 hours. A setting of 0 indicates that the router is not a default router.
Retransmit timer	Time between retransmitted Neighbor Solicitation messages, in milliseconds.
Current hop limit	Configured current hop limit.
Prefix	Name and length of the prefix.
Valid lifetime	How long the prefix remains valid for onlink determination.
Preferred lifetime	How long the prefix generated by stateless autoconfiguration remains preferred.
On link	Onlink flag: 0 (not onlink) or 1 (onlink).
Autonomous	Autonomous address configuration flag: 0 (not autonomous) or 1 (autonomous).

Sample Output

show ipv6 router-advertisement

```

user@host> show ipv6 router-advertisement
Interface: fe-0/1/1.0
  Advertisements sent: 0
  Solicits received: 0
  Advertisements received: 0
Interface: fxp0.0
  Advertisements sent: 0
  Solicits received: 0

```

```
Advertisements received: 1
Advertisement from fe80::2d0:b7ff:fe1e:7b0e, heard 00:00:13 ago
Managed: 0
Other configuration: 0 [1]
  Reachable time: 0 ms
  Default lifetime: 1800 sec
  Retransmit timer: 0 ms
  Current hop limit: 64
```

show ipv6 router-advertisement conflicts

```
user@host> show ipv6 router-advertisement conflicts
Interface: fxp0.0
  Advertisement from fe80::2d0:b7ff:fe1e:7b0e, heard 00:01:08 ago
  Other configuration: 0 [1]
```

show ipv6 router-advertisement prefix

```
user@host> show ipv6 router-advertisement prefix 2001:db8:8040::/16
Interface: fe-0/1/3.0
  Advertisements sent: 3, last sent 00:04:11 ago
  Solicits received: 0
  Advertisements received: 3
  Advertisement from fe80::290:69ff:fe9a:5403, heard 00:00:05 ago
  Managed: 0
  Other configuration: 0
  Reachable time: 0 ms
  Default lifetime: 180 sec [1800 sec]
  Retransmit timer: 0 ms
  Current hop limit: 64
  Prefix: 2001:db8:8040:1::/64
    Valid lifetime: 2592000 sec
    Preferred lifetime: 604800 sec
  On link: 1
  Autonomous: 1
```

Output Fields Table 151 on page 2067 describes the output fields for the **show isis adjacency** command. Output fields are listed in the approximate order in which they appear.

Table 151: show isis adjacency Output Fields

Field Name	Field Description	Level of Output
Interface	Interface through which the neighbor is reachable.	All levels
System	System identifier (sysid), displayed as a name, if possible.	brief
L or Level	Level: <ul style="list-style-type: none"> • 1—Level 1 only • 2—Level 2 only • 3—Level 1 and Level 2 An exclamation point (!) preceding the level number indicates that the adjacency is missing an IP address.	All levels
State	State of the adjacency: Up , Down , New , One-way , Initializing , or Rejected .	All levels
Hold (secs)	Remaining hold time of the adjacency.	brief
SNPA	Subnetwork point of attachment (MAC address of the next hop).	brief
Expires in	How long until the adjacency expires, in seconds.	detail
Priority	Priority to become the designated intermediate system.	detail extensive
Up/Down transitions	Count of adjacency status changes from Up to Down or from Down to Up .	detail
Last transition	Time of the last Up/Down transition.	detail
Circuit type	Bit mask of levels on this interface: 1=Level 1 router; 2=Level 2 router; 3=both Level 1 and Level 2 router.	detail
Speaks	Protocols supported by this neighbor.	detail extensive
MAC address	MAC address of the interface.	detail extensive
Topologies	Supported topologies.	detail extensive
Restart capable	Whether a neighbor is capable of graceful restart: Yes or No .	detail extensive
Adjacency advertisement: Advertise	This routing device has signaled to advertise this interface to its neighbors in their link-state PDUs.	detail extensive
Adjacency advertisement: Suppress	This neighbor has signaled not to advertise the interface in the routing device's outbound link-state PDUs.	detail extensive

Table 151: show isis adjacency Output Fields (continued)

Field Name	Field Description	Level of Output
IP addresses	IP address of this neighbor.	detail extensive
IPv6 Address	IPv6 address of the neighbor.	detail extensive
Level 1 IPv4 Adj-SID	Level 1 IPv4 node-SID of the adjacent neighbor.	detail extensive
Level 1 IPv6 Adj-SID	Level 1 IPv6 node-SID of the adjacent neighbor.	
Level 2 IPv4 Adj-SID	Level 2 IPv4 node-SID of the adjacent neighbor.	detail extensive
Level 2 IPv6 Adj-SID	Level 2 IPv6 node-SID of the adjacent neighbor.	detail extensive

Table 151: show isis adjacency Output Fields (continued)

Field Name	Field Description	Level of Output
Transition log	<p>List of recent transitions, including:</p> <ul style="list-style-type: none"> • When—Time at which an IS-IS adjacency transition occurred. • State—Current state of the IS-IS adjacency (up, down, or rejected). <ul style="list-style-type: none"> • Up—Adjacency is up and operational. • Down—Adjacency is down and not available. • Rejected—Adjacency has been rejected. • Event—Type of transition that occurred. <ul style="list-style-type: none"> • Seenself—Possible routing loop has been detected. • Interface down—IS-IS interface has gone down and is no longer available. • Error—Adjacency error. • Down reason—Reason that an IS-IS adjacency is down: <ul style="list-style-type: none"> • 3-Way Handshake Failed—Connection establishment failed. • Address Mismatch—Address mismatch caused link failure. • Aged Out—Link expired. • ISO Area Mismatch—IS-IS area mismatch caused link failure. • Bad Hello—Unacceptable hello message caused link failure. • BFD Session Down—Bidirectional failure detection caused link failure. • Interface Disabled—IS-IS interface is disabled. • Interface Down—IS-IS interface is unavailable. • Interface Level Disabled—IS-IS level is disabled. • Level Changed—IS-IS level has changed on the adjacency. • Level Mismatch—Levels on adjacency are not compatible. • MPLS LSP Down—Label-switched path (LSP) is unavailable. • MT Topology Changed—IS-IS topology has changed. • MT Topology Mismatch—IS-IS topology is mismatched. • Remote System ID Changed—Adjacency peer system ID changed. • Protocol Shutdown—IS-IS protocol is disabled. • CLI Command—Adjacency brought down by user. • Unknown—Unknown. 	extensive

Sample Output

show isis adjacency

```
user@host> show isis adjacency
```

Interface	System	L State	Hold (secs)	SNPA
at-2/3/0.0	ranier	3 Up	23	

show isis adjacency brief

The output for the **show isis adjacency brief** command is identical to that for the **show isis adjacency** command. For sample output, see [show isis adjacency on page 2069](#).

Output Fields [Table 155 on page 2078](#) lists the output fields for the **show isis backup spf results** command. Output fields are listed in the approximate order in which they appear.

Table 155: show isis backup spf results Output Fields

Field Name	Field Description
node-name	Name of the destination node.
Address	Address of the destination node.
Primary next-hop	Interface and name of the node of the primary next hop to reach the destination.
Root	Name of the next-hop neighbor.
Metric	Metric to the node.
Eligible	Indicates that the next-hop neighbor has been designated as a backup path to the destination node.
Backup next-hop	Name of the interface of the backup next hop.
SNPA	Subnetwork point of attachment (MAC address of the next hop).
LSP	Name of the MPLS label-switched path (LSP) designated as a backup path.
Not eligible	Indicates that the next-hop neighbor cannot function as a backup path to the destination.
Reason	Describes why the next-hop neighbor is designated as Not eligible as a backup path.

show isis context-identifier

Syntax show isis context-identifier
 <brief | detail | extensive>
 <identifier name>
 <instance instance-name>
 <logical-system (all | logical-system-name)>

Release Information Command introduced in Junos OS Release 10.4.

Description Display IS-IS context identifier information.

Options **brief | detail | extensive**—(Optional) Display the specified level of output.

identifier name—(Optional) Display information about the specified context identifier.

instance instance-name—(Optional) Display entries for the specified routing instance.

logical-system (all | logical-system-name)—(Optional) Display the context identifier information for all logical systems or for a particular logical system.

Required Privilege Level View

Output Fields [Table 156 on page 2081](#) lists the output fields for the **show isis context-identifier** command. Output fields are listed in the approximate order in which they appear.

Table 156: show isis context-identifier Output Fields

Field Name	Field Description	Level of Output
Context	IPv4 address that defines a protection pair. The context is manually configured on both primary and protector PEs.	detail
Owner	Protocol that requires the context.	detail
Role	Role of the PE, which is either primary or protector.	detail
Primary	Name of the primary PE.	detail
Metric	Advertised interior gateway protocol (IGP) metric.	detail

Sample Output

```
user@host> show isis context-identifier detail
```

```
IS-IS context database:
Context          Owner      Role      Primary    Metric
```

```

```

show isis database

List of Syntax [Syntax on page 2083](#)
 [Syntax \(EX Series Switches and QFX Series\) on page 2083](#)

Syntax show isis database
 <system-id>
 <brief | detail | extensive>
 <instance *instance-name*>
 <level (1 | 2)>
 <logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches and QFX Series) show isis database
 <system-id>
 <brief | detail | extensive>
 <level (1 | 2)>
 <instance *instance-name*>

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Command introduced in Junos OS Release 12.1 for the QFX Series.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
 Command introduced in Junos OS Release 15.1X53-D30 for the QFX10002 switch.

Description Display the entries in the Intermediate System-to-Intermediate System (IS-IS) link-state database, which contains data about PDU packets.

Options **none**—Display standard information about IS-IS link-state database entries for all routing instances.

system id—(Optional) Display IS-IS link-state database entries for the specified intermediate system.

brief | detail | extensive—(Optional) Display the specified level of output.

instance *instance-name*—(Optional) Display IS-IS link-state database entries for the specified routing instance.

level (1 | 2)—(Optional) Display IS-IS link-state database entries for the specified IS-IS level.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

Output Fields [Table 157 on page 2084](#) describes the output fields for the **show isis database** command. Output fields are listed in the approximate order in which they appear. Fields that contain internal IS-IS information useful only in troubleshooting obscure problems are not described in the table. For more details about these fields, contact your customer support representative.

Table 157: show isis database Output Fields

Field Name	Field Description	Level of Output
Interface name	Name of the interface on which the link-state PDU has been received; always IS-IS for this command.	All levels
level	Level of intermediate system: <ul style="list-style-type: none"> • 1—Intermediate system routes within an area; when the destination is outside an area, it routes toward a Level 2 system. • 2—Intermediate system routes between areas and toward other ASs. 	All levels
LSP ID	Link-state PDU identifier.	All levels
Sequence	Sequence number of the link-state PDU.	All levels
Checksum	Checksum value of the link-state PDU.	All levels
Lifetime (secs)	Remaining lifetime of the link-state PDU, in seconds.	All levels
Attributes	Attributes of the specified database: L1 , L2 , Overload , or Attached (L1 only).	none brief
# LSPs	Total number of link-state PDUs in the specified link-state database.	none brief
IP prefix	Prefix advertised by this link-state PDU.	detail extensive
IS neighbor	IS-IS neighbor of the advertising system.	detail extensive
IP prefix	IPv4 prefix advertised by this link-state PDU.	detail extensive
V6 prefix	IPv6 prefix advertised by this link-state PDU.	detail extensive
Metric	Metric of the prefix or neighbor.	detail extensive

Table 157: show isis database Output Fields (continued)

Field Name	Field Description	Level of Output
Header	<ul style="list-style-type: none"> • LSP ID—Link state PDU identifier of the header. • Length—Header length. • Allocated Length—Amount of length available for the header. • Router ID—Address of the local routing device. • Remaining Lifetime—Remaining lifetime of the link-state PDU, in seconds. 	extensive
Packet	<ul style="list-style-type: none"> • LSP ID—The identifier for the link-state PDU. • Length—Packet length. • Lifetime—Remaining lifetime, in seconds. • Checksum—The checksum of the link-state PDU. • Sequence—The sequence number of the link-state PDU. Every time the link-state PDU is updated, this number increments. • Attributes—Packet attributes. • NLPID—Network layer protocol identifier. • Fixed length—Specifies the set length for the packet. 	extensive
TLVs	<ul style="list-style-type: none"> • Area Address—Area addresses that the routing device can reach. • Speaks—Supported routing protocols. • IP router id—ID of the routing device (usually the IP address). • IP address—IPv4 address. • Hostname—Assigned name of the routing device. • IP prefix—IP prefix of the routing device. • Metric—IS-IS metric that measures the cost of the adjacency between the originating routing device and the advertised routing device. • IP extended prefix—Extended IP prefix of the routing device. • IS neighbor—Directly attached neighbor's name and metric. • IS extended neighbor—Directly attached neighbor's name, metric, IP address, local interface index, and remote interface index. The interface indexes enable Junos OS to support unnumbered extensions for IS-IS, as described in RFC 4205. • Router Capability—ID of the routing device and flag. NOTE: Router capability also specifies SPRING capability and SPRING algorithm when segment routing is enabled on the routing device. 	extensive
Extended IS Reachability TLV	Type and length of the TLV is useful to identify the IS extended neighbors packed in this TLV.	extensive
SubTLV len	The length of the SubTLV of IS extended neighbor.	extensive

Sample Output

show isis database

```
user@host> show isis database
```

IS-IS level 1 link-state database:

LSP ID	Sequence	Checksum	Lifetime	Attributes
kobuk.00-00	0x3	0x3167	1057	L1 L2
camaro.00-00	0x5	0x770e	1091	L1 L2
ranier.00-00	0x4	0xaa95	1091	L1 L2
glacier.00-00	0x4	0x206f	1089	L1 L2
glacier.02-00	0x1	0xd141	1089	L1 L2
badlands.00-00	0x3	0x87a2	1093	L1 L2

6 LSPs

IS-IS level 2 link-state database:

LSP ID	Sequence	Checksum	Lifetime	Attributes
kobuk.00-00	0x6	0x8d6b	1096	L1 L2
camaro.00-00	0x9	0x877b	1101	L1 L2
ranier.00-00	0x8	0x855d	1103	L1 L2
glacier.00-00	0x7	0xf892	1098	L1 L2
glacier.02-00	0x1	0xd141	1089	L1 L2
badlands.00-00	0x6	0x562	1105	L1 L2

6 LSPs

show isis database brief

The output for the **show isis database brief** command is identical to that for the **show isis database** command. For sample output, see [show isis database on page 2085](#).

show isis hostname

List of Syntax [Syntax on page 2098](#)
[Syntax \(EX Series Switches and QFX Series\) on page 2098](#)

Syntax `show isis hostname`
`<logical-system (all | logical-system-name)>`

Syntax (EX Series Switches and QFX Series) `show isis hostname`

Release Information Command introduced before Junos OS Release 7.4.
Command introduced in Junos OS Release 9.0 for EX Series switches.
Command introduced in Junos OS Release 12.1 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Display IS-IS hostname database information.

This command displays the system ID-to-name cache. The output shows if the mapping has been learned by receipt of a Hostname TLV #137 (type dynamic) configured in Junos OS with the **set system host-name** command, or a static mapping defined in Junos OS with the **set system static-host-mapping *hostname* sysid** command (type static). The local router always has its type set to static even if **static-host-mapping** is not configured.

Options **none**—Display IS-IS hostname database information.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output [show isis hostname on page 2099](#)

Output Fields [Table 158 on page 2098](#) describes the output fields for the **show isis hostname** command. Output fields are listed in the approximate order in which they appear.

Table 158: show isis hostname Output Fields

Field Name	Field Description
System Id	System identifier mapped to the hostname.
Hostname	Hostname mapped to the system identifier.

Table 158: show isis hostname Output Fields (continued)

Field Name	Field Description
Type	Type of mapping between system identifier and hostname. <ul style="list-style-type: none">• Dynamic—Hostname mapping determined as described in RFC 2763, <i>Dynamic Hostname Exchange Mechanism for IS-IS</i>.• Static—Hostname mapping configured by user.

Sample Output

show isis hostname

```
user@host> show isis hostname
IS-IS hostname database:
System Id      Hostname      Type
1921.6800.4201 isis1         Dynamic
1921.6800.4202 isis2         Static
1921.6800.4203 isis3         Dynamic
```

show isis interface

List of Syntax [Syntax on page 2100](#)
 [Syntax \(EX Series Switches and QFX Series\) on page 2100](#)

Syntax show isis interface
 <brief | detail | extensive>
 <interface-name>
 <logical-system (all | *logical-system-name*)>

Syntax (EX Series Switches and QFX Series) show isis interface
 <brief | detail | extensive>
 <interface-name>

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Command introduced in Junos OS Release 12.1 for the QFX Series.

Description Display status information about Intermediate System-to-Intermediate System (IS-IS)-enabled interfaces.

NOTE: If the configured metric for an IS-IS level is above 63, and the **wide-metrics-only** statement is not configured, the **show isis interface detail** command and the **show isis interface extensive** command display 63 as the metric value for that level. Configure the **wide-metrics-only** statement to generate metric values greater than 63 on a per IS-IS level basis.

The **show isis interface** command displays the configured metric value for an IS-IS level irrespective of whether is configured or not.

Options **none**—Display standard information about all IS-IS-enabled interfaces.

 brief | detail | extensive—(Optional) Display the specified level of output.

 interface-name—(Optional) Display information about the specified interface only.

 logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

Output Fields [Table 159 on page 2101](#) describes the output fields for the **show isis interface** command. Output fields are listed in the approximate order in which they appear.

Table 159: show isis interface Output Fields

Field Name	Field Description	Level of Output
interface-name	Name of the interface.	detail
Designated router	Routing device selected by other routers that is responsible for sending link-state advertisements that describe the network. Used only on broadcast networks.	detail
Index	Interface index assigned by the Junos OS kernel.	detail
State	Internal implementation information.	detail
Circuit id	Circuit identifier. NOTE: Each IS-IS interface is assigned a circuit ID value to identify the interface within the linkstate database. All interfaces (loopback, broadcast, and so on) and all point-to-point links share the locally significant value of 0x01, and this value is not incremented.	detail
Circuit type	Circuit type: <ul style="list-style-type: none"> • 1—Level 1 only • 2—Level 2 only • 3—Level 1 and Level 2 	detail
LSP interval	Interval between link-state PDUs sent from the interface.	detail
CSNP interval	Interval between complete sequence number PDUs sent from the interface.	detail extensive
Sysid	System identifier.	detail
Interface	Interface through which the adjacency is made.	none brief
L or Level	Level: <ul style="list-style-type: none"> • 1—Level 1 only • 2—Level 2 only • 3—Level 1 and Level 2 NOTE: The default IS-IS level on loopback interfaces are always same as the IS-IS level configured on other IS-IS interfaces in a router. You can also configure IS-IS level on loopback interfaces per your requirement.	All levels
CirID	Circuit identifier.	none brief

Table 159: show isis interface Output Fields (continued)

Field Name	Field Description	Level of Output
Level 1 DR	Level 1 designated intermediate system.	none brief
Level 2 DR	Level 2 designated intermediate system.	none brief
L1/L2 Metric	Interface's metric for Level 1 and Level 2. If there is no information, the metric is 0.	none brief
Flood-group Area-ID	Flood-group is configured on a specific IS-IS interface NOTE: Seen only when Flood-group is configured.	detail extensive
Adjacency advertisement: Advertise	This routing device has signaled to advertise this interface to its neighbors in their label-switched paths (LSPs).	detail extensive
Adjacency advertisement: Suppress	This neighbor has signaled not to advertise this interface in the routing device's outbound LSPs.	detail extensive
Adjacencies	Number of adjacencies established on this interface.	detail
Priority	Priority value for this interface.	detail
Metric	Metric value for this interface.	detail
Hello(s) / Hello Interval	Interface's hello interval.	detail extensive
Hold(s) / Hold Time	Interface's hold time.	detail extensive
Designated Router	Router responsible for sending network link-state advertisements, which describe all the routing devices attached to the network.	detail
Hello padding	Type of hello padding: <ul style="list-style-type: none"> • Adaptive—On point-to-point connections, the hello packets are padded from the initial detection of a new neighbor until the neighbor verifies the adjacency as Up in the adjacency state TLV. If the neighbor does not support the adjacency state TLV, then padding continues. On LAN connections, padding starts from the initial detection of a new neighbor until there is at least one active adjacency on the interface. • Loose—(Default) The hello packet is padded from the initial detection of a new neighbor until the adjacency transitions to the Up state. • Strict—Padding is performed on all interface types and for all adjacency states, and is continuous. 	extensive
LDP sync state	Current LDP synchronization state: in sync , in holddown , or not supported .	extensive
reason	Reason for being in the LDP sync state.	extensive

Table 159: show isis interface Output Fields (continued)

Field Name	Field Description	Level of Output
config holdtime	Configured value of the hold timer.	extensive
remaining	If the state is not in sync and the hold time is not infinity, then this field displays the remaining hold time in seconds.	extensive
IIH max size	Configured value of IS-IS hello packets	extensive

Sample Output

show isis interface

```
user@host> show isis interface
```

```
IS-IS interface database:
```

Interface	L	CirID	Level 1 DR	Level 2 DR	L1/L2 Metric
at-2/3/0.0	3	0x1	Point to Point	Point to Point	10/10
lo0.0	3	0x1	Passive	Passive	0/0

List of Sample Output	show isis overview on page 2107
Output Fields	Table 160 on page 2105 lists the output fields for the show isis overview command. Output fields are listed in the approximate order in which they appear.

Table 160: show isis overview Output Fields

Field Name	Field Description
Hostname	Name of the router.
Sysid	Part of the ISO address of the routing device.
Areaid	The area number of the routing device.
Instance	IS-IS routing instance.
Router ID	Router ID of the routing device.
Adjacency holddown	Adjacency holddown capability: enabled or disabled .

Table 160: show isis overview Output Fields (continued)

Field Name	Field Description
Maximum Areas	Maximum number of IS-IS areas advertised by the routing device.
LSP life time	Lifetime of the link-state PDU, in seconds.
Filter low life time LSPs up to	LSPs with a lifetime lower than this value are filtered out.
Attached bit evaluation	Attached bit capability: enabled or disabled .
SPF delay	Delay before performing consecutive shortest-path-first (SPF) calculations.
SPF holddown	Delay before performing additional SPF calculations after the maximum number of consecutive SPF calculations is reached.
SPF rapid runs	Maximum number of SPF calculations that can be performed in succession before the holddown timer begins.
Overload bit at startup is set	Overload bit capability is enabled.
Overload high metrics	Overload high metrics capability: enabled or disabled .
Allow internal prefix overloading	Allow internal prefixes to be advertised with high metric: enabled or disabled
Allow external prefix overloading	Allow external prefixes to be advertised with high metric: enabled or disabled
Overload timeout	Time period after which overload is reset and the time that remains before the timer is set to expire.
Traffic engineering	Traffic engineering capability: enabled or disabled .
Restart	Graceful restart capability: enabled or disabled .
Restart duration	Time period for complete reacquisition of IS-IS neighbors.
Helper mode	Graceful restart helper capability: enabled or disabled .
Level	IS-IS level: <ul style="list-style-type: none"> • 1—Level 1 information • 2—Level 2 information
IPv4 is enabled	IP Protocol version 4 capability is enabled.
IPv6 is enabled	IP Protocol version 6 capability is enabled.

Table 160: show isis overview Output Fields (continued)

Field Name	Field Description
Micro-loop avoidance	Micro-loop avoidance is enabled. Generally adjacent nodes converge faster than neighboring nodes causing traffic to loop. A route convergence delay is configured to avoid such micro loops.
Internal route preference	Preference value of internal routes.
External route preference	Preference value of external routes.
Prefix export limit	Number of prefixes allowed to be exported, as configured by the prefix-export-limit statement.
Prefix export count	Number of prefixes exported.
Wide area metrics are enabled	Wide area metrics capability is enabled.
Narrow metrics are enabled	Narrow metrics capability is enabled.
Adjacency holddown is active	IS-IS adjacencies come up one after another when adjacency holddown is enabled.

Sample Output

show isis overview

show isis route

List of Syntax [Syntax on page 2110](#)
[Syntax \(EX Series Switches and QFX Series\) on page 2110](#)

Syntax

```
show isis route
<destination>
[inet | inet6]
[instance instance-name]
[logical-system (all | logical-system-name)]
[topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)]
```

Syntax (EX Series Switches and QFX Series)

```
show isis route
<destination>
[inet | inet6]
[instance instance-name]
[topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)]
```

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Command introduced in Junos OS Release 12.1 for the QFX Series.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Display the routes in the IS-IS routing table.

Options **none**—Display all routes in the IS-IS routing table for all supported address families for all routing instances.

destination—(Optional) Destination address for the route.

inet | inet6—(Optional) Display inet (IPv4) or inet6 (IPv6) routes, respectively.

instance *instance-name*—(Optional) Display routes for the specified routing instance only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

topology (ipv4-multicast | ipv6-multicast | ipv6-unicast | unicast)—(Optional) Display routes for the specified topology only, or use unicast to display information, if available, for both IPv4 and IPv6 unicast topologies.

Output Fields [Table 161 on page 2111](#) describes the output fields for the **show isis route** command. Output fields are listed in the approximate order in which they appear.

Table 161: show isis route Output Fields

Field Name	Field Description
Current version	Number of the current version of the IS-IS routing table.
L1	Version of Level 1 SPF that was run.
L2	Version of Level 2 SPF that was run.
Prefix or Label	Destination of the route.
L	IS-IS level: <ul style="list-style-type: none"> • 1—Level 1 only • 2—Level 2 only • 3—Level 1 and Level 2
Version	Version of SPF that generated the route.
Metric	Metric value associated with the route.
Type	Metric type: int (internal) or ext (external).
Interface	Interface to the next hop.
Via	System identifier of the next hop, displayed as a name if possible.
ISO Routes	ISO routing table entries.
snpa	MAC address.

show isis spf

List of Syntax	Syntax on page 2115 Syntax (EX Series Switches) on page 2115
Syntax	<pre>show isis spf (brief log results) <instance <i>instance-name</i>> <level (1 2)> <logical-system (all <i>logical-system-name</i>)> <topology (ipv4-multicast ipv6-multicast ipv6-unicast unicast)></pre>
Syntax (EX Series Switches)	<pre>show isis spf (brief log results) <instance <i>instance-name</i>> <level (1 2)> <topology (ipv4-multicast ipv6-multicast ipv6-unicast unicast)></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p>
Description	Display information about IS-IS shortest-path-first (SPF) calculations.
Options	<p>brief—Display an overview of SPF calculations.</p> <p>log—Display the log of SPF calculations.</p> <p>results—Display the results of SPF calculations.</p> <p>instance <i>instance-name</i>—(Optional) Display SPF calculations for the specified routing instance.</p> <p>level (1 2)—(Optional) Display SPF calculations for the specified IS-IS level.</p> <p>log—Display the log of SPF calculations.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>results—Display the results of SPF calculations.</p> <p>topology (ipv4-multicast ipv6-multicast ipv6-unicast unicast)—(Optional) Display SPF calculations for the specified topology only.</p>
Required Privilege Level	view
List of Sample Output	show isis spf log on page 2116 show isis spf results logical-system on page 2117 show isis spf results (CLNS) on page 2118

Output Fields Table 162 on page 2116 describes the output fields for the **show isis spf** command. Output fields are listed in the approximate order in which they appear.

Table 162: show isis spf Output Fields

Field Name	Field Description
Node	System ID of a node.
Metric	Metric to the node.
Interface	Interface of the next hop.
Via	System ID of the next hop.
SNPA	Subnetwork point of attachment (MAC address of the next hop).
Start time	(log option only) Time that the SPF computation started.
Elapsed (secs)	(log option only) Length of time, in seconds, required to complete the SPF computation.
Count	(log option only) Number of times the SPF was triggered.
Reason	(log option only) Reason that the SPF computation was completed.

Sample Output

show isis spf log

```
user@host> show isis spf log logical-system lsl
```

```
IS-IS level 1 SPF log:

show isis statistics

List of Syntax	Syntax on page 2120 Syntax (EX Series Switches and QFX Series) on page 2120
Syntax	<pre>show isis statistics <instance <i>instance-name</i>> <logical-system (all <i>logical-system-name</i>)></pre>
Syntax (EX Series Switches and QFX Series)	<pre>show isis statistics <instance <i>instance-name</i>></pre>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 12.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display statistics about IS-IS traffic.
Options	none —Display IS-IS traffic statistics for all routing instances. instance <i>instance-name</i> —(Optional) Display statistics for the specified routing instance. logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• clear isis statistics on page 2064
List of Sample Output	show isis statistics on page 2122
Output Fields	Table 163 on page 2121 describes the output fields for the show isis statistics command. Output fields are listed in the approximate order in which they appear.

Table 163: show isis statistics Output Fields

Field Name	Field Description
PDU type	<p>PDU type:</p> <ul style="list-style-type: none"> • CSNP—Complete sequence number PDUs contain a complete list of all link-state PDUs in the IS-IS database. CSNPs are sent periodically on all links, and the receiving systems use the information in the CSNP to update and synchronize their link-state PDU databases. The designated router multicasts CSNPs on broadcast links in place of sending explicit acknowledgments for each link-state PDU. • IIH—IS-IS hello packets are broadcast to discover the identity of neighboring IS-IS systems and to determine whether the neighbors are Level 1 or Level 2 intermediate systems. • LSP—Link-state PDUs contain information about the state of adjacencies to neighboring IS-IS systems. Link-state PDUs are flooded periodically throughout an area. • PSNP—Partial sequence number PDUs are sent multicast by a receiver when it detects that it is missing a link-state PDU (when its link-state PDU database is out of date). The receiver sends a PSNP to the system that transmitted the CSNP, effectively requesting that the missing link-state PDU be transmitted. That routing device, in turn, forwards the missing link-state PDU to the requesting routing device. • Unknown—The PDU type is unknown.
Received	Number of PDUs received since IS-IS started or since the statistics were set to zero.
Processed	Number of PDUs received less the number dropped.
Drops	Number of PDUs dropped.
Sent	Number of PDUs transmitted since IS-IS started or since the statistics were set to zero.
Rexmit	Number of PDUs retransmitted since IS-IS started or since the statistics were set to zero.
Total packets received/sent	Total number of PDUs received and transmitted since IS-IS started or since the statistics were set to zero.
SNP queue length	Number of CSPN and PSNP packets currently waiting in the queue for processing. This value is almost always 0.
LSP queue length	Number of link-state PDUs waiting in the queue for processing. This value is almost always 0.
SPF runs	Number of shortest-path-first (SPF) calculations that have been performed. If this number is incrementing rapidly, it indicates that the network is unstable.
Fragments rebuilt	Number of link-state PDU fragments that the local system has computed.
LSP regenerations	Number of link-state PDUs that have been regenerated. A link-state PDU is regenerated when it is nearing the end of its lifetime and it has not changed.
Purges initiated	Number of purges that the system initiated. A purge is initiated if the software decides that a link-state PDU must be removed from the network.

Sample Output

LLDP Operational Commands

- `clear lldp neighbors`
- `clear lldp statistics`
- `show lldp`
- `show lldp local-information`
- `show lldp neighbors`
- `show lldp remote-global-statistics`
- `show lldp statistics`

clear lldp neighbors

Syntax	<code>clear lldp neighbor</code> <code><interface <i>interface-name</i>></code>
Release Information	Command introduced in Junos OS Release 9.6.
Description	<p>Clear information regarding all Link Layer Discovery Protocol (LLDP) neighbors or LLDP neighbors of the specified interface.</p> <p>For information about interface names, see “Interface Naming Overview” on page 33. For information about interface names for TX Matrix routers, see <i>TX Matrix Router Chassis and Interface Names</i>. For information about FPC numbering on TX Matrix routers, see <i>Routing Matrix with a TX Matrix Router FPC Numbering</i>.</p> <p>For information about interface names in the Junos Fusion technology, see <i>Understanding Junos Fusion Ports</i>.</p>
Options	<code>interface <i>interface-name</i></code> —(Optional) Clear the LLDP neighbors on the specified interface.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• clear lldp statistics on page 2125
List of Sample Output	clear lldp neighbors on page 2124 clear lldp neighbors interface ge-0/1/1.0 on page 2124
Output Fields	When you enter this command, you are provided no feedback on the status of your request. You can enter the show lldp neighbors command before and after clearing the LLDP neighbors to verify the clear operation.

Sample Output

clear lldp neighbors

```
user@switch> clear lldp neighbors
```

clear lldp neighbors interface ge-0/1/1.0

```
user@switch> clear lldp neighbors interface ge-0/1/1.0
```

clear lldp statistics

Syntax	<code>clear lldpp neighbor <interface <i>interface-name</i>></code>
Release Information	Command introduced in Junos OS Release 9.6.
Description	<p>Clear all Link Layer Discovery Protocols (LLDP) statistics or LLDP statistics associated with the specified interface.</p> <p>For information about interface names, see “Interface Naming Overview” on page 33. For information about interface names for TX Matrix routers, see <i>TX Matrix Router Chassis and Interface Names</i>. For information about FPC numbering on TX Matrix routers, see <i>Routing Matrix with a TX Matrix Router FPC Numbering</i>.</p> <p>For information about interface names in the Junos Fusion technology, see <i>Understanding Junos Fusion Ports</i>.</p>
Options	<code>interface <i>interface-name</i></code> —(Optional) Clear LLDP statistics on the specified interface.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none"> clear lldp neighbors on page 2124
List of Sample Output	clear lldp statistics on page 2125 clear lldp statistics interface ge-0/1/1.0 on page 2125
Output Fields	When you enter this command, you are provided no feedback on the status of your request. You can enter the show lldp statistics command before and after clearing the LLDP statistics to verify the clear operation.

Sample Output

clear lldp statistics

```
user@switch> clear lldp statistics
```

clear lldp statistics interface ge-0/1/1.0

```
user@switch> clear lldp statistics interface ge-0/1/1.0
```

show lldp

Syntax	<code>show lldp</code> <code><detail></code>
Release Information	Command introduced in Junos OS Release 9.6.
Description	Display information about the Link Layer Discovery Protocol (LLDP).
Options	detail —(Optional) Display the detailed output level.
Required Privilege Level	view
List of Sample Output	show lldp on page 2128 show lldp detail on page 2128
Output Fields	Table 164 on page 2126 describes the output fields for the show lldp command. Output fields are listed in the approximate order in which they appear.

Table 164: show lldp Output Fields

Field Name	Field Description
LLDP	Status of LLDP: Enabled or Disabled .
Advertisement interval	Value of the advertisement interval parameter.
Transmit delay	Value of the transmit delay parameter.
Hold timer	Value of the hold timer parameter.
Notification interval	Value of the notification interval parameter.
Config Trap Interval	Value of the configuration trap parameter.
Connection Hold timer	Value of the connection hold timer parameter.
Port ID TLV subtype	<ul style="list-style-type: none"> <i>interface-name</i>—Indicates the interface name as the port information for the local device. <i>locally-assigned</i>—Indicates that the sub-type for port ID TLV generation is locally assigned value of SNMP index of the interface. <p>For more information about port ID TLV subtype, see <i>port-id-subtype</i>..</p>

Table 164: show lldp Output Fields (continued)

Field Name	Field Description
Port Description TLV type	<p>Following value used for port description TLV:</p> <ul style="list-style-type: none"> interface-alias (ifAlias)—Indicates that the <i>ifAlias</i> MIB object value is used to generate the port description TLV. interface-description (ifDescr)—Indicates that the <i>ifDescr</i> MIB object value is used to generate the port description TLV. <p>For more information about port description TLV type, see <i>port-description-type</i>.</p>
Interface	<p>Name of the interface for which LLDP configuration information is being reported</p> <p>For information about interface names, see "Interface Naming Overview" on page 33. For information about interface names for TX Matrix routers, see <i>TX Matrix Router Chassis and Interface Names</i>. For information about FPC numbering on TX Matrix routers, see <i>Routing Matrix with a TX Matrix Router FPC Numbering</i>.</p>
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the interface belongs.
LLDP	LLDP operating state. The state can be Enabled or Disabled.
LLDP-MED	LLDP-MED operating state. The state can be Enabled or Disabled.
Power Negotiation	LLDP power negotiation operating state. The state can be Enabled or Disabled.
LLDP basic TLVs supported	List of basic LLDP TLVs supported by this device (detail only).
LLDP 802 TLVs supported	List of IEEE 802.1 LLDP TLVs supported by this device (detail only).

Sample Output

show lldp

Port Description TLV type : interface-description (ifDescr)
```

Interface	Parent Interface	LLDP	LLDP-MED	Power Negotiation
Neighbor count				
all	-	Enabled		
2				

Interface	Parent Interface	Vlan-id	Vlan-name
xe-0/0/0	-	4080	vlan-4080
xe-0/0/1	-	4080	vlan-4080

Basic Management TLVs supported:

End Of LLDPDU, Chassis ID, Port ID, Time To Live, Port Description, System Name, System Description, System Capabilities, Management Address

Organizationally Specific TLVs supported:

Port VLAN tag, VLAN Name, MAC/PHY Configuration/Status, Link Aggregation, Maximum Frame Size

show lldp local-information

Syntax	show lldp local-information
Release Information	Command introduced in Junos OS Release 9.6.
Description	Display local Link Layer Discovery Protocol (LLDP) information.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show lldp local-information(Management Information Address Subtype is IPv4) on page 2131 show lldp local-information(Management Information Address Subtype is IPv6) on page 2131
Output Fields	Table 165 on page 2129 describes the output fields for the show lldp local-information command. Output fields are listed in the approximate order in which they appear.

Table 165: show lldp local-information Output Fields

Field Name	Field Description
LLDP Local Information details	Information that follows pertains to the local system.
Chassis ID	List of chassis identifiers for local information.
System name	Local system name reported by LLDP.
System descr	Local system description reported by LLDP.
System Capabilities	Capabilities (such as Bridge or Router) that are Supported or Enabled by system on the interface.
Management Information	Listed by Interface Name , Address Subtype (such as ipv4 , ipv6), Address (such as 192.168.168.229 , 1fd::1a10), Interface Number , and Interface Numbering Subtype .
Interface Name	List of local interfaces. For information about interface names, see "Interface Naming Overview" on page 33 . For information about interface names for TX Matrix routers, see <i>TX Matrix Router Chassis and Interface Names</i> . For information about FPC numbering on TX Matrix routers, see <i>Routing Matrix with a TX Matrix Router FPC Numbering</i> .
Parent Interface	Name of the ae interface to which the interface belongs

Table 165: show lldp local-information Output Fields (continued)

Field Name	Field Description
Interface ID	List of local interface identifiers.
Interface Description	List of local interface descriptions.
Status	List of interface conditions: UP or DOWN .

Sample Output

show lldp local-information(Management Information Address Subtype is IPv4)

```

user@host> show lldp local-information

LLDP Local Information details

Chassis ID   : 64:87:88:65:37:c0
System name  : apg-hp1
System descr : Juniper Networks, Inc. mx240 , version 14.1I20131231_0701_builder
[builder] Build date: 2013-12-31 07:13:42 UTC

System Capabilities
  Supported      : Bridge Router
  Enabled        : Bridge Router

Management Information
  Interface Name : Unknown
  Address Subtype : IPv4(1)
  Address        : 10.216.97.103

```

show lldp neighbors

Syntax `show lldp neighbors`
`<interface interface-name>`

Release Information Command introduced in Junos OS Release 9.6.

Description Display information about LLDP neighbors.

For information about interface names, see [“Interface Naming Overview” on page 33](#). For information about interface names for TX Matrix routers, see *TX Matrix Router Chassis and Interface Names*. For information about FPC numbering on TX Matrix routers, see *Routing Matrix with a TX Matrix Router FPC Numbering*.

For information about extended port names in the Junos Fusion technology, see *Understanding Junos Fusion Ports*.

Options `interface interface-name`—(Optional) Display the neighbor information about a particular physical interface.

NOTE: Starting with Junos OS Release 14.2, you can also display LLDP neighbor details for management interfaces, such as fxp or me, on MX Series routers.

Required Privilege Level view

Output Fields [Table 166 on page 2132](#) describes the output fields for the **show lldp neighbors** command. Output fields are listed in the approximate order in which they appear.

Table 166: show lldp neighbors Output Fields

Field Name	Field Description
LLDP Remote Devices Information	Information about remote devices.

Table 166: show lldp neighbors Output Fields (continued)

Field Name	Field Description
LocalInterface	List of local interfaces for which neighbor information is available.
ChassisId	List of chassis identifiers for neighbors.
PortInfo	List of port information gathered from neighbors. This could be the port identifier or port description.
SysName	List of system names gathered from neighbors.
LLDP Neighbor Information	Information about both local and neighbor systems on the interface (appears when the interface option is used).
Local Information	Information about local systems on the interface (appears when the interface option is used).
Neighbor Information	Information about both local and neighbor system on the interface (appears when the interface option is used).
Index	Local interface index (appears when the interface option is used).
Time Mark	Date and timestamp of information (appears when the interface option is used).
Time To Live	Number of seconds for which this information is valid (appears when the interface option is used).
Local Interface	Name of the local physical interface (appears when the interface option is used).
Parent Interface	Name of the ae interface to which the interface belongs
Local Port ID	Local port identifier (appears when the interface option is used).
Neighbor Information	Information about neighbor systems on the interface (appears when the interface option is used).
Chassis type	Type of chassis identifier supplied, such as MAC address (appears when the interface option is used).
Chassis ID	Chassis identifier of type listed (appears when the interface option is used).
Port type	Type of port identifier supplied, such as local (appears when the interface option is used).
Port ID	Port identifier of type listed (appears when the interface option is used).
Port description	Port description (appears when the interface option is used).

Table 166: show lldp neighbors Output Fields (continued)

Field Name	Field Description
System name	Name supplied by the system on the interface (appears when the interface option is used).
System Description	Description supplied by the system on the interface (appears when the interface option is used).
System Capabilities	Capabilities (such as bridge or router) that are Supported or Enabled by the system on the interface (appears when the interface option is used).
Management address	Details of the management address: Address Type (such as ipv4 and ipv6), Address (such as 10.204.34.35 , 1fd::1a10), Interface Number , Interface Subtype , and Organization Identifier (OID) (appears when the interface option is used).
Organization Info	One or more entries listing remote information by Organizationally Unique Identifier (OUI), Subtype , Index , and Info (appears when the interface option is used).

Sample Output

show lldp neighbors

```
user@host> show lldp neighbors
```

Local Interface	Parent Interface	Chassis Id	Port info	System Name
ge-2/0/0	ae0	ac:4b:c8:92:67:c0	528	apg-hp

show lldp remote-global-statistics

Syntax	show lldp remote-global-statistics
Release Information	Command introduced in Junos OS Release 9.6.
Description	Display remote Link Layer Discovery Protocol (LLDP) global statistics.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show lldp remote-global-statistics on page 2139
Output Fields	Table 167 on page 2138 describes the output fields for the show lldp remote-global-statistics command. Output fields are listed in the approximate order in which they appear.

Table 167: show lldp remote-global-statistics Output Fields

Field Name	Field Description
LLDP Remote Database Table Counters	Information about remote database table counters.
LastchangeTime	Time elapsed between LLDP agent startup and the last change to the remote database table information.
Inserts	Number of insertions made in the remote database table.
Deletes	Number of deletions made in the remote database table.
Drops	Number of LLDP frames dropped from the remote database table because of errors.
Ageouts	Number of remote database table entries that have aged out of the table.

Sample Output

show lldp remote-global-statistics

```
user@host> show lldp remote-global-statistics
```

```
user@host> show lldp remote-global-statistics
```

```
LLDP Remote Database Table Counters
```

LastchangeTime	Inserts	Deletes	Drops	Ageouts
00:00:76 (76 sec)	192	0	0	0

show lldp statistics

Syntax `show lldp statistics`
`<interface interface-name>`

Release Information Command introduced in Junos OS Release 9.6.

Description Display information about Link Layer Discovery Protocol (LLDP) statistics.

Options `interface interface-name`—(Optional) Display the statistics about a particular physical interface.

NOTE: Starting with Junos OS Release 14.2, you can also display LLDP statistical details for management interfaces, such as `fxp` or `me`, on MX Series routers.

Required Privilege Level view

Related Documentation • [clear lldp statistics on page 2125](#)

CHAPTER 23

MVRP Operational Commands

- `show mvrp`
- `show mvrp applicant-state`
- `show mvrp dynamic-vlan-memberships`
- `show mvrp interface`
- `show mvrp registration-state`
- `show mvrp statistics`

show mvrp

Syntax	show mvrp
Release Information	<p>Command introduced in Junos OS Release 10.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 10.1 for MX Series routers.</p> <p>Command introduced in Junos OS Release 13.2X50-D10 for EX Series switches.</p> <p>Command introduced in Junos OS Release 15.1X49-D70 for SRX Series devices.</p>
Description	Display Multiple VLAN Registration Protocol (MVRP) configuration information.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • <i>Example: Configuring Automatic VLAN Administration Using MVRP on EX Series Switches</i> • <i>Verifying That MVRP Is Working Correctly on Switches</i> • show mvrp statistics on page 2156 • show mvrp applicant-state on page 2147 • show mvrp dynamic-vlan-memberships on page 2150 • show mvrp interface on page 2152 • show mvrp registration-state on page 2154 • show mvrp statistics on page 2156 • show mvrp applicant-state on page 2147 • show mvrp dynamic-vlan-memberships on page 2150 • show mvrp interface on page 2152 • show mvrp registration-state on page 2154
List of Sample Output	<p>show mvrp (EX Series switches and MX Series routers) on page 2145</p> <p>show mvrp (SRX1500, SRX300, SRX550M, SRX345, SRX340 and SRX320) on page 2145</p> <p>show mvrp (EX Series switches) on page 2146</p>
Output Fields	Table 169 on page 2144 lists the output fields for the show mvrp command. Output fields are listed in the approximate order in which they appear.

Table 169: show mvrp Output Fields

Field Name	Field Description
MVRPdynamic VLAN creation	Displays whether global MVRP dynamic VLAN creation is Enabled or Disabled .

Table 169: show mvrp Output Fields (continued)

Field Name	Field Description
Global MVRP configuration	Displays global MVRP information: <ul style="list-style-type: none"> • MVRP status—Displays whether MVRP is Enabled or Disabled. • MVRP dynamic vlan creation—Displays whether global MVRP dynamic VLAN creation is Enabled or Disabled.
MVRP BPDU MAC address	Displays the multicast media access control (MAC) address for MVRP. If configured, the provider MVRP multicast MAC address is used; otherwise, the customer MVRP multicast MAC address is used.
MVRP timers (ms)	Displays MVRP timer information: <ul style="list-style-type: none"> • Interface—The interface on which MVRP is configured. • Join—The maximum number of milliseconds the interfaces must wait before sending VLAN advertisements. • Leave—The number of milliseconds an interface must wait after receiving a Leave message to remove the interface from the VLAN specified in the message. • LeaveAll—The interval at which LeaveAll messages are sent on interfaces. LeaveAll messages maintain current MVRP VLAN membership information in the network.
Interface based configuration	Displays interface-specific MVRP information: <ul style="list-style-type: none"> • Interface—The interface on which MVRP is configured. • Status—Displays whether MVRP is Enabled or Disabled. • Registration—Displays whether registration for the interface is Forbidden or Normal. • Dynamic VLAN Creation—Displays whether interface dynamic VLAN creation is Enabled or Disabled.

Sample Output

show mvrp (EX Series switches and MX Series routers)

```

user@host> show mvrp

MVRP configuration for routing instance 'default-switch'
MVRP dynamic VLAN creation : Enabled
MVRP BPDU MAC address      : Customer bridge group (01-80-C2-00-00-21)
MVRP timers (ms)
  Interface  Join   Leave  LeaveAll
  ge-11/2/8   200    800    10000

```

Sample Output

show mvrp (SRX1500, SRX300, SRX550M, SRX345, SRX340 and SRX320)

```

user@host> show mvrp

MVRP configuration for routing instance 'default-switch'
MVRP dynamic VLAN creation : Enabled
MVRP BPDU MAC address      : Customer bridge group (00-00-5E-00-53-00)
MVRP timers (ms)

```

Interface	Join	Leave	LeaveAll
ge-0/0/1	200	800	60

Sample Output

show mvrp (EX Series switches)

```
user@switch> show mvrp
```

Global MVRP configuration

MVRP status : Enabled

MVRP dynamic vlan creation: Enabled

MVRP Timers (ms):

Interface	Join	Leave	LeaveAll
all	200	600	10000
xe-0/1/1.0	200	600	10000

Interface based configuration:

Interface	Status	Registration	Dynamic VLAN Creation
all	Disabled	Normal	Enabled
xe-0/1/1.0	Enabled	Normal	Enabled

show mvrp applicant-state

Syntax	show mvrp applicant-state
Release Information	Command introduced in Junos OS Release 10.1. Command introduced in Junos OS Release 15.1X49-D70 for SRX Series devices.
Description	For MX Series routers, EX Series switches, SRX1500, SRX300, SRX550M, SRX345, SRX340, and SRX320, display Multiple VLAN Registration Protocol (MVRP) applicant state information.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• show mvrp on page 2144• show mvrp interface on page 2152• show mvrp registration-state on page 2154• show mvrp statistics on page 2156• show mvrp interface on page 2152• show mvrp registration-state on page 2154

show mvrp dynamic-vlan-memberships

Syntax	<code>show mvrp dynamic-vlan-memberships</code>
Release Information	<p>Command introduced in Junos OS Release 10.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 10.1 for MX Series routers.</p> <p>Command introduced in Junos OS Release 13.2X50-D10 for EX Series switches.</p> <p>Command introduced in Junos OS Release 15.1X49-D70 for SRX Series devices.</p>
Description	Display all VLANs that have been created dynamically using Multiple VLAN Registration Protocol (MVRP) on the router, switch, or SRX Series device.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none"> • <i>Example: Configuring Automatic VLAN Administration Using MVRP on EX Series Switches</i> • <i>Verifying That MVRP Is Working Correctly on Switches</i> • show mvrp on page 2144 • show mvrp applicant-state on page 2147 • show mvrp interface on page 2152 • show mvrp registration-state on page 2154 • show mvrp registration-state on page 2154 • show mvrp statistics on page 2156
List of Sample Output	<p>show mvrp dynamic-vlan-memberships (MX Series and EX Series) on page 2151</p> <p>show mvrp dynamic-vlan-memberships (EX Series) on page 2151</p> <p>show mvrp dynamic-vlan-memberships on page 2151</p>
Output Fields	Table 171 on page 2150 lists the output fields for the <code>show mvrp dynamic-vlan-memberships</code> command on MX Series routers and EX Series switches. Output fields are listed in the approximate order in which they appear.

Table 171: show mvrp dynamic-vlan-memberships Output Fields

Field Name	Field Description
VLAN Id	The VLAN ID of the dynamically created VLAN.
Interfaces	The interface or interfaces that are bound to the dynamically created VLAN.

Sample Output (MX Series Routers and EX Series Switches)

show mvrp dynamic-vlan-memberships (MX Series and EX Series)

```
user@host> show mvrp dynamic-vlan-memberships

MVRP dynamic vlans for routing instance 'default-switch'
(s) static vlan, (f) fixed registration

VLAN Id      Interfaces
  100 (s)    ge-11/3/0
  200 (s)    ge-11/3/0
  300 (s)
```

Sample Output (EX Series Switches)

show mvrp dynamic-vlan-memberships (EX Series)

```
user@switch> show mvrp dynamic-vlan-memberships

VLAN Name      Interfaces
-----
__mvrp_100__    xe-0/1/1.0
                 xe-0/1/0.0
__mvrp_200__    xe-0/1/1.0
                 xe-0/1/0.0
__mvrp_300__    xe-0/1/1.0
```

Sample Output (SRX1500, SRX300, SRX550M, SRX345, SRX340, SRX320)

show mvrp dynamic-vlan-memberships

```
user@host> show mvrp dynamic-vlan-memberships

MVRP dynamic vlans for routing instance 'default-switch'
(s) static vlan, (f) fixed registration

VLAN Id      Interfaces
  1  (s)
 30  (s)
 40  (s)    ge-0/0/1
 50  (s)    ge-0/0/1
100  (s)    ge-0/0/1 (f)
```

show mvrp interface

Syntax	show mvrp interface
Release Information	Command introduced in Junos OS Release 10.1. Command introduced in Junos OS Release 15.1X49-D70 for SRX Series devices.
Description	Display Multiple VLAN Registration Protocol (MVRP) interface-specific information.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show mvrp on page 2144 • show mvrp applicant-state on page 2147 • show mvrp dynamic-vlan-memberships on page 2150 • show mvrp registration-state on page 2154 • show mvrp registration-state on page 2154 • show mvrp statistics on page 2156
List of Sample Output	show mvrp interface on page 2152 show mvrp interface on page 2153
Output Fields	Table 172 on page 2152 lists the output fields for the show mvrp interface command. Output fields are listed in the approximate order in which they appear.

Table 172: show mvrp interface Output Fields

Field Name	Field Description
Interface	Interface on which MVRP is configured.
Status	Status of the MVRP: Enabled or Disabled .
Registration Mode	Registration for the interface: Fixed , Forbidden , or Normal .
Applicant Mode	Applicant mode.

Sample Output (MX Series Routers and SX Series Switches)

show mvrp interface

```
user@host> show mvrp interface
MVRP interface information for routing instance 'default-switch'
```

Interface	Status	Registration Mode	Applicant Mode
ge-11/2/8	Enabled	Normal	Normal
ge-11/0/9	Enabled	Normal	Normal
ge-11/3/0	Enabled	Normal	Normal

Sample Output (SRX1500, SRX300, SRX550M, SRX345, SRX340 and SRX320)

show mvrp interface

```
user@host> show mvrp interface
```

MVRP interface information for routing instance 'default-switch'

Interface	Status Mode	Registration Mode	Applicant Mode
ge-0/0/1	Enabled	Normal	Normal

show mvrp registration-state

Syntax	show mvrp registration-state
Release Information	Command introduced in Junos OS Release 10.1. Command introduced in Junos OS Release 15.1X49-D70 for SRX Series devices.
Description	For MX Series routers, EX Series switches and SRX1500, SRX300, SRX550M, SRX345, SRX340 and SRX320, display Multiple VLAN Registration Protocol (MVRP) registration state information.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> • show mvrp on page 2144 • show mvrp dynamic-vlan-memberships on page 2150 • show mvrp interface on page 2152 • show mvrp statistics on page 2156
List of Sample Output	show mvrp registration-state (EX Series and MX Series) on page 2155 show mvrp registration-state (SRX1500, SRX300, SRX550M, SRX345, SRX340 and SRX320) on page 2155
Output Fields	Table 173 on page 2154 lists the output fields for the show mvrp registration-state command. Output fields are listed in the approximate order in which they appear.

Table 173: show mvrp registration-state Output Fields

Field Name	Field Description
VLAN Id	Displays the VLAN ID number.
Interface	Displays the interface number associated with the VLAN ID.
Registrar State	Displays whether the registrar state is Registered or Empty.
Forced State	Displays whether the forced state is Registered or Empty.
Managed State	Displays one of the following states: <ul style="list-style-type: none"> • fixed—VLANs always stay in a registered state and are declared as such on all other forwarding ports. • normal —VLANs participate in the MVRP protocol and honor incoming join requests normally. • forbidden —VLANs ignore the incoming join requests and always stay in an unregistered state.
STP State	Displays whether the Spanning Tree Protocol (STP) is Blocking or Forwarding.

Sample Output

show mvrp registration-state (EX Series and MX Series)

```
user@host> show mvrp registration-state
```

MVRP registration state for routing instance 'default-switch'

VLAN Id	Interface	Registrar State	Forced State	Managed State	STP State
100	ge-11/2/8	Empty	Registered	Fixed	Forwarding
	ge-11/0/9	Empty	Empty	Normal	Forwarding
	ge-11/3/0	Registered	Registered	Normal	Forwarding
101	ge-11/2/8	Empty	Registered	Fixed	Forwarding
	ge-11/0/9	Empty	Empty	Normal	Forwarding
	ge-11/3/0	Registered	Registered	Normal	Forwarding

Sample Output

show mvrp registration-state (SRX1500, SRX300, SRX550M, SRX345, SRX340 and SRX320)

```
user@host> show mvrp registration-state
```

MVRP registration state for routing instance 'default-switch'

VLAN Id	Interface	Registrar State	Forced State	Managed State	STP State
1	ge-0/0/1	Empty	Empty	Normal	Forwarding
30	ge-0/0/1	Empty	Empty	Normal	Forwarding
40	ge-0/0/1	Registered	Registered	Normal	Forwarding
50	ge-0/0/1	Registered	Registered	Normal	Forwarding
100	ge-0/0/1	Empty	Registered	Fixed	Forwarding

show mvrp statistics

List of Syntax	Syntax (EX Series Switches) on page 2156 Syntax (Switches with ELS Support) on page 2156 Syntax (SRX Devices) on page 2156
Syntax (EX Series Switches)	<pre>show mvrp statistics <interface <i>interface-name</i>></pre>
Syntax (Switches with ELS Support)	<pre>show mvrp statistics <interface <i>interface-name</i>> <routing-instance <i>routing-instance-name</i>></pre>
Syntax (SRX Devices)	<pre>show mvrp statistics</pre>
Release Information	Command introduced in Junos OS Release 10.0 for EX Series switches. Command introduced in Junos OS Release 13.2X50-D10 (ELS). Command introduced in Junos OS Release 15.1X49-D70 for SRX Series devices.
Description	Display Multiple VLAN Registration Protocol (MVRP) statistics in the form of Multiple Registration Protocol data unit (MRPDU) messages.
Options	none —Show MVRP statistics for all interfaces on the switch. interface <i>interface-name</i> —(Optional) Show MVRP statistics for the specified interface.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• show mvrp on page 2144• <i>clear mvrp statistics</i>• <i>Example: Configuring Automatic VLAN Administration Using MVRP on EX Series Switches</i>• <i>Verifying That MVRP Is Working Correctly on Switches</i>• <i>Verifying That MVRP Is Working Correctly on EX Series Switches with ELS Support</i>
List of Sample Output	show mvrp statistics interface xe-0/1/1.0 on page 2159 show mvrp statistics on page 2159 show mvrp statistics (SRX Devices) on page 2159
Output Fields	Table 171 on page 2150 lists the output fields for the show mvrp statistics command on EX Series switches. Output fields are listed in the approximate order in which they appear.

Table 174: show mvrp statistics Output Fields

Field Name	Field Description
MRPDU received	Number of MRPDU messages received on the switch.
Invalid PDU received	Number of invalid MRPDU messages received on the switch.
New received	Number of new messages received on the switch.
Join Empty received	Number of MRP JoinEmpty messages received on the switch. Either this value or the value for <i>JoinIn received</i> should increase when the value for <i>MRPDU received</i> increases. If this value is not incrementing when it should, you might have a Junos OS release version compatibility issue. To fix a version compatibility issue, see <i>Configuring Multiple VLAN Registration Protocol (MVRP) on Switches</i> .
Join In received	Number of MRP JoinIn messages received on the switch. Either this value or the value for <i>JoinEmpty received</i> should increase when the value for <i>MRPDU received</i> increases. If this value is not incrementing when it should, you might have a Junos OS release version compatibility issue. To fix a version compatibility issue, see <i>Configuring Multiple VLAN Registration Protocol (MVRP) on Switches</i> .
Empty received	Number of MRP Empty messages received on the switch.
In received	Number of MRP In messages received on the switch.
Leave received	Number of MRP Leave messages received on the switch.
LeaveAll received	Number of LeaveAll messages received on the switch.
MRPDU transmitted	Number of MRPDU messages transmitted from the switch.
MRPDU transmit failures	Number of MRPDU transmit failures from the switch.
New transmitted	Number of new messages transmitted from the switch.
Join Empty transmitted	Number of JoinEmpty messages sent from the switch.
Join In transmitted	Number of MRP JoinIn messages sent from the switch.
Empty transmitted	Number of MRP Empty messages sent from the switch.
In transmitted	Number of MRP In messages sent from the switch.
Leave transmitted	Number of MRP Leave Empty messages sent from the switch.
LeaveAll transmitted	Number of MRP LeaveAll messages sent from the switch.

Table 175 on page 2158 lists the output fields for the **show mvrp statistics** command on SRX devices. Output fields are listed in the approximate order in which they appear.

Table 175: show mvrp statistics Output Fields

Field Name	Field Description
Interface name	Interface for which MVRP statistics are displayed.
VLAN IDs registered	Number of Virtual LAN (VLAN) IDs registered.
Sent MVRP PDUs	Number of MRPDU messages transmitted from the switch.
Received MVRP PDUs without error	Number of MRPDU messages received on the switch.
Received MVRP PDUs with error	Number of invalid MRPDU messages received on the switch.
Transmitted Join Empty	Number of JoinEmpty messages sent from the switch.
Transmitted Leave All	Number of MRP LeaveAll messages sent from the switch.
Received Join In	Number of MRP JoinIn messages received on the switch. Either this value or the value for Received Join Empty should increase when the value for Received MVRP PDUs without error increases. If this value is not incrementing when it should, you might have a Junos OS release compatibility issue. To resolve the issue, see <i>Configuring Multiple VLAN Registration Protocol (MVRP) on Switches</i> .
Transmitted Join In	Number of MRP JoinIn messages sent from the switch.
Transmitted Empty	Number of MRP Empty messages sent from the switch.
Transmitted Leave	Number of MRP LeaveEmpty messages sent from the switch.
Transmitted In	Number of MRP In messages sent from the switch.
Transmitted New	Number of New messages transmitted from the switch.
Received Leave All	Number of LeaveAll messages received on the switch.
Received Leave	Number of MRP Leave messages received on the switch.
Received In	Number of MRP In messages received on the switch.
Received Empty	Number of MRP Empty messages received on the switch.
Received Join Empty	Number of MRP JoinEmpty messages received on the switch. Either this value or the value for Received Join In should increase when the value for Received MVRP PDUs without error increases. If this value is not incrementing when it should, you might have a Junos OS release compatibility issue. To resolve the issue, see <i>Configuring Multiple VLAN Registration Protocol (MVRP) on Switches</i> .
Received New	Number of New messages received on the switch.

Sample Output

`<router>`

Release Information Command introduced before Junos OS Release 7.4.
advertising-router *router-id*, **netsummary**, **network**, **nssa**, **opaque-area**, and **router** options added in Junos OS Release 8.3. You must use the **purge** command with these options.
area *area-id* option added in Junos OS Release 8.3.
Command introduced in Junos OS Release 9.0 for EX Series switches.

realm option added in Junos OS Release 9.2.

advertising-router (*router-id* | **self**) option added in Junos OS Release 9.5.

advertising-router (*router-id* | **self**) option introduced in Junos OS Release 9.5 for EX Series switches.

Command introduced in Junos OS Release 11.3 for the QFX Series.

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

purge option (and all options that are dependent on the **purge** option) hidden in Junos OS Release 13.3.

Description With the master Routing Engine, delete entries in the Open Shortest Path First (OSPF) link-state advertisement (LSA) database. With the backup Routing Engine, delete the OSPF LSA database and sync the new database with the master Routing Engine.

CAUTION: You can also use the **purge** command with any of the options to discard rather than delete the specified LSA entries. This command is useful only for testing. Use it with care, because it causes significant network disruption.

Options **all**—Delete all LSAs other than the system's own LSAs, which are regenerated. To resynchronize the database, the system destroys all adjacent neighbors that are in the state **EXSTART** or higher. The neighbors are then reacquired and the databases are synchronized.

advertising-router (*router-id* | **self**)—(Optional) Discard entries for the LSA entries advertised by the specified routing device or by this routing device.

area *area-id*—(Optional) Discard entries for the LSAs in the specified area.

asbrsummary—(Optional) Discard summary AS boundary router LSA entries.

external—(Optional) Discard external LSAs.

instance *instance-name*—(Optional) Delete or discard entries for the specified routing instance only.

inter-area-prefix—(OSPFv3 only) (Optional) Discard interarea prefix LSAs.

inter-area-router—(OSPFv3 only) (Optional) Discard interarea router LSAs.

intra-area-prefix—(OSPFv3 only) (Optional) Discard intra-area prefix LSAs.

logical-system (**all** | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

link-local—(Optional) Delete link-local LSAs.

lsa-id *lsa-id*—(Optional) Discard the LSA entries with the specified LSA identifier.

netsummary—(Optional) Discard summary network LSAs.

network—(Optional) Discard network LSAs.

nssa—(Optional) Discard not-so-stubby area (NSSA) LSAs.

opaque-area—(Optional) Discard opaque area-scope LSAs.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(OSPFv3 only) (Optional)
Delete the entries for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

router—(Optional) Discard router LSAs.

purge—(Optional) Discard all entries in the link-state advertisement database. All link-state advertisements are set to **MAXAGE** and are flooded. The database is repopulated when the originators of the link-state advertisements receive the **MAXAGE** link-state advertisements and reissue them.

Release Information

Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
realm option introduced in Junos OS Release 9.2.
 Command introduced in Junos OS Release 11.3 for the QFX Series.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Tear down Open Shortest Path First (OSPF) neighbor connections.

Options

all—Tear down OSPF connections with all neighbors for all routing instances.

area *area-id*—(Optional) Tear down neighbor connections for the specified area only.

instance *instance-name*—(Optional) Tear down neighbor connections for the specified routing instance only.

interface *interface-name*—(Optional) Tear down neighbor connections for the specified interface only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor—(Optional) Clear the state of the specified neighbor only.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) (OSPFv3 only) Clear the state of the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

Required Privilege Level clear

Ext2	1	1	100.00%
All	5	7	71.43%

show (ospf | ospf3) backup lsp

Syntax `show (ospf | ospf3) backup lsp`
 `<logical-system (all | logical-system-name)>`
 `<realm (ipv4-unicast | ipv6-unicast)>`

Release Information Command introduced in Junos OS Release 10.0.

Description Display information about MPLS label-switched-paths (LSPs) designated as backup routes for OSPF routes.

NOTE: MPLS LSPs can be used as backup routes only for routes in the default OSPFv2 topology and not for any configured topology. Additionally, MPLS LSPs cannot be used as backup routes for nondefault instances either for OSPFv2 or OSPFv3.

- Options** **none**—Display information all MPLS LSPs designated as backup routes.
- logical-system (all | *logical-system-name*)**—(Optional) Display information about MPLS LSPs designated as backup routes for all logical systems or a specific logical system.
- realm (ipv4-unicast | ipv6-unicast)**—(Optional) (OSPFv3 only) Display information about MPLS LSPs designated as backup routes for a specific realm, or address family.

Table 177: show (ospf | ospf3) backup lsp Output Fields

Field Name	Field Description
<i>MPLS LSP name</i>	Name of each MPLS LSP designated as a backup path.
Egress	IP address of the egress router for the LSP.

Table 177: show (ospf | ospf3) backup lsp Output Fields (continued)

Field Name	Field Description
Status	<p>State of the LSP:</p> <ul style="list-style-type: none"> • Up—The router can detect RSVP hello messages from the neighbor. • Down—The router has received one of the following indications: <ul style="list-style-type: none"> • Communication failure from the neighbor. • Communication from IGP that the neighbor is unavailable. • Change in the sequence numbers in the RSVP hello messages sent by the neighbor. • Deleted—The LSP is no longer available as a backup path.
Last change	Time elapsed since the neighbor state changed either from up or down or from down to up . The format is <i>hh:mm:ss</i> .
TE-metric	Configured traffic engineering metric.
Metric	Configured metric.

Sample Output

show ospf backup lsp

```
user@host> show ospf backup lsp
tobanff
  Egress: 10.255.71.239, Status: up, Last change: 00:00:23

Output Fields [Table 180 on page 2187](#) lists the output fields for the **show ospf context-identifier** command. Output fields are listed in the approximate order in which they appear.

Table 180: show ospf context-identifier Output Fields

Field Name	Field Description	Level of Output
Context	IPv4 address that defines a protection pair. The context is manually configured on both primary and protector provider edge (PE) devices.	All levels
Status	State of the path: active or inactive .	All levels
Metric	Advertised OSPF metric.	All levels
Area	OSPF area number.	All levels
Other Advertisements	Other advertisements received by the OSPF node: <ul style="list-style-type: none"> • Advertising router— Address of the device that sent the advertisement. • Type—Type of OSPF path: inter-area and stub. • Metric—Advertised OSPF metric. • None—No additional advertisements were received by the OSPF node. 	detail

Sample Output

show ospf context-identifier

```
user@host> show ospf context-identifier
```

```
Context-id: 2.2.4.3
```

```
Status: active, Metric: 65534, PE role: protector, Area: 0.0.0.0
```

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 advertising-router self (*address* | self) option introduced in Junos OS Release 9.5.
 advertising-router self (*address* | self) option introduced in Junos OS Release 9.5 for EX Series switches.
 Command introduced in Junos OS Release 11.3 for the QFX Series.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Display the entries in the OSPF version 2 (OSPFv2) link-state database, which contains data about link-state advertisement (LSA) packets.

Options **none**—Display standard information about entries in the OSPFv2 link-state database for all routing instances.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

advertising-router (*address* | *self*)—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.

area *area-id*—(Optional) Display the LSAs in a particular area.

asbrsummary—(Optional) Display summary AS boundary router LSA entries.

external—(Optional) Display external LSAs.

instance *instance-name*—(Optional) Display all OSPF database information under the named routing instance.

link-local—(Optional) Display information about link-local LSAs.

logical-system (*all* | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsa-id *lsa-id*—(Optional) Display the LSA with the specified LSA identifier.

netsummary—(Optional) Display summary network LSAs.

network—(Optional) Display information about network LSAs.

nssa—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

opaque-area—(Optional) Display opaque area-scope LSAs.

router—(Optional) Display information about router LSAs.

Output Fields

[Table 181 on page 2189](#) describes the output fields for the **show ospf database** command. Output fields are listed in the approximate order in which they appear.

Table 181: show ospf database Output Fields

Field Name	Field Description	Level of Output
area	Area number. Area 0.0.0.0 is the backbone area.	All levels

Table 181: show ospf database Output Fields (continued)

Field Name	Field Description	Level of Output
Type	Type of link advertisement: ASBR Sum, Extern , Network , NSSA , OpaqArea , Router , or Summary .	All levels
ID	LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device.	All levels
Adv Rtr	Address of the routing device that sent the advertisement.	All levels
Seq	Link sequence number of the advertisement.	All levels
Age	Time elapsed since the LSA was originated, in seconds.	All levels
Opt	Optional OSPF capabilities associated with the LSA.	All levels
Cksum	Checksum value of the LSA.	All levels
Len	Length of the advertisement, in bytes.	All levels
Router	Router link-state advertisement information: <ul style="list-style-type: none"> bits—Flags describing the routing device that generated the LSP. link count—Number of links in the advertisement. id—ID of a routing device or subnet on the link. data—For stub networks, the subnet mask. Otherwise, the IP address of the routing device that generated the LSP. type—Type of link. It can be PointToPoint, Transit, Stub, or Virtual. TOS count—Number of type-of-service (ToS) entries in the advertisement. TOS 0 metric—Metric for ToS 0. TOS—Type-of-service (ToS) value. metric—Metric for the ToS. 	detail extensive
Network	Network link-state advertisement information: <ul style="list-style-type: none"> mask—Network mask. attached router—ID of the attached neighbor. 	detail extensive
Summary	Summary link-state advertisement information: <ul style="list-style-type: none"> mask—Network mask. TOS—Type-of-service (ToS) value. metric—Metric for the ToS. 	detail extensive
Gen timer	How long until the LSA is regenerated.	extensive
Aging timer	How long until the LSA expires.	extensive
Installed hh:mm:ss ago	How long ago the route was installed.	extensive

Table 181: show ospf database Output Fields (continued)

Field Name	Field Description	Level of Output
expires in <i>hh:mm:ss</i>	How long until the route expires.	extensive
sent <i>hh:mm:ss</i> ago	How long ago the LSA was sent.	extensive
Last changed <i>hh:mm:ss</i> ago	How long ago the route was changed.	extensive
Change count	Number of times the route has changed.	extensive
Ours	Indicates that this is a local advertisement.	extensive
Router LSAs	Number of router link-state advertisements in the link-state database.	summary
Network LSAs	Number of network link-state advertisements in the link-state database.	summary
Summary LSAs	Number of summary link-state advertisements in the link-state database.	summary
NSSA LSAs	Number of not-so-stubby area link-state advertisements in the link-state database.	summary

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 realm option introduced in Junos OS Release 9.2.
 advertising-router (address | self) option introduced in Junos Release 9.5.
 advertising-router (address | self) option introduced in Junos OS Release 9.5 for EX Series switches.
 Command introduced in Junos OS Release 11.3 for the QFX Series.

Description Display the entries in the OSPF version 3 (OSPFv3) link-state database, which contains data about link-state advertisement (LSA) packets.

Options **none**—Display standard information about all entries in the OSPFv3 link-state database.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

advertising-router (address | self)—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.

area area-id—(Optional) Display the LSAs in a particular area.

external—(Optional) Display external LSAs.

instance instance-name—(Optional) Display all OSPF database information under the named routing instance.

inter-area-prefix—(Optional) Display information about interarea-prefix LSAs.

inter-area-router—(Optional) Display information about interarea-router LSAs.

intra-area-prefix—(Optional) Display information about intra-area-prefix LSAs.

link—(Optional) Display information about link LSAs.

link-local—(Optional) Display information about link-local LSAs.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

lsa-id lsa-id—(Optional) Display the LSA with the specified LSA identifier.

network—(Optional) Display information about network LSAs.

nssa—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(Optional) Display information about the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family other than IPv6 unicast, which is the default.

router—(Optional) Display information about router LSAs.

Output Fields [Table 182 on page 2201](#) lists the output fields for the **show ospf3 database** command. Output fields are listed in the approximate order in which they appear.

Table 182: show ospf3 database Output Fields

Field Name	Field Description	Level of Output
OSPF link state database, area <i>area-number</i>	Entries in the link-state database for this area.	brief detail extensive
OSPF AS SCOPE link state database	Entries in the AS scope link-state database.	brief detail extensive
OSPF Link-Local link state database, interface <i>interface-name</i>	Entries in the link-local link-state database for this interface.	brief detail extensive
area	Area number. Area 0.0.0.0 is the backbone area.	All levels
Type	Type of link advertisement: Extern , InterArPfx , InterArRtr , IntraArPrx , Link , Network , NSSA , or Router .	brief detail extensive
ID	Link identifier included in the advertisement. An asterisk (*) preceding the identifier marks database entries that originated from the local routing device.	brief detail extensive
Adv Rtr	Address of the routing device that sent the advertisement.	brief detail extensive
Seq	Link sequence number of the advertisement.	brief detail extensive
Age	Time elapsed since the LSA was originated, in seconds.	brief detail extensive
Cksum	Checksum value of the LSA.	brief detail extensive
Len	Length of the advertisement, in bytes.	brief detail extensive
Router (Router Link-State Advertisements)		
bits	Flags describing the routing device that generated the LSP.	detail extensive
Options	Option bits carried in the router LSA.	detail extensive
For Each Router Link		
Type	Type of interface. The value of all other output fields describing a routing device interface depends on the interface's type: <ul style="list-style-type: none"> • PointToPoint (1)—Point-to-point connection to another routing device. • Transit (2)—Connection to a transit network. • Virtual (4)—Virtual link. 	detail extensive
Loc-if-id	Local interface ID assigned to the interface that uniquely identifies the interface with the routing device.	detail extensive
Nbr-if-id	Interface ID of the neighbor's interface for this routing device link.	detail extensive

Table 182: show ospf3 database Output Fields (continued)

Field Name	Field Description	Level of Output
Nbr-rtr-id	Router ID of the neighbor routing device (for type 2 interfaces, the attached link's designated router).	detail extensive
Metric	Cost of the router link.	detail extensive
Gen timer	How long until the LSA is regenerated, in the format <i>hours:minutes:seconds</i> .	extensive
Aging timer	How long until the LSA expires, in the format <i>hours:minutes:seconds</i> .	extensive
Installed <i>nn:nn:nn</i> ago	How long ago the route was installed, in the format <i>hours:minutes:seconds</i> .	extensive
expires in <i>nn:nn:nn</i>	How long until the route expires, in the format <i>hours:minutes:seconds</i> .	extensive
sent <i>nn:nn:nn</i> ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format <i>hours:minutes:seconds</i> .	extensive
Ours	Indicates that this is a local advertisement.	extensive
Network (Network Link-State Advertisements)		
Options	Option bits carried in the network LSA.	detail extensive
Attached Router	Router IDs of each of the routing devices attached to the link. Only routing devices that are fully adjacent to the designated router are listed. The designated router includes itself in this list.	detail extensive
InterArPfx (Interarea-Prefix Link-State Advertisements)		
Prefix	IPv6 address prefix.	detail extensive
Prefix-options	Option bit associated with the prefix.	detail extensive
Metric	Cost of this route. Expressed in the same units as the interface costs in the router LSAs. When the interarea-prefix LSA is describing a route to a range of addresses, the cost is set to the maximum cost to any reachable component of the address range.	detail extensive
Gen timer	How long until the LSA is regenerated, in the format <i>hours:minutes:seconds</i> .	extensive
Aging timer	How long until the LSA expires, in the format <i>hours:minutes:seconds</i> .	extensive
Installed <i>nn:nn:nn</i> ago	How long ago the route was installed, in the format <i>hours:minutes:seconds</i> .	extensive
expires in <i>nn:nn:nn</i>	How long until the route expires, in the format <i>hours:minutes:seconds</i> .	extensive
sent <i>nn:nn:nn</i> ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format <i>hours:minutes:seconds</i> .	extensive

Table 182: show ospf3 database Output Fields (continued)

Field Name	Field Description	Level of Output
Ours	Indicates that this is a local advertisement.	extensive
InterArRtr (Interarea-Router Link-State Advertisements)		
Dest-router-id	Router ID of the routing device described by the LSA.	detail extensive
options	Optional capabilities supported by the routing device.	detail extensive
Metric	Cost of this route. Expressed in the same units as the interface costs in the router LSAs. When the interarea-prefix LSA is describing a route to a range of addresses, the cost is set to the maximum cost to any reachable component of the address range.	detail extensive
Prefix	IPv6 address prefix.	extensive
Prefix-options	Option bit associated with the prefix.	extensive
Extern (External Link-State Advertisements)		
Prefix	IPv6 address prefix.	detail extensive
Prefix-options	Option bit associated with the prefix.	detail extensive
Metric	Cost of the route, which depends on the value of Type .	detail extensive
Type <i>n</i>	Type of external metric: Type 1 or Type 2 .	detail extensive
Aging timer	How long until the LSA expires, in the format <i>hours:minutes:seconds</i> .	extensive
Installed <i>nn:nn:nn</i> ago	How long ago the route was installed, in the format <i>hours:minutes:seconds</i> .	extensive
expires in <i>nn:nn:nn</i>	How long until the route expires, in the format <i>hours:minutes:seconds</i> .	extensive
sent <i>nn:nn:nn</i> ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format <i>hours:minutes:seconds</i> .	extensive
Link (Link-State Advertisements)		
IPv6-Address	IPv6 link-local address on the link for which this link LSA originated.	detail extensive
Options	Option bits carried in the link LSA.	detail extensive
priority	Router priority of the interface attaching the originating routing device to the link.	detail extensive
Prefix-count	Number of IPv6 address prefixes contained in the LSA. The rest of the link LSA contains a list of IPv6 prefixes to be associated with the link.	detail extensive
Prefix	IPv6 address prefix.	detail extensive

Table 182: show ospf3 database Output Fields (continued)

Field Name	Field Description	Level of Output
Prefix-options	Option bit associated with the prefix.	detail extensive
Gen timer	How long until the LSA is regenerated, in the format <i>hours:minutes:seconds</i> .	extensive
Aging timer	How long until the LSA expires, in the format <i>hours:minutes:seconds</i> .	extensive
Installed <i>nn:nn:nn</i> ago	How long ago the route was installed, in the format <i>hours:minutes:seconds</i> .	extensive
expires in <i>nn:nn:nn</i>	How long until the route expires, in the format <i>hours:minutes:seconds</i> .	extensive
sent <i>nn:nn:nn</i> ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format <i>hours:minutes:seconds</i> .	extensive
Ours	Indicates that this is a local advertisement.	extensive
IntraArPfx (Intra-Area-Prefix Link-State Advertisements)		
Ref-lsa-type	LSA type of the referenced LSA. <ul style="list-style-type: none"> • Router—Address prefixes are associated with a router LSA. • Network—Address prefixes are associated with a network LSA. 	detail extensive
Ref-lsa-id	Link-state ID of the referenced LSA.	detail extensive
Ref-router-id	Advertising router ID of the referenced LSA.	detail extensive
Prefix-count	Number of IPv6 address prefixes contained in the LSA. The rest of the link LSA contains a list of IPv6 prefixes to be associated with the link.	detail extensive
Prefix	IPv6 address prefix.	detail extensive
Prefix-options	Option bit associated with the prefix.	detail extensive
Metric	Cost of this prefix. Expressed in the same units as the interface costs in the router LSAs.	detail extensive
Gen timer	How long until the LSA is regenerated, in the format <i>hours:minutes:seconds</i> .	extensive
Aging timer	How long until the LSA expires, in the format <i>hours:minutes:seconds</i> .	extensive
Installed <i>hh:mm:ss</i> ago	How long ago the route was installed, in the format <i>hours:minutes:seconds</i> .	extensive
expires in <i>hh:mm:ss</i>	How long until the route expires, in the format <i>hours:minutes:seconds</i> .	extensive
sent <i>hh:mm:ss</i> ago	Time elapsed since the LSA was last transmitted or flooded to an adjacency or an interface, respectively, in the format <i>hours:minutes:seconds</i> .	extensive

Table 182: show ospf3 database Output Fields (continued)

Field Name	Field Description	Level of Output
<i>n</i> Router LSAs	Number of router LSAs in the link-state database.	summary
<i>n</i> Network LSAs	Number of network LSAs in the link-state database.	summary
<i>n</i> InterArPfx LSAs	Number of interarea-prefix LSAs in the link-state database.	summary
<i>n</i> InterArRtr LSAs	Number of interarea-router LSAs in the link-state database.	summary
<i>n</i> IntraArPfx LSAs	Number of intra-area-prefix LSAs in the link-state database.	summary
Externals	Display of the external LSA database.	summary
<i>n</i> Extern LSAs	Number of external LSAs in the link-state database.	summary
Interface <i>interface-name</i>	Name of the interface for which link-local LSA information is displayed.	summary
<i>n</i> Link LSAs	Number of link LSAs in the link-state database.	summary

show (ospf | ospf3) interface

List of Syntax [Syntax on page 2210](#)
 [Syntax \(EX Series Switches and QFX Series\) on page 2210](#)

Syntax `show (ospf | ospf3) interface`
 `<brief | detail | extensive>`
 `<area area-id>`
 `<interface-name>`
 `<instance instance-name>`
 `<logical-system (all | logical-system-name)>`
 `<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>`

Syntax (EX Series Switches and QFX Series) `show (ospf | ospf3) interface`
 `<brief | detail | extensive>`
 `<area area-id>`
 `<interface-name>`
 `<instance instance-name>`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 area option introduced in Junos OS Release 9.2.
 area option introduced in Junos OS Release 9.2 for EX Series switches.
 realm option introduced in Junos OS Release 9.2.
 Command introduced in Junos OS Release 11.3 for the QFX Series.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Display the status of OSPF interfaces.

Options **none**—Display standard information about the status of all OSPF interfaces for all routing instances

brief | detail | extensive—(Optional) Display the specified level of output.

area *area-id*—(Optional) Display information about the interfaces that belong to the specified area.

interface-name—(Optional) Display information for the specified interface.

instance *instance-name*—(Optional) Display all OSPF interfaces under the named routing instance.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(OSPFv3 only) (Optional) Display information about the interfaces for the specified OSPFv3 realm, or address

family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

Required Privilege Level view

List of Sample Output [show ospf interface brief on page 2213](#)
[show ospf interface detail on page 2213](#)

[show ospf interface extensive \(When LDP Synchronization Is Configured\) on page 2215](#)

Output Fields [Table 183 on page 2211](#) lists the output fields for the **show (ospf | ospf3) interface** command. Output fields are listed in the approximate order in which they appear.

Table 183: show (ospf | ospf3) interface Output Fields

Field Name	Field Description	Level of Output
Interface	Name of the interface running OSPF version 2 or OSPF version 3.	All levels
State	State of the interface: BDR , Down , DR , DRother , Loop , PtToPt , or Waiting .	All levels
Area	Number of the area that the interface is in.	All levels
DR ID	Address of the area's designated router.	All levels
BDR ID	Backup designated router for a particular subnet.	All levels
Nbrs	Number of neighbors on this interface.	All levels
Type	Type of interface: LAN , NBMA , P2MP , P2P , or Virtual .	detail extensive
Address	IP address of the neighbor.	detail extensive
Mask	Netmask of the neighbor.	detail extensive
Prefix-length	(OSPFv3) IPv6 prefix length, in bits.	detail extensive
OSPF3-Intf-Index	(OSPFv3) OSPF version 3 interface index.	detail extensive
MTU	Interface maximum transmission unit (MTU).	detail extensive
Cost	Interface cost (metric).	detail extensive
DR addr	Address of the designated router.	detail extensive
BDR addr	Address of the backup designated router.	detail extensive

Table 183: show (ospf | ospf3) interface Output Fields (continued)

Field Name	Field Description	Level of Output
Adj count	Number of adjacent neighbors.	detail extensive
Secondary	Indicates that this interface is configured as a secondary interface for this area. This interface can belong to more than one area, but can be designated as a primary interface for only one area.	detail extensive
Flood Reduction	Indicates that this interface is configured with flooding reduction. All self-originated LSAs from this interface are initially sent with the DoNotAge bit set. As a result, LSAs are refreshed only when a change occurs.	extensive
Priority	Router priority used in designated router (DR) election on this interface.	detail extensive
Flood list	List of link-state advertisements (LSAs) that might be about to flood this interface.	extensive
Ack list	Acknowledgment list. List of pending acknowledgments on this interface.	extensive
Descriptor list	List of packet descriptors.	extensive
Hello	Configured value for the hello timer.	detail extensive
Dead	Configured value for the dead timer.	detail extensive
Auth type	(OSPFv2) Authentication mechanism for sending and receiving OSPF protocol packets: <ul style="list-style-type: none"> • MD5—The MD5 mechanism is configured in accordance with RFC 2328. • None—No authentication method is configured. • Password—A simple password (RFC 2328) is configured. 	detail extensive
Topology	(Multiarea adjacency) Name of topology: default or name .	
LDP sync state	(OSPFv2 and LDP synchronization) Current state of LDP synchronization: in sync , in holddown , and not supported .	extensive
reason	(OSPFv2 and LDP synchronization) Reason for the current state of LDP synchronization. The LDP session might be up or down, or adjacency might be up or down.	extensive
config holdtime	(OSPFv2 and LDP synchronization) Configured value of the hold timer. If the state is not synchronized, and the hold time is not infinity, the remaining field displays the number of seconds that remain until the configured hold timer expires.	extensive
IPSec SA name	(OSPFv2) Name of the IPSec security association name.	detail extensive
Active key ID	(OSPFv2 and MD5) Number from 0 to 255 that uniquely identifies an MD5 key.	detail extensive

Table 183: show (ospf | ospf3) interface Output Fields (continued)

Field Name	Field Description	Level of Output
Start time	(OSPFv2 and MD5) Time at which the routing device starts using an MD5 key to authenticate OSPF packets transmitted on the interface on which this key is configured. To authenticate received OSPF protocol packets, the key becomes effective immediately after the configuration is committed. If the start time option is not configured, the key is effective immediately for send and receive and is displayed as Start time 1970 Jan 01 00:00:00 PST .	detail extensive
ReXmit	Configured value for the Retransmit timer.	detail extensive
Stub, Not Stub, or Stub NSSA	Type of area.	detail extensive

Output Fields [Table 184 on page 2216](#) lists the output fields for the **show ospf io-statistics** command. Output fields are listed in the approximate order in which they appear.

Table 184: show (ospf | ospf3) io-statistics Output Fields

Field Name	Field Description
Packets read	Number of OSPF packets read since the last time the routing protocol was started.
average per run	Total number of packets divided by the total number of times the OSPF read operation is scheduled to run.
max run	Maximum number of packets for a given run among all scheduled runs.

Table 184: show (ospf | ospf3) io-statistics Output Fields (continued)

Field Name	Field Description
Receive errors	Number of faulty packets received with errors.

Sample Output

show ospf io-statistics

```
user@host> show ospf io-statistics
```

```
Packets read: 7361, average per run: 1.00, max run: 1
Receive errors:
  None
```

 `<neighbor>`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 instance all option introduced in Junos OS Release 9.1.
 instance all option introduced in Junos OS Release 9.1 for EX Series switches.
 area, **interface**, and **realm** options introduced in Junos OS Release 9.2.
 area and **interface** options introduced in Junos OS Release 9.2 for EX Series switches.
 Command introduced in Junos OS Release 11.3 for the QFX Series.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Display information about OSPF neighbors.

CPU utilization might increase while the device learns its OSPF neighbors. We recommend that you use the **show (ospf | ospf3) neighbor** command after the device learns and establishes OSPF neighbor adjacencies. Depending on the size of your network, this might take several minutes. If you receive a “timeout communicating with routing daemon” error when using the **show (ospf | ospf3) neighbor** command, wait several minutes before attempting to use the command again. This is not a critical system error, but you might experience a delay in using the CLI.

Options **none**—Display standard information about all OSPF neighbors for all routing instances.

brief | detail | extensive—(Optional) Display the specified level of output.

area *area-id*—(Optional) Display information about the OSPF neighbors for the specified area.

instance (**all** | *instance-name*)—(Optional) Display all OSPF interfaces for all routing instances or under the named routing instance.

interface *interface-name*—(Optional) Display information about OSPF neighbors for the specified logical interface.

logical-system (**all** | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

neighbor—(Optional) Display information about the specified OSPF neighbor.

realm (**ipv4-multicast** | **ipv4-unicast** | **ipv6-multicast**)—(OSPFv3 only) (Optional) Display information about the OSPF neighbors for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

Output Fields

[Table 186 on page 2222](#) lists the output fields for the **show (ospf | ospf3) neighbor** command. Output fields are listed in the approximate order in which they appear.

Table 186: show (ospf | ospf3) neighbor Output Fields

Field Name	Field Description	Level of Output
Address	Address of the neighbor.	All levels
Interface	Interface through which the neighbor is reachable.	All levels

Table 186: `show (ospf | ospf3) neighbor` Output Fields (continued)

Field Name	Field Description	Level of Output
State	<p>State of the neighbor:</p> <ul style="list-style-type: none"> • Attempt—Valid only for neighbors attached to nonbroadcast networks. It indicates that no recent information has been received from the neighbor, but that a more concerted effort must be made to contact the neighbor. • Down—Initial state of a neighbor conversation. It indicates that no recent information has been received from the neighbor. Hello packets might continue to be sent to neighbors in the Down state, although at a reduced frequency. • Exchange—Routing device is describing its entire link-state database by sending database description packets to the neighbor. Each packet has a sequence number and is explicitly acknowledged. • ExStart—First step in creating an adjacency between the two neighboring routing devices. The goal of this step is to determine which routing device is the master, and to determine the initial sequence number. • Full—Neighboring routing devices are fully adjacent. These adjacencies appear in router link and network link advertisements. • Init—A hello packet has recently been sent by the neighbor. However, bidirectional communication has not yet been established with the neighbor. This state may occur, for example, because the routing device itself did not appear in the neighbor's hello packet. • Loading—Link-state request packets are sent to the neighbor to acquire more recent advertisements that have been discovered (but not yet received) in the Exchange state. • 2Way—Communication between the two routing devices is bidirectional. This state has been ensured by the operation of the Hello Protocol. This is the most advanced state short of beginning adjacency establishment. The (backup) designated router is selected from the set of neighbors in state 2Way or greater. 	All levels
ID	Router ID of the neighbor.	All levels
Pri	Priority of the neighbor to become the designated router.	All levels
Dead	Number of seconds until the neighbor becomes unreachable.	All levels
Link state acknowledgment list	Number of link-state acknowledgments received.	extensive
Link state retransmission list	<p>Total number of link-state advertisements retransmitted. For extensive output only, the following information is also displayed:</p> <ul style="list-style-type: none"> • Type—Type of link advertisement: ASBR, Sum, Extern, Network, NSSA, OpaqueArea, Router, or Summary. • LSA ID—LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device. • Adv rtr—Address of the routing device that sent the advertisement. • Seq—Link sequence number of the advertisement. 	detail extensive

Table 186: `show (ospf | ospf3) neighbor` Output Fields (continued)

Field Name	Field Description	Level of Output
Neighbor-address	(OSPFv3 only) If the neighbor uses virtual links, the Neighbor-address is the site-local, local, or global address. If the neighbor uses a physical interface, the Neighbor-address is an IPv6 link-local address.	detail extensive
area	Area that the neighbor is in.	detail extensive
OSPF3-Intf-Index	(OSPFv3 only) Displays the OSPFv3 interface index.	detail extensive
opt	Option bits received in the hello packets from the neighbor.	detail extensive
DR or DR-ID	Address of the designated router.	detail extensive
BDR or BDR-ID	Address of the backup designated router.	detail extensive
Up	Length of time since the neighbor came up.	detail extensive
adjacent	Length of time since the adjacency with the neighbor was established.	detail extensive
SPRING Adjacency Labels	Segment routing in networking adjacency labels. <i>NOTE:</i> Displayed only when segment routing is enabled	detail extensive
Label	Segment routing label.	detail extensive
Flags	Segment routing flags. Flags VL indicate <i>value</i> and <i>local</i> .	detail extensive

Output Fields Table 187 on page 2229 lists the output fields for the **show ospf overview** command. Output fields are listed in the approximate order in which they appear.

Table 187: show ospf overview Output Fields

Field name	Field Description	Level of Output
Instance	OSPF routing instance.	All levels
Router ID	Router ID of the routing device.	All levels
Route table index	Route table index.	All levels
Configured overload	Overload capability is enabled. If the overload timer is also configured, display the time that remains before it is set to expire. This field is not displayed after the timer expires.	All levels
Topology	Topology identifier.	All levels
Prefix export count	Number of prefixes exported into OSPF.	All levels
Full SPF runs	Number of complete Shortest Path First calculations.	All levels
SPF delay	Delay before performing consecutive Shortest Path First calculations.	All levels
SPF holddown	Delay before performing additional Shortest Path First (SPF) calculations after the maximum number of consecutive SPF calculations is reached.	All levels
SPF rapid runs	Maximum number of Shortest Path First calculations that can be performed in succession before the hold-down timer begins.	All levels
LSA refresh time	Refresh period for link-state advertisement (in minutes).	All levels
SPRING	Source protocol routing in networking: enable or disable .	All levels
Node Segments	Nodes of source protocol routing in networking: enable or disable .	All levels
Ipv4 Index	Ipv4 Index.	All levels
Index Range	Ipv4 Index range.	All levels
Node Segment Blocks Allocated	Details about node segment blocks.	All levels
Database protection state	Current state of database protection.	All levels
Warning threshold	Threshold at which a warning message is logged (percentage of maximum LSA count).	All levels
Non self-generated LSAs	Number of LSAs whose router ID is not equal to the local router ID: Current , Warning (threshold), and Allowed .	All levels

Table 187: show ospf overview Output Fields (continued)

Field name	Field Description	Level of Output
Ignore time	How long the database has been in the ignore state.	All levels
Reset time	How long the database must stay out of the ignore or isolated state before it returns to normal operations.	All levels
Ignore count	Number of times the database has been in the ignore state: Current and Allowed .	All levels
Restart	Graceful restart capability: enabled or disabled .	All levels
Restart duration	Time period for complete reacquisition of OSPF neighbors.	All levels
Restart grace period	Time period for which the neighbors should consider the restarting routing device as part of the topology.	All levels
Graceful restart helper mode	(OSPFv2) Standard graceful restart helper capability (based on RFC 3623): enabled or disabled .	All levels
Restart-signaling helper mode	(OSPFv2) Restart signaling-based graceful restart helper capability (based on RFC 4811, RFC 4812, and RFC 4813): enabled or disabled .	All levels
Helper mode	(OSPFv3) Graceful restart helper capability: enabled or disabled .	All levels
Trace options	OSPF-specific trace options.	extensive
Trace file	Name of the file to receive the output of the tracing operation.	extensive
Area	Area number. Area 0.0.0.0 is the backbone area.	All levels
Stub type	Stub type of area: Normal Stub , Not Stub , or Not so Stubby Stub .	All levels
Authentication Type	Type of authentication: None , Password , or MD5 . NOTE: The Authentication Type field refers to the authentication configured at the <code>[edit protocols ospf area area-id]</code> level. Any authentication configured for an interface in this area will not affect the value of this field.	All levels
Area border routers	Number of area border routers.	All levels
Neighbors	Number of autonomous system boundary routers.	All levels

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 topology option introduced in Junos OS Release 9.0.
 realm option introduced in Junos OS Release 9.2.
 Command introduced in Junos OS Release 11.3 for the QFX Series.
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Display the entries in the Open Shortest Path First (OSPF) routing table.

Options **none**—Display standard information about all entries in the OSPF routing table for all routing instances and all topologies.

destination—Display routes to the specified IP address (with optional destination prefix length).

brief | detail | extensive—(Optional) Display the specified level of output.

abr—(Optional) Display routes to area border routers.

asbr—(Optional) Display routes to autonomous system border routers.

extern—(Optional) Display external routes.

inter—(Optional) Display interarea routes.

intra—(Optional) Display intra-area routes.

instance (default | ipv4-multicast | *instance-name*)—(Optional) Display entries for the default routing instance, the IPv4 multicast routing instance, or for the specified routing instance.

logical-system (default | ipv4-multicast | *logical-system-name*)—(Optional) Perform this operation on the default logical system, the IPv4 multicast logical system, or on a particular logical system.

network—(Optional) Display routes to networks.

no-backup-coverage—(Optional) Display routes with no backup coverage.

realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)—(OSPFv3 only) (Optional) Display entries in the routing table for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

router—(Optional) Display routes to all routers.

topology (default | ipv4-multicast | *topology-name*)—(OSPFv2 only) (Optional) Display routes for the default OSPF topology, IPv4 multicast topology, or for a particular topology.

transit—(Optional) (OSPFv3 only) Display OSPFv3 routes to pseudonodes.

Output Fields

[Table 188 on page 2234](#) list the output fields for the **show (ospf | ospf3) route** command. Output fields are listed in the approximate order in which they appear.

Table 188: show (ospf | ospf3) route Output Fields

Field Name	Field Description	Output Level
Topology	Name of the topology.	All levels

Table 188: *show (ospf | ospf3) route* Output Fields (continued)

Field Name	Field Description	Output Level
Prefix	Destination of the route.	All levels
Path type	How the route was learned: <ul style="list-style-type: none"> • Inter—Interarea route • Ext1—External type 1 route • Ext2—External type 2 route • Intra—Intra-area route 	All levels
Route type	The type of routing device from which the route was learned: <ul style="list-style-type: none"> • AS BR—Route to AS border router. • Area BR—Route to area border router. • Area/AS BR—Route to router that is both an Area BR and AS BR. • Network—Network router. • Router—Route to a router that is neither an Area BR nor an AS BR. • Transit—(OSPFv3 only) Route to a pseudonode representing a transit network, LAN, or nonbroadcast multiaccess (NBMA) link. • Discard—Route to a summary discard. 	All levels
NH Type	Next-hop type: LSP or IP .	All levels
Metric	Route's metric value.	All levels
NH-interface	(OSPFv3 only) Interface through which the route's next hop is reachable.	All levels
NH-addr	(OSPFv3 only) IPv6 address of the next hop.	All levels
NextHop Interface	(OSPFv2 only) Interface through which the route's next hop is reachable.	All levels
Nexthop addr/label	(OSPFv2 only) If the NH Type is IP , then it is the address of the next hop. If the NH Type is LSP , then it is the name of the label-switched path.	All levels
Area	Area ID of the route.	detail
Origin	Router from which the route was learned.	detail
Type 7	Route was learned through a not-so-stubby area (NSSA) link-state advertisement (LSA).	detail
P-bit	Route was learned through NSSA LSA and the propagate bit was set.	detail
Fwd NZ	Forwarding address is nonzero. Fwd NZ is only displayed if the route is learned through an NSSA LSA.	detail

Table 188: show (ospf | ospf3) route Output Fields (continued)

Field Name	Field Description	Output Level
optional-capability	Optional capabilities propagated in the router LSA. This field is in the output for intra-area router routes only (when Route Type is Area BR , AS BR , Area/AS BR , or Router), not for interarea router routes or network routes. Three bits in this field are defined as follows: <ul style="list-style-type: none"> • 0x4 (V)—Routing device is at the end of a virtual active link. • 0x2 (E)—Routing device is an autonomous system boundary router. • 0x1 (B)—Routing device is an area border router. 	detail
priority	The priority assigned to the prefix: <ul style="list-style-type: none"> • high • medium • low <p>NOTE: The priority field applies only to routes of type Network.</p>	detail
BGP-ORR Generation-ID	Display the BGP-ORR generation identifier of the main OSPF route. This field is shown only for non-zero values.	extensive

show (ospf | ospf3) statistics

List of Syntax	Syntax on page 2240 Syntax (EX Series Switch and QFX Series) on page 2240
Syntax	<pre>show (ospf ospf3) statistics <instance <i>instance-name</i>> <logical-system (all <i>logical-system-name</i>)> <realm (ipv4-multicast ipv4-unicast ipv6-multicast)></pre>
Syntax (EX Series Switch and QFX Series)	<pre>show (ospf ospf3) statistics <instance <i>instance-name</i>></pre>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. realm option introduced in Junos OS Release 9.2. Command introduced in Junos OS Release 11.3 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Display OSPF statistics.
Options	none —Display OSPF statistics for all routing instances. instance <i>instance-name</i> —(Optional) Display all statistics for the specified routing instance. logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system. realm (ipv4-multicast ipv4-unicast ipv6-multicast) —(Optional) (OSPFv3 only) Display all statistics for the specified OSPFv3 realm, or address family. Use the realm option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.
Required Privilege Level	view

List of Sample Output	show ospf statistics on page 2242 show ospf statistics logical-system all on page 2242 show ospf3 statistics on page 2243
Output Fields	Table 189 on page 2241 lists the output fields for the show (ospf ospf3) statistics command. Output fields are listed in the approximate order in which they appear.

Table 189: *show (ospf | ospf3) statistics* Output Fields

Field Name	Field Description
Packet type	Type of OSPF packet.
Total Sent/Total Received	Total number of packets sent and received.
Last 5 seconds Sent/Last 5 seconds Received	Total number of packets sent and received in the last 5 seconds.
DBDs retransmitted	Total number of database description packets retransmitted, and number retransmitted in the last 5 seconds.
LSAs flooded	Total number of link-state advertisements flooded, and number flooded in the last 5 seconds.
LSAs flooded high-prio	<p>Total number of high priority link-state advertisements flooded, and number flooded in the last 5 seconds.</p> <p>A link-state advertisement is deemed a high priority if it has changed since it was last sent.</p>
LSAs retransmitted	Total number of link-state advertisements retransmitted, and number retransmitted in the last 5 seconds.
LSAs transmitted to nbr	Total number of link-state advertisements transmitted to a neighbor, and number transmitted in the last 5 seconds.
LSAs requested	Total number of link-state advertisements requested by neighboring devices, and number requested in the last 5 seconds.
LSAs acknowledged	Total number of link-state advertisements acknowledged, and number acknowledged in the last 5 seconds.
Flood queue depth	Total number of entries in the extended queue.
Total rexmit entries	Total number of retransmission entries waiting to be sent from the OSPF routing instance.
db summaries	Total number of database description summaries waiting to be sent from the OSPF routing instance.
lsreq entries	Total number of link-state request entries waiting to be sent from the OSPF routing instance.

Table 189: show (ospf | ospf3) statistics Output Fields (continued)

Field Name	Field Description
Receive errors	<p>Number and type of receive errors. Some sample receive errors include:</p> <ul style="list-style-type: none"> • mtu mismatches • no interface found • no virtual link found • nssa mismatches • stub area mismatches • subnet mismatches <p>If there are no receive errors, the output displays none.</p>

List of Syntax	Syntax on page 2247 Syntax (EX Series Switches) on page 2247
Syntax	<pre>show as-path <brief detail> <logical-system (all <i>logical-system-name</i>)></pre>
Syntax (EX Series Switches)	<pre>show as-path <brief detail></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
Description	<p>Display the distribution of autonomous system (AS) paths that the local routing device is using (usually through the routing table). Use this command to debug problems for AS paths and to understand how AS paths have been manipulated through a policy (through the as-path-prepend action) or through aggregation.</p> <p>AS paths are stored in a hash table. A hash table is one method for fast lookup. Each entry in the table is called a bucket. Junos OS computes a hash value that indicates in which bucket the AS path is stored. The AS paths are dispersed among the hash buckets so that a manageable number of AS paths is stored in each bucket. Only unique AS paths are stored. Duplicate AS paths increase a reference count, but do not increase the number of AS paths stored in the hash table.</p>
Options	<p>none—Display basic information about AS paths that the local routing device is using (same as brief).</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>

Output Fields Table 190 on page 2248 lists the output fields for the **show as-path** command. Output fields are listed in the approximate order in which they appear.

Table 190: show as-path Output Fields

Field Name	Field Description	Level of Output
Total AS paths	Total number of AS paths.	brief none
Bucket	Bucket number.	All levels
Count	Number of AS path entries in this bucket.	All levels
AS path	AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated: <ul style="list-style-type: none"> • I—IGP. • E—EGP. • ?—Incomplete; typically, the AS path was aggregated. • Atomic—Route is an aggregate of several route prefixes. • Aggregator—Routing device has summarized a range of prefixes. 	All levels
domain	Number of independent AS domains. The AS paths of an independent AS domain are not shared with the AS paths and AS path attributes of other domains, including the master routing instance domain.	detail
neighbor as	AS peer address.	detail
length	Length of the AS path.	detail
segments	Length of the AS segment descriptor.	detail
unique-count	Number of unique autonomous systems (ASs) present in the AS path	detail
references	Path reference count.	detail

show as-path summary

List of Syntax [Syntax on page 2255](#)
[Syntax \(EX Series Switches\) on page 2255](#)

Syntax `show as-path summary`
`<logical-system (all | logical-system-name)>`

Syntax (EX Series Switches) `show as-path summary`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.

Description Display autonomous system (AS) path summary information.

AS paths are stored in a hash table. A hash table is one method for fast lookup. Each entry in the table is called a bucket. Junos OS computes a hash value that indicates in which bucket the AS path is stored. The AS paths are dispersed among the hash buckets so that a manageable number of AS paths is stored in each bucket. Only unique AS paths are stored. Duplicate AS paths increase a reference count, but do not increase the number of AS paths stored in the hash table.

Options **none**—(Optional) Display AS path summary information for all routing instances.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

<logical-system (all | logical-system-name)>
<private>
<te-ipv4-prefix-ip te-ipv4-prefix-ip>
<te-ipv4-prefix-node-ip te-ipv4-prefix-node-ip>
<te-ipv4-prefix-node-iso te-ipv4-prefix-node-iso>
```

Syntax (EX Series Switches)

```
show route
<all>
<destination-prefix>
<private>
```

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Option **private** introduced in Junos OS Release 9.5.
 Option **private** introduced in Junos OS Release 9.5 for EX Series switches.
 Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.
 Option **display-client-data** introduced in Junos OS Release 16.2R1 on MX80, MX104, MX240, MX480, MX960, MX2010, MX2020, vMX Series routers.
 Options **te-ipv4-prefix-ip**, **te-ipv4-prefix-node-ip**, and **te-ipv4-prefix-node-iso** introduced in Junos OS Release 17.2R1 on MX Series and PTX Series.

Description Display the active entries in the routing tables.

Options **none**—Display brief information about all active entries in the routing tables.

all—(Optional) Display information about all routing tables, including private, or internal, routing tables.

destination-prefix—(Optional) Display active entries for the specified address or range of addresses.

logical-system (all | logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.

private—(Optional) Display information only about all private, or internal, routing tables.

display-client-data —(Optional) Display client id and cookie information for routes installed by the routing protocol process client applications.

te-ipv4-prefix-ip *te-ipv4-prefix-ip*—(Optional) Display IPv4 address of the traffic-engineering prefix, without the mask length if present in the routing table.

te-ipv4-prefix-node-ip *te-ipv4-prefix-node-ip*—(Optional) Display all prefixes that have originated from the traffic-engineering node. You can filter IPv4 node addresses from the traffic-engineered routes in the **lsdist.0** table.

te-ipv4-prefix-node-iso *te-ipv4-prefix-node-iso*—(Optional) Display all prefixes that have originated from the traffic-engineering node. You can filter IPv4 routes with the specified ISO circuit ID from the **lsdist.0** table.

Output Fields

[Table 193 on page 2258](#) describes the output fields for the **show route** command. Output fields are listed in the approximate order in which they appear.

Table 193: show route Output Fields

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).

Table 193: show route Output Fields (continued)

Field Name	Field Description
<i>number destinations</i>	Number of destinations for which there are routes in the routing table.
<i>number routes</i>	<p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> • active (routes that are active). • holddown (routes that are in the pending state before being declared inactive). A holddown route was once the active route and is no longer the active route. The route is in the holddown state because a protocol still has interest in the route, meaning that the interest bit is set. A protocol might have its interest bit set on the previously active route because the protocol is still advertising the route. The route will be deleted after all protocols withdraw their advertisement of the route and remove their interest bit. A persistent holddown state often means that the interested protocol is not releasing its interest bit properly. <p>However, if you have configured advertisement of multiple routes (with the add-path or advertise-inactive statement), the holddown bit is most likely set because BGP is advertising the route as an active route. In this case, you can ignore the holddown state because nothing is wrong.</p> <ul style="list-style-type: none"> • hidden (routes that are not used because of a routing policy).
<i>destination-prefix</i>	<p>Route destination (for example:10.0.0.1/24). Sometimes the route information is presented in another format, such as:</p> <ul style="list-style-type: none"> • MPLS-label (for example, 80001). • interface-name (for example, ge-1/0/2). • neighbor-address:control-word-status:encapsulation type:vc-id:source (Layer 2 circuit only. For example, 10.1.1.195:NoCtrlWord:1:1:Local/96): <ul style="list-style-type: none"> • neighbor-address—Address of the neighbor. • control-word-status—Whether the use of the control word has been negotiated for this virtual circuit: NoCtrlWord or CtrlWord. • encapsulation type—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport. • vc-id—Virtual circuit identifier. • source—Source of the advertisement: Local or Remote.
<i>[protocol, preference]</i>	<p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> • +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • -—A hyphen indicates the last active route. • *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route. <p>In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.</p>
<i>weeks:days hours:minutes:seconds</i>	How long the route been known (for example, 2w4d 13:11:14 , or 2 weeks, 4 days, 13 hours, 11 minutes, and 14 seconds).

Table 193: show route Output Fields (continued)

Field Name	Field Description
metric	Cost value of the indicated route. For routes within an AS, the cost is determined by the IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
localpref	Local preference value included in the route.
from	Interface from which the route was received.
AS path	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> • I—IGP. • E—EGP. • ?—Incomplete; typically, the AS path was aggregated. <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> • []—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured. • { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • ()—Parentheses enclose a confederation. • ([])—Parentheses and brackets enclose a confederation set. <p>NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>
encapsulated	Extended next-hop encoding capability enabled for the specified BGP community for routing IPv4 traffic over IPv6 tunnels. When BGP receives routes without the tunnel community, IPv4-Over IPv6 tunnels are not created and BGP routes are resolved without encapsulation.
Route Labels	Stack of labels carried in the BGP route update.
validation-state	<p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> • Invalid—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database. • Unknown—Indicates that the prefix is not among the prefixes or prefix ranges in the database. • Unverified—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers. • Valid—Indicates that the prefix and autonomous system pair are found in the database.
to	<p>Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.</p> <p>If the destination is Discard, traffic is dropped.</p>

Table 193: show route Output Fields (continued)

Field Name	Field Description
via	<p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word Selected. This field can also contain the following information:</p> <ul style="list-style-type: none"> • Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible. • Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing. • lsp-path-name—Name of the LSP used to reach the next hop. • label-action—MPLS label and operation occurring at the next hop. The operation can be pop (where a label is removed from the top of the stack), push (where another label is added to the label stack), or swap (where a label is replaced by another label). For VPNs, expect to see multiple push operations, corresponding to the inner and outer labels required for VPN routes (in the case of a direct PE-to-PE connection, the VPN route would have the inner label push only).
Private unicast	(Enhanced subscriber management for MX Series routers) Indicates that an access-internal route is managed by enhanced subscriber management. By contrast, access-internal routes <i>not</i> managed by enhanced subscriber management are displayed with associated next-hop and media access control (MAC) address information.
balance	Distribution of the load based on the underlying operational interface bandwidth for equal-cost multipaths (ECMP) across the nexthop gateways in percentages.

Sample Output

show route

```

user@host> show route

inet.0: 11 destinations, 12 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

1:65500:1:10.0.0.20/240
    *[MVPN/70] 19:53:41, metric2 1
    Indirect
1:65500:1:10.0.0.40/240

    > to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF
    [BGP/170] 19:53:25, localpref 100, from 10.0.0.33
    AS path: I
    > to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF

```

show route (VPN)

The following sample output shows a VPN route with composite next hops enabled. The first **Push** operation corresponds to the outer label. The second **Push** operation corresponds to the inner label.

```
user@host> show route 192.0.2.0
```

```

show route active-path

List of Syntax	Syntax on page 2279 Syntax (EX Series Switches) on page 2279
Syntax	<pre>show route active-path <brief detail extensive terse> <logical-system (all <i>logical-system-name</i>)></pre>
Syntax (EX Series Switches)	<pre>show route active-path <brief detail extensive terse></pre>
Release Information	<p>Command introduced in Junos OS Release 8.0.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p>
Description	Display all active routes for destinations. An active route is a route that is selected as the best path. Inactive routes are not displayed.
Options	<p>none—Display all active routes.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Required Privilege Level	view

show route advertising-protocol

Syntax	<code>show route advertising-protocol <i>protocol neighbor-address</i></code> <code><brief detail extensive terse></code> <code><logical-system (all <i>logical-system-name</i>)></code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display the routing information as it has been prepared for advertisement to a particular neighbor of a particular dynamic routing protocol.
Options	<p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><i>neighbor-address</i>—Address of the neighboring router to which the route entry is being transmitted.</p> <p><i>protocol</i>—Protocol transmitting the route:</p> <ul style="list-style-type: none">• bgp—Border Gateway Protocol• dvmrp—Distance Vector Multicast Routing Protocol• msdp—Multicast Source Discovery Protocol• pim—Protocol Independent Multicast• rip—Routing Information Protocol• ripng—Routing Information Protocol next generation
Additional Information	Routes displayed are routes that the routing table has exported into the routing protocol and that have been filtered by the associated protocol's export routing policy statements. Starting with Junos OS Release 13.3, you can display the routing instance table foo for any address family, on a VPN route reflector, or a VPN AS boundary router that is advertising local VPN routes. However, If you do not specify the table in the command, the output displays each VRF prefix twice.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• <i>Example: Configuring the MED Attribute That Determines the Exit Point in an AS</i>

Output Fields Table 194 on page 2285 lists the output fields for the **show route advertising-protocol** command. Output fields are listed in the approximate order in which they appear.

Table 194: show route advertising-protocol Output Fields

Field Name	Field Description	Level of Output
<i>routing-table-name</i>	Name of the routing table—for example, inet.0.	All levels
<i>number destinations</i>	Number of destinations for which there are routes in the routing table.	All levels
<i>number routes</i>	Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> • active (routes that are active) • holddown (routes that are in the pending state before being declared inactive) • hidden (routes that are not used because of a routing policy) 	All levels
Prefix	Destination prefix.	brief none
<i>destination-prefix (entry, announced)</i>	Destination prefix. The entry value is the number of routes for this destination, and the announced value is the number of routes being announced for this destination.	detail extensive
BGP group and type	BGP group name and type (Internal or External).	detail extensive
Route Distinguisher	Unique 64-bit prefix augmenting each IP subnet.	detail extensive
Advertised Label	Incoming label advertised by the Label Distribution Protocol (LDP). When an IP packet enters a label-switched path (LSP), the ingress router examines the packet and assigns it a label based on its destination, placing the label in the packet's header. The label transforms the packet from one that is forwarded based on its IP routing information to one that is forwarded based on information associated with the label.	detail extensive
Label-Base, range	First label in a block of labels and label block size. A remote PE router uses this first label when sending traffic toward the advertising PE router.	detail extensive
VPN Label	Virtual private network (VPN) label. Packets are sent between CE and PE routers by advertising VPN labels. VPN labels transit over either a Resource Reservation Protocol (RSVP) or a Label Distribution Protocol (LDP) label-switched path (LSP) tunnel.	detail extensive

Table 194: *show route advertising-protocol* Output Fields (continued)

Field Name	Field Description	Level of Output
Nexthop	<p>Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.</p> <p>If the next-hop advertisement to the peer is Self, and the RIB-out next hop is a specific IP address, the RIB-out IP address is included in the extensive output. See show route advertising-protocol bgp extensive all (Next Hop Self with RIB-out IP Address) on page 2289.</p>	All levels
MED	Multiple exit discriminator value included in the route.	brief
Lclpref or Localpref	Local preference value included in the route.	All levels
Queued	When BGP route prioritization is enabled and a route is present in a priority queue, this shows which priority queue the route is in.	All levels except brief
AS path	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> • I—IGP. • E—EGP. • ?—Incomplete; typically, the AS path was aggregated. <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> • []—Brackets enclose the local AS number associated with the AS path if configured on the router, or if AS path prepending is configured. • { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • ()—Parentheses enclose a confederation. • ([])—Parentheses and brackets enclose a confederation set. <p>NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>	All levels
Route Labels	Stack of labels carried in the BGP route update.	detail extensive
Cluster list	(For route reflected output only) Cluster ID sent by the route reflector.	detail extensive
Originator ID	(For route reflected output only) Address of routing device that originally sent the route to the route reflector.	detail extensive
Communities	Community path attribute for the route. See the output field table for the show route detail command for all possible values for this field.	detail extensive
AIGP	Accumulated interior gateway protocol (AIGP) BGP attribute.	detail extensive

Table 194: show route advertising-protocol Output Fields (continued)

Field Name	Field Description	Level of Output
Attrset AS	Number, local preference, and path of the autonomous system (AS) that originated the route. These values are stored in the Attrset attribute at the originating router.	detail extensive
Layer2-info:encaps	Layer 2 encapsulation (for example, VPLS).	detail extensive
control flags	Control flags: none or Site Down .	detail extensive
mtu	Maximum transmission unit (MTU) of the Layer 2 circuit.	detail extensive

show route all

List of Syntax	Syntax on page 2290 Syntax (EX Series Switches) on page 2290
Syntax	<pre>show route all <logical-system (all <i>logical-system-name</i>)></pre>
Syntax (EX Series Switches)	<pre>show route all</pre>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display information about all routes in all routing tables, including private, or internal, tables.
Options	none —Display information about all routes in all routing tables, including private, or internal, tables. logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• show route brief on page 2297• show route detail on page 2310
List of Sample Output	show route all on page 2290
Output Fields	In Junos OS Release 9.5 and later, only the output fields for the show route all command display all routing tables, including private, or hidden, routing tables. The output field table of the show route command does not display entries for private, or hidden, routing tables in Junos OS Release 9.5 and later.

Sample Output

show route all

The following example displays a snippet of output from the **show route** command and then displays the same snippet of output from the **show route all** command:

```
user@host> show route
```

```

mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
0          *[MPLS/0] 2d 02:24:39, metric 1
            Receive
1          *[MPLS/0] 2d 02:24:39, metric 1
            Receive
2          *[MPLS/0] 2d 02:24:39, metric 1
            Receive
800017     *[VPLS/7] 1d 14:00:16
            > via vt-3/2/0.32769, Pop
800018     *[VPLS/7] 1d 14:00:26
            > via vt-3/2/0.32772, Pop

```

```
user@host> show route all
```

```

mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
+ = Active Route, - = Last Active, * = Both
0          *[MPLS/0] 2d 02:19:12, metric 1
            Receive

show route aspath-regex

List of Syntax	Syntax on page 2292 Syntax (EX Series Switches) on page 2292
Syntax	<pre>show route aspath-regex <i>regular-expression</i> <logical-system (all <i>logical-system-name</i>)></pre>
Syntax (EX Series Switches)	<pre>show route aspath-regex <i>regular-expression</i></pre>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display the entries in the routing table that match the specified autonomous system (AS) path regular expression.
Options	<p><i>regular-expression</i>—Regular expression that matches an entire AS path.</p> <p><i>logical-system (all logical-system-name)</i>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Additional Information	<p>You can specify a regular expression as:</p> <ul style="list-style-type: none">• An individual AS number• A period wildcard used in place of an AS number• An AS path regular expression that is enclosed in parentheses <p>You also can include the operators described in the table of AS path regular expression operators in the <i>Junos Policy Framework Configuration Guide</i>. The following list summarizes these operators:</p> <ul style="list-style-type: none">• <i>{m,n}</i>—At least <i>m</i> and at most <i>n</i> repetitions of the AS path term.• <i>{m}</i>—Exactly <i>m</i> repetitions of the AS path term.• <i>{m,}</i>—<i>m</i> or more repetitions of the AS path term.• <i>*</i>—Zero or more repetitions of an AS path term.• <i>+</i>—One or more repetitions of an AS path term.• <i>?</i>—Zero or one repetition of an AS path term.• <i>aspath_term aspath_term</i>—Match one of the two AS path terms. <p>When you specify more than one AS number or path term, or when you include an operator in the regular expression, enclose the entire regular expression in quotation marks. For example, to match any path that contains AS number 234, specify the following command:</p>

```
show route aspath-regex ".* 234 .*"
```

Required Privilege Level view

show route community

List of Syntax [Syntax on page 2301](#)
 [Syntax \(EX Series Switches\) on page 2301](#)

Syntax `show route community as-number:community-value`
 `<brief | detail | extensive | terse>`
 `<logical-system (all | logical-system-name)>`

Syntax (EX Series Switches) `show route community as-number:community-value`
 `<brief | detail | extensive | terse>`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.

Description Display the route entries in each routing table that are members of a Border Gateway Protocol (BGP) community.

Options *as-number:community-value*—One or more community identifiers. *as-number* is the AS number, and *community-value* is the community identifier. When you specify more than one community identifier, enclose the identifiers in double quotation marks. Community identifiers can include wildcards.

For example:

```
user@host> show route table inet.0 protocol bgp community "12083:6015"
community "12083:65551"
```

or

```
user@host> show route table inet.0 protocol bgp community [12083:6014
12083:65551]
```

brief | detail | extensive | terse—(Optional) Display the specified level of output.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Additional Information Specifying the community option displays all routes matching the community found within the routing table. The community option does not limit the output to only the routes being advertised to the neighbor after any egress routing policy.

Output Fields Table 195 on page 2306 lists the output fields for the **show route damping** command. Output fields are listed in the approximate order in which they appear.

Table 195: show route damping Output Fields

Field Name	Field Description	Level of Output
<i>routing-table-name</i>	Name of the routing table—for example, inet.0 .	All levels
destinations	Number of destinations for which there are routes in the routing table.	All levels
<i>number routes</i>	Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> • active • holddown (routes that are in a pending state before being declared inactive) • hidden (the routes are not used because of a routing policy) 	All levels
<i>destination-prefix (entry, announced)</i>	Destination prefix. The entry value is the number of routes for this destination, and the announced value is the number of routes being announced for this destination.	detail extensive
<i>[protocol, preference]</i>	Protocol from which the route was learned and the preference value for the route. <ul style="list-style-type: none"> • +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • -—A hyphen indicates the last active route. • *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route. <p>In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.</p>	All levels
Next-hop reference count	Number of references made to the next hop.	detail extensive
Source	IP address of the route source.	detail extensive
Next hop	Network layer address of the directly reachable neighboring system.	detail extensive
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word Selected .	detail extensive
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.	detail extensive
Indirect next hop	Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.	detail extensive

Table 195: show route damping Output Fields (continued)

Field Name	Field Description	Level of Output
State	Flags for this route. For a description of possible values for this field, see the output field table for the show route detail command.	detail extensive
Local AS	AS number of the local routing device.	detail extensive
Peer AS	AS number of the peer routing device.	detail extensive
Age	How long the route has been known.	detail extensive
Metric	Metric for the route.	detail extensive
Task	Name of the protocol that has added the route.	detail extensive
Announcement bits	List of protocols that announce this route. n-Resolve inet indicates that the route is used for route resolution for next hops found in the routing table. n is an index used by Juniper Networks customer support only.	detail extensive
AS path	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> • I—IGP. • E—EGP. • ?—Incomplete; typically, the AS path was aggregated. <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> • []—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device or if AS path prepending is configured. • { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • ()—Parentheses enclose a confederation. • ([])—Parentheses and brackets enclose a confederation set. <p>NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>	All levels
to	Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.	brief none
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word Selected .	brief none
Communities	Community path attribute for the route. See the output field table for the show route detail command.	detail extensive

Table 195: show route damping Output Fields (continued)

Field Name	Field Description	Level of Output
Localpref	Local preference value included in the route.	All levels
Router ID	BGP router ID as advertised by the neighbor in the open message.	detail extensive
Merit (last update/now)	Last updated and current figure-of-merit value.	detail extensive
damping-parameters	Name that identifies the damping parameters used, which is defined in the damping statement at the [edit policy-options] hierarchy level.	detail extensive
Last update	Time of most recent change in path attributes.	detail extensive
First update	Time of first change in path attributes, which started the route damping process.	detail extensive
Flaps	Number of times the route has gone up or down or its path attributes have changed.	detail extensive
Suppressed	(suppressed keyword only) This route is currently suppressed. A suppressed route does not appear in the forwarding table and routing protocols do not export it.	All levels
Reusable in	(suppressed keyword only) Time when a suppressed route will again be available.	All levels
Preference will be	(suppressed keyword only) Preference value that will be applied to the route when it is again active.	All levels

Output Fields	<p>Table 196 on page 2310 describes the output fields for the show route detail command. Output fields are listed in the approximate order in which they appear.</p>

Table 196: show route detail Output Fields

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).
<i>number destinations</i>	Number of destinations for which there are routes in the routing table.

Table 196: show route detail Output Fields (continued)

Field Name	Field Description
<i>number routes</i>	<p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> • active (routes that are active) • holddown (routes that are in the pending state before being declared inactive) • hidden (routes that are not used because of a routing policy)
<i>route-destination</i> (entry, announced)	<p>Route destination (for example:10.0.0.1/24). The entry value is the number of routes for this destination, and the announced value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> • MPLS-label (for example, 80001). • interface-name (for example, ge-1/0/2). • neighbor-address:control-word-status:encapsulation type:vc-id:source (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> • neighbor-address—Address of the neighbor. • control-word-status—Whether the use of the control word has been negotiated for this virtual circuit: NoCtrlWord or CtrlWord. • encapsulation type—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport. • vc-id—Virtual circuit identifier. • source—Source of the advertisement: Local or Remote. • source—Source of the advertisement: Local or Remote.
<i>label stacking</i>	<p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> • S=0 route indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed). • If there is no S= information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).

Table 196: show route detail Output Fields (continued)

Field Name	Field Description
[protocol, preference]	<p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> • +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • - —A hyphen indicates the last active route. • *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route. <p>In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value.</p> <p>Preference2 values are signed integers, that is, Preference2 values can be either positive or negative values. However, Junos OS evaluates Preference2 values as unsigned integers that are represented by positive values. Based on the Preference2 values, Junos OS evaluates a preferred route differently in the following scenarios:</p> <ul style="list-style-type: none"> • Both Signed Preference2 values <ul style="list-style-type: none"> • Route A = -101 • Route B = -156 <p>Where both the Preference2 values are signed, Junos OS evaluates only the unsigned value of Preference2 and Route A, which has a lower Preference2 value is preferred.</p> • Unsigned Preference2 values <p>Now consider both unsigned Preference2 values:</p> <ul style="list-style-type: none"> • Route A = 4294967096 • Route B = 200 <p>Here, Junos OS considers the lesser Preference2 value and Route B with a Preference2 value of 200 is preferred because it is less than 4294967096.</p> • Combination of signed and unsigned Preference2 values <p>When Preference2 values of two routes are compared, and for one route the Preference2 is a signed value, and for the other route it is an unsigned value, Junos OS prefers the route with the positive Preference2 value over the negative Preference2 value. For example, consider the following signed and unsigned Preference2 values:</p> <ul style="list-style-type: none"> • Route A = -200 • Route B = 200 <p>In this case, Route B with a Preference2 value of 200 is preferred although this value is greater than -200, because Junos OS evaluates only the unsigned value of the Preference2 value.</p>
Level	(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.
Route Distinguisher	IP subnet augmented with a 64-bit prefix.
PMSI	Provider multicast service interface (MVPN routing table).

Table 196: show route detail Output Fields (continued)

Field Name	Field Description
Next-hop type	Type of next hop. For a description of possible values for this field, see Table 197 on page 2316 .
Next-hop reference count	Number of references made to the next hop.
Flood nexthop branches exceed maximum message	Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.
Source	IP address of the route source.
Next hop	Network layer address of the directly reachable neighboring system.
via	<p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word Selected. This field can also contain the following information:</p> <ul style="list-style-type: none"> • Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible. • Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.
Label-switched-path lsp-path-name	Name of the LSP used to reach the next hop.
Label operation	MPLS label and operation occurring at this routing device. The operation can be pop (where a label is removed from the top of the stack), push (where another label is added to the label stack), or swap (where a label is replaced by another label).
Interface	(Local only) Local interface name.
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.
Indirect next hop	Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.
State	State of the route (a route can be in more than one state). See Table 198 on page 2318 .
Local AS	AS number of the local routing device.
Age	How long the route has been known.
AIGP	Accumulated interior gateway protocol (AIGP) BGP attribute.

Table 196: show route detail Output Fields (continued)

Field Name	Field Description
Metric	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
MED-plus-IGP	Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.
TTL-Action	For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances. For sample output, see show route table .
Task	Name of the protocol that has added the route.
Announcement bits	The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the KRT for installing the route into the Packet Forwarding Engine, to a resolve tree, a L2 VC, or even a VPN. For example, n-Resolve inet indicates that the specified route is used for route resolution for next hops found in the routing table. <ul style="list-style-type: none"> n—An index used by Juniper Networks customer support only.
AS path	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> I—IGP. E—EGP. Recorded—The AS path is recorded by the sample process (sampled). ?—Incomplete; typically, the AS path was aggregated. <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> []—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893. []—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path. { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. ()—Parentheses enclose a confederation. ([])—Parentheses and brackets enclose a confederation set. <p>NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>

Table 196: show route detail Output Fields (continued)

Field Name	Field Description
validation-state	<p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> • Invalid—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database. • Unknown—Indicates that the prefix is not among the prefixes or prefix ranges in the database. • Unverified—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers. • Valid—Indicates that the prefix and autonomous system pair are found in the database.
ORR Generation-ID	Displays the optimal route reflection (ORR) generation identifier. ISIS and OSPF interior gateway protocol (IGP) updates filed whenever any of the corresponding ORR route has its metric valued changed, or if the ORR route is added or deleted.
FECs bound to route	Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.
Primary Upstream	When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.
RPF Nexthops	When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.
Label	Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.
weight	Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.
VC Label	MPLS label assigned to the Layer 2 circuit virtual connection.
MTU	Maximum transmission unit (MTU) of the Layer 2 circuit.
VLAN ID	VLAN identifier of the Layer 2 circuit.
Prefixes bound to route	Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.
Communities	Community path attribute for the route. See Table 199 on page 2320 for all possible values for this field.
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).
control flags	Control flags: none or Site Down .
mtu	Maximum transmission unit (MTU) information.

Table 196: show route detail Output Fields (continued)

Field Name	Field Description
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.
status vector	Layer 2 VPN and VPLS network layer reachability information (NLRI).
Accepted Multipath	Current active path when BGP multipath is configured.
Accepted LongLivedStale	The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.
Accepted LongLivedStaleImport	<p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.</p> <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table</p>
ImportAccepted LongLivedStaleImport	<p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table</p> <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.</p>
Accepted MultipathContrib	Path currently contributing to BGP multipath.
Localpref	Local preference value included in the route.
Router ID	BGP router ID as advertised by the neighbor in the open message.
Primary Routing Table	In a routing table group, the name of the primary routing table in which the route resides.
Secondary Tables	In a routing table group, the name of one or more secondary tables in which the route resides.

[Table 197 on page 2316](#) describes all possible values for the Next-hop Types output field.

Table 197: Next-hop Types Output Field Values

Next-Hop Type	Description
Broadcast (bcast)	Broadcast next hop.
Deny	Deny next hop.
Discard	Discard next hop.
Dynamic List	Dynamic list next hop

Table 197: Next-hop Types Output Field Values (continued)

Next-Hop Type	Description
Flood	Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast.
Hold	Next hop is waiting to be resolved into a unicast or multicast type.
Indexed (idxd)	Indexed next hop.
Indirect (indr)	Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.
Interface	Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.
Local (locl)	Local address on an interface. This next-hop type causes packets with this destination address to be received locally.
Multicast (mcst)	Wire multicast next hop (limited to the LAN).
Multicast discard (mdsc)	Multicast discard.
Multicast group (mgrp)	Multicast group member.
Receive (recv)	Receive.
Reject (rjct)	Discard. An ICMP unreachable message was sent.
Resolve (rslv)	Resolving next hop.
Routed multicast (mcrt)	Regular multicast next hop.
Router	<p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> • Must not be a direct or local subnet for the routing device. • Must have a next hop that is directly connected to the routing device.
Table	Routing table next hop.

Table 197: Next-hop Types Output Field Values (continued)

Next-Hop Type	Description
Unicast (ucst)	Unicast.
Unilist (ulst)	List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.

Table 198 on page 2318 describes all possible values for the State output field. A route can be in more than one state (for example, **<Active NoReadvrt Int Ext>**).

Table 198: State Output Field Values

Value	Description
Accounting	Route needs accounting.
Active	Route is active.
Always Compare MED	Path with a lower multiple exit discriminator (MED) is available.
AS path	Shorter AS path is available.
Cisco Non-deterministic MED selection	Cisco nondeterministic MED is enabled, and a path with a lower MED is available.
Clone	Route is a clone.
Cluster list length	Length of cluster list sent by the route reflector.
Delete	Route has been deleted.
Ex	Exterior route.
Ext	BGP route received from an external BGP neighbor.
FlashAll	Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes.
Hidden	Route not used because of routing policy.
IfCheck	Route needs forwarding RPF check.
IGP metric	Path through next hop with lower IGP metric is available.
Inactive reason	Flags for this route, which was not selected as best for a particular destination.
Initial	Route being added.

Table 198: State Output Field Values (continued)

Value	Description
Int	Interior route.
Int Ext	BGP route received from an internal BGP peer or a BGP confederation peer.
Interior > Exterior > Exterior via Interior	Direct, static, IGP, or EBGp path is available.
Local Preference	Path with a higher local preference value is available.
Martian	Route is a martian (ignored because it is obviously invalid).
MartianOK	Route exempt from martian filtering.
Next hop address	Path with lower metric next hop is available.
No difference	Path from neighbor with lower IP address is available.
NoReadvrt	Route not to be advertised.
NotBest	Route not chosen because it does not have the lowest MED.
Not Best in its group	Incoming BGP AS is not the best of a group (only one AS can be the best).
NotInstall	Route not to be installed in the forwarding table.
NSR-incapable	Route added by non-NSR supported protocols.
Number of gateways	Path with a greater number of next hops is available.
Origin	Path with a lower origin code is available.
Pending	Route pending because of a hold-down configured on another route.
Programmed	Route installed programatically by on-box or off-box applications using API.
Release	Route scheduled for release.
RIB preference	Route from a higher-numbered routing table is available.
Route Distinguisher	64-bit prefix added to IP subnets to make them unique.
Route Metric or MED comparison	Route with a lower metric or MED is available.
Route Preference	Route with lower preference value is available

Table 198: State Output Field Values (continued)

Value	Description
Router ID	Path through a neighbor with lower ID is available.
Secondary	Route not a primary route.
Unusable path	Path is not usable because of one of the following conditions: <ul style="list-style-type: none"> • The route is damped. • The route is rejected by an import policy. • The route is unresolved.
Update source	Last tiebreaker is the lowest IP address value.
ProtectionCand	Indicates paths requesting protection.
ProtectionPath	Indicates the route entry that can be used as a protection path.

[Table 199 on page 2320](#) describes the possible values for the Communities output field.

Table 199: Communities Output Field Values

Value	Description
<i>area-number</i>	4 bytes, encoding a 32-bit area number. For AS-external routes, the value is 0 . A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.
bandwidth: local AS number:link-bandwidth-number	Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute.
domain-id	Unique configurable number that identifies the OSPF domain.
domain-id-vendor	Unique configurable number that further identifies the OSPF domain.
<i>link-bandwidth-number</i>	Link-bandwidth number: from 0 through 4,294,967,295 (bytes per second).
<i>local AS number</i>	Local AS number: from 1 through 65,535 .
<i>options</i>	1 byte. Currently this is only used if the route type is 5 or 7 . Setting the least significant bit in the field indicates that the route carries a type 2 metric.
origin	(Used with VPNs) Identifies where the route came from.
<i>ospf-route-type</i>	1 byte, encoded as 1 or 2 for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); 3 for summary routes; 5 for external routes (area number must be 0); 7 for NSSA routes; or 129 for sham link endpoint addresses.

Table 199: Communities Output Field Values (continued)

Value	Description
route-type-vendor	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x8000 . The format is area-number:ospf-route-type:options .
rte-type	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x0306 . The format is area-number:ospf-route-type:options .
target	Defines which VPN the route participates in; target has the format 32-bit IP address:16-bit number . For example, 10.19.0.0:100.
unknown IANA	Incoming IANA codes with a value between 0x1 and 0x7fff . This code of the BGP extended community attribute is accepted, but it is not recognized.
unknown OSPF vendor community	Incoming IANA codes with a value above 0x8000 . This code of the BGP extended community attribute is accepted, but it is not recognized.

show route export

List of Syntax	Syntax on page 2332 Syntax (EX Series Switches) on page 2332
Syntax	<pre>show route export <brief detail> <instance <instance-name> routing-table-name> <logical-system (all logical-system-name)></pre>
Syntax (EX Series Switches)	<pre>show route export <brief detail> <instance <instance-name> routing-table-name></pre>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display policy-based route export information. Policy-based export simplifies the process of exchanging route information between routing instances.
Options	<p>none—(Same as brief.) Display standard information about policy-based export for all instances and routing tables on all systems.</p> <p>brief detail—(Optional) Display the specified level of output.</p> <p>instance <instance-name>—(Optional) Display a particular routing instance for which policy-based export is currently enabled.</p> <p>logical-system (all logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>routing-table-name—(Optional) Display information about policy-based export for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the show route export inet command).</p>
Required Privilege Level	view
List of Sample Output	show route export on page 2333 show route export detail on page 2333 show route export instance detail on page 2334
Output Fields	Table 200 on page 2333 lists the output fields for the show route export command. Output fields are listed in the approximate order in which they appear.

Table 200: show route export Output Fields

Field Name	Field Description	Level of Output
Table or <i>table-name</i>	Name of the routing tables that either import or export routes.	All levels
Routes	Number of routes exported from this table into other tables. If a particular route is exported to different tables, the counter will only increment by one.	brief none
Export	Whether the table is currently exporting routes to other tables: Y or N (Yes or No).	brief none
Import	Tables currently importing routes from the originator table. (Not displayed for tables that are not exporting any routes.)	detail
Flags	(instance keyword only) Flags for this feature on this instance: <ul style="list-style-type: none"> config auto-policy—The policy was deduced from the configured IGP export policies. cleanup—Configuration information for this instance is no longer valid. config—The instance was explicitly configured. 	detail
Options	(instance keyword only) Configured option displays the type of routing tables the feature handles: <ul style="list-style-type: none"> unicast—Indicates <i>instance.inet.0</i>. multicast—Indicates <i>instance.inet.2</i>. unicast multicast—Indicates <i>instance.inet.0</i> and <i>instance.inet.2</i>. 	detail
Import policy	(instance keyword only) Policy that route export uses to construct the import-export matrix. Not displayed if the instance type is vrf .	detail
Instance	(instance keyword only) Name of the routing instance.	detail
Type	(instance keyword only) Type of routing instance: forwarding , non-forwarding , or vrf .	detail

Sample Output

show route export

```
user@host> show route export
```

Table	Export	Routes
inet.0	N	0
black.inet.0	Y	3
red.inet.0	Y	4

show route export detail

```
user@host> show route export detail
```

inet.0	Routes:	0
black.inet.0	Routes:	3
Import: [inet.0]		

red.inet.0	Routes:	4
Import: [inet.0]		

show route export instance detail

```
user@host> show route export instance detail
```

Instance: master	Type: forwarding
Flags: <config auto-policy>	Options: <unicast multicast>
Import policy: [(ospf-master-from-red isis-master-from-black)]	
Instance: black	Type: non-forwarding
Instance: red	Type: non-forwarding

show route export vrf-target

Syntax `show route export vrf-target`
`<brief | detail>`
`<community community--regular-expression>`
`<logical-system (all | logical-system-name)>`

Release Information Command introduced before Junos OS Release 7.4.

Description Display the VPN routing and forwarding (VRF) target communities for which policy-based route export is currently distributing routes. This command is relevant when there are overlapping virtual private networks (VPNs).

Options **none**—Display standard information about all target communities.

brief | detail—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

community *community--regular-expression*—(Optional) Display information about the specified community.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output [show route export vrf-target on page 2336](#)
[show route export vrf-target community on page 2336](#)
[show route export vrf-target detail on page 2336](#)

Output Fields [Table 201 on page 2335](#) lists the output fields for the **show route export vrf-target** command. Output fields are listed in the approximate order in which they appear.

Table 201: show route export vrf-target Output Fields

Field Name	Field Description	Level of Output
Route target	Target communities for which auto-export is currently distributing routes.	brief none
Family	Routing table entries for the specified family.	brief none
<i>type-of-routing-table(s)</i>	Type of routing tables the feature handles: <ul style="list-style-type: none"> unicast—Indicates <i>instance.inet.0</i>. multicast—Indicates <i>instance.inet.2</i>. unicast multicast—Indicates <i>instance.inet.0</i> and <i>instance.inet.2</i>. 	brief none

Table 201: show route export vrf-target Output Fields (continued)

Field Name	Field Description	Level of Output
Import	Number of routing tables that are currently importing routes with this target community. Omitted for tables that are not importing routes.	brief none
Export	Number of routing tables that are currently exporting routes with this target community. Omitted for tables that are not exporting routes.	brief none
Target	Target communities, family, and options for which auto-export is currently distributing routes.	detail
Import table(s)	Name of the routing tables that are importing a particular route target.	detail
Export table(s)	Name of the routing tables that are exporting a particular route target.	detail

Sample Output

show route export vrf-target

```
user@host> show route export vrf-target
```

Route	Target	Family		Import	Export
69:1		inet	unicast	2	2
69:2		inet	unicast	2	2

show route export vrf-target community

```
user@host> show route export vrf-target community target:69:1
```

Route	Target	Family		Import	Export
69:1		inet	unicast	2	2

show route export vrf-target detail

```
user@host> show route export vrf-target detail
```

```
Target: 1:12                                inet    unicast

Output Fields	<p>Table 202 on page 2337 describes the output fields for the show route extensive command. Output fields are listed in the approximate order in which they appear.</p>

Table 202: show route extensive Output Fields

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).

Table 202: show route extensive Output Fields (continued)

Field Name	Field Description
<i>number destinations</i>	Number of destinations for which there are routes in the routing table.
<i>number routes</i>	<p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> • active (routes that are active). • holddown (routes that are in the pending state before being declared inactive). • hidden (routes that are not used because of a routing policy).
<i>route-destination</i> (entry, announced)	<p>Route destination (for example: 10.0.0.1/24). The entry value is the number of route for this destination, and the announced value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> • MPLS-label (for example, 80001). • interface-name (for example, ge-1/0/2). • neighbor-address:control-word-status:encapsulation type:vc-id:source (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> • neighbor-address—Address of the neighbor. • control-word-status—Whether the use of the control word has been negotiated for this virtual circuit: NoCtrlWord or CtrlWord. • encapsulation type—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport. • vc-id—Virtual circuit identifier. • source—Source of the advertisement: Local or Remote.
TSI	Protocol header information.
label stacking	<p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> • S=0 route indicates that a packet with an incoming label stack depth of two or more exits this router with one fewer label (the label-popping operation is performed). • If there is no S= information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).
[protocol, preference]	<p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> • +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • —A hyphen indicates the last active route. • *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route. <p>In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.</p>

Table 202: show route extensive Output Fields (continued)

Field Name	Field Description
Level	(IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.
Route Distinguisher	IP subnet augmented with a 64-bit prefix.
PMSI	Provider multicast service interface (MVPN routing table).
Next-hop type	Type of next hop. For a description of possible values for this field, see the Output Field table in the show route detail command.
Next-hop reference count	Number of references made to the next hop.
Flood nexthop branches exceed maximum message	Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.
Source	IP address of the route source.
Next hop	Network layer address of the directly reachable neighboring system.
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word Selected . This field can also contain the following information: <ul style="list-style-type: none"> • Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible. • Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.
Label-switched-path lsp-path-name	Name of the LSP used to reach the next hop.
Label operation	MPLS label and operation occurring at this routing device. The operation can be pop (where a label is removed from the top of the stack), push (where another label is added to the label stack), or swap (where a label is replaced by another label).
Offset	Whether the metric has been increased or decreased by an offset value.
Interface	(Local only) Local interface name.
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop.

Table 202: *show route extensive Output Fields (continued)*

Field Name	Field Description
<i>label-operation</i>	MPLS label and operation occurring at this routing device. The operation can be pop (where a label is removed from the top of the stack), push (where another label is added to the label stack), or swap (where a label is replaced by another label).
Indirect next hops	<p>When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved.</p> <p>When BGP PIC Edge is enabled, the output lines that contain Indirect next hop: weight follow next hops that the software can use to repair paths where a link failure occurs. The next-hop weight has one of the following values:</p> <ul style="list-style-type: none">• 0x1 indicates active next hops.• 0x4000 indicates passive next hops.
State	State of the route (a route can be in more than one state). See the Output Field table in the show route detail command.
Session ID	The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA).
Weight	<p>Weight for the backup path. If the weight of an indirect next hop is larger than zero, the weight value is shown.</p> <p>For sample output, see show route table.</p>

Table 202: show route extensive Output Fields (continued)

Field Name	Field Description
Inactive reason	<p>If the route is inactive, the reason for its current state is indicated. Typical reasons include:</p> <ul style="list-style-type: none"> • Active preferred—Currently active route was selected over this route. • Always compare MED—Path with a lower multiple exit discriminator (MED) is available. • AS path—Shorter AS path is available. • Cisco Non-deterministic MED selection—Cisco nondeterministic MED is enabled and a path with a lower MED is available. • Cluster list length—Path with a shorter cluster list length is available. • Forwarding use only—Path is only available for forwarding purposes. • IGP metric—Path through the next hop with a lower IGP metric is available. • IGP metric type—Path with a lower OSPF link-state advertisement type is available. • Interior > Exterior > Exterior via Interior—Direct, static, IGP, or EBGP path is available. • Local preference—Path with a higher local preference value is available. • Next hop address—Path with a lower metric next hop is available. • No difference—Path from a neighbor with a lower IP address is available. • Not Best in its group—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process. When this reason is displayed, an additional reason is provided (typically one of the other reasons listed). • Number of gateways—Path with a higher number of next hops is available. • Origin—Path with a lower origin code is available. • OSPF version—Path does not support the indicated OSPF version. • RIB preference—Route from a higher-numbered routing table is available. • Route distinguisher—64-bit prefix added to IP subnets to make them unique. • Route metric or MED comparison—Route with a lower metric or MED is available. • Route preference—Route with a lower preference value is available. • Router ID—Path through a neighbor with a lower ID is available. • Unusable path—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved. • Update source—Last tiebreaker is the lowest IP address value.
Local AS	Autonomous system (AS) number of the local routing device.
Age	How long the route has been known.
AIGP	Accumulated interior gateway protocol (AIGP) BGP attribute.
Metric	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
MED-plus-IGP	Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.
TTL-Action	<p>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.</p> <p>For sample output, see show route table.</p>

Table 202: show route extensive Output Fields (continued)

Field Name	Field Description
Task	Name of the protocol that has added the route.
Announcement bits	<p>List of protocols that are consumers of the route. Using the following output as an example, Announcement bits (3): 0-KRT 5-Resolve tree 2 8-BGP RT Background there are (3) announcement bits to reflect the three clients (protocols) that have state for this route: Kernel (0-KRT), 5 (resolution tree process 2), and 8 (BGP).</p> <p>The notation <i>n</i>-Resolve inet indicates that the route is used for route resolution for next hops found in the routing table. <i>n</i> is an index used by Juniper Networks customer support only.</p>
AS path	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> • I—IGP. • E—EGP. • Recorded—The AS path is recorded by the sample process (sampled). • ?—Incomplete; typically, the AS path was aggregated. <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> • []—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured. • { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • ()—Parentheses enclose a confederation. • ([])—Parentheses and brackets enclose a confederation set. <p>NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>
validation-state	<p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> • Invalid—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database. • Unknown—Indicates that the prefix is not among the prefixes or prefix ranges in the database. • Unverified—Indicates that origin validation is not enabled for the BGP peers. • Valid—Indicates that the prefix and autonomous system pair are found in the database.
FECs bound to route	Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.
AS path: I <Originator>	(For route reflected output only) Originator ID attribute set by the route reflector.

Table 202: show route extensive Output Fields (continued)

Field Name	Field Description
route status	<p>Indicates the status of a BGP route:</p> <ul style="list-style-type: none"> • Accepted—The specified BGP route is imported by the default BGP policy. • Import—The route is imported into a Layer 3 VPN routing instance. • Import-Protect—A remote instance egress that is protected. • Multipath—A BGP multipath active route. • MultipathContrib—The route is not active but contributes to the BGP multipath. • Protect—An egress route that is protected. • Stale—A route that is marked stale due to graceful restart.
Primary Upstream	When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.
RPF Nexthops	When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.
Label	Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.
weight	Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.
VC Label	MPLS label assigned to the Layer 2 circuit virtual connection.
MTU	Maximum transmission unit (MTU) of the Layer 2 circuit.
VLAN ID	VLAN identifier of the Layer 2 circuit.
Cluster list	(For route reflected output only) Cluster ID sent by the route reflector.
Originator ID	(For route reflected output only) Address of router that originally sent the route to the route reflector.
Prefixes bound to route	Forwarding Equivalent Class (FEC) bound to this route. Applicable only to routes installed by LDP.
Communities	Community path attribute for the route. See the Output Field table in the show route detail command for all possible values for this field.
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).
control flags	Control flags: none or Site Down.
mtu	Maximum transmission unit (MTU) information.
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.

Table 202: show route extensive Output Fields (continued)

Field Name	Field Description
status vector	Layer 2 VPN and VPLS network layer reachability information (NLRI).
Localpref	Local preference value included in the route.
Router ID	BGP router ID as advertised by the neighbor in the open message.
Primary Routing Table	In a routing table group, the name of the primary routing table in which the route resides.
Secondary Tables	In a routing table group, the name of one or more secondary tables in which the route resides.
Originating RIB	Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of inet.0 resolving through inet.0 and inet.3, this field indicates which routing table, inet.0 or inet.3, provided the best path for a particular prefix.
Node path count	Number of nodes in the path.
Forwarding nexthops	Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.

show route flow validation

List of Syntax	Syntax on page 2356 Syntax (EX Series Switches) on page 2356
Syntax	<pre>show route flow validation <brief detail> <ip-prefix> <table table-name> <logical-system (all logical-system-name)></pre>
Syntax (EX Series Switches)	<pre>show route flow validation <brief detail> <ip-prefix> <table table-name></pre>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display flow route information.
Options	<p>none—Display flow route information.</p> <p>brief detail—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.</p> <p>ip-prefix—(Optional) IP address for the flow route.</p> <p>logical-system (all logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>table table-name—(Optional) Display flow route information for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the show route flow validation inet command).</p>
Required Privilege Level	view
List of Sample Output	show route flow validation on page 2357 show route flow validation (IPv6) on page 2357
Output Fields	Table 203 on page 2357 lists the output fields for the show route flow validation command. Output fields are listed in the approximate order in which they appear.

Table 203: show route flow validation Output Fields

Field Name	Field Description	Level of Output
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).	All levels
<i>prefix</i>	Route address.	All levels
Active unicast route	Active route in the routing table.	All levels
Dependent flow destinations	Number of flows for which there are routes in the routing table.	All levels
Origin	Source of the route flow.	All levels
Neighbor AS	Autonomous system identifier of the neighbor.	All levels
Flow destination	Number of entries and number of destinations that match the route flow.	All levels
Unicast best match	Destination that is the best match for the route flow.	All levels
Flags	Information about the route flow.	All levels

Sample Output

show route flow validation

```

user@host> show route flow validation

inet.0:
10.0.5.0/24Active unicast route
Dependent flow destinations: 1
Origin: 192.168.224.218, Neighbor AS: 64501
Flow destination (3 entries, 1 match origin)
Unicast best match: 10.0.5.0/24
Flags: SubtreeApex Consistent

```

show route flow validation (IPv6)

```

user@host> show route flow validation

inet6.0:
2001:db8::11:11:11:0/120
    Active unicast route
    Dependent flow destinations: 2
    Origin: 2001:db8::13:14:2:2, Neighbor AS: 2000
2001:db8::11:11:11:10/128
    Flow destination (1 entries, 1 match origin, next-as)
    Unicast best match: 2001:db8::11:11:11:0/120
    Flags: Consistent
2001:db8::11:11:11:30/128
    Flow destination (1 entries, 1 match origin, next-as)

```

Unicast best match: 2001:db8::11:11:11:0/120
Flags: Consistent

Release Information Command introduced before Junos OS Release 7.4.
Option **bridge-domain** introduced in Junos OS Release 7.5
Option **learning-vlan-id** introduced in Junos OS Release 8.4
Options **all** and **vlan** introduced in Junos OS Release 9.6.
Command introduced in Junos OS Release 11.3 for the QFX Series.
Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Description Display the Routing Engine's forwarding table, including the network-layer prefixes and their next hops. This command is used to help verify that the routing protocol process has relayed the correction information to the forwarding table. The Routing Engine constructs and maintains one or more routing tables. From the routing tables, the Routing Engine derives a table of active routes, called the forwarding table.

NOTE: The Routing Engine copies the forwarding table to the Packet Forwarding Engine, the part of the router that is responsible for forwarding packets. To display the entries in the Packet Forwarding Engine's forwarding table, use the **show pfe route** command.

Options **none**—Display the routes in the forwarding tables. By default, the **show route forwarding-table** command does not display information about private, or internal, forwarding tables.

detail | extensive | summary—(Optional) Display the specified level of output.

all—(Optional) Display routing table entries for all forwarding tables, including private, or internal, tables.

bridge-domain (all | bridge-domain-name)—(MX Series routers only) (Optional) Display route entries for all bridge domains or the specified bridge domain.

ccc interface-name—(Optional) Display route entries for the specified circuit cross-connect interface.

destination destination-prefix—(Optional) Destination prefix.

family family—(Optional) Display routing table entries for the specified family: **bridge (ccc | destination | detail | extensive | interface-name | label | learning-vlan-id | matching | multicast | summary | table | vlan | vpn)**, **ethernet-switching**, **evpn**, **fibre-channel**, **fmembers**, **inet**, **inet6**, **iso**, **mcsnoop-inet**, **mcsnoop-inet6**, **mpls**, **satellite-inet**, **satellite-inet6**, **satellite-vpls**, **tnp**, **unix**, **vpls**, or **vlan-classification**.

interface-name interface-name—(Optional) Display routing table entries for the specified interface.

label name—(Optional) Display route entries for the specified label.

lcc number—(TX Matrix and TX matrix Plus routers only) (Optional) On a routing matrix composed of a TX Matrix router and T640 routers, display information for the

specified T640 router (or line-card chassis) connected to the TX Matrix router. On a routing matrix composed of the TX Matrix Plus router and T1600 or T4000 routers, display information for the specified router (line-card chassis) connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

learning-vlan-id *learning-vlan-id*—(MX Series routers only) (Optional) Display learned information for all VLANs or for the specified VLAN.

matching *matching*—(Optional) Display routing table entries matching the specified prefix or prefix length.

multicast—(Optional) Display routing table entries for multicast routes.

table —(Optional) Display route entries for all the routing tables in the main routing instance or for the specified routing instance. If your device supports logical systems, you can also display route entries for the specified logical system and routing instance. To view the routing instances on your device, use the [show route instance](#) command.

vlan (all | *vlan-name*)—(Optional) Display information for all VLANs or for the specified VLAN.

vpn *vpn*—(Optional) Display routing table entries for a specified VPN.

Required Privilege Level

Output Fields [Table 204 on page 2362](#) lists the output fields for the **show route forwarding-table** command. Output fields are listed in the approximate order in which they appear. Field names might be abbreviated (as shown in parentheses) when no level of output is specified, or when the **detail** keyword is used instead of the **extensive** keyword.

Table 204: show route forwarding-table Output Fields

Field Name	Field Description	Level of Output
Logical system	Name of the logical system. This field is displayed if you specify the table logical-system-name/routing-instance-name option on a device that is configured for and supports logical systems.	All levels
Routing table	Name of the routing table (for example, inet, inet6, mpls).	All levels

Table 204: show route forwarding-table Output Fields (continued)

Field Name	Field Description	Level of Output
Enabled protocols	<p>The features and protocols that have been enabled for a given routing table. This field can contain the following values:</p> <ul style="list-style-type: none"> • BUM hashing—BUM hashing is enabled. • MAC Stats—Mac Statistics is enabled. • Bridging—Routing instance is a normal layer 2 bridge. • No VLAN—No VLANs are associated with the bridge domain. • All VLANs—The vlan-id all statement has been enabled for this bridge domain. • Single VLAN—Single VLAN ID is associated with the bridge domain. • MAC action drop—New MACs will be dropped when the MAC address limit is reached. • Dual VLAN—Dual VLAN tags are associated with the bridge domain • No local switching—No local switching is enabled for this routing instance.. • Learning disabled—Layer 2 learning is disabled for this routing instance. • MAC limit reached—The maximum number of MAC addresses that was configured for this routing instance has been reached. • VPLS—The VPLS protocol is enabled. • No IRB I2-copy—The no-irb-layer-2-copy feature is enabled for this routing instance. • ACKed by all peers—All peers have acknowledged this routing instance. • BUM Pruning—BUM pruning is enabled on the VPLS instance. • Def BD VXLAN—VXLAN is enabled for the default bridge domain. • EVPN—EVPN protocol is enabled for this routing instance. • Def BD OVSDb—Open vSwitch Database (OVSDb) is enabled on the default bridge domain. • Def BD Ingress replication—VXLAN ingress node replication is enabled on the default bridge domain. • L2 backhaul—Layer 2 backhaul is enabled. • FRR optimize—Fast reroute optimization • MAC pinning—MAC pinning is enabled for this bridge domain. • MAC Aging Timer—The MAC table aging time is set per routing instance. • EVPN VXLAN—This routing instance supports EVPN with VXLAN encapsulation. • PBBN—This routing instance is configured as a provider backbone bridged network. • PBN—This routing instance is configured as a provider bridge network. • ETREE—The ETREE protocol is enabled on this EVPN routing instance. • ARP/NDP suppression—EVPN ARP NDP suppression is enabled in this routing instance. • Def BD EVPN VXLAN—EVPN VXLAN is enabled for the default bridge domain. • MPLS control word—Control word is enabled for this MPLS routing instance. 	All levels
Address family	Address family (for example, IP, IPv6, ISO, MPLS, and VPLS).	All levels
Destination	Destination of the route.	detail extensive

Table 204: *show route forwarding-table* Output Fields (continued)

Field Name	Field Description	Level of Output
Route Type (Type)	<p>How the route was placed into the forwarding table. When the detail keyword is used, the route type might be abbreviated (as shown in parentheses):</p> <ul style="list-style-type: none"> • cloned (clon)—(TCP or multicast only) Cloned route. • destination (dest)—Remote addresses directly reachable through an interface. • destination down (iddn)—Destination route for which the interface is unreachable. • interface cloned (ifcl)—Cloned route for which the interface is unreachable. • route down (ifdn)—Interface route for which the interface is unreachable. • ignore (ignr)—Ignore this route. • interface (intf)—Installed as a result of configuring an interface. • permanent (perm)—Routes installed by the kernel when the routing table is initialized. • user—Routes installed by the routing protocol process or as a result of the configuration. 	All levels
Route Reference (RtRef)	Number of routes to reference.	detail extensive
Flags	<p>Route type flags:</p> <ul style="list-style-type: none"> • none—No flags are enabled. • accounting—Route has accounting enabled. • cached—Cache route. • incoming-iface interface-number—Check against incoming interface. • prefix load balance—Load balancing is enabled for this prefix. • rt nh decoupled—Route has been decoupled from the next hop to the destination. • sent to PFE—Route has been sent to the Packet Forwarding Engine. • static—Static route. 	extensive
Next hop	IP address of the next hop to the destination.	detail extensive

Table 204: show route forwarding-table Output Fields (continued)

Field Name	Field Description	Level of Output
Next hop Type (Type)	<p>Next-hop type. When the detail keyword is used, the next-hop type might be abbreviated (as indicated in parentheses):</p> <ul style="list-style-type: none"> • broadcast (bcst)—Broadcast. • deny—Deny. • discard (dscd)—Discard. • hold—Next hop is waiting to be resolved into a unicast or multicast type. • indexed (idxd)—Indexed next hop. • indirect (indr)—Indirect next hop. • local (locl)—Local address on an interface. • routed multicast (mcrst)—Regular multicast next hop. • multicast (mcst)—Wire multicast next hop (limited to the LAN). • multicast discard (mdsc)—Multicast discard. • multicast group (mgrp)—Multicast group member. • receive (rcv)—Receive. • reject (rjct)—Discard. An ICMP unreachable message was sent. • resolve (rslv)—Resolving the next hop. • unicast (ucst)—Unicast. • unilist (ulst)—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list. 	detail extensive
Index	Software index of the next hop that is used to route the traffic for a given prefix.	detail extensive none
Route interface-index	Logical interface index from which the route is learned. For example, for interface routes, this is the logical interface index of the route itself. For static routes, this field is zero. For routes learned through routing protocols, this is the logical interface index from which the route is learned.	extensive
Reference (NhRef)	Number of routes that refer to this next hop.	detail extensive none
Next-hop interface (Netif)	Interface used to reach the next hop.	detail extensive none
Weight	Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible (see the Balance field description).	extensive
Balance	Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a router is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.	extensive
RPF interface	List of interfaces from which the prefix can be accepted. Reverse path forwarding (RPF) information is displayed only when rpf-check is configured on the interface.	extensive

show route forwarding-table extensive (RPF)

The next example is based on the following configuration, which enables an RPF check on all routes that are learned from this interface, including the interface route:

```

so-1/1/0 {
  unit 0 {
    family inet {
      rpf-check;
      address 192.0.2.2/30;
    }
  }
}

```

```
}
}
```

```
user@host> show route forwarding-table extensive
```

```
Routing table: inet [Index 0]
Internet:
...
...
Destination: 192.0.2.3/32
Route type: destination
Route reference: 0                      Route interface-index: 67
Flags: sent to PFE
Nexthop: 192.0.2.3
Next-hop type: broadcast                Index: 328      Reference: 1
Next-hop interface: so-1/1/0.0
RPF interface: so-1/1/0.0
```

show route forwarding-table (dynamic list next hop)

The **show route forwarding table** output shows the two next hop elements for a multihomed EVPN destination.

```
user@host> show route forwarding-table label 299952 extensive
```

```
MPLS:

Destination: 299952
Route type: user
Route reference: 0                      Route interface-index: 0
Multicast RPF nh index: 0

show route forwarding-table interface-name

Syntax `show route forwarding-table interface-name interface-name`
`<detail | extensive>`
`<all>`

Release Information Command introduced in Junos OS Release 9.6.

Description Display the interfaces in the Routing Engine's forwarding table.

Options **none**—Display information for the specified interface.

detail | extensive—(Optional) Display the specified level of output.

all—(Optional) Display all interfaces in the routing table.

Required Privilege Level view

List of Sample Output [show route forwarding-table interface-name fe-0/1/1 on page 2378](#)
[show route forwarding-table interface-name all on page 2378](#)
[show route forwarding-table interface-name all detail on page 2379](#)

Output Fields [Table 205 on page 2377](#) lists the output fields for the **show route forwarding-table interface-name** command. Output fields are listed in the approximate order in which they appear.

Table 205: show route forwarding-table interface-name Output Fields

Field Name	Field Description	Level of Output
Name	Name of the interface (for example fe-0/1/1 , lo0 , ae0 , and so on).	All levels
MTU	Interface's maximum transmission unit (MTU).	All levels
Afam	Configured address family (for example inet , tnp , inet6 , and so on).	detail extensive
Network	Network information: <ul style="list-style-type: none"> • <Link>—Physical interface, not a logical interface. • <PtoP>—Point-to-point network. • ipaddress—Network address. 	All levels
Address	Address of the interface. The address can be a MAC address, IPv4 address, IPv6 address, and so on.	All levels
IPkts	Number of packets received on the interface.	All levels
Ierr	Number of packets received on the interface with errors.	All levels

Table 205: show route forwarding-table interface-name Output Fields (continued)

Field Name	Field Description	Level of Output
Opkts	Number of packets transmitted or sent from the interface.	All levels
Oerr	Number of packets transmitted or sent from the interface with errors.	All levels
Coll	Number of packets that experienced collisions on the interface.	All levels

Sample Output

show route forwarding-table interface-name fe-0/1/1

```
user@host> show route forwarding-table interface-name fe-0/1/1
```

Name	Mtu	Network	Address	Ipkts	Ierr	Opkts	Oerr	Coll
fe-0/1/1	1514	<Link>	00.05.85.88.cc.20	0	0	0	0	0

show route forwarding-table interface-name all

```
user@host> show route forwarding-table interface-name all
```

show route hidden

Syntax	<code>show route hidden</code> <code><brief detail extensive terse></code> <code><logical-system (all <i>logical-system-name</i>)></code>
Release Information	Command introduced before Junos OS Release 7.4.
Description	Display only hidden route information. A hidden route is unusable, even if it is the best path.
Options	brief detail extensive terse —(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief . logical-system (all <i>logical-system-name</i>) —(Optional) Perform this operation on all logical systems or on a particular logical system.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none">• Understanding Hidden Routes
List of Sample Output	show route hidden on page 2380 show route hidden detail on page 2381 show route hidden extensive on page 2381 show route hidden terse on page 2382
Output Fields	For information about output fields, see the output field table for the show route command, the show route detail command, the show route extensive command, or the show route terse command.

Sample Output

Table 206: show route instance Output Fields

Field Name	Field Description	Level of Output
Instance or <i>instance-name</i>	Name of the routing instance.	All levels
Operational Routing Instances	(operational keyword only) Names of all operational routing instances.	—
Type	Type of routing instance: forwarding , l2vpn , no-forwarding , vpls , virtual-router , or vrf .	All levels
State	State of the routing instance: active or inactive .	brief detail none
Interfaces	Name of interfaces belonging to this routing instance.	brief detail none
Restart State	Status of graceful restart for this instance: Pending or Complete .	detail
Path selection timeout	Maximum amount of time, in seconds, remaining until graceful restart is declared complete. The default is 300 .	detail
Tables	Tables (and number of routes) associated with this routing instance.	brief detail none
Route-distinguisher	Unique route distinguisher associated with this routing instance.	detail
Vrf-import	VPN routing and forwarding instance import policy name.	detail
Vrf-export	VPN routing and forwarding instance export policy name.	detail
Vrf-import-target	VPN routing and forwarding instance import target community name.	detail
Vrf-export-target	VPN routing and forwarding instance export target community name.	detail
Vrf-edge-protection-id	Context identifier configured for edge-protection.	detail
Fast-reroute-priority	Fast reroute priority setting for a VPLS routing instance: high , medium , or low . The default is low .	detail
Restart State	Restart state: <ul style="list-style-type: none"> Pending:protocol-name—List of protocols that have not yet completed graceful restart for this routing table. Complete—All protocols have restarted for this routing table. 	detail

Table 206: show route instance Output Fields (continued)

Field Name	Field Description	Level of Output
Primary rib	Primary table for this routing instance.	brief none summary
Active/holddown/hidden	Number of active, hold-down, and hidden routes.	All levels

Sample Output

                 > to 111.222.1.9 via s0-0/0/0, label-switched-path sf-to-ny

iso.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

mpls.0: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both
```

show route localization

Syntax	<code>show route localization</code>
Release Information	Command introduced in Junos OS Release 11.4 for T-Series routers. Command introduced in Junos OS Release 12.3 for MX Series routers.
Description	(T320, T640, and T1600 routers only) Display route localization details.
Options	detail —Display detailed output.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> <i>Example: Configuring Packet Forwarding Engine FIB Localization</i>
Output Fields	Table 207 on page 2404 lists the output fields for the show route localization command. Output fields are listed in the approximate order in which they appear.

Table 207: show route localization Output Fields

Field Name	Field Description
FIB-local	FPCs configured as FIB-local.
FIB-remote	FPCs configured as FIB-remote.
Normal	FPCs neither configured as FIB-local or FIB-remote .
Protocols	IPv4 (inet) or IPv6 (inet6) traffic configured for route localization.

Sample Output

```
user@R0> show route localization
```

```
FIB localization ready FPCs (and FIB-local Forwarding Engine addresses)
FIB-local:  FPC2(4,5)
FIB-remote: FPC0, FPC1
Normal:     FPC3, FPC4, FPC5, FPC6, FPC7
```

```
user@R0> show route localization detail
```

```
FIB localization ready FPCs (and FIB-local Forwarding Engine addresses)
FIB-local:  FPC2(4,5)
FIB-remote: FPC0, FPC1
Normal:     FPC3, FPC4, FPC5, FPC6, FPC7
FIB localization configuration
```

```
Protocols:  inet, inet6
FIB-local:  FPC2
FIB-remote: FPC0, FPC1
Forwarding Engine addresses
FPC0: 1
FPC1: 2
FPC2: 4, 5
FPC3: 6
FPC4: 8
FPC5: 11
FPC6: 13
FPC7: 15
```

show route martians

List of Syntax [Syntax on page 2406](#)
[Syntax \(EX Series Switches\) on page 2406](#)

Syntax `show route martians`
`<logical-system (all | logical-system-name)>`
`<table routing-table-name>`

Syntax (EX Series Switches) `show route martians`
`<table routing-table-name>`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.

Description Display the martian (invalid and ignored) entries associated with each routing table.

Options **none**—Display standard information about route martians for all routing tables.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

table *routing-table-name*—(Optional) Display information about route martians for all routing tables whose name begins with this string (for example, **inet.0** and **inet6.0** are both displayed when you run the **show route martians table inet** command).

Required Privilege Level view

show route protocol

List of Syntax [Syntax on page 2424](#)
 [Syntax \(EX Series Switches\) on page 2424](#)

Syntax `show route protocol protocol`
 `<brief | detail | extensive | terse>`
 `<logical-system (all | logical-system-name)>`

Syntax (EX Series Switches) `show route protocol protocol`
 `<brief | detail | extensive | terse>`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 ospf2 and **ospf3** options introduced in Junos OS Release 9.2.
 ospf2 and **ospf3** options introduced in Junos OS Release 9.2 for EX Series switches.
 flow option introduced in Junos OS Release 10.0.
 flow option introduced in Junos OS Release 10.0 for EX Series switches.

Description Display the route entries in the routing table that were learned from a particular protocol.

Options **brief | detail | extensive | terse**—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

protocol—Protocol from which the route was learned:

- **access**—Access route for use by DHCP application
- **access-internal**—Access-internal route for use by DHCP application
- **aggregate**—Locally generated aggregate route
- **arp**—Route learned through the Address Resolution Protocol
- **atmvpn**—Asynchronous Transfer Mode virtual private network
- **bgp**—Border Gateway Protocol
- **ccc**—Circuit cross-connect
- **direct**—Directly connected route
- **dvmrp**—Distance Vector Multicast Routing Protocol
- **esis**—End System-to-Intermediate System
- **flow**—Locally defined flow-specification route
- **frr**—Precomputed protection route or backup route used when a link goes down

- **isis**—Intermediate System-to-Intermediate System
- **ldp**—Label Distribution Protocol
- **l2circuit**—Layer 2 circuit
- **l2vpn**—Layer 2 virtual private network
- **local**—Local address
- **mpls**—Multiprotocol Label Switching
- **msdp**—Multicast Source Discovery Protocol
- **ospf**—Open Shortest Path First versions 2 and 3
- **ospf2**—Open Shortest Path First versions 2 only
- **ospf3**—Open Shortest Path First version 3 only
- **pim**—Protocol Independent Multicast
- **rip**—Routing Information Protocol
- **ripng**—Routing Information Protocol next generation
- **rsvp**—Resource Reservation Protocol
- **rtarget**—Local route target virtual private network
- **static**—Statically defined route
- **tunnel**—Dynamic tunnel
- **vpn**—Virtual private network

NOTE: EX Series switches run a subset of these protocols. See the switch CLI for details.

show route range

List of Syntax	Syntax on page 2438 Syntax (EX Series Switches) on page 2438
Syntax	<pre>show route range <brief detail extensive terse> <destination-prefix> <logical-system (all logical-system-name)></pre>
Syntax (EX Series Switches)	<pre>show route range <brief detail extensive terse> <destination-prefix></pre>
Release Information	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
Description	Display routing table entries using a prefix range.
Options	<p>none—Display standard information about all routing table entries using a prefix range.</p> <p>brief detail extensive terse—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.</p> <p>destination-prefix—Destination and prefix mask for the range.</p> <p>logical-system (all logical-system-name)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
Required Privilege Level	view
List of Sample Output	show route range on page 2438 show route range destination-prefix on page 2439 show route range detail on page 2439 show route range extensive on page 2440 show route range terse on page 2441
Output Fields	For information about output fields, see the output field tables for the show route command, the show route detail command, the show route extensive command, or the show route terse command.

show route receive-protocol

List of Syntax	Syntax on page 2443 Syntax (EX Series Switches) on page 2443
Syntax	<pre>show route receive-protocol <i>protocol neighbor-address</i> <brief detail extensive terse> <logical-system (all <i>logical-system-name</i>)</pre>
Syntax (EX Series Switches)	<pre>show route receive-protocol <i>protocol neighbor-address</i> <brief detail extensive terse></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p>
Description	Display the routing information as it was received through a particular neighbor using a particular dynamic routing protocol.
Options	<p>brief detail extensive terse—(Optional) Display the specified level of output.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><i>protocol neighbor-address</i>—Protocol transmitting the route (bgp, dvmrp, msdp, pim, rip, or ripng) and address of the neighboring router from which the route entry was received.</p>
Additional Information	The output displays the selected routes and the attributes with which they were received, but does not show the effects of import policy on the routing attributes.
Required Privilege Level	view
List of Sample Output	show route receive-protocol bgp on page 2446 show route receive-protocol bgp extensive on page 2446 show route receive-protocol bgp table extensive on page 2447 show route receive-protocol bgp logical-system extensive on page 2447 show route receive-protocol bgp detail (Layer 2 VPN) on page 2448 show route receive-protocol bgp extensive (Layer 2 VPN) on page 2448 show route receive-protocol bgp (Layer 3 VPN) on page 2449 show route receive-protocol bgp detail (Layer 3 VPN) on page 2449 show route receive-protocol bgp detail (Long-Lived Graceful Restart) on page 2450 show route receive-protocol bgp detail (Labeled Unicast) on page 2451 show route receive-protocol bgp extensive (Layer 3 VPN) on page 2451 Show route receive protocol (Segment Routing Traffic Engineering) on page 2452

Output Fields Table 209 on page 2444 describes the output fields for the **show route receive-protocol** command. Output fields are listed in the approximate order in which they appear.

Table 209: show route receive-protocol Output Fields

Field Name	Field Description	Level of Output
<i>routing-table-name</i>	Name of the routing table—for example, inet.0.	All levels
<i>number destinations</i>	Number of destinations for which there are routes in the routing table.	All levels
<i>number routes</i>	Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> • active • holddown (routes that are in pending state before being declared inactive) • hidden (routes that are not used because of a routing policy) 	All levels
Prefix	Destination prefix.	none brief
MED	Multiple exit discriminator value included in the route.	none brief
<i>destination-prefix</i> (entry, announced)	Destination prefix. The entry value is the number of routes for this destination, and the announced value is the number of routes being announced for this destination.	detail extensive
Accepted LongLivedStale	The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag.	detail extensive
Accepted LongLivedStaleImport	The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag may be displayed for a route. Neither of these flags are displayed at the same time as the Stale (ordinary GR stale) flag. Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table	detail extensive
ImportAccepted LongLivedStaleImport	Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.	detail extensive
Route Distinguisher	64-bit prefix added to IP subnets to make them unique.	detail extensive
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.	detail extensive

Table 209: show route receive-protocol Output Fields (continued)

Field Name	Field Description	Level of Output
VPN Label	Virtual private network (VPN) label. Packets are sent between CE and PE routing devices by advertising VPN labels. VPN labels transit over either an RSVP or an LDP label-switched path (LSP) tunnel.	detail extensive
Next hop	Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.	All levels
Localpref or Lclpref	Local preference value included in the route.	All levels
AS path	<p>Autonomous system (AS) path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> • I—IGP. • E—EGP. • ?—Incomplete; typically, the AS path was aggregated. <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> • []—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used the AS-path merge process, as defined in RFC 4893. • []—If more than one AS number is configured on the router, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path. • { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. • ()—Parentheses enclose a confederation. • ([])—Parentheses and brackets enclose a confederation set. <p>NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>	All levels
Route Labels	Stack of labels carried in the BGP route update.	detail extensive
Cluster list	(For route reflected output only) Cluster ID sent by the route reflector.	detail extensive
Originator ID	(For route reflected output only) Address of routing device that originally sent the route to the route reflector.	detail extensive
Communities	Community path attribute for the route. See the Output Field table in the show route detail command for all possible values for this field.	detail extensive
AIGP	Accumulated interior gateway protocol (AIGP) BGP attribute.	detail extensive
Attrset AS	Number, local preference, and path of the AS that originated the route. These values are stored in the Attrset attribute at the originating routing device.	detail extensive

Table 209: show route receive-protocol Output Fields (continued)

Field Name	Field Description	Level of Output
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).	detail extensive
control flags	Control flags: none or Site Down.	detail extensive
mtu	Maximum transmission unit (MTU) of the Layer 2 circuit.	detail extensive

 <table *routing-table-name*>
 <unresolved>

Syntax (EX Series Switches) show route resolution
 <brief | detail | extensive | summary>
 <index *index*>
 <prefix>
 <table *routing-table-name*>
 <unresolved>

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.

Description Display the entries in the next-hop resolution database. This database provides for recursive resolution of next hops through other prefixes in the routing table.

Options **none**—Display standard information about all entries in the next-hop resolution database.

brief | detail | extensive | summary—(Optional) Display the specified level of output.

index *index*—(Optional) Show the index of the resolution tree.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

prefix *network/destination-prefix*—(Optional) Display database entries for the specified address.

table *routing-table-name*—(Optional) Display information about a particular routing table (for example, **inet.0**) where policy-based export is currently enabled.

unresolved—(Optional) Display routes that could not be resolved.

Required Privilege Level view

 [show route resolution unresolved on page 2457](#)

Output Fields Table 210 on page 2455 describes the output fields for the **show route resolution** command. Output fields are listed in the approximate order in which they appear.

Table 210: show route resolution Output Fields

Field Name	Field Description
routing-table-name	Name of the routing table whose prefixes are resolved using the entries in the route resolution database. For routing table groups, this is the name of the primary routing table whose prefixes are resolved using the entries in the route resolution database.
Tree index	Tree index identifier.
Nodes	Number of nodes in the tree.
Reference count	Number of references made to the next hop.
Contributing routing tables	Routing tables used for next-hop resolution.
Originating RIB	Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of inet.0 resolving through inet.0 and inet.3 , this field indicates which routing table, inet.0 or inet.3 , provided the best path for a particular prefix.
Metric	Metric associated with the forwarding next hop.
Node path count	Number of nodes in the path.
Forwarding next hops	Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.
	Merged—Merged next hops when recursive resolution of multipath is configured.

Sample Output

show route summary

List of Syntax	Syntax on page 2467 Syntax (EX Series Switches) on page 2467
Syntax	<pre>show route summary <logical-system (all <i>logical-system-name</i>)> <table <i>routing-table-name</i>></pre>
Syntax (EX Series Switches)	<pre>show route summary</pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p>
Description	<p>Display summary statistics about the entries in the routing table.</p> <p>CPU utilization might increase while the device learns routes. We recommend that you use the show route summary command after the device learns and enters the routes into the routing table. Depending on the size of your network, this might take several minutes. If you receive a “timeout communicating with routing daemon” error when using the show route summary command, wait several minutes before attempting to use the command again. This is not a critical system error, but you might experience a delay in using the command-line interface (CLI).</p>
Options	<p>none—Display summary statistics about the entries in the routing table.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>table <i>routing-table-name</i>—(Optional) Display summary statistics for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the show route summary table inet command). If you only want to display statistics for a specific routing table, make sure to enter the exact name of that routing table.</p>
Required Privilege Level	view
List of Sample Output	show route summary on page 2469 show route summary table on page 2470 show route summary table (with Route Limits Configured for the Routing Table) on page 2470
Output Fields	<p>Table 211 on page 2468 lists the output fields for the show route summary command. Output fields are listed in the approximate order in which they appear.</p>

Table 211: show route summary Output Fields

Field Name	Field Description
Router ID	Address of the local routing device.
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).
destinations	Number of destinations for which there are routes in the routing table.
routes	<p>Number of routes in the routing table:</p> <ul style="list-style-type: none"> active—Number of routes that are active. holddown—Number of routes that are in the hold-down state before being declared inactive. hidden—Number of routes that are not used because of routing policy.
Restart complete	<p>All protocols have restarted for this routing table.</p> <p>Restart state:</p> <ul style="list-style-type: none"> Pending:protocol-name—List of protocols that have not yet completed graceful restart for this routing table. Complete—All protocols have restarted for this routing table. <p>For example, if the output shows-</p> <div> <ul style="list-style-type: none"> LDP.inet.0: 5 routes (4 active, 1 holddown, 0 hidden) Restart Pending: OSPF LDP VPN <p>This indicates that OSPF, LDP, and VPN protocols did not restart for LDP.inet.0 routing table.</p> <ul style="list-style-type: none"> vp1s_1.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden) Restart Complete <p>This indicates that all protocols have restarted for vp1s_1.l2vpn.0 routing table.</p> </div>
Limit/Threshold	<p>Displays the configured route limits for the routing table set with the maximum-prefixes and the maximum-paths statements. If you do not configure route limits for the routing table, the show output does not display this information.</p> <ul style="list-style-type: none"> destinations—The first number represents the maximum number of route prefixes installed in the routing table. The second number represents the number of route prefixes that trigger a warning message. routes—The first number represents the maximum number of routes. The second number represents the number of routes that trigger a warning message.
Direct	Routes on the directly connected network.
Local	Local routes.

Table 211: show route summary Output Fields (continued)

Field Name	Field Description
<i>protocol-name</i>	Name of the protocol from which the route was learned. For example, OSPF, RSVP, and Static.

Output Fields [Table 193 on page 2258](#) describes the output fields for the **show route table** command. Output fields are listed in the approximate order in which they appear.

Table 212: show route table Output Fields

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).

Table 212: *show route table* Output Fields (continued)

Field Name	Field Description
Restart complete	<p>All protocols have restarted for this routing table.</p> <p>Restart state:</p> <ul style="list-style-type: none"> • Pending;protocol-name—List of protocols that have not yet completed graceful restart for this routing table. • Complete—All protocols have restarted for this routing table. <p>For example, if the output shows-</p> <pre> • LDP.inet.0 : 5 routes (4 active, 1 holddown, 0 hidden) Restart Pending: OSPF LDP VPN </pre> <p>This indicates that OSPF, LDP, and VPN protocols did not restart for the LDP.inet.0 routing table.</p> <pre> • vpls_1.l2vpn.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden) Restart Complete </pre> <p>This indicates that all protocols have restarted for the vpls_1.l2vpn.0 routing table.</p>
<i>number destinations</i>	Number of destinations for which there are routes in the routing table.
<i>number routes</i>	<p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> • active (routes that are active) • holddown (routes that are in the pending state before being declared inactive) • hidden (routes that are not used because of a routing policy)

Table 212: show route table Output Fields (continued)

Field Name	Field Description
<i>route-destination</i> (entry, announced)	<p>Route destination (for example:10.0.0.1/24). The entry value is the number of routes for this destination, and the announced value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> • MPLS-label (for example, 80001). • interface-name (for example, ge-1/0/2). • neighbor-address:control-word-status:encapsulation type:vc-id:source (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> • neighbor-address—Address of the neighbor. • control-word-status—Whether the use of the control word has been negotiated for this virtual circuit: NoCtrlWord or CtrlWord. • encapsulation type—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport. • vc-id—Virtual circuit identifier. • source—Source of the advertisement: Local or Remote. • inclusive multicast Ethernet tag route—Type of route destination represented by (for example, 3:100.100.100.10:100::0::10::100.100.100.10/384): <ul style="list-style-type: none"> • route distinguisher—(8 octets) Route distinguisher (RD) must be the RD of the EVPN instance (EVI) that is advertising the NLRI. • Ethernet tag ID—(4 octets) Identifier of the Ethernet tag. Can set to 0 or to a valid Ethernet tag value. • IP address length—(1 octet) Length of IP address in bits. • originating router's IP address—(4 or 16 octets) Must set to the provider edge (PE) device's IP address. This address should be common for all EVIs on the PE device, and may be the PE device's loopback address.
label stacking	<p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> • S=0 route indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed). • If there is no S= information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).
[<i>protocol, preference</i>]	<p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> • +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • -—A hyphen indicates the last active route. • *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route. <p>In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.</p>

Table 212: show route table Output Fields (continued)

Field Name	Field Description
Level	(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.
Route Distinguisher	IP subnet augmented with a 64-bit prefix.
PMSI	Provider multicast service interface (MVPN routing table).
Next-hop type	Type of next hop. For a description of possible values for this field, see Table 197 on page 2316 .
Next-hop reference count	Number of references made to the next hop.
Flood nexthop branches exceed maximum message	Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.
Source	IP address of the route source.
Next hop	Network layer address of the directly reachable neighboring system.
via	Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word Selected . This field can also contain the following information: <ul style="list-style-type: none"> • Weight—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible. • Balance—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.
Label-switched-path <i>lsp-path-name</i>	Name of the LSP used to reach the next hop.
Label operation	MPLS label and operation occurring at this routing device. The operation can be pop (where a label is removed from the top of the stack), push (where another label is added to the label stack), or swap (where a label is replaced by another label).
Interface	(Local only) Local interface name.
Protocol next hop	Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.
Indirect next hop	Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.
State	State of the route (a route can be in more than one state). See Table 198 on page 2318 .

Table 212: show route table Output Fields (continued)

Field Name	Field Description
Local AS	AS number of the local routing devices.
Age	How long the route has been known.
AI GP	Accumulated interior gateway protocol (AI GP) BGP attribute.
Metric <i>n</i>	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
MED-plus-IGP	Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.
TTL-Action	For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.
Task	Name of the protocol that has added the route.
Announcement bits	<p>The number of BGP peers or protocols to which Junos OS has announced this route, followed by the list of the recipients of the announcement. Junos OS can also announce the route to the kernel routing table (KRT) for installing the route into the Packet Forwarding Engine, to a resolve tree, a Layer 2 VC, or even a VPN. For example, <i>n-Resolve inet</i> indicates that the specified route is used for route resolution for next hops found in the routing table.</p> <ul style="list-style-type: none"> <i>n</i>—An index used by Juniper Networks customer support only.
AS path	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> I—IGP. E—EGP. Recorded—The AS path is recorded by the sample process (sampled). ?—Incomplete; typically, the AS path was aggregated. <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> []—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893. []—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path. { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order. ()—Parentheses enclose a confederation. ([])—Parentheses and brackets enclose a confederation set. <p>NOTE: In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>

Table 212: show route table Output Fields (continued)

Field Name	Field Description
validation-state	<p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> • Invalid—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database. • Unknown—Indicates that the prefix is not among the prefixes or prefix ranges in the database. • Unverified—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers. • Valid—Indicates that the prefix and autonomous system pair are found in the database.
FECs bound to route	Indicates point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.
Primary Upstream	When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, indicates the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.
RPF Nexthops	When multipoint LDP with MoFRR is configured, indicates the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.
Label	Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.
weight	Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.
VC Label	MPLS label assigned to the Layer 2 circuit virtual connection.
MTU	Maximum transmission unit (MTU) of the Layer 2 circuit.
VLAN ID	VLAN identifier of the Layer 2 circuit.
Prefixes bound to route	Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.
Communities	Community path attribute for the route. See Table 199 on page 2320 for all possible values for this field.
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).
control flags	Control flags: none or Site Down .
mtu	Maximum transmission unit (MTU) information.
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.
status vector	Layer 2 VPN and VPLS network layer reachability information (NLRI).

Table 212: show route table Output Fields (continued)

Field Name	Field Description
Accepted Multipath	Current active path when BGP multipath is configured.
Accepted LongLivedStale	The LongLivedStale flag indicates that the route was marked LLGR-stale by this router, as part of the operation of LLGR receiver mode. Either this flag or the LongLivedStaleImport flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.
Accepted LongLivedStaleImport	<p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy. Either this flag or the LongLivedStale flag might be displayed for a route. Neither of these flags is displayed at the same time as the Stale (ordinary GR stale) flag.</p> <p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and import into the inet.0 routing table</p>
ImportAccepted LongLivedStaleImport	<p>Accept all received BGP long-lived graceful restart (LLGR) and LLGR stale routes learned from configured neighbors and imported into the inet.0 routing table</p> <p>The LongLivedStaleImport flag indicates that the route was marked LLGR-stale when it was received from a peer, or by import policy.</p>
Accepted MultipathContrib	Path currently contributing to BGP multipath.
Localpref	Local preference value included in the route.
Router ID	BGP router ID as advertised by the neighbor in the open message.
Primary Routing Table	In a routing table group, the name of the primary routing table in which the route resides.
Secondary Tables	In a routing table group, the name of one or more secondary tables in which the route resides.

[Table 197 on page 2316](#) describes all possible values for the Next-hop Types output field.

Table 213: Next-hop Types Output Field Values

Next-Hop Type	Description
Broadcast (bcast)	Broadcast next hop.
Deny	Deny next hop.
Discard	Discard next hop.
Flood	Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast.

Table 213: Next-hop Types Output Field Values (continued)

Next-Hop Type	Description
Hold	Next hop is waiting to be resolved into a unicast or multicast type.
Indexed (idxd)	Indexed next hop.
Indirect (indr)	Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.
Interface	Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.
Local (locl)	Local address on an interface. This next-hop type causes packets with this destination address to be received locally.
Multicast (mcst)	Wire multicast next hop (limited to the LAN).
Multicast discard (mdsc)	Multicast discard.
Multicast group (mgrp)	Multicast group member.
Receive (recv)	Receive.
Reject (rjct)	Discard. An ICMP unreachable message was sent.
Resolve (rslv)	Resolving next hop.
Routed multicast (mcrtr)	Regular multicast next hop.
Router	<p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as a next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> • Must not be a direct or local subnet for the routing device. • Must have a next hop that is directly connected to the routing device.
Table	Routing table next hop.
Unicast (ucst)	Unicast.
Unilist (ulst)	List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.

Table 198 on page 2318 describes all possible values for the State output field. A route can be in more than one state (for example, <Active NoReadvrt Int Ext>).

Table 214: State Output Field Values

Value	Description
Accounting	Route needs accounting.
Active	Route is active.
Always Compare MED	Path with a lower multiple exit discriminator (MED) is available.
AS path	Shorter AS path is available.
Cisco Non-deterministic MED selection	Cisco nondeterministic MED is enabled, and a path with a lower MED is available.
Clone	Route is a clone.
Cluster list length	Length of cluster list sent by the route reflector.
Delete	Route has been deleted.
Ex	Exterior route.
Ext	BGP route received from an external BGP neighbor.
FlashAll	Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes.
Hidden	Route not used because of routing policy.
IfCheck	Route needs forwarding RPF check.
IGP metric	Path through next hop with lower IGP metric is available.
Inactive reason	Flags for this route, which was not selected as best for a particular destination.
Initial	Route being added.
Int	Interior route.
Int Ext	BGP route received from an internal BGP peer or a BGP confederation peer.
Interior > Exterior > Exterior via Interior	Direct, static, IGP, or EBGp path is available.

Table 214: State Output Field Values (continued)

Value	Description
Local Preference	Path with a higher local preference value is available.
Martian	Route is a martian (ignored because it is obviously invalid).
MartianOK	Route exempt from martian filtering.
Next hop address	Path with lower metric next hop is available.
No difference	Path from neighbor with lower IP address is available.
NoReadvrt	Route not to be advertised.
NotBest	Route not chosen because it does not have the lowest MED.
Not Best in its group	Incoming BGP AS is not the best of a group (only one AS can be the best).
NotInstall	Route not to be installed in the forwarding table.
Number of gateways	Path with a greater number of next hops is available.
Origin	Path with a lower origin code is available.
Pending	Route pending because of a hold-down configured on another route.
Release	Route scheduled for release.
RIB preference	Route from a higher-numbered routing table is available.
Route Distinguisher	64-bit prefix added to IP subnets to make them unique.
Route Metric or MED comparison	Route with a lower metric or MED is available.
Route Preference	Route with lower preference value is available.
Router ID	Path through a neighbor with lower ID is available.
Secondary	Route not a primary route.
Unusable path	Path is not usable because of one of the following conditions: <ul style="list-style-type: none"> • The route is damped. • The route is rejected by an import policy. • The route is unresolved.
Update source	Last tiebreaker is the lowest IP address value.

Table 199 on page 2320 describes the possible values for the Communities output field.

Table 215: Communities Output Field Values

Value	Description
<i>area-number</i>	4 bytes, encoding a 32-bit area number. For AS-external routes, the value is 0. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.
bandwidth: local AS number:link-bandwidth-number	Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute.
domain-id	Unique configurable number that identifies the OSPF domain.
domain-id-vendor	Unique configurable number that further identifies the OSPF domain.
<i>link-bandwidth-number</i>	Link-bandwidth number: from 0 through 4,294,967,295 (bytes per second).
<i>local AS number</i>	Local AS number: from 1 through 65,535.
<i>options</i>	1 byte. Currently this is only used if the route type is 5 or 7. Setting the least significant bit in the field indicates that the route carries a type 2 metric.
origin	(Used with VPNs) Identifies where the route came from.
<i>ospf-route-type</i>	1 byte, encoded as 1 or 2 for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); 3 for summary routes; 5 for external routes (area number must be 0); 7 for NSSA routes; or 129 for sham link endpoint addresses.
route-type-vendor	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x8000. The format is area-number:ospf-route-type:options .
rte-type	Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute 0x0306. The format is area-number:ospf-route-type:options .
target	Defines which VPN the route participates in; target has the format 32-bit IP address:16-bit number . For example, 10.19.0.0:100.
unknown IANA	Incoming IANA codes with a value between 0x1 and 0x7fff. This code of the BGP extended community attribute is accepted, but it is not recognized.
unknown OSPF vendor community	Incoming IANA codes with a value above 0x8000. This code of the BGP extended community attribute is accepted, but it is not recognized.
evpn-mcast-flags	Identifies the value in the multicast flags extended community and whether snooping is enabled. A value of 0x1 indicates that the route supports IGMP proxy.

Table 215: Communities Output Field Values (continued)

Value	Description
evpn-l2-info	Identifies whether Multihomed Proxy MAC and IP Address Route Advertisement is enabled. A value of 0x20 indicates that the proxy bit is set. . Use the show bridge mac-ip-table extensive statement to determine whether the MAC and IP address route was learned locally or from a PE device.

Sample Output

show route table bgp.l2.vpn

```
user@host> show route table bgp.l2.vpn

show route terse

List of Syntax [Syntax on page 2514](#)
[Syntax \(EX Series Switches\) on page 2514](#)

Syntax `show route terse`
`<logical-system (all | logical-system-name)>`

Syntax (EX Series Switches) `show route terse`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.

Description Display a high-level summary of the routes in the routing table.

NOTE: For BGP routes, the `show route terse` command displays the local preference attribute and MED instead of the metric1 and metric2 values. This is mostly due to historical reasons.

To display the metric1 and metric2 value of a BGP route, use the [show route extensive](#) command.

Options **none**—Display a high-level summary of the routes in the routing table.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output [show route terse on page 2516](#)

Output Fields [Table 216 on page 2514](#) describes the output fields for the `show route terse` command. Output fields are listed in the approximate order in which they appear.

Table 216: show route terse Output Fields

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).
<i>number destinations</i>	Number of destinations for which there are routes in the routing table.

Table 216: show route terse Output Fields (continued)

Field Name	Field Description
<i>number routes</i>	Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> • active (routes that are active) • holddown (routes that are in the pending state before being declared inactive) • hidden (routes that are not used because of a routing policy)
<i>route key</i>	Key for the state of the route: <ul style="list-style-type: none"> • +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table. • -—A hyphen indicates the last active route. • *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a to line indicates the best subpath to the route.
A	Active route. An asterisk (*) indicates this is the active route.
V	Validation status of the route: <ul style="list-style-type: none"> • ?—Not evaluated. Indicates that the route was not learned through BGP. • I—Invalid. Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database. • N—Unknown. Indicates that the prefix is not among the prefixes or prefix ranges in the database. • V—Valid. Indicates that the prefix and autonomous system pair are found in the database.
<i>Destination</i>	Destination of the route.
P	Protocol through which the route was learned: <ul style="list-style-type: none"> • A—Aggregate • B—BGP • C—CCC • D—Direct • G—GMPLS • I—IS-IS • L—L2CKT, L2VPN, LDP, Local • K—Kernel • M—MPLS, MSDP • O—OSPF • P—PIM • R—RIP, RIPng • S—Static • T—Tunnel
Prf	Preference value of the route. In every routing metric except for the BGP LocalPref attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the LocalPref value in the Preference2 field. For example, if the LocalPref value for Route 1 is 100, the Preference2 value is -101. If the LocalPref value for Route 2 is 155, the Preference2 value is -156. Route 2 is preferred because it has a higher LocalPref value and a lower Preference2 value.

Table 216: show route terse Output Fields (continued)

Field Name	Field Description
Metric 1	First metric value in the route. For routes learned from BGP, this is the MED metric.
Metric 2	Second metric value in the route. For routes learned from BGP, this is the IGP metric.
Next hop	Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.
AS path	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> I—IGP. E—EGP. ?—Incomplete; typically, the AS path was aggregated.

Sample Output

Output Fields	<p>Table 218 on page 2524 lists the output fields for the show rip neighbor command. Output fields are listed in the approximate order in which they appear.</p>

Table 218: show rip neighbor Output Fields

Field Name	Field Description
Neighbor	Name of the RIP neighbor. NOTE: Beginning with Junos OS Release 11.1, when you configure demand circuits, the output displays a demand circuit (DC) flag next to neighbor interfaces configured for demand circuits. If you configure demand circuits at the [edit protocols rip group group-name neighbor neighbor-name] hierarchy level, the output shows only the neighboring interface that you specifically configured as a demand circuit. If you configure demand circuits at the [edit protocols rip group group-name] hierarchy level, all of the interfaces in the group are configured as demand circuits. Therefore, the output shows all of the interfaces in that group as demand circuits.
State	State of the connection: Up or Dn (Down).
Source Address	Address of the port on the local router.
Destination Address	Address of the port on the remote router.
Send Mode	Send options: broadcast , multicast , none , or version 1 .
Receive Mode	Type of packets to accept: both , none , version 1 , or version 2 .
In Met	Metric added to incoming routes when advertising into RIP routes that were learned from other protocols.

Sample Output

show rip neighbor

```
user@host> show rip neighbor
```

Neighbor	Local State	Source Address	Destination Address	Send Mode	Receive Mode	In Met
ge-2/3/0.0	Up	192.168.9.105	192.168.9.107	bcast	both	1
at-5/1/1.42	Dn	(null)	(null)	mcast	v2 only	3
at-5/1/0.42	Dn	(null)	(null)	mcast	both	3
at-5/1/0.0	Up	198.51.100.0	224.0.0.9	mcast	both	3
so-0/0/0.0	Up	192.168.9.97	224.0.0.9	mcast	both	3

show rip neighbor (With Demand Circuits Configured)

```
user@host> show rip neighbor
```

Neighbor	Local State	Source Address	Destination Address	Send Mode	Receive Mode	In Met
so-0/1/0.0(DC)	Up	10.10.10.2	224.0.0.9	mcast	both	1
so-0/2/0.0(DC)	Up	192.0.2.2	224.0.0.9	mcast	both	1

Table 219: show rip statistics Output Fields

Field Name	Field Description
RIP info	<p>Information about RIP on the specified interface:</p> <ul style="list-style-type: none"> • port—UDP port number used for RIP. • update interval—Interval between routing table updates, in seconds. • holddown—Hold-down interval, in seconds. • timeout—Timeout interval, in seconds. • restart in progress—Graceful restart status. Displayed when RIP is or has been in the process of graceful restart. • restart time—Estimated time for the graceful restart to finish, in seconds. • restart will complete in—Remaining time for the graceful restart to finish, in seconds. • rts learned—Number of routes learned through RIP. • rts held down—Number of routes held down by RIP. • rqsts dropped—Number of received request packets that were dropped. • resps dropped—Number of received response packets that were dropped.
logical-interface	<p>Name of the logical interface and its statistics:</p> <ul style="list-style-type: none"> • routes learned—Number of routes learned on the logical interface. • routes advertised—Number of routes advertised by the logical interface.
Counter	<p>List of counter types:</p> <ul style="list-style-type: none"> • Updates Sent—Number of update messages sent. • Triggered Updates Sent—Number of triggered update messages sent. • Responses Sent—Number of response messages sent. • Bad Messages—Number of invalid messages received. • RIPv1 Updates Received—Number of RIPv1 update messages received. • RIPv1 Bad Route Entries—Number of RIPv1 invalid route entry messages received. • RIPv1 Updates Ignored—Number of RIPv1 update messages ignored. • RIPv2 Updates Received—Number of RIPv2 update messages received. • RIPv2 Bad Route Entries—Number of RIPv2 invalid route entry messages received. • RIPv2 Updates Ignored—Number of RIPv2 update messages that were ignored. • Authentication Failures—Number of received update messages that failed authentication. • RIP Requests Received—Number of RIP request messages received. • RIP Requests Ignored—Number of RIP request messages ignored.
Total	Total number of packets for the selected counter.
Last 5 min	Number of packets for the selected counter in the most recent 5-minute period.
Last minute	Number of packets for the selected counter in the most recent 1-minute period.

Sample Output

show rip statistics

```
user@host> show rip statistics so-0/0/0.0
```

```
RIP info: port 520; update interval: 30s; holddown 180s; timeout 120s
restart in progress: restart time 60s; restart will complete in 55s
```

```
   rts learned   rts held down   rqsts dropped   resps dropped
           0             0             0             0
```

```

CHAPTER 28

Firewall Filter Operational Commands

- `clear firewall`
- `show firewall`
- `show firewall filter version`
- `show firewall log`
- `show firewall prefix-action-stats`
- `show firewall templates-in-use`
- `show policer`

clear firewall

List of Syntax [Syntax on page 2540](#)
[Syntax \(EX Series Switches\) on page 2540](#)

Syntax `clear firewall (all | counter counter-name | filter filter-name | log (all | logical-system-name) | logical-system logical-system-name)`

Syntax (EX Series Switches) `clear firewall (all | counter counter-name | filter filter-name | log (all | logical-system-name) | policer counter (all | counter-id counter-index))`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
logical-system option introduced in Junos OS Release 9.3.
log option introduced before Junos OS Release 11.4.

Description Clear statistics about configured firewall filters.

When you clear the counters of a filter, this impacts not only the counters shown by the CLI, but also the ones tracked by SNMP2.

Subscriber management uses firewall filters to capture and report the volume-based service accounting counters that are used for subscriber billing. The **clear firewall** command also clears the service accounting counters that are reported to the RADIUS accounting server. For this reason, you must be cautious in specifying which firewall statistics you want to clear.

NOTE: The **clear firewall** command cannot be used to clear the Routing Engine filter counters on a backup Routing Engine that is enabled for graceful Routing Engine switchover (GRES).

If you clear statistics for firewall filters that are applied to Trio-based DPCs and that also use the **prefix-action** action on matched packets, wait at least 5 seconds before you enter the **show firewall prefix-action-stats** command. A 5-second pause between issuing the **clear firewall** and **show firewall prefix-action-stats** commands avoids a possible timeout of the **show firewall prefix-action-stats** command.

Options **all**—Clear the packet and byte counts for all filters. On EX Series switches, this option also clears the packet counts for all policer counters.

counter *counter-name*—Clear the packet and byte counts for a filter counter that has been configured with the counter firewall filter action.

filter *filter-name*—Clear the packet and byte counts for the specified firewall filter.

log (all | *logical-system-name*)—Clear log entries for IPv4 firewall filters that have **then log** as an action. Use **log all** to clear all log entries or **log *logical-system-name*** to clear log entries for the specified logical system.

logical-system *logical-system-name*—Clear the packet and byte counts for the specified logical system.

policer counter (all | counter-id *counter-index*)—(EX8200 switches only) Clear all policer counters using the **policer counter all** command, or clear a specific policer counter using the **policer counter counter-id *counter-index*** command. The value of *counter-index* can be 0, 1, or 2.

Required Privilege Level

show firewall

List of Syntax [Syntax on page 2542](#)
[Syntax \(EX Series Switches\) on page 2542](#)

Syntax `show firewall`
 `<application (CFM | eswd | RMPS)>>`
 `<counter counter-name>`
 `<detail>`
 `<filter filter-name>`
 `<filter regex regular-expression>`
 `<logical-system (all | logical-system-name)>`
 `<terse>`

Syntax (EX Series Switches) `show firewall`
 `<application (CFM | eswd | RMPS)>>`
 `<counter counter-name>`
 `<detail>`
 `<filter filter-name>`
 `<filter regex regular-expression>`
 `<log <(detail | interface interface-name)>>`
 `<policer counters <(detail | counter-id counter-index <detail>)>>`
 `<terse>`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
 Option **logical-system** introduced in Junos OS Release 9.3.
 Option **terse** introduced in Junos OS Release 9.4.
 Option **policer counters** introduced in Junos OS Release 12.2 for EX Series switches.
 Option **detail** introduced in Junos OS Release 12.3 for EX Series switches.
 Option **detail** introduced in Junos OS Release 14.1 for MX Series routers.
 Option **regex *regular-expression*** introduced in Junos OS Release 14.2.

Description Display enhanced statistics and counters for all configured firewall filters.

Options **none**—(Optional) Display statistics and counters for all configured firewall filters and counters. For EX Series switches, this command also displays statistics about all configured policers.

application (CFM | eswd | RMPS)—(Optional) Show firewall elements owned by the selected software component:

- Connectivity Fault Management (CFM)
- Ethernet switching daemon (eswd)—Shows only on devices that support it.
- Resource Management and Packet Steering (RMPS)

counter *counter-name*—(Optional) Name of a filter counter.

detail—(EX Series switches and MX Series routers only) (Optional) Display firewall filter statistics and enhanced policer statistics and counters.

filter *filter-name*—(Optional) Name of a configured filter.

filter regex *regular-expression*—(Optional) Regular expression that matches the names of a subset of filters.

logical-system (**all** | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

log—(Optional) Display log entries for firewall filters.

log <(**detail** | **interface** *interface-name*)>—(EX Series switches only) (Optional) Display detailed log entries of firewall activity or log information about a specific interface.

policer counters <(**detail** | **counter-id** *counter-index* <**detail**>)>—(EX8200 switches only) (Optional) Display enhanced policer counter statistics in brief or in detail.

terse—(Optional) Display firewall filter names only.

Output Fields Table 223 on page 2544 lists the output fields for the **show firewall** command. Output fields are listed in the approximate order in which they appear.

Table 223: *show firewall* Output Fields

Field Name	Field Description
Filter	<p>Name of a filter that has been configured with the filter statement at the [edit firewall] hierarchy level.</p> <p>Except on EX Series switches:</p> <ul style="list-style-type: none"> When an interface-specific filter is displayed, the name of the filter is followed by the full interface name and by either -i for an input filter or -o for an output filter. When dynamic filters are displayed, the name of the filter is followed by the full interface name and by either -in for an input filter or -out for an output filter. When a logical system-specific filter is displayed, the name of the filter is prefixed with two underscore (__) characters and the name of the logical system (for example, __ls1/filter1). When a service filter is displayed that uses a service set, the separator between the service-set name and the service-filter name is a semicolon (:). <p>NOTE: For bridge family filter, the ip-protocol match criteria is supported only for IPv4 and not for IPv6. This is applicable for line cards that support the Junos Trio chipset, such as the MX 3D MPC line cards.</p>
Counters	<p>Display filter counter information:</p> <ul style="list-style-type: none"> Name—Name of a filter counter that has been configured with the counter firewall filter action. Bytes—Number of bytes that match the filter term under which the counter action is specified. Packets—Number of packets that matched the filter term under which the counter action is specified. <p>NOTE: On M and T Series routers, firewall filters cannot count ip-options packets on a per option type and per interface basis. A limited work around is to use the show pfe statistics ip options command to see ip-options statistics on a per Packet Forwarding Engine (PFE) basis. See <i>show pfe statistics ip</i> for sample output.</p>
Policers	<p>Display policer information:</p> <ul style="list-style-type: none"> Name—Name of policer. Bytes—(For two-color policers on MX Series routers and EX Series switches, and for hierarchical policers on interfaces hosted on MICs and MPCs in MX Series routers) Number of bytes that match the filter term under which the policer action is specified. This is only the number out-of-specification (out-of-spec) byte counts, not all the bytes in all packets policed by the policer. For other combinations of policer type, device, and line card type, this field is blank. Packets—Number of packets that matched the filter term under which the policer action is specified. This is only the number of out-of-specification (out-of-spec) packet counts, not all packets policed by the policer.
Policer Counter Index	(EX8200 switch only) Global management counter ID. The counter ID value (<i>counter-index</i>) can be 0, 1, or 2.
Green	(EX8200 switch only) Number of packets within the limits. The number of packets is smaller than the committed information rate (CIR).

Table 223: *show firewall Output Fields (continued)*

Field Name	Field Description
Yellow	(EX8200 switch only) Number of packets partially within the limits. The number of packets is greater than the CIR, but the burst size is within the excess burst size (EBS) limit.
Discard	(EX8200 switch only) Number of discarded packets.
Bytes	(EX8200 switch only) Number of green, yellow, red, or discarded packets in bytes.
Packets	(EX8200 switch only) Number of green, yellow, red, or discarded packets.
Filter name	(EX8200 switch only) Name of the filter with a term associated to a policer.
Term name	(EX8200 switch only) Name of the term associated with a policer.
Policer name	(EX8200 switch only) Name of the policer that is associated with a global management counter.
PI-t1	<ul style="list-style-type: none"> • OOS packet statistics for packets that are marked out-of-specification (out-of-spec) by the policer. Changes to all packets that have out-of-spec actions, such as discard, color marking, or forwarding-class, are included in this counter. • Offered packet statistics for traffic subjected to policing. • Transmitted packet statistics for traffic that is not discarded by the policer. When the policer action is discard, the statistics are the same as the in-spec statistics; when the policer action is non-discard (loss-priority or forwarding-class), the statistics are included in this counter.

show firewall filter version

Syntax	<code>show firewall filter version <filter-name></code>
Release Information	Command introduced in Junos OS Release 10.2R2.
Description	Display the version number of the installed firewall filter in the Routing Engine.
Options	<p><code>none</code>—(Optional) Display the version number of all installed firewall filters.</p> <p><code>filter-name</code>—(Optional) Name of a configured filter. If you specify the name of a filter, only the version number of that filter is displayed.</p>
Additional Information	The initial version number is 1. This number increments by one when you modify the firewall filter settings or an associated prefix action. The maximum version number is 4,294,967,295. When the version number reaches 4,294,967,295, this number is reset to 1.
Required Privilege Level	view
List of Sample Output	show firewall filter version on page 2550
Output Fields	Table 224 on page 2550 lists the output fields for the show firewall filter version command. Output fields are listed in the approximate order in which they appear.

Table 224: show firewall filter version Output Fields

Field Name	Field Description
Filter	Name of a filter that has been configured with the filter statement at the [edit firewall] hierarchy level.
Version	Display the version number of the firewall filter.

Sample Output

show firewall filter version

```
user@host> show firewall filter version
```

```
Filter version information :
Filter                               Version
test                               10

show firewall log

List of Syntax [Syntax on page 2551](#)
[Syntax \(EX Series Switches\) on page 2551](#)

Syntax `show firewall log`
`<detail>`
`<extensive>`
`<interface interface-name>`
`<logical-system (logical-system-name | all)>`

Syntax (EX Series Switches) `show firewall log`
`<detail>`
`<interface interface-name>`

Release Information Command introduced before Junos OS Release 7.4.
 Command introduced in Junos OS Release 9.0 for EX Series switches.
extensive option introduced in Junos OS Release 16.1.
logical-system option introduced in Junos OS Release 9.3.

Description Display log information about firewall filters.

Options **none**—Display log information about firewall filters.

detail—(Optional) Display detailed information.

extensive—(Optional) Display hex dump of packet captured by log action.

interface *interface-name*—(Optional) Display log information about a specific interface.

logical-system (*logical-system-name* | all)—(Optional) Perform this operation on all logical systems or on a particular system.

Required Privilege Level view

[show firewall log extensive on page 2553](#)

Output Fields [Table 225 on page 2551](#) lists the output fields for the **show firewall log** command. Output fields are listed in the approximate order in which they appear.

Table 225: show firewall log Output Fields

Field Name	Field Description
Time of Log	Time that the event occurred.

Table 225: show firewall log Output Fields (continued)

Field Name	Field Description
Filter	<ul style="list-style-type: none"> Displays the name of a configured firewall filter or service filter only if the packet hit the filter's log action in a kernel filter (in the control plane). For any traffic that reaches the Routing Engine, the packets hit the log action in the kernel. For all other logged packets (packet hit the filter's log action in the Packet Forwarding Engine), this field displays pfe instead of a configured filter name.
Filter Action	Filter action: <ul style="list-style-type: none"> A—Accept D—Discard R—Reject
Name of Interface	<ul style="list-style-type: none"> Displays a physical interface name if the packet arrived at a port on a line card. Displays local if the packet was generated by the device's internal Ethernet interface, em1 or fxp1, which connects the Routing Engine with the router's packet-forwarding components.
Name of protocol	Packet's protocol name: egp , gre , icmp , ipip , ospf , pim , rsvp , tcp , or udp .
Packet length	Length of the packet.
Source address	Packet's source address.
Destination address	Packet's destination address and port.

Sample Output

show firewall log

```
user@host>show firewall log
```

Time	Filter	Action	Interface	Protocol	Src Addr	Dest Addr

-----	Reference Count

egressFilter	10
ingressFilter	10
dfilter	5
dfilter-pol	5

show policer

Syntax `show policer`
`<detail>`
`<policer-name>`

Release Information Command introduced before Junos OS Release 7.4.
Option **detail** introduced in Junos OS Release 12.3.

Description Display the number of policed packets for a given policer or an aggregate policer. An aggregate policer is an aggregate of different policers on the same logical interface.

Options **none**—Display the number of policed packets for all configured policers.
detail—(Optional) Display enhanced statistics and counters for policers.
policer-name—(Optional) Display the number of policed packets for the specified policer.

Required Privilege Level view

List of Sample Output [show policer \(MX Series\) on page 2559](#)
[show policer \(non MX Series Router\) on page 2559](#)
[show policer \(Aggregate Policer, non MX Series Router\) on page 2559](#)
[show policer detail on page 2560](#)

Output Fields [Table 228 on page 2558](#) lists the output fields for the **show policer** command. Output fields are listed in the approximate order in which they appear.

Table 228: show policer Output Fields

Field Name	Field Description
Name	Name of the policer.
Bytes	<ul style="list-style-type: none"> (For two-color policers on MX Series routers, and for hierarchical policers on MS-DPC, MIC, and MPC interfaces on MX Series routers)—Total number of bytes policed by the specified policer. For other combinations of policer type, device, and line card type, this field is blank. (T Series and M10i)—Not applicable. The Bytes information is not displayed.
Packets	Total number of packets policed by the specified policer.

Table 228: show policer Output Fields (continued)

Field Name	Field Description
Policer detail	<ul style="list-style-type: none"> OOS packet statistics for packets that are marked out-of-specification by the policer. Changes to all packets that have out-of-specification actions, such as discard, color marking, or forwarding-class, are included in this counter. Offered packet statistics for traffic subjected to policing. Transmitted packet statistics for traffic that is not discarded by the policer. When the policer action is discard, the statistics are the same as the within-specification statistics; when the policer action is non-discard (loss-priority or forwarding-class), the statistics are included in this counter.

Sample Output

show policer (MX Series)

```
user@host> show policer
```

`clear error bpdu interface ge-1/1/1`

```
user@host> clear error bpdu interface ge-1/1/1
```

clear error mac-rewrite

Syntax	<code>clear error mac-rewrite <interface <i>interface-name</i>></code>
Release Information	Command introduced in Junos OS Release 9.1.
Description	<p>Clear a MAC rewrite error condition caused by the reception of tunneled protocol packets on an interface with Layer 2 protocol tunneling enabled.</p> <p>On interfaces with L2PT configured, customer-facing ports should not receive packets with the L2PT MAC address as the destination address unless there is a network topology or configuration error. Any such interface receiving an L2PT packet becomes “Disabled”, and must subsequently be re-enabled by clearing the error with this command.</p>
Options	interface <i>interface-name</i> —(Optional) Clear the MAC rewrite error condition for the specified interface.
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none">• <i>Layer2 Protocol Tunneling Through a Network</i>• <i>Configuring Layer 2 Protocol Tunneling on EX Series Switches with ELS Support</i>• <i>Clearing a MAC Rewrite Error on an Interface with Layer 2 Protocol Tunneling</i>• show mac-rewrite interface on page 2590
List of Sample Output	clear error mac-rewrite interface on page 2564
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear error mac-rewrite interface

```
user@host> clear error mac-rewrite interface ge-1/0/1
```

show bridge domain

Syntax `show bridge domain`
`<brief | detail | extensive>`
`<bridge-domain (all | domain-name)>`
`<instance instance-name>`
`<operational>`

Release Information Command introduced in Junos OS Release 8.4.

Description (MX Series routers only) Display bridge domain information.

Options **none**—Display information for all bridge domains.

brief | detail | extensive—(Optional) Display the specified level of output.

bridge-domain (all | *domain-name*)— (Optional) Display information about all bridge domains or the specified bridge domain.

instance *instance-name*—(Optional) Display information for the specified routing instance.

operational—(Optional) Display information for the operational routing instances.

Required Privilege Level view

show bridge mac-table

Syntax **show bridge mac-table**
 <age>
 <brief | count | detail | extensive>
 <bridge-domain (all | *bridge-domain-name*)>
 <global-count>
 <instance *instance-name*>
 <interface *interface-name*>
 <mac-address>
 <instance *instance-name*>
 <vlan-id (all-vlan | *vlan-id*)>

Release Information Command introduced in Junos OS Release 8.4.
 Command introduced in Junos OS Release 15.1
 Support for PBB-EVPN instance added in Junos OS Release 16.1
 MAC Flag P to indicate a MAC Pinned interface introduced in Junos OS 16.2

Description (MX Series routers only) Display Layer 2 MAC address information.

Options **none**—Display all learned Layer 2 MAC address information.

age— (Optional) Display age of a single mac-address.

brief | count | detail | extensive—(Optional) Display the specified level of output.

bridge-domain (all | *bridge-domain-name*)—(Optional) Display learned Layer 2 MAC addresses for all bridging domains or for the specified bridging domain.

global-count—(Optional) Display the total number of learned Layer 2 MAC addresses on the system.

instance *instance-name*—(Optional) Display learned Layer 2 MAC addresses for the specified routing instance.

interface *interface-name*—(Optional) Display learned Layer 2 MAC addresses for the specified interface.

mac-address—(Optional) Display the specified learned Layer 2 MAC address information.

vlan-id (all-vlan | *vlan-id*)—(Optional) Display learned Layer 2 MAC addresses for all VLANs or for the specified VLAN.

Additional Information When Layer 2 protocol tunneling is enabled, the tunneling MAC address 01:00:0c:cd:cd:d0 is installed in the MAC table. When the Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunk Protocol (VTP) is configured for Layer 2 protocol tunneling on an interface, the corresponding protocol MAC address is installed in the MAC table.

Required Privilege Level view

Output Fields [Table 229 on page 2575](#) describes the output fields for the **show bridge mac-table** command. Output fields are listed in the approximate order in which they appear.

Table 229: show bridge mac-table Output Fields

Field Name	Field Description
Age	Age of a single mac-address.
Routing instance	Name of the routing instance.
Bridging domain	Name of the bridging domain.
MAC address	MAC address or addresses learned on a logical interface.
MAC flags	Status of MAC address learning properties for each interface: <ul style="list-style-type: none"> • S—Static MAC address is configured. • D—Dynamic MAC address is configured. • L—Locally learned MAC address is configured. • C—Control MAC address is configured. • SE—MAC accounting is enabled. • NM—Non-configured MAC. • R—Remote PE MAC address is configured. • P—MAC Pinned interface is configured
Logical interface	Name of the logical interface.
MAC count	Number of MAC addresses learned on the specific routing instance or interface.
Learning interface	Name of the logical interface on which the MAC address was learned.
Learning VLAN	VLAN ID of the routing instance or bridge domain in which the MAC address was learned.
VXLAN ID/VXLAN	VXLAN Network Identifier (VNI).

Table 229: show bridge mac-table Output Fields (continued)

Field Name	Field Description
Layer 2 flags	Debugging flags signifying that the MAC address is present in various lists.
Epoch	Spanning Tree Protocol epoch number identifying when the MAC address was learned. Used for debugging.
Sequence number	Sequence number assigned to this MAC address. Used for debugging.
Learning mask	Mask of the Packet Forwarding Engines where this MAC address was learned. Used for debugging.
IPC generation	Creation time of the logical interface when this MAC address was learned. Used for debugging.

show l2-learning global-information

Syntax	<code>show l2-learning global-information</code>
Release Information	Command introduced in Junos OS Release 8.4.
Description	(MX Series routers only) Display Layer 2 learning process-related information for the entire router.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show l2-learning global-information on page 2583
Output Fields	Table 230 on page 2583 describes the output fields for the show l2-learning global-information command. Output fields are listed in the approximate order in which they appear.

Table 230: show l2-learning global-information Output Fields

Field Name	Field Description
MAC aging interval	Configured timeout interval, in seconds, for all MAC table entries.
MAC learning	Status of MAC learning: Enabled or Disabled .
MAC statistics	Status of MAC accounting: Enabled or Disabled .
MAC limit Count	Configured maximum limit on the number of MAC addresses that can be learned.
MAC limit hit flag	Status of the learned MAC limit hit flag: Enabled (the learned MAC exceeds the global MAC limit) or Disabled (the learned MAC does not exceed the global MAC limit).
MAC packet action drop	Status of action to drop packets after the configured MAC address limit is reached: Enabled (packets are dropped) or Disabled (packets are forwarded).

Sample Output

show l2-learning global-information

```
user@host> show l2-learning global-information
Global Configuration:
```

```
MAC aging interval      : 300
MAC learning            : Enabled
MAC statistics          : Disabled
MAC limit Count         : 393215
MAC limit hit flag      : Disabled
MAC packet action drop: Disabled
```

show l2-learning global-mac-count

Syntax	<code>show l2-learning global-mac-count</code>
Release Information	Command introduced in Junos OS Release 9.3.
Description	(MX Series routers only) Display the total number of dynamic and static MAC addresses learned for the entire router.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show l2-learning global-mac-count on page 2585
Output Fields	Displays the total number of dynamic and static MAC addresses learned for the entire router.

Sample Output

show l2-learning global-mac-count

```
user@host> show l2-learning global-mac-count
100 dynamic and static MAC addresses learned globally
```

show l2-learning instance

Syntax	show l2-learning instance
Release Information	(MX Series routers only) Command introduced in Junos OS Release 8.4.
Description	Display Layer 2 learning properties for all the configured routing instances.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show l2-learning instance on page 2587
Output Fields	Table 231 on page 2586 describes the output fields for the show l2-learning instance command. Output fields are listed in the approximate order in which they appear.

Table 231: show l2-learning instance Output Fields

Field Name	Field Description
Routing Instance	Name of routing instance.
Bridging Domain	Name of bridging domain. On MX Series routers you can use the show l2-learning instance <extensive> command option to display the Bridge Service-id information which includes the Config Service ID and the Active Service ID.
Index	Number associated with the routing instance or bridging domain.
Logical System	Name of logical system or Default if no logical system is configured.
Routing instance flags	Status of Layer 2 learning properties for each routing instance: <ul style="list-style-type: none"> • DL—MAC learning is disabled. • SE—MAC accounting is enabled. • AD—Packets are dropped after MAC address limit is reached. • LH—The maximum number of MAC addresses has been learned on the routing instance. The routing instance is not able to learn any additional MAC addresses.
MAC limit	Maximum number of MAC addresses that can be learned from each interface in the routing instance or bridging domain.

Sample Output

show l2-learning instance

```
user@host> show l2-learning instance
```

```
Information for routing instance:
```

```
Routing Instance flags (DL -disable learning, SE -stats enabled,  
AD -packet action drop, LH -mac limit hit)
```

Routing Instance	Bridging Domain	Index	Logical System	Routing flags	MAC limit
__juniper_private1__		1	Default		5000
vs1	vlan100	3	Default		5120
vs1	vlan200	4	Default		5120

show l2-learning interface

Syntax	show l2-learning interface
Release Information	Command introduced in Junos OS Release 8.4. Added sample output to indicate an EVPN MAC Pinned interface, introduced in Junos OS 16.2R1.
Description	(MX Series routers only) Display Layer 2 learning information for all the interfaces.
Options	This command has no options.
Required Privilege Level	view
List of Sample Output	show l2-learning interface on page 2588 show l2 learning-interface on page 2589
Output Fields	Table 232 on page 2588 describes the output fields for the show l2-learning interface command. Output fields are listed in the approximate order in which they appear.

Table 232: show l2-learning interface Output Fields

Field Name	Field Description
Logical interface	Name of the logical interface.
Index	Index of the interface.
Routing Instance	Number of the routing instance to which the interface belongs.
Interface device	Value of the order in which the Junos OS finds and initializes the interface.
Logical interface flags	Status of Layer 2 learning properties for each interface: <ul style="list-style-type: none"> • DL—MAC learning is disabled. • SE—MAC accounting is enabled. • AD—Packets are dropped after the MAC interface limit is reached. • MAC limit—Maximum number of MAC addresses that can be learned from the interface. • MP—MAC Pinning enabled.

Sample Output

show l2-learning interface

```
user@host> show l2-learning interface
```

Information for interface family:

Logical Interface flags (DL -disable learning, SE -stats enabled,
AD -packet action drop, LH -mac limit hit)

Logical interface	Index	Routing instance	Interface device	Logical Interface flags	MAC limit
ge-11/0/3.0	79	3	136		1024

clear vpls mac-address

Syntax `clear vpls mac-address`
 `<instance instance-name>`
 `<logical-system (all | logical-system-name)>`
 `<mac-address>`

Release Information Command introduced before Junos OS Release 7.4.

Description (T Series and M Series routers, except for the M160 router) Clear media access control (MAC) address entries from the virtual private LAN service (VPLS) table.

Options **none**—Clear all MAC address entries from the VPLS table for all routing instances.

instance *instance-name*—(Optional) Clear all MAC address entries for a VPLS instance from the VPLS table.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

mac-address—(Optional) Clear a specific MAC address in a VPLS instance from the VPLS table.

Required Privilege Level maintenance

List of Sample Output [clear vpls mac-address on page 2594](#)

Output Fields When you enter this command, you are provided feedback on the status of your request.

Sample Output

`clear vpls mac-address`

```
user@host> clear vpls mac-address
```

clear vpls mac-table

Syntax	<pre>clear vpls mac-table <instance <i>instance-name</i>> <interface <i>interface-name</i>> <logical-system (all <i>logical-system-name</i>)> <mac-address> <vlan-id></pre>
Release Information	Command introduced before Junos OS Release 9.5.
Description	(MX Series routers) Clear media access control (MAC) addresses from the virtual private LAN service (VPLS) MAC table.
Options	<p>none—Clear all MAC addresses from the VPLS table for all routing instances.</p> <p>instance <i>instance-name</i>—(Optional) Clear all MAC addresses for a VPLS instance from the VPLS table.</p> <p>interface <i>interface-name</i>—(Optional) Clear all MAC addresses for a VPLS interface from the VPLS table.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>mac-address—(Optional) Clear a specific MAC address in a VPLS instance from the VPLS table.</p> <p>vlan-id—(Optional) Clear MAC addresses on a specified VLAN (0 through 4095).</p>
Required Privilege Level	maintenance
List of Sample Output	clear vpls mac-table on page 2595
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

clear vpls mac-table

```
user@host> clear vpls mac-table
```

request l2circuit-switchover

Syntax	<pre>request l2circuit-switchover <logical-system (all logical-system-name)> <neighbor address> <virtual-circuit-id identifier></pre>
Release Information	Command introduced in Junos OS Release 9.2. Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.
Description	Manually trigger a switch from the active pseudowire to the redundant pseudowire. This command can be useful when performing network maintenance.
Options	<p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>neighbor <i>address</i>—(Optional) Trigger a switch of all of the active pseudowire connections with the specified neighbor to their respective redundant pseudowires.</p> <p>virtual-circuit-id <i>identifier</i>—(Optional) Trigger a switch from the active pseudowire connection of the specified Layer 2 circuit to its redundant pseudowire.</p>
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none">• <i>MPLS Feature Support on QFX Series and EX4600 Switches</i>
List of Sample Output	request l2circuit-switchover virtual-circuit-id on page 2596
Output Fields	When you enter this command, you are provided feedback on the status of your request.

Sample Output

request l2circuit-switchover virtual-circuit-id

```
user@host>request l2circuit-switchover virtual-circuit-id 12
```

show dynamic-tunnels database

Syntax show dynamic-tunnels database
 <destination>
 <logical-system (all | *logical-system-name*) >
 <table *routing-table-name*>

Release Information Command introduced before Junos OS Release 7.4.

Description Display dynamic tunnel database information.

Options **none**—Display dynamic tunnel database information for all destinations and routing tables.

destination—(Optional) Display database entries for the specified IP address (with optional destination prefix length) only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

table *routing-table-name*—(Optional) Display database entries for the specified table only.

Required Privilege Level view

List of Sample Output [show dynamic-tunnels database \(Tunnel Is Up\) on page 2598](#)
[show dynamic-tunnels database \(No Tunnel PIC\) on page 2598](#)
[show dynamic-tunnels database \(Tunnel Is Expiring\) on page 2599](#)
[show dynamic-tunnels database \(Destination Specified\) on page 2599](#)
[show dynamic-tunnels database \(Localization\) on page 2599](#)
[show dynamic-tunnels database \(MPLS-over-UDP Dynamic Tunnels on PTX Series Routers and QFX Series Switches\) on page 2599](#)

Output Fields [Table 234 on page 2597](#) lists the output fields for the **show dynamic-tunnels database** command. Output fields are listed in the approximate order in which they appear.

Table 234: show dynamic-tunnels database Output Fields

Field Name	Field Description
Table	Name of the routing table (for example, <i>inet.0</i>).
Destination-network	Destination IP address and subnet.
Tunnel to	Destination IP address and prefix of the tunnel.
State	State of the tunnel: Up , Up (expires in <i>nn:nn:nn</i>seconds) , or Dn (down).

Table 234: show dynamic-tunnels database Output Fields (continued)

Field Name	Field Description
Reference count	Number of routes across the dynamic tunnel that are currently being resolved.
Next-hop type	Type of tunnel: GRE or UDP (BGP-Signal).
Source address	Source IP address of the tunnel.
Next-hop	IP address of the destination interface.
VPN Label	The label provided by the peer device to identify the VPN through which the packet needs to go. This label is used to identify the VRF for route lookup.
Ingress Route	The IGP route along with the corresponding metric that has been selected for forwarding the tunnel-encapsulated packet.
Localized PFE	Packet Forwarding Engine interface which is the anchor Packet Forwarding Engine for the localized next-hop-based dynamic tunnels. When the anchor Packet Forwarding Engine of the tunnel goes down, it is represented by a # near the Packet Forwarding Engine name.
State	State of the destination interface: Up, Dn, or Dn (no tunnel pic).

Sample Output

show dynamic-tunnels database (Tunnel Is Up)

```

user@host> show dynamic-tunnels database
Table: inet.3
Destination-network: 10.255.120.94/32
Tunnel to: 10.255.120.94/32

```

show hfrr profiles

Syntax `show hfrr profiles
<brief |extensive>`

Release Information Command introduced in Junos OS Release 12.2.

Description Display host fast reroute (HFRR) profile information.

HFRR adds a precomputed protection path into the Packet Forwarding Engine, such that if a link between a provider edge device and a server farm becomes unusable for forwarding, the Packet Forwarding Engine can use another path without having to wait for the router or the protocols to provide updated forwarding information.

Options **none**—Display information about HFRR profiles.

brief | extensive—(Optional) Display the specified level of output.

Required Privilege Level view

Related Documentation

- *Example: Configuring Link Protection with Host Fast Reroute*

List of Sample Output [show hfrr profiles on page 2602](#)

Output Fields [Table 235 on page 2601](#) describes the output fields for the **show hfrr profiles** command. Output fields are listed in the approximate order in which they appear.

Table 235: show hfrr profiles Output Fields

Field Name	Field Description
HFRR	
HFRR current state	Status of the HFRR profile: HFRR_ACTIVE, HFRR_INACTIVE, HFRR_IFLH-NOT-CONF, and so on.
HFRR Prefix limit blackout timer expiry (in secs)	Time interval between an HFRR profile becoming inactive on exceeding the ARP prefix limit, and the profile starting the SYNC process.
HFRR prefix limit hit count	Number of times that an HFRR profile becomes inactive on exceeding the ARP prefix limit.
HFRR protected IFL name	Interface configured for the HFRR feature.
HFRR protected IFL handle	

Table 235: show hfr profiles Output Fields (continued)

Field Name	Field Description
HFRR routing instance name	The routing instance in which the HFRR interface is configured.
HFRR routing instance handle	
HFRR sync BG scheduled	
HFRR RTS filter on	
HFRR delete BG scheduled	
HFRR ARP prefix limit	Configured ARP prefix limit.
HFRR ARP supplementary blackout timeout (in mins)	Supplementary time-out value configured for profile to be inactive when it hits ARP prefix limit.
HFRR number of ARP routes learned	Number of ARP routes learned on the configured interface.
HFRR number of FRR routes created	Number of ARP routes created on the configured interface.

Sample Output

show hfr profiles

```

user@host> show hfr profiles
HFRR pointer: 0x9254000
HFRR current state: HFRR_ACTIVE
HFRR Prefix limit blackout timer expiry (in secs): 0
HFRR prefix limit hit count: 0
HFRR protected IFL name: ge-4/1/0.0
HFRR protected IFL handle: 0x9248738
HFRR routing instance name: test
HFRR routing instance handle: 0x9145740
HFRR sync BG scheduled: NO
HFRR RTS filter on: YES
HFRR delete BG scheduled: NO
HFRR ARP prefix limit: 0
HFRR ARP supplementary blackout timeout (in mins): 1
HFRR number of ARP routes learned: 4
HFRR number of FRR routes created: 2

```

show ingress-replication mvpn

Syntax show ingress-replication mvpn

Release Information Command introduced in Junos OS Release 10.4.

Description Display the state and configuration of the ingress replication tunnels created for the MVPN application when using the **mpls-internet-multicast** routing instance type.

Required Privilege Level View

List of Sample Output [show ingress-replication mvpn on page 2603](#)

Output Fields [Table 236 on page 2603](#) lists the output fields for the **show ingress-replication mvpn** command. Output fields are listed in the approximate order in which they appear.

Table 236: show ingress-replication mvpn Output Fields

Field Name	Field Description
Ingress tunnel	Identifies the MVPN ingress replication tunnel.
Application	Identifies the application (MVPN).
Unicast tunnels	List of unicast tunnels in use.
Leaf address	Address of the tunnel.
Tunnel type	Identifies the unicast tunnel type.
Mode	Indicates whether the tunnel was created as a new tunnel for the ingress replication, or if an existing tunnel was used.
State	Indicates whether the tunnel is Up or Down.

Sample Output

show ingress-replication mvpn

```

user@host> show ingress-replication mvpn

Ingress Tunnel: mvpn:1
  Application: MVPN
  Unicast tunnels
    Leaf Address      Tunnel-type      Mode      State
    10.255.245.2      P2P LSP         New       Up
    10.255.245.4      P2P LSP         New       Up
Ingress Tunnel: mvpn:2
  Application: MVPN

```

Unicast tunnels			
Leaf Address	Tunnel-type	Mode	State
10.255.245.2	P2P LSP	Existing	Up

show l2circuit connections

Syntax	<pre>show l2circuit connections <brief extensive summary> <down up up-down> <history> <interface <i>interface-name</i>> <logical-system (all <i>logical-system-name</i>)> <neighbor <i>neighbor</i>> <status></pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Display enhancements in Junos OS Release 9.6.</p> <p>Display enhancements in Junos OS Release 10.2.</p> <p>Display enhancements in Junos OS Release 12.1.</p> <p>Display enhancements in Junos OS Release 13.2.</p> <p>Statement introduced in Junos OS Release 14.1X53-D10 for the QFX Series and for EX4600 switches.</p>
Description	Display status information about Layer 2 virtual circuits from the local provider edge (PE) router to its neighbors.
Options	<p>none—Display standard information about Layer 2 virtual circuits on all interfaces for all neighbors.</p> <p>brief extensive summary—(Optional) Display the specified level of output. Use history to display information about connection history. Use status to display information about the connection and interface status.</p> <p>down up up-down—(Optional) Display nonoperational, operational, or both kinds of connections.</p> <p>history—(Optional) Display information about connection history.</p> <p>interface <i>interface-name</i>—(Optional) Show all Layer 2 virtual circuits on an interface.</p> <p>logical-system (all <i>logical-system-name</i>)—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p>neighbor <i>neighbor</i>—(Optional) IP address of a specific neighbor.</p> <p>status—(Optional) Display information about the connection and interface status.</p>
Required Privilege Level	view
List of Sample Output	<p>show l2circuit connections on page 2609</p> <p>show l2circuit connections interface on page 2610</p> <p>show l2circuit connections extensive on page 2610</p>

[show l2circuit connections extensive \(Pseudowire Redundancy with Hot Standby\)](#) on page 2611

Output Fields [Table 237 on page 2606](#) lists the output fields for the **show l2circuit connections** command. Output fields are listed in the approximate order in which they appear.

Table 237: show l2circuit connections Output Fields

Field Name	Field Description
Layer-2 Circuit Connections	Displays the legends for connection and interface status.
Neighbor	Remote PE neighbor.
Interface	Logical PE-to-CE interface on which the virtual circuit is configured.
Type	VC type: rmt (remote) or loc (local).

Table 237: *show l2circuit connections Output Fields (continued)*

Field Name	Field Description
Legend for connection status (St)	<p>Status of the virtual circuit connection:</p> <ul style="list-style-type: none"> • EI—The local virtual circuit interface is configured with an encapsulation that is not supported. • MM—The two routers do not agree on an MTU value, which causes an MTU mismatch. • EM—The encapsulation type received on this virtual circuit from the neighbor does not match the local virtual circuit interface encapsulation type. • CM—The two routers do not agree on a control word, which causes a control word mismatch. • VM—The remote and local VLAN IDs do not match across the Layer 2 circuit. • OL—No advertisement has been received for this virtual circuit from the neighbor. There is no outgoing label available for use by this virtual circuit. • NC—The interface is not configured as a CCC or TCC interface. • BK—The virtual circuit has switched to a backup connection. • CB—The remote PE router is advertising a different cell bundle from that configured on the local PE router. • LD—The connection to the local site is signaled down, because the CE-facing interface to the local site is down. • RD—The remote neighbor is down. It has signaled a problem using the pseudowire status code. • NP—The router detects that interface hardware is not present. The hardware may be offline, a PIC may not be of the desired type, or the interface may be configured in a different routing instance. • Dn—The virtual circuit is down. • VC-Dn—The virtual circuit is down because there is no tunnel LSP from the local PE router to the neighbor. • UP—The virtual circuit is operational. • CF—The router cannot find enough bandwidth to the remote router to satisfy the Layer 2 circuit bandwidth requirement. • IB—The bit rate is incompatible for Time Division Multiplexing (TDM). • TDM—TDM is not configured correctly. • ST—The virtual circuit has been switched to a standby connection. • SP—The virtual circuit connection is using a static pseudowire. • RS—The remote site is in a standby state. • XX—The virtual circuit is down for an unknown reason. This is a programming error.
Time last up	Date and time the virtual circuit was last operational.
# Up trans	Number of times the virtual circuit came up.
local-interface-name	Name of the local PE-to-CE interface.
Status	Status of the local interface.
Up	Interface is operational.

Table 237: *show l2circuit connections Output Fields (continued)*

Field Name	Field Description
Dn	Interface is not operational.
NP	Not present. Interface does not exist.
DS	Disabled. Interface has been administratively disabled.
WE	Wrong encapsulation. The interface is not configured as CCC.
UN	Interface status is initialized.
Encapsulation	Encapsulation of the local interface.
Flow Label Transmit	Flow label transmit status.
Flow Label Receive	Flow label receive status.
Remote PE	Prefix of the remote PE router.
Negotiated control-word	Whether the use of the control word has been negotiated for this virtual circuit: Yes (Null) or No .
Incoming label	Label used by the remote side of the virtual circuit to send packets destined to the local side. This label is routed to the local virtual circuit interface.
Outgoing label	Label used by the local side of the virtual circuit to send packets to the remote side of the virtual circuit. Packets originated on the local virtual circuit interface are encapsulated with this label before being placed on the tunnel LSP to the neighbor for this virtual circuit. This label is allocated by the neighbor and is used in demultiplexing incoming packets destined for this virtual circuit.
Negotiated PW status TLV	Displays the pseudowire status type, length, and value (TLV). TLVs are a method of encoding variable-length or optional information. If the pseudowire status TLV is used, the corresponding local or neighbor PE router status code is also displayed.
local PW status code	If the pseudowire status TLV is used, displays the local PE router status code.
Neighbor PW status code	If the pseudowire status TLV is used, displays the neighbor PE router status code.
Local interface	Name of the local interface used for the Layer 2 circuit connection.
Status	Status of the local interface (Up or Down).
Encapsulation	Encapsulation configured for the local interface.
APS-active	Indicates that the interface belongs to the working circuit.

Table 237: *show l2circuit connections Output Fields (continued)*

Field Name	Field Description
APS-inactive	Indicates that the interface belongs to the protect circuit.
Connection protection	Whether or not connection protection is configured for the Layer 2 circuit to the neighbor: Yes or No .
VC bandwidth	Bandwidth requirement of the Layer 2 circuit.
Time	Time at which the event occurred.
Connection History	<p>Event types logged in history.</p> <ul style="list-style-type: none"> • loc intf up—Local virtual circuit interface went up. • loc intf down—Local virtual circuit interface went down. • In lbl Update—Incoming label has been updated. • Out lbl Update—Outgoing label has been updated. • PE route changed—Route to PE router has been updated. • PE route down—Route to PE router is down. • rmt side marked—Remote side is marked. • VC Dn—Remote side indicated that its end of the virtual circuit is down (if the tunnel LSP from the remote side to the local side is down). • status update timer—Status update timer processing. It computes the state of the virtual circuit, and determines whether it should be advertised to or withdrawn from the remote side.

[show l2vpn connections on page 2617](#)
[show l2vpn connections extensive on page 2618](#)
[show l2vpn connections extensive \(VPWS\) on page 2618](#)

Output Fields [Table 238 on page 2614](#) lists the output fields for the **show l2vpn connections** command. Output fields are listed in the approximate order in which they appear.

Table 238: show l2vpn connections Output Fields

Field Name	Field Description
Instance	Name of Layer 2 VPN instance.
L2vpn-id	For BGP autodiscovery, a globally unique Layer 2 VPN community identifier for the instance.
Local-ID	BGP local-address assigned to the local routing device.
Local site	Name of local site.
Local source-attachment-id	For FEC 129, the VPWS source attachment identifier. The point-to-point nature of VPWS requires that you specify the source access individual identifier (SAII) and the target access individual identifier (TAII). This SAII-TAII pair defines a unique pseudowire between two PE devices.
Target-attachment-id	For FEC 129, the VPWS target attachment identifier. If the configured target identifier matches a source identifier advertised by a remote PE device by way of a BGP auto-discovery message, the pseudowire between that source-target pair is signaled. If there is no match between an advertised source identifier and the configured target identifier, the pseudowire is not established.
Interface name	Name of interface.
Remote Site ID	Remote site ID.
Label Offset	Numbers within the label block that are skipped to find the next label base.
Label-base	Advertises the first label in a block of labels. A remote PE router uses this first label when sending traffic toward the advertising PE router.
Range	Advertises the label block size.
status-vector	Bit vector advertising the state of local PE-CE circuits to remote PE routers. A bit value of 0 indicates that the local circuit and LSP tunnel to the remote PE router are up, whereas a value of 1 indicates either one or both are down.
connection-site	Name of the connection site.
Type	Type of connection: loc (local) or rmt (remote).
St	Status of the connection. (For a list of possible values, see the Legend for connection status (St) field.)

Table 238: *show l2vpn connections Output Fields (continued)*

Field Name	Field Description
Time last up	Time that the connection was last in the Up condition.
# Up trans	Number of transitions from Down to Up condition.
Local circuit	Address and status of local circuit.
Remote circuit	Address and status of remote circuit.
St	<p>Status of the Layer 2 VPN connection (corresponds with Legend for Connection Status):</p> <ul style="list-style-type: none"> • EI—The local Layer 2 VPN interface is configured with an encapsulation that is not supported. • EM—The encapsulation type received on this Layer 2 VPN connection from the neighbor does not match the local Layer 2 VPN connection interface encapsulation type. • VC-Dn—The virtual circuit is currently down. • CM—The two routers do not agree on a control word, which causes a control word mismatch. • CN—The virtual circuit is not provisioned properly. • OR—The label associated with the virtual circuit is out of range. • OL—No advertisement has been received for this virtual circuit from the neighbor. There is no outgoing label available for use by this virtual circuit. • LD—All of the CE-facing interfaces to the local site are down. Therefore, the connection to the local site is signaled as down to the other PE routers. No pseudowires can be established. • RD—All the interfaces to the remote neighbor are down. Therefore, the remote site has been signaled as down to the other PE routers. No pseudowires can be established. • LN—The local site has lost path selection to the remote site and therefore no pseudowires can be established from this local site. • RN—The remote site has lost path selection to a local site or other remote site and therefore no pseudowires are established to this remote site. • XX—The Layer 2 VPN connection is down for an unknown reason. This is a programming error. • NC—The interface encapsulation is not configured as an appropriate CCC, TCC, or Layer 2 VPN encapsulation. • WE—The encapsulation configured for the interface does not match the encapsulation configured for the associated connection within the Layer 2 VPN routing instance. • NP—The router detects that interface hardware is not present. The hardware might be offline, a PIC might not be of the desired type, or the interface might be configured in a different routing instance. • ->—Only the outbound connection is up. • <-—Only the inbound connection is up. • Up—The Layer 2 VPN connection is operational. • Dn—The Layer 2 VPN connection is down. • CF—The router cannot find enough bandwidth to the remote router to satisfy the Layer 2 VPN connection bandwidth requirement.

Table 238: show l2vpn connections Output Fields (continued)

Field Name	Field Description
	<ul style="list-style-type: none"> • SC—The local site identifier matches the remote site identifier. No pseudowire can be established between these two sites. You should configure different values for the local and remote site identifiers. • LM—The local site identifier is not the minimum designated, meaning it is not the lowest. There is another local site with a lower site identifier. Pseudowires are not being established to this local site, and the associated local site identifier is not being used to distribute Layer 2 VPN label blocks. However, this is not an error state. Traffic continues to be forwarded to the PE router interfaces connected to the local sites when the local sites are in this state. • RM—The remote site identifier is not the minimum designated, meaning it is not the lowest. There is another remote site connected to the same PE router which has lower site identifier. The PE router cannot establish a pseudowire to this remote site and the associated remote site identifier cannot be used to distribute VPLS label blocks. However, this is not an error state. Traffic can continue to be forwarded to the PE router interface connected to this remote site when the remote site is in this state. • IL—The incoming packets for the Layer 2 VPN connection have no MPLS label.
Remote PE	Address of the remote provider edge router.
Incoming label	Name of the incoming label.
Outgoing label	Name of the outgoing label.
Egress Protection	Whether the given PVC is protected by connection protection logic using egress protection for BGP signaled layer 2 services.
Flow Label Receive	Capability to pop the flow label in the receive direction to the remote provider edge (PE) router
Flow Label Transmit	Capability to push the flow label in the transmit direction to the provider edge (PE) router
Time	Date and time of Layer 2 VPN connection event.
Event	Type of event.
Interface/Lbl/PE	Interface, label, or PE router.

show mvpn neighbor

Syntax `show mvpn neighbor`
`<extensive | summary>`
`<inet | inet6>`
`<instance instance-name | neighbor-address address>`
`<logical-system logical-system-name>`

Release Information Command introduced in Junos OS Release 8.4.

Description Display multicast VPN neighbor information.

Options **extensive | summary**—(Optional) Display the specified level of output for all multicast VPN neighbors.

inet | inet6—(Optional) Display IPv4 or IPv6 information for all multicast VPN neighbors.

instance *instance-name* | neighbor-address *address*—(Optional) Display multicast VPN neighbor information for the specified instance or the specified neighbor.

logical-system *logical-system-name*—(Optional) Display multicast VPN neighbor information for the specified logical system.

show vpls connections

Syntax `show vpls connections`
 `<brief | extensive>`
 `<down | up | up-down>`
 `<history>`
 `<instance instance-name local-site local-site-name remote-site remote-site-name>`
 `<instance-history>`
 `<logical-system (all | logical-system-name)>`
 `<status>`
 `<summary>`

Release Information Command introduced before Junos OS Release 7.4.
 instance-history option introduced in Junos OS Release 12.3R2.

Description (T Series and M Series routers, except for the M160 router) Display virtual private LAN service (VPLS) connection information.

Options **none**—Display information about all VPLS connections for all routing instances.

brief | extensive—(Optional) Display the specified level of output.

down | up | up-down—(Optional) Display nonoperational, operational, or both types of connections.

history—(Optional) Display information about connection history.

instance *instance-name*—(Optional) Display the VPLS connections for the specified routing instance only.

instance-history—(Optional) Display information about connection history for a particular instance.

local-site *local-site-name*—(Optional) Display the VPLS connections for the specified local site name or ID only.

remote-site *remote-site-name*—(Optional) Display the VPLS connections for the specified remote site name or ID only. Label block size information is always shown as 0 when using this option.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

status—(Optional) Display information about the connection and interface status.

summary—(Optional) Display summary of all VPLS connections information.

Required Privilege Level view

List of Sample Output [show vpls connections on page 2637](#)
[show vpls connections \(with FEC128 and FEC129 in the same routing-instance\) on page 2639](#)
[show vpls connections \(with multiple pseudowires\) on page 2640](#)
[show vpls connections extensive \(Static VPLS Neighbors\) on page 2641](#)

Output Fields [Table 242 on page 2633](#) lists the output fields for the **show vpls connections** command. Output fields are listed in the approximate order in which they appear.

Table 242: show vpls connections Output Fields

Field Name	Field Description
Instance	Name of the VPLS instance.
Local site	Name of the local site.
VPLS-id	Identifier for the VPLS site.
Number of local interfaces	Number of interfaces configured for the local site.
Number of local interfaces up	Number of interfaces configured for the local site that are currently up.
IRB interface present	Indicates whether or not an integrated routing and bridging (IRB) interface is present (yes or no).
Intf	<p>List of all of the interfaces configured for the local site. The types of interfaces can include VPLS virtual loopback tunnel interfaces and label-switched interfaces. Any interface that supports VPLS could be listed here.</p> <p>Virtual loopback tunnel interfaces are displayed using the vt-fpc/pic/port.nnnnn format. Label-switched interfaces are displayed using the lsi.nnnnn format. In both cases, nnnnn is a dynamically generated virtual port used to transport and receive packets from other provider edge (PE) routers in the VPLS domain.</p> <p>Each interface might include the following information:</p> <ul style="list-style-type: none"> • Identification as a VPLS interface • Name of the associated VPLS routing instance • Local site number • Remote site number • VPLS neighbor address • VPLS identifier
Interface flags	<p>Flag associated with the interface. Can include the following:</p> <ul style="list-style-type: none"> • VC-Down—The virtual circuit associated with this interface is down.
Label-base	First label in a block of labels. A remote PE router uses this first label when sending traffic toward the advertising PE router.

Table 242: *show vpls connections* Output Fields (continued)

Field Name	Field Description
Offset	Displays the VPLS Edge (VE) block offset in the Layer 2 VPN NLRI. The VE block offset is used to identify a label block from which a particular label value is selected to setup a pseudowire for a remote site. The block offset value itself indicates the starting VE ID that maps to the label base contained in the VPLS NLRI advertisement.
Size	Label block size. A configurable value that represents the number of label blocks required to cover all the pseudowires for the remote peer. Acceptable configuration values are: 2 , 4 , 8 and 16 . The default value is 2 . A value of 0 will be displayed when using the remote-site option.
Range	Label block range. A value that keeps track of the numbers of remote sites discovered within each label block.
Preference	Preference value advertised for a VPLS site. When multiple PE routers are assigned the same VE ID for multihoming, you might need to specify that a particular PE router acts as the designated forwarder by configuring the site preference value. The site preference indicates the degree of preference for a particular customer site. The site preference is one of the tie-breaking criteria used in a designated forwarder election.
status-vector	Bit vector advertising the state of local PE-CE circuits to remote PE routers. A bit value of 0 indicates that the local circuit and LSP tunnel to the remote PE router are up, whereas a value of 1 indicates either one or both are down.
connection-site	Name of the connection site.
Neighbor	IP address and VPLS identifier for the VPLS neighbor. If multiple pseudowires have been configured, the IP address will also show the PW-specific <i>vpls-id-list</i> , for example, 203.0.113.144 (vpls-id 200).
Type	Type of connection: loc (local) or rmt (remote).

Table 242: *show vpls connections* Output Fields (continued)

Field Name	Field Description
St	<p>Status of the VPLS connection (corresponds with Legend for Connection Status):</p> <ul style="list-style-type: none"> • EI—The local VPLS interface is configured with an encapsulation that is not supported. • EM—The encapsulation type received on this VPLS connection from the neighbor does not match the local VPLS connection interface encapsulation type. • VC-Dn—The virtual circuit is currently down. • CM—The two routers do not agree on a control word, which causes a control word mismatch. • CN—The virtual circuit is not provisioned properly. • OR—The label associated with the virtual circuit is out of range. • OL—No advertisement has been received for this virtual circuit from the neighbor. There is no outgoing label available for use by this virtual circuit. • LD—All of the CE-facing interfaces to the local site are down. Therefore, the connection to the local site is signaled as down to the other PE routers. No pseudowires can be established. • RD—All the interfaces to the remote neighbor are down. Therefore, the remote site has been signaled as down to the other PE routers. No pseudowires can be established. • LN—The local site has lost path selection to the remote site and therefore no pseudowires can be established from this local site. • RN—The remote site has lost path selection to a local site or other remote site and therefore no pseudowires are established to this remote site. In a multihoming configuration, one multihomed PE site displays the state LN, and the other multihomed PE site displays the state RN in the following circumstances: <ul style="list-style-type: none"> • The multihomed links are both configured to be the backup site. • The two multihomed PE routers have the same site ID, but have a peering relationship with a route reflector (RR) that has a different site ID. • XX—The VPLS connection is down for an unknown reason. This is a programming error. • MM—The MTU for the local site and the remote site do not match. • BK—The router is using a backup connection. • PF—Profile parse failure. • RS—The remote site is in a standby state. • NC—The interface encapsulation is not configured as an appropriate CCC, TCC, or VPLS encapsulation. • WE—The encapsulation configured for the interface does not match the encapsulation configured for the associated connection within the VPLS routing instance.

Table 242: *show vpls connections* Output Fields (continued)

Field Name	Field Description
	<ul style="list-style-type: none"> • NP—The router detects that interface hardware is not present. The hardware might be offline, a PIC might not be of the desired type, or the interface might be configured in a different routing instance. • -->—Only the outbound connection is up. • <--—Only the inbound connection is up. • Up—The VPLS connection is operational. • Dn—The VPLS connection is down. • CF—The router cannot find enough bandwidth to the remote router to satisfy the VPLS connection bandwidth requirement. • SC—The local site identifier matches the remote site identifier. No pseudowire can be established between these two sites. You should configure different values for the local and remote site identifiers. • LM—The local site identifier is not the minimum designated, meaning it is not the lowest. There is another local site with a lower site identifier. Pseudowires are not being established to this local site, and the associated local site identifier is not being used to distribute VPLS label blocks. However, this is not an error state. Traffic continues to be forwarded to the PE router interfaces connected to the local sites when the local sites are in this state. • RM—The remote site identifier is not the minimum designated, meaning it is not the lowest. There is another remote site connected to the same PE router which has lower site identifier. The PE router cannot establish a pseudowire to this remote site and the associated remote site identifier cannot be used to distribute VPLS label blocks. However, this is not an error state. Traffic can continue to be forwarded to the PE router interface connected to this remote site when the remote site is in this state. • IL—The incoming packets for the VPLS connection have no MPLS label. • MI—The configured mesh group identifier is in use by another system in the network. • ST—The router has switched to a standby connection. • PB—Profile busy. • SN—The VPLS neighbor is static.
Time last up	Time connection was last in the Up condition.
# Up trans	Number of transitions from Down to Up condition.
Status	Status of the (local or remote circuit) local interface: <ul style="list-style-type: none"> • Up—Operational • Dn—Down • NP—Not present • DS—Disabled • WE—Wrong encapsulation • UN—Uninitialized
Encapsulation	Type of encapsulation: VPLS .
Remote PE	Address of the remote provider edge router.

Table 242: *show vpls connections* Output Fields (continued)

Field Name	Field Description
Negotiated control-word	Whether a control word has been negotiated: Yes or No .
Incoming label	Name of the incoming label.
Outgoing label	Name of the outgoing label.
Negotiated PW status TLV	Indicates whether or not the pseudowire status TLV has been negotiated for the VPLS connection.
Local interface	Provides the following information about the local interface configured for the VPLS neighbor: <ul style="list-style-type: none"> • Name of the local interface • Status—Interface status (Up or Down) • Encapsulation—Interface encapsulation (for example, ETHERNET) • Description—Includes the VPLS instance name, the VPLS neighbor address, and the VPLS identifier
Time	Date and time of VPLS connection event.
Event	Type of event.
Interface/Lbl/PE	Interface, label, or PE router.
Connection History	Each entry can include the date, time, year, and the connection event. Connection events include any of a variety of events related to VPLS connections, such as route changes, label updates, and interfaces going down or coming up.

```

show vpls flood route

Syntax `show vpls flood route`
 (all-ce-flood instance-name *instance-name* <logical-system-name *logical-system-name*>
 |
 ce-flood interface *interface-name*)

Release Information Command introduced in Junos OS Release 8.0.

Description Display VPLS route information related to the flood process for either the specified routing instance or the specified interface.

Options **all-ce-flood**—Display the flood next-hop route for all customer edge routers for traffic coming from the core of the network.

ce-flood interface *interface-name*—Display the flood next-hop route for traffic coming from the specified customer edge interface.

instance-name *instance-name*—Display the flood routes for the specified instance.

logical-system-name *logical-system-name*—(Optional) Specify the logical system whose flood routes you want to display. You can only specify the default logical system name for VPLS. The default logical system name is `_example_ls1_` (the name must be entered in the command with the underscore characters).

Required Privilege Level view

List of Sample Output [show vpls flood route all-ce-flood on page 2648](#)
[show vpls flood route ce-flood on page 2648](#)

Output Fields [Table 245 on page 2647](#) lists the output for the **show vpls flood route** command. Output fields are listed in the approximate order in which they appear.

Table 245: show vpls flood route Output Fields

Field Name	Field Description
Flood route prefix	Prefix for the flood route.
Flood route type	Type of flood route (either CE_FLOOD or ALL_CE_FLOOD).
Flood route owner	VPLS routing instance or interface associated with the flood route.
Nexthop type	Next-hop type. For example, flood for a flood route.
Nexthop index	Next-hop index number for the route.

Table 245: show vpls flood route Output Fields (continued)

Field Name	Field Description
Interfaces flooding to	Interfaces to which VPLS routes are being flooded.
Name	Name of the interface.
Type	Type of VPLS router (CE or VE).
Nh type	Next-hop type.
Index	Index number for the flood route.

Sample Output

show vpls flood route all-ce-flood

```
user@host: __example_lsi__> show vpls flood route all-ce-flood logical-system-name
__example_lsi__instance-name green
```

```
Flood route prefix: default

Output Fields Table 246 on page 2650 describes the output fields for the **show vpls mac-table** command. Output fields are listed in the approximate order in which they appear.

Table 246: show vpls mac-table Output fields

Field Name	Field Description
Age	Age of a single mac-address.
Routing instance	Name of the routing instance.
Bridging domain	Name of the bridging domain.
MAC address	MAC address or addresses learned on a logical interface.
MAC flags	Status of MAC address learning properties for each interface: <ul style="list-style-type: none"> • S—Static MAC address configured. • D—Dynamic MAC address learned. • SE—MAC accounting is enabled. • NM—Nonconfigured MAC.
Logical interface	Name of the logical interface.
MAC count	Number of MAC addresses learned on a specific routing instance or interface.
Learning interface	Logical interface or logical Label Switched Interface (LSI) the address is learned on.
Base learning interface	Base learning interface of the MAC address. This field is introduced in Junos OS Release 14.2.
Learn VLAN ID/VLAN	VLAN ID of the routing instance or bridge domain in which the MAC address was learned.
VXLAN ID/VXLAN	VXLAN Network Identifier (VNI)
Layer 2 flags	Debugging flags signifying that the MAC address is present in various lists.
Epoch	Spanning Tree Protocol epoch number identifying when the MAC address was learned. Used for debugging.
Sequence number	Sequence number assigned to this MAC address. Used for debugging.
Learning mask	Mask of Packet Forwarding Engines where this MAC address was learned. Used for debugging.
IPC generation	Creation time of the logical interface when this MAC address was learned. Used for debugging.

Sample Output

show vpls mac-table

```
user@host> show vpls mac-table

```

show vpls statistics

Syntax `show vpls statistics`
`<instance instance-name>`
`<logical-system (all | logical-system-name)>`

Release Information Command introduced before Junos OS Release 7.4.

Description (T Series and M Series routers, except for the M160 router) Display virtual private LAN service (VPLS) statistics.

Options **none**—Display VPLS statistics for all routing instances.

instance *instance-name*—(Optional) Display VPLS statistics for a specific VPLS routing instance only.

logical-system (all | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

Required Privilege Level view

List of Sample Output [show vpls statistics on page 2656](#)
[show vpls statistics instance on page 2657](#)

Output Fields [Table 247 on page 2655](#) lists the output fields for the **show vpls statistics** command. Output fields are listed in the approximate order in which they appear.

Table 247: show vpls statistics Output Fields

Field Name	Field Description
Instance	Name of the VPLS instance.
Local interface	Name of the local VPLS virtual loopback tunnel interface, vt-fpc/pic/port.nnnnn , where nnnnn is a dynamically generated virtual port used to transport and receive packets from other provider edge (PE) routers in the VPLS domain.
Index	Number associated with the next hop.
Remote provider edge router	Address of the remote provider edge router.
Multicast packets	Number of multicast packets received.
Multicast bytes	Number of multicast bytes received.
Flood packets	Number of VPLS flood packets received.

Table 247: show vpls statistics Output Fields (continued)

Field Name	Field Description
Flood bytes	Number of VPLS flood bytes received.
Current MAC count	Number of MAC addresses learned by the interface and the configured maximum limit on the number of MAC addresses that can be learned.

Sample Output

show vpls statistics

```
user@host> show vpls statistics
```

```
VPLS statistics:
```

```
Instance: green
```

```
Local interface: fe-2/2/1.0, Index: 69
Multicast packets:      1
Multicast bytes   :      60
Flooded packets   :      18
Flooded bytes    :     2556
Current MAC count:      1
```

```
Local interface: lt-0/3/0.2, Index: 72
Multicast packets:      3
Multicast bytes   :     153
Flooded packets   :      1
Flooded bytes    :      51
Current MAC count:      1
```

```
Local interface: lsi.32769, Index: 75
Current MAC count:      0
```

```
Local interface: lsi.32771, Index: 77
Remote PE: 10.255.14.222
Current MAC count:      2
```

```
Instance: red
```

```
Local interface: vt-0/3/0.32768, Index: 74
Multicast packets:      0
Multicast bytes   :      0
Flooded packets   :      0
Flooded bytes    :      0
Current MAC count:      0
```

```
Local interface: vt-0/3/0.32770, Index: 76
Multicast packets:      0
Multicast bytes   :      0
Flooded packets   :      0
Flooded bytes    :      0
Current MAC count:      0
```

show vpls statistics instance

```
user@host> show vpls statistics instance red
```

```
Layer-2 VPN Statistics:
```

```
Instance: red
```

```
Local interface: vt-3/2/0.32768, Index: 73
```

```
Remote provider edge router: 10.255.17.35
```

```
Multicast packets: 0
```

```
Multicast bytes : 0
```

```
Flood packets : 0
```

```
Flood bytes : 0
```

```
Current MAC count: 1 (Limit 20)
```
