**Hierarchy Level** [edit access [profile](#) *profile-name*]

**Release Information** Statement introduced in Junos OS Release 9.1.  
Statement introduced in Junos OS Release 9.1 for EX Series switches.

**Description** Configure the RADIUS parameters that the router uses for AAA authentication and accounting for subscribers.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Description</b>              | Configure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces to be reconfigured when a RADIUS-initiated disconnect is received by the DHCP client or group of clients. A group configuration takes precedence over a DHCP local server configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Default</b>                  | The client is deleted when a RADIUS-initiated disconnect is received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

    source-ipv4-address ipv4-address;
}

```

Hierarchy Level [edit services]

**Release Information** Statement introduced in Junos OS Release 9.4.

**Description** Configure the radius-flow-tap service for subscriber secure policy mirroring. Both RADIUS-initiated and Dynamic Tasking Control Protocol (DTCP)-initiated mirroring are supported.

Starting in Junos OS Release 17.3R1, the radius-flow-tap service can run concurrently on the same router with the FlowTapLite service. The FlowTapLite service is a version of the flow-tap service (**[edit services flow-tap]**) that is configured only on tunnel interfaces on MX Series routers.

In earlier releases, the radius-flow-tap and FlowTapLite services cannot run concurrently on an MX Series router, preventing you from running FlowTapLite monitoring and subscriber secure policy mirroring at the same time.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

Required Privilege Level

flow-tap—To view this statement in the configuration.

## radius-options (Interfaces)

**Syntax**

```
radius-options {
  nas-port-options nas-port-options-name {
    nas-port-extended-format {
      adapter-width width;
      ae-width width;
      port-width width;
      slot-width width;
      stacked;
      stacked-vlan-width width;
      vci-width width;
      vlan-width width;
      vpi-width width;
    }
    nas-port-type port-type;
    stacked-vlan-ranges (any | low-outer-tag-high-outer-tag),any;
    vlan-ranges (any | low-tag-high-tag);
  }
}
```

**Hierarchy Level** [edit interfaces *interface-name*]

**Release Information** Statement introduced in Junos OS Release 12.3.

**Description** Configure RADIUS options to set the NAS-Port-Type (61) RADIUS IETF attribute, and an extended format for the NAS-Port (5) RADIUS IETF attribute, on a per-physical interface, per-VLAN, or per-stacked VLAN (S-VLAN) basis.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure DHCPv6 local server to recognize the Rapid Commit option (DHCPv6 option 14) in DHCPv6 solicit messages sent from the DHCPv6 client. When rapid commit is enabled for both DHCPv6 local server and the DHCPv6 client, a two-message handshake is used instead of the standard four-message handshake. You can enable rapid commit support on DHCPv6 local server globally, for a named group, or for a specific interface.</p>                                                                                                                                                                                                                                                                                    |
| <b>Default</b>                  | Rapid commit support is not enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Release Information | <p>Statement introduced in Junos OS Release 17.4R1 on MX Series routers.</p> <p>Support at the <code>[edit ... system services dhcp-local-server dual-stack-group]</code> hierarchy level introduced in Junos OS Release 18.1R1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Description         | <p>Enable DHCP client reauthentication, that is, trigger <code>jdhcpd</code> to request reauthentication from <code>authd</code>, which in turn reissues the RADIUS Access-Request for subscriber authentication. The purpose of the reauthentication is to change characteristics of the subscriber session, such as activating subscriber services or changing attributes. You can use reauthentication as an alternative to a RADIUS CoA request.</p> <p>Starting in Junos OS Release 18.1R1, reauthentication can be triggered by discover and solicit messages in addition to the previously supported renew and rebind messages. The release also introduces reauthentication support for dual-stack, single-session subscribers.</p> <p>You can specify that reauthentication occurs in response to all DHCP renew, rebind, discover, or solicit messages or only in response to discover and solicit messages that include a new (different) Agent Remote ID for the DHCP client.</p> <p>You can use the Juniper Networks VSA, Reauthentication-On-Renew (26-206) as an alternative to the CLI configuration to enable reauthentication. The <b>reauthenticate</b> statement overrides the VSA when the VSA is present with a value of <code>disable</code>.</p> |

**NOTE:** Reauthentication for dual-stack, single-session subscribers requires that the `on-demand-address-allocation` statement is configured for the dual-stack group. This is true whether you enable reauthentication with the **reauthenticate** statement or the Reauthenticate-On-Renew VSA (26-206).

NOTE: You cannot configure both the reauthenticate statement and the [remote-id-mismatch](#) statement at the global level, [edit system services dhcp-local-server]. However, DHCP precedence rules do permit you to configure both statements when they are at different levels. For example, you can configure reauthenticate at the global level and [remote-id-mismatch](#) for DHCPv6 at the [edit system services dhcp-local-server dhcpv6] or for a specific group at the [edit system services dhcp-local-server group *name*] hierarchy level, and so on.

NOTE: Reauthentication does not support Extensible Services Subscriber Management (essmd) services. Activation or deactivation of any such service causes the request to fail.

## reconfigure (DHCP Local Server)

**Syntax**

```
reconfigure {
  attempts attempt-count;
  clear-on-abort;
  strict;
  support-option-pd-exclude;
  timeout timeout-value;
  token token-value;
  trigger {
    radius-disconnect;
  }
}
```

**Hierarchy Level**

```
[edit logical-systems logical-system-name routing-instances routing-instance-name system
services dhcp-local-server],
[edit logical-systems logical-system-name routing-instances routing-instance-name system
services dhcp-local-server dhcpv6],
[edit logical-systems logical-system-name routing-instances routing-instance-name system
services dhcp-local-server group group-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name system
services dhcp-local-server dhcpv6 group group-name],
[edit logical-systems logical-system-name system services dhcp-local-server],
[edit logical-systems logical-system-name system services dhcp-local-server dhcpv6],

[edit system services dhcp-local-server dhcpv6 group group-name]
```

**Release Information** Statement introduced in Junos OS Release 10.0.  
 Support at the [edit ... **dhcpv6** ...] hierarchy levels introduced in Junos OS Release 10.4.  
 Statement introduced in Junos OS Release 12.1 for EX Series switches.  
**support-option-pd-exclude** statement introduced in Junos OS Release 17.3 for the MX Series.

**Description** Enable dynamic reconfiguration triggered by the DHCP local server of all DHCP clients or only the DHCP clients serviced by the specified group of interfaces. A group configuration takes precedence over a DHCP local server configuration. The **strict** statement is available only for DHCPv6.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Options**    **support-option-pd-exclude**—Request to exclude prefix option in the reconfigure message.

**Required Privilege**    system—To view this statement in the configuration.  
**Level**    system-control—To add this statement to the configuration.

| <b>Description</b>              | Specify that the DHCPv6 Relay Agent Remote-ID option (option 37) in the client PDU name is concatenated with the username during the subscriber authentication or DHCP client authentication process. In order to generate an ASCII version of the username, the router concatenates only the remote-id portion of option 37 to the username, and ignores the enterprise number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Description              | Specify that the DHCPv6 Relay Agent Remote-ID option (option 37) in the client PDU name is concatenated with the username during the subscriber authentication or client authentication process. In order to generate an ASCII version of the username, the router concatenates only the remote-id portion of option 37 to the username, and ignores the enterprise number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## relay-option (DHCP Relay Agent)

**Syntax**

```

relay-option {
  option-number option-number;
  default-action {
    drop;
    forward-only;
    local-server-group local-server-group;
    relay-server-group relay-server-group;
  }
  equals (ascii ascii-string | hexadecimal hexadecimal-string) {
    drop;
    forward-only;
    local-server-group local-server-group;
    relay-server-group relay-server-group;
  }
  starts-with (ascii ascii-string | hexadecimal hexadecimal-string) {
    drop;
    forward-only;
    local-server-group local-server-group;
    relay-server-group relay-server-group;
  }
}

```

**Hierarchy Level**

```

[edit forwarding-options dhcp-relay],
[edit forwarding-options dhcp-relay dhcpv6],
[edit forwarding-options dhcp-relay group group-name],
[edit forwarding-options dhcp-relay dhcpv6 group group-name],
[edit logical-systems logical-system-name forwarding-options dhcp-relay ...],
[edit logical-systems logical-system-name routing-instances routing-instance-name
  forwarding-options dhcp-relay ...],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay ...]

```

**Release Information** Statement introduced in Junos OS Release 12.3.  
Statement introduced in Junos OS Release 12.3 for EX Series switches.

**Description** Configure the extended DHCP relay agent selective processing that is based on DHCP options in DHCP client packets and specify the action to perform on client traffic. You can configure support globally or for a named group of interfaces, and for either DHCP or DHCPv6 relay agent.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| Description              | <p>Add vendor-specific information to the vendor-specific option (17) field of DHCPv6 control messages on server-facing interfaces. The vendor-specific information can be a hostname, a location (such as a unique connection identifier), or both. The hostname can be a string of characters such as <b>Juniper-AB-1</b>. The location should be specified as interface, VLAN ID, and if applicable, stacked VLAN ID. For example, <b>&lt;ifd-name&gt;:&lt;vlan&gt;</b> (ae0:100) or <b>&lt;ifd-name&gt;:&lt;svlan&gt; -&lt;vlan&gt;</b> (ae0:100-10).</p> <p>Junos OS automatically adds the remaining vendor-specific information as per RFC 4243. The enterprise ID is 2636. The hostname is option-data 1, and the location is option-data 2. The DHCPv6 relay strips the suboption data from replies from the server before it relays the packets out the client facing interface.</p> <p>This feature can be useful, in conjunction with operator-developed tools, for troubleshooting DHCP servers and providing service assurances. For example, a central DHCP server can log the information, and operators can query a single entity to track and troubleshoot subscriber IP information and network attachment points.</p> |

```

**Release Information** Statement introduced in Junos OS Release 8.3.  
Statement introduced in Junos OS Release 12.3 for EX Series switches.

**Description** Enable or disable the insertion of the DHCP relay agent information option (option 82) in DHCP packets destined for a DHCP server.

To enable insertion of option 82 information in DHCP packets, you must specify at least one of the **circuit-id** or **remote-id** statements.

You can use the **relay-option-82** statement and its subordinate statements at the **[edit forwarding-options dhcp-relay]** hierarchy level to control insertion of option 82 information

globally, or at the `[edit forwarding-options dhcp-relay group group-name]` hierarchy level to control insertion of option 82 information for a named group of interfaces.

To restore the default behavior (option 82 information is not inserted into DHCP packets), use the `delete relay-option-82` statement.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

| <b>Description</b>              | Relay DHCP client packets to the specified group of DHCP servers when you use the DHCP relay selective processing feature. You can configure the relay operation globally or for a group of interfaces, and for either DHCP or DHCPv6 relay agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | <p>Configure DHCP relay server to use the configured loopback address as the source address in both the IP header and in DHCP messages relayed to the server.</p> <p>In network configurations where a firewall on the broadband network gateway (BNG) is between the DHCP relay agent and the DHCP server, only the BNG loopback address passes through the BNG firewall. In that case, DHCP unicast packets do not pass through the firewall and are discarded. This configuration statement places the loopback address in IP headers and DHCP messages, which enables DHCP unicast packets to pass through the firewall to the DHCP server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <i>interface-name</i> —Specify the loopback interface. The <i>interface-name</i> must be <code>lo0</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## remote-id (DHCP Relay Agent)

**Syntax**

```
remote-id {
  include-irb-and-l2;
  keep-incoming-remote-id;
  no-vlan-interface-name;
  prefix prefix;
  use-interface-description (logical | device);
  use-vlan-id;
}
```

**Hierarchy Level**

```
[edit forwarding-options dhcp-relay relay-option-82],
[edit forwarding-options dhcp-relay group group-name relay-option-82],
[edit logical-systems logical-system-name forwarding-options dhcp-relay ... relay-option-82],
[edit logical-systems logical-system-name routing-instances routing-instance-name
 forwarding-options dhcp-relay ... relay-option-82],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay ...
 relay-option-82]
```

**Release Information** Statement introduced in Junos OS Release 14.1.

**Description** Specify the Agent Remote ID suboption (suboption 2) of the DHCP relay agent information option (option 82) to include in DHCP packets destined for a DHCP server. Optionally specify that the suboption includes a prefix, textual description, or VLAN tag.

**NOTE:** For Layer 3 interfaces, when you configure `relay-option-82` only, the Agent Remote ID is the default. If no VLAN tags are configured, then the default is the logical interface device (IFL) name. For integrated routing and bridging (IRB) interfaces, the default is the Layer 2 IFL name and bridge domain name.

The interface to bridge domain relationship may be implicit (the interface is mapped to the bridge domain by the system based on VLAN tag) or explicit (the interface is mapped to the bridge domain by configuring it in the bridge domain definition). For the explicit case, tagging might not be relevant for the mapping.

The format of the Agent Remote ID information for Fast Ethernet or Gigabit Ethernet interfaces that do not use virtual LANs (VLANs), stacked VLANs (S-VLANs), or bridge domains is as follows:

```
(fe | ge)-fpc/pic/port.subunit
```

**NOTE:** For remote systems, the *subunit* is required and is used to differentiate an interface.

The format of the Agent Remote ID information for Fast Ethernet or Gigabit Ethernet interfaces that use VLANs is as follows:

```
(fe | ge)-fpc/pic/port:vlan-id
```

The format of the Agent Remote ID information for Fast Ethernet or Gigabit Ethernet interfaces that use S-VLANs is as follows:

```
(fe | ge)-fpc/pic/port:svlan-id--vlan-id
```

In the case of an IRB interface, the format displays the Layer 2 interface instead of the IRB interface along with the bridge domain name. For IRB interfaces (or other pseudo devices) the default format is as follows:

- IRB interfaces that use bridge domains but do not use VLANs or S-VLANs:

```
(fe | ge)-fpc/pic/port.subunit:bridge-domain-name
```

- IRB interfaces that use VLANs:

```
(fe | ge)-fpc/pic/port.subunit:vlan-name
```

To include the IRB interface name with the Layer 2 interface name, configure the **include-irb-and-l2** statement. The format is as follows:

- IRB interfaces that use bridge domains but do not use VLANs or S-VLANs:

```
(fe | ge)-fpc/pic/port:bridge-domain-name+irb.subunit
```

- IRB interfaces that use VLANs:

```
(fe | ge)-fpc/pic/port:vlan-name+irb.subunit
```

To include only the IRB interface name without the Layer 2 interface and bridge domain or VLAN, configure the **no-vlan-interface-name** statement. The format is as follows:

```
irb.subunit
```

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

| Release Information | Statement introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Description         | <p>Configure the DHCP local server or DHCP relay agent to detect a mismatch in the Agent Remote ID value to trigger a new connection request. Information about a subscriber's service plan is encoded in the Agent Remote ID, which is conveyed in option 82, suboption 2, for DHCPv4 clients and in option 37 for DHCPv6 clients. When a subscriber session is activated, the Agent Remote ID value for the authorized service plan is stored in the session database. When you configure <b>remote-id-mismatch</b>, the DHCP local server and relay agent inspect incoming renew and rebind messages and compare the Agent Remote ID in the message against the initial value that DHCP stored in the database. When DHCP local server discovers a mismatch between the stored value and the value in the message, DHCP local server sends a NAK to the client and tears down the client binding. If the client is a DHCPv6 client, because DHCPv6 does not support an explicit NAK message, the local server sends a reply packet with lifetime set to 0 to signify a logical NAK.</p> <p>When DHCP relay agent discovers the mismatch, it sends a NAK or logical NAK (for DHCPv6) to the DHCP client. The relay agent cannot tear down the binding itself, so it sends a release message to the local server, causing the local server to tear down the binding. For this to happen, you must configure the <a href="#">send-release-on-delete</a> statement on the DHCP relay agent; otherwise it will not send the release message to the local server. In that case, the local server retains the client entry in the database until it times out or the IP address is used for a different binding.</p> |

**NOTE:** **remote-id-mismatch** functionality overrides the default DHCP relay agent bind-on-request behavior. By default, when a stray DHCP request is received, that is, one for which there is an entry in the local server database but not in the relay agent database, a complete binding is automatically made with the relay agent and the local server.

The DHCP client initiates renegotiation when it receives the NAK. The changed Agent Remote ID value is conveyed as part of the request, enabling the new service plan to be submitted for authorization.

The **remote-id-mismatch** statement is typically used in an environment that uses local authorization instead of RADIUS authorization.

**NOTE:** You cannot configure both the **remote-id-mismatch** statement and the **reauthenticate** statement at the global level, [edit system services dhcp-local-server]. However, DHCP precedence rules do permit you to configure both statements when they are at different levels. For example, you can configure **reauthenticate** at the global level and **remote-id-mismatch** for DHCPv6 at the [edit system services dhcp-local-server dhcpv6] hierarchy level or for a specific group at the [edit system services dhcp-local-server group *name*] hierarchy level, and so on.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | <p>Configure the Policy and Charging Rule Function (PCRF) partition to generate reports for resource allocation failures by default. If you configure this statement, this generates the same result as if you enabled the Resource-Allocation-Notification message trigger with every rule received from the PCRF.</p> <p>The following example shows predefined rule installation commands, including the Resource-Allocation-Notification command, for Credit Control Answer (CCA-GX) and Reauthorization Request (RAR-GX) messages between the PCRF and Gx:</p> <pre>{ Charging-Rule-Install { Charging-Rule-Name:  "fixed-cos" } { Charging-Rule-Definition: { Charging-Rule-Name:  "firewall" } { Service-Identifier:  10 } { Rating-Group:       292 } { Juniper-Param-V4-Input-Filter: "my_input_filter" } { Juniper-Param-V4-Output-Filter: "my_output_filter" } } [ Resource-Allocation-Notification: ENABLE_NOTIFICATION(0) ] }</pre> |
|                                 | <p> <b>NOTE:</b> Some PCRFs may be unable to generate a Resource-Allocation-Notification AVP. As a result, the <code>report-resource-allocation</code> statement provides generated reports by default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                                 | <p>For login and update interactions between the PCRF and the Online Charging System (OCS), the OCS sends applicable reports to the PCRF using a CCR-GX-U message. If the service-dynamic-profile instantiation fails, and the Resource-Allocation-Notification (ENABLE_NOTIFICATION) is set for the charging rule, then the OCS sends a report. The router acknowledges the subscriber activation, allows subscriber traffic to flow, and continues to repeat the process.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | <p>Configure the Policy and Charging Rule Function (PCRF) partition to generate reports for both resource allocation successes and failures by default. If you configure this statement, this generates the same result as if you enabled the Successful-Resource-Allocation-Notification message trigger with every CCA-GX-I, CCA-GX-U, and RAR-GX-A message.</p> <p>The following example shows a predefined event trigger command for CCA-GX and RAR-GX messages between the PCRF and Gx:</p> <pre>{ Event-Trigger: SUCCESSFUL_RESOURCE_ALLOCATION(22) }</pre> <p>If the SUCCESSFUL_RESOURCE_ALLOCATION (22) trigger value exists in the downstream data, the Broadband Policy and Charging Enforcement Function (PCEF) reports successful installations of rules marked with Resource-Allocation-Notification AVP in the Charging-Rule-Install AVP.</p> <div>  <p><b>NOTE:</b> Some PCRFs may be unable to generate this event trigger. As a result, the <code>report-successful-resource-allocation</code> statement provides generated reports by default.</p> </div> <p>For login and update interactions between the PCRF and the Online Charging System (OCS), the OCS sends applicable reports to the PCRF using a CCR-GX-U message. If the service-dynamic-profile instantiation succeeds, and the Resource-Allocation-Notification (ENABLE_NOTIFICATION) is set for the charging rule, and the SUCCESSFUL_RESOURCE_ALLOCATION event trigger is set in the request, then the OCS sends a report.</p> |

| Release Information      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Description              | Specify the number of times that the router or switch is allowed to attempt to contact a RADIUS authentication or accounting server. You can override the retry limit for accounting servers with the <a href="#">accounting-retry</a> statement.                                                                                                                                                                                                                                                                                          |
|                          | <div>  <p><b>NOTE:</b> To successfully set a retry limit for the accounting servers different from the authentication servers, you must configure both the <a href="#">accounting-retry</a> and <a href="#">accounting-timeout</a> statements. If you configure only one of these statements, then the value you configure is ignored in favor of the values configured with the <a href="#">retry</a> and <a href="#">timeout</a> statements.</p> </div> |
|                          | <div>  <p><b>NOTE:</b> The maximum retry duration (the number of retries times the length of the timeout) cannot exceed 2700 seconds. An error message is displayed if you configure a longer duration.</p> </div>                                                                                                                                                                                                                                      |
| Options                  | <p><b><i>attempts</i></b>—Number of times that the router is allowed to attempt to contact a RADIUS server.</p> <p><b>Range:</b> 1 through 100</p> <p><b>Default:</b> 3</p>                                                                                                                                                                                                                                                                                                                                                                |

| Description         | Specify that the routing instance name be concatenated with the username during the subscriber authentication or DHCP client authentication process. No routing instance name is concatenated if the configuration is in the default routing instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Description         | <p>Specify that the routing instance name is concatenated with the username during the subscriber authentication or client authentication process. No routing instance name is concatenated if the configuration is in the default routing instance. Use the statement at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels to configure DHCPv6 support.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## routing-instance-name (Static Subscribers)

**Syntax** routing-instance-name;

**Hierarchy Level**

```
[edit logical-systems logical-system-name routing-instances routing-instances-name system
services static-subscribers authentication username-include],
[edit logical-systems logical-system-name routing-instances routing-instances-name system
services static-subscribers group group-name authentication username-include],
[edit logical-systems logical-system-name system services static-subscribers authentication
username-include],
[edit logical-systems logical-system-name system services static-subscribers group
group-name authentication username-include],
[edit routing-instances routing-instances-name system services static-subscribers
authentication username-include],
[edit routing-instances routing-instances-name system services static-subscribers group
group-name authentication username-include],
[edit system services static-subscribers authentication username-include],
[edit system services static-subscribers group group-name authentication username-include]
```

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** Specify that the name of the routing instance is included as part of the username created for all static subscribers or for the static subscribers in the specified group. The group version of the statement takes precedence over the global version. The username is also sent to RADIUS in the Access-Request message.

**Required Privilege Level** system—To view this statement in the configuration.  
 system-control—To add this statement to the configuration.

| Release Information      | Statement introduced in Junos OS Release 14.2.<br>Statement deprecated in Junos OS Release 17.4R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |         |             |        |                                                                                                                                                                                                                     |
| Description              | Adjust the number of frame overhead bytes by the specified number of bytes in the actual downstream rate reported in the ANCP Port Up message for an SDSL access line. The ANCP agent reports the adjusted value to CoS. The adjusted value accounts for the traffic encapsulation overhead.                                                                                                                                                                                                                                                                                                                         |         |             |        |                                                                                                                                                                                                                     |
|                          | <div>  <p><b>NOTE:</b> Starting in Junos OS Release 17.4R1, this statement is deprecated and replaced by the <a href="#">sdsl-overhead-bytes</a> option of the <a href="#">access-line</a> statement at the [edit system] hierarchy level. The ANCP agent ignores the <a href="#">sdsl-bytes</a> statement if it is present. This means that when you upgrade from Junos OS Release 17.3 or earlier with an existing configuration, you must reconfigure your adjustment with the <a href="#">access-line</a> statement.</p> </div> |         |             |        |                                                                                                                                                                                                                     |

## sdsl-overhead-adjust

**Syntax** `sdsl-overhead-adjust percentage;`

**Hierarchy Level** `[edit protocols ancp qos-adjust]`

**Release Information** Statement introduced in Junos OS Release 14.2.  
Statement deprecated in Junos OS Release 17.4R1.

**Description** Adjust the actual downstream rate for an SDSL access line reported in the ANCP Port Up message by multiplying the rate by the specified percentage. The ANCP agent reports the adjusted rate to CoS.

**NOTE:** Starting in Junos OS Release 17.4R1, this statement is deprecated and replaced by the `sdsl-overhead-adjust` option of the [access-line](#) statement at the `[edit system]` hierarchy level. The ANCP agent ignores the `sdsl-overhead-adjust` statement if it is present. This means that when you upgrade from Junos OS Release 17.3 or earlier with an existing configuration, you must reconfigure your adjustment with the [access-line](#) statement.

**Options** *percentage*—Percentage by which to multiply the rate.  
**Range:** 80 through 100 percent  
**Default:** 100 percent

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## send-dyn-subscription-indicator (PCRF Partition)

**Syntax** send-dyn-subscription-indicator;

**Hierarchy Level** [edit access [pcrf partition](#) *partition-name*],

**Release Information** Statement introduced in Junos OS Release 16.2.

**Description** Include the Juniper-Network-Family-Indicator AVP into its message requests. To enable the Policy Control and Charging Rules Function (PCRF) to dynamically pass subscription-ID parameters, and support a variety of authentication, authorization, and provisioning configuration, the Juniper attribute-value pairs (AVPs) in [Table 74 on page 1382](#) have been allocated from the Juniper Vendor-ID space (2636) vendor-specific attribute (VSA).

**NOTE:** If no dynamic-subscription ID is received, then neither Online Charging System (OCS) or Offline Charging System (OFCS) communications is initiated.

**Table 74: Allocated Juniper AVPs**

| AVP Name                           | Vendor-ID | AVP Type | Diameter Type | Diameter Flag |
|------------------------------------|-----------|----------|---------------|---------------|
| Juniper-Dyn-Subscription-Indicator | 2636      | 10001    | Enum          | V             |
| Juniper-Dyn-Subscription-Id        | 2636      | 10002    | Grouped       | VM            |
| Juniper-Dyn-Subscription-Id-Type   | 2636      | 10003    | Integer32     | VM            |
| Juniper-Dyn-Subscription-Id-Data   | 2636      | 10004    | UTF8String    | VM            |

The client system (router) sends the Juniper-Dyn-Subscription-Id-Indicator AVP to indicate support of the dynamic assignment of the subscription ID. The Juniper-Dyn-Subscription-Id-Indicator attribute has two values:

- DYN\_SUBSCRIPTION\_NOT\_SUPPORTED (0)
- DYN\_SUBSCRIPTION\_SUPPORTED (1)

The server then sends the Juniper-Dyn-Subscription-Id AVP to the client that indicated support. This is a grouped AVP that contains the values to be sent as Subscription-Id-Type and Subscription-Id-Data.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>         | Include the Juniper-Network-Family-Indicator AVP into its message requests. In many cases, wireline subscribers support only one IP family, which is required information for both AAA service and Policy Control and Charging Rules Function (PCRF). To indicate this information, the Juniper-Network-Family-Indicator AVP has been allocated from the Juniper Vendor-ID space (2636) VSA in <a href="#">Table 75 on page 1384</a> . |

*Table 75: Network Family Indicator AVP*

| AVP Name                         | Vendor-ID | AVP Type | Diameter Type | Diameter Flag |
|----------------------------------|-----------|----------|---------------|---------------|
| Juniper-Network-Family-Indicator | 2636      | 10010    | Enum          | V             |

The client system (router) sends the Juniper-Network-Family-Indicator AVP to indicate which network families are associated with the service request and supported by the subscriber. When you configure the Juniper-Network-Family-Indicator AVP to indicate the associated network family, the system sends the information to the PCRF. The Juniper-Network-Family-Indicator attribute has four values:

- UNSPECIFIED (0)
- IPV4\_FAMILY (1)
- IPV6\_FAMILY (2)
- IPV4\_IPV6\_FAMILY (3)

| <b>Description</b>              | <p>Include the Origin-State AVP for the Diameter peer, OCS partition, or PCRF partition. The AVP is conveyed in Diameter-level or partition-level messages, respectively. The value of the AVP increases every time it changes, such as when the system reboots. Sending the Origin-State AVP in messages enables Diameter entities that receive the message to infer from a changed AVP value that sessions associated with a lower value are no longer active.</p> <p>If you include the <b>send-origin-state-id</b> statement for the OCS or PCRF partition, a new value is sent for the partition only when a cold boot occurs. The system daemon detects the cold boot and changes the Origin-State-Id when required.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>Configure the DHCP Unique Identifier (DUID) type that the DHCPv6 server supports. The server uses the DUID to identify clients for configuration and to group clients into identity associations.</p> <p>Use this statement to explicitly configure the DUID-LL type. DUID-LL uses a link-layer network interface address on the device as part of the unique identifier. Remove this configuration to return to the default type, DUID-EN. DUID-EN has a vendor-assigned value based on the vendor's enterprise number and an IANA-recognized hardware type code. DUID-EN is not explicitly configurable.</p> |
|                                 | <div>  <p><b>NOTE:</b> The DUID-LLT type is not supported.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                  | <b>type</b> —DUID type to support. The only available option is <b>duid-ll</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Description              | <p>Specify the name of a group of DHCP server addresses for use by the extended DHCP relay agent. Apply the group with the <a href="#">active-server-group</a> statement globally for all interfaces or for a named group of interfaces configured with the <a href="#">group</a> statement. This mechanism enables you to apply different DHCP relay configurations for different groups of servers, with a common configuration for the servers within a server group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Options                  | <p><b><i>server-group-name</i></b>—Name of the group of DHCP or DHCPv6 server addresses.</p> <p><b><i>server-ip-address</i></b>—IP address of the DHCP server belonging to this named server group. Use IPv6 addresses when configuring DHCPv6 support. Starting in Junos OS Release 18.4R1, you can configure up to 32 server IP addresses per group for DHCPv4 servers. In earlier releases, you can configure only up to 5 server IP addresses for DHCPv4 servers. For DHCPv6 servers, you can configure only up to 32 addresses in all releases. The configuration fails commit check if you configure more than the maximum number of server addresses.</p>                                                                                                                                                                                                                                           |

| Description              | <p>Add the suboptions <b>link-selection</b> and <b>server-id override</b> to option-82 information for DHCP packets relayed to the server.</p> <p>In network configurations where a firewall on the broadband network gateway (BNG) is between the DHCPv4 relay agent and the DHCP server, only the BNG loopback address passes through the BNG firewall. In that case, DHCP unicast packets do not pass through the firewall and are discarded. To enable DHCP unicast packets to pass through the BNG firewall, use the <b>relay-source</b> configuration statement to configure the DHCP relay agent to use the loopback address as the source address in IP headers and DHCP messages. In this case, this configuration statement adds the <b>link-selection</b> suboption to provide the DHCP server information to locate the correct address pool for the DHCP client and adds the <b>server-id override</b> suboption to set the server ID option.</p> |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | Configure the timeframe during which the router monitors DHCP server responsiveness within the routing instance. The router generates a system log message when the DHCP server does not respond to relayed packets during the specified timeframe.                                                                                                                                                                                                                                                                                                                              |

| Description              | Configure the service-context-id to globally and uniquely identify the Service-Context-Id AVP (cc-service-context) and the Service-Identifier AVP (cc-service-identifier), which is part of the Diameter Credit Control Service charging system. The service provider or operator allocates this identifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                          | <p> <b>NOTE:</b> For every service used to support the packet-switching charging infrastructure, you must prepare the necessary documentation and define associated cc-service-context-id values.</p> <p>For mobile subscribers, the user equipment requests services; whereas for broadband wireline subscribers, the Policy Control and Charging Rules Function (PCRF) requests services. In the wireline environment, PCRF functions as the service requester, and the Policy and Charging Enforcement Function (PCEF) functions as the service receiver and enforcer.</p> <p>The PCRF controls the PCEF by pushing charging rules. Charging rules are reused as service (policy) rules to push policies. Charging rules may also have an associated rating group, or charging key. As a result, you must configure the PCEF to define a charging rules mapping between credit control services (cc-services) and rating groups.</p> |

**Hierarchy Level** [edit system]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
**extension-service** option added in Junos OS Release 16.1 for MX80, MX104, MX240, MX480, MX960, MX2010, MX2020, vMX Series.  
**grpc** option added in Junos OS Release 16.2 for MX80, MX104, MX240, MX480, MX960, MX2010, MX2020, vMX Series.

**Description** Configure the router or switch so that users on remote systems can access the local router or switch through the DHCP server, DTCP over SSH, finger, rlogin, SSH, telnet, Web management, Junos XML protocol SSL, and network utilities, or enable Junos OS to work with the Session and Resource Control (SRC) software. Also, enable configuration of third-party applications developed using the Juniper Extension Toolkit (JET) to run on Junos OS.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

| Description              | <p>Limit the number of active sessions allowed for a username associated with a given access profile. This enables you to control credential sharing by legitimate subscribers. After the limit is configured, existing subscriber sessions for the access profile are tracked as active sessions, as are any new sessions that do not exceed the limit. Requests for sessions that exceed the configured limit are blocked.</p> <p>Use the <a href="#">show network-access aaa statistics session-limit-per-username</a> command to view statistics for active sessions and blocked requests.</p> <p>You can use the <a href="#">clear network-access aaa statistics session-limit-per-username username</a> command as an aid to debugging by clearing the blocked request statistics for any of the following cases:</p> <ul style="list-style-type: none"><li>• For all usernames across all access profiles.</li><li>• For a specific username across all access profiles.</li><li>• For a specific username in a specific access profile.</li><li>• For all usernames in a specific access profile.</li></ul> |
| Options                  | <p><b><i>number</i></b>—Maximum number of subscriber sessions allowed per username in the access profile.</p> <p><b>Range:</b> 1 through 16</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## sftp-backup (OCS Partition)

**Syntax**

```
sftp-backup {
  accumulation-timeout seconds;
  accumulation-count messages;
  accumulation-size bytes;
  logical-system;
  retry-interval seconds;
  response-timeout seconds;
  routing-instance;
  address ipv4 | ipv6;
  port number;
  directory filename;
  file-name-prefix filename-prefix;
  node-ipv4-address;
  node-ipv6-address;
  ssh-login;
  ssh-connection-linger;
  ssh-log-verbose;
  ssh-passphrase;
}
```

**Hierarchy Level** [edit access [ocs partition](#) *partition-name*]

**Release Information** Statement introduced in Junos OS Release 18.1.

**Description** The data backup for OCS using the SFTP protocol to store data on a remote server.

**Options**

- accumulation-timeout *seconds***—The file accumulation time since the first CCR-GY-T was submitted. The maximum time is 30 seconds.
- accumulation-count *messages***—The number of requests that are past file account count. The maximum accumulation count is 2000 messages.
- accumulation-size *bytes***—The file once its size has reached the accumulation size limit. The maximum accumulation size is 3000000 bytes.
- logical-system**—The logical system to be used by sftp.
- retry-interval *seconds***—Every failed write operation is retried after this interval until backup timeout is accumulated. The maximum retry interval is 1200 seconds.
- response-timeout *seconds***—The timeout on individual SFTP command response. The maximum response timeout is 60 seconds.
- routing-instance**—The SFTP service connection context for the routing instance.
- address**—The address of SFTP server
- port**—The port number. The default port number is 22.

**directory**—The directory name.

**file-prefix** *prefix*—The prefix for the file.

**node-ipv4-address**—The IPv4 address of the sending node.

**node-ipv6-address**—The IPv6 address of the sending node.

**ssh-login**—The login name on SFTP server, may include %h and/or %r similar to directory.

**ssh-connection-linger**—The time to keep existing ssh connection idle state.

**ssh-log-verbose** —The verbose logs to be collected from ssh session.

**ssh-passphrase**—The password or later passphrase.

## shmlog (Shared Memory Log)

**Syntax**

```
shmlog {
  disable;
  file filename <files maximum-no-files> <size maximum-file-size>;
  filtering enable;
  log-name {
    all;
    logname {
      <brief | detail | extensive | none | terse>;
      <file-logging | no-file-logging>;
    }
  }
  log-type (debug | info | notice);
}
```

**Hierarchy Level** [edit system services subscriber-management [overrides](#)]

**Release Information** Statement introduced in Junos OS Release 16.2.

**Description** Junos OS uses a shared memory space to store log entries for subscriber service daemons including jpppd, jdhcpd, jl2tpd, autoconfd, bbe-smgd, authd, cosd, and dfwd. Shared memory logging is enabled by default and occurs at the client level. You can view the shmlogs on a per subscriber basis, or use filters to retrieve logs according to a variety of different parameters such as interface name, IP address, session ID, subnet, and VLAN in addition to the Client Identifier or Client DUID. Filtering is disabled by default. To see a complete list of supported filters, use this command:

```
user@rdevice> show shmlog entries logname all ?
```

When viewing logs you can limit results on the basis of event flags that include interface events, routing process interaction events, l2tp tunneling events, and ldap authentication events. To see a complete list of supported flags, use this command:

```
user@rdevice> show shmlog entries logname all flag-name ?
```

**Options** **disable**—Name of the command to override the default behavior. Use this option to disable shared memory logging; it is always enabled otherwise.

**file**— Name of the file containing the shmlogs. Use this option to redirect shmlogs to a file for file-based logging. Specify the file name, define the number of files (from 2 to 1000), and set the maximum file size (from 10240 to 1073741824 bytes). Data will be written to the `/var/log/shmlog/` directory. Files follow this naming convention: `<cfg-file-name>-<daemon>-<severity>.log`. The shmlog files are not human-readable, so to access the logs you must first run the following command to generate a file in the `/var/log/<file-name>/` directory with logs from all daemons:

```
user@rdevice> show shmlog entries filename /var/log/shmlog/<file-name>* logname
all
```

If you then want to view logs from a specific daemon, you need to run the following command to generate a file under the `/var/log/<file-name>/` directory with complete logs:

```
user@rdevice> show shmlog entries filename /var/log/shmlog/<filename> logname
authd*
```

**filtering**— Command to enable filtering. Filtering is subscriber centric and is useful for debugging and troubleshooting. It is disabled by default so you must use this option to enable it.

For example, if you want to quickly view the transmit packet logs for subscribers with interface-name `pp0.100`, you could use the following command to display only the relevant results:

```
user@rdevice> show shmlog entries logname jpppd* interface-name pp0.100 flag
transmit-packets
```

To debug sessions according to the interface name, use this command:

```
user@rdevice> show shmlog entries logname all interface-name pp0.100
```

To debug sessions that are logging in via VLAN 7 on physical-interface `ge-0/0/0`, use this command:

```
user@rdevice> show shmlog entries logname all vlan 7 physical-interface ge-0/0/0
```

**log-name**—Name of the file containing the log output. Use this option to override all logs or a specified log, and to set the verbosity level (brief, detail, extensive, none, or terse). For example, to configure **bbe-autoconf-info** for detailed file logging, you would use the following command:

```
user@rdevice> [edit system services subscriber-management overrides shmlog]
user@rdevice> set log-name bbe-autoconf-info detail file-logging
```

**log-type**— Severity level of the collected logs. Use this option to configure the severity level for captured logs (notice, info, or debug).

| <b>Release Information</b> | Statement introduced in Junos OS Release 18.2R1 on MX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>         | <p>Enable DHCP short-cycle protection to reduce resource usage associated with connection and authentication processing in highly scaled networks. You must configure both the minimum duration and the maximum duration for the lockout period.</p> <p>The router detects short-lived client sessions and clients that repeatedly fail session negotiation, then locks them out from access by dropping subsequent DHCP discover or solicit messages from the client. The clients are tracked by the client identifier (client key), which can be a MAC address or some other unique value for DHCPv4 clients or the DUID for DHCPv6 clients. Locked-out clients are entered in the lockout database. If a locked-out client attempts another session before the grace time threshold is reached, it is locked out again. Each successive lockout period is increased exponentially up to the maximum lockout period. The grace time threshold is automatically set at whichever value is larger, 900 seconds or the configured maximum value.</p>                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>             | <p><b>lockout-max-time seconds</b>—Maximum length of any lockout period; the upper bound of the lockout range.</p> <p><b>Range:</b> 1 through 86400</p> <p><b>lockout-min-time seconds</b>—Minimum length of any lockout period; the lower bound of the lockout period. ## sip-server-address

---

**Syntax** sip-server-address *ipv6-address*;

**Hierarchy Level** [edit access address-assignment pool *pool-name* family *family* dhcp-attributes],  
[edit access protocol-attributes *attribute-set-name*]

**Release Information** Statement introduced in Junos OS Release 10.0.

**Description** Specify a SIP outbound proxy server that DHCPv6 local server clients can use. This is equivalent to DHCPv6 option 22. To specify multiple serv*ipv6-address*s, add multiple **sip-server-address** statements in order of preference.

**Options** *ipv6-address*—IPv6 address of a SIP outbound proxy server.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

```

**Release Information** Statement introduced in Junos OS Release 12.3.  
Statement updated in Junos OS Release 17.4.

**Description** Configure a partial match criteria used with the DHCP relay agent selective processing feature. DHCP relay agent compares the configured partial match string with the option-specific string received in DHCP client packets. If there is an partial left-to-right match, DHCP performs the action you define for the match criteria.

The option-specific string in the DHCP client packets can contain a superset of the specified ASCII or hexadecimal match string, provided that the leftmost characters of the option-specific string entirely match the characters in the configured match string.

You can configure an unlimited number of match strings. If you have multiple partial match configurations, the longest match rule applies. For example, DHCP relay agent matches the string "test123" before it matches the string "test". Match strings do not support wildcard attributes.

The **local-server-group** option is not supported for DHCPv6 relay agent.

**Options**    *ascii-string*—ASCII string of 1 through 255 alphanumeric characters.

*hexadecimal-string*—Hexadecimal string of 1 through 255 hexadecimal characters (0 through 9, a through f, A through F).

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege**    interface—To view this statement in the configuration.

**Level**                interface-control—To add this statement to the configuration.

## static-subscribers

**Syntax**

```
static-subscribers {
  access-profile profile-name;
  authentication {
    password password-string;
    username-include {
      domain-name domain-name;
      interface;
      logical-system-name;
      routing-instance-name;
      user-prefix user-prefix-string;
    }
  }
  dynamic-profile profile-name {
    aggregate-clients (merge | replace);
  }
  group group-name {
    access-profile profile-name;
    authentication {
      password password-string;
      username-include {
        delimiter delimiter-character;
        domain-name domain-name;
        interface;
        logical-system-name;
        routing-instance-name;
        user-prefix user-prefix-string;
        vlan-tags;
      }
    }
    dynamic-profile profile-name {
      aggregate-clients (merge | replace);
    }
    interface interface-name <exclude> <upto upto-interface-name>;
  }
  service-profile service-profile-name
}
```

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.2R1 for MX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | Configure the router to collect time statistics, or both volume and time statistics, for the service accounting sessions being managed by AAA.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>                  | <p><b>time</b>—Collect uptime statistics only.</p> <p><b>volume-time</b>—Collect both volume and uptime statistics.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                                 | <p> <b>NOTE:</b> You must not configure the <b>volume-time</b> option if the <b>local</b> option is configured at the <code>[edit access profile <i>profile-name</i> service accounting-order]</code> hierarchy level, because the local configuration automatically determines that both volume and time statistics are collected for the service accounting sessions. If you configure the <b>volume-time</b> option in this case, an error is generated when you commit the configuration.</p> |
| <b>Required Privilege Level</b> | <p><b>admin</b>—To view this statement in the configuration.</p> <p><b>admin-control</b>—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 10.4.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | Specify whether the server denies a client to bind when the client does not indicate that it accepts reconfigure messages. This feature is available only for DHCPv6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Default</b>                  | Accept solicit messages from clients that do not support reconfiguration and permit them to bind.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## subscriber (Access Profile)

**Syntax**

```
subscriber username {
  delegated-pool delegated-pool-name;
  framed-ip-address ipv4-address;
  framed-ipv6-pool ipv6-pool-name;
  framed-pool ipv4-pool-name;
  password password;
  target-logical-system logical-system-name<(target-routing-instance (default |
    routing-instance-name))>;
  target-routing-instance (default | routing-instance-name);
}
```

**Hierarchy Level** [edit access [profile](#) *profile-name*]

**Release Information** Statement introduced in Junos OS Release 18.2R1 on MX Series routers.

**Description** Enable local authentication for subscribers by configuring a password to match the subscriber. Local authentication can take the form of either user password authentication or Challenge Handshake Authentication Protocol' (CHAP) authentication. For user password authentication, the configured password is used to verify the subscriber's login password. For CHAP authentication, the configured password acts as the challenge secret to verify the subscriber's challenge password and challenge response credential.

**NOTE:** Local authentication and authorization also requires the **password** option to be configured as an **authentication-order** method for the access profile.

You can also optionally configure several attributes, such as an address, address pool, logical system, or routing instance, to be authorized locally for the subscriber when authentication is successful.

Local authentication supports all subscriber types that are currently supported by subscriber management and services on MX Series routers.

Local authentication is useful when you do not want to use external authentication servers. The associated local authorization similarly is useful when you do not want to use external authorization servers. Another use case might be when you are migrating a network from E Series routers running JunosE software to MX Series routers running Junos OS. You may also want to configure local authentication and authorization as a backup for RADIUS authentication.

If you do not configure an address or address pool for local authorization, address assignment is based on network matching or the first address pool assigned to the routing instance.

**NOTE:** Local authentication and authorization supports a chassis-wide maximum of 100 subscribers. If subscribers are configured in access profiles where **authentication-order password** is not configured, local authentication does not occur, but these subscriber count against the system limit of 100 subscribers for local authentication.

Hierarchy Level [edit system services]

Release Information Statement introduced in Junos OS Release 11.1.

Description Configure global services for subscriber management, such as maintaining subscribers, tracing operations, and enabling enhanced subscriber management.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

| Release Information | <p>Statement introduced in Junos OS Release 16.2.</p> <p><b>vlan-tags</b> option added in Junos OS Release 18.3R1 on MX Series routers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Description         | Configure the subscriber data to use in a Policy and Charging Rules Function (PCRF).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Options             | <p><b>base-interface-name</b>—Use the specified physical or underlying interface name. If both the underlying interface and the client application perform authentication, authorization, and provisioning, the identification attributes in the server requests enable the AAA or PCRF server to make an association between the two entities.</p> <p><b>delimiter <i>delimiter-character</i></b>—Use the specified character used as the delimiter between the concatenated components of the subscription-id-data-include. You cannot use the semicolon (;) as a delimiter.</p> <p><b>Default:</b> @</p> <p><b>domain-name <i>name</i></b>—Use the specified domain name that is concatenated with the subscription-id-data-include during the subscriber identification process.</p> <p><b>interface-name</b>—Use the specified interface name that is concatenated with the subscription-id-data-include during the subscriber identification process; for example, demux0.</p> <p><b>mac-address</b>—Use the specified client hardware address (chaddr) from the incoming packet that is concatenated with the subscription-id-data-include during the subscriber identification process.</p> <p><b>nas-port-id</b>—Use the specified NAS-Port-ID (RADIUS attribute 87), which identifies the physical interface that subscriber management uses to identify subscribers that is concatenated with the subscription-id-data-include during the subscriber</p> |

identification process. By default, the NAS-Port-ID includes the interface-description value that describes the physical interface.

**origin-host**—Use the specified name of the host that originates the Diameter message that is concatenated with the subscription-id-data-include during the subscriber identification process. Supplied as the value of Origin-Host AVP for all messages sent by the Diameter master instance.

**origin-realm**—Use the specified realm of the host that originates the Diameter message that is concatenated with the subscription-id-data-include during the subscriber identification process. Supplied as the value of Origin-Realm AVP for all messages sent by the Diameter master instance.

**user-name**—Use the specified subscriber username that is concatenated with the subscription-id-data-include during the subscriber identification process.

**user-prefix *prefix***—Use the specified user prefix that is concatenated with the subscription-id-data-include during the subscriber identification process.

**vlan-tags**—Include the subscriber session VLAN tags in the subscription ID. Both single-tagged and double-tagged VLANs are supported: The tags are added in the format ***outer-vlan-tag-inner-vlan-tag***. The outer tag is always included; the inner tag is included for double-tagged VLANs.

Use this option instead of the **interface-name** option when you the outer VLAN tag is unique across the system and you do not need the underlying physical interface name to be part of the format.

| Release Information      | Statement introduced in Junos OS Release 13.3.<br>DHCPv4 server support added in Junos OS Release 17.2.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Description              | <p>Specify a percentage of the <b>preferred-lifetime</b> value. After this percentage of the <b>preferred-lifetime</b> value elapses, the DHCPv4 or DHCPv6 client requests an extension on its lease from any available DHCPv4 or DHCPv6 server. The <b>t2-percentage</b> is also referred to as the rebinding time.</p> <p>The <b>t2-percentage</b> value must be greater than the <b>t1-percentage</b> value.</p>                                                                                                             |
| Options                  | <p><b>percentage</b>—Percentage of the <b>preferred-lifetime</b> value.</p> <p><b>Range:</b> 0 through 100</p> <p><b>Default:</b> If the <b>t2-percentage</b> value is not configured, the default is based on the <b>preferred-lifetime</b> value:</p> <ul style="list-style-type: none"> <li>• If the <b>preferred-lifetime</b> value is finite, the default is 80 percent. of the <b>preferred-lifetime</b> value.</li> <li>• When the <b>preferred-lifetime</b> value is infinite, the default is also infinite.</li> </ul> |
| Required Privilege Level | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Release Information</b> | Statement introduced in Junos OS Release 11.4.<br><b>vlan</b> option added in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>         | <p>Customize the mapping between a termination cause (the internal termination identifier) and a numerical code value for the cause that is reported in the RADIUS Acct-Terminate-Cause attribute (49).</p> <p>When a RADIUS Acct-Stop message is issued as a result of the termination of a subscriber or service session, the RADIUS Acct-Terminate-Cause attribute (49) reports the cause or reason for the termination. This attribute is included only in RADIUS Acct-Stop messages. The termination cause is conveyed as a code value in the attribute. <i>RFC 2866, RADIUS Accounting</i>, defines the standard mapping between 18 code values and termination causes.</p> <p>Junos OS defines a set of internal termination cause codes for AAA, DHCP, L2TP, PPP, and VLAN subscriber and service session failures. By default, these internal cause codes are mapped to the RFC-defined code values. When a subscriber or service session is terminated, the router logs a message for the internal termination cause and logs another message for the RADIUS Acct-Terminate-Cause attribute. You can use the logged information to help monitor and troubleshoot the events.</p> <p>Because there are many different Junos OS internal identifiers for termination causes and only 18 supported, RFC-defined standard code values, by default a given code value can map to multiple identifiers. Instead of using the default code values, you can use the <b>terminate-code</b> statement to map any of the internally defined termination causes to any 32-bit number (1 through 4,294,967,295). The flexibility of customized mapping greatly increases the possibilities for fine-grained analytics and failure tracking.</p> |
| <b>Options</b>             | <p><b>aaa</b>—Map internal identifiers for AAA-specific termination causes to a numerical value.</p> <p><b>deny</b>—Limit selection of termination causes to those associated with denial of subscriber access.</p> <p><b>dhcp</b>—Map internal identifiers for DHCP-specific termination causes to a numerical value.</p> <p><b>l2tp</b>—Map internal identifiers for L2TP-specific termination causes to a numerical value.</p> <p><b>ppp</b>—Map internal identifiers for PPP-specific termination causes to a numerical value.</p> <p><b>radius value</b>—Number that represents the termination cause in the RADIUS Acct-Terminate-Cause attribute (49).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Range:** 1 through 4,294,967,295

**service-shutdown**—Limit selection of termination causes to those associated with established service sessions independent of the parent subscriber session.

**shutdown**—Limit selection of termination causes to those associated with established subscriber sessions.

**vlan**—Map internal identifiers for VLAN-specific termination causes to a numerical value.

**term-reason**—Internal identifier for the termination causes defined for the specified protocol type.

For protocol-specific termination causes, see the following topics:

| Release Information      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Description              | Configure the amount of time that the local router or switch waits to receive a response from RADIUS authentication and accounting servers. You can override the timeout value for accounting servers with the <a href="#">accounting-timeout</a> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                          | <p> <b>NOTE:</b> To successfully set a timeout value for the accounting servers different from the authentication servers, you must configure both the <a href="#">accounting-retry</a> and <a href="#">accounting-timeout</a> statements. If you configure only one of these statements, then the value you configure is ignored in favor of the values configured with the <a href="#">retry</a> and <a href="#">timeout</a> statements.</p> <p> <b>NOTE:</b> The maximum retry duration (the number of retries times the length of the timeout) cannot exceed 2700 seconds. An error message is displayed if you configure a longer duration.</p> |
| Options                  | <p><i>seconds</i>—Amount of time to wait.</p> <p><b>Range:</b> 1 through 1000 seconds</p> <p><b>Default:</b> 3 seconds</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Release Information      | Statement introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Description              | Specify the number of seconds that a connection on the TCP socket is idle before the DHCP local server closes the connection. Closing inactive connections enables the DHCP local server to more efficiently apply resources in support of active TCP connections.                                                                                                                                                                                                                                                                                                |

| Description              | <p>Configure a grace period during which a RADIUS server that times out after failing to respond to an authentication request is not considered to be down (if other servers are available) or unreachable (if it is the only configured server). The server is marked as down or unreachable only when it does not successfully respond to an authentication request during the grace period and times out again after the period expires.</p> <p>You can use long grace periods to give unresponsive servers more opportunities to respond before abandoning them. You can use short grace periods to cause the router to declare unresponsive servers down and direct requests to available servers sooner.</p> |
| Options                  | <p><b>seconds</b>—Duration of the server timeout grace period.</p> <p><b>Range:</b> 0 through 30</p> <p><b>Default:</b> 10</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>              | <p>Configure a plain-text token for all DHCP clients or only the DHCP clients serviced by the specified group of interfaces. The token enables rudimentary entity authentication to protect against inadvertently instantiated DHCP servers. A null token (empty string) indicates that the configuration token functionality is not enabled. A group configuration takes precedence over a DHCP local server configuration. For more information about tokens, see RFC 3118, <i>Authentication for DHCP Messages</i>, section 4.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Description         | Define tracing operations for ANCP agent processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Options             | <p><b>file <i>filename</i></b>— Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>— (Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. Include the <b>disable</b> option after a flag to disable tracing for that flag. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations.</li> <li>• <b>config</b>—Trace configuration events.</li> <li>• <b>cos</b>—Trace class-of-service events.</li> <li>• <b>general</b>—Trace general flow.</li> <li>• <b>packet</b>—Trace ANCP packet transmit and receive operations.</li> <li>• <b>process</b>—Trace process internals.</li> <li>• <b>protocol</b>—Trace protocol events.</li> <li>• <b>restart</b>—Trace process restart flow</li> <li>• <b>routing-socket</b>—Trace routing socket events.</li> <li>• <b>session</b>—Trace connection events and flow.</li> <li>• <b>startup</b>—Trace ANCP startup events and flow.</li> <li>• <b>subscriber</b>—Trace subscriber events.</li> </ul> |

- **timer**—Trace timer processing.

**level**—Level of tracing to perform. You can specify any of the following levels:

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**Default:** error

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| <div style="display: flex; align-items: center;">  <div> <p><b>NOTE:</b> Traceoptions does not differentiate between a logical system and tenant system, and can be configured under the root logical system.</p> </div> </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                                                                                                                                                                                                                                                                                                                                 | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000<br/><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all events.</li> <li>• <b>auth</b>—Trace authentication events.</li> <li>• <b>database</b>—Trace database events.</li> <li>• <b>fwd</b>—Trace firewall process events.</li> </ul> |

- **general**—Trace miscellaneous events.
- **ha**—Trace high availability-related events.
- **interface**—Trace interface operations.
- **io**—Trace I/O operations.
- **liveness-detection**—Trace liveness detection operations.
- **packet**—Trace packet and option decoding operations.
- **performance**—Trace performance measurement operations.
- **profile**—Trace profile operations.
- **rpd**—Trace routing protocol process events.
- **rtsock**—Trace routing socket operations.
- **security-persistence**—Trace security persistence events.
- **session-db**—Trace session database events.
- **state**—Trace changes in state.
- **statistics**—Trace baseline statistics.
- **ui**—Trace user interface operations.

**level**—Level of tracing to perform; also known as severity level. The option you configure enables tracing of events at that level and all higher (more restrictive) levels. You can specify any of the following levels:

- **all**—Match messages of all levels.
- **error**—Match error messages.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages. This is the lowest (least restrictive) severity level; when you configure **verbose**, messages at all higher levels are traced. Therefore, the result is the same as when you configure **all**.
- **warning**—Match warning messages.

**Default:** **error**

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access, allowing only the user **root** and users who have the Junos OS **maintenance** permission to access the trace files.

**size** *maximum-file-size*—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (*maximum-file-sizek*), megabytes (*maximum-file-sizem*), or gigabytes (*maximum-file-sizeg*). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Range:** 10,240 through 1,073,741,824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| Description         | Define tracing options for Diameter processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Options             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the filename within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations</li> <li>• <b>application</b>—Trace Diameter application interface events</li> <li>• <b>configuration</b>—Trace configuration events</li> <li>• <b>daemon</b>—Trace Diameter daemon level events</li> <li>• <b>diameter-instance</b>—Trace Diameter instance events</li> <li>• <b>dne</b>—Trace Diameter network element events</li> <li>• <b>framework</b>—Trace Diameter framework events</li> <li>• <b>memory-management</b>—Trace memory management events</li> <li>• <b>messages</b>—Trace Diameter messages</li> <li>• <b>node</b>—Trace Diameter node events</li> <li>• <b>peer</b>—Trace Diameter peer events</li> </ul> <p><b>level</b>—Level of tracing to perform. You can specify any of the following levels:</p> |

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| <b>Hierarchy Level</b>     | [edit system processes smg-service]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Release Information</b> | Statement introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>         | Define tracing operations for the main enhanced subscriber management session management process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>             | <p><b>file <i>filename</i></b>— Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All trace logs are stored in the directory <code>/var/log/bbesmgd</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 5 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. Include the <b>disable</b> option after a flag to disable tracing for that flag. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations.</li> <li>• <b>auth</b>—Trace general authentication events.</li> <li>• <b>autoconf</b>—Trace autoconfiguration events.</li> <li>• <b>config</b>—Trace configuration events.</li> <li>• <b>demux</b>—Trace demultiplexing (demux) events.</li> <li>• <b>dhcp</b>—Trace DHCP Server events.</li> <li>• <b>dprof</b>—Trace dynamic profile events.</li> <li>• <b>interface</b>—Trace interface events.</li> <li>• <b>io</b>—Trace packet socket events.</li> <li>• <b>l2tp</b>—Trace L2TP events.</li> </ul> |

- **main**—Trace main operations.
- **net**—Trace network processing events.
- **ppp**—Trace PPP events.
- **pppoe**—Trace PPPoE events.
- **rpd**—Trace routing protocol process events.
- **rtsock**—Trace routing socket events.
- **service**—Trace service events.
- **session**—Trace connection events and flow.
- **stats**—Trace statistics events.
- **ucac**—Trace universal call admission control events.
- **ui**—Trace user interface events.
- **vbf**—Trace variable-based forwarding events.

**level *level***—Level of tracing to perform. You can specify any of the following levels:

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10,240 through 1,073,741,824 bytes

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| Hierarchy Level     | [edit system processes general-authentication-service]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Release Information | Statement introduced in Junos OS Release 9.0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Description         | Configure tracing options for the general authentication service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Options             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>filter</b>—Additional filter to refine the output to display particular subscribers. Filtering based on the following subscriber identifier simplifies troubleshooting in a scaled environment.</p> <ul style="list-style-type: none"> <li><b>user <i>user@domain</i></b>—Username of a subscriber. Optionally use an asterisk (*) as a wildcard to substitute for characters at the beginning or end of either term or both terms.</li> </ul> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li><b>address-assignment</b>—Trace address-assignment pool events</li> <li><b>all</b>—Trace all tracing operations</li> <li><b>configuration</b>—Trace configuration events</li> <li><b>framework</b>—Trace authentication framework events</li> <li><b>gx-plus</b>—Trace Gx-Plus events</li> <li><b>jsrc</b>—Trace JSRC events</li> </ul> |

- **ldap**—Trace LDAP authentication events
- **local-authentication**—Trace local authentication events
- **radius**—Trace RADIUS authentication events
- **user-access**—Trace user access events, such as login, logout, and authenticate.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| <b>Description</b>         | Define tracing operations for static subscriber processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <p><b>file <i>filename</i></b>— Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>— (Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations.</li> <li>• <b>authentication</b>—Trace authentication events.</li> <li>• <b>configuration</b>—Trace configuration events.</li> <li>• <b>database</b>—Trace database events.</li> <li>• <b>general</b>—Trace general events.</li> <li>• <b>gres</b>—Trace GRES events.</li> <li>• <b>profile</b>—Trace dynamic profile events.</li> <li>• <b>rtsock</b>—Trace routing socket events.</li> <li>• <b>statistics</b>—Trace statistics events.</li> <li>• <b>subscriber</b>—Trace subscriber events.</li> </ul> |

**level**—Level of tracing to perform. You can specify any of the following levels:

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**Default:** **error**

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—(Optional) Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **sizek** to specify KB, **sizem** to specify MB, or **sizeg** to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | Specify the event that triggers DHCPv6 relay agent to send bulk leasequery messages to the DHCPv6 servers in the logical system/routing instance. The trigger initiates the bulk leasequery configuration parameters you specify in the DHCPv6 relay agent configuration. The optional event support is in addition to the default CLI command support. |
| <b>Options</b>                  | <b>automatic</b> —Specify that the DHCPv6 relay agent always sends a bulk leasequery message whenever the jdhcp daemon is started or restarted and there are no bound subscribers in the session database. The automatic trigger updates the DHCP relay agent's binding information for clients associated with the requesting DHCPv6 relay agent.      |

| <b>Description</b>              | Enable processing of DHCP client packets that have a gateway IP address (giaddr) of 0 (zero) and contain option 82 information. By default, the DHCP relay agent treats such packets as if they originated at an untrusted source, and drops them without further processing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | Configure the router to provide a unique value for the NAS-Port attribute (RADIUS attribute 5) of each subscriber. You can configure a NAS-Port value that is unique within the router only, or unique across the different MX routers in the network.                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <p><b>chassis-id</b>—Value for the <b>chassis-id</b> part of NAS-Port attribute. To ensure that NAS-Port values are unique across all MX series routers in the network, you must specify a unique <b>chassis-id</b> for each MX router.</p> <p><b>Range:</b> 0-127 bits</p> <p><b>chassis-id-width</b>—Number of bits used to uniquely identify the chassis across the MX series routers in the network. All routers must use the same <b>chassis-id-width</b>. If you do not configure a <b>chassis-id-width</b>, the resulting NAS-Port attribute is unique within the router only.</p> <p><b>Range:</b> 1-7 bits</p> |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Hierarchy Level** [edit interfaces *interface-name*],  
 [edit logical-systems *logical-system-name* interfaces *interface-name*],  
 [edit interfaces interface-set *interface-set-name* interface *interface-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Range increased for static pseudowire interfaces to 1,073,741,823 in Junos OS Release 18.3R1.

**Description** Configure a logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

**Options** *logical-unit-number*—Number of the logical unit.  
**Range:** 0 through 1,073,741,823 for demux, PPPoE, and pseudowire static interfaces. 0 through 16,385 for all other static interface types.

**etree-ac-role (leaf | root)**—To configure an interface as either leaf or root.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

**Hierarchy Level** [edit [dynamic-profiles](#) *profile-name* [interfaces](#) *interface-name*]

**Release Information** Statement introduced in Junos OS Release 9.2.

**Description** Configure a logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

**Options** *logical-unit-number*—The specific unit number of the interface you want to assign to the dynamic profile, or one of the following predefined variables:

- **\$junos-underlying-interface-unit**—For static VLANs, the unit number variable. The static unit number variable is dynamically replaced with the client unit number when the client session begins. The client unit number is specified by the DHCP when it accesses the subscriber network.
- **\$junos-interface-unit**—The unit number variable on a dynamic underlying VLAN interface for which you want to enable the creation of dynamic VLAN subscriber interfaces based on the ACI.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Enable interim accounting updates and configure the amount of time that the router or switch waits before sending a new accounting update.</p> <p>Interim accounting updates are included in the exchange of messages between the client and the accounting server. In RADIUS accounting, the client is the network access server (NAS), which can be the router or switch. The NAS sends Accounting-Request messages to the server, which acknowledges receipt of the requests with Accounting-Response messages. Interim accounting updates are sent in Accounting-Request packets with the Acct-Status-Type attribute set to Interim-Update.</p> <p>When a user is authenticated, the authentication server issues an Access-Accept message in response to a successful Access-Request message. The interval between interim updates can be configured directly on the server using the Acct-Interim-Interval attribute of the Access-Accept message. However, if the update interval is configured on the NAS using <b>update-interval</b>, then the locally configured value overrides the value found in an Access-Accept message from the server.</p> |
|                                 | <p> <b>NOTE:</b> All information in an interim update message is cumulative from the beginning of the session, not from the last interim update message.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Default</b>                  | No interim updates are sent from the client to the accounting server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                  | <p><b>minutes</b>—Amount of time between updates, in minutes. All values are rounded to the next higher multiple of 10. | <b>Description</b>              | <p>Specify a recommended shaping rate to be applied to upstream traffic on an interface.</p> <p>For ANCP interfaces, this configured rate is used as the default value for the Juniper VSA Upstream-Calculated-Qos-Rate (26-142) when the router has not received and processed the attributes from the access node.</p> <p>For L2TP, the rate is configured on an underlying PPPoE logical interface for a subscriber on an MX Series router acting as a LAC. When the subscriber is tunneled, this rate, referred to as speed for L2TP, is sent to the LNS in the ICCN message as AVP 38.</p> |

| <b>Description</b>         | <p>Use the textual interface description instead of the interface identifier in the DHCP base option 82 Agent Circuit ID (suboption 1) or Agent Remote ID (suboption 2) information, or in the DHCPv6 option 18 (Relay Agent Interface ID) or option 37 (Relay Agent Remote ID) information in DHCP packets that the DHCP relay agent sends to a DHCP server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**NOTE:** For integrated routing and bridging (IRB) interfaces, the option 82 field must be able to uniquely identify the incoming interface based on either the Agent Circuit ID or Agent Remote ID. You can modify the information in the textual interface description to match the raw IFD (physical interface without a subunit) name and configure the option 82 field to use the interface description.

The textual description is configured using the **description** statement at the `[edit interfaces interface-name]` hierarchy level. If you specify that the textual description be used and no description is configured for the interface, DHCP relay defaults to using the Layer 2

interface name. When you use the interface description rather than the interface name, the interface description has to be specified under interface unit ("set interfaces ge-0/0/0 unit 0 description "client"). If you do not do this, then the interface name is used.

In the case of integrated routing and bridging (IRB) interfaces, the textual description of the Layer 2 interface is used instead of the IRB interface. If there is no description configured, the Layer 2 logical interface name is used. To include the IRB interface description instead of the Layer 2 interface description, configure the **use-interface-description** and the **no-vlan-interface-name** statements. If no description is configured for the IRB interface, DHCP relay defaults to using the IRB interface name.

**NOTE:** The **use-interface-description** statement is mutually exclusive with the **use-vlan-id** statement.

---

If you specify the textual interface description, rather than accepting the default syntax, the identification is for packets returned from the server, and only for instances where that identification would be required by the DHCP relay, such as a stateless pass-through.

**NOTE:** By default, DHCP relay accepts a maximum of 253 ASCII characters. If the textual interface description exceeds 253 characters, DHCP relay drops the packet, which results in the DHCP client failing to bind.

---

**Options**    **logical**—Use the textual description that is configured for the logical interface.  
**device**—Use the textual description that is configured for the device interface.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                         interface-control—To add this statement to the configuration.

- **relay-agent-subscriber-id**

**Options**    **vlan-tags**—Include the subscriber session VLAN tags in the username for interactions with an external authority. Both single-tagged and double-tagged VLANs are supported: The tags are added in the format **outer-vlan-tag-inner-vlan-tag**. The outer tag is always included; the inner tag is included for double-tagged VLANs.

Use this option instead of the **interface-name** option when the outer VLAN tag is unique across the system and you do not need the underlying physical interface name to be part of the format.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level**    system—To view this statement in the configuration.  
                                         system-control—To add this statement to the configuration.

[edit routing-instances routing-instance-name forwarding-options dhcp-relay ...]
```

**Release Information**

Statement introduced in Junos OS Release 9.1.

Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Support at the **[edit ... dhcpv6]** hierarchy levels introduced in Junos OS Release 11.4.

Support at the **[edit ... dual-stack-group dual-stack-group-name]** hierarchy level introduced in Junos OS Release 15.1.

**vlan-tags** option added in Junos OS Release 18.3R1 on MX Series routers.

**Description**

Configure the username that the router (or switch) passes to the external AAA server. You must include at least one of the optional statements for the username to be valid. If you do not configure a username, the router (or switch) accesses the local authentication service only and does not use external authentication services, such as RADIUS. Use the statement at the **[edit...dhcpv6]** hierarchy levels to configure DHCPv6 support.

The following statements are not supported in the DHCPv6 hierarchy levels:

- **option-60**

- **option-82**

The following statements are supported in the DHCPv6 hierarchy levels only:

- **client-id**
- **relay-agent-interface-id**
- **relay-agent-remote-id**
- **relay-agent-subscriber-id**

**Options** **vlan-tags**—Include the subscriber session VLAN tags in the username for interactions with an external authority. Both single-tagged and double-tagged VLANs are supported: The tags are added in the format ***outer-vlan-tag-inner-vlan-tag***. The outer tag is always included; the inner tag is included for double-tagged VLANs.

Use this option instead of the **interface-name** option when the outer VLAN tag is unique across the system and you do not need the underlying physical interface name to be part of the format.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| Release Information | Statement introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Description         | Configure the username identification to be used in an Online Charging Function (OCS) partition. You can configure a data string to include the following options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Options             | <p><b>base-interface-name</b>—Use the physical or underlying interface name. If both the underlying interface and the client application perform authentication, authorization, and provisioning, the identification attributes in the server requests enable the AAA or PCRF server to make an association between the two entities.</p> <p><b>delimiter <i>delimiter-character</i></b>—Use the specified character as the delimiter between the concatenated components of the <b>user-name-include</b> statement. You cannot use the semicolon (;) as a delimiter.<br/> <b>Default:</b> @</p> <p><b>domain-name <i>my-domain</i></b>—Use the specified domain name that is concatenated with the <b>user-name-include</b> statement during the subscriber identification process.</p> <p><b>interface-name</b>—Use the interface name that is concatenated with the <b>user-name-include</b> statement during the subscriber identification process; for example, demux0.</p> <p><b>mac-address</b>—Use the client hardware address (chaddr) from the incoming packet that is concatenated with the <b>user-name-include</b> statement during the subscriber identification process.</p> <p><b>nas-port-id</b>—Use the NAS-Port-ID (RADIUS attribute 87), which identifies the physical interface that subscriber management uses to identify users that is concatenated with the <b>user-name-include</b> statement during the subscriber identification process. By default, the NAS-Port-ID includes the interface-description value that describes the physical interface.</p> |

**origin-host**—Use the name of the host that originates the Diameter message that is concatenated with the **user-name-include** statement during the subscriber identification process. Supplied as the value of Origin-Host AVP for all messages sent by the Diameter master instance.

**origin-realm**—Use the realm of the host that originates the Diameter message that is concatenated with the **user-name-include** statement during the subscriber identification process. Supplied as the value of Origin-Realm AVP for all messages sent by the Diameter master instance.

**user-name**—(Included in the **user-name-include** statement by default) Use the username that is concatenated with the **user-name-include** statement during the subscriber identification process.

**user-prefix *prefix***—Use the specified user prefix that is concatenated with the **user-name-include** statement during the subscriber identification process.

| Release Information | <p>Statement introduced in Junos OS Release 9.6.</p> <p><b>delimiter</b> and <b>vlan-tags</b> options added in Junos OS Release 18.3R1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Description         | <p>Specify the information included in the username created for all static subscribers or for static subscribers in a specified group. The group version of the statement takes precedence over the global version. The username is also sent to RADIUS in the Access-Request message.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Options             | <p><b>delimiter</b> <i>delimiter-character</i>—Specify the delimiter character that separates the different fields configured for the username. You can specify only a single character as the delimiter.</p> <p><b>Default:</b> The default delimiter is a period (.).</p> <p><b>vlan-tags</b>—Include the VLAN tags (VLAN IDs) for the interface. For single-tagged VLANs, the field is encoded as <b>outer-tag</b>. For stacked VLANs, the field is encoded as <b>outer-tag-inner-tag</b>. For IP demux interfaces configured for static subscribers, the VLAN tags configured on the underlying interface are used.</p> <p>The remaining statements are explained separately. Search for a statement in <a href="#">CLI Explorer</a> or click a linked statement in the Syntax section for details.</p>                                                                                                                                                                                                                                                                                                                                        |

|                              |                                                                                                                                                                                                                                                                                                                        |

| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 13.2.</p> <p>Support at the [...<b>relay-agent-remote-id</b>] hierarchy level introduced in Junos OS Release 15.1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | <p>For the <b>relay-agent-interface-id</b> statement, specify that in dual-stack environments, the DHCPv6 relay agent uses an Interface-ID option (option 18) that is based on the DHCPv4 relay agent information option (option 82). When you include this statement, the DHCPv6 relay agent checks for the option 82 Agent Circuit-ID suboption (suboption 1) and inserts it into the outgoing RELAY-FORW message.</p> <p>For the <b>relay-agent-remote-id</b> statement, specify that in dual-stack environments, the DHCPv6 relay agent uses a Remote-ID option (option 37) that is based on the DHCPv4 relay agent information option (option 82). When you include this statement, the DHCPv6 relay agent checks for the option 82 Remote-ID suboption (suboption 2) and inserts it into the outgoing RELAY-FORW message.</p>        |
| <b>Options</b>                  | <b>strict</b> —(Optional) The router drops Solicit messages that do not include a DHCPv4 Remote-ID (option 82 suboption 2). If you do not specify the <b>strict</b> keyword, the router sends the RELAY-FORW message without adding option 37.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Description         | <p>Specify the dynamic profile to configure as the primary dynamic profile. The primary dynamic profile is instantiated when the first subscriber logs in. Subsequent subscribers are not assigned the primary dynamic profile; instead, they are assigned the dynamic profile specified for the interface. When the first subscriber logs out, the next subscriber that logs in is assigned the primary dynamic profile.</p> <p>Use the statement at the [edit ... <b>dhcpv6</b>] hierarchy levels to configure DHCPv6 support.</p> <p>EX Series switches do not support DHCPv6.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Release Information</b>                                | <p>Statement introduced in Junos OS Release 9.3 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Hierarchy level <code>[edit vlans <i>vlan-name</i> forwarding-options dhcp-security]</code> introduced in Junos OS Release 13.2X50-D10. (See <i>Using the Enhanced Layer 2 Software CLI</i> for information about ELS.)</p> <p>Hierarchy level <code>[edit bridge-domains <i>bridge-domain-name</i> forwarding-options dhcp-security]</code> introduced in Junos OS Release 14.1 for the MX Series.</p> |

**NOTE:** The EX Series switches that support the `use-vlan-id` statement are the EX4300, EX4600, and EX9200 switches.

**Description** Use the VLAN ID rather than the VLAN name (the default) in the circuit ID or remote ID value in the DHCP option 82 information.

**NOTE:** The `use-vlan-id` statement is mutually exclusive with the `use-interface-description` and `no-vlan-interface-name` statements.

The `use-vlan-id` statement only applies to interfaces in a bridge domain. The format of the Agent Circuit ID or Agent Remote ID information for Fast Ethernet or Gigabit Ethernet interfaces is as follows:

```
(fe | ge)-fpc/pic/port.subunit:svlan_id-vlan_id
```

**NOTE:** The *subunit* is required and used to differentiate the interface for remote systems, and *svlan\_id-vlan\_id* represents the VLANs associated with the bridge domain.

| Description         | Specify the user prefix that is concatenated with the username during the subscriber authentication or client authentication process. Use the statement at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels to configure DHCPv6 support.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## user-prefix (Interfaces)

**Syntax** `user-prefix user-prefix-string;`

**Hierarchy Level**

```
[edit interfaces interface-name unit unit-number demux inet auto-configure address-range
authentication username-include]
[edit interfaces interface-name unit unit-number demux inet6 auto-configure address-range
authentication username-include]
```

**Release Information** Statement introduced in Junos OS Release 18.1R1.

**Description** Specify the user prefix that is concatenated with the username for the demultiplexing (demux) interface options.

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Specify that a string is included as the beginning of the username created for all static subscribers or for the static subscribers in a specified group. The group version of the statement takes precedence over the global version. The username is also sent to RADIUS in the Access-Request message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <i>user-prefix-string</i> —String that begins the username. The string can include the following characters: a through z, A through Z, 0 through 9, “-”, or “.”.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>              | Adjust the number of frame overhead bytes by the specified number of bytes in the actual downstream rate reported in the ANCP Port Up message for a VDSL access line. The ANCP agent reports the adjusted value to CoS. The adjusted value accounts for the traffic encapsulation overhead.                                                                                                                                                                                                                                                                                                                           |         |             |        |                                                                                                                                                                                                                            |
|                                 | <div>  <p><b>NOTE:</b> Starting in Junos OS Release 17.4R1, this statement is deprecated and replaced by the <code>vdsl-overhead-bytes</code> option of the <code>access-line</code> statement at the <code>[edit system]</code> hierarchy level. The ANCP agent ignores the <code>vdsl-bytes</code> statement if it is present. This means that when you upgrade from Junos OS Release 17.3 or earlier with an existing configuration, you must reconfigure your adjustment with the <code>access-line</code> statement.</p> </div> |         |             |        |                                                                                                                                                                                                                            |

| Release Information      | Statement introduced in Junos OS Release 14.2.<br>Statement deprecated in Junos OS Release 17.4R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |             |        |                                                                                                                                                                                                                             |
| Description              | Adjust the actual downstream rate for a VDSL access line reported in the ANCP Port Up message by multiplying the rate by the specified percentage. The ANCP agent reports the adjusted rate to CoS.                                                                                                                                                                                                                                                                                                                                                                                                                              |         |             |        |                                                                                                                                                                                                                             |
|                          | <div>  <p><b>NOTE:</b> Starting in Junos OS Release 17.4R1, this statement is deprecated and replaced by the <code>vdsl-overhead-adjust</code> option of the <code>access-line</code> statement at the <code>[edit system]</code> hierarchy level. The ANCP agent ignores the <code>vdsl-overhead-adjust</code> statement if it is present. This means that when you upgrade from Junos OS Release 17.3 or earlier with an existing configuration, you must reconfigure your adjustment with the <code>access-line</code> statement.</p> </div> |         |             |        |                                                                                                                                                                                                                             |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.2.<br>Statement deprecated in Junos OS Release 17.4R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |        |                                                                                                                                                                                                                             |
| <b>Description</b>              | Adjust the number of frame overhead bytes by the specified number of bytes in the actual downstream rate reported in the ANCP Port Up message for a VDSL2 access line. The ANCP agent reports the adjusted value to CoS. The adjusted value accounts for the traffic encapsulation overhead.                                                                                                                                                                                                                                                                                                                            |         |             |        |                                                                                                                                                                                                                             |
|                                 | <div>  <p><b>NOTE:</b> Starting in Junos OS Release 17.4R1, this statement is deprecated and replaced by the <code>vdsl2-overhead-bytes</code> option of the <code>access-line</code> statement at the <code>[edit system]</code> hierarchy level. The ANCP agent ignores the <code>vdsl2-bytes</code> statement if it is present. This means that when you upgrade from Junos OS Release 17.3 or earlier with an existing configuration, you must reconfigure your adjustment with the <code>access-line</code> statement.</p> </div> |         |             |        |                                                                                                                                                                                                                             |

| Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Adjust the actual downstream rate for a VDSL2 access line received in the ANCP Port Up message by multiplying the rate by the specified percentage. The ANCP agent reports the adjusted rate to CoS.                                                                                                                              |         |             |        |                                                                                                                                                                                                                                 |
| <div>  <p><b>NOTE:</b> Starting in Junos OS Release 17.4R1, this statement is deprecated and replaced by the <code>vdsl2-overhead-adjust</code> option of the <a href="#">access-line</a> statement at the <code>[edit system]</code> hierarchy level. The ANCP agent ignores the <code>vdsl2-overhead-adjust</code> statement if it is present. This means that when you upgrade from Junos OS Release 17.3 or earlier with an existing configuration, you must reconfigure your adjustment with the <a href="#">access-line</a> statement.</p> </div> |                                                                                                                                                                                                                                                                                                                                   |         |             |        |                                                                                                                                                                                                                                 |

| <b>Release Information</b>      | Command introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | <p>Add vendor-specific information to the option-82, suboption 9 field of DHCPv4 control messages on server-facing interfaces. The vendor-specific information can be a hostname, a location (such as a unique connection identifier), or both. The hostname can be a string of characters such as <b>Juniper-AB-1</b>. The location should be specified as interface, VLAN ID, and if applicable, stacked VLAN ID. For example, <b>&lt;ifd-name&gt;:&lt;vlan&gt;</b> (ae0:100) or <b>&lt;ifd-name&gt;:&lt;svlan&gt; -&lt;vlan&gt;</b> (ae0:100-10).</p> <p>Junos OS automatically adds the remaining vendor-specific information as per RFC 4243. The enterprise ID is 2636. The hostname is option-data 1, and the location is option-data 2. The DHCPv4 relay strips the suboption data from replies from the server before it relays the packets out the client facing interface.</p> <p>This feature can be useful, in conjunction with operator-developed tools, for troubleshooting DHCP servers and providing service assurances. For example, a central DHCP server can log the information, and operators can query a single entity to track and troubleshoot subscriber IP information and network attachment points.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## violation-action (DHCP Local Server and DHCP Relay Agent)

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>              | Configure the action that the router performs when a DHCP lease-time violation occurs. The violation occurs when a third-party DHCP server or address-assignment pool offers a DHCP lease time that is less than the threshold specified by the <b>lease-time-threshold</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Release Information      | Statement introduced in Junos OS Release 12.3.                                                                                                                                                                                                                                                                                               |
| Description              | Configure the VLAN range of subscribers to which the named NAS-Port options definition applies.                                                                                                                                                                                                                                              |
|                          | <p> <b>NOTE:</b> You can configure a maximum of 16 NAS-Port options definitions per physical interface. Each definition can include a maximum of 32 VLAN ranges or 32 S-VLAN ranges, but cannot include a combination of VLAN ranges and S-VLAN ranges.</p> |
| Options                  | <p><b>any</b>—Entire VLAN range representing all VLAN IDs.</p> <p><b><i>low-tag</i></b>—VLAN ID tag representing the lower limit of the VLAN range.<br/> <b>Range:</b> 1 through 4094</p> <p><b><i>high-tag</i></b>—VLAN ID tag representing the upper limit of the VLAN range.<br/> <b>Range:</b> 1 through 4094</p>                        |
|                          | <p> <b>NOTE:</b> To specify a single VLAN ID, set <i>low-tag</i> and <i>high-tag</i> to the same value.</p>                                                                                                                                               |

| Release Information      | Statement introduced in Junos OS Release 12.3.<br>Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Description              | <p>Configure the router's authd process to wait for an Acct-On-Ack response message from RADIUS before sending new authentication and accounting updates to the RADIUS server. This configuration ensures that when a new subscriber session starts, the authentication and accounting information for the new session does not get deleted when RADIUS clears previously existing session state information.</p> <p>At subscriber session startup, the Junos OS authd process sends an Acct-On message to the RADIUS server and the new session starts authentication and accounting operations. However, in some service provider environments, upon receipt of the Acct-On message, the RADIUS server cleans up the previous session state and removes accounting statistics. In this scenario, the RADIUS server's cleanup operation can inadvertently delete the new session's authentication and accounting information, which might include customer billing information.</p> <p>To ensure that the new session's authentication and accounting information is not deleted, you can include the <b>wait-for-acct-on-ack</b> statement to configure authd to wait for an Acct-On-Ack response message from the RADIUS accounting server, so the RADIUS cleanup can finish before authd sends any new authentication and accounting updates.</p> |

| <b>Release Information</b>      | Command introduced in Junos OS Release 9.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | <p>Clear the ANCP agent connection with all ANCP neighbors or with the specified ANCP neighbor. This command deletes information for subscribers associated with the neighbor, causing the adjusted traffic rates to revert to the configured rate for the subscriber interfaces. The neighbor remains configured (its administrative state is <i>enabled</i>) and can reestablish adjacencies.</p> <p>This command initiates logout of ANCP-triggered dynamic VLAN sessions on the physical interface associated with the specified neighbor; conventionally autosensed dynamic VLAN sessions and their associated logical interfaces are not affected.</p> |
| <b>Options</b>                  | <p><b>none</b>—Clear all ANCP neighbors.</p> <p><b>ip-address <i>ip-address</i></b>—(Optional) Clear the ANCP neighbor specified by the IP address.</p> <p><b>system-name <i>mac-address</i></b>—(Optional) Clear the ANCP neighbor specified by the MAC address.</p>                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Output Fields</b>            | When you enter this command, you are provided no feedback on the status of your request. You can enter the <b>show ancp neighbor</b> command before and after clearing the ANCP neighbors to verify the clear operation.                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Sample Output

### clear ancp neighbor

```
user@host> clear ancp neighbor
```

## show ancp neighbor

The following sample output displays the connections with ANCP neighbors before and after the **clear ancp neighbor** command was issued.

```
user@host> show ancp neighbor
```

| IP Address    | MAC Address       | State       | Subscriber Count | Capabilities |
|---------------|-------------------|-------------|------------------|--------------|
| 203.0.113.102 | 00:00:5e:00:53:10 | Established | 5                | Topo         |
| 203.0.113.122 | 00:00:5e:00:53:12 | Established | 5                | Topo         |
| 203.0.113.132 | 00:00:5e:00:53:13 | Established | 5                | Topo         |
| 203.0.113.142 | 00:00:5e:00:53:14 | Established | 5                | Topo         |

```
user@host> clear ancp neighbor ip-address 203.0.113.102
```

```
user@host> show ancp neighbor
```

| IP Address    | MAC Address       | State       | Subscriber Count | Capabilities |

You can enter the <b>show ancp neighbor</b> command before and after clearing the ANCP neighbor statistics to verify the clear operation.                                                                   |

## Sample Output

### clear ancp statistics

```
user@host> clear ancp statistics
```

### show ancp neighbor

The following sample output displays statistics for an ANCP neighbor before and after the **clear ancp statistics** command was issued.

```
user@host> show ancp neighbor ip-address 192.168.10.1 detail
```

```
Neighbor Information
  IP Address           : 192.168.10.1
```

```

```

## clear dhcp relay binding

---

**Syntax**    **clear dhcp relay binding**  
              <address>  
              <all>  
              <dual-stack>  
              <interface *interface-name*>  
              <interfaces-vlan>  
              <interfaces-wildcard>  
              <logical-system *logical-system-name*>  
              <routing-instance *routing-instance-name*>

**Release Information**    Command introduced in Junos OS Release 8.3.  
                              Options **all** and **interface** added in Junos OS Release 8.4.  
                              Options *interfaces-vlan* and *interfaces-wildcard* added in Junos OS Release 12.1.  
                              Command introduced in Junos OS Release 12.1X48R3 for PTX Series Packet Transport Routers.  
                              Option **dual-stack** added in Junos OS Release 15.1.

**Description**    Clear the binding state of a Dynamic Host Configuration Protocol (DHCP) client from the client table.

**Options**    **address**—(Optional) Clear the binding state for the DHCP client, using one of the following entries:

- *ip-address*—The specified IP address.
- *mac-address*—The specified MAC address.
- *session-id*—The specified session ID.

**all**—(Optional) Clear the binding state for all DHCP clients.

**dual-stack**—(Optional) Clear the binding state for DHCPv4 clients and the associated DHCPv6 bindings in the single-session DHCP dual stack. DHCPv6 clients created in a DHCPv6-only stack are not affected.

**interface *interface-name***—(Optional) Clear the binding state for DHCP clients on the specified interface.

***interfaces-vlan***—(Optional) Clear the binding state on the interface VLAN ID and S-VLAN ID.

***interfaces-wildcard***—(Optional) The set of interfaces on which to clear bindings. This option supports the use of the wildcard character (\*).

**logical-system *logical-system-name***—(Optional) Clear the binding state for DHCP clients on the specified logical system.

**routing-instance** *routing-instance-name*—(Optional) Clear the binding state for DHCP clients on the specified routing instance.

## Sample Output

### clear dhcp relay binding

The following sample output displays the address bindings in the DHCP client table before and after the **clear dhcp relay binding** command is issued.

```
user@host> show dhcp relay binding
```

| IP address    | Hardware address  | Type   | Lease expires at        |
|---------------|-------------------|--------|-------------------------|
| 198.51.100.32 | 00:00:5e:00:53:01 | active | 2007-02-08 16:41:17 EST |
| 192.168.14.8  | 00:00:5e:00:53:02 | active | 2007-02-10 10:01:06 EST |

```
user@host> clear dhcp relay binding 198.51.100.32
```

```
user@host> show dhcp relay binding
```

| IP address   | Hardware address  | Type   | Lease expires at        |
|--------------|-------------------|--------|-------------------------|
| 192.168.14.8 | 00:00:5e:00:53:02 | active | 2007-02-10 10:01:06 EST |

### clear dhcp relay binding all

The following command clears all DHCP relay agent bindings:

```
user@host> clear dhcp relay binding all
```

### clear dhcp relay binding dual-stack all

The following command clears all DHCP relay agent bindings for all DHCPv4 clients and the associated DHCPv6 bindings in the single-session DHCP dual stack. DHCPv6 clients created in a DHCPv6-only stack are not affected.

```
user@host> clear dhcp relay binding dual-stack all
```

### clear dhcp relay binding interface

The following command clears DHCP relay agent bindings on a specific interface:

```
user@host> clear dhcp relay binding interface fe-0/0/3
```

### clear dhcp relay binding <interfaces-vlan>

The following command uses the *interfaces-vlan* option to clear all DHCP relay agent bindings on top of the underlying interface **ae0**, which clears DHCP bindings on all demux VLANs on top of **ae0**:

```
user@host> clear dhcp relay binding interface ae0
```

### clear dhcp relay binding <interfaces-wildcard>

The following command uses the *interfaces-wildcard* option to clear all DHCP relay agent bindings over a specific interface:

```
user@host> clear dhcp relay binding ge-1/0/0.*
```

## clear dhcp relay lockout-entries

## Sample Output

### clear dhcp relay lockout-entries (Specific Lockout Entry)

The following sample output displays the lockout entries in the database before and after **clear dhcp relay lockout-entries** command is issued for a specific entry.

```
user@host> show dhcp relay lockout-entries all
```

| Index | Key               | State   | Expires(s) | Elapsed(s) | Count |
|-------|-------------------|---------|------------|------------|-------|
| 1     | 00:00:5E:00:53:00 | Lockout | 30         | 5200       | 2     |
| 2     | 00:00:5E:00:53:11 | Grace   | 120        | 780        | 2     |
| 3     | 00:00:5E:00:53:22 | Lockout | 180        | 2300       | 1     |

```
user@host> clear dhcp relay lockout-entries index 2
```

```
user@host> show dhcp relay lockout-entries all
```

| Index | Key               | State   | Expires(s) | Elapsed(s) | Count |
|-------|-------------------|---------|------------|------------|-------|
| 1     | 00:00:5E:00:53:00 | Lockout | 30         | 5200       | 2     |
| 3     | 00:00:5E:00:53:22 | Lockout | 180        | 2300       | 1     |

### clear dhcp relay lockout-entries (All Lockout Entries)

The following sample output displays the lockout entries in the database before and after **clear dhcp relay lockout-entries** command is issued for all entries.

```
user@host> show dhcp relay lockout-entries all
```

| Index | Key               | State   | Expires(s) | Elapsed(s) | Count |
|-------|-------------------|---------|------------|------------|-------|
| 1     | 00:00:5E:00:53:00 | Lockout | 30         | 5200       | 2     |
| 2     | 00:00:5E:00:53:11 | Grace   | 120        | 780        | 2     |
| 3     | 00:00:5E:00:53:22 | Lockout | 180        | 2300       | 1     |

```
user@host> clear dhcp relay lockout-entries all
```

```
user@host> show dhcp relay lockout-entries all
```

## Sample Output

### clear dhcp relay statistics

The following sample output displays the DHCP relay statistics before and after the **clear dhcp relay statistics** command is issued.

```
user@host> show dhcp relay statistics
```

```
Packets dropped:
  Total          1
  Lease Time Violated 1

Messages received:
  BOOTREQUEST    116
  DHCPDECLINE    0
  DHCPDISCOVER   11
  DHCPINFORM     0
  DHCPRELEASE    0
  DHCPREQUEST    105
```

```
Messages sent:
  BOOTREPLY      44
  DHCPOFFER      11
  DHCPACK        11
  DHCPNAK        11
```

```
user@host> clear dhcp relay statistics
```

```
user@host> show dhcp relay statistics
```

```
Packets dropped:
  Total          0

Messages received:
  BOOTREQUEST    0
  DHCPDECLINE    0
  DHCPDISCOVER   0
  DHCPINFORM     0
  DHCPRELEASE    0
  DHCPREQUEST    0

Messages sent:
  BOOTREPLY      0
  DHCPOFFER      0
  DHCPACK        0
  DHCPNAK        0
```

## clear dhcp server binding

**Syntax**

```
clear dhcp server binding
<address>
<all>
<interface interface-name>
<interfaces-vlan>
<interfaces-wildcard>
<logical-system logical-system-name>
<routing-instance routing-instance-name>
<dual-stack>
```

**Release Information** Command introduced in Junos OS Release 9.0.  
Options *interfaces-vlan* and *interfaces-wildcard* added in Junos OS Release 12.1.  
Command updated with **dual-stack** statement in Junos OS Release 17.3.

**Description** Clear the binding state of a Dynamic Host Configuration Protocol (DHCP) client from the client table on the extended DHCP local server.

**NOTE:** If you delete the DHCP server configuration, DHCP server bindings might still remain. To ensure that DHCP bindings are removed, issue the `clear dhcp server binding` command before you delete the DHCP server configuration.

**Options** **address**—(Optional) Clear the binding state for the DHCP client, using one of the following entries:

- *ip-address*—The specified IP address.
- *mac-address*—The specified MAC address.
- *session-id*—The specified session ID.

**all**—(Optional) Clear the binding state for all DHCP clients.

**interface interface-name**—(Optional) Clear the binding state for DHCP clients on the specified interface.

**NOTE:** This option clears all bindings whose initial login requests were received over the specified interface. Dynamic demux login requests are not received over the dynamic demux interface, but rather the underlying interface of the dynamic demux interface. To clear a specific dynamic demux interface, use the *ip-address* or *mac-address* options.

***interfaces-vlan***—(Optional) Clear the binding state on the interface VLAN ID and S-VLAN ID.

***interfaces-wildcard***—(Optional) Clear bindings on a set of interfaces. This option supports the use of the wildcard character (\*).

**logical-system *logical-system-name***—(Optional) Clear the binding state for DHCP clients on the specified logical system.

**routing-instance *routing-instance-name***—(Optional) Clear the binding state for DHCP clients on the specified routing instance.

**dual-stack**—(Optional) Remove either both arms or single arm of dual-stack.

NOTE:

- The **dual-stack** command is added in the syntax removes both arms of the dual-stack with a single command entry.
- When the **dual-stack** command is not added in the syntax, the **clear dhcpv6 server binding** command clears only the family specific arm of the dual-stack.

## Sample Output

**clear dhcp server binding <ip-address>**

The following sample output displays the address bindings in the DHCP client table on the extended DHCP local server before and after the **clear dhcp server binding** command is issued.

```
user@host> show dhcp server binding
```

```
2 clients, (0 bound, 0 selecting, 0 renewing, 0 rebinding)
```

IP address	Hardware address	Type	Lease expires at
198.51.100.1	00:00:5e:00:53:01	active	2007-01-17 11:38:47 PST
198.51.100.3	00:00:5e:00:53:02	active	2007-01-17 11:38:41 PST

```
user@host> clear dhcp server binding 198.51.100.1
```

```
user@host> show dhcp server binding
```

```
1 clients, (0 bound, 0 selecting, 0 renewing, 0 rebinding)
```

IP address	Hardware address	Type	Lease expires at
198.51.100.3	00:00:5e:00:53:02	active	2007-01-17 11:38:41 PST

### clear dhcp server binding all

The following command clears all DHCP local server bindings:

```
user@host> clear dhcp server binding all
```

### clear dhcp server binding interface

The following command clears DHCP local server bindings on a specific interface:

```
user@host> clear dhcp server binding interface fe-0/0/2
```

### clear dhcp server binding <interfaces-vlan>

The following command uses the *interfaces-vlan* option to clear all DHCP local server bindings on top of the underlying interface **ae0**, which clears DHCP bindings on all demux VLANs on top of **ae0**:

```
user@host> clear dhcp server binding ae0
```

### clear dhcp server binding <interfaces-wildcard>

The following command uses the *interfaces-wildcard* option to clear all DHCP local server bindings over a specific interface:

```
user@host> clear dhcp server binding ge-1/0/0.*
```

**clear dhcp server binding dual-stack all**

The following command clears all the dual-stack local server bindings.

```
user@host> clear dhcp server binding dual-stack all
```

## clear dhcp server lockout-entries

<b>Syntax</b>	clear dhcp server lockout-entries (all   index <i>index</i> )
<b>Release Information</b>	Command introduced in Junos OS Release 18.2R1 on MX Series routers.
<b>Description</b>	Clear all client entries from the DHCPv4 local server lockout database or only the specified entries. The lockout is terminated for all affected client sessions. The lockout history for these clients is also cleared. The clients that were locked out are allowed to attempt to log in. Any subsequent short-cycle event results in a new lockout, with the initial lockout period at the low end of the range.
<b>Options</b>	<p><b>all</b>—Clear all client entries from the lockout database.</p> <p><b>index <i>index</i></b>—Number identifying a client entry to be cleared from the lockout database. You can view the index numbers associated with all clients by issuing the <b>show dhcp-server lockout-entries</b> command.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">show dhcp server lockout-entries on page 1721</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear dhcp server lockout-entries (Specific Lockout Entry) on page 1548</a> <a href="#">clear dhcp server lockout-entries (All Lockout Entries) on page 1549</a>
<b>Output Fields</b>	See <a href="#">show dhcp server lockout-entries</a> for an explanation of the output fields.

## Sample Output

### clear dhcp server lockout-entries (Specific Lockout Entry)

The following sample output displays the lockout entries in the database before and after **clear dhcp server lockout-entries** command is issued for a specific entry.

```
user@host> show dhcp server lockout-entries all
```

Index	Key	State	Expires(s)	Elapsed(s)	Count
1	00:00:5E:00:53:00	Lockout	30	5200	2
2	00:00:5E:00:53:11	Grace	120	780	2
3	00:00:5E:00:53:22	Lockout	180	2300	1

```
user@host> clear dhcp server lockout-entries index 2
```

```
user@host> show dhcp server lockout-entries all
```

Index	Key	State	Expires(s)	Elapsed(s)	Count
1	00:00:5E:00:53:00	Lockout	30	5200	2
3	00:00:5E:00:53:22	Lockout	180	2300	1

#### clear dhcp server lockout-entries (All Lockout Entries)

The following sample output displays the lockout entries in the database before and after **clear dhcp server lockout-entries** command is issued for all entries.

```
user@host> show dhcp server lockout-entries all
```

Index	Key	State	Expires(s)	Elapsed(s)	Count
1	00:00:5E:00:53:00	Lockout	30	5200	2
2	00:00:5E:00:53:11	Grace	120	780	2
3	00:00:5E:00:53:22	Lockout	180	2300	1

```
user@host> clear dhcp server lockout-entries all
```

```
user@host> show dhcp server lockout-entries all
```

## clear dhcp server statistics

<b>Syntax</b>	<pre>clear dhcp server statistics &lt;bulk-leasequery-connections&gt; &lt;logical-system <i>logical-system-name</i>&gt; &lt;routing-instance <i>routing-instance-name</i>&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.0.</p> <p><b>bulk-leasequery-connections</b> option introduced in Junos OS Release 16.1.</p>
<b>Description</b>	Clear all extended Dynamic Host Configuration Protocol (DHCP) local server statistics.
<b>Options</b>	<p><b>bulk-leasequery-connections</b>—(Optional) Clear bulk leasequery statistics.</p> <p><b>logical-system <i>logical-system-name</i></b>—(Optional) Clear the statistics for DHCP clients on the specified logical system. If you do not specify a logical system, statistics are cleared for the default logical system.</p> <p><b>routing-instance <i>routing-instance-name</i></b>—(Optional) Clear the statistics for DHCP clients on the specified routing instance. If you do not specify a routing instance, statistics are cleared for the default routing instance.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">clear dhcp server statistics on page 1550</a>
<b>Output Fields</b>	See <a href="#">show dhcp server statistics</a> for an explanation of output fields.

## Sample Output

### clear dhcpv6 relay binding all

The following command clears all DHCP relay agent bindings:

```
user@host> clear dhcpv6 relay binding all
```

### clear dhcpv6 relay binding dual-stack all

The following command clears all DHCPv6 relay agent bindings for all DHCPv6 clients and the associated DHCPv4 bindings in the single-session DHCP dual stack. DHCPv4 clients created in a DHCPv4-only stack are not affected.

```
user@host> clear dhcpv6 relay binding dual-stack all
```

### clear dhcpv6 relay binding interface

The following command clears DHCPv6 relay agent bindings on a specific interface:

```
user@host> clear dhcpv6 relay binding interface fe-0/0/2
```

### clear dhcpv6 relay binding <interfaces-vlan>

The following command uses the *interfaces-vlan* option to clear all DHCPv6 relay agent bindings on top of the underlying interface **ae0**, which clears DHCPv6 bindings on all demux VLANs on top of **ae0**:

```
user@host> clear dhcpv6 relay binding interface ae0
```

### clear dhcpv6 relay binding <interfaces-wildcard>

The following command uses the *interfaces-wildcard* option to clear all DHCPv6 relay agent bindings over a specific interface:

```
user@host> clear dhcpv6 relay binding ge-1/0/0.*
```

## clear dhcpv6 relay lockout-entries

## clear dhcpv6 server binding

**Syntax** `clear dhcpv6 server binding`  
`<address>`  
`<all>`  
`<interface interface-name>`  
`<interfaces-vlan>`  
`<interfaces-wildcard>`  
`<logical-system logical-system-name>`  
`<routing-instance routing-instance-name>`  
`<dual-stack>`

**Release Information** Command introduced in Junos OS Release 9.6.  
Options *interfaces-vlan* and *interfaces-wildcard* added in Junos OS Release 12.1.  
Command updated with **dual-stack** statement in Junos OS Release 17.3.

**Description** Clear the binding state of a Dynamic Host Configuration Protocol for IPv6 (DHCPv6) client from the client table on the extended DHCPv6 local server.

**Options** **address**—(Optional) Clear the binding state for the DHCPv6 client, using one of the following entries:

- *CID*—The specified Client ID (CID).
- *ipv6-prefix*—The specified IPv6 prefix.
- *session-id*—The specified session ID.

**all**—(Optional) Clear the binding state for all DHCPv6 clients.

**interface interface-name**—(Optional) Clear the binding state for DHCPv6 clients on the specified interface.

**interfaces-vlan**—(Optional) Clear the binding state on the interface VLAN ID and S-VLAN ID.

**interfaces-wildcard**—(Optional) Clear bindings on a set of interfaces. This option supports the use of the wildcard character (\*).

**logical-system logical-system-name**—(Optional) Clear the binding state for DHCPv6 clients on the specified logical system.

**routing-instance routing-instance-name**—(Optional) Clear the binding state for DHCPv6 clients on the specified routing instance.

**dual-stack**—(Optional) Remove either both arms or single arm of dual-stack.

---

**NOTE:**

- The **dual-stack** command is added in the syntax removes both arms of the dual-stack with a single command entry.
  - When the **dual-stack** command is not added in the syntax, the **clear dhcpv6 server binding** command clears only the family specific arm of the dual-stack.
- 

**Required Privilege Level** clear

## Sample Output

### [clear dhcpv6 server binding all](#)

The following command clears all DHCPv6 local server bindings:

```
user@host> clear dhcpv6 server binding all
```

---

### [clear dhcpv6 server binding <ipv6-prefix>](#)

The following command clears DHCPv6 local server bindings for a specific IPv6 prefix:

```
user@host> clear dhcpv6 server binding 14/0x00010001/0x02b3be8f/0x00109400/0x0005
```

---

### [clear dhcpv6 server binding interface](#)

The following command clears DHCPv6 local server bindings on a specific interface:

```
user@host> clear dhcpv6 server binding interface fe-0/0/2
```

### `clear dhcpv6 server binding <interfaces-vlan>`

The following command uses the *interfaces-vlan* option to clear all DHCPv6 local server bindings on top of the underlying interface **ae0**, which clears DHCPv6 bindings on all demux VLANs on top of **ae0**:

```
user@host> clear dhcpv6 server binding interface ae0
```

### `clear dhcpv6 server binding <interfaces-wildcard>`

The following command uses the *interfaces-wildcard* option to clear all DHCPv6 local server bindings over a specific interface:

```
user@host> clear dhcpv6 server binding ge-1/0/0.*
```

### `clear dhcpv6 server binding dual-stack all`

The following command clears all the dual-stack local server bindings.

```
user@host> clear dhcpv6 server binding dual-stack all
```

## clear dhcpv6 server lockout-entries

<b>Syntax</b>	<code>clear dhcpv6 server lockout-entries (all   index <i>index</i>)</code>
<b>Release Information</b>	Command introduced in Junos OS Release 18.2R1 on MX Series routers.
<b>Description</b>	Clear all client entries from the DHCPv6 local server lockout database or only the specified entries. The lockout is terminated for all affected client sessions. The lockout history for these clients is also cleared. The clients that were locked out are allowed to attempt to log in. Any subsequent short-cycle event results in a new lockout, with the initial lockout period at the low end of the range.
<b>Options</b>	<p><b>all</b>—Clear all client entries from the lockout database.</p> <p><b>index <i>index</i></b>—Number identifying a client entry to be cleared from the lockout database. You can view the index numbers associated with all clients by issuing the <b>show dhcpv6-server lockout-entries</b> command.</p>

## clear dhcpv6 server statistics

---

Syntax	<pre>clear dhcpv6 server statistics &lt;bulk-leasequery-connections&gt; &lt;interface <i>interface-name</i>&gt; &lt;logical-system <i>logical-system-name</i>&gt; &lt;routing-instance <i>routing-instance-name</i>&gt;</pre>
Release Information	Command introduced in Junos OS Release 9.6. <b>bulk-leasequery-connections</b> option introduced in Junos OS Release 16.1.
Description	Clear all extended Dynamic Host Configuration Protocol for IPv6 (DHCPv6) local server statistics.
Options	<p><b>bulk-leasequery-connections</b>—(Optional) Clear bulk leasequery statistics.</p> <p><b>logical-system <i>logical-system-name</i></b>—(Optional) Clear the statistics for DHCPv6 clients on the specified logical system. If you do not specify a logical system, statistics are cleared for the default logical system.</p> <p><b>routing-instance <i>routing-instance-name</i></b>—(Optional) Clear the statistics for DHCPv6 clients on the specified routing instance. If you do not specify a routing instance, statistics are cleared for the default routing instance.</p>
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">show dhcpv6 server statistics on page 1751</a></li></ul>
List of Sample Output	<a href="#">clear dhcpv6 server statistics on page 1564</a>
Output Fields	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### clear dhcpv6 server statistics

```
user@host> clear dhcpv6 server statistics
```

## clear diameter function statistics

<b>Syntax</b>	<b>clear diameter function</b> < <i>function-name</i> > <b>statistics</b>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.6.</p> <p>Support for PTSP introduced in Junos OS Release 10.2.</p> <p>Support for Gx-Plus introduced in Junos OS Release 11.2.</p> <p>Support for PTSP discontinued in Junos OS Release 13.1.</p>
<b>Description</b>	Clear current statistics accumulated for a specified function (application) or for all functions associated with the Diameter instance.
<b>Options</b>	<i>function-name</i> —(Optional) Clear statistics for the specified function. Gx-Plus, JSRC, and packet-triggered-subscribers are supported functions.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Gx-Plus for Provisioning Subscribers Overview on page 701</a></li> <li>• <a href="#">Juniper Networks Session and Resource Control (SRC) and JSRC Overview on page 759</a></li> <li>• <a href="#">show diameter on page 1755</a></li> <li>• <a href="#">show diameter function on page 1761</a></li> <li>• <a href="#">show diameter function statistics on page 1765</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear diameter function statistics on page 1565</a>
<b>Output Fields</b>	When you enter this command, you are not provided feedback on the status of your request.

## Sample Output

### clear diameter function statistics

```
user@host> clear diameter function jsrc statistics
```

## clear diameter peer

---

Syntax	<code>clear diameter peer <i>peer-name</i> &lt;connection   statistics&gt;</code>
Release Information	Command introduced in Junos OS Release 9.6.
Description	Delete the specified Diameter peer and clear all statistics or only current statistics for the specified peer.
Options	<p><b><i>peer-name</i></b>—Delete the Diameter peer.</p> <p><b>connection</b>—(Optional) Clear all peer statistics and restart the peer state machine for the specified Diameter peer. This is the default action.</p> <p><b>statistics</b>—(Optional) Clear current statistics for the specified Diameter peer.</p>
Required Privilege Level	clear
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">show diameter on page 1755</a></li><li>• <a href="#">show diameter peer on page 1777</a></li><li>• <a href="#">show diameter peer map on page 1782</a></li><li>• <a href="#">show diameter peer statistics on page 1785</a></li></ul>
List of Sample Output	<a href="#">clear diameter peer on page 1566</a>
Output Fields	When you enter this command, you are not provided feedback on the status of your request.

## Sample Output

### clear diameter peer

```
user@host> clear diameter peer peer5 connection
```

---

## clear extensible-subscriber-services counters

---

**Syntax**      `clear extensible-subscriber-services counters`

**Release Information**      Command introduced in Junos OS Release 15.1.

**Description**      Clear values of all event counters to zero. Active sessions and services counters are not reset.

**Required Privilege Level**      view

**Related Documentation**

- [show extensible-subscriber-services counters on page 1799](#)

### Sample Output

```
#clear extensible-subscriber-services counters
```

## clear extensible-subscriber-services sessions

---

<b>Syntax</b>	<code>clear extensible-subscriber-services sessions &lt;accounting-session-id&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 15.1.
<b>Description</b>	Clear extensible subscriber service sessions in any state by executing the operational script or the application to remove all services created. Specify an accounting session ID to clear a specific session. If you do not specify an accounting session ID in the command, the command clears all sessions.
<b>Options</b>	<i>accounting-session-id</i> —(Optional) Identifier of the ESSM session you want cleared.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show extensible-subscriber-services sessions on page 1812</a></li></ul>

### Sample Output

```
#clear extensible-subscriber-services sessions "jnpr demux0.1073762028:46422"
```

## clear ipv6 router-advertisement

<b>Syntax</b>	clear ipv6 router-advertisement <interface <i>interface</i> > <logical-system (all   <i>logical-system-name</i> )>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Clear IPv6 router advertisement counters.
<b>Options</b>	<p><b>none</b>—Clear IPv6 router advertisement counters for all interfaces.</p> <p><b>interface <i>interface</i></b>—(Optional) Clear IPv6 router advertisement counters for the specified interface.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show ipv6 router-advertisement on page 1816</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear ipv6 router-advertisement on page 1569</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear ipv6 router-advertisement

```
user@host> clear ipv6 router-advertisement
```

## clear network-access aaa statistics

**Syntax**    clear network-access aaa statistics  
               <accounting>  
               <address-assignment (client | pool *pool-name*)>  
               <authentication>  
               <dynamic-requests>  
               <radius>  
               <re-authentication>  
               <session-limit-per-username username *username* access-profile *profile-name*>  
               <terminate-code>

**Release Information**    Command introduced in Junos OS Release 10.0.  
                               **radius** option introduced in Junos OS Release 11.4  
                               **terminate-code** option introduced in Junos OS Release 11.4.  
                               **session-limit-per-username** option introduced in Junos OS Release 18.4R1 on MX Series routers.

**Description**    Clear AAA statistics.

**Options**    **accounting**—(Optional) Clear AAA accounting statistics.

**address-assignment client**—(Optional) Clear AAA address-assignment statistics for the client.

**address-assignment pool *pool-name***—(Optional) Clear AAA address-assignment pool statistics.

**authentication**—(Optional) Clear AAA authentication statistics.

**dynamic-requests**—(Optional) Clear AAA dynamic-request statistics.

**radius**—(Optional) Clears the values in the **Peak** and **Exceeded** columns only.

**re-authentication**—(Optional) Clear AAA reauthentication statistics.

**session-limit-per-username**—(MX Series routers only) (Optional) Clear all blocked request statistics for all access profiles from the username session-limit table. You can also specify additional options:

- **username *username***—Clear the blocked request statistics for the specified username across all access profiles. A given username can be used in more than one access profile.
- **access-profile *profile-name***—Clear the blocked request statistics for all usernames in the specified access profile.

**NOTE:** This command does not clear (delete) the entry in the session-limit table. Entries in the table are added or deleted during session login or logout processing.

**terminate-code**—(Optional) Clear AAA termination code statistics.

**Required Privilege Level** maintenance

**Related Documentation**

## clear network-access aaa subscriber

---

<b>Syntax</b>	<pre>clear network-access aaa subscriber &lt;session-id <i>identifier</i> &lt;reconnect&gt;&gt; &lt;statistics username <i>username</i>&gt; &lt;username <i>username</i> &lt;reconnect&gt;&gt;</pre>
<b>Release Information</b>	Command introduced in Junos OS Release 9.1. <b>reconnect</b> and <b>session-id</b> options added in Junos OS Release 16.1R4.
<b>Description</b>	Clear AAA subscriber statistics and log out subscribers. You can log out subscribers based on the username or on the subscriber session identifier. Use the session identifier when more than one session has the same username string.
<b>Options</b>	<p><b>reconnect</b>—(Optional) Reconnect as a Layer 2 wholesale session when the subscriber session has been fully logged out. This option is equivalent to issuing a RADIUS-initiated disconnect with reconnect semantics; that is, when the message includes Acct-Terminate-Cause (RADIUS attribute 49) with a value of callback (16). You can apply this option to either a Layer 2 wholesale session or a conventionally auto-sensed dynamic VLAN supporting a PPPoE session.</p> <p>In the latter case, this option triggers a PPPoE session logout and removal of the dynamic VLAN logical interface. This is followed by authorization of the access-line to attempt creation of a dynamic VLAN IFL supporting Layer 2 wholesale session in its place.</p> <p><b>session-id <i>identifier</i></b>—(Optional) Log out the subscriber based on the subscriber session identifier.</p> <p><b>statistics username <i>username</i></b>—(Optional) Clear AAA subscriber statistics and log out the subscriber.</p> <p><b>username <i>username</i></b>—(Optional) Log out the AAA subscriber.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Verifying and Managing Subscriber AAA Information on page 158</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear network-access aaa subscriber statistics username on page 1575</a> <a href="#">clear network-access aaa subscriber username on page 1575</a> <a href="#">clear network-access aaa subscriber username on page 1575</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

clear network-access aaa subscriber statistics username

```
user@host> clear network-access aaa subscriber statistics username user22@example.com
```

clear network-access aaa subscriber username

```
user@host> clear network-access aaa subscriber username user22@example.com
```

clear network-access aaa subscriber session-id

```
user@host> clear network-access aaa subscriber session-id 18367425
```

## clear network-access gx-plus replay

---

<b>Syntax</b>	clear network-access gx-plus replay
<b>Release Information</b>	Command introduced in Junos OS Release 11.2.
<b>Description</b>	Clear pending Gx-Plus login and logout requests (replays). Sends JSER message to PCRF that includes the Juniper-Event-Type AVP (AVP code 2103) with a value of 3 indicating a discovery request. The PCRF returns a JDER message to initiate discovery of all subscribers. When this discovery completes, all pending subscriber requests are cleared.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">clear network-access gx-plus statistics on page 1577</a></li><li>• <a href="#">show network-access gx-plus on page 1868</a></li></ul>

```
user@host> clear network-access ocs statistics
```

## clear network-access pcrf

<b>Syntax</b>	<code>clear network-access pcrf (statistics   subscribers)</code>
<b>Release Information</b>	Command introduced in Junos OS Release 16.2.
<b>Description</b>	Clear Policy and Charging Rules Function (PCRF) provisioning statistics and subscribers information.
<b>Options</b>	<p><b>statistics</b>—(Optional) Clear PCRF provisioning statistics.</p> <p><b>subscribers</b>—(Optional) Force logout of all PCRF subscribers. Used with draining mode to flush all subscribers before making substantial configuration changes.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">pcrf on page 1272</a></li> <li>• <a href="#">show network-access pcrf on page 1876</a></li> <li>• <a href="#">Understanding Gx Interactions Between the Router and the PCRF on page 722</a></li> <li>• <a href="#">Understanding Rule Interactions Between the PCRF, PCEF, and OCS on page 736</a></li> <li>• <a href="#">Understanding Upstream and Downstream Messages for the PCRF on page 742</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">clear network-access pcrf statistics on page 1579</a></p> <p><a href="#">clear network-access pcrf subscribers on page 1579</a></p>
<b>Output Fields</b>	When you enter this command, you are provided no feedback on the status of your request.

### Sample Output

#### clear network-access pcrf statistics

```
user@host> clear network-access pcrf statistics
```

### Sample Output

#### clear network-access pcrf subscribers

```
user@host> clear network-access pcrf subscribers
```

## clear system subscriber-management statistics

---

<b>Syntax</b>	clear system subscriber-management statistics
<b>Release Information</b>	Command introduced in Junos OS Release 15.1.
<b>Description</b>	Clear subscriber-management statistics.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view and system
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show system subscriber-management statistics on page 1973</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear subscriber-management statistics on page 1580</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### clear subscriber-management statistics

```
user@host> clear subscriber-management statistics
```

## request ancp oam interface

<b>Syntax</b>	<b>request ancp oam interface</b> <i>(interface-name   interface-set set-name)</i> <count <i>count</i> > <timeout <i>duration</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 11.4.
<b>Description</b>	Trigger the access node to run a loopback test on the local loop between the access node and the customer premises equipment. You must specify either an ANCP interface or an ANCP interface set. The access node responds to the NAS with the results of the test.
<b>Options</b>	<p><b>interface-name</b>—Name of the ANCP interface on whose local loop the loopback test is run.</p> <p><b>interface-set <i>set-name</i></b>—Name of the ANCP interface set on whose local loop the loopback test is run.</p> <p><b>count <i>count</i></b>—(Optional) Number of times a loopback message is sent on the local loop. Range: 1 through 32. Default: 1.</p> <p><b>timeout <i>duration</i></b>—(Optional) Period of time in seconds that the NAS waits for a response to the OAM request. Range: 0 through 255. Default: 5.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Triggering ANCP OAM to Test the Local Loop on page 662</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request ancp oam interface on page 1581</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request, including the result of the test, the response code, and the response string returned with the OAM response in the event of failure, an error code is displayed.

## Sample Output

### request ancp oam interface

```
user@host> request ancp oam interface ge-1/0/4.12 count 5 timeout 40
request succeeded
0x503 : DSL line status showtime
DEFAULT RESPONSE
```

## request ancp oam neighbor

<b>Syntax</b>	<pre>request ancp oam neighbor (ip-address <i>ip-address</i>   system-name <i>neighbor-name</i>) subscriber <i>identifier-string</i> &lt;count <i>count</i>&gt; &lt;timeout <i>duration</i>&gt;</pre>
<b>Release Information</b>	Command introduced in Junos OS Release 11.4.
<b>Description</b>	Trigger the access node to run a loopback test on the local loop between the access node and the customer premises equipment. You must specify both the access node and the subscriber. The access node responds to the NAS with the results of the test.
<b>Options</b>	<p><b>ip-address <i>ip-address</i></b>—IP address that specifies the access node on whose local loop the loopback test is run.</p> <p><b>system-name <i>neighbor-name</i></b>—System name that specifies the access node on whose local loop the loopback test is run.</p> <p><b>subscriber <i>identifier-string</i></b>—Access identifier that specifies the subscriber on whose local loop the loopback test is run.</p> <p><b>count <i>count</i></b>—(Optional) Number of times a loopback message is sent on the local loop. Range: 1 through 32. Default: 1.</p> <p><b>timeout <i>duration</i></b>—(Optional) Period of time in seconds that the NAS waits for a response to the OAM request. Range: 0 through 255. Default: 5.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Triggering ANCP OAM to Test the Local Loop on page 662</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request ancp oam subscriber on page 1583</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request, including the result of the test, the response code, and the response string returned with the OAM response in the event of failure, an error code is displayed.

## Sample Output

### request ancp oam subscriber

```
user@host> request ancp oam neighbor 203.0.113.21 subscriber "dslam port-1-11"
```

```
request succeeded
0x503 : DSL line status showtime
DEFAULT RESPONSE
```

## request ancp oam port-down

<b>Syntax</b>	<b>request ancp oam port-down</b> (neighbor <i>ip-address</i>   subscriber-interface <i>physical-interface-name</i> ) circuit-id <i>aci</i> remote-id <i>ari</i> outer-vlan-id <i>vlan-id</i>
<b>Release Information</b>	Command introduced in Junos OS Release 16.1R4.
<b>Description</b>	Simulate an ANCP Port Down message on the specified access loop for troubleshooting or to mitigate an abnormal condition. Triggers removal of the corresponding out-of-band triggered, autosensed dynamic VLAN session for which no ANCP-sourced information exists. You must specify an ACI, an ARI, and an outer VLAN tag. This command is overridden by a genuine ANCP Port-Up message, meaning that you cannot use this command to initiate a Port Down condition when the access node has already reported a Port Up condition.
<b>Options</b>	<p><b>aci</b>—ANCP Access-Loop-Circuit-ID TLV that corresponds to a subscriber interface on the access node; used to identify the access node from which the message is simulated.</p> <p><b>ari</b>—ANCP Access-Loop-Remote-ID TLV that identifies the subscriber associated with an interface on the access node; used to identify the access node from which the message is simulated.</p> <p><b>ip-address</b>—IP address that specifies the access node from which the message is simulated.</p> <p><b>physical-interface-name</b>—Name of the access-facing subscriber interface that specifies the access node on whose local loop the loopback test is run.</p> <p><b>vlan-id</b>—ANCP Access-Aggregation-Circuit-ID-Binary TLV, the outer VLAN tag inserted by the access node on upstream traffic; used to identify the access node from which the message is simulated.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Triggering ANCP OAM to Simulate ANCP Port Down and Port Up Messages</i></li> <li>• <i>Layer 2 Wholesale with ANCP-Triggered VLANs Overview</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request ancp oam port-down neighbor circuit-id remote-id outer-vlan-id on page 1586</a>
<b>Output Fields</b>	When you enter this command, you are provided no feedback on the status of your request. You can enter the <b>show ancp neighbor detail</b> , <b>show subscribers client-type vlan-oob detail</b> , and the <b>show subscribers summary</b> commands before and after initiating the Port Down message to verify the operation.

## Sample Output

`request ancp oam port-down neighbor circuit-id remote-id outer-vlan-id`

```
user@host> request ancp oam port-down neighbor 192.168.25.31 circuit-id line-aci-1 remote-id  
line-ari-1 outer-vlan-id 126
```

## request ancpl oam port-up

<b>Syntax</b>	<b>request ancpl oam port-up</b> (neighbor <i>ip-address</i>   subscriber-interface <i>physical-interface-name</i> ) circuit-id <i>aci</i> remote-id <i>ari</i> outer-vlan-id <i>vlan-id</i>
<b>Release Information</b>	Command introduced in Junos OS Release 16.1R4.
<b>Description</b>	Simulate an ANCP Port Up message on the specified access loop for troubleshooting or to mitigate an abnormal condition. You must specify an ACI, an ARI, and an outer VLAN tag. This command is overridden by a genuine ANCP Port Down message, meaning that you cannot use this command to initiate a Port Up condition when the access node has already reported a Port Down condition.
<b>Options</b>	<p><b>aci</b>—ANCP Access-Loop-Circuit-ID TLV that corresponds to a subscriber interface on the access node; used to identify the access node from which the message is simulated.</p> <p><b>ip-address</b>—IP address that specifies the access node from which the message is simulated.</p> <p><b>ari</b>—ANCP Access-Loop-Remote-ID TLV that identifies the subscriber associated with an interface on the access node; used to identify the access node from which the message is simulated.</p> <p><b>physical-interface-name</b>—Name of the access-facing subscriber interface that specifies the access node on whose local loop the loopback test is run.</p> <p><b>vlan-id</b>—ANCP Access-Aggregation-Circuit-ID-Binary TLV, the outer VLAN tag inserted by the access node on upstream traffic; used to identify the access node from which the message is simulated.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Triggering ANCP OAM to Simulate ANCP Port Down and Port Up Messages</i></li> <li>• <i>Layer 2 Wholesale with ANCP-Triggered VLANs Overview</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request ancpl oam port-up neighbor circuit-id remote-id outer-vlan-id on page 1588</a>
<b>Output Fields</b>	When you enter this command, you are provided no feedback on the status of your request. You can enter the <b>show ancpl neighbor detail</b> , <b>show subscribers client-type vlan-oob detail</b> , and the <b>show subscribers summary</b> commands before and after initiating the Port Up message to verify the operation.

## Sample Output

`request ancp oam port-up neighbor circuit-id remote-id outer-vlan-id`

```
user@host> request ancp oam port-up neighbor 192.168.25.31 circuit-id line-aci-1 remote-id  
line-ari-1 outer-vlan-id 126
```

## request dhcp relay bulk-leasequery

**Syntax** request dhcp relay bulk-leasequery (*client-id* | *ipv4-address* | *mac-address*)  
 <server-address *address* | server-group *group-name*>  
 <logical-system *logical-system*>  
 <routing-instance *routing-instance*>

**Release Information** Command introduced in Junos OS Release 16.1.

**Description** Initiate the bulk leasequery operation that updates binding information for subscribers by requesting that DHCP relay agent send the bulk leasequery message to the configured DHCP servers. The DHCP bulk leasequery feature must be configured in the DHCP relay agent.

**Options**  **NOTE:** You must configure at least one of *client-id*, *ipv4-address*, or *mac-address*.

**address**—Specify the IP address of the DHCP local server to query.

**client-id**—Use the DHCP client identifier option (option 61) to identify the client whose binding information is requested.

**group-name**—Specify the name of a group of DHCP local servers to query.

**mac-address**—Use the MAC address to identify the client whose binding information is requested.

**logical-system**—Specify an optional logical system for the DHCP server being queried. The default logical system is used by default.

**routing-instance**—Specify an optional routing instance for the DHCP server being queried. The default routing instance is used by default.

**Required Privilege Level** view

**List of Sample Output** [request dhcp relay bulk-leasequery on page 1590](#)

**Output Fields** When you enter this command, DHCP relay agent initiates the bulk leasequery operation.

## Sample Output

`request dhcp relay bulk-leasequery`

```
user@host> request dhcp relay bulk-leasequery 4/1224 server-address 192.168.10.10
```

## request dhcp relay leasequery

**Syntax** request dhcp relay leasequery (*client-id* | *ipv4-address* | *mac-address*)  
 <server-address *address* | server-group *group-name*>  
 <logical-system *logical-system*>  
 <routing-instance *routing-instance*>

**Release Information** Command introduced in Junos OS Release 16.1.

**Description** Initiate the leasequery operation that updates binding information for a specific subscriber by requesting that DHCP relay agent send the leasequery message to the configured DHCP servers. The DHCP leasequery feature must be configured in the DHCP relay agent.

**Options**  **NOTE:** You must configure at least one of *client-id*, *ipv4-address*, or *mac-address*.

***address***—Specify the IP address of the DHCP local server to query.

***client-id***—Use the DHCP client identifier option (option 61) to identify the client whose binding information is requested.

***group-name***—Specify the name of a group of DHCP local servers to query.

***ipv4-address***—Use the IPv4 address to identify the client whose binding information is requested.

***logical-system***—Specify an optional logical system for the DHCP servers being queried. The default logical system is used by default.

***mac-address***—Use the MAC address to identify the client whose binding information is requested.

***routing-instance***—Specify an optional routing instance for the DHCP servers being queried. The default routing instance is used by default.

**List of Sample Output** [request dhcp relay leasequery on page 1592](#)

**Output Fields** When you enter this command, DHCP relay agent initiates the leasequery operation.

## Sample Output

### request dhcp relay leasequery

```
user@host> request dhcp relay leasequery 192.168.25.25 server-group DHCPgroup-10
```

## request dhcp server reconfigure

**Syntax** `request dhcp server reconfigure (all | address | interface interface-name | logical-system logical-system-name | routing-instance routing-instance-name)`

**Release Information** Command introduced in Junos OS Release 10.0.  
Command introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** Initiate reconfiguration processing for the specified DHCP clients if they are in the bound state. If the clients are in the reconfiguring state, this command has no effect. If the clients are in any state other than bound or reconfiguring, this command has the same effect as the **clear dhcp server binding** command.

When the local server state machine starts the reconfiguration process on a bound client, the client transitions to the reconfiguring state and the local server sends a forcerenew message to the client. Because the client was in the bound state before entering the reconfiguring state, all subscriber (or DHCP client) services, such as forwarding and statistics, continue to work. An exponential back-off timer determines the interval at which the forcerenew message is sent. If the final attempt is unsuccessful, the client is returned to its original state by default. You can optionally include the **clear-on-abort** statement to configure the client to be cleared when reconfiguration fails.

**Options** **all**—Initiate reconfiguration for all DHCP clients.

***address***—Initiate reconfiguration for DHCP client with the specified IP address or MAC address.

**interface *interface-name***—Initiate reconfiguration for all DHCP clients on this logical interface (clients whose initial login requests were received over the specified interface).

**NOTE:** You cannot use the interface *interface-name* option with the **request dhcp server reconfigure** command for DHCP passive clients (clients that are added as a result of DHCP snooped packets). For passive clients, the interface is not guaranteed to be the next-hop interface to the client, as is the case for active clients.

**logical-system *logical-system-name***—Initiate reconfiguration for all DHCP clients on the specified logical system.

**routing-instance *routing-instance-name***—Initiate reconfiguration reconfigured for all DHCP clients in the specified routing instance.

```

## request network-access aaa accounting

<b>Syntax</b>	<code>request network-access aaa accounting (baseline   suspend   resume)</code>
<b>Release Information</b>	Command introduced in Junos OS Release 14.2R1 for MX Series routers.
<b>Description</b>	Suspend accounting processes; determine a baseline of the statistical details while accounting is suspended; and restart accounting operations after baselining is completed. This command is useful in service provider environments when an upgrade of the server infrastructure is critical and needed immediately. RADIUS Acct-Start, Interim-Update, and Acct-Stop messages are not generated while accounting is suspended; the router does not send any accounting messages to the RADIUS server. While accounting is suspended, subscribers can continue to log in and log out.
<b>Options</b>	<p><b>baseline</b>—(Optional) Determine a baseline of accounting statistics for current subscriber sessions. Applies to only those subscribers for which interim accounting is configured. The router implements the baseline by reading and storing the statistics at the time the baseline is set and then subtracting this baseline when you retrieve baseline-relative statistics after accounting resumes.</p> <p><b>resume</b>—Restart the accounting processes for all logged-in subscriber sessions after baselining of statistics completes.</p> <p><b>suspend</b>—Temporarily halt accounting processes for all logged-in subscriber sessions.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring RADIUS Accounting Suspension and Baselining Accounting Statistics on page 157</a></li> <li>• <a href="#">Suspending RADIUS Accounting and Baselining Accounting Statistics Overview on page 153</a></li> </ul>

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Option <b>other-routing-engine</b> introduced in Junos OS Release 8.0.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Option <b>sfc</b> introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Option <b>partition</b> changed to <b>slice</b> in Junos OS Release 10.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Option <b>both-routing-engines</b> introduced in Junos OS Release 12.1.</p>
Description	<p>Reboot the software.</p> <p>This command can be used on standalone devices and on devices supported in a Virtual Chassis, Virtual Chassis Fabric, or QFabric system.</p>

**NOTE:** Starting with Junos OS Release 15.1F3, the statement `request system reboot` reboots only the guest operating system on the PTX5000 with RE-PTX-X8-64G and, MX240, MX480, and MX960 with RE-S-X6-64G.

Starting with Junos OS Release 15.1F5, the statement `request system reboot` reboots only the guest operating system on the MX2010, and MX2020 with REMX2K-X8-64G.

**NOTE:** Starting from Junos OS Release 17.2R1, PTX10008 routers do not support the `request system reboot` command. Starting from Junos OS Release 17.4R1, PTX10016 routers do not support the `request system reboot` command. Use the `request vmhost reboot` command instead of the `request system reboot` command on the PTX10008 and PTX10016 routers to reboot the Junos OS software package or bundle on the router. See *request vmhost reboot*.

**NOTE:** On a QFabric system, to avoid traffic loss on the network Node group, switch mastership of the Routing Engine to the backup Routing Engine, and then reboot.

**Options** The options described here are not all supported on every platform or release of Junos OS. Refer to the Syntax sections for the options commonly available on each type of platform.

**none**—Reboot the software immediately.

**all-chassis**—(Optional) On a TX Matrix router or TX Matrix Plus router, reboot all routers connected to the TX Matrix or TX Matrix Plus router, respectively.

**all-lcc**—(Optional) On a TX Matrix router or TX Matrix Plus router, reboot all line card chassis connected to the TX Matrix or TX Matrix Plus router, respectively.

**all-members | local | member *member-id***—(Optional) Specify which member of the Virtual Chassis to reboot:

- **all-members**—Reboots each switch that is a member of the Virtual Chassis.
- **local**—Reboots only the local switch (switch where you are logged in).
- **member *member-id***—Reboots the specified member switch of the Virtual Chassis

**at *time***—(Optional) Time at which to reboot the software, specified in one of the following ways:

- **now**—Stop or reboot the software immediately. This is the default.
- **+minutes**—Number of minutes from now to reboot the software.
- **yymmddhhmm**—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.
- **hh:mm**—Absolute time on the current day at which to stop the software, specified in 24-hour time.

**both-routing-engines**—(Optional) Reboot both Routing Engines at the same time.

**hypervisor**—(Optional) Reboot Junos OS, host OS, and any installed guest VMs.

**in minutes**—(Optional) Number of minutes from now to reboot the software. This option is an alias for the **at +minutes** option.

**junos**—(Optional) Reboot from the Junos OS (main) volume.

**lcc number**—(Optional) Line-card chassis (LLC) number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**media (compact-flash | disk | removable-compact-flash | usb)**—(Optional) Use the indicated boot medium for the next boot.

**media (external | internal)**—(Optional) Use the indicated boot medium for the next boot:

- **external**—Reboot the device using a software package stored on an external boot source, such as a USB flash drive.
- **internal**—Reboot the device using a software package stored in an internal memory source.

**message "text"**—(Optional) Message to display to all system users before stopping or rebooting the software.

**network**—(Optional) Reboot using the Preboot Execution Environment (PXE) boot method over the network.

**oam**—(Optional) Reboot from the maintenance volume (OAM volume, usually the compact flash drive).

**other-routing-engine**—(Optional) Reboot the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is rebooted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is rebooted.

**partition *partition***—(Optional) Reboot using the specified partition on the boot media. This option is equivalent to the **slice** option that is supported on some devices. Specify one of the following *partition* values:

- **1**—Reboot from partition 1.
- **2**—Reboot from partition 2.
- **alternate**—Reboot from the alternate partition.

**scc**—(Optional) Reboot the Routing Engine on the TX Matrix switch-card chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted.

**sfc *number***—(Optional) Reboot the Routing Engine on the TX Matrix Plus switch-fabric chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted. Replace *number* with 0.

**slice *slice***—(Optional) Reboot using the specified partition on the boot media. This option was originally the **partition** option but was renamed to **slice** on EX Series and QFX Series switches. Specify one of the following *slice* values:

- **1**—Reboot from partition 1.
- **2**—Reboot from partition 2.
- **alternate**—Reboot from the alternate partition (which did not boot the switch at the last bootup).

**NOTE:** The slice option is not supported on QFX Series switches that have no alternate slice when Junos OS boots as a Virtual Machine (VM). To switch to the previous version of Junos OS, issue the **request system software rollback** command.

**usb**—(Optional) Reboot from a USB device.

The following options are available only on QFabric Systems:

**all**—(Optional) Reboots the software on the Director group, fabric control Routing Engines, fabric manager Routing Engines, Interconnect devices, and network and server Node groups.

**director-device *name***—(Optional) Reboots the software on the Director device and the default partition (QFabric CLI).

**director-group**—(Optional) Reboots the software on the Director group and the default partition (QFabric CLI).

**fabric**—(Optional) Reboots the fabric control Routing Engines and the Interconnect devices.

**node-group *name***—(Optional) Reboots the software on a server Node group or a network Node group.

**graceful**—(Optional) Enables the QFabric component to reboot with minimal impact to network traffic. This sub-option is only available for the **all**, **fabric**, and **director-group** options.

**Additional Information** Reboot requests are recorded in the system log files, which you can view with the **show log** command (see *show log*). Also, the names of any running processes that are scheduled to be shut down are changed. You can view the process names with the **show system processes** command (see *show system processes*).

On a TX Matrix or TX Matrix Plus router, if you issue the **request system reboot** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are rebooted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are rebooted.

**NOTE:** Before issuing the **request system reboot** command on a TX Matrix Plus router with no options or the **all-chassis**, **all-lcc**, **lcc *number***, or **sfc** options, verify that master Routing Engine for all routers in the routing matrix are in the same slot number. If the master Routing Engine for a line-card chassis is in a different slot number than the master Routing Engine for a TX Matrix Plus router, the line-card chassis might become logically disconnected from the routing matrix after the **request system reboot** command.

**NOTE:** To reboot a router that has two Routing Engines, reboot the backup Routing Engine (if you have upgraded it) first, and then reboot the master Routing Engine.

**Required Privilege Level** maintenance

**Related Documentation**

- *clear system reboot*
- *request system halt*

- [Routing Matrix with a TX Matrix Plus Router Solutions Page](#)
- `request vmhost reboot`

**List of Sample Output**

- [request system reboot on page 1619](#)
- [request system reboot \(at 2300\) on page 1619](#)
- [request system reboot \(in 2 Hours\) on page 1619](#)
- [request system reboot \(Immediately\) on page 1619](#)
- [request system reboot \(at 1:20 AM\) on page 1619](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system reboot

```
user@host> request system reboot
Reboot the system ? [yes,no] (no)
```

### request system reboot (at 2300)

```
user@host> request system reboot at 2300 message ?Maintenance time!?
Reboot the system ? [yes,no] (no) yes

shutdown: [pid 186]
*** System shutdown message from root@test.example.net ***
System going down at 23:00
```

### request system reboot (in 2 Hours)

The following example, which assumes that the time is 5 PM (17:00), illustrates three different ways to request the system to reboot in two hours:

```
user@host> request system reboot at +120
user@host> request system reboot in 120
user@host> request system reboot at 19:00
```

### request system reboot (Immediately)

```
user@host> request system reboot at now
```

### request system reboot (at 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system reboot at 06060120

request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

## restart extensible-subscriber-services

---

<b>Syntax</b>	restart extensible-subscriber-services
<b>Release Information</b>	Command introduced in Junos OS Release 15.1.
<b>Description</b>	Restart essmd.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">disable on page 999</a></li></ul>

### Sample Output

```
# restart extensible-subscriber-services
```

## show accounting pending-accounting-stops

**Syntax** `show accounting pending-accounting-stops`  
`<detail | terse>`  
`<profile-name>`

**Release Information** Command introduced in Junos OS Release 13.1.

**Description** Display all statistics for all pending accounting stop requests, including both service and session requests.

**Options** **none**—Display information for all access profiles.

**detail | terse**—(Optional) Display the specified level of output.

**profile-name**—(Optional) Particular access profile for which you want to display accounting stop statistics.

**Required Privilege Level** view

**Output Fields** [Table 79 on page 1621](#) lists the output fields for the **show accounting pending-accounting-stops** command. Output fields are listed in the approximate order in which they appear.

*Table 79: show accounting pending-accounting-stops Output Fields*

Field Name	Field Description	Level of Output
Type	Type of client.	All levels
Username	Name of the user logged in to the session.	All levels
Logical system/Routing instance	Logical system and routing instance used for the session.	<b>detail</b> none
Access-profile	Access profile used for AAA services for the session.	<b>detail</b> none

Table 79: show accounting pending-accounting-stops Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Session ID</b>	ID of the subscriber session; generated when the subscriber logs in. In the <b>Service name</b> block, this is the ID of the service session.	All levels
<b>Accounting Session ID</b>	ID of the accounting session (RADIUS attribute 44). The ID appears in decimal or description format, as specified by the <b>accounting-session-id-format</b> statement.	detail none
<b>IP Address</b>	IP address of the subscriber.	detail none
<b>IPv6 Prefix</b>	IPv6 address of the subscriber.	detail none
<b>Authentication State</b>	State of the subscriber authentication session: <b>AuthInit</b> , <b>AuthStart</b> , <b>AuthChallenge</b> , <b>AuthRedirect</b> , <b>AuthClntRespWait</b> , <b>AuthAcctVolStatsAckWait</b> , <b>AuthAcctStopAckWait</b> , <b>AuthServCreateRespWait</b> , <b>AuthLogoutStart</b> , <b>AuthStateActive</b> , <b>AuthClntLogoutRespWait</b> , <b>AuthProfileUpdateWait</b> , <b>AuthProvisionRespWait</b> , <b>AuthProvisionServiceCreationWait</b>	detail none
<b>Accounting State</b>	State of the subscriber accounting session: <b>Acc-Init</b> , <b>Acc-Start-Sent</b> , <b>Imm-Update-Stats-Pending</b> , <b>Acc-Interim-Sent</b> , <b>Acc-Stop-Stats-Pending</b> , <b>Acc-Stop-Sent</b> , <b>Acc-Stop-On-Fail-Deny-Sent</b> , <b>Acc-Stop-Ackd</b>	detail none
<b>Service name</b>	Name of the attached service or policy.	detail none
<b>Service State</b>	State of the service provided in the subscriber session.	detail none
<b>Session uptime</b>	How long the session has been up, in <i>HH:MM:SS</i> .	detail none
<b>Accounting status</b>	Status of the accounting configuration for the service, <b>on</b> or <b>off</b> , and the type of accounting, <b>time</b> or <b>volume+time</b> . Configured in RADIUS Service-Statistics VSA [26-69].	detail none
<b>Service accounting session ID</b>	ID of the service accounting session; RADIUS Acct-Session-Id attribute (44). The ID appears in decimal or description format, as specified by the <b>accounting-session-id-format</b> statement.	detail none
<b>Service accounting state</b>	State of the service accounting session: <b>Acc-Init</b> , <b>Acc-Start-Sent</b> , <b>Imm-Update-Stats-Pending</b> , <b>Acc-Interim-Sent</b> , <b>Acc-Stop-Stats-Pending</b> , <b>Acc-Stop-Sent</b> , <b>Acc-Stop-On-Fail-Deny-Sent</b> , <b>Acc-Stop-Ackd</b>	detail none
<b>Accounting interim interval</b>	Amount of time between interim accounting updates for this service, in seconds; RADIUS Service-Interim-Acct-Interval VSA [26-140] or Diameter Acct-Interim-Interval AVP (85).	detail none

Table 79: show accounting pending-accounting-stops Output Fields (continued)

Field Name	Field Description	Level of Output
Subscriber ID	ID of the subscriber; generated when the subscriber logs in.	<b>detail none</b>
Service ID	ID of the subscriber service.	All levels
Service	Name of the attached service or policy.	<b>terse</b>

## show ancp cos

**Syntax** `show ancp cos`  
`<identifier identifier>`  
`<last-update>`  
`<pending-update>`

**Release Information** Command introduced in Junos OS Release 9.4.

**Description** Display information about the CoS state for subscriber traffic.

**Options** **identifier *identifier***—(Optional) Display information about the local loops for the specified access identifier.

**last-update**—(Optional) Display the most recently updated CoS information.

**pending-update**—(Optional) Display the pending update of CoS information.

**Required Privilege Level** view

**Related Documentation**

- [show ancp neighbor on page 1630](#)
- [show ancp statistics on page 1638](#)
- [show ancp subscriber on page 1643](#)

**List of Sample Output** [show ancp cos on page 1627](#)  
[show ancp cos last-update on page 1628](#)  
[show ancp cos pending-update on page 1629](#)

**Output Fields** [Table 80 on page 1625](#) lists the output fields for the **show ancp cos** command. Output fields are listed in the approximate order in which they appear.

*Table 80: show ancp cos Output Fields*

Field Name	Field Description
Per-DSL CoS adjustment	Adjustment values applied by the ANCP agent to the actual downstream rates and frame overhead for frame-mode DSL types. The agent then reports the adjusted rates to CoS to establish a shaping rate for the CoS node that corresponds to the subscriber access line.
QoS Adjust Flag	State of QoS adjust: <ul style="list-style-type: none"> <li>• <b>TRUE</b>—The ANCP agent is enabled to adjust the actual downstream data rates and frame overhead and report the adjusted values to CoS.</li> <li>• <b>FALSE</b>—The ANCP agent is not enabled to adjust and report values to CoS.</li> </ul>

Table 80: show ancp cos Output Fields (continued)

Field Name	Field Description
<b>ADSL bytes</b>	Number of bytes by which the actual ADSL downstream cell overhead is adjusted before reporting it to CoS.
<b>ADSL2 bytes</b>	Number of bytes by which the actual ADSL2 downstream cell overhead is adjusted before reporting it to CoS.
<b>ADSL2-PLUS bytes</b>	Number of bytes by which the actual ADSL2+ downstream cell overhead is adjusted before reporting it to CoS.
<b>SDSL overhead adjusted</b>	Percentage by which the actual SDSL downstream rate is adjusted before reporting it to CoS.
<b>SDSL bytes</b>	Number of bytes by which the actual SDSL downstream frame overhead is adjusted before reporting it to CoS.
<b>OTHER overhead adjusted</b>	Percentage by which the actual OTHER downstream rate is adjusted before reporting it to CoS.
<b>OTHER bytes</b>	Number of bytes by which the actual OTHER downstream frame overhead is adjusted before reporting it to CoS.
<b>VDSL overhead adjusted</b>	Percentage by which the actual VDSL downstream rate is adjusted before reporting it to CoS.
<b>VDSL bytes</b>	Number of bytes by which the actual VDSL downstream frame overhead is adjusted before reporting it to CoS.
<b>VDSL2 overhead adjusted</b>	Percentage by which the actual VDSL2 downstream rate is adjusted before reporting it to CoS.
<b>VDSL2 bytes</b>	Number of bytes by which the actual VDSL2 downstream frame overhead is adjusted before reporting it to CoS.
<b>Per-DSL adjustment for reporting</b>	Adjustment values applied by the ANCP agent to the actual downstream rates for individual DSL types to account for traffic overhead. The agent then reports the adjusted rates to AAA.
<b>ADSL adjustment factor</b>	Percentage by which the actual ADSL downstream rate is adjusted before reporting it to AAA.
<b>ADSL2 adjustment factor</b>	Percentage by which the actual ADSL2 downstream rate is adjusted before reporting it to AAA.
<b>ADSL2+ adjustment factor</b>	Percentage by which the actual ADSL2+ downstream rate is adjusted before reporting it to AAA.
<b>VDSL adjustment factor</b>	Percentage by which the actual VDSL downstream rate is adjusted before reporting it to AAA.

Table 80: show ancp cos Output Fields (continued)

Field Name	Field Description
<b>VDSL2 adjustment factor</b>	Percentage by which the actual VDSL2 downstream rate is adjusted before reporting it to AAA.
<b>SDSL adjustment factor</b>	Percentage by which the actual SDSL downstream rate is adjusted before reporting it to AAA.
<b>OTHER adjustment factor</b>	Percentage by which the actual OTHER downstream rate is adjusted before reporting it to AAA.
<b>Keepalive Timer</b>	Interval between the keepalive messages that the ANCP agent sends to CoS.
<b>Cos State</b>	State of the interaction between the ANCP agent and CoS: <ul style="list-style-type: none"> <li>• ANCPD_COS_CONNECT_NEEDED</li> <li>• ANCPD_COS_CONNECT_PENDING</li> <li>• ANCPD_COS_CONNECT_DONE</li> <li>• ANCPD_COS_SESSION_SENT</li> <li>• ANCPD_COS_WRITE_READY</li> </ul>
<b>Connect Time</b>	Time at which the ANCP agent connected to CoS; useful for debugging.
<b>Session Time</b>	Time at which the ANCP agent sent a session connect message to CoS; useful for debugging.
<b>Routing Instance Time</b>	Time at which the ANCP agent sent the routing instance to CoS; useful for debugging.
<b>Keepalive Time</b>	Time at which the last keepalive message was sent.
<b>Update Time</b>	Time at which the shaping rate was last updated.
<b>Type</b>	Subscriber access type: <b>ifl</b> indicates that a single VLAN carries subscriber traffic and <b>iflset</b> indicates that a set of VLANs carries subscriber traffic.
<b>Name</b>	System-wide name of the particular subscriber access.
<b>Index</b>	Access identifier.
<b>Pending Update</b>	Actual downstream data rate to be applied next to this local loop, in Kbps.
<b>Last Update</b>	Adjusted downstream data rate last reported to CoS by the ANCP agent for this local loop, in Kbps.

## Sample Output

show ancp cos

```

## show ancp neighbor

Syntax	<pre>show ancp neighbor &lt;brief   detail&gt; &lt;ip-address ip-address&gt; &lt;system-name mac-address&gt;</pre>
Release Information	Command introduced in Junos OS Release 9.4.
Description	Display information about all ANCP neighbors or the specified ANCP neighbor, regardless of operational state.
Options	<p><b>brief   detail</b>—(Optional) Display the specified level of detail.</p> <p><b>ip-address ip-address</b> —(Optional) Display information about the neighbor (access node) specified by the IP address.</p> <p><b>system-name mac-address</b>—(Optional) Display information about the neighbor (access node) specified by the MAC address.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> <li>• <a href="#">show ancp cos on page 1625</a></li> <li>• <a href="#">show ancp subscriber on page 1643</a></li> </ul>
List of Sample Output	<a href="#">show ancp neighbor on page 1633</a> <a href="#">show ancp neighbor detail on page 1634</a> <a href="#">show ancp neighbor ip-address on page 1635</a> <a href="#">show ancp neighbor system-name on page 1636</a>
Output Fields	<a href="#">Table 81 on page 1630</a> lists the output fields for the <b>show ancp neighbor</b> command. Output fields are listed in the approximate order in which they appear.

Table 81: show ancp neighbor Output Fields

Field Name	Field Description	Level of Output
Version	Version of the ANCP implementation: <ul style="list-style-type: none"> <li>• <b>0x31</b>—General Switch Management Protocol (GSMP) version 3, sub-version 1; ANCP version before <i>RFC 6320, Protocol for Access Node Control Mechanism in Broadband Networks</i>.</li> <li>• <b>0x32</b>—ANCP version 1, defined in <i>RFC 6320, Protocol for Access Node Control Mechanism in Broadband Networks</i>.</li> </ul>	<b>brief detail</b> none

Table 81: show ancp neighbor Output Fields (continued)

Field Name	Field Description	Level of Output
IP Address	IP address of the ANCP neighbor.	<b>brief detail</b> none
PartId	Number that associates the ANCP message with a specific partition.	<b>brief</b> none
State	Operational state of the ANCP adjacency: <ul style="list-style-type: none"> <li>Configured—The neighbor has been configured, but has never been in the <b>Established</b> state. An asterisk (*) is prefixed to the neighbor entry for this state.</li> <li>Establishing—Adjacency negotiations are in progress for the neighbor. An asterisk (*) is prefixed to the neighbor entry for this state. This state is rarely seen because the adjacency is established so quickly.</li> <li><b>Established</b>—Adjacency negotiations have succeeded for the neighbor and an ANCP session has been established.</li> <li>Not Estblshed—Not Established; adjacency negotiations are ready to begin. Indicates that this neighbor previously had been in the <b>Established</b> state; that is, it has lost a previously established adjacency. An asterisk (*) is prefixed to the neighbor entry for this state.</li> </ul>	All levels
Time	How long the adjacency has been up in one of the following formats: <ul style="list-style-type: none"> <li><i>nwndnh</i>—number of weeks, days, and hours</li> <li><i>nd hh:mm:ss</i>—number of days, hours, minutes, and seconds</li> </ul>	<b>brief detail</b> none
Subscriber Count	Number of subscribers associated with the ANCP neighbor (access local loop).	<b>brief</b> none
Capabilities	Negotiated ANCP capability: <ul style="list-style-type: none"> <li><b>Topo</b>—Topology discovery.</li> <li><b>OAM</b>—Performance of local Operations Administration Maintenance (OAM) procedures on an access loop controlled by the router.</li> </ul>	All levels
System Name	MAC address of the ANCP neighbor.	<b>detail</b>
TCP Port	TCP port on which ANCP messages are exchanged.	<b>detail</b>
System Instance	Number identifying the ANCP link instance from the edge device's perspective.	<b>detail</b>
Peer Instance	Number identifying the ANCP instance from the access node's perspective. This number is unique and changes when the node or link comes back up after going down.	<b>detail</b>
Timer	Adjacency timer value advertised by the ANCP peer in 100 ms increments; the interval between ANCP ACK messages. This value remains constant for the duration of an ANCP session.	<b>detail</b>

Table 81: show ancp neighbor Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Partition Type</b>	Number that identifies whether partitions are used and how the ID is negotiated: <ul style="list-style-type: none"> <li>0—No partition.</li> <li>1—Fixed partition requested.</li> <li>2—Fixed partition assigned.</li> </ul>	<b>detail</b>
<b>Partition Flag</b>	Number that specifies the type of partition requested: 1 (new adjacency) or 2 (recovered adjacency).	<b>detail</b>
<b>Partition Identifier</b>	Number that identifies a logical partition of an access node with which the ANCP agent has formed an adjacency.  A value of zero indicates that the agent supports each neighbor on an IP address over a single TCP session with a partition ID of zero. This is the default support case.  A nonzero value indicates that the agent supports each neighbor on an IP address over a single TCP session with a nonzero partition ID.	<b>detail</b>
<b>Partition Adjacencies</b>	Number of adjacencies that share the partition.	<b>detail</b>
<b>Dead Timer</b>	Remaining period that the edge device waits for adjacency packets from a neighbor before declaring the neighbor to be down. The maximum dead time value is three times the configured adjacency timer value. This field displays the current value based on the time that the last adjacency packet was received.	<b>detail</b>
<b>Received Syn Count</b>	Number of synchronization messages received from neighbors to maintain adjacencies.	<b>detail</b>
<b>Received Synack Count</b>	Number of synchronization acknowledgment messages received from neighbors in response to the node's synchronization messages.	<b>detail</b>
<b>Received Rstack Count</b>	Number of messages received from neighbors indicating that the link to the neighbor needs to be reset.	<b>detail</b>
<b>Received Ack Count</b>	Number of acknowledgment messages periodically received from neighbors after an adjacency has been established.	<b>detail</b>
<b>Received Port Up Count</b>	Number of status messages received from neighbors indicating that a port has transitioned to the up state.	<b>detail</b>
<b>Received Port Down Count</b>	Number of status messages received from neighbors indicating that a port has transitioned to the down state.	<b>detail</b>
<b>Received Generic Resp Count</b>	Number of generic response messages received from neighbors.	<b>detail</b>
<b>Received Adjacency Update Count</b>	Number of adjacency update messages received from neighbors.	<b>detail</b>
<b>Received OAM Count</b>	Number of OAM responses received from neighbors in reply to <b>request</b> commands.	<b>detail</b>

Table 81: show ancp neighbor Output Fields (continued)

Field Name	Field Description	Level of Output
Received Other Count	Number of all other ANCP message packets received from neighbors that do not fit into one of the other categories.	detail
Sent Syn Count	Number of synchronization messages sent to neighbors to maintain adjacencies.	detail
Sent Synack Count	Number of synchronization acknowledgment messages sent to neighbors in response to the their synchronization messages.	detail
Sent Rstack Count	Number of messages sent to neighbors indicating that the link to the neighbor needs to be reset.	detail
Sent Ack Count	Number of acknowledgment messages periodically sent to neighbors after an adjacency has been established.	detail
Sent Generic Resp Count	Number of generic response messages sent to neighbors.	detail
Sent OAM Count	Number of OAM <b>request</b> commands sent to neighbors.	detail
Max Discovery Limit Exceed Count	Number of times that the maximum number of discovery table entries accepted from the neighbor has been exceeded.	detail
Result Codes	<p>Number of generic response messages sent to neighbors that include each of the following result codes:</p> <ul style="list-style-type: none"> <li>• <b>Invalid Request Message Count</b>—A properly formed request message violated the protocol because of timing (such as a race condition) or direction of transmission.</li> <li>• <b>Specified Port(s) Down Count</b>—One or more of the specified ports are down because of a state mismatch between the router and an ANCP control application.</li> <li>• <b>Out of Resources Count</b>—ANCP is out of resources, probably not related to the access lines. This result code is sent only by an access node.</li> <li>• <b>Request Msg Not Implemented Count</b>—</li> <li>• <b>Malformed Msg Count</b>—Message is malformed because it was corrupted in transit or there was an implementation error at either end of the connection.</li> <li>• <b>TLV Missing Count</b>—One or more mandatory TLVs was missing from a request.</li> <li>• <b>Invalid TLV Contents Count</b>—The contents of one or more TLVs in the request do not match its required specification.</li> <li>• <b>Non-Existent Port(s) Count</b>—One or more of the ports specified in a request do not exist, possibly because of a configuration mismatch between the access node and the router or AAA.</li> </ul>	detail

## show ancp statistics

**Syntax** `show ancp statistics`  
`<ip-address ip-address>`  
`<system-name mac-address>`

**Release Information** Command introduced in Junos OS Release 13.3.

**Description** Display statistics for all ANCP neighbors (access nodes) or the specified ANCP neighbor.

**Options** **none**—Display statistics for all ANCP neighbors, including global statistics not show for individual neighbors.

**ip-address *ip-address***—(Optional) Display statistics for only the neighbor with the specified IP address.

**system-name *mac-address***—(Optional) Display statistics for only the neighbor with the specified MAC address.

**Required Privilege Level** view

**Related Documentation**

- [show ancp subscriber on page 1643](#)

**List of Sample Output** [show ancp statistics on page 1640](#)  
[show ancp statistics ip-address on page 1641](#)  
[show ancp statistics system-name on page 1641](#)

**Output Fields** [Table 82 on page 1638](#) lists the output fields for the **show ancp statistics** command. Output fields are listed in the approximate order in which they appear.

*Table 82: show ancp statistics Output Fields*

Field Name	Field Description
Number of neighbors	Total count of ANCP neighbors.
Number of subscribers	Total count of ANCP subscribers.
Accept Count	Number of neighbor TCP/IP sessions accepted on listener socket.

*Table 82: show ancp statistics Output Fields (continued)*

Field Name	Field Description
<b>Accept Fail Count</b>	Number of neighbor TCP/IP sessions that failed due to one of the following causes: session already exists, maximum number of ANCP connections exceeded, creation of session or neighbor failed, or protocol start failed.
<b>No Config Accept Deny Count</b>	Number of neighbor TCP/IP sessions that failed because the neighbor was not configured.
<b>Received Syn Count</b>	Number of synchronization messages received from neighbors to maintain adjacencies.
<b>Received Synack Count</b>	Number of synchronization acknowledgment messages received from neighbors in response to the node's synchronization messages.
<b>Received Rstack Count</b>	Number of messages received from neighbors indicating that the link to the neighbor needs to be reset.
<b>Received Ack Count</b>	Number of acknowledgment messages periodically received from neighbors after an adjacency has been established.
<b>Received Port Up Count</b>	Number of status messages received from neighbors indicating that a port has transitioned to the up state.
<b>Received Port Down Count</b>	Number of status messages received from neighbors indicating that a port has transitioned to the down state.
<b>Received Generic Resp Count</b>	Number of generic response messages received from neighbors.
<b>Received Adjacency Update Count</b>	Number of adjacency update messages received from neighbors.
<b>Received OAM Count</b>	Number of OAM responses received from neighbors in reply to <b>request</b> commands.
<b>Received Other Count</b>	Number of all other ANCP message packets received from neighbors that do not fit into one of the other categories.
<b>Sent Syn Count</b>	Number of synchronization messages sent to neighbors to maintain adjacencies.
<b>Sent Synack Count</b>	Number of synchronization acknowledgment messages sent to neighbors in response to the their synchronization messages.
<b>Sent Rstack Count</b>	Number of messages sent to neighbors indicating that the link to the neighbor needs to be reset.
<b>Sent Ack Count</b>	Number of acknowledgment messages periodically sent to neighbors after an adjacency has been established.
<b>Sent Generic Resp Count</b>	Number of generic response messages sent to neighbors.

Table 82: show ancpl statistics Output Fields (continued)

Field Name	Field Description
Sent OAM Count	Number of OAM request commands sent to neighbors.
Result Codes	<p>Number of generic response messages sent to neighbors that include each of the following result codes:</p> <ul style="list-style-type: none"> <li>• <b>Invalid Request Message Count</b>—A properly formed request messages violated the protocol because of timing (such as a race condition) or direction of transmission.</li> <li>• <b>Specified Port(s) Down Count</b>—One or more of the specified ports are down because of a state mismatch between the router and an ANCP control application.</li> <li>• <b>Out of Resources Count</b>—the ANCP agent is out of resources, probably not related to the access lines. ## show ancp subscriber

<b>Syntax</b>	<pre>show ancp subscriber &lt;brief   detail&gt; &lt;access-aggregation-circuit-id <i>circuit-identifier</i>&gt; &lt;identifier <i>identifier</i>&gt; &lt;ip-address <i>ip-address</i>&gt; &lt;system-name <i>mac-address</i>&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.4.</p> <p><b>neighbor</b> option replaced with <b>ip-address</b> in Junos OS Release 16.1.</p> <p><b>system-name</b> option introduced in Junos OS Release 16.1.</p> <p><b>access-aggregation-circuit-id</b> option introduced in Junos OS Release 18.4R1.</p>
<b>Description</b>	<p>Display information about active subscribers regardless of the subscriber's operational state, for all subscribers (local access loops), the subscriber associated with the access line specified by an ACI, or the subscriber associated with the specified ANCP neighbor (access node).</p> <p>After an ancpd restart, this command displays orphaned entries (marked with an <b>o</b>) for subscriber sessions that were established before the restart but which have not yet been reestablished. As sessions are reestablished, the number of orphaned entries displayed by the command decreases. The number reaches zero when all sessions are reestablished or when the orphaned-interface timer expires.</p>
<b>Options</b>	<p><b>none</b>—Display information about all subscribers.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of detail.</p> <p><b>access-aggregation-circuit-id <i>circuit-identifier</i></b>—(Optional) Display information about ANCP subscribers whose Access-Aggregation-Circuit-ID-ASCII attribute (TLV 0x0003) matches the specified value.</p> <p>A <i>circuit-identifier</i> that begins with the <b>#</b> character indicates a backhaul line identifier. You can specify a wildcard (*) anywhere in the string.</p> <p><b>identifier <i>identifier</i></b>—(Optional) Display information about the subscriber associated with the access line (ACI) specified by the access identifier.</p> <p><b>ip-address <i>ip-address</i></b>—(Optional) Display information about the subscribers connected to the access node specified by the IP address.</p> <p><b>system-name <i>mac-address</i></b>—(Optional) Display information about the subscribers connected to the access node specified by the MAC address.</p>

- Output Fields** Table 83 on page 1644 lists the output fields for the **show ancp subscriber** command. Output fields are listed in the approximate order in which they appear.

*Table 83: show ancp subscriber Output Fields*

Field Name	Field Description	Level of Output
<b>Loop Identifier</b>	<p>Access loop identifier as sent by the access node and configured to map the subscriber to an interface.</p> <p>An asterisk (*) indicates that the information might be stale due to receiving a Port Down message with a DSL Line State of Idle.</p> <p>Two asterisks (**) indicate that the neighbor associated with the subscriber has lost its adjacency. In this case, the DSL Line State might be Established.</p> <p>An <b>o</b> indicates that the entry is for an orphaned interface and represents a previously established subscriber session that has not been reestablished after an ancpd restart.</p> <p>The number of orphaned entries decreases as the ANCP neighbors reestablish adjacencies and the protocol subscriber sessions are reestablished. The command output indicates this by removing the <b>o</b> marker.</p> <p>Eventually the number of orphaned entries reaches zero, because either all the adjacencies and subscriber sessions have been reestablished or any remaining orphaned entries are removed when the orphaned-interface timer expires.</p>	<b>brief none</b>
<b>DSL Line State</b>	State of the DSL line: <b>Idle</b> , <b>Showtime</b> , or <b>Silent</b> .	<b>brief detail</b>
<b>Access Type</b>	Type of access line employed by the access node: <b>ADSL1</b> , <b>ADSL2</b> , <b>ADSL2+</b> , <b>VDSL1</b> , <b>VDSL2</b> , <b>SDSL</b> , <b>G.fast</b> , <b>VDSL2 Annex Q</b> , <b>SDSL bonded</b> , <b>VDSL2 bonded</b> , <b>G.fast bonded</b> <b>VDSL2 Annex Q bonded</b> or <b>OTHER</b> .	<b>brief detail none</b>
<b>Interface</b>	Name of the interface set or logical interface.	<b>brief detail none</b>

Table 83: show ancp subscriber Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Rate Kbps</b>	Actual downstream data rate for this local loop.	<b>brief none</b>
<b>Neighbor</b>	IP address of ANCP neighbor (access node).	<b>brief none</b>
<b>Access Loop Circuit Identifier</b>	<p>Access loop circuit identifier as sent by the access node and configured to map the subscriber to an interface.</p> <p>An asterisk (*) indicates that the information might be stale due to receiving a Port Down message with a DSL Line State of Idle.</p> <p>Two asterisks (**) indicate that the neighbor associated with the subscriber has lost its adjacency. In this case, the DSL Line State might be Established.</p>	<b>detail</b>
<b>Neighbor IP Address</b>	IP address of the ANCP neighbor (access node).	<b>detail</b>
<b>Aggregate Circuit Identifier</b>	ASCII identifier for the subscriber access loop; value of the Access-Aggregation-Circuit-ID-ASCII attribute (TLV 0x0003).	<b>detail</b>
<b>Aggregate Circuit Identifier Binary</b>	Binary identifier for the VLAN circuit ID.	<b>detail</b>
<b>Tech Type</b>	Type of technology employed by the subscriber. Currently Junos OS supports <b>DSL</b> technology type only.	<b>detail</b>
<b>DSL Line Data Link</b>	Data link protocol employed on the access loop: <b>AAL5</b> or <b>Ethernet</b> .	<b>detail</b>
<b>DSL Line Encapsulation</b>	<p>Encapsulation type on the access loop, for Ethernet only:</p> <ul style="list-style-type: none"> <li>0—NA, type not conveyed</li> <li>1—Untagged Ethernet</li> <li>2—Single-tagged Ethernet</li> </ul>	<b>detail</b>
<b>DSL Line Encapsulation Payload</b>	<p>Payload carried across the access loop:</p> <ul style="list-style-type: none"> <li>0—NA, type not conveyed</li> <li>1—PPPoA LLC</li> <li>2—PPPoA null</li> <li>3—IPoA LLC</li> <li>4—IPoA null</li> <li>5—Ethernet over AAL5 LLC with FCS</li> <li>6—Ethernet over AAL5 LLC without FCS</li> <li>7—Ethernet over AAL5 null with FCS</li> <li>8—Ethernet over AAL5 null without FCS</li> </ul>	<b>detail</b>

Table 83: show ancp subscriber Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Interface Type</b>	Type of interface employed for subscriber traffic: ifl for a single VLAN or <b>interface-set</b> for a configured group of VLANs.	<b>detail</b>
<b>Actual Net Data Upstream</b>	Actual upstream data rate for this local loop, in Kbps.	<b>detail</b>
<b>Actual Net Data Downstream</b>	Actual downstream data rate for this local loop, in Kbps.	<b>detail</b>
<b>Minimum Net Data Upstream</b>	Minimum upstream data rate desired by the operator for this local loop, in Kbps.	<b>detail</b>
<b>Minimum Net Data Downstream</b>	Minimum downstream data rate desired by the operator for this local loop, in Kbps.	<b>detail</b>
<b>Maximum Net Data Upstream</b>	Maximum upstream data rate desired by the operator for this local loop, in Kbps.	<b>detail</b>
<b>Maximum Net Data Downstream</b>	Maximum downstream data rate desired by the operator for this local loop, in Kbps.	<b>detail</b>
<b>Attainable Net Data Upstream</b>	Maximum attainable upstream data rate for this local loop, in Kbps.	<b>detail</b>
<b>Attainable Net Data Downstream</b>	Maximum attainable downstream data rate for this local loop, in Kbps.	<b>detail</b>
<b>Minimum Low Power Data Downstream</b>	Minimum downstream data rate desired by the operator for this local loop in low power state, in Kbps.	<b>detail</b>
<b>Minimum Low Power Data Upstream</b>	Minimum upstream data rate desired by the operator for this local loop in low power state, in Kbps.	<b>detail</b>
<b>Maximum Interleave Delay Downstream</b>	Maximum interleaving delay for downstream data, in milliseconds.	<b>detail</b>
<b>Maximum Interleave Delay Upstream</b>	Maximum interleaving delay for upstream data, in milliseconds.	<b>detail</b>
<b>Actual Interleave Delay Downstream</b>	Actual interleaving delay for downstream data, in milliseconds.	<b>detail</b>
<b>Actual Interleave Delay Upstream</b>	Actual interleaving delay for upstream data, in milliseconds.	<b>detail</b>

## show ancp summary

<b>Syntax</b>	show ancp summary
<b>Release Information</b>	Command introduced in Junos OS Release 13.1.
<b>Description</b>	Display a summary of the counts and states for all ANCP neighbors and subscribers.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show ancp neighbor on page 1630</a></li> <li>• <a href="#">show ancp summary neighbor on page 1652</a></li> <li>• <a href="#">show ancp subscriber on page 1643</a></li> <li>• <a href="#">show ancp summary subscriber on page 1654</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ancp summary on page 1651</a>
<b>Output Fields</b>	Table 84 on page 1650 lists the output fields for the <b>show ancp summary</b> command. Output fields are listed in the approximate order in which they appear.

*Table 84: show ancp summary Output Fields*

Field Name	Field Description
<b>Configured</b>	Number of ANCP neighbors in the <b>Configured</b> state; that is, that have been configured but never established.
<b>Establishing</b>	Number of ANCP neighbors in the <b>Establishing</b> state; that is, where negotiations are in progress.
<b>Established</b>	Number of ANCP neighbors in the <b>Established</b> state; that is, where negotiations have succeeded and the ANCP session has been established.
<b>Not Estblshd</b>	Number of ANCP neighbors in the <b>Not Estblshd</b> state; that is, that have lost a previously established adjacency and are ready to begin negotiations.
<b>Total</b>	Total number of ANCP neighbors; sum of neighbors in the <b>Configured</b> , <b>Establishing</b> , <b>Established</b> , and <b>Not Estblshd</b> states.
<b>Showtime</b>	Number of DSL lines in <b>Showtime</b> state.
<b>Idle</b>	Number of DSL lines in <b>Idle</b> state.

Table 84: show ancp summary Output Fields (continued)

Field Name	Field Description
<b>Silent</b>	Number of DSL lines in <b>Silent</b> state.
<b>Unknown</b>	Number of DSL lines where the state is not <b>Showtime</b> , <b>Idle</b> , or <b>Silent</b> .
<b>Total</b>	Total number of DSL lines (ANCP subscribers); sum of DSL lines in the <b>Showtime</b> , <b>Idle</b> , <b>Silent</b> , and <b>Unknown</b> states.

## Sample Output

### show ancp summary

```
user@host> show ancp summary
```

#### Neighbors Summary:

Configured	Establishing	Established	Not Established	Total
22	0	2	0	24

#### Subscribers Summary:

## show class-of-service interface

**Syntax** `show class-of-service interface  
<comprehensive | detail> <interface-name>`

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Forwarding class map information added in Junos OS Release 9.4.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.  
 Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport routers.  
 Command introduced in Junos OS Release 12.2 for the ACX Series Universal Metro routers.  
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.  
 Options **detail** and **comprehensive** introduced in Junos OS Release 11.4.  
 Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.

**Description** Display the logical and physical interface associations for the classifier, rewrite rules, and scheduler map objects.

**NOTE:** On routing platforms with dual Routing Engines, running this command on the backup Routing Engine, with or without any of the available options, is not supported and produces the following error message:

**error: the class-of-service subsystem is not running**

**Options** **none**—Display CoS associations for all physical and logical interfaces.

**comprehensive**—(M Series, MX Series, and T Series routers) (Optional) Display comprehensive quality-of-service (QoS) information about all physical and logical interfaces.

**detail**—(M Series, MX Series, and T Series routers) (Optional) Display QoS and CoS information based on the interface.

If the **interface** *interface-name* is a physical interface, the output includes:

- Brief QoS information about the physical interface
- Brief QoS information about the logical interface
- CoS information about the physical interface
- Brief information about filters or policers of the logical interface
- Brief CoS information about the logical interface

If the **interface** *interface-name* is a logical interface, the output includes:

- Brief QoS information about the logical interface
- Information about filters or policers for the logical interface
- CoS information about the logical interface

**interface-name**—(Optional) Display class-of-service (CoS) associations for the specified interface.

**none**—Display CoS associations for all physical and logical interfaces.

**NOTE:** ACX5000 routers do not support classification on logical interfaces and therefore do not show CoS associations for logical interfaces with this command.

**Output Fields** [Table 87 on page 1657](#) describes the output fields for the **show class-of-service interface** command. Output fields are listed in the approximate order in which they appear.

*Table 87: show class-of-service interface Output Fields*

Field Name	Field Description
Physical interface	Name of a physical interface.
Index	Index of this interface or the internal index of this object.  (Enhanced subscriber management for MX Series routers) Index values for dynamic CoS traffic control profiles and dynamic scheduler maps are larger for enhanced subscriber management than they are for legacy subscriber management.

Table 87: show class-of-service interface Output Fields (continued)

Field Name	Field Description
<b>Dedicated Queues</b>	<p>Status of dedicated queues configured on an interface. Supported only on Trio MPC/MIC interfaces on MX Series routers.</p> <p>(Enhanced subscriber management for MX-Series routers) This field is not displayed for enhanced subscriber management.</p>
<b>Maximum usable queues</b>	Number of queues you can configure on the interface.
<b>Maximum usable queues</b>	Maximum number of queues you can use.
<b>Total non-default queues created</b>	<p>Number of queues created in addition to the default queues. Supported only on Trio MPC/MIC interfaces on MX Series routers.</p> <p>(Enhanced subscriber management for MX Series routers) This field is not displayed for enhanced subscriber management.</p>
<b>Rewrite Input IEEE Code-point</b>	(QFX3500 switches only) IEEE 802.1p code point (priority) rewrite value. Incoming traffic from the Fibre Channel (FC) SAN is classified into the forwarding class specified in the native FC interface (NP_Port) fixed classifier and uses the priority specified as the IEEE 802.1p rewrite value.
<b>Shaping rate</b>	Maximum transmission rate on the physical interface. You can configure the shaping rate on the physical interface, or on the logical interface, but not on both. Therefore, the <b>Shaping rate</b> field is displayed for either the physical interface or the logical interface.
<b>Scheduler map</b>	<p>Name of the output scheduler map associated with this interface.</p> <p>(Enhanced subscriber management for MX Series routers) The name of the dynamic scheduler map object is associated with a generated UID (for example, <b>SMAP-1_UID1002</b>) instead of with a subscriber interface.</p>
<b>Scheduler map forwarding class sets</b>	(QFX Series only) Name of the output fabric scheduler map associated with a QFabric system Interconnect device interface.
<b>Input shaping rate</b>	For Gigabit Ethernet IQ2 PICs, maximum transmission rate on the input interface.
<b>Input scheduler map</b>	For Gigabit Ethernet IQ2 PICs, name of the input scheduler map associated with this interface.
<b>Chassis scheduler map</b>	Name of the scheduler map associated with the packet forwarding component queues.
<b>Rewrite</b>	Name and type of the rewrite rules associated with this interface.
<b>Traffic-control-profile</b>	<p>Name of the associated traffic control profile.</p> <p>(Enhanced subscriber management for MX Series routers) The name of the dynamic traffic control profile object is associated with a generated UID (for example, <b>TC_PROF_100_199_SERIES_UID1006</b>) instead of with a subscriber interface.</p>
<b>Classifier</b>	Name and type of classifiers associated with this interface.

Table 87: *show class-of-service interface Output Fields (continued)*

Field Name	Field Description
<b>Forwarding-class-map</b>	Name of the forwarding map associated with this interface.
<b>Congestion-notification</b>	(QFX Series and EX4600 switches only) Congestion notification state, <b>enabled</b> or <b>disabled</b> .
<b>Logical interface</b>	Name of a logical interface.
<b>Object</b>	Category of an object: <b>Classifier</b> , <b>Fragmentation-map</b> (for LSQ interfaces only), <b>Scheduler-map</b> , <b>Rewrite</b> , <b>Translation Table</b> (for IQE PICs only), or <b>traffic-class-map</b> (for T4000 routers with Type 5 FPCs).
<b>Name</b>	Name of an object.
<b>Type</b>	Type of an object: <b>dscp</b> , <b>dscp-ipv6</b> , <b>exp</b> , <b>ieee-802.1</b> , <b>ip</b> , <b>inet-precedence</b> , or <b>ieee-802.1ad</b> (for traffic class map on T4000 routers with Type 5 FPCs)..
<b>Link-level type</b>	Encapsulation on the physical interface.
<b>MTU</b>	MTU size on the physical interface.
<b>Speed</b>	Speed at which the interface is running.
<b>Loopback</b>	Whether loopback is enabled and the type of loopback.
<b>Source filtering</b>	Whether source filtering is enabled or disabled.
<b>Flow control</b>	Whether flow control is enabled or disabled.
<b>Auto-negotiation</b>	(Gigabit Ethernet interfaces) Whether autonegotiation is enabled or disabled.
<b>Remote-fault</b>	(Gigabit Ethernet interfaces) Remote fault status. <ul style="list-style-type: none"> <li>• <b>Online</b>—Autonegotiation is manually configured as online.</li> <li>• <b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul>

Table 87: show class-of-service interface Output Fields (continued)

Field Name	Field Description
<b>Device flags</b>	<p>The <b>Device flags</b> field provides information about the physical device and displays one or more of the following values:</p> <ul style="list-style-type: none"> <li>• <b>Down</b>—Device has been administratively disabled.</li> <li>• <b>Hear-Own-Xmit</b>—Device receives its own transmissions.</li> <li>• <b>Link-Layer-Down</b>—The link-layer protocol has failed to connect with the remote endpoint.</li> <li>• <b>Loopback</b>—Device is in physical loopback.</li> <li>• <b>Loop-Detected</b>—The link layer has received frames that it sent, thereby detecting a physical loopback.</li> <li>• <b>No-Carrier</b>—On media that support carrier recognition, no carrier is currently detected.</li> <li>• <b>No-Multicast</b>—Device does not support multicast traffic.</li> <li>• <b>Present</b>—Device is physically present and recognized.</li> <li>• <b>Promiscuous</b>—Device is in promiscuous mode and recognizes frames addressed to all physical addresses on the media.</li> <li>• <b>Quench</b>—Transmission on the device is quenched because the output buffer is overflowing.</li> <li>• <b>Recv-All-Multicasts</b>—Device is in multicast promiscuous mode and therefore provides no multicast filtering.</li> <li>• <b>Running</b>—Device is active and enabled.</li> </ul>
<b>Interface flags</b>	<p>The <b>Interface flags</b> field provides information about the physical interface and displays one or more of the following values:</p> <ul style="list-style-type: none"> <li>• <b>Admin-Test</b>—Interface is in test mode and some sanity checking, such as loop detection, is disabled.</li> <li>• <b>Disabled</b>—Interface is administratively disabled.</li> <li>• <b>Down</b>—A hardware failure has occurred.</li> <li>• <b>Hardware-Down</b>—Interface is nonfunctional or incorrectly connected.</li> <li>• <b>Link-Layer-Down</b>—Interface keepalives have indicated that the link is incomplete.</li> <li>• <b>No-Multicast</b>—Interface does not support multicast traffic.</li> <li>• <b>No-receive No-transmit</b>—Passive monitor mode is configured on the interface.</li> <li>• <b>Point-To-Point</b>—Interface is point-to-point.</li> <li>• <b>Pop all MPLS labels from packets of depth</b>—MPLS labels are removed as packets arrive on an interface that has the <b>pop-all-labels</b> statement configured. The depth value can be one of the following: <ul style="list-style-type: none"> <li>• <b>1</b>—Takes effect for incoming packets with one label only.</li> <li>• <b>2</b>—Takes effect for incoming packets with two labels only.</li> <li>• <b>[ 1 2 ]</b>—Takes effect for incoming packets with either one or two labels.</li> </ul> </li> <li>• <b>Promiscuous</b>—Interface is in promiscuous mode and recognizes frames addressed to all physical addresses.</li> <li>• <b>Recv-All-Multicasts</b>—Interface is in multicast promiscuous mode and provides no multicast filtering.</li> <li>• <b>SNMP-Traps</b>—SNMP trap notifications are enabled.</li> <li>• <b>Up</b>—Interface is enabled and operational.</li> </ul>

Table 87: show class-of-service interface Output Fields (continued)

Field Name	Field Description
<b>Flags</b>	<p>The <b>Logical interface flags</b> field provides information about the logical interface and displays one or more of the following values:</p> <ul style="list-style-type: none"> <li>• <b>ACFC Encapsulation</b>—Address control field Compression (ACFC) encapsulation is enabled (negotiated successfully with a peer).</li> <li>• <b>Device-down</b>—Device has been administratively disabled.</li> <li>• <b>Disabled</b>—Interface is administratively disabled.</li> <li>• <b>Down</b>—A hardware failure has occurred.</li> <li>• <b>Clear-DF-Bit</b>—GRE tunnel or IPsec tunnel is configured to clear the Don't Fragment (DF) bit.</li> <li>• <b>Hardware-Down</b>—Interface protocol initialization failed to complete successfully.</li> <li>• <b>PFC</b>—Protocol field compression is enabled for the PPP session.</li> <li>• <b>Point-To-Point</b>—Interface is point-to-point.</li> <li>• <b>SNMP-Traps</b>—SNMP trap notifications are enabled.</li> <li>• <b>Up</b>—Interface is enabled and operational.</li> </ul>
<b>Encapsulation</b>	Encapsulation on the logical interface.
<b>Admin</b>	Administrative state of the interface ( <b>Up</b> or <b>Down</b> )
<b>Link</b>	Status of physical link ( <b>Up</b> or <b>Down</b> ).
<b>Proto</b>	Protocol configured on the interface.
<b>Input Filter</b>	Names of any firewall filters to be evaluated when packets are received on the interface, including any filters attached through activation of dynamic service.
<b>Output Filter</b>	Names of any firewall filters to be evaluated when packets are transmitted on the interface, including any filters attached through activation of dynamic service.
<b>Link flags</b>	<p>Provides information about the physical link and displays one or more of the following values:</p> <ul style="list-style-type: none"> <li>• <b>ACFC</b>—Address control field compression is configured. The Point-to-Point Protocol (PPP) session negotiates the ACFC option.</li> <li>• <b>Give-Up</b>—Link protocol does not continue connection attempts after repeated failures.</li> <li>• <b>Loose-LCP</b>—PPP does not use the Link Control Protocol (LCP) to indicate whether the link protocol is operational.</li> <li>• <b>Loose-LMI</b>—Frame Relay does not use the Local Management Interface (LMI) to indicate whether the link protocol is operational.</li> <li>• <b>Loose-NCP</b>—PPP does not use the Network Control Protocol (NCP) to indicate whether the device is operational.</li> <li>• <b>Keepalives</b>—Link protocol keepalives are enabled.</li> <li>• <b>No-Keepalives</b>—Link protocol keepalives are disabled.</li> <li>• <b>PFC</b>—Protocol field compression is configured. The PPP session negotiates the PFC option.</li> </ul>
<b>Hold-times</b>	Current interface hold-time up and hold-time down, in milliseconds.
<b>CoS queues</b>	Number of CoS queues configured.

Table 87: show class-of-service interface Output Fields (continued)

Field Name	Field Description
<b>Last flapped</b>	Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .
<b>Statistics last cleared</b>	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>
<b>Exclude Overhead Bytes</b>	<p>Exclude the counting of overhead bytes from aggregate queue statistics.</p> <ul style="list-style-type: none"> <li>• <b>Disabled</b>—Default configuration. Includes the counting of overhead bytes in aggregate queue statistics.</li> <li>• <b>Enabled</b>—Excludes the counting of overhead bytes from aggregate queue statistics for just the physical interface.</li> <li>• <b>Enabled for hierarchy</b>—Excludes the counting of overhead bytes from aggregate queue statistics for the physical interface as well as all child interfaces, including logical interfaces and interface sets.</li> </ul>
<b>IPv6 transit statistics</b>	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.
<b>Input errors</b>	<p>Input errors on the interface. The labels are explained in the following list:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant threshold.</li> <li>• <b>Bucket Drops</b>—Drops resulting from the traffic load exceeding the interface transmit or receive leaky bucket configuration.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. Layer 3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>HS link FIFO overflows</b>—Number of FIFO overflows on the high-speed links between the ASICs responsible for handling the router interfaces.</li> </ul>

Table 87: show class-of-service interface Output Fields (continued)

Field Name	Field Description
<b>Output errors</b>	<p>Output errors on the interface. The labels are explained in the following list:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the <b>Drops</b> field does not always use the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> <ul style="list-style-type: none"> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>HS link FIFO underflows</b>—Number of FIFO underflows on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeds the MTU of the interface.</li> </ul>
<b>Egress queues</b>	Total number of egress Maximum usable queues on the specified interface.
<b>Queue counters</b>	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the <b>Dropped packets</b> field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p>
<b>SONET alarms</b> <b>SONET defects</b>	<p>(SONET) SONET media-specific alarms and defects that prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: <b>SONET PHY</b>, <b>SONET section</b>, <b>SONET line</b>, and <b>SONET path</b>.</p>
<b>SONET PHY</b>	<p>Counts of specific SONET errors with detailed information.</p> <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Number of seconds the defect has been active.</li> <li>• <b>Count</b>—Number of times that the defect has gone from inactive to active.</li> <li>• <b>State</b>—State of the error. A state other than <b>OK</b> indicates a problem.</li> </ul> <p>The <b>SONET PHY</b> field has the following subfields:</p> <ul style="list-style-type: none"> <li>• <b>PLL Lock</b>—Phase-locked loop</li> <li>• <b>PHY Light</b>—Loss of optical signal</li> </ul>

Table 87: show class-of-service interface Output Fields (continued)

Field Name	Field Description
<b>SONET section</b>	<p>Counts of specific SONET errors with detailed information.</p> <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Number of seconds the defect has been active.</li> <li>• <b>Count</b>—Number of times that the defect has gone from inactive to active.</li> <li>• <b>State</b>—State of the error. A state other than <b>OK</b> indicates a problem.</li> </ul> <p>The <b>SONET section</b> field has the following subfields:</p> <ul style="list-style-type: none"> <li>• <b>BIP-B1</b>—Bit interleaved parity for SONET section overhead</li> <li>• <b>SEF</b>—Severely errored framing</li> <li>• <b>LOS</b>—Loss of signal</li> <li>• <b>LOF</b>—Loss of frame</li> <li>• <b>ES-S</b>—Errored seconds (section)</li> <li>• <b>SES-S</b>—Severely errored seconds (section)</li> <li>• <b>SEFS-S</b>—Severely errored framing seconds (section)</li> </ul>
<b>SONET line</b>	<p>Active alarms and defects, plus counts of specific SONET errors with detailed information.</p> <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Number of seconds the defect has been active.</li> <li>• <b>Count</b>—Number of times that the defect has gone from inactive to active.</li> <li>• <b>State</b>—State of the error. A state other than <b>OK</b> indicates a problem.</li> </ul> <p>The <b>SONET line</b> field has the following subfields:</p> <ul style="list-style-type: none"> <li>• <b>BIP-B2</b>—Bit interleaved parity for SONET line overhead</li> <li>• <b>REI-L</b>—Remote error indication (near-end line)</li> <li>• <b>RDI-L</b>—Remote defect indication (near-end line)</li> <li>• <b>AIS-L</b>—Alarm indication signal (near-end line)</li> <li>• <b>BERR-SF</b>—Bit error rate fault (signal failure)</li> <li>• <b>BERR-SD</b>—Bit error rate defect (signal degradation)</li> <li>• <b>ES-L</b>—Errored seconds (near-end line)</li> <li>• <b>SES-L</b>—Severely errored seconds (near-end line)</li> <li>• <b>UAS-L</b>—Unavailable seconds (near-end line)</li> <li>• <b>ES-LFE</b>—Errored seconds (far-end line)</li> <li>• <b>SES-LFE</b>—Severely errored seconds (far-end line)</li> <li>• <b>UAS-LFE</b>—Unavailable seconds (far-end line)</li> </ul>

Table 87: show class-of-service interface Output Fields (continued)

Field Name	Field Description
<b>SONET path</b>	<p>Active alarms and defects, plus counts of specific SONET errors with detailed information.</p> <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Number of seconds the defect has been active.</li> <li>• <b>Count</b>—Number of times that the defect has gone from inactive to active.</li> <li>• <b>State</b>—State of the error. A state other than <b>OK</b> indicates a problem.</li> </ul> <p>The <b>SONET path</b> field has the following subfields:</p> <ul style="list-style-type: none"> <li>• <b>BIP-B3</b>—Bit interleaved parity for SONET section overhead</li> <li>• <b>REI-P</b>—Remote error indication</li> <li>• <b>LOP-P</b>—Loss of pointer (path)</li> <li>• <b>AIS-P</b>—Path alarm indication signal</li> <li>• <b>RDI-P</b>—Path remote defect indication</li> <li>• <b>UNEQ-P</b>—Path unequipped</li> <li>• <b>PLM-P</b>—Path payload (signal) label mismatch</li> <li>• <b>ES-P</b>—Errored seconds (near-end STS path)</li> <li>• <b>SES-P</b>—Severely errored seconds (near-end STS path)</li> <li>• <b>UAS-P</b>—Unavailable seconds (near-end STS path)</li> <li>• <b>ES-PFE</b>—Errored seconds (far-end STS path)</li> <li>• <b>SES-PFE</b>—Severely errored seconds (far-end STS path)</li> <li>• <b>UAS-PFE</b>—Unavailable seconds (far-end STS path)</li> </ul>
<b>Received SONET overhead</b>  <b>Transmitted SONET overhead</b>	<p>Values of the received and transmitted SONET overhead:</p> <ul style="list-style-type: none"> <li>• <b>C2</b>—Signal label. Allocated to identify the construction and content of the STS-level SPE and for PDI-P.</li> <li>• <b>F1</b>—Section user channel byte. This byte is set aside for the purposes of users.</li> <li>• <b>K1 and K2</b>—These bytes are allocated for APS signaling for the protection of the multiplex section.</li> <li>• <b>J0</b>—Section trace. This byte is defined for STS-1 number 1 of an STS-<i>N</i> signal. Used to transmit a 1-byte fixed-length string or a 16-byte message so that a receiving terminal in a section can verify its continued connection to the intended transmitter.</li> <li>• <b>S1</b>—Synchronization status. The S1 byte is located in the first STS-1 number of an STS-<i>N</i> signal.</li> <li>• <b>Z3 and Z4</b>—Allocated for future use.</li> </ul>
<b>Received path trace</b>  <b>Transmitted path trace</b>	<p>SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.</p>
<b>HDLC configuration</b>	<p>Information about the HDLC configuration.</p> <ul style="list-style-type: none"> <li>• <b>Policing bucket</b>—Configured state of the receiving policer.</li> <li>• <b>Shaping bucket</b>—Configured state of the transmitting shaper.</li> <li>• <b>Giant threshold</b>—Giant threshold programmed into the hardware.</li> <li>• <b>Runt threshold</b>—Runt threshold programmed into the hardware.</li> </ul>

Table 87: show class-of-service interface Output Fields (continued)

Field Name	Field Description
<b>Packet Forwarding Engine configuration</b>	Information about the configuration of the Packet Forwarding Engine: <ul style="list-style-type: none"> <li>• <b>Destination slot</b>—FPC slot number.</li> <li>• <b>PLP byte</b>—Packet Level Protocol byte.</li> </ul>
<b>CoS information</b>	Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> <li>• <b>CoS transmit queue</b>—Queue number and its associated user-configured forwarding class name.</li> <li>• <b>Bandwidth %</b>—Percentage of bandwidth allocated to the queue.</li> <li>• <b>Bandwidth bps</b>—Bandwidth allocated to the queue (in bps).</li> <li>• <b>Buffer %</b>—Percentage of buffer space allocated to the queue.</li> <li>• <b>Buffer usec</b>—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time.</li> <li>• <b>Priority</b>—Queue priority: <b>low</b> or <b>high</b>.</li> <li>• <b>Limit</b>—Displayed if rate limiting is configured for the queue. Possible values are <b>none</b> and <b>exact</b>. If <b>exact</b> is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If <b>none</b> is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.</li> </ul>
<b>Forwarding classes</b>	Total number of forwarding classes supported on the specified interface.
<b>Egress queues</b>	Total number of egress Maximum usable queues on the specified interface.
<b>Queue</b>	Queue number.
<b>Forwarding classes</b>	Forwarding class name.
<b>Queued Packets</b>	Number of packets queued to this queue.
<b>Queued Bytes</b>	Number of bytes queued to this queue. The byte counts vary by PIC type.
<b>Transmitted Packets</b>	Number of packets transmitted by this queue. When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (displayed under the <b>Packet Forwarding Engine Chassis Queues</b> field) shows the prefragmentation values.
<b>Transmitted Bytes</b>	Number of bytes transmitted by this queue. The byte counts vary by PIC type.
<b>Tail-dropped packets</b>	Number of packets dropped because of tail drop.

Table 87: *show class-of-service interface Output Fields (continued)*

Field Name	Field Description
<b>RED-dropped packets</b>	<p>Number of packets dropped because of random early detection (RED).</p> <ul style="list-style-type: none"> <li>(M Series and T Series routers only) On M320 and M120 routers and the T Series routers, the total number of dropped packets is displayed. On all other M Series routers, the output classifies dropped packets into the following categories: <ul style="list-style-type: none"> <li><b>Low, non-TCP</b>—Number of low-loss priority non-TCP packets dropped because of RED.</li> <li><b>Low, TCP</b>—Number of low-loss priority TCP packets dropped because of RED.</li> <li><b>High, non-TCP</b>—Number of high-loss priority non-TCP packets dropped because of RED.</li> <li><b>High, TCP</b>—Number of high-loss priority TCP packets dropped because of RED.</li> </ul> </li> <li>(MX Series routers with enhanced DPCs, and T Series routers with enhanced FPCs only) The output classifies dropped packets into the following categories: <ul style="list-style-type: none"> <li><b>Low</b>—Number of low-loss priority packets dropped because of RED.</li> <li><b>Medium-low</b>—Number of medium-low loss priority packets dropped because of RED.</li> <li><b>Medium-high</b>—Number of medium-high loss priority packets dropped because of RED.</li> <li><b>High</b>—Number of high-loss priority packets dropped because of RED.</li> </ul> </li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p>
<b>RED-dropped bytes</b>	<p>Number of bytes dropped because of RED. The byte counts vary by PIC type.</p> <ul style="list-style-type: none"> <li>(M Series and T Series routers only) On M320 and M120 routers and the T Series routers, only the total number of dropped bytes is displayed. On all other M Series routers, the output classifies dropped bytes into the following categories: <ul style="list-style-type: none"> <li><b>Low, non-TCP</b>—Number of low-loss priority non-TCP bytes dropped because of RED.</li> <li><b>Low, TCP</b>—Number of low-loss priority TCP bytes dropped because of RED.</li> <li><b>High, non-TCP</b>—Number of high-loss priority non-TCP bytes dropped because of RED.</li> <li><b>High, TCP</b>—Number of high-loss priority TCP bytes dropped because of RED.</li> </ul> </li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p>
<b>Transmit rate</b>	Configured transmit rate of the scheduler. The rate is a percentage of the total interface bandwidth.
<b>Rate Limit</b>	<p>Rate limiting configuration of the queue. Possible values are :</p> <ul style="list-style-type: none"> <li><b>None</b>—No rate limit.</li> <li><b>exact</b>—Queue transmits at the configured rate.</li> </ul>
<b>Buffer size</b>	Delay buffer size in the queue.
<b>Priority</b>	Scheduling priority configured as <b>low</b> or <b>high</b> .
<b>Excess Priority</b>	Priority of the excess bandwidth traffic on a scheduler: <b>low</b> , <b>medium-low</b> , <b>medium-high</b> , <b>high</b> , or <b>none</b> .

Table 87: show class-of-service interface Output Fields (continued)

Field Name	Field Description
<b>Drop profiles</b>	<p>Display the assignment of drop profiles.</p> <ul style="list-style-type: none"> <li>• <b>Loss priority</b>—Packet loss priority for drop profile assignment.</li> <li>• <b>Protocol</b>—Transport protocol for drop profile assignment.</li> <li>• <b>Index</b>—Index of the indicated object. Objects that have indexes in this output include schedulers and drop profiles.</li> <li>• <b>Name</b>—Name of the drop profile.</li> <li>• <b>Type</b>—Type of the drop profile: <b>discrete</b> or <b>interpolated</b>.</li> <li>• <b>Fill Level</b>—Percentage fullness of a queue.</li> <li>• <b>Drop probability</b>—Drop probability at this fill level.</li> </ul>
<b>Excess Priority</b>	Priority of the excess bandwidth traffic on a scheduler.
<b>Drop profiles</b>	<p>Display the assignment of drop profiles.</p> <ul style="list-style-type: none"> <li>• <b>Loss priority</b>—Packet loss priority for drop profile assignment.</li> <li>• <b>Protocol</b>—Transport protocol for drop profile assignment.</li> <li>• <b>Index</b>—Index of the indicated object. ### show class-of-service interface (Gigabit Ethernet)

user@host> show class-of-service interface ge-6/2/0

Physical interface: ge-6/2/0, Index: 175

Maximum usable queues: 4, Queues in use: 4

Scheduler map: <default>, Index: 2

Input scheduler map: <default>, Index: 3

Chassis scheduler map: <default-chassis>, Index: 4

### show class-of-service interface (ANCP)

user@host> show class-of-service interface pp0.1073741842

Logical interface: pp0.1073741842, Index: 341

Object	Name	Type	Index
Traffic-control-profile	TCP-CVLAN	Output	12408
Classifier	dscp-ipv6-compatibility	dscp-ipv6	9
Classifier	ipprec-compatibility	ip	13

Adjusting application: ancp LS-0

Adjustment type: absolute

Configured shaping rate: 4000000

Adjustment value: 11228000

Adjustment overhead-accounting mode: Frame Mode

Adjustment overhead bytes: 50

Adjustment target: node

### show class-of-service interface (PPPoE Interface)

user@host> show class-of-service interface pp0.1

Logical interface: pp0.1, Index: 85

Object	Name	Type	Index
Traffic-control-profile	tcp-pppoe.o.pp0.1	Output	2726446535
Classifier	ipprec-compatibility	ip	13

Adjusting application: PPPoE

Adjustment type: absolute

Adjustment value: 5000000

Adjustment overhead-accounting mode: cell

Adjustment target: node

### show class-of-service interface (DHCP Interface)

user@host> show class-of-service interface demux0.1

Logical interface: pp0.1, Index: 85

Object	Name	Type	Index
Traffic-control-profile	tcp-dhcp.o.demux0.1	Output	2726446535

```

Classifier                ipprec-compatibility  ip                13

Adjusting application: DHCP
Adjustment type: absolute
Adjustment value: 5000000
Adjustment overhead-accounting mode: cell
Adjustment target: node

## show class-of-service interface-set

<b>Syntax</b>	<code>show class-of-service interface-set</code> <code>&lt;interface-set-name&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.4. Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.
<b>Description</b>	Display the configured shaping rate and the adjusted shaping rate for each logical interface set configured for hierarchical class of service (CoS).
<b>Options</b>	<b>none</b> —Display CoS associations for all logical interface sets.  <b>interface-set <i>interface-set-name</i></b> —(Optional) Display CoS associations for the specified interface set.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show class-of-service interface-set on page 1688</a> <a href="#">show class-of-service interface-set (Enhanced Subscriber Management) on page 1688</a>
<b>Output Fields</b>	<a href="#">Table 88 on page 1687</a> describes the output fields for the <b>show class-of-service interface-set</b> command. Output fields are listed in the approximate order in which they appear.

*Table 88: show class-of-service interface-set Output Fields*

Field Name	Field Description
<b>Interface-set</b>	Name of a logical interface set composed of one or more logical interfaces for which hierarchical scheduling is enabled.
<b>Index</b>	Index number of this interface set or the internal index number of this object.
<b>Physical interface</b>	Name of a physical interface.
<b>Queues supported</b>	Number of queues you can configure on the interface.
<b>Queues in use</b>	Number of queues currently configured.
<b>Output traffic control profile</b>	Name of the output traffic control profile attached to the logical interface set.
<b>Output traffic control profile remaining</b>	(Enhanced subscriber management for MX Series routers) For dynamic subscriber management, name of the output traffic control profile for remaining traffic attached to the logical interface set.

Table 88: *show class-of-service interface-set* Output Fields (continued)

Field Name	Field Description
Adjusting application	<p>Name of the application that communicates shaping-rate adjustment information to the Junos OS class-of-service process (<b>cosd</b>) on the broadband services router (BSR). The BSR uses the information from this application to perform shaping-rate adjustments on the scheduler node that manages the interface set. The adjusting application appears as <b>ancp LS-0</b> which is the Junos OS Access Node Control Profile process (<b>ancpd</b>) that performs shaping-rate adjustments on schedule nodes. The nodes are logical interface sets configured to represent subscriber local loops. When the synchronization speed of the DSL line changes, <b>ancpd</b> communicates the local loop speed to <b>cosd</b> over the default logical system, <b>LS-0</b>, and then the BSR throttles the shaping rate on the scheduler node to the loop speed.</p> <p>The adjusting application can also appear as <b>PPPoE</b>, which adjusts the shaping-rate and overhead-accounting class-of-service attributes on dynamic subscriber interfaces in a broadband access network based on access line parameters in Point-to-Point Protocol over Ethernet (PPPoE) Tags [TR-101]. This feature is supported on MPC/MIC interfaces on MX Series routers. The shaping rate is based on the actual data rate downstream attribute. The overhead accounting value is based on the access loop encapsulation attribute and specifies whether the access loop uses Ethernet (frame mode) or ATM (cell mode).</p>
Adjustment type	Type of shaping-rate adjustment performed by the BSR on the scheduler node. The type of adjustment appears as <b>Adjustment type</b> , meaning that the configured shaping rate is adjusted by an absolute value as opposed to by a percentage of the configured rate.
Configured shaping rate	The maximum transmission rate on the physical interface as configured by the output traffic-control profile attached to the scheduler node.
Adjustment value	Value of the shaping-rate adjustment information sent by the adjusting application to <b>cosd</b> .
Adjustment overhead-accounting mode	Configured shaping mode: <b>frame</b> or <b>cell</b> .

## Sample Output

### *show class-of-service interface-set*

```

user@host> show class-of-service interface-set example-ifset-ge-4/0/0-7

Interface-set: example-ifset-ge-4/0/0-7, Index: 8
Physical interface: ge-4/0/0, Index: 270
Queues supported: 8, Queues in use: 8
  Output traffic control profile: example-tcp-basic-rate, Index: 11395
Adjusting application: ancp LS-0
Adjustment type: absolute
Configured shaping rate: 50000000
Adjustment value: 888000
Adjustment overhead-accounting mode: cell

```

### *show class-of-service interface-set* (Enhanced Subscriber Management)

```

user@host> show class of service interface-set

Interface-set: ge-1/0/0-201-201, Index: 1
Physical interface: ge-1/0/0, Index: 142

```

```
Queues supported: 8, Queues in use: 4  
  Output traffic control profile: LEVEL_2_UID1001, Index: 4294967307  
  Output traffic control profile remaining: TCP_REMAIN_UID1003, Index: 4294967308
```

## show class-of-service scheduler-map

<b>Syntax</b>	<code>show class-of-service scheduler-map</code> <code>&lt;name&gt;</code>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.</p>
<b>Description</b>	Display the mapping of schedulers to forwarding classes and a summary of scheduler parameters for each entry.
<b>Options</b>	<p><b>none</b>—Display all scheduler maps.</p> <p><b>name</b>—(Optional) Display a summary of scheduler parameters for each forwarding class to which the named scheduler is assigned.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Verifying and Managing Junos OS Enhanced Subscriber Management</i></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show class-of-service scheduler-map on page 1691</a></p> <p><a href="#">show class-of-service scheduler-map (QFX Series) on page 1692</a></p>
<b>Output Fields</b>	<a href="#">Table 89 on page 1690</a> describes the output fields for the <b>show class-of-service scheduler-map</b> command. Output fields are listed in the approximate order in which they appear.

*Table 89: show class-of-service scheduler-map Output Fields*

Field Name	Field Description
<b>Scheduler map</b>	<p>Name of the scheduler map.</p> <p>(Enhanced subscriber management for MX Series routers) The name of the dynamic scheduler map object is associated with a generated UID (for example, <b>SMAP-1_UID1002</b>) instead of with a subscriber interface.</p>
<b>Index</b>	<p>Index of the indicated object. Objects having indexes in this output include scheduler maps, schedulers, and drop profiles.</p> <p>(Enhanced subscriber management for MX Series routers) Index values for dynamic CoS traffic control profiles are larger for enhanced subscriber management than they are for legacy subscriber management.</p>
<b>Scheduler</b>	Name of the scheduler.

Table 89: show class-of-service scheduler-map Output Fields (continued)

Field Name	Field Description
<b>Forwarding class</b>	Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router.
<b>Transmit rate</b>	Configured transmit rate of the scheduler (in bps). The rate is a percentage of the total interface bandwidth, or the keyword <b>remainder</b> , which indicates that the scheduler receives the remaining bandwidth of the interface.
<b>Rate Limit</b>	Rate limiting configuration of the queue. Possible values are <b>none</b> , meaning no rate limiting, and <b>exact</b> , meaning the queue only transmits at the configured rate.
<b>Maximum buffer delay</b>	Amount of transmit delay (in milliseconds) or the buffer size of the queue. The buffer size is shown as a percentage of the total interface buffer allocation, or by the keyword <b>remainder</b> to indicate that the buffer is sized according to what remains after other scheduler buffer allocations.
<b>Priority</b>	Scheduling priority: <b>low</b> or <b>high</b> .
<b>Excess priority</b>	Priority of excess bandwidth: <b>low</b> , <b>medium-low</b> , <b>medium-high</b> , <b>high</b> , or <b>none</b> .
<b>Explicit Congestion Notification</b>	(QFX Series, OCX Series, and EX4600 switches only) Explicit congestion notification (ECN) state: <ul style="list-style-type: none"> <li>• Disable—ECN is disabled on the specified scheduler</li> <li>• Enable—ECN is enabled on the specified scheduler</li> </ul> ECN is disabled by default.
<b>Adjust minimum</b>	Minimum shaping rate for an adjusted queue, in bps.
<b>Adjust percent</b>	Bandwidth adjustment applied to a queue, in percent.
<b>Drop profiles</b>	Table displaying the assignment of drop profiles by name and index to a given loss priority and protocol pair.
<b>Loss priority</b>	Packet loss priority for drop profile assignment.
<b>Protocol</b>	Transport protocol for drop profile assignment.
<b>Name</b>	Name of the drop profile.

## Sample Output

### show class-of-service scheduler-map

```

user@host> show class-of-service scheduler-map
Scheduler map: dd-scheduler-map, Index: 84

Scheduler: aa-scheduler, Index: 8721, Forwarding class: aa-forwarding-class
Transmit rate: 30 percent, Rate Limit: none, Maximum buffer delay: 39 ms,
Priority: high
Drop profiles:

```

Loss priority	Protocol	Index	Name
Low	non-TCP	8724	aa-drop-profile
Low	TCP	9874	bb-drop-profile
High	non-TCP	8833	cc-drop-profile
High	TCP	8484	dd-drop-profile

Scheduler: bb-scheduler, Forwarding class: aa-forwarding-class  
 Transmit rate: 40 percent, Rate limit: none, Maximum buffer delay: 68 ms,  
 Priority: high  
 Drop profiles:

Loss priority	Protocol	Index	Name
Low	non-TCP	8724	aa-drop-profile
Low	TCP	9874	bb-drop-profile
High	non-TCP	8833	cc-drop-profile
High	TCP	8484	dd-drop-profile

### show class-of-service scheduler-map (QFX Series)

```
user@switch# show class-of-service scheduler-map
```

```
Scheduler map: be-map, Index: 12240
```

Scheduler:be-sched, Forwarding class: best-effort, Index: 115  
 Transmit rate: 30 percent, Rate Limit: none, Buffer size: remainder,  
 Buffer Limit: none, Priority: low  
 Excess Priority: unspecified, Explicit Congestion Notification: disable

Drop profiles:

Loss priority	Protocol	Index	Name
Low	any	3312	lan-dp
Medium-high	any	2714	be-dp1
High	any	3178	be-dp2

## show class-of-service traffic-control-profile

<b>Syntax</b>	<code>show class-of-service traffic-control-profile</code> <code>&lt;profile-name&gt;</code>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 12.2 for ACX Series Routers.</p> <p>Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.</p>
<b>Description</b>	<p>For Gigabit Ethernet IQ PICs, Channelized IQ PICs, EQ DPCs, and MPC/MIC interfaces only, display traffic shaping and scheduling profiles.</p> <p>(ACX Series routers) For ATM IMA pseudowire interfaces, display traffic shaping and scheduling profiles.</p>
<b>Options</b>	<p><b>none</b>—Display all profiles.</p> <p><b>profile-name</b>—(Optional) Display information about a single profile.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Verifying and Managing Junos OS Enhanced Subscriber Management</i></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show class-of-service traffic-control-profile on page 1695</a></p> <p><a href="#">show class-of-service traffic-control-profile (MX Series routers with Clear Channel Multi-Rate CE MIC) on page 1696</a></p> <p><a href="#">show class-of-service traffic-control-profile (ACX Series routers with ATM IMA pseudowire interfaces) on page 1696</a></p> <p><a href="#">show class-of-service traffic-control-profile (Enhanced Subscriber Management) on page 1697</a></p>
<b>Output Fields</b>	<p><a href="#">Table 90 on page 1694</a> describes the output fields for the <b>show class-of-service traffic-control-profile</b> command. Output fields are listed in the approximate order in which they appear.</p>

*Table 90: show class-of-service traffic-control-profile Output Fields*

Field Name	Field Description
<b>Traffic control profile</b>	<p>Name of the traffic control profile.</p> <p>(Enhanced subscriber management for MX Series routers) The name of the dynamic traffic control profile object is associated with a generated UID (for example, <code>TC_PROF_100_199_SERIES_UID1000</code>) instead of with a subscriber interface.</p>
<b>Index</b>	<p>Index number of the traffic control profile.</p> <p>(Enhanced subscriber management for MX Series routers) Index values for dynamic CoS traffic control profiles are larger for enhanced subscriber management than they are for legacy subscriber management.</p>
<b>ATM Service</b>	<p>(MX Series routers with ATM Multi-Rate CE MIC) Configured category of ATM service. Possible values:</p> <ul style="list-style-type: none"> <li>• cbr—Constant bit rate.</li> <li>• rtvbr—Real time variable bit rate.</li> <li>• nrtvbr—Non real time variable bit rate.</li> <li>• ubr—Unspecified bit rate.</li> </ul>
<b>Maximum Burst Size</b>	Configured maximum burst size, in cells.
<b>Peak rate</b>	Configured peak rate, in cps.
<b>Sustained rate</b>	Configured sustained rate, in cps.
<b>Shaping rate</b>	<p>Configured shaping rate, in bps.</p> <p><b>NOTE:</b> (MX Series routers with ATM Multi-Rate CE MIC) Configured peak rate, in cps.</p>
<b>Shaping rate burst</b>	<p>Configured burst size for the shaping rate, in bytes.</p> <p><b>NOTE:</b> (MX Series routers with ATM Multi-Rate CE MIC) Configured maximum burst rate, in cells.</p>
<b>Shaping rate priority high</b>	Configured shaping rate for high-priority traffic, in bps.
<b>Shaping rate priority medium</b>	Configured shaping rate for medium-priority traffic, in bps.
<b>Shaping rate priority low</b>	Configured shaping rate for low-priority traffic, in bps.
<b>Shaping rate excess high</b>	Configured shaping rate for high-priority excess traffic, in bps.
<b>Shaping rate excess low</b>	Configured shaping rate for low-priority excess traffic, in bps.

*Table 90: show class-of-service traffic-control-profile Output Fields (continued)*

Field Name	Field Description
<b>Scheduler map</b>	Name of the associated scheduler map.  (Enhanced subscriber management for MX Series routers) The name of the dynamic scheduler map object is associated with a generated UID (for example, <b>SMAP-1_UID1002</b> ) instead of with a subscriber interface.
<b>Delay Buffer rate</b>	Configured delay buffer rate, in bps.
<b>Excess rate</b>	Configured excess rate, in percent or proportion.
<b>Excess rate high</b>	Configured excess rate for high priority traffic, in percent or proportion.
<b>Excess rate low</b>	Configured excess rate for low priority traffic, in percent or proportion.
<b>Guaranteed rate</b>	Configured guaranteed rate, in bps or cps.  <b>NOTE:</b> (MX Series routers with ATM Multi-Rate CE MIC) This value depends on the ATM service category chosen. Possible values: <ul style="list-style-type: none"> <li>• <b>cbr</b>—Guaranteed rate is equal to the configured peak rate in cps.</li> <li>• <b>rtvbr</b>—Guaranteed rate is equal to the configured sustained rate in cps.</li> <li>• <b>nrtvbr</b>—Guaranteed rate is equal to the configured sustained rate in cps.</li> </ul>
<b>Guaranteed rate burst</b>	Configured burst size for the guaranteed rate, in bytes.
<b>adjust-minimum</b>	Configured minimum shaping rate for an adjusted queue, in bps.
<b>overhead accounting mode</b>	Configured shaping mode: <b>Frame Mode</b> or <b>Cell Mode</b> .
<b>Overhead bytes</b>	Configured byte adjustment value.
<b>Adjust parent</b>	Configured shaping-rate adjustment for parent scheduler nodes. If enabled, this field appears.  <b>flow-aware</b> indicates that the parent scheduler node is adjusted only once per multicast channel.

## Sample Output

### show class-of-service traffic-control-profile

```

## show database-replication statistics

<b>Syntax</b>	show database-replication statistics
<b>Release Information</b>	Command introduced in Junos OS Release 9.3.
<b>Description</b>	Display statistics regarding the replication of the subscriber management session database.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show database-replication summary on page 1700</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show database-replication statistics on page 1698</a>
<b>Output Fields</b>	<p><a href="#">Table 91 on page 1698</a> lists the output fields for the <b>show database-replication statistics</b> command. Output fields are listed in the approximate order in which they appear.</p>

*Table 91: show database-replication statistics Output Fields*

Field Name	Field Description
General	Number of dropped connections and the maximum buffer count.
Message Received	Total size of messages received and the number of received messages that have been processed.
Message Sent	Total size of messages sent and the number of sent messages that have been processed.
Message Queue	Number of messages in the queue and the maximum size of the queue.

## Sample Output

### show database-replication statistics

```
user@host> show database-replication statistics
```

```
General:
  Dropped connections      0
  Max buffer count        0
Message received:
  Size (bytes)            0
```

Processed	0
Message sent:	
Size (bytes)	0
Processed	0
Message queue:	
Queue full	0
Max queue size	0

## show database-replication summary

**Syntax** show database-replication summary

**Release Information** Command introduced in Junos OS Release 9.3.

**Description** Display summary information regarding database replication for the subscriber management session database.

**Options** This command has no options.

**Required Privilege Level** view

**Related Documentation**

- [show database-replication statistics on page 1698](#)

**List of Sample Output** [show database-replication summary on page 1701](#)

**Output Fields** [Table 92 on page 1700](#) lists the output fields for the **show database-replication summary** command. Output fields are listed in the approximate order in which they appear.

*Table 92: show database-replication summary Output Fields*

Field Name	Field Description
Graceful Restart	State of graceful Routing Engine switchover (GRES): <ul style="list-style-type: none"><li>• Enabled</li><li>• Disabled</li></ul>
Mastership	State of the Routing Engine: <ul style="list-style-type: none"><li>• Master</li><li>• Standby</li></ul>
Connection	State of the connection: <ul style="list-style-type: none"><li>• Up</li><li>• Down</li></ul>
Database	State of the subscriber management database: <ul style="list-style-type: none"><li>• Available</li><li>• Unavailable</li><li>• Synchronized</li></ul>

*Table 92: show database-replication summary Output Fields (continued)*

Field Name	Field Description
Message Queue	State of the message queue: <ul style="list-style-type: none"><li>• Full</li><li>• Init</li><li>• Not Ready</li><li>• Ready</li></ul>

## Sample Output

### show database-replication summary

```
user@host> show database-replication summary
```

General:

Graceful Restart	Enabled
Mastership	Standby
Connection	Up
Database	Available
Message Queue	Ready

## show dhcp relay binding

**Syntax**

```
show dhcp relay binding
<address>
<brief>
<detail>
<interface interface-name>
<interfaces-vlan>
<interfaces-wildcard>
<ip-address | mac-address>
<logical-system logical-system-name>
<routing-instance routing-instance-name>
<summary>
```

**Release Information** Command introduced in Junos OS Release 8.3.  
Options **interface** and **mac-address** added in Junos OS Release 8.4.  
Options **interfaces-vlan** and **interfaces-wildcard** added in Junos OS Release 12.1.  
Command introduced in Junos OS Release 12.1X48R3 for PTX Series Packet Transport Routers.

**Description** Display the address bindings in the Dynamic Host Configuration Protocol (DHCP) client table.

**Options** **address**—(Optional) Display DHCP binding information for a specific client identified by one of the following entries:

- **ip-address**—The specified IP address.
- **mac-address**—The specified MAC address.
- **session-id**—The specified session ID.

**brief**—(Optional) Display brief information about the active client bindings. This is the default, and produces the same output as **show dhcp relay binding**.

**detail**—(Optional) Display detailed client binding information.

**interface interface-name**—(Optional) Perform this operation on the specified interface. You can optionally filter on VLAN ID and SVLAN ID.

**interfaces-vlan**—(Optional) Show the binding state information on the interface VLAN ID and S-VLAN ID.

**interfaces-wildcard**—(Optional) The set of interfaces on which to show binding state information. This option supports the use of the wildcard character (\*).

**logical-system logical-system-name**—(Optional) Perform this operation on the specified logical system.

**routing-instance *routing-instance-name***—(Optional) Perform this operation on the specified routing instance.

**summary**—(Optional) Display a summary of DHCP client information.

**Required Privilege Level**

**Output Fields**

[Table 93 on page 1703](#) lists the output fields for the **show dhcp relay binding** command. Output fields are listed in the approximate order in which they appear.

*Table 93: show dhcp relay binding Output Fields*

Field Name	Field Description	Level of Output
<i>number clients, (number init, number bound, number selecting, number requesting, number renewing, number rebinding, number releasing)</i>	Summary counts of the total number of DHCP clients and the number of DHCP clients in each state.	<b>summary</b>
<b>IP address</b>	IP address of the DHCP client.	<b>brief detail</b>
<b>Session Id</b>	Session ID of the subscriber session.	<b>brief detail</b>
<b>Generated Remote ID</b>	Remote ID generated by the Option 82 Agent Remote ID (suboption 1)	<b>detail</b>
<b>Hardware address</b>	Hardware address of the DHCP client.	<b>brief detail</b>
<b>Expires</b>	Number of seconds in which the lease expires.	<b>brief detail</b>

Table 93: show dhcp relay binding Output Fields (continued)

Field Name	Field Description	Level of Output
<b>State</b>	State of the DHCP relay address binding table on the DHCP client: <ul style="list-style-type: none"> <li>• <b>BOUND</b>—Client has an active IP address lease.</li> <li>• <b>INIT</b>—Initial state.</li> <li>• <b>REBINDING</b>—Client is broadcasting a request to renew the IP address lease.</li> <li>• <b>RELEASE</b>—Client is releasing the IP address lease.</li> <li>• <b>RENEWING</b>—Client is sending a request to renew the IP address lease.</li> <li>• <b>REQUESTING</b>—Client is requesting a DHCP server.</li> <li>• <b>SELECTING</b>—Client is receiving offers from DHCP servers.</li> </ul>	<b>brief detail</b>
<b>Interface</b>	Incoming client interface.	brief
<b>Lease Expires</b>	Date and time at which the client's IP address lease expires.	detail
<b>Lease Expires in</b>	Number of seconds in which the lease expires.	detail
<b>Lease Start</b>	Date and time at which the client's IP address lease started.	detail
<b>Lease time violated</b>	Lease time violation has occurred.	detail
<b>Incoming Client Interface</b>	Client's incoming interface.	detail
<b>Server IP Address</b>	IP address of the DHCP server.	detail
<b>Server Interface</b>	Interface of the DHCP server.	detail
<b>Bootp Relay Address</b>	IP address of BOOTP relay.	detail
<b>Type</b>	Type of DHCP packet processing performed on the router: <ul style="list-style-type: none"> <li>• <b>active</b>—Router actively processes and relays DHCP packets.</li> <li>• <b>passive</b>—Router passively snoops DHCP packets passing through the router.</li> </ul>	All levels
<b>Lease expires at</b>	Date and time at which the client's IP address lease expires.	All levels
<b>Dual Stack Group</b>	Name of dual stack that is configured with the DHCP binding.	detail
<b>Dual Stack Peer Prefix</b>	Prefix of dual stack DHCPv6 peer.	detail
<b>Dual Stack Peer Address</b>	Address of the dual stack DHCPv6 peer.	detail

## Sample Output

## show dhcp relay lockout-entries

<b>Syntax</b>	<code>show dhcp relay lockout-entries (all   index <i>index</i>)</code>
<b>Release Information</b>	Command introduced in Junos OS Release 18.2R1 on MX Series routers.
<b>Description</b>	Display information about all client entries or detailed information about a specific client entry in the DHCPv4 relay agent lockout database.
<b>Options</b>	<p><b>all</b>—Display all client entries in the lockout database.</p> <p><b>index</b>—Number identifying a client entry to be displayed.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear dhcp relay lockout-entries on page 1539</a></li> <li>• <a href="#">show dhcp server lockout-entries on page 1721</a></li> <li>• <a href="#">show dhcpv6 relay lockout-entries on page 1736</a></li> <li>• <a href="#">show dhcpv6 server lockout-entries on page 1749</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show dhcp relay lockout-entries (All Entries) on page 1709</a></p> <p><a href="#">show dhcp relay lockout-entries (Specific Entry) on page 1709</a></p>
<b>Output Fields</b>	Table 94 on page 1708 lists the output fields for the <b>show dhcp relay lockout-entries</b> command. Output fields are listed in the approximate order in which they appear.

Table 94: show dhcp relay lockout-entries Output Fields

Field Name	Field Description	Level of Output
<b>Index</b>	Number identifying a specific entry in the lockout database.	<b>all</b> and <b>index</b>
<b>Key</b>	Client identifier for the client in the lockout database.	<b>all</b> and <b>index</b>
<b>State</b>	<p>Type of lockout period for the entry:</p> <ul style="list-style-type: none"> <li>• <b>Grace</b>—A previously locked out client enters the grace period when the lockout expires. If the client attempts to establish a session within in this period, the next lockout time is increased. If the grace time passes without a log in, the entry is removed from the lockout database.</li> <li>• <b>Lockout</b>—Client is currently locked out; attempts to establish a session are rejected.</li> </ul>	<b>all</b> and <b>index</b>
<b>Expires (s)</b>	Number of seconds until the current lockout period expires.	<b>all</b> only

Table 94: show dhcp relay lockout-entries Output Fields (continued)

Field Name	Field Description	Level of Output
Elapsed (s)	Number of seconds since the current lockout or grace timer started.	all only
Count	Number of consecutive times the client has been locked out.	all only
Expires	Date and time when the current lockout period ends.	index only
Expires in	Number of seconds until the current period expires.	index only
Lockout count	Number of consecutive times client has been locked out.	index only
Next lockout time	Duration of the next lockout period for this client.	index only
Min lockout time	Minimum duration for a lockout period; the initial lockout time.	index only
Lockout reason	Reason for the current lockout. The possible values are internal jdhcpd error codes. These values are provided for debugging by Juniper Networks technical support.	index only

## Sample Output

### show dhcp relay lockout-entries (All Entries)

```
user@host> show dhcp relay lockout-entries all
```

Index	Key	State	Expires(s)	Elapsed(s)	Count
1	00:00:5E:00:53:00	Lockout	30	5200	2
2	00:00:5E:00:53:11	Grace	120	780	2
3	00:00:5E:00:53:22	Lockout	180	2300	1

### show dhcp relay lockout-entries (Specific Entry)

```
user@host> show dhcp relay lockout-entries index 2
```

```

Index:                2
Key:                  default/00 01 00 01 5a bc e1 7b 00
10 94 00 00 06/
State:                Lockout
Expires:              2018-03-29 19:06:17 IST
Expires in:           87
Lockout count:        1
Next lockout time:    200
Min lockout time:     100
Lockout reason:       181
```

## show dhcp relay statistics

---

Syntax	<pre>show dhcp relay statistics &lt;bulk-leasequery-connections&gt; &lt;logical-system <i>logical-system-name</i>&gt; &lt;routing-instance <i>routing-instance-name</i>&gt;</pre>
Syntax	Syntax for EX Series switches: <pre>show dhcp relay statistics &lt;routing-instance <i>routing-instance-name</i>&gt;</pre>
Release Information	Command introduced in Junos OS Release 8.3. Command introduced in Junos OS Release 12.1 for EX Series switches. Command introduced in Junos OS Release 12.1X48R3 for PTX Series Packet Transport Routers. <b>bulk-leasequery-connections</b> option introduced in Junos OS Release 16.1.
Description	Display Dynamic Host Configuration Protocol (DHCP) relay statistics.
Options	<b>bulk-leasequery-connections</b> —(Optional) Display information about bulk leasequery operations.  <b>logical-system <i>logical-system-name</i></b> —(On routers only) (Optional) Perform this operation on the specified logical system. If you do not specify a logical system name, statistics are displayed for the default logical system.  <b>routing-instance <i>routing-instance-name</i></b> —(Optional) Perform this operation on the specified routing instance. If you do not specify a routing instance name, statistics are displayed for the default routing instance.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"><li><a href="#">clear dhcp relay statistics on page 1541</a></li></ul>
List of Sample Output	<a href="#">show dhcp relay statistics on page 1712</a> <a href="#">show dhcp relay statistics bulk-leasequery-connections on page 1713</a>
Output Fields	<a href="#">Table 95 on page 1711</a> lists the output fields for the <b>show dhcp relay statistics</b> command. Output fields are listed in the approximate order in which they appear.

Table 95: show dhcp relay statistics Output Fields

Field Name	Field Description
<b>Packets dropped</b>	<p>Number of packets discarded by the extended DHCP relay agent application due to errors. Only nonzero statistics appear in the <b>Packets dropped</b> output. When all of the Packets dropped statistics are 0 (zero), only the <b>Total</b> field appears.</p> <ul style="list-style-type: none"> <li>• <b>Total</b>—Total number of packets discarded by the extended DHCP relay agent application.</li> <li>• <b>Bad hardware address</b>—Number of packets discarded because an invalid hardware address was specified.</li> <li>• <b>Bad opcode</b>—Number of packets discarded because an invalid operation code was specified.</li> <li>• <b>Bad options</b>—Number of packets discarded because invalid options were specified.</li> <li>• <b>Invalid server address</b>—Number of packets discarded because an invalid server address was specified.</li> <li>• <b>Lease Time Violation</b>—Number of packets discarded because of a lease time violation</li> <li>• <b>No available addresses</b>—Number of packets discarded because there were no addresses available for assignment.</li> <li>• <b>No interface match</b>—Number of packets discarded because they did not belong to a configured interface.</li> <li>• <b>No routing instance match</b>—Number of packets discarded because they did not belong to a configured routing instance.</li> <li>• <b>No valid local address</b>—Number of packets discarded because there was no valid local address.</li> <li>• <b>Packet too short</b>—Number of packets discarded because they were too short.</li> <li>• <b>Read error</b>—Number of packets discarded because of a system read error.</li> <li>• <b>Send error</b>—Number of packets that the extended DHCP relay application could not send.</li> <li>• <b>Option 60</b>—Number of packets discarded containing DHCP option 60 vendor-specific information.</li> <li>• <b>Option 82</b>—Number of packets discarded because DHCP option 82 information could not be added.</li> </ul>
<b>Messages received</b>	<p>Number of DHCP messages received.</p> <ul style="list-style-type: none"> <li>• <b>BOOTREQUEST</b>—Number of BOOTP protocol data units (PDUs) received</li> <li>• <b>DHCPDECLINE</b>—Number of DHCP PDUs of type DECLINE received</li> <li>• <b>DHCPDISCOVER</b>—Number of DHCP PDUs of type DISCOVER received</li> <li>• <b>DHCPINFORM</b>—Number of DHCP PDUs of type INFORM received</li> <li>• <b>DHCPRELEASE</b>—Number of DHCP PDUs of type RELEASE received</li> <li>• <b>DHCPREQUEST</b>—Number of DHCP PDUs of type REQUEST received</li> <li>• <b>DHCPLEASEACTIVE</b>—Number of active DHCP leases</li> <li>• <b>DHCPLEASEUNASSIGNED</b>—Number of DHCP leases that are managed by the server but have not yet been assigned</li> <li>• <b>DHCPLEASEUNKNOWN</b>—Number of unknown DHCP leases</li> <li>• <b>DHCPLEASEQUERYDONE</b>—The leasequery is complete</li> </ul>
<b>Messages sent</b>	<p>Number of DHCP messages sent.</p> <ul style="list-style-type: none"> <li>• <b>BOOTREPLY</b>—Number of BOOTP PDUs transmitted</li> <li>• <b>DHCPOFFER</b>—Number of DHCP OFFER PDUs transmitted</li> <li>• <b>DHCPACK</b>—Number of DHCP ACK PDUs transmitted</li> <li>• <b>DHCPNACK</b>—Number of DHCP NACK PDUs transmitted</li> <li>• <b>DHCPFORCERENEW</b>—Number of DHCP FORCERENEW PDUs transmitted</li> <li>• <b>DHCPLEASEQUERY</b>—Number of DHCP leasequery messages transmitted</li> <li>• <b>DHCPLEASEBULKLEASEQUERY</b>—Number of DHCP bulk leasequery messages transmitted</li> </ul>

Table 95: show dhcp relay statistics Output Fields (continued)

Field Name	Field Description
External Server Response	State of the external DHCP server responsiveness.
Packets forwarded	Number of packets forwarded. <ul style="list-style-type: none"> <li><b>BOOTREQUEST</b>—Number of BOOTREQUEST protocol data units (PDUs) forwarded</li> <li><b>BOOTREPLY</b>—Number of BOOTREPLY protocol data units (PDUs) forwarded</li> </ul>
External Server Response	State of the external DHCP server responsiveness.
Total Requested Servers	Total number of servers with which the DHCP relay agent has requested a bulk leasequery connection.
Total Attempted Servers	Total number of servers with which the DHCP relay agent has attempted to create a bulk leasequery connection.
Total Connected	Total number of servers that have formed a bulk leasequery connection with the DHCP relay agent.
Total Terminated by Server	Total number of servers that have terminated a bulk leasequery connection with the DHCP relay agent.
Total Max Attempted	Total number of servers where the DHCP relay agent reached the maximum retry limit when it attempted to create a bulk leasequery connection.
Total Closed due to Errors	Total number of bulk leasequery connections that closed due to an internal error on the DHCP relay agent.
In-Flight Connected	Number of current bulk leasequery connections on the DHCP relay agent.
Bulk Leasequery Reply Packet Retries	Number of bulk leasequery reply packets that the DHCP relay agent has retried.

## Sample Output

### show dhcp relay statistics

```
user@host> show dhcp relay statistics
```

```
Packets dropped:
  Total                34
  Bad hardware address  1
  Bad opcode           1
  Bad options          3
  Invalid server address 5
  Lease Time Violation  1
  No available addresses 1
  No interface match    2
  No routing instance match 9
  No valid local address 4
  Packet too short      2
```

```

Read error          1
Send error          1

```

## show dhcp server binding

**Syntax** `show dhcp server binding`  
`<address>`  
`<interfaces-vlan> <brief | detail | summary>`  
`<interface interface-name>`  
`<interfaces-vlan>`  
`<interfaces-wildcard>`  
`<logical-system logical-system-name>`  
`<routing-instance routing-instance-name>`

**Release Information** Command introduced in Junos OS Release 9.0.  
Options *interfaces-vlan* and *interfaces-wildcard* added in Junos OS Release 12.1.

**Description** Display the address bindings in the client table on the extended Dynamic Host Configuration Protocol (DHCP) local server.

**NOTE:** If you delete the DHCP server configuration, DHCP server bindings might still remain. To ensure that DHCP bindings are removed, issue the `clear dhcp server binding` command before you delete the DHCP server configuration.

**Options** *address*—(Optional) Display DHCP binding information for a specific client identified by one of the following entries:

- *ip-address*—The specified IP address.
- *mac-address*—The specified MAC address.
- *session-id*—The specified session ID.

**brief | detail | summary**—(Optional) Display the specified level of output about active client bindings. The default is **brief**, which produces the same output as **show dhcp server binding**.

**interface interface-name**—(Optional) Display information about active client bindings on the specified interface. You can optionally filter on VLAN ID and SVLAN ID.

**interfaces-vlan**—(Optional) Show the binding state information on the interface VLAN ID and S-VLAN ID.

**interfaces-wildcard**—(Optional) The set of interfaces on which to show the binding state information. This option supports the use of the wildcard character (\*).

**logical-system logical-system-name**—(Optional) Display information about active client bindings for DHCP clients on the specified logical system.

**routing-instance *routing-instance-name***—(Optional) Display information about active client bindings for DHCP clients on the specified routing instance.

**Required Privilege Level** view

**Output Fields** Table 96 on page 1715 lists the output fields for the **show dhcp server binding** command. Output fields are listed in the approximate order in which they appear.

Table 96: show dhcp server binding Output Fields

Field Name	Field Description	Level of Output
<i>number</i> clients, ( <i>number</i> init, <i>number</i> bound, <i>number</i> selecting, <i>number</i> requesting, <i>number</i> renewing, <i>number</i> releasing)	Summary counts of the total number of DHCP clients and the number of DHCP clients in each state.	summary
IP address	IP address of the DHCP client.	brief detail
Session Id	Session ID of the subscriber session.	brief detail
Hardware address	Hardware address of the DHCP client.	brief detail
Expires	Number of seconds in which lease expires.	brief detail

Table 96: show dhcp server binding Output Fields (continued)

Field Name	Field Description	Level of Output
<b>State</b>	State of the address binding table on the extended DHCP local server: <ul style="list-style-type: none"> <li>• <b>BOUND</b>—Client has active IP address lease.</li> <li>• <b>FORCERENEW</b>—Client has received forcerenew message from server.</li> <li>• <b>INIT</b>—Initial state.</li> <li>• <b>RELEASE</b>—Client is releasing IP address lease.</li> <li>• <b>RENEWING</b>—Client sending request to renew IP address lease.</li> <li>• <b>REQUESTING</b>—Client requesting a DHCP server.</li> <li>• <b>SELECTING</b>—Client receiving offers from DHCP servers.</li> </ul>	<b>brief</b> <b>detail</b>
<b>Interface</b>	Interface on which the request was received.	<b>brief</b>
<b>Lease Expires</b>	Date and time at which the client's IP address lease expires.	<b>detail</b>
<b>Lease Expires in</b>	Number of seconds in which lease expires.	<b>detail</b>
<b>Lease Start</b>	Date and time at which the client's IP address lease started.	<b>detail</b>
<b>Lease time violated</b>	Lease time violation has occurred.	<b>detail</b>
<b>Last Packet Received</b>	Date and time at which the router received the last packet.	<b>detail</b>
<b>Incoming Client Interface</b>	Client's incoming interface.	<b>detail</b>
<b>Client Interface Svlan Id</b>	S-VLAN ID of the client's incoming interface.	<b>detail</b>
<b>Client Interface Vlan Id</b>	VLAN ID of the client's incoming interface.	<b>detail</b>
<b>Demux Interface</b>	Name of the IP demultiplexing (demux) interface.	<b>detail</b>
<b>Server IP Address or Server Identifier</b>	IP address of DHCP server.	<b>detail</b>
<b>Server Interface</b>	Interface of DHCP server.	<b>detail</b>
<b>Client Pool Name</b>	Name of address pool used to assign client IP address lease.	<b>detail</b>

Table 96: show dhcp server binding Output Fields (continued)

Field Name	Field Description	Level of Output
Liveness Detection State	<p>State of the liveness detection status for a subscriber's Bidirectional Forwarding Detection (BFD) protocol session:</p> <p><b>NOTE:</b> This output field displays status only when liveness detection has been explicitly configured for a subscriber and the liveness detection protocol is actively functioning for that subscriber.</p> <ul style="list-style-type: none"> <li><b>DOWN</b>—Liveness detection has been enabled for a subscriber but the broadband network gateway (BNG) detects that the liveness detection session for the BFD protocol is in the <b>DOWN</b> state. A liveness detection session that was previously in an <b>UP</b> state has transitioned to a <b>DOWN</b> state, beginning with a liveness detection failure, and ending with the deletion of the client binding. The <b>DOWN</b> state is reported only during this transition period of time.</li> <li><b>UNKNOWN</b>—Liveness detection has been enabled for a subscriber but the actual liveness detection state has not yet been determined. The <b>UNKNOWN</b> state is reported after a DHCP subscriber initially logs in while the underlying liveness detection protocol handshake, such as BFD, is still processing and the BFD session has not yet reached the <b>UP</b> state.</li> <li><b>UP</b>—Liveness detection has been enabled for a subscriber, and the BNG and the subscriber or client have <i>both</i> determined that the liveness detection session for the BFD protocol is in the <b>UP</b> state.</li> <li><b>WENT_DOWN</b>—State is functionally equivalent to the <b>DOWN</b> state. A liveness detection session that was previously in an <b>UP</b> state has transitioned to a <b>DOWN</b> state implying a liveness detection failure. The <b>WENT_DOWN</b> state applies to the internal distribution of the liveness detection mechanism between the Junos DHCP Daemon for Subscriber Services (JDHCPd), the BFD plug-in within the Broadband Edge Subscriber Management Daemon (BBE-SMGD), and the Packet Forwarding Engine.</li> </ul>	detail
ACI Interface Set Name	Internally generated name of the dynamic agent circuit identifier (ACI) interface set.	detail
ACI Interface Set Index	Index number of the dynamic ACI interface set.	detail
ACI Interface Set Session ID	Identifier of the dynamic ACI interface set entry in the session database.	detail
Client Profile Name	DHCP client profile name.	detail
Dual Stack Group	DHCP server profile name.	detail
Dual Stack Peer Prefix	IPv6 prefix of peer.	detail

Table 96: show dhcp server binding Output Fields (continued)

Field Name	Field Description	Level of Output
Dual Stack Peer Address	IPv6 address of peer.	detail

## Sample Output

### show dhcp server binding

```
user@host> show dhcp server binding
```

IP address	Session Id	Hardware address	Expires	State	Interface

## show dhcp server lockout-entries

<b>Syntax</b>	show dhcp server lockout-entries (all   index <i>index</i> )
<b>Release Information</b>	Command introduced in Junos OS Release 18.2R1 on MX Series routers.
<b>Description</b>	Display information about all client entries or detailed information about a specific client entry in the DHCPv4 local lockout database.
<b>Options</b>	<p><b>all</b>—Display all client entries in the lockout database.</p> <p><b>index <i>index</i></b>—Display detailed information for the specified client.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear dhcp server lockout-entries on page 1548</a></li> <li>• <a href="#">show dhcp relay lockout-entries on page 1708</a></li> <li>• <a href="#">show dhcpv6 relay lockout-entries on page 1736</a></li> <li>• <a href="#">show dhcpv6 server lockout-entries on page 1749</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show dhcp server lockout-entries (All Entries) on page 1722</a></p> <p><a href="#">show dhcp server lockout-entries (Specific Entry) on page 1722</a></p>
<b>Output Fields</b>	Table 97 on page 1721 lists the output fields for the <b>show dhcp server lockout-entries</b> command. Output fields are listed in the approximate order in which they appear.

Table 97: show dhcp server lockout-entries Output Fields

Field Name	Field Description	Level of Output
<b>Index</b>	Number identifying a specific entry in the lockout database.	<b>all</b> and <b>index</b>
<b>Key</b>	Client identifier for the client in the lockout database.	<b>all</b> and <b>index</b>
<b>State</b>	Type of lockout period for the entry: <ul style="list-style-type: none"> <li>• <b>Grace</b>—A previously locked out client enters the grace period when the lockout expires. If the client attempts to establish a session within in this period, the next lockout time is increased. If the grace time passes without a log in, the entry is removed from the lockout database.</li> <li>• <b>Lockout</b>—Client is currently locked out; attempts to establish a session are rejected.</li> </ul>	<b>all</b> and <b>index</b>
<b>Expires (s)</b>	Number of seconds until the current lockout period expires.	<b>all</b> only

Table 97: show dhcp server lockout-entries Output Fields (continued)

Field Name	Field Description	Level of Output
Elapsed (s)	Number of seconds since the current lockout or grace timer started.	all only
Count	Number of consecutive times the client has been locked out.	all only
Expires	Date and time when the current lockout period ends.	index only
Expires in	Number of seconds until the current period expires.	index only
Lockout count	Number of consecutive times client has been locked out.	index only
Next lockout time	Duration of the next lockout period for this client.	index only
Min lockout time	Minimum duration for a lockout period; the initial lockout time.	index only
Lockout reason	Reason for the current lockout. The possible values are internal jdhcpd error codes. These values are provided for debugging by Juniper Networks technical support.	index only

## Sample Output

### show dhcp server lockout-entries (All Entries)

```

user@host> show dhcp server lockout-entries all

```

Index	Key	State	Expires(s)	Elapsed(s)	Count
1	00:00:5E:00:53:00	Lockout	30	5200	2
2	00:00:5E:00:53:11	Grace	120	780	2
3	00:00:5E:00:53:22	Lockout	180	2300	1

### show dhcp server lockout-entries (Specific Entry)

```

user@host> show dhcp server lockout-entries index 2

```

Index:	2
Key:	default/00 01 00 01 5a bc e1 7b 00
10 94 00 00 06/	
State:	Lockout
Expires:	2018-03-29 19:06:17 IST
Expires in:	87
Lockout count:	1
Next lockout time:	200
Min lockout time:	100
Lockout reason:	181

## show dhcp server statistics

Syntax	<pre>show dhcp server statistics &lt;bulk-leasequery-connections&gt; &lt;logical-system <i>logical-system-name</i>&gt; &lt;routing-instance <i>routing-instance-name</i>&gt;</pre>
Release Information	<p>Command introduced in Junos OS Release 9.0.</p> <p><b>bulk-leasequery-connections</b> option introduced in Junos OS Release 16.1.</p>
Description	Display extended Dynamic Host Configuration Protocol (DHCP) local server statistics.
Options	<p><b>bulk-leasequery-connections</b>—(Optional) Display bulk leasequery statistics.</p> <p><b>bulk-leasequery-connections</b>—(Optional) Display information about bulk leasequery statistics.</p> <p><b>logical-system <i>logical-system-name</i></b>—(Optional) Display information about extended DHCP local server statistics on the specified logical system. If you do not specify a logical system, statistics are displayed for the default logical system.</p> <p><b>routing-instance <i>routing-instance-name</i></b>—(Optional) Display information about extended DHCP local server statistics on the specified routing instance. If you do not specify a routing instance, statistics are displayed for the default routing instance.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> <li>• <a href="#">clear dhcp server statistics on page 1550</a></li> </ul>
List of Sample Output	<p><a href="#">show dhcp server statistics on page 1725</a></p> <p><a href="#">show dhcp server statistics on page 1726</a></p>
Output Fields	<p><a href="#">Table 98 on page 1724</a> lists the output fields for the <b>show dhcp server statistics</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 98: show dhcp server statistics Output Fields

Field Name	Field Description
<b>Packets dropped</b>	<p>Number of packets discarded by the extended DHCP local server because of errors. Only nonzero statistics appear in the Packets dropped output. When all of the Packets dropped statistics are 0 (zero), only the Total field appears.</p> <ul style="list-style-type: none"> <li>• <b>Total</b>—Total number of packets discarded by the extended DHCP local server</li> <li>• <b>Authentication</b>—Number of packets discarded because they could not be authenticated</li> <li>• <b>Bad hardware address</b>—Number of packets discarded because an invalid hardware address was specified</li> <li>• <b>Bad opcode</b>—Number of packets discarded because an invalid operation code was specified</li> <li>• <b>Bad options</b>—Number of packets discarded because invalid options were specified</li> <li>• <b>Dynamic profile</b>—Number of packets discarded due to dynamic profile information</li> <li>• <b>Invalid server address</b>—Number of packets discarded because an invalid server address was specified</li> <li>• <b>Lease Time Violation</b>—Number of packets discarded because of a lease time violation</li> <li>• <b>No available addresses</b>—Number of packets discarded because there were no addresses available for assignment</li> <li>• <b>No interface match</b>—Number of packets discarded because they did not belong to a configured interface</li> <li>• <b>No routing instance match</b>—Number of packets discarded because they did not belong to a configured routing instance</li> <li>• <b>No valid local address</b>—Number of packets discarded because there was no valid local address</li> <li>• <b>Packet too short</b>—Number of packets discarded because they were too short</li> <li>• <b>Read error</b>—Number of packets discarded because of a system read error</li> <li>• <b>Send error</b>—Number of packets that the extended DHCP local server could not send</li> </ul>
<b>Offer Delay</b>	<p>Number of DHCPv4 offer messages delayed.</p> <ul style="list-style-type: none"> <li>• <b>DELAYED</b>—Number of DHCPv4 offer packets that have been sent after being delayed.</li> <li>• <b>INPROGRESS</b>—Number of DHCPv4 offer packets that are in the delay queue.</li> <li>• <b>TOTAL</b>—Total number of delayed DHCPv4 offer messages; sum of <b>DELAYED</b> and <b>INPROGRESS</b>.</li> </ul>
<b>Messages received</b>	<p>Number of DHCP messages received.</p> <ul style="list-style-type: none"> <li>• <b>BOOTREQUEST</b>—Number of BOOTP protocol data units (PDUs) received</li> <li>• <b>DHCPDECLINE</b>—Number of DHCP PDUs of type DECLINE received</li> <li>• <b>DHCPDISCOVER</b>—Number of DHCP PDUs of type DISCOVER received</li> <li>• <b>DHCPINFORM</b>—Number of DHCP PDUs of type INFORM received</li> <li>• <b>DHCPRELEASE</b>—Number of DHCP PDUs of type RELEASE received</li> <li>• <b>DHCPREQUEST</b>—Number of DHCP PDUs of type REQUEST received</li> <li>• <b>DHCPLEASEQUERY</b>—Number of DHCP leasequery messages received.</li> <li>• <b>DHCPBULKLEASEQUERY</b>—Number of DHCP bulk leasequery messages received.</li> <li>• <b>DHCPRENEW</b>—Number of DHCP renew messages received; subset of <b>DHCPREQUEST</b> counter.</li> <li>• <b>DHCPREBIND</b>—Number of DHCP rebind messages received; subset of <b>DHCPREQUEST</b> counter.</li> </ul>

Table 98: show dhcp server statistics Output Fields (continued)

Field Name	Field Description
<b>Messages sent</b>	<p>Number of DHCP messages sent.</p> <ul style="list-style-type: none"> <li><b>BOOTREPLY</b>—Number of BOOTP PDUs transmitted</li> <li><b>DHCPOFFER</b>—Number of DHCP OFFER PDUs transmitted</li> <li><b>DHCPACK</b>—Number of DHCP ACK PDUs transmitted</li> <li><b>DHC PNACK</b>—Number of DHCP NACK PDUs transmitted</li> <li><b>DHCPFORCERENEW</b>—Number of DHCP FORCERENEW PDUs transmitted</li> <li><b>DHCPLEASEUNASSIGNED</b>—Number of DHCP leases that are managed by the server but have not yet been assigned</li> <li><b>DHCPLEASEUNKNOWN</b>—Number of unknown DHCP leases</li> <li><b>DHCPLEASEACTIVE</b>—Number of active DHCP leases</li> <li><b>DHCPLEASEQUERYDONE</b>—The leasequery is complete</li> </ul>
<b>Total Accepted Connections</b>	Total number of bulk leasequery connections accepted by the server.
<b>Total Not-Accepted Connections</b>	Total number of bulk leasequery connections not accepted by the server.
<b>Connections Closed due to Errors</b>	Number of bulk leasequery connections that the server closed due to an internal error.
<b>Connections Closed due to max-empty-replies</b>	Number of bulk leasequery connections that the server closed because the maximum number of empty replies was reached.
<b>In-flight Connections</b>	Number of bulk leasequery connections on the server.

## Sample Output

## show dhcpv6 relay binding

**Syntax** `show dhcpv6 relay binding`  
`<address>`  
`<brief>`  
`<detail>`  
`<interface interface-name>`  
`<interfaces-vlan>`  
`<interfaces-wildcard>`  
`<logical-system logical-system-name>`  
`<routing-instance routing-instance-name>`  
`<summary>`

**Release Information** Command introduced in Junos OS Release 11.4.  
*interfaces-vlan* and *interfaces-wildcard* options introduced in Junos OS Release 12.1.

**Description** Display the DHCPv6 address bindings in the Dynamic Host Configuration Protocol (DHCP) client table.

**Options** **address**—(Optional) One of the following identifiers for the DHCPv6 client whose binding state you want to show:

- *CID*—The specified Client ID (CID).
- *ipv6-prefix*—The specified IPv6 prefix.
- *session-id*—The specified session ID.

**brief**—(Optional) Display brief information about the active client bindings. This is the default, and produces the same output as **show dhcpv6 relay binding**.

**detail**—(Optional) Display detailed client binding information.

**interface interface-name**—(Optional) Perform this operation on the specified interface. You can optionally filter on VLAN ID and S-VLAN ID.

**interfaces-vlan**—(Optional) Interface VLAN ID or S-VLAN ID interface on which to show binding state information.

**interfaces-wildcard**—(Optional) Set of interfaces on which to show binding state information. This option supports the use of the wildcard character (\*).

**logical-system logical-system-name**—(Optional) Perform this operation on the specified logical system.

**routing-instance routing-instance-name**—(Optional) Perform this operation on the specified routing instance.

**summary**—(Optional) Display a summary of DHCPv6 client information.

**Required Privilege Level** view

**Output Fields** [Table 99 on page 1728](#) lists the output fields for the **show dhcpv6 relay binding** command. Output fields are listed in the approximate order in which they appear.

*Table 99: show dhcpv6 relay binding Output Fields*

Field Name	Field Description	Level of Output
<i>number clients, (number init, number bound, number selecting, number requesting, number renewing, number rebinding, number releasing)</i>	Summary counts of the total number of DHCPv6 clients and the number of DHCPv6 clients in each state.	<b>summary</b>
Client IPv6 Prefix	Prefix of the DHCPv6 client.	<b>brief detail</b>
Client IPv6 Excluded Prefix	IPv6 Prefix of the DHCP client excluded.	<b>detail</b>
Client DUID	DHCP for IPv6 Unique Identifier (DUID) of the client.	<b>brief detail</b>
Client IPv6 Address	IPv6 address assigned to the subscriber.	<b>detail</b>
Session Id	Session ID of the subscriber session.	<b>brief detail</b>
Expires	Number of seconds in which the lease expires.	<b>brief detail</b>

Table 99: show dhcpv6 relay binding Output Fields (continued)

Field Name	Field Description	Level of Output
<b>State</b>	<p>State of the DHCPv6 relay address binding table on the DHCPv6 client:</p> <ul style="list-style-type: none"> <li>• <b>BOUND</b>—Client has an active IP address lease.</li> <li>• <b>INIT</b>—Initial state.</li> <li>• <b>REBINDING</b>—Client is broadcasting a request to renew the IP address lease.</li> <li>• <b>RECONFIGURE</b>—Client is broadcasting a request to reconfigure the IP address lease.</li> <li>• <b>RELEASE</b>—Client is releasing the IP address lease.</li> <li>• <b>RENEWING</b>—Client is sending a request to renew the IP address lease.</li> <li>• <b>REQUESTING</b>—Client is requesting a DHCPv6 server.</li> <li>• <b>SELECTING</b>—Client is receiving offers from DHCPv6 servers.</li> </ul>	<b>brief detail</b>
<b>Interface</b>	Incoming client interface.	<b>brief</b>
<b>Lease Expires</b>	Date and time at which the client's IP address lease expires.	<b>detail</b>
<b>Lease Expires in</b>	Number of seconds in which the lease expires.	<b>detail</b>
<b>Preferred Lease Expires</b>	Date and UTC time at which the client's IPv6 prefix expires.	<b>detail</b>
<b>Preferred Lease Expires in</b>	Number of seconds at which the client's IPv6 prefix expires.	<b>detail</b>
<b>Lease Start</b>	Date and time at which the client's IP address lease started.	<b>detail</b>
<b>Lease time violated</b>	Lease time violation has occurred.	<b>detail</b>
<b>Incoming Client Interface</b>	Client's incoming interface.	<b>detail</b>
<b>Server Address</b>	<p>IP address of the DHCPv6 server.</p> <p>Displays <b>unknown</b> for a DHCPv6 relay agent in a multi-relay topology that is not directly adjacent to the DHCPv6 server and does not detect the IP address of the server. In that case, the output instead displays the <b>Next Hop Server Facing Relay</b> field.</p>	<b>detail</b>
<b>Next Hop Server Facing Relay</b>	Next-hop address in the direction of the DHCPv6 server.	<b>detail</b>
<b>Server Interface</b>	Interface of the DHCPv6 server.	<b>detail</b>
<b>Relay Address</b>	IP address of the relay.	<b>detail</b>
<b>Client Pool Name</b>	Address pool that granted the client lease.	<b>detail</b>
<b>Client ID Length</b>	Length of client ID.	All levels

Table 99: show dhcpv6 relay binding Output Fields (continued)

Field Name	Field Description	Level of Output
Client Id	Client ID.	All levels
Generated Circuit ID	Circuit ID generated by the DHCPv6 Interface-ID option (option 18)	<b>detail</b>
Generated Remote ID Enterprise Number	The Juniper Networks IANA private enterprise number	<b>detail</b>
Generated Remote ID	Remote ID generated by the DHCPv6 Remote-ID option (option 37)	<b>detail</b>
Dual Stack Group	Name of the dual-stack group for the DHCPv6 binding.	<b>detail</b>
Dual Stack Peer Address	Address of the dual-stack DHCPv4 peer.	<b>detail</b>

## show dhcpv6 relay lockout-entries

<b>Syntax</b>	show dhcpv6 relay lockout-entries (all   index <i>index</i> )
<b>Release Information</b>	Command introduced in Junos OS Release 18.2R1 on MX Series routers.
<b>Description</b>	Display information about all client entries or detailed information about a specific client entry in the DHCPv6 relay agent lockout database.
<b>Options</b>	<p><b>all</b>—Display all client entries in the lockout database.</p> <p><b>index <i>index</i></b>—Display detailed information for the specified client.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear dhcpv6 relay lockout-entries on page 1555</a></li> <li>• <a href="#">show dhcp relay lockout-entries on page 1708</a></li> <li>• <a href="#">show dhcp server lockout-entries on page 1721</a></li> <li>• <a href="#">show dhcpv6 server lockout-entries on page 1749</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show dhcpv6 relay lockout-entries (All Entries) on page 1737</a></p> <p><a href="#">show dhcpv6 relay lockout-entries (Specific Entry) on page 1737</a></p>
<b>Output Fields</b>	Table 100 on page 1736 lists the output fields for the <b>show dhcpv6 relay lockout-entries</b> command. Output fields are listed in the approximate order in which they appear.

Table 100: show dhcpv6 relay lockout-entries Output Fields

Field Name	Field Description	Level of Output
<b>Index</b>	Number identifying a specific entry in the lockout database.	<b>all</b> and <b>index</b>
<b>Key</b>	DUID identifying the client in the lockout database.	<b>all</b> and <b>index</b>
<b>State</b>	Type of lockout period for the entry: <ul style="list-style-type: none"> <li>• <b>Grace</b>—A previously locked out client enters the grace period when the lockout expires. If the client attempts to establish a session within in this period, the next lockout time is increased. If the grace time passes without a log in, the entry is removed from the lockout database.</li> <li>• <b>Lockout</b>—Client is currently locked out; attempts to establish a session are rejected.</li> </ul>	<b>all</b> and <b>index</b>
<b>Expires (s)</b>	Number of seconds until the current lockout period expires.	<b>all</b> only

Table 100: show dhcpv6 relay lockout-entries Output Fields (continued)

Field Name	Field Description	Level of Output
Elapsed (s)	Number of seconds since the current lockout or grace timer started.	all only
Count	Number of consecutive times the client has been locked out.	all only
Expires	Date and time when the current lockout period ends.	index only
Expires in	Number of seconds until the current period expires.	index only
Lockout count	Number of consecutive times client has been locked out.	index only
Next lockout time	Duration of the next lockout period for this client.	index only
Min lockout time	Minimum duration for a lockout period; the initial lockout time.	index only
Lockout reason	Reason for the current lockout. The possible values are internal jdhcpd error codes. These values are provided for debugging by Juniper Networks technical support.	index only

## Sample Output

### show dhcpv6 relay lockout-entries (All Entries)

```
user@host> show dhcpv6 relay lockout-entries all
```

Index	Key	State	Expires(s)	Elapsed(s)	Count
1	00:00:5E:00:53:00	Lockout	30	5200	2
2	00:00:5E:00:53:11	Grace	120	780	2
3	00:00:5E:00:53:22	Lockout	180	2300	1

### show dhcpv6 relay lockout-entries (Specific Entry)

```
user@host> show dhcpv6 relay lockout-entries index 2
```

```

Index:                2
Key:                  default/00 01 00 01 5a bc e1 7b 00
10 94 00 00 06/
State:                Lockout
Expires:              2018-03-29 19:06:17 IST
Expires in:           87
Lockout count:        1
Next lockout time:    200
Min lockout time:     100
Lockout reason:       181
```

## show dhcpv6 relay statistics

---

Syntax	<pre>show dhcpv6 relay statistics &lt;bulk-leasequery-connections&gt; &lt;logical-system <i>logical-system-name</i>&gt; &lt;routing-instance <i>routing-instance-name</i>&gt;</pre>
Release Information	<p>Command introduced in Junos OS Release 11.4.</p> <p>Command introduced in Junos OS Release 12.1X48R3 for PTX Series Packet Transport Switches.</p> <p>Command introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p><b>bulk-leasequery-connections</b> option introduced in Junos OS Release 16.1.</p>
Description	Display Dynamic Host Configuration Protocol for IPv6 (DHCPv6) relay statistics.
Options	<p><b>bulk-leasequery-connections</b>—(Optional) Display bulk leasequery statistics.</p> <p><b>logical-system <i>logical-system-name</i></b>—(Optional) Perform this operation on the specified logical system. If you do not specify a logical system name, statistics are displayed for the default logical system.</p> <p><b>routing-instance <i>routing-instance-name</i></b>—(Optional) Perform this operation on the specified routing instance. If you do not specify a routing instance name, statistics are displayed for the default routing instance.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">clear dhcpv6 relay statistics on page 1557</a></li><li>• <a href="#">DHCPv6 Client MAC Address Validation to Prevent Session Hijacking on page 396</a></li></ul>
List of Sample Output	<p><a href="#">show dhcpv6 relay statistics on page 1740</a></p> <p><a href="#">show dhcpv6 relay statistics bulk-leasequery-connections on page 1741</a></p>
Output Fields	<p><a href="#">Table 101 on page 1739</a> lists the output fields for the <b>show dhcpv6 relay statistics</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 101: show dhcpv6 relay statistics Output Fields

Field Name	Field Description
DHCPv6 Packets dropped	<p>Number of packets discarded by the extended DHCPv6 relay agent application due to errors. Only nonzero statistics appear in the <b>Packets dropped</b> output. When all of the Packets dropped statistics are 0 (zero), only the <b>Total</b> field appears.</p> <ul style="list-style-type: none"> <li>• <b>Total</b>—Total number of packets discarded by the DHCPV6 relay agent application.</li> <li>• <b>Bad options</b>—Number of packets discarded because invalid options were specified.</li> <li>• <b>Bad send</b>—Number of packets that the extended DHCP relay application could not send.</li> <li>• <b>Bad src address</b>—Number of packets discarded because the family type was not AF_INET6.</li> <li>• <b>Client MAC validation</b>—Number of packets discarded because validation of the client MAC address failed.</li> <li>• <b>No client id</b>—Number of packets discarded because they could not be matched to a client.</li> <li>• <b>Lease Time Violation</b>—Number of packets discarded because of a lease time violation</li> <li>• <b>No safd</b>—Number of packets discarded because they arrived on an unconfigured interface.</li> <li>• <b>Short packet</b>—Number of packets discarded because they were too short.</li> <li>• <b>Relay hop count</b>—Number of packets discarded because the hop count in the packet exceeded 32.</li> </ul>
Messages received	<p>Number of DHCPv6 messages received.</p> <ul style="list-style-type: none"> <li>• <b>DHCPv6_DECLINE</b>—Number of DHCPv6 PDUs of type DECLINE received</li> <li>• <b>DHCPv6_SOLICIT</b>—Number of DHCPv6 PDUs of type SOLICIT received</li> <li>• <b>DHCPv6_INFORMATION_REQUEST</b>—Number of DHCPv6 PDUs of type INFORMATION-REQUEST received</li> <li>• <b>DHCPv6_RELEASE</b>—Number of DHCPv6 PDUs of type RELEASE received</li> <li>• <b>DHCPv6_REQUEST</b>—Number of DHCPv6 PDUs of type REQUEST received</li> <li>• <b>DHCPv6_CONFIRM</b>—Number of DHCPv6 PDUs of type CONFIRM received</li> <li>• <b>DHCPv6_RENEW</b>—Number of DHCPv6 PDUs of type RENEW received</li> <li>• <b>DHCPv6_REBIND</b>—Number of DHCPv6 PDUs of type REBIND received</li> <li>• <b>DHCPv6_RELAY_REPL</b>—Number of DHCPv6 PDUs of type RELAY-REPL received</li> <li>• <b>DHCPv6_RELAY_FORW</b>—Number of DHCPv6 RELAY-FORW PDUs received.</li> <li>• <b>DHCPv6_LEASEQUERY_REPLY</b>—Number of DHCPv6 replies received from the DHCPv6 sever</li> <li>• <b>DHCPv6_LEASEQUERY_DATA</b>—xxxx</li> <li>• <b>DHCPv6_LEASEQUERY_DONE</b>—The leasequery is complete</li> </ul>

Table 101: show dhcpv6 relay statistics Output Fields (continued)

Field Name	Field Description
<b>External Server Response</b>	State of the external DHCP server responsiveness.
<b>Total Requested Servers</b>	Total number of servers with which the DHCP relay agent has requested a bulk leasequery connection.
<b>Total Attempted Servers</b>	Total number of servers with which the DHCP relay agent has attempted to create a bulk leasequery connection.
<b>Total Connected</b>	Total number of servers that have formed a bulk leasequery connection with the DHCP relay agent.
<b>Total Terminated by Server</b>	Total number of servers that have terminated a bulk leasequery connection with the DHCP relay agent.
<b>Total Max Attempted</b>	Total number of servers where the DHCP relay agent reached the maximum retry limit when it attempted to create a bulk leasequery connection.
<b>Total Closed due to Errors</b>	Total number of bulk leasequery connections that closed due to an internal error on the DHCP relay agent.
<b>In-Flight Connected</b>	Number of current bulk leasequery connections on the DHCP relay agent.
<b>Bulk Leasequery Reply Packet Retries</b>	Number of bulk leasequery reply packets that the DHCP relay agent has retried.

## Sample Output

### show dhcpv6 relay statistics

```
user@host> show dhcpv6 relay statistics
```

```
DHCPv6 Packets dropped:
```

```
  Total                2
  Lease Time Violation  1
  Client MAC validation  1
```

```
Messages received:
```

```
  DHCPV6_DECLINE        0
  DHCPV6_SOLICIT        10

```

## show dhcpv6 server binding

---

Syntax	<pre>show dhcpv6 server binding &lt;address&gt; &lt;brief   detail   summary&gt; &lt;interface interface-name&gt; &lt;interfaces-vlan&gt; &lt;interfaces-wildcard&gt; &lt;logical-system logical-system-name&gt; &lt;routing-instance routing-instance-name&gt;</pre>
Release Information	Command introduced in Junos OS Release 9.6. Options <i>interfaces-vlan</i> and <i>interfaces-wildcard</i> added in Junos OS Release 12.1.
Description	Display the address bindings in the client table on the extended Dynamic Host Configuration Protocol for IPv6 (DHCPv6) local server.
Options	<p><b>address</b>—(Optional) One of the following identifiers for the DHCPv6 client whose binding state you want to show:</p> <ul style="list-style-type: none"><li>• <i>CID</i>—The specified Client ID (CID).</li><li>• <i>ipv6-prefix</i>—The specified IPv6 prefix.</li><li>• <i>session-id</i>—The specified session ID.</li></ul> <p><b>brief   detail   summary</b>—(Optional) Display the specified level of output about active client bindings. The default is <b>brief</b>, which produces the same output as <b>show dhcpv6 server binding</b>.</p> <p><b>interface interface-name</b>—(Optional) Display information about active client bindings on the specified interface. You can optionally filter on VLAN ID and SVLAN ID.</p> <p><b>interfaces-vlan</b>—(Optional) Interface VLAN ID or S-VLAN ID interface on which to show binding state information.</p> <p><b>interfaces-wildcard</b>—(Optional) Set of interfaces on which to show binding state information. This option supports the use of the wildcard character (*).</p> <p><b>logical-system logical-system-name</b>—(Optional) Display information about active client bindings for DHCPv6 clients on the specified logical system.</p> <p><b>routing-instance routing-instance-name</b>—(Optional) Display information about active client bindings for DHCPv6 clients on the specified routing instance.</p>

**Output Fields** [Table 102 on page 1743](#) lists the output fields for the **show dhcpv6 server binding** command. Output fields are listed in the approximate order in which they appear.

*Table 102: show dhcpv6 server binding Output Fields*

Field Name	Field Description	Level of Output
<i>number clients, (number init, number bound, number selecting, number requesting, number renewing, number releasing)</i>	Summary counts of the total number of DHCPv6 clients and the number of DHCPv6 clients in each state.	<b>summary</b>
<b>Prefix</b>	Client's DHCPv6 prefix, or prefix used to support multiple address assignment.	<b>brief detail</b>
<b>Session Id</b>	Session ID of the subscriber session.	<b>brief detail</b>
<b>Expires</b>	Number of seconds in which lease expires.	<b>brief detail</b>
<b>State</b>	State of the address binding table on the extended DHCPv6 local server: <ul style="list-style-type: none"> <li>• <b>BOUND</b>—Client has active IP address lease.</li> <li>• <b>INIT</b>—Initial state.</li> <li>• <b>RECONFIGURE</b>—Server has sent reconfigure message to client.</li> <li>• <b>RELEASE</b>—Client is releasing IP address lease.</li> <li>• <b>RENEWING</b>—Client sending request to renew IP address lease.</li> <li>• <b>REQUESTING</b>—Client requesting a DHCPv6 server.</li> <li>• <b>SELECTING</b>—Client receiving offers from DHCPv6 servers.</li> </ul>	<b>brief detail</b>
<b>Interface</b>	Interface on which the DHCPv6 request was received.	<b>brief</b>
<b>Client IPv6 Address</b>	Client's IPv6 address.	<b>detail</b>
<b>Client IPv6 Prefix</b>	Client's IPv6 prefix.	<b>detail</b>

Table 102: show dhcpv6 server binding Output Fields (continued)

Field Name	Field Description	Level of Output
Client IPv6 Excluded Prefix	IPv6 Prefix of the DHCP client excluded.	detail
Client DUID	Client's DHCP Unique Identifier (DUID).	brief detail
Lease expires	Date and time at which the client's IP address lease expires.	detail
Lease expires in	Number of seconds in which lease expires.	detail
Preferred Lease Expires	Date and UTC time at which the client's IPv6 prefix expires.	detail
Preferred Lease Expires in	Number of seconds at which client's IPv6 prefix expires.	detail
Lease Start	Date and time at which the client's address lease was obtained.	detail
Lease time violated	Lease time violation has occurred.	detail
Incoming Client Interface	Client's incoming interface.	detail
Server IP Address	IP address of DHCPv6 server.	detail
Server Interface	Interface of DHCPv6 server.	detail
Client Pool Name	Address pool used to assign IPv6 address.	detail
Client Prefix Pool Name	Address pool used to assign IPv6 prefix.	detail
Client Id length	Length of the DHCPv6 client ID, in bytes.	detail
Client Id	ID of the DHCPv6 client.	detail
Server Id	DHCP unique identifier (DUID) for the DHCPv6 server.	detail
Client Interface Svlan Id	S-VLAN ID of the client's incoming interface.	detail
Client Interface Vlan Id	VLAN ID of the client's incoming interface.	detail
Dual Stack Group	DHCPv6 server profile name.	detail
Dual Stack Peer Address	DHCPv6 Peer IP address.	detail

## Sample Output

## show dhcpv6 server lockout-entries

<b>Syntax</b>	<code>show dhcpv6 server lockout-entries (all   index <i>index</i>)</code>
<b>Release Information</b>	Command introduced in Junos OS Release 18.2R1 on MX Series routers.
<b>Description</b>	Display information about all client entries or detailed information about a specific client entry in the DHCPv6 local server lockout database.
<b>Options</b>	<p><b>all</b>—Display all client entries in the lockout database.</p> <p><b>index <i>index</i></b>—Display detailed information for the specified client.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear dhcpv6 server lockout-entries on page 1562</a></li> <li>• <a href="#">show dhcp relay lockout-entries on page 1708</a></li> <li>• <a href="#">show dhcp server lockout-entries on page 1721</a></li> <li>• <a href="#">show dhcpv6 relay lockout-entries on page 1736</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show dhcpv6 server lockout-entries (All Entries) on page 1750</a></p> <p><a href="#">show dhcpv6 server lockout-entries (Specific Entry) on page 1750</a></p>
<b>Output Fields</b>	Table 103 on page 1749 lists the output fields for the <b>show dhcpv6 server lockout-entries</b> command. Output fields are listed in the approximate order in which they appear.

Table 103: show dhcpv6 server lockout-entries Output Fields

Field Name	Field Description	Level of Output
<b>Index</b>	Number identifying a specific entry in the lockout database.	<b>all</b> and <b>index</b>
<b>Key</b>	DUID identifying the client in the lockout database.	<b>all</b> and <b>index</b>
<b>State</b>	Type of lockout period for the entry: <ul style="list-style-type: none"> <li>• <b>Grace</b>—A previously locked out client enters the grace period when the lockout expires. If the client attempts to establish a session within in this period, the next lockout time is increased. If the grace time passes without a log in, the entry is removed from the lockout database.</li> <li>• <b>Lockout</b>—Client is currently locked out; attempts to establish a session are rejected.</li> </ul>	<b>all</b> and <b>index</b>
<b>Expires (s)</b>	Number of seconds until the current lockout period expires.	<b>all</b> only

Table 103: show dhcpv6 server lockout-entries Output Fields (continued)

Field Name	Field Description	Level of Output
Elapsed (s)	Number of seconds since the current lockout or grace timer started.	all only
Count	Number of consecutive times the client has been locked out.	all only
Expires	Date and time when the current lockout period ends.	index only
Expires in	Number of seconds until the current period expires.	index only
Lockout count	Number of consecutive times client has been locked out.	index only
Next lockout time	Duration of the next lockout period for this client.	index only
Min lockout time	Minimum duration for a lockout period; the initial lockout time.	index only
Lockout reason	Reason for the current lockout. The possible values are internal jdhcpd error codes. These values are provided for debugging by Juniper Networks technical support.	index only

## Sample Output

### show dhcpv6 server lockout-entries (All Entries)

```
user@host> show dhcpv6 server lockout-entries all
```

Index	Key	State	Expires(s)	Elapsed(s)	Count
1	00:00:5E:00:53:00	Lockout	30	5200	2
2	00:00:5E:00:53:11	Grace	120	780	2
3	00:00:5E:00:53:22	Lockout	180	2300	1

### show dhcpv6 server lockout-entries (Specific Entry)

```
user@host> show dhcpv6 server lockout-entries index 2
```

```

Index:                2
Key:                  default/00 01 00 01 5a bc e1 7b 00
10 94 00 00 06/
State:                Lockout
Expires:              2018-03-29 19:06:17 IST
Expires in:           87
Lockout count:        1
Next lockout time:    200
Min lockout time:     100
Lockout reason:       181
```

## show dhcpv6 server statistics

Syntax	<pre>show dhcpv6 server statistics &lt;bulk-leasequery-connections&gt; &lt;logical-system <i>logical-system-name</i>&gt; &lt;routing-instance <i>routing-instance-name</i>&gt;</pre>
Release Information	<p>Command introduced in Junos OS Release 9.6.</p> <p><b>bulk-leasequery-connections</b> option introduced in Junos OS Release 16.1.</p>
Description	Display extended Dynamic Host Configuration Protocol for IPv6 (DHCPv6) local server statistics.
Options	<p><b>bulk-leasequery-connections</b>—(Optional) Display bulk leasequery statistics.</p> <p><b>logical-system <i>logical-system-name</i></b>—(Optional) Display information about extended DHCPv6 local server statistics on the specified logical system. If you do not specify a logical system, statistics are displayed for the default logical system.</p> <p><b>routing-instance <i>routing-instance-name</i></b>—(Optional) Display information about extended DHCPv6 local server statistics on the specified routing instance. If you do not specify a routing instance, statistics are displayed for the default routing instance.</p>

```

## show diameter

<b>Syntax</b>	<b>show diameter</b> <b>&lt;brief   detail   summary&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 9.6.
<b>Description</b>	Display information about the Diameter node.
<b>Options</b>	<b>brief   detail   summary</b> —(Optional) Display the specified level of output. The <b>summary</b> output is displayed by default and includes Diameter node status. The <b>brief</b> output adds summary information about functions, instances, network elements, and peers. The <b>detail</b> output adds summary information about routes.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear diameter function statistics on page 1565</a></li> <li>• <a href="#">clear diameter peer on page 1566</a></li> <li>• <a href="#">show diameter function on page 1761</a></li> <li>• <a href="#">show diameter instance on page 1769</a></li> <li>• <a href="#">show diameter network-element on page 1771</a></li> <li>• <a href="#">show diameter peer on page 1777</a></li> <li>• <a href="#">show diameter route on page 1789</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show diameter brief on page 1758</a> <a href="#">show diameter detail on page 1759</a> <a href="#">show diameter summary on page 1759</a>
<b>Output Fields</b>	<a href="#">Table 105 on page 1755</a> lists the output fields for the <b>show diameter</b> command. Output fields are listed in the approximate order in which they appear.

*Table 105: show diameter Output Fields*

Field Name	Field Description	Level of Output
<b>Diameter process id</b>	ID number of the Diameter process.	All levels
<b>Functions</b>	Number of functions associated with Diameter.	All levels
<b>Connected functions</b>	Number of functions with active Diameter connections.	All levels

Table 105: show diameter Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Instances</b>	Number of configured Diameter instances.	All levels
<b>Network elements (NEs)</b>	Number of configured Diameter network elements.	All levels
<b>Connected NEs</b>	Number of Diameter network elements with active connections.	All levels
<b>Peers</b>	Number of Diameter peer nodes.	All levels
<b>Activated peers</b>	Number of Diameter peers with active connections.	All levels
<b>Open peers</b>	Number of peers in the open state, without active network element connections but available for a connection.	All levels
<b>Transports</b>	Number of transports configured.	All levels
<b>Requests queued for network transmit</b>	Number of requests waiting to be sent to the Diameter peers.	All levels
<b>Answers queued for network transmit</b>	Number of replies waiting to be sent to the Diameter peers.	All levels
<b>Expected answers from network</b>	Number of replies expected to be received from the Diameter peers.	All levels
<b>Requests queued for function transmit</b>	Number of requests waiting to be sent to the functions associated with Diameter.	All levels
<b>Answers queued for function transmit</b>	Number of replies waiting to be sent to the functions associated with Diameter.	All levels
<b>Expected answers from functions</b>	Number of replies expected to be received from the functions associated with Diameter.	All levels
<b>Memory used by network transmit queues</b>	Amount of memory consumed by network transmit queues.	All levels
<b>Memory used by function transmit queues</b>	Amount of memory consumed by function transmit queues.	All levels
<b>Origin-state-id</b>	Value of the Origin-State-ID AVP.	All levels
<b>Function</b>	Name of the function for which information is displayed.	<b>brief detail</b>

Table 105: show diameter Output Fields (continued)

Field Name	Field Description	Level of Output
<b>State</b>	State of the Diameter connection with the function: <b>Connected</b> or <b>Disconnec</b> (disconnected).	<b>brief detail</b>
<b>Upstream Transaction Utilization</b>	Percent of upstream traffic used for this function.	<b>brief detail</b>
<b>Downstream Transaction Utilization</b>	Percent of downstream traffic used for this function.	<b>brief detail</b>
<b>Net Queue Buffer Utilization</b>	Percent of network transmission buffer used for this function.	<b>brief detail</b>
<b>Func Queue Buffer Utilization</b>	Percent of function transmission buffer used for this function.	<b>brief detail</b>
<b>Routed Dests</b>	Number of destinations that have this function associated with their routes.	<b>brief detail</b>
<b>Name</b>	Name of the Diameter instance.	<b>brief detail</b>
<b>Origin-Realm</b>	Value of Origin-Realm attribute-value pair (AVP).	<b>brief detail</b>
<b>Origin Host</b>	Value of Origin-Host AVP.	<b>brief detail</b>
<b>NE-Total</b>	Number of configured network elements.	<b>brief detail</b>
<b>NE-Connected</b>	Number of network elements with active Diameter connections.	<b>brief detail</b>
<b>Name</b>	Name of the Diameter network element.	<b>brief detail</b>
<b>Instance</b>	Name of the Diameter instance in which the network element is configured.	<b>brief detail</b>
<b>State</b>	State of the network element: <ul style="list-style-type: none"> <li>• Connecting—None of the network element peers are in the open state and available for connection.</li> <li>• Selecting—One network element peer is connected and the network element is waiting for another peer to reach the open state so that it can be connected.</li> <li>• Partially-Connected—One network element peer is in the open state and connected.</li> <li>• Post-selection-delay—Three or more peers are in the open state and the network element is waiting to deactivate the peers in excess of two.</li> <li>• Fully-connected—Two network element peers are in the open state and connected.</li> </ul>	<b>brief detail</b>
<b>Primary Peer</b>	Primary peer for the network element, based on the configured peer priority.	<b>brief detail</b>
<b>Secondary Peer</b>	Secondary peer for the network element, based on the configured peer priority.	<b>brief detail</b>

Table 105: show diameter Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Peer</b>	Name of the peer.	<b>brief detail</b>
<b>Instance</b>	Name of the Diameter instance in which the peer is configured.	<b>brief detail</b>
<b>State</b>	State of the peer: <ul style="list-style-type: none"> <li>• Bad-Config—Misconfiguration.</li> <li>• Bad-Remote—Remote side does not conform to one of the decisions or is sending malformed messages.</li> <li>• Closed—Normal disconnect due to a request from the remote site or due to excessive watchdog timeouts.</li> <li>• Destructing—Peer to be deleted on the next timer tick. Until then, it performs no actions.</li> <li>• Disabled—Peer is administratively disabled.</li> <li>• Internal-error—Internal error has been detected and the peer is in the process of restarting.</li> <li>• No-Activation—Peer is not used by any Diameter network element.</li> <li>• Rejected—Connection was rejected by remote side of the connection.</li> <li>• Suspended—All other reasons to be suspended.</li> </ul>	<b>brief detail</b>
<b>NE-Count</b>	Number of network elements associated with the peer.	<b>brief detail</b>
<b>Activated Count</b>	Activation status of the peer: <ul style="list-style-type: none"> <li>• 1—Peer is activated.</li> <li>• 0—Peer is not activated.</li> </ul>	<b>brief detail</b>
<b>Primary Count</b>	Status of the peer: primary (1) or secondary (0).	<b>brief detail</b>
<b>Secondary Count</b>	Status of the peer: secondary (0) or primary (1).	<b>brief detail</b>
<b>Route</b>	Name of the Diameter route.	<b>detail</b>
<b>NE</b>	Name of the Diameter network element in which the route is configured	<b>detail</b>
<b>Instance</b>	Name of the Diameter instance in which the route is configured.	<b>detail</b>
<b>Valid</b>	Determination of whether the route is valid: <b>yes</b> or <b>no</b> .	<b>detail</b>
<b>Up</b>	State of the route: <b>yes</b> for an active route, <b>no</b> for an inactive route.	<b>detail</b>

## show diameter function statistics

<b>Syntax</b>	<b>show diameter function statistics</b> <b>&lt;brief   detail   summary&gt;</b> <b>&lt;function-name&gt;</b>	
<b>Release Information</b>	Command introduced in Junos OS Release 9.6. Support for PTSP introduced in Junos OS Release 10.2. Support for Gx-Plus introduced in Junos OS Release 11.2. Support for PTSP discontinued in Junos OS Release 13.1.	
<b>Description</b>	Display statistics about all functions associated with Diameter instances or only the specified function.	
<b>Options</b>	<p><b>brief   detail   summary</b>—(Optional) Display the specified level of output. The <b>summary</b> output is displayed by default and includes basic function statistics. The <b>brief</b> output displays the summary information in a different format and adds numbers accumulated since the Diameter node was started. The <b>detail</b> output adds information to the <b>brief</b> output.</p> <p><b>function-name</b>—(Optional) Display information for only the specified function. Gx-Plus, JSRC, and packet-triggered-subscribers are supported functions. When you specify a function, the <b>brief</b> output is displayed by default, even when you explicitly specify <b>summary</b>.</p>	
<b>Required Privilege Level</b>	view	
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear diameter function statistics on page 1565</a></li> <li>• <a href="#">show diameter on page 1755</a></li> <li>• <a href="#">show diameter function on page 1761</a></li> </ul>	
<b>List of Sample Output</b>	<a href="#">show diameter function statistics on page 1767</a> <a href="#">show diameter function statistics brief on page 1767</a> <a href="#">show diameter function statistics detail on page 1767</a>	
<b>Output Fields</b>	Table 107 on page 1765 lists the output fields for the <b>show diameter function statistics</b> command. Output fields are listed in the approximate order in which they appear.	

Table 107: show diameter function statistics Output Fields

Field Name	Field Description	Level of Output
<b>Function</b>	Name of the function for which information is displayed.	All levels

Table 107: show diameter function statistics Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Delivered Requests</b>	Number of requests delivered by Diameter to the application.	All levels
<b>Delivered Answers</b>	Number of answers delivered by Diameter to the application.	All levels
<b>Delivered Messages</b>	Total number of messages delivered by Diameter to the application.	All levels
<b>Forwarded Requests</b>	Number of requests sent by Diameter to the network.	All levels
<b>Forwarded Answers</b>	Number of answers sent by Diameter to the network.	All levels
<b>Forwarded Messages</b>	Number of messages sent by Diameter to the network.	All levels
<b>Function name</b>	Name of the function for which information is displayed.	All levels
<b>Over-limit network requests</b>	Number of requests sent to Diameter peers that exceeded the limit on the network transmit queue.	detail
<b>Over-limit network answers</b>	Number of answers sent to Diameter peers that exceeded the limit on the network transmit queue.	detail
<b>Over-limit network messages</b>	Total number of messages sent to Diameter peers that exceeded the limit on the network transmit queue.	detail
<b>Failed to deliver requests</b>	Number of requests sent by Diameter to its application that were not successfully delivered.	detail
<b>Failed to deliver answers</b>	Number of answers sent by Diameter to its application that were not successfully delivered.	detail
<b>Failed to deliver messages</b>	Total number of messages sent by Diameter to its application that were not successfully delivered.	detail

## Sample Output

### show diameter function statistics

```
user@host> show diameter function statistics
```

```
Diameter function statistics:
      Delivered Delivered Delivered Forwarded Forwarded Forwarded
Function Requests  Answers  Messages Requests  Answers  Messages
jsrc              0          0          0          0          0          0
```

### show diameter function statistics brief

```
user@host> show diameter function statistics brief
```

```
Diameter function statistics:
Function name           : jsrc

Delivered requests      :          0          0
Delivered answers       :          0          0
Delivered messages      :          0          0
Forwarded requests      :          0          0
Forwarded answers       :          0          0
Forwarded messages      :          0          0
```

### show diameter function statistics detail

```
user@host> show diameter function statistics detail
```

```
Diameter function statistics:
Function name           : jsrc

Delivered requests      :          0          0
Delivered answers       :          0          0
Delivered messages      :          0          0
Forwarded requests      :          0          0
Forwarded answers       :          0          0
Forwarded messages      :          0          0
Over-limit network requests :          0          0
Over-limit network answers :          0          0
Over-limit network messages :          0          0
Failed to deliver requests :          0          0
Failed to deliver answers  :          0          0
Failed to deliver messages :          0          0
Over-limit function requests :          0          0
Over-limit function answers :          0          0
Over-limit function messages :          0          0
Failed to forward requests :          0          0
```

Failed to forward answers	:	0	0
Failed to forward messages	:	0	0

## show diameter instance

**Syntax** `show diameter instance  
<brief | detail | summary>  
<instance-name>`

**Release Information** Command introduced in Junos OS Release 9.6.

**Description** Display information about all Diameter instances or only the specified instance.

**Options** **brief | detail | summary**—(Optional) Display the specified level of output. The **summary** output is displayed by default and includes basic instance information. The **brief** output displays the summary information in a different format. The **detail** output is the same as the **brief** output.

**instance-name**—(Optional) Display information for only the specified Diameter instance.

**Required Privilege Level** view

**Related Documentation** • [show diameter on page 1755](#)

**List of Sample Output** [show diameter instance on page 1770](#)  
[show diameter instance detail on page 1770](#)

**Output Fields** [Table 108 on page 1769](#) lists the output fields for the **show diameter instance** command. Output fields are listed in the approximate order in which they appear.

*Table 108: show diameter instance Output Fields*

Field Name	Field Description	Level of Output
name	Name of the Diameter instance.	summary
Origin-realm	Value of Origin-Realm AVP.	summary
Origin-host	Value of Origin-Host AVP.	summary
NE-total	Total number of network elements configured for this instance.	summary
NE-connected	Number of network elements with active Diameter connections.	summary
Instance name	Name of the Diameter instance.	brief detail
Origin realm	Value of Origin-Realm AVP.	brief detail
Origin host	Value of Origin-Host AVP.	brief detail

Table 108: show diameter instance Output Fields (continued)

Field Name	Field Description	Level of Output
<b>NEs</b>	Total number of network elements configured for this instance.	<b>brief detail</b>
<b>Connected NEs</b>	Number of network elements with active Diameter connections.	<b>brief detail</b>

## Sample Output

### show diameter instance

```
user@host> show diameter instance
```

```
Diameter instances:
  Name      Origin-Realm  Origin-Host  NE-Total  NE-Connected
  master    rrrr         hhhh        1         1
```

### show diameter instance detail

```
user@host> show diameter instance detail
```

```
Diameter instance:
  Instance name : master

  Origin realm  : rrrr

  Origin host   : hhhh

  NEs           : 1
  Connected NEs : 1
```

## show diameter network-element

**Syntax** `show diameter network-element  
<brief | detail | summary>  
<element-name>`

**Release Information** Command introduced in Junos OS Release 9.6.

**Description** Display information about all Diameter network elements or only the specified network element.

**Options** **brief | detail | summary**—(Optional) Display the specified level of output. The **summary** output is displayed by default and includes basic network element information. The **brief** output displays the summary information in a different format. The **detail** output adds information to the **brief** output.

**element-name**—(Optional) Display information for only the specified network element.

**Required Privilege Level** view

- [show diameter route on page 1789](#)

**List of Sample Output** [show diameter network-element on page 1772](#)  
[show diameter network-element detail on page 1773](#)

**Output Fields** [Table 109 on page 1771](#) lists the output fields for the **show diameter network-element** command. Output fields are listed in the approximate order in which they appear.

*Table 109: show diameter network-element Output Fields*

Field Name	Field Description	Level of Output
<b>Name</b>	Name of the Diameter network element.	<b>summary</b>
<b>Instance</b>	Name of the Diameter instance in which the network element is configured.	<b>summary</b>

Table 109: show diameter network-element Output Fields (continued)

Field Name	Field Description	Level of Output
<b>State</b>	State of the network element: <ul style="list-style-type: none"> <li>Connecting—None of the network element peers are in the open state and available for connection.</li> <li>Selecting—One network element peer is connected and the network element is waiting for another peer to reach the open state so that it can be connected.</li> <li>Partially-Connected—One network element peer is in the open state and connected.</li> <li>Post-selection-delay—Three or more peers are in the open state and the network element is waiting to deactivate the peers in excess of two.</li> <li>Fully-connected—Two network element peers are in the open state and connected.</li> </ul>	All levels
<b>Primary peer</b>	Primary peer for the network element, based on the configured peer priority.	All levels
<b>Secondary peer</b>	Secondary peer for the network element, based on the configured peer priority.	All levels
<b>NE name</b>	Name of the Diameter network element.	<b>brief detail</b>
<b>Instance name</b>	Name of the Diameter instance in which the network element is configured.	<b>brief detail</b>
<b>Peers</b>	Number of configured peers.	<b>brief detail</b>
<b>Activated peers</b>	Number of peers that have been activated.	<b>brief detail</b>
<b>Open peers</b>	Number of peers in the open state, without active network element connections but available for a connection.	<b>brief detail</b>
<b>Routes</b>	Number of routes configured for the network element.	<b>brief detail</b>
<b>Invalid routes</b>	Number of routes that are invalid because they lack one or more of the following: application and partition, Diameter instance, or destination realm.	<b>brief detail</b>
<b>Activation delay</b>	Period in milliseconds between peer activations by the network element.	<b>brief detail</b>
<b>First selection delay</b>	Period in milliseconds that the network element waited after connecting to the first peer to allow other peers to reach the open state.	<b>brief detail</b>
<b>Postselection delay</b>	Period in milliseconds that the network element waited after having two peers in the open state before deactivating all lower-priority peers.	<b>brief detail</b>

## Sample Output

### show diameter network-element

```
user@host> show diameter network-element
```

```
Diameter network-elements:
```

Name	Instance	State	Primary Peer	Secondary Peer
ne0	master	Fully-connected	p0	p1

### show diameter network-element detail

```
user@host> show diameter network-element detail
```

```
Diameter network-element:
  NE name           : ne0

  Instance name     : master

  State             : Fully-connected
  Primary peer      : p0

  Secondary peer    : p1

  Peers             : 5
  Activated peers   : 4
  Open peers        : 2
  Routes            : 1
  Invalid routes    : 0
  Activation delay   : 10000 ms
  First selection delay : 0 ms
  Post selection delay : 30000 ms
```

## show diameter network-element map

**Syntax** `show diameter network-element map`  
`<brief | detail | summary>`  
`<element-name>`

**Release Information** Command introduced in Junos OS Release 9.6.

**Description** Display network-element-to-peer mapping information for all Diameter network elements or only the specified network element.

**Options** **brief | detail | summary**—(Optional) Display the specified level of output. The **summary** output is displayed by default. The **brief** output and **detail** output display the summary information in a different format.

**element-name**—(Optional) Display information for only the specified network element.

**Required Privilege Level** view

**Related Documentation**

**List of Sample Output** [show diameter peer on page 1779](#)  
[show diameter peer detail on page 1780](#)

**Output Fields** [Table 111 on page 1777](#) lists the output fields for the **show diameter peer** command. Output fields are listed in the approximate order in which they appear.

*Table 111: show diameter peer Output Fields*

Field Name	Field Description	Level of Output
Peer	Name of the peer.	brief summary
Instance	Name of the Diameter instance in which the peer is configured.	brief summary

Table 111: show diameter peer Output Fields (continued)

Field Name	Field Description	Level of Output
<b>State</b>	State of the peer: <ul style="list-style-type: none"> <li>• Bad-Config—Misconfiguration.</li> <li>• Bad-Remote—Remote side does not conform to one of the decisions or is sending malformed messages.</li> <li>• Closed—Normal disconnect due to a request from the remote site or due to excessive watchdog timeouts.</li> <li>• Destructing—Peer to be deleted on the next timer tick; until then, it performs no actions.</li> <li>• Disabled—Peer is administratively disabled.</li> <li>• Internal-error—Internal error has been detected and the peer is in the process of restarting.</li> <li>• No-Activation—Peer is not used by any Diameter network element.</li> <li>• Rejected—Connection was rejected by remote side of the connection.</li> <li>• Reopen—Connection has been unexpectedly closed and Diameter is attempting to reopen the connection.</li> <li>• Suspended—All other reasons to be suspended.</li> </ul>	All levels
<b>NE-Count</b>	Number of network elements associated with the peer.	<b>brief summary</b>
<b>Activated Count</b>	Activation status of the peer: <ul style="list-style-type: none"> <li>• 1—Peer is activated.</li> <li>• 0—Peer is not activated.</li> </ul>	All levels
<b>Primary Count</b>	Status of the peer, primary (1) or secondary (0).	All levels
<b>Secondary Count</b>	Secondary (0) versus Primary (1) status of the peer.	All levels
<b>Peer name</b>	Name of the peer.	<b>detail</b>
<b>NEs</b>	Number of network elements associated with the peer.	<b>detail</b>
<b>Vrf</b>	Logical system:routing instance of the configuration.	<b>detail</b>
<b>Remote address</b>	Remote IP address of the peer.	<b>detail</b>
<b>Remote port</b>	Remote port on the peer on which the connection is made.	<b>detail</b>
<b>Remote end origin realm</b>	Name of the realm of the Diameter node that originates messages to the peer.	<b>detail</b>
<b>Remote end origin host</b>	Name of the host of the Diameter node that originates messages to the peer.	<b>detail</b>
<b>Local address</b>	Local IP address on the Diameter origin node.	<b>detail</b>
<b>Local port</b>	Local port on the Diameter origin node.	<b>detail</b>

Table 111: show diameter peer Output Fields (continued)

Field Name	Field Description	Level of Output
Local transport	Number of transports configured.	detail
Time since last enable	Period since peer was enabled in <i>hh:mm:ss</i> format.	detail
In state time	Period that peer has been in present state in <i>hh:mm:ss</i> format.	detail
Remaining in state time	Period that peer will remain in present state in <i>hh:mm:ss</i> format.	detail
Missing wd events	Number of missed watchdog events.	detail
Tx queue length	Number of messages in the transmit queue.	detail
Answer waiting count	Number of answers on which the peer is waiting.	detail
Time since last rx	Number of milliseconds since the last message was received by the peer.	detail
Time until wd timeout	Time remaining until next watchdog event.	detail
Operation timeout	Watchdog timeout period.	detail
Suspended timeout base	Base timeout period in suspended states (suspended, rejected, bad-remonte, bad-config). This timeout doubles after each consecutive suspension, until the maximum value of 600 seconds is reached.	detail
Closed timeout	Timeout period in normal closed state, such as when an external peer requested a disconnect.	detail
Connection timeout	Timeout period for establishing a connection.	detail
Waiting origin state id	Whether the peer is waiting for the Origin-State-Id AVP, <b>yes</b> or <b>no</b> .	detail

## Sample Output

### show diameter peer

```
user@host> show diameter peer
```

```
Diameter peer list:
```

Peer	Instance	State	NE-Count	Activated Count	Primary Count	Secondary Count
p0	master	I-Open	1	1	1	0
p1	master	I-Open	1	1	0	1
p288	master	Suspended	1	1	0	0

## show diameter peer map

**Syntax** `show diameter peer map`  
`<brief | detail | summary>`  
`<peer-name>`

**Release Information** Command introduced in Junos OS Release 9.6.

**Description** Display peer-to-network-element mapping information for all peers associated with Diameter instances or with the specified peer.

**Options** **brief | detail | summary**—(Optional) Display the specified level of output. The **summary** output is displayed by default and includes basic peer information. The **brief** output displays the summary information in a different format. The **detail** output adds information to the **brief** output.

**peer-name**—(Optional) Display mapping information for only the specified peer.

**Required Privilege Level** view

**Output Fields** [Table 112 on page 1782](#) lists the output fields for the **show diameter peer map** command. Output fields are listed in the approximate order in which they appear.

*Table 112: show diameter peer map Output Fields*

Field Name	Field Description	Level of Output
<b>Peer</b>	Name of the peer.	All levels
<b>Instance</b>	Name of the Diameter instance in which the network element is configured.	All levels
<b>NE</b>	Name of the Diameter network element.	All levels
<b>Priority</b>	Priority configured for the peer. A lower number indicates a higher priority.	All levels

Table 112: show diameter peer map Output Fields (continued)

Field Name	Field Description	Level of Output
<b>State</b>	State of the peer: <ul style="list-style-type: none"> <li>Activated—Peer has been activated (selected) by the network element.</li> <li>Not-Activated—Peer has not been selected by the network element.</li> <li>Primary—Peer that is connected to the network element and has the higher priority of the two connected peers.</li> <li>Secondary—Peer that is connected to the network element and has the lower priority of the two connected peers.</li> </ul>	All levels
<b>Instance name</b>	Name of the Diameter instance in which the network element is configured.	<b>brief detail</b>
<b>NE name</b>	Name of the Diameter network element.	<b>brief detail</b>
<b>Usage</b>	Role of the peer for the network element, <b>Primary</b> or <b>Secondary</b> .	<b>brief detail</b>

## Sample Output

### show diameter peer map

```
user@host> show diameter peer map
```

```
Diameter peer usage by network elements:
```

Peer	Instance	NE	Priority	State
p0	master	ne0	20	Primary
p1	master	ne0	10	Secondary
p288	master	ne0	30	Activated
pA	master	ne0	15	Activated
pB	master	ne0	5	Not-Activated

### show diameter peer map detail

```
user@host> show diameter peer map detail
```

```
Diameter network-element peers:
```

```
Peer           : p0

Instance name   : master

NE name         : ne0

Priority        :      20
Usage          : Primary

Peer           : p1

Instance name   : master

NE name         : ne0

Priority        :      10
```

Usage	: Secondary
Peer	: p288
Instance name	: master
NE name	: ne0
Priority	: 30
Usage	: Activated
Peer	: pA
Instance name	: master
NE name	: ne0
Priority	: 15
Usage	: Activated
Peer	: pB
Instance name	: master
NE name	: ne0
Priority	: 5
Usage	: Not-Activated

## show diameter peer statistics

**Syntax** `show diameter peer statistics`  
`<brief | detail | summary>`  
`<peer-name>`

**Release Information** Command introduced in Junos OS Release 9.6.

**Description** Display statistics about all peers associated with Diameter instances or only the specified peer.

**Options** **brief | detail | summary**—(Optional) Display the specified level of output. The **summary** output is displayed by default and includes basic function statistics. The **brief** output displays the summary information in a different format and adds numbers accumulated since the peer was connected. The **detail** output adds information to the **brief** output.

**peer-name**—(Optional) Display information for only the specified peer. When you specify a peer, the **brief** output is displayed by default, even when you explicitly specify **summary**.

**Required Privilege Level** view

**Output Fields** [Table 113 on page 1785](#) lists the output fields for the **show diameter peer statistics** command. Output fields are listed in the approximate order in which they appear.

*Table 113: show diameter peer statistics Output Fields*

Field Name	Field Description	Level of Output
Peer	Name of the peer.	summary brief
Instance	Name of the Diameter instance in which the network element is configured.	summary brief
Rx	Total number of messages received.	summary brief

Table 113: show diameter peer statistics Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Rx-Peer</b>	Number of messages received by the peer.	<b>summary brief</b>
<b>Rx-node</b>	Number of messages received by the Diameter node.	<b>summary brief</b>
<b>Forw</b>	Total number of forwarded messages.	<b>summary brief</b>
<b>Tx-Peer</b>	Number of messages transmitted by the peer.	<b>summary brief</b>
<b>Tx</b>	Total number of transmitted messages.	<b>summary brief</b>
<b>Peer name</b>	Name of the peer.	<b>detail</b>
<b>Instance name</b>	Name of the Diameter instance in which the network element is configured.	<b>detail</b>

## Sample Output

### show diameter peer statistics

```
user@host> show diameter peer statistics
```

```
Diameter peer statistics:
Peer      Instance  Rx      Rx-Peer  Rx-Node  Forw     Tx-Peer  Tx

## show diameter route

**Syntax** `show diameter route  
<brief | detail | summary>  
<route-name>`

**Release Information** Command introduced in Junos OS Release 9.6.

**Description** Display information about all routes associated with Diameter instances or only the specified route.

**Options** **brief | detail | summary**—(Optional) Display the specified level of output. The **summary** output is displayed by default and includes basic function information. The **brief** output displays the summary information in a different format. The **detail** output adds information to the **brief** output.

**route-name**—(Optional) Display information for only the specified route.

**Required Privilege Level** view

**Related Documentation**

- [show diameter on page 1755](#)
- [show diameter network-element on page 1771](#)

**List of Sample Output** [show diameter route on page 1790](#)  
[show diameter route detail on page 1790](#)

**Output Fields** [Table 114 on page 1789](#) lists the output fields for the **show diameter route** command. Output fields are listed in the approximate order in which they appear.

*Table 114: show diameter route Output Fields*

Field Name	Field Description	Level of Output
Route	Name of the route.	summary brief
NE	Name of the network element associated with the route.	summary brief
Instance	Name of the Diameter instance in which the route is configured.	summary brief
NE name	Name of the network element associated with the route.	brief detail
Instance name	Name of the Diameter instance in which the route is configured.	brief detail
Valid	Determination whether the route is valid, <b>yes</b> or <b>no</b> .	All levels

Table 114: show diameter route Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Up</b>	State of the route, <b>yes</b> (up) or <b>no</b> (down).	All levels
<b>Function</b>	Name of the function associated with the route.	<b>brief detail</b>
<b>Partition</b>	Partition associated with the function.	<b>brief detail</b>
<b>Dest-realm</b>	Destination realm configured for the route.	<b>brief detail</b>
<b>Dest-host</b>	Destination hostname configured for the route.	<b>brief detail</b>
<b>Metric</b>	Metric associated with the destination and function to create the route.	<b>brief detail</b>
<b>Score</b>	Value that represents how a route is configured. The basic score is 0. Points are added according to the following scheme: <ul style="list-style-type: none"> <li>Function is specified—Add 3.</li> <li>Function partition is specified—Add 1.</li> <li>Destination realm is specified—Add 1.</li> <li>Destination host is specified—Add 1.</li> </ul>	<b>brief detail</b>

## Sample Output

### show diameter route

```
user@host> show diameter route
```

```
Diameter routes:
Route      NE          Instance   Valid Up
rA         ne0         master    yes  yes
```

### show diameter route detail

```
user@host> show diameter route detail
```

```
Diameter route:
Route name      : rA
NE name         : ne0
Instance name   : master
Valid           : yes
Up              : yes
Function        : jsrsc
Partition       : jsrsc-a
Dest-realm      : outer-realm
Dest-host       : outer-host
Metric          : 50
Score           : 6
```

## show dynamic-profile session

**Syntax** show dynamic-profile session  
 <client-id *client-id*>  
 <profile-name *profile-name*>  
 <service-id *service-id*>

**Release Information** Command introduced in Junos OS Release 13.3.

**Description** Display dynamic profile (client or service) information for all subscribers or for subscribers specified by client ID or service session ID. You can filter the output by also specifying a dynamic profile.

### NOTE:

- The output does not display the variable stanzas defined in the dynamic profile configuration.
- The variables in the profile configuration are replaced with subscriber specific values.
- If the conditional variable in the dynamic profile is evaluated as NULL, the subscriber value for the variable is displayed as NONE in the command output.
- The variable is also displayed as NONE when the variable (any variable and not necessarily conditional) in the dynamic profile has no value associated with it.
- The format in which the configuration is displayed looks similar, but not exactly the same as the format of the `show configuration dynamic-profiles` command.

**Options** **client-id *client-id***—Display dynamic profile information for subscribers associated with the specified client.

**profile-name *profile-name***—(Optional) Display dynamic profile information for the specified subscriber or service profile.

**service-id *service-id***—Display dynamic profile information for subscribers associated with the specified service session.

**Required Privilege Level** view

**List of Sample Output** [show dynamic-profile session client-id \(Client ID\) on page 1792](#)

[show dynamic-profile session client-id profile-name \(Client ID and Dynamic Profile\) on page 1794](#)

[show dynamic-profile session service-id \(Service Session\) on page 1794](#)

**Output Fields** This command displays the dynamic client or service profile configuration for each subscriber.

## Sample Output

### [show dynamic-profile session client-id \(Client ID\)](#)

```
user@host>show dynamic-profile session client-id 20
```

```

## show extensible-subscriber-services accounting

<b>Syntax</b>	<code>show extensible-subscriber-services accounting vsa &lt;vsa&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 15.1.
<b>Description</b>	Display the accounting statistics collected in the current log file. If the <b>vsa</b> option is not provided, the entire content of the current statistics file is displayed. If the <b>vsa</b> option and value are specified, contents of each line that matches the vendor-specific attribute are displayed.
<b>Options</b>	<b>vsa</b> —(Optional) Vendor-specific attribute. <b>Range:</b> 1 through 255
<b>Required Privilege Level</b>	view
<b>Output Fields</b>	<a href="#">Table 115 on page 1796</a> lists the output fields for the <b>show extensible-subscriber-services accounting</b> command. Output fields are listed in the approximate order in which they appear.

*Table 115: show extensible-subscriber-services accounting Output Fields*

Field Name	Field Description
Timestamp	System time when the statistics file is generated in UTC.
Accounting-Status-Type	Type of status, whether it is service start, stop, or update message
NAS-Port-ID	NAS port ID
Line-ID	Line ID
Vlan-ID	VLAN ID
Logical-Interface	Physical and logical interface information
Total-Input-Bytes	Number of bytes received on the interface
Total-Input-Packets	Number of packets received on the interface
IPv6-Input-Bytes	Number of IPv6 bytes received on the interface
IPv6-Input-Packets	Number of IPv6 packets received on the interface
Total-Output-Bytes	Number of bytes transmitted from the interface

*Table 115: show extensible-subscriber-services accounting Output Fields (continued)*

Field Name	Field Description
Total-Output-Packets	Number of packets transmitted from the interface
IPv6-Output-Bytes	Number of IPv6 bytes transmitted from the interface
IPv6-Output-Packets	Number of IPv6 packets transmitted from the interface
Egress-Queued-Packets	Number of packets sent for this class
Egress-Queued-Bytes	Number of bytes, sent for this class
Egress-TX-Packets	Number of packets transmitted by this queue
Egress-TX-Bytes	Number of bytes actually transmitted by this queue
Egress-Tail-Drop-Packets	Number of packets dropped because of tail drop
Egress-Red-Drop-Packets	Number of packets dropped because of random early detection
Egress-Red-Drop-Bytes	Number of bytes dropped because of random early detection

## Sample Output

```
#show extensible-subscriber-services accounting vsa

## show extensible-subscriber-services counters

<b>Syntax</b>	show extensible-subscriber-services counters
<b>Release Information</b>	Command introduced in Junos OS Release 15.1.
<b>Description</b>	Display number of times various events were processed by Extensible Subscriber Services Manager.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear extensible-subscriber-services counters on page 1567</a></li> </ul>
<b>Output Fields</b>	<a href="#">Table 116 on page 1799</a> describes the output fields for the <b>show extensible-subscriber-services counters</b> command. Output fields are listed in the approximate order in which they appear.

*Table 116: show extensible-subscriber-services counters Output Fields*

Field Name	Field Description
Total Sessions	Number of extensible-subscriber-service control sessions that are currently in the system
Total Services	Number of extensible-subscriber-services that are currently in the system
Active Services	Number of extensible-subscriber-services that are currently in active state
Op-script execution	Total number of operational scripts executed: <ul style="list-style-type: none"> <li>• Successful—Operational scripts that are executed without error</li> <li>• Unsuccessful—Operational scripts that encountered errors</li> </ul>
Commit execution	Total number of commit scripts executed: <ul style="list-style-type: none"> <li>• Successful—Commit scripts that are executed without error</li> <li>• Unsuccessful—Commit scripts that encountered errors</li> </ul>
Application execution	Number of applications executed: <ul style="list-style-type: none"> <li>• Successful—Applications that are executed without error</li> <li>• Unsuccessful—Applications that encountered errors</li> </ul>
Service requests	Number of service requests received by the daemon. It has counters for total number of requests received, acknowledged (Acked), and negatively acknowledged (Nacked).

## Sample Output

```
# show extensible-subscriber-services counters

Total Sessions:      7
Total Services:     14
Active Services:     14

Op-script execution:
  Successful         30
  Unsuccessful        0
Commit execution:
  Successful          4
  Unsuccessful        0
Application execution:
  Successful          0
  Unsuccessful        0
Service requests:
  Received            30
  Acked                30
  Nacked              0
```

## show extensible-subscriber-services debug-information

<b>Syntax</b>	show extensible-subscriber-services debug-information
<b>Release Information</b>	Command introduced in Junos OS Release 15.1.
<b>Description</b>	Write service session information to a file.
<b>Required Privilege Level</b>	view
<b>Output Fields</b>	<a href="#">Table 117 on page 1801</a> lists the output fields for the <b>show extensible-subscriber-services debug-information</b> command.

*Table 117: show extensible-subscriber-services debug-information Output Fields*

Field Name	Field Description
File Name	Name of the file that contains the service session information

## Sample Output

```
#show extensible-subscriber-services debug-information
File Name: /var/tmp/dump_session_record
```

## show extensible-subscriber-services dictionary

<b>Syntax</b>	show extensible-subscriber-services dictionary
<b>Release Information</b>	Command introduced in Junos OS Release 15.1.
<b>Description</b>	Display contents of the dictionary including attributes and services.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">dictionary on page 998</a></li> <li>• <a href="#">request services extensible-subscriber-services reload-dictionary on page 1606</a></li> <li>• <a href="#">show extensible-subscriber-services dictionary attributes on page 1806</a></li> <li>• <a href="#">show extensible-subscriber-services dictionary services on page 1809</a></li> <li>• <i>Understanding the Dictionary File</i></li> </ul>
<b>Output Fields</b>	<a href="#">Table 118 on page 1802</a> lists the output fields for the <b>show extensible-subscriber-services dictionary</b> command. Output fields are listed in the approximate order in which they appear.

*Table 118: show extensible-subscriber-services dictionary Output Fields*

Field Name	Field Description
Acct-Session-Id	<p>Unique accounting identifier that makes it easy to match start and stop records in a log file. The identifier can be in one of the following formats:</p> <ul style="list-style-type: none"> <li>• <b>decimal</b>—For example, 435264</li> <li>• <b>description</b>—In the generic format, <b>jnpr interface-specifier:subscriber-session-id</b>; For example, <b>jnpr fastEthernet 3/2.6:1010101010101</b></li> </ul>
ERX-Service-Activate	Service to be activated for the subscriber.
Service-Type	Type of service the user has requested or the type of service to be provided.
ADSL-Agent-Remote-Id	Identifier for the subscriber on the digital subscriber line access multiplexer (DSLAM) interface that initiated the service request.
ERX-Med-Port-Number	UDP port in the mediation device to which mirrored traffic is forwarded
NAS-Port-Id	Text string that identifies the physical interface of the NAS that is authenticating the user.
ERX-Med-Dev-Handle	Identifier that associates mirrored traffic with a specific subscriber
ERX-Service-Deactivate	Service to be deactivated for the subscriber.

Table 118: show extensible-subscriber-services dictionary Output Fields (continued)

Field Name	Field Description
NAS-IP-Address	IP address of the network access server (NAS) that is requesting authentication of the user.
NAS-Identifier	Name of the NAS that originated the authentication or accounting request.
ERX-Service-Acct-Interval	Amount of time between accounting updates for the service type
ADSL-Agent-Circuit-Id	Identifier for subscriber's access node and the digital subscriber line (DSL) on the access node.
ERX-LI-Action	<p>Traffic mirroring action.</p> <p>For dynamic CoA, VSA 26-58 changes the action on the mirrored traffic identified by VSA 26-59.</p> <p>CoA-Request messages that include any of the RADIUS-based mirroring attributes (VSAs 26-58, 26-59, 26-60, or 26-61) must always include all four VSAs.</p> <p>If the CoA action is to stop mirroring (VSA 26-58 value is 0), then the values of the other three attributes in the CoA message must match the existing attribute values, or the action fails.</p>
ERX-Med-Ip-Address	IP address of content destination device to which mirrored traffic is forwarded.

## Sample Output

```
root@ce-bras-mx240-g> show extensible-subscriber-services dictionary
```

## show extensible-subscriber-services sessions

<b>Syntax</b>	<code>show extensible-subscriber-services sessions <i>accounting-session-id</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 15.1.
<b>Description</b>	Display session information. It displays a list of the services applied and their current state. Specify the accounting session ID to view information about a specific session. If an accounting session ID is not specified in the command, the command displays details of all the sessions.
<b>Options</b>	<i>accounting-session-id</i> —Identifier of the session you want information about.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">clear extensible-subscriber-services sessions on page 1568</a></li> </ul>
<b>Output Fields</b>	<a href="#">Table 121 on page 1812</a> describes the output fields for the <b>show extensible-subscriber-services sessions</b> command. Output fields are listed in the approximate order in which they appear.

Table 121: show extensible-subscriber-services sessions Output Fields

Field Name	Field Description
Session ID	Session ID. Accounting session ID must be enclosed in quotation marks.
Timestamp	Time when the session was started
Service Name	Name of the service
Commit State	Commit state: <b>Init</b> , <b>Queued</b> , or <b>Success</b> .
Service ID	Service ID

## Sample Output

```
#show extensible-subscriber-services sessions
Session ID: jnpr demux0.1073762028:46422
  Timestamp: Fri Mar  8 04:58:27 2013
  Service Name: ngcoco
  Service Name: dhcprelay

Total Sessions: 1

```

## show extensible-subscriber-services service

<b>Syntax</b>	show extensible-subscriber-services service
<b>Release Information</b>	Command introduced in Junos OS Release 15.1.
<b>Description</b>	Display service information. It displays the service name specified in the dictionary, scripts used for provisioning and deprovisioning, and the number of services. A service can have more than one version. Each version is grouped using an action set. The number of action sets is equal to the number of versions for the service. Number of services in all the versions is displayed in <b>Total Services</b> .
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Understanding the Dictionary File</i></li> </ul>
<b>Output Fields</b>	Table 122 on page 1814 lists the output fields for the <b>show extensible-subscriber-services service</b> command. Output fields are listed in the approximate order in which they appear.

Table 122: show extensible-subscriber-services service Output Fields

Field Name	Field Description
Service Name	Name of the service
Action	Name and number of services provisioned or deprovisioned.
Total Services	Total number of services provisioned or deprovisioned.

## Sample Output

```
#show extensible-subscriber-services services
Service Name: ngcoco
  Action:
    Provision:      iceaaa_ngcoco_add_1
    Deprovision:    iceaaa_del_1
    Services:       1301

    Total Services: 1301

<b>List of Sample Output</b>	<p><a href="#">show ipv6 router-advertisement on page 1817</a></p> <p><a href="#">show ipv6 router-advertisement conflicts on page 1818</a></p> <p><a href="#">show ipv6 router-advertisement prefix on page 1818</a></p>
<b>Output Fields</b>	<a href="#">Table 123 on page 1817</a> describes the output fields for the <b>show ipv6 router-advertisement</b> command. Output fields are listed in the approximate order in which they appear.

Table 123: show ipv6 router-advertisement Output Fields

Field Name	Field Description
Interface	Name of the interface.
Advertisements sent	Number of router advertisements sent and the elapsed time since they were sent.
Solicits received	Number of solicitation messages received.
Advertisements received	Number of router advertisements received.
Advertisements from	Names of interfaces from which router advertisements have been received and the elapsed time since the last one was received.
Managed	Managed address configuration flag: 0 (stateless) or 1 (stateful).
Other configuration	Other stateful configuration flag: 0 (stateless) or 1 (stateful).
Reachable time	Time that a node identifies a neighbor as reachable after receiving a reachability confirmation, in milliseconds.
Default lifetime	Default lifetime, in seconds: from 0 seconds to 18.2 hours. A setting of 0 indicates that the router is not a default router.
Retransmit timer	Time between retransmitted Neighbor Solicitation messages, in milliseconds.
Current hop limit	Configured current hop limit.
Prefix	Name and length of the prefix.
Valid lifetime	How long the prefix remains valid for onlink determination.
Preferred lifetime	How long the prefix generated by stateless autoconfiguration remains preferred.
On link	Onlink flag: 0 (not onlink) or 1 (onlink).
Autonomous	Autonomous address configuration flag: 0 (not autonomous) or 1 (autonomous).

## Sample Output

### show ipv6 router-advertisement

```

user@host> show ipv6 router-advertisement
Interface: fe-0/1/1.0
  Advertisements sent: 0
  Solicits received: 0
  Advertisements received: 0
Interface: fxp0.0
  Advertisements sent: 0
  Solicits received: 0

```

```
Advertisements received: 1
Advertisement from fe80::2d0:b7ff:fe1e:7b0e, heard 00:00:13 ago
Managed: 0
Other configuration: 0 [1]
  Reachable time: 0 ms
  Default lifetime: 1800 sec
  Retransmit timer: 0 ms
  Current hop limit: 64
```

#### show ipv6 router-advertisement conflicts

```
user@host> show ipv6 router-advertisement conflicts
Interface: fxp0.0
  Advertisement from fe80::2d0:b7ff:fe1e:7b0e, heard 00:01:08 ago
  Other configuration: 0 [1]
```

#### show ipv6 router-advertisement prefix

```
user@host> show ipv6 router-advertisement prefix 2001:db8:8040::/16
Interface: fe-0/1/3.0
  Advertisements sent: 3, last sent 00:04:11 ago
  Solicits received: 0
  Advertisements received: 3
  Advertisement from fe80::290:69ff:fe9a:5403, heard 00:00:05 ago
  Managed: 0
  Other configuration: 0
  Reachable time: 0 ms
  Default lifetime: 180 sec [1800 sec]
  Retransmit timer: 0 ms
  Current hop limit: 64
  Prefix: 2001:db8:8040:1::/64
    Valid lifetime: 2592000 sec
    Preferred lifetime: 604800 sec
  On link: 1
  Autonomous: 1
```

## show network-access aaa accounting

<b>Syntax</b>	<b>show network-access aaa accounting</b>
<b>Release Information</b>	Command introduced in Junos OS Release 12.3.
<b>Description</b>	Display the state of the RADIUS Acct-On response sent from the RADIUS server.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">RADIUS Acct-On and Acct-Off Messages on page 133</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show network-access aaa accounting on page 1819</a>
<b>Output Fields</b>	Table 124 on page 1819 lists the output fields for the <b>show network-access aaa accounting</b> command. Output fields are listed in the approximate order in which they appear.

*Table 124: show network-access aaa accounting Output Fields*

Field Name	Field Description
<b>Profile</b>	Name of the profile associated with the RADIUS server. A RADIUS server can be associated with more than one profile.
<b>Logical System</b>	Logical system associated with the access profile.
<b>Routing Instance</b>	Routing instance associated with the access profile.
<b>Acct-On-Response</b>	Status of the RADIUS Acct-On response. <ul style="list-style-type: none"> <li>• ACK—ACK response for the Acct-On message is received from the RADIUS server.</li> <li>• ERROR—An error condition has occurred.</li> <li>• NONE— No Acct-On message is sent.</li> <li>• PENDING—Acct-On message is sent to RADIUS server, but no response has been received yet.</li> </ul>

## Sample Output

### show network-access aaa accounting

```
user@host> show network-access aaa accounting
```

Profile	Logical System	Routing Instance	Acct-On-Response
ppp-profile	default	default	ACK
l2tp-profile	default	l2tp_RI	PENDING

## show network-access aaa radius-servers

<b>Syntax</b>	<b>show network-access aaa radius-servers</b> <b>&lt;detail&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 12.1.
<b>Description</b>	Display RADIUS server status and information.
<b>Options</b>	<b>detail</b> —(Optional) Display detailed level of information.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Verifying and Managing Subscriber AAA Information on page 158</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show network-access aaa radius-servers on page 1825</a> <a href="#">show network-access aaa radius-servers on page 1826</a> <a href="#">show network-access aaa radius-servers detail on page 1826</a>
<b>Output Fields</b>	<p><a href="#">Table 125 on page 1820</a> lists the output fields for the <b>show network-access aaa radius-servers</b> command. Output fields are listed in the approximate order in which they appear.</p>

*Table 125: show network-access aaa radius-servers Output Fields*

Field Name	Field Description	Level of Output
<b>Profile</b>	Name of the profile associated with the RADIUS server. A RADIUS server can be associated with more than one profile.	All levels
<b>Server address</b>	IPv4 or IPv6 address of the RADIUS server.	All levels
<b>Authentication port</b>	RADIUS server authentication port number.	All levels
<b>Preauthentication port</b>	RADIUS server preauthentication port number.	All levels
<b>Accounting port</b>	RADIUS server accounting port number.	All levels
<b>Accounting retry</b>	Number of times the router retransmits RADIUS accounting messages when no response is received from the server.	Detail
<b>Accounting timeout</b>	Period the local router waits to receive a response from a RADIUS accounting server before retransmitting the message.	Detail

*Table 125: show network-access aaa radius-servers Output Fields (continued)*

Field Name	Field Description	Level of Output
Status		All levels

Table 125: show network-access aaa radius-servers Output Fields (continued)

Field Name	Field Description	Level of Output
	<p>RADIUS server status, <b>UP</b> (Alive), <b>UNREACHABLE</b>, or <b>DOWN</b> (DEAD).</p> <p>If status is <b>DOWN</b>, the Status field includes the number of seconds configured by the <b>revert-interval</b> statement. The router does not send requests to servers in the <b>DOWN</b> state, but does send requests to servers with a status of either <b>UP</b> or <b>UNREACHABLE</b>.</p> <p>This field also displays the status of AAA accounting suspension or resumption, and the status of baselining of accounting statistics if you suspended or resumed accounting operations or initiated the generation of a baseline. This information is applicable only for RADIUS servers that are in the <b>UP</b> state.</p> <p><b>NOTE:</b></p> <p>After requests to a server or set of servers time out after 10 seconds, the status of the servers changes. The following guidelines apply to server status:</p> <ul style="list-style-type: none"> <li>For the purpose of marking a server as <b>Down</b> (DEAD), the request includes the original request and any retries that are configured. The 10-second timeout period starts after the initial request and all retries have expired without receiving a response from the server.</li> </ul> <p>The amount of the timeout period that elapses before the server is marked <b>Down</b> is not always exactly 10 seconds, and can vary depending on how frequently subscribers are logging in. When subscribers are continually and rapidly logging in, the server is marked as <b>Down</b> at 10 seconds. However, if subscribers are logging in less frequently and at a slower pace, then the server is not marked <b>Down</b> until a subsequent subscriber attempts to log in. For example, if the subsequent subscriber logs in a minute after the request and all retries lapse, and the 10-second timeout starts, the actual time until the server is marked <b>Down</b> is 50 seconds after the timeout starts (the one minute between subscriber login minus the 10-second timeout).</p> <ul style="list-style-type: none"> <li>All servers cannot be marked as <b>DOWN</b>; instead, the unresponsive servers are marked as <b>UNREACHABLE</b>. For example, if only one RADIUS server is configured and that server is unresponsive, the server status is marked as <b>UNREACHABLE</b> rather than <b>DOWN</b>.</li> <li>If at least one server has a status of <b>UP</b>, the status of all unresponsive servers is set to <b>DOWN</b> for the remainder of the configured revert-interval setting.</li> <li>If no server has a status of <b>UP</b>, then the status of the unresponsive servers is set to <b>UNREACHABLE</b> for the remainder of the revert-interval setting or for 30 seconds, whichever is less.</li> <li>The status of unresponsive servers is returned to <b>UP</b></li> </ul>	

*Table 125: show network-access aaa radius-servers Output Fields (continued)*

Field Name	Field Description	Level of Output
	<p>from <b>DOWN</b> or <b>UNREACHABLE</b> at the end of the revert-interval setting (or the 30-second interval).</p> <ul style="list-style-type: none"> <li>If no requests are sent to a server, the server's status is always <b>UP</b>.</li> </ul>	
<b>RADIUS servers</b>	Details for specific RADIUS server, identified by IP address.	Detail
<b>Authentication requests</b>	Number of authentication requests received by the authentication server.	Detail
<b>Authentication rollover requests</b>	Number of requests coming into the server as a result of the previous server timing out.	Detail
<b>Authentication retransmissions</b>	Number of retransmissions.	Detail
<b>Accepts</b>	Number of authentication requests accepted by the authentication server.	Detail
<b>Rejects</b>	Number of authentication requests rejected by the authentication server.	Detail
<b>Challenges</b>	Number of authentication requests challenged by the authentication server.	Detail
<b>Authentication malformed responses</b>	Number of responses with attributes having an invalid length or unexpected attributes (such as two attributes when the response is required to have at most one).	Detail
<b>Authentication bad authenticators</b>	Number of responses in which the authenticator is incorrect for the authentication request. This can occur if the RADIUS secrets for the client and server do not match.	Detail
<b>Authentication requests pending</b>	Number of authentication requests waiting for a response.	Detail
<b>Authentication request timeouts</b>	Number of times an authentication request to the server timed out.	Detail
<b>Authentication unknown responses</b>	Number of unknown responses. The RADIUS response type in the header is invalid or unsupported.	Detail
<b>Authentication packets dropped</b>	Number of packets dropped because they are too short or because the router receives a response for which there is no corresponding request.	Detail

*Table 125: show network-access aaa radius-servers Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Preauthentication requests</b>	Number of preauthentication requests received by the preauthentication server.	Detail
<b>Preauthentication rollover requests</b>	Number of preauthentication requests coming into the server as a result of the previous server timing out.	Detail
<b>Preauthentication retransmissions</b>	Number of retransmissions of preauthentication requests.	Detail
<b>Preauthentication Accepts</b>	Number of preauthentication requests accepted by the preauthentication server.	Detail
<b>Preauthentication Rejects</b>	Number of preauthentication requests rejected by the preauthentication server.	Detail
<b>Preauthentication Challenges</b>	Number of preauthentication requests challenged by the preauthentication server.	Detail
<b>Preauthentication malformed responses</b>	Number of responses to preauthentication requests with attributes having an invalid length or unexpected attributes (such as two attributes when the response is required to have at most one).	Detail
<b>Preauthentication bad authenticators</b>	Number of responses in which the authenticator is incorrect for the preauthentication request. This can occur if the RADIUS secrets for the client and server do not match.	Detail
<b>Preauthentication requests pending</b>	Number of preauthentication requests waiting for a response.	Detail
<b>Preauthentication request timeouts</b>	Number of times a preauthentication request to the server timed out.	Detail
<b>Preauthentication unknown responses</b>	Number of unknown responses during the preauthentication phase. The RADIUS response type in the header is invalid or unsupported.	Detail
<b>Preauthentication packets dropped</b>	Number of preauthentication packets dropped because they are too short or because the router receives a response for which there is no corresponding request.	Detail
<b>Accounting start requests</b>	Number of accounting start requests received.	Detail
<b>Accounting interim requests</b>	Number of accounting interim requests received.	Detail
<b>Accounting stop requests</b>	Number of accounting stop requests received.	Detail

*Table 125: show network-access aaa radius-servers Output Fields (continued)*

Field Name	Field Description	Level of Output

Table 126: show network-access aaa statistics Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Accounting request timeouts</b>	Number of accounting requests to the accounting server that timed out. This field was named <b>Timed out requests</b> in releases before Junos OS Release 16.1.  Does not include requests sent from backup accounting.	All levels
<b>Accounting Response failures</b>	Number of accounting requests not acknowledged (NAK) by the accounting server.  Does not include requests sent from backup accounting.	All levels
<b>Accounting response success</b>	Number of accounting requests acknowledged by the accounting server.  Does not include requests sent from backup accounting.	All levels
<b>Account on responses</b>	Number of accounting on requests acknowledged by the RADIUS accounting server.	<b>detail</b>
<b>Accounting start responses</b>	Number of accounting start requests acknowledged by the RADIUS accounting server.	<b>detail</b>
<b>Accounting interim responses</b>	Number of accounting interim requests acknowledged by the RADIUS accounting server.	<b>detail</b>
<b>Accounting stop responses</b>	Number of accounting stop requests acknowledged by the RADIUS accounting server.  Does not include requests sent from backup accounting.	<b>detail</b>
<b>Accounting rollover requests</b>	Number of accounting requests coming to a RADIUS accounting server after a previous server timing out.	<b>detail</b>
<b>Accounting unknown requests</b>	Number of unknown accounting requests sent from a client to a RADIUS accounting server (for example, when the header has invalid or unsupported information).	<b>detail</b>
<b>Accounting radius pending requests</b>	Number of accounting requests sent from a client to a RADIUS accounting server that are waiting for a response from the server.	<b>detail</b>
<b>Accounting malformed responses</b>	Number of accounting responses from a RADIUS accounting server that have invalid or unexpected attributes.	<b>detail</b>

Table 126: show network-access aaa statistics Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Accounting retransmissions</b>	Number of accounting requests made by a client to the RADIUS sever that were retransmitted.  Does not include requests sent from backup accounting.	<b>detail</b>
<b>Accounting bad authenticators</b>	Number of accounting responses from a RADIUS accounting server that have an incorrect authenticator (for example, the client and server RADIUS secret do not match).	<b>detail</b>
<b>Accounting packets dropped</b>	Number of accounting responses from a RADIUS accounting server that are dropped by a client.	<b>detail</b>
<b>Accounting backup record creation requests</b>	Number of accounting stop requests from a client to a RADIUS accounting server that were forwarded to be backed up.	<b>detail</b>
<b>Accounting backup replay request success</b>	Number of backup accounting stop requests successfully created by clients after each timeout for replay to a RADIUS accounting server.	<b>detail</b>
<b>Accounting backup request failures</b>	Number of backup accounting requests that failed to be sent or queued from a client to a RADIUS accounting server.	<b>detail</b>
<b>Accounting backup request success</b>	Number of backup accounting requests successfully sent or queued from a client to a RADIUS accounting server.	<b>detail</b>
<b>Accounting backup timeouts</b>	Number of backup accounting requests that timed out after being sent to a RADIUS accounting server.	<b>detail</b>

Table 126: show network-access aaa statistics Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Accounting backup in-flight requests</b>	<p>Number of backup accounting requests that were successfully sent or queued to a RADIUS accounting server for which no response or error has been received yet.</p> <p>Backup requests are replayed only in the following circumstances:</p> <ul style="list-style-type: none"> <li>When the request being replayed receives a positive response, the next request can be replayed.</li> <li>When the request being replayed receives a timeout response, it can be replayed again.</li> </ul> <p>Consequently this intermediate timer displays 1 or 0. The value eventually drops to 0 as requests are responded to positively or fail due to error.</p>	<b>detail</b>
<b>Accounting backup responses success</b>	Number of backup records that were successfully acknowledged with a positive response from a RADIUS accounting server.	<b>detail</b>
<b>Accounting backup radius requests</b>	<p>Number of backup requests sent to UDP level.</p> <p>This is a RADIUS-level counter and increments rapidly based on the configured retries and timeouts and the RADIUS-level retransmissions. An observation that the value is increasing is more significant than the exact value of the counter.</p>	<b>detail</b>
<b>Accounting backup radius responses</b>	<p>Number of responses received at the UDP level for backup requests.</p> <p>This is a RADIUS-level counter and increments rapidly based on the configured retries and timeouts and the RADIUS-level retransmissions. Observation that the value is increasing is more significant than the exact value of the counter.</p>	<b>detail</b>
<b>Accounting backup radius timeouts</b>	<p>Number of backup requests that timed out after being sent to UDP.</p> <p>This is a RADIUS-level counter and increments rapidly based on the configured retries and timeouts and the RADIUS-level retransmissions. Observation that the value is increasing is more significant than the exact value of the counter.</p>	<b>detail</b>

Table 126: show network-access aaa statistics Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Accounting backup radius pending requests</b>	<p>Number of backup requests sent to a RADIUS accounting server that are waiting for a response from the server.</p> <p>This is an intermediate state counter that eventually drops to zero as requests are responded to or failed due to error.</p>	<b>detail</b>
<b>Accounting backup radius retransmissions</b>	<p>Sum of backup request retransmissions for each RADIUS accounting server.</p> <p>This is a RADIUS-level counter and increments rapidly based on the configured retries and timeouts and the RADIUS-level retransmissions. Observation that the value is increasing is more significant than the exact value of the counter.</p>	<b>detail</b>
<b>Accounting backup malformed responses</b>	Sum of malformed responses received for backup requests sent to each RADIUS accounting server at the UDP level.	<b>detail</b>
<b>Accounting backup bad authenticators</b>	Sum of responses received for backup accounting requests for each RADIUS accounting server where authenticators were mismatched.	<b>detail</b>
<b>Accounting backup responses dropped</b>	Sum of responses for backup accounting requests for each RADIUS accounting server that were dropped due to various sanity checks.	<b>detail</b>
<b>Accounting backup rollover requests</b>	Sum of backup accounting requests rolled over for each RADIUS accounting server.	<b>detail</b>
<b>Accounting backup unknown responses</b>	Sum of unknown responses for backup accounting requests for each RADIUS accounting server.	<b>detail</b>
<b>Client</b>	Client type; for example, DHCP, Mobile IP, PPP.	none specified
<b>Out of Memory</b>	Number of times an address was not given to the client due to memory issues.	none specified
<b>No Matches</b>	Number of times there were no network matches for the pool.	none specified
<b>Pool Name</b>	Name of the address-assignment pool for this client.	none specified

Table 126: show network-access aaa statistics Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Out of Addresses</b>	Number of times there were no available addresses in the pool.	none specified
<b>Address total</b>	Number of addresses in the pool.	none specified
<b>Addresses in use</b>	Number of addresses in use.	none specified
<b>Addresses excluded</b>	Number of addresses excluded from being allocated from the pool with the <b>excluded-address</b> or <b>excluded-range</b> statements.	none specified
<b>Address Usage (percent)</b>	Percentage of total addresses in use. This value does not take excluded addresses into account.	none specified
<b>Pool drain configured</b>	Configuration state of active drain for the specified local address pool, <b>yes</b> or <b>no</b> .	none specified
<b>Pool Usage</b>	Percentage of allocated addresses in the specified address pool.	none specified
<b>processed successfully</b>	Number of dynamic requests processed successfully by the AAA framework.	All levels
<b>errors during processing</b>	Number of dynamic requests that resulted in processing errors by the AAA framework.	All levels
<b>Link Name</b>	Name of the secondary address-assignment pool to which the primary pool is linked.	
<b>silently dropped</b>	Number of dynamic requests dropped by the AAA framework due to multiple back-to-back or duplicate requests.	All levels
<b>RADIUS Server</b>	IPv4 or IPv6 address of the RADIUS server to which the router is sending requests.	All levels
<b>Profile</b>	Name of the RADIUS profile associated with the RADIUS server. A RADIUS server can be associated with more than one RADIUS profile.	All levels
<b>Configured</b>	Configured maximum number of outstanding requests from the router to the RADIUS server for a specific profile. An outstanding request is a request to which the RADIUS server has not yet responded. The range of values is 0 through 2000 outstanding requests. The default value is 1000.	All levels

Table 126: show network-access aaa statistics Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Current</b>	Current number of outstanding requests from the router to the RADIUS server for a specific profile. An outstanding request is a request to which the RADIUS server has not yet responded.	All levels
<b>Peak</b>	Highest number of outstanding requests from the router to the RADIUS server for a specific profile at any point in time since the router was started or since the counter was last cleared.  <b>NOTE:</b> If the value of this field is equal to the value of the <b>Configured</b> field, you may want to increase the value of the <b>Configured</b> field.	All levels
<b>Exceeded</b>	Number of times that the router attempted to send requests to the RADIUS server in excess of the configured maximum value for a specific profile.  <b>NOTE:</b> If the value of this field is nonzero, you may want to increase the value of the <b>Configured</b> field.	All levels
<b>Username</b>	Username for a subscriber with one or more active sessions for an access profile.	<b>brief detail</b>
<b>Access-profile</b>	Name of the access profile where the username is active.	<b>brief detail</b>
<b>Blocked requests</b>	Number of session requests that have been blocked for the username for an access profile. A request is blocked when it exceeds the configured session limit.	<b>brief detail</b>
<b>Session count</b>	Number of active sessions for the username for an access profile.	<b>brief detail</b>
<b>Total usernames</b>	Number of active usernames for all access profiles.	none <b>summary</b>
<b>Total usernames exceeding session limit</b>	Number of usernames that have attempted sessions greater than the limit configured for the username.	none <b>summary</b>
<b>Total blocked requests</b>	Number of session requests that have been blocked because the session limit is exceeded.	none <b>summary</b>

```
Total usernames: 15  
Total usernames exceeding session limit: 2  
Total blocked requests: 5
```

## show network-access aaa statistics authentication

<b>Syntax</b>	<b>show network-access aaa statistics authentication</b> <b>&lt;detail&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 9.1. Option <b>detail</b> introduced in Junos OS Release 12.1.
<b>Description</b>	Display AAA authentication statistics.
<b>Options</b>	<b>detail</b> —(Optional) Displays detailed information about authentication.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Verifying and Managing Subscriber AAA Information on page 158</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show network-access aaa statistics authentication on page 1841</a> <a href="#">show network-access aaa statistics authentication detail on page 1841</a>
<b>Output Fields</b>	<a href="#">Table 127 on page 1839</a> lists the output fields for the <b>show network-access aaa statistics authentication</b> command. Output fields are listed in the approximate order in which they appear.

*Table 127: show network-access aaa statistics authentication Output Fields*

Field Name	Field Description	Level of Output
Requests received	Number of authentication requests received from clients.	All levels
Accepts	Number of authentication requests accepted by the authentication server.	All levels
Rejects	Number of authentication requests rejected by the authentication server.	All levels
Challenges	Number of authentication requests challenged by the authentication server.	All levels
Timed out requests	Number of authentication requests that timed out.	All levels
RADIUS authentication failures	Number of RADIUS authentication requests that have failed.	Detail
Queue request deleted	Number of queue requests that have been deleted.	Detail

Table 127: show network-access aaa statistics authentication Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Malformed reply</b>	Number of malformed replies received from the RADIUS authentication server.	Detail
<b>No server configured</b>	Number of authentication requests that failed because no authentication server is configured.	Detail
<b>Access Profile configuration not found</b>	Number of authentication requests that failed because no access profile is configured.	Detail
<b>Unable to create client record</b>	Number of times that the router is unable to create the client record for the authentication request.	Detail
<b>Unable to create client request</b>	Number of times that the router is unable to create the client request for the authentication request.	Detail
<b>Unable to build authentication request</b>	Number of times that the router is unable to build the authentication request.	Detail
<b>No server found</b>	Number of requests to the authentication server that have timed out; the server is then considered to be down.	Detail
<b>Unable to create handle</b>	Number of authentication requests that have failed because of an internal allocation failure.	Detail
<b>Unable to queue request</b>	Number of times the router was unable to queue the request to the authentication server.	Detail
<b>Invalid credentials</b>	Number of times the router did not have proper authorization to access the authentication server.	Detail
<b>Malformed request</b>	Number of times the router request to the authentication server is malformed.	Detail
<b>License unavailable</b>	Number of times the router did not have a license to access the authentication server.	Detail
<b>Redirect requested</b>	Number of authentication requests that have been redirected based on routing instance.	Detail
<b>Internal failure</b>	Number of internal failures.	Detail
<b>Local authentication failures</b>	Number of times local authentication failed.	Detail
<b>LDAP lookup failures</b>	Number of times the LDAP lookup operation failed.	Detail

## Sample Output

### show network-access aaa statistics authentication

```
user@host> show network-access aaa statistics authentication
```

```
Authentication module statistics
Requests received: 2118
  Accepts: 261
  Rejects: 975
Challenges: 0
Timed out requests: 882
```

### show network-access aaa statistics authentication detail

```
user@host> show network-access aaa statistics authentication detail
```

```
Authentication module statistics
Requests received: 2118
  Accepts: 261
  Rejects: 975
    RADIUS authentication failures: 975
      Queue request deleted: 0
      Malformed reply: 0

```

## show network-access aaa statistics re-authentication

<b>Syntax</b>	<code>show network-access aaa statistics re-authentication</code>
<b>Release Information</b>	Command introduced in Junos OS Release 17.4R1.
<b>Description</b>	Display statistics for RADIUS re-authentication, and starting in Junos OS Release 18.2R1, for local re-authentication.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">reauthenticate (DHCP Local Server) on page 1333</a></li> </ul>
<b>Output Fields</b>	<a href="#">Table 130 on page 1845</a> lists the output fields for the show network-access aaa statistics re-authentication command. Output fields are listed in the approximate order in which they appear.

*Table 130: show network-access aaa statistics re-authentication Output Fields*

Field Name	Field Description
Re-authentication statistics	Displays re-authentication statistics.
Requests received	Total number of re-authentication requests that the device received from clients.
Aborts	Total number of re-authentication aborts.
Challenges	Total number of re-authentication challenges.
Internal errors	Total number of re-authentication internal errors.
Rejects	Total number of re-authentications rejected.
Accounting request timeouts	Total number of re-authentication accounting timeouts.

## show network-access aaa statistics re-authentication

```

user@host> show network-access aaa statistics re-authentication
Re-authentication statistics
Requests received: 0
Aborts: 0
Challenges: 0
Internal errors: 0
Rejects: 0
Accounting request timeouts: 0

```

## show network-access aaa subscribers

<b>Syntax</b>	<pre>show network-access aaa subscribers &lt;logical-system <i>logical-system-name</i>&gt; &lt;routing-instance <i>routing-instance-name</i>&gt; &lt;statistics&gt; &lt;username&gt; &lt;session-id <i>session-id-number</i> detail&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.1.</p> <p>Command updated with <b>session-id <i>session-id-number</i> detail</b> in Junos OS Release 17.3.</p>
<b>Description</b>	Display subscriber-specific AAA statistics.
<b>Options</b>	<p><b>logical-system <i>logical-system-name</i></b>—(Optional) List subscribers in the specific logical system.</p> <p><b>routing-instance <i>routing-instance-name</i></b>—(Optional) List subscribers for the specific routing instance. If you do not specify a routing instance name, the default routing instance is assumed.</p> <p><b>statistics</b>—(Optional) Display statistics for the subscriber events.</p> <p><b>username</b>—(Optional) Display information for the specified subscriber.</p> <p><b>session-id <i>session-id-number</i> detail</b>—(Optional) Display information for the specified session ID.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Verifying and Managing Subscriber AAA Information on page 158</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show network-access aaa subscribers logical-system on page 1849</a></p> <p><a href="#">show network-access aaa subscribers logical-system routing-instance on page 1849</a></p> <p><a href="#">show network-access aaa subscribers statistics username on page 1849</a></p> <p><a href="#">show network-access aaa subscribers username on page 1850</a></p> <p><a href="#">show network-access aaa subscribers session-id 26 detail on page 1850</a></p>
<b>Output Fields</b>	<p><a href="#">Table 131 on page 1847</a> lists the output fields for the <b>show network-access aaa subscribers</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 131: show network-access aaa subscribers Output Fields

Field Name	Field Description
Challenge requests	Number of authentication requests challenged by the authentication server for this subscriber.

Table 131: show network-access aaa subscribers Output Fields (continued)

Field Name	Field Description
Challenge responses	Number of challenge responses sent by the subscriber to the authentication server.
START sent successfully	Number of accounting start requests generated by the AAA framework for this subscriber.
START send failures	Number of accounting start requests that failed to make it to the accounting server for this subscriber.
START ack received	Number of accounting start requests acknowledged by the accounting server for this subscriber.
INTERIM sent successfully	Number of accounting interim requests generated by the AAA framework for this subscriber.
INTERIM send failures	Number of accounting interim requests that failed to make it to the accounting server for this subscriber.
INTERIM ack received	Number of accounting interim requests acknowledged by the accounting server for this subscriber.
Requests received	Number of reauthentication requests received by the authentication server.
Successful responses	Number of successful reauthentication requests granted by the authentication server.
Aborts handled	Number of reauthentication requests aborted by the authentication server.
Service name	Name of the subscriber service.
Creation requests	Number of requests to create the service.
Deletion requests	Number of requests to delete the service.
Request timeouts	Number of times the service request was timed out.
Client type	Type of client; for example, DHCP, Mobile IP, PPP.
Session-ID	ID of the subscriber session.
Session uptime	How long the session has been up, in <i>HH:MM:SS</i> .
Accounting	Status of accounting, and type of accounting if accounting is on.
Stripped username	Username of the subscriber session.
AAA Logical system/Routing instance	AAA framework for the subscriber of logical system or routing instance.
Target Logical system/Routing instance	Target framework for the subscriber of logical system or routing instance.

Table 131: show network-access aaa subscribers Output Fields (continued)

Field Name	Field Description
Access-profile	Profile of the subscriber.
Accounting Session ID	ID of the subscriber session for accounting.
Multi Accounting Session ID	ID of the subscriber session for multiple accounting.
IP Address	IPv4 address of the subscriber.
IPv6 Address	IPv6 address of the subscriber.
IPv6 Prefix	IPv6 prefix of the subscriber.
Authentication State	State of subscriber session authentication.
Accounting State	State of subscriber session accounting.
Provisioning Type	Type of subscriber provisioning.

## Sample Output

### show network-access aaa subscribers logical-system

```
user@host> show network-access aaa subscribers logical-system
Username           Client type   Logical system/Routing instance
user61@example.net  ppp          default
00010e020304.1231  dhcp         isp-bos-metro-12:isp-cmborg-12
user54@example.com  dhcp         default:isp-gtown-r3-00
0020df980102.2334  dhcp         isp-bos-metro-16:isp-cmborg-12
```

### show network-access aaa subscribers logical-system routing-instance

```
user@host> show network-access aaa subscribers logical-system isp-bos-metro-16
routing-instance isp-cmborg-12-32
Username           Client type   Logical system/Routing instance
00010e020304.1231  dhcp         isp-bos-metro-12:isp-cmborg-12
user54@example.com  dhcp         default:isp-gtown-r3-00
0020df980102.2334  dhcp         isp-bos-metro-16:isp-cmborg-12
```

### show network-access aaa subscribers statistics username

```
user@host> show network-access aaa subscribers statistics username 00010e020304.1231
Authentication statistics
  Challenge requests: 0
  Challenge responses: 0
Accounting statistics
  START sent successfully: 1
  START send failures: 0
```

```

START ack received: 1
INTERIM sent successfully: 0
INTERIM send failures: 0
INTERIM ack received: 0
Re-authentication statistics
Requests received: 0
Successful responses: 0
Aborts handled: 0
Service statistics
Service name: filter-serv
Creation requests: 1
Deletion requests: 0
Request timeouts: 0
Service name: filter-serv2
Creation requests: 144
Deletion requests: 0
Request timeouts: 144

```

#### show network-access aaa subscribers username

```
user@host> show network-access aaa subscribers username user80@example.net
```

Logical system/Routing instance	Client type	Session-ID	Session uptime
Accounting			
isp-bos-metro-16:isp-cmbrg-12	dhcp	7	01:12:56
on/volume			
Service name	Service type	Quota	Accounting
I-Cast	volume	1200 Mbps	on/volume+time
Voip			on/volume
GamingBurst	time	6000 secs	on/volume

#### show network-access aaa subscribers session-id 26 detail

The following command output is seen when only an IPv4 client is associated with the session:

```
user@host> show network-access aaa subscribers session-id 26 detail
```

```

Type: dhcp
Stripped username: my-customer
AAA Logical system/Routing instance: default:default
Target Logical system/Routing instance: default:default
Access-profile: AccessProfile
Session ID: 26
Accounting Session ID: 26
Multi Accounting Session ID: 0
IP Address: 10.0.0.2
Authentication State: AuthStateActive
Accounting State: Acc-Interim-Sent
Provisioning Type: None

```

The following command output is seen when IPv6 client logs in (after IPv4 association) and is associated with the same session ID:

```
user@host> show network-access aaa subscribers session-id 26 detail
```

```

Type: dhcp
Stripped username: my-customer
AAA Logical system/Routing instance: default:default

```

```
Target Logical system/Routing instance: default:default
Access-profile: AccessProfile
Session ID: 26
Accounting Session ID: 26
Multi Accounting Session ID: 0
IP Address: 10.0.0.2
IPv6 Address: 2001:db8:0:8003::2
IPv6 Prefix: 2001:db8:ffff:0:4::/64
Authentication State: AuthStateActive
Accounting State: Acc-Interim-Sent
Provisioning Type: None
```

## show network-access aaa subscribers session-id

---

Syntax	<code>show network-access aaa subscribers session-id <i>session-id</i></code> <code>&lt;brief   detail&gt;</code>
Release Information	Command introduced in Junos OS Release 10.0.
Description	Display information about the specified subscriber session.
Options	<b><i>session-id</i></b> —ID of the subscriber session.  <b>brief   detail</b> —(Optional) Display the specified level of information.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Verifying and Managing Subscriber AAA Information on page 158</a></li><li>• <a href="#">Local and Remote Service Activation and Deactivation Using the CLI</a></li><li>• <a href="#">Deactivating a Single Instance of a Subscriber Service</a></li><li>• <a href="#">Deactivating All Instances of a Subscriber Service</a></li><li>• <a href="#">Verifying Subscriber Services with Multiple Instances</a></li><li>• <a href="#">Policy and Charging Enforcement Function Overview for Broadband Wireline Subscribers on page 718</a></li><li>• <a href="#">Understanding Gy Interactions Between the Router and the OCS on page 730</a></li><li>• <a href="#">Understanding Rule Interactions Between the PCRF, PCEF, and OCS on page 736</a></li></ul>

Output Fields	<a href="#">Table 132 on page 1853</a> lists the output fields for the <b>show network-access aaa subscribers session-id</b> command. Output fields are listed in the approximate order in which they appear.

Table 132: show network-access aaa subscribers session-id Output Fields

Field Name	Field Description	Level of Output
<b>Type and Client type</b>	Type of client.	All levels
<b>Accounting</b>	Status of the accounting configuration for the service, <b>on</b> or <b>off</b> , and the type of accounting, <b>time</b> , <b>volume+time</b> , or <b>flat-file</b> .  The <b>time</b> and <b>volume+time</b> types are configured in RADIUS Service-Statistics VSA [26-69].	brief none
<b>Service type</b>	Type of accounting: <b>volume</b> , <b>time</b> , <b>volume+time</b> , or <b>na</b> .	brief
<b>Quota</b>	Quota for service: volume (in Mbps) or time (seconds).	brief
<b>Username</b>	Name of the user logged in to the session.	detail
<b>Stripped username</b>	Username after the domain has been removed.	detail
<b>Logical system/Routing instance and AAA Logical system/Routing instance</b>	Name of the routing instance, logical system name, or both used for the session.	All levels
<b>Target Logical system/Routing instance</b>	Logical system/routing instance to which the session is mapped.	detail
<b>Access-profile</b>	Access profile used for AAA services for the session.	detail
<b>Session ID</b>	ID of the subscriber session.  The session ID value displayed under <b>Service name</b> is the service session ID.	detail
<b>Accounting Session ID</b>	ID of the accounting session (RADIUS attribute 44). The ID appears in decimal or description format, as specified by the <b>accounting-session-id-format</b> statement.	detail
<b>Multi Accounting Session ID</b>	Bundle ID for MLPPP sessions. Acct-Multi-Session-Id (RADIUS attribute 50) uses the value of the session database bundle session ID to enable RADIUS to link together multiple related sessions. The value of this field is zero when no MLPPP sessions exist.	detail
<b>IP Address</b>	IP address of the subscriber. For a single-session dual stack, addresses of both IPv4 and IPv6 clients are displayed.	detail

Table 132: show network-access aaa subscribers session-id Output Fields (continued)

Field Name	Field Description	Level of Output
<b>IPv6 Address</b>	IPv6 address of the subscriber. For a single-session dual stack, addresses of both IPv4 and IPv6 clients are displayed.	detail
<b>IPv6 Prefix</b>	IPv6 prefix of the subscriber. For a single-session dual stack, addresses of both IPv4 and IPv6 clients are displayed.	detail
<b>Authentication State</b>	State of the subscriber authentication session: <b>AuthInit</b> , <b>AuthStart</b> , <b>AuthChallenge</b> , <b>AuthRedirect</b> , <b>AuthClntRespWait</b> , <b>AuthAcctVolStatsAckWait</b> , <b>AuthAcctStopAckWait</b> , <b>AuthServCreateRespWait</b> , <b>AuthLogoutStart</b> , <b>AuthStateActive</b> , <b>AuthClntLogoutRespWait</b> , <b>AuthProfileUpdateWait</b> , <b>AuthProvisionRespWait</b> , <b>AuthProvisionServiceCreationWait</b>	detail
<b>Gx-Plus Provisioning State</b>	State of Gx-Plus provisioning: <ul style="list-style-type: none"> <li>ignored—Subscriber has no IPv4 address or NAS-Port-ID.</li> <li>in-progress—Provisioning is in progress.</li> <li>logout—Subscriber logout is in progress.</li> <li>logout-done—Logout response has been received.</li> <li>response-received—Provisioning response has been received.</li> </ul>	detail
<b>Pcrf Provisioning State</b>	State of PCRF provisioning: <ul style="list-style-type: none"> <li><b>active</b>—PCRF provisioning is active.</li> <li><b>ignored</b>—Subscriber has no IPv4 address or NAS-Port-ID.</li> <li><b>in-progress</b>—Provisioning is in progress.</li> <li><b>logout</b>—Subscriber logout is in progress.</li> <li><b>logout-done</b>—Logout response has been received.</li> <li><b>response-received</b>—Provisioning response has been received.</li> </ul>	detail
<b>Pcrf Subscription-Id-Type</b>	Type of subscriber for a PCRF partition. You can define your own or use a predefined value: <b>0</b> (END_USER_E164), <b>1</b> (END_USER_IMSI), <b>2</b> (END_USER_SIP_URI), <b>3</b> (END_USER_NAI), <b>4</b> (END_USER_PRIVATE).	detail
<b>Pcrf Subscription-Id-Data</b>	Subscriber data string concatenated from a list of user-selected data options used to identify the subscriber type for a PCRF partition; for example, demux0	detail

Table 132: show network-access aaa subscribers session-id Output Fields (continued)

Field Name	Field Description	Level of Output
Ocs Subscription-Id-Type	Type of subscriber for an OCS partition. You can define your own or use a predefined value: 0 (END_USER_E164), 1 (END_USER_IMSI), 2 (END_USER_SIP_URI), 3 (END_USER_NAI), 4 (END_USER_PRIVATE).	detail
Ocs Subscription-Id-Data	Subscriber data string concatenated from a list of user-selected data options used to identify the subscriber type for an OCS partition; for example: test-sid	detail
Ocs Interrogation State	State of the OCS interrogation: first, intermediate, final.	detail
Ocs Data State	State of the OCS data: none	detail
Accounting State	State of the subscriber accounting session: Acc-Init, Acc-Start-Sent, Imm-Update-Stats-Pending, Acc-Interim-Sent, Acc-Stop-Stats-Pending, Acc-Stop-Sent, Acc-Stop-On-Fail-Deny-Sent, Acc-Stop-Ackd	detail
Provisioning-type	Provisioning type for this session: <ul style="list-style-type: none"> <li>gx-plus—Subscriber service uses Gx-Plus provisioning.</li> <li>jsrc—Subscriber service uses JSRC provisioning.</li> <li>none—Provisioning is not enabled.</li> </ul>	detail
Service name	Name of the attached service or policy. <ul style="list-style-type: none"> <li>For RADIUS-activated and CLI-activated services, displays the full activation string for the service. If the activation string includes service parameters, then both the service name and service parameters are displayed.</li> <li>For JSRC-activated policies—displays the policy name.</li> </ul>	All levels
Service State	State of the service provided in the subscriber session.	detail
Service Family	Network family of the service provided in the subscriber session.	detail
Service Activation Source	Source used to activate the service.	detail
Session uptime	How long the session has been up, in HH:MM:SS.	All levels
Service CC-Service-Identifier	Data identification element of the 3GPP Diameter credit control service charging system that uniquely defines the CC-Service-Context.	detail

Table 132: show network-access aaa subscribers session-id Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Service Rating-Group</b>	Value associated with a charging rule and part of the accounting data stream for the PCRF.	detail
<b>Ocs Control</b>	Whether OCS controls the service: <b>yes</b> or <b>no</b> .	detail
<b>Accounting status</b>	Status of the accounting configuration for the service, <b>on</b> or <b>off</b> , and the type of accounting, <b>time</b> , <b>volume+time</b> , or <b>flat-file</b> .  The <b>time</b> and <b>volume+time</b> types are configured in RADIUS Service-Statistics VSA [26-69].	detail
<b>Service accounting session ID</b>	ID of the service accounting session; RADIUS Acct-Session-Id attribute (44). The ID appears in decimal or description format, as specified by the <b>accounting-session-id-format</b> statement.	detail
<b>Service accounting state</b>	State of the service accounting session: <b>Acc-Init</b> , <b>Acc-Start-Sent</b> , <b>Imm-Update-Stats-Pending</b> , <b>Acc-Interim-Sent</b> , <b>Acc-Stop-Stats-Pending</b> , <b>Acc-Stop-Sent</b> , <b>Acc-Stop-On-Fail-Deny-Sent</b> , <b>Acc-Stop-Ackd</b>	detail
<b>Accounting interim interval</b>	Amount of time between interim accounting updates for this service, in seconds; RADIUS Service-Interim-Acct-Interval VSA [26-140] or Diameter Acct-Interim-Interval AVP (85).	detail

## Sample Output

### show network-access aaa subscribers session-id brief

```
user@host> show network-access aaa subscribers session-id 6 brief
```

Logical system/Routing instance	Client type	Session uptime	Accounting
default:default	dhcp	00:01:29	on/time
Service name	Service type	Quota	Accounting
filter-service	-na-	-na-	off
filter-service-2	volume+time	77.00MB/120secs	off
1337994190863204450	-na-	-na-	off

### show network-access aaa subscribers session-id 2 (Flat File Accounting)

```

**Output Fields** Table 133 on page 1860 lists the output fields for the **show network-access aaa terminate-code** command. Output fields are listed in the approximate order in which they appear.

*Table 133: show network-access aaa terminate-code Output Fields*

Field Name	Field Description	Level of Output
RADIUS	RFC-defined code value conveyed in the RADIUS Acct-Terminate-Cause attribute (49) or a nonstandard, customized value that you configure with the <b>terminate-code aaa</b> statement at the <b>[edit access]</b> hierarchy level.	<b>brief detail</b> None (with <b>reverse</b> option)
Custom	Whether or not the termination cause is a customized mapping or the default mapping.	All levels
Mapping-Count	Number of mappings that occurred for a specific terminate cause type or category (standard or summary output) or per termination cause (reverse output).	<b>summary</b> None
Usage-Count	Number of times the terminate code mapping was used.	All levels
Type	Termination cause type—null, aaa, dhcp, l2tp, ppp, or vlan.  <b>NOTE:</b> The null termination cause type indicates that no termination reason was provided by the subscriber and the RADIUS Acct-Terminate-Cause attribute (49) was not included in the Acct-Stop request	All levels
Code	Specific termination cause.	<b>brief detail</b>

## Sample Output

**show network-access aaa terminate-code**

```
user@host> show network-access aaa terminate-code
```

```
Terminate-code:
  Custom Mapping-Count Usage-Count Type
```

no	1	0	null

## show network-access address-assignment pool

**Syntax** `show network-access address-assignment pool pool-name`  
`<logical-system logical-system-name>`  
`<routing-instance routing-instance-name>`

**Release Information** Command introduced in Junos OS Release 9.0.

**Description** Display state information for each address-assignment pool.

**Options** **none**—Display information about clients that have obtained addresses from the address-assignment pool.

**pool *pool-name***—Display information about the specified address-assignment pool.

**logical-system *logical-system-name***—(Optional) Perform this operation on the specified logical system.

**routing-instance *routing-instance-name***—(Optional) Perform this operation on the specified routing instance.

**Required Privilege Level** view and system

**List of Sample Output** [show network-access address-assignment pool on page 1865](#)

**Output Fields** [Table 134 on page 1864](#) lists the output fields for the **show network-access address-assignment pool** command. Output fields are listed in the approximate order in which they appear.

*Table 134: show network-access address-assignment pool Output Fields*

Field Name	Field Description
IP address/prefix	IP address of the client.
Hardware address	MAC address of the client.  Displays <b>NA</b> for addresses excluded from being allocated from the pool with the <b>excluded-address</b> or <b>excluded-range</b> statements.
Host/User	Hostname or username of the client.  Displays <b>EXCLUDED</b> for addresses excluded from being allocated from the pool with the <b>excluded-address</b> or <b>excluded-range</b> statements.

*Table 134: show network-access address-assignment pool Output Fields (continued)*

Field Name	Field Description
<b>Type</b>	Type of client.  Displays <b>unknown</b> for addresses excluded from being allocated from the pool with the <b>excluded-address</b> or <b>excluded-range</b> statements.

## Sample Output

### show network-access address-assignment pool

```
user@host> show network-access address-assignment pool sunnywest logical-system ls1
routing-instance routinst2
```

IP address/prefix	Hardware address	Host/User	Type
192.168.2.1	00:00:5e:00:53:01	user1	DHCP
192.168.2.2	00:00:5e:00:53:02	user2	DHCP
192.168.2.3	00:00:5e:00:53:03	user3	DHCP
192.168.2.4	NA	EXCLUDED	unknown

## show network-access domain-map

<b>Syntax</b>	<b>show network-access domain-map</b> <b>&lt;statistics&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 10.4.
<b>Description</b>	Display domain map information.
<b>Options</b>	<b>statistics</b> —(Optional) Display domain map statistics.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Verifying Domain Maps on page 213</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show network-access domain-map statistics on page 1866</a>
<b>Output Fields</b>	<a href="#">Table 135 on page 1866</a> lists the output fields for the <b>show network-access domain-map statistics</b> command. Output fields are listed in the approximate order in which they appear.

*Table 135: show network-access domain-map Output Fields*

Field Name	Field Description
<b>Matched domains</b>	Number of usernames with domain names that are matched.
<b>Unmatched domains</b>	Number of usernames with domain names that are not matched.
<b>Missing domain names</b>	Number of usernames without a domain name.
<b>Stripped username</b>	Number of usernames from which the domain name has been stripped.
<b>Default used</b>	Number of times the default domain map is used.

## Sample Output

### show network-access domain-map statistics

```

user@host> show network-access domain-map statistics
General domain mapping statistics
  Matched domains: 7
  Unmatched domains: 1
  Missing domain names: 0

```

```
Stripped username: 7
Domain statistics for domain-name: default
Default used: 1
```

## show network-access gx-plus

<b>Syntax</b>	<b>show network-access gx-plus</b> <b>&lt;state   statistics   sync-state&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 11.2.
<b>Description</b>	Display Gx-Plus provisioning state, synchronization state, and statistics information.
<b>Options</b>	<b>state</b> —(Optional) Display Gx-Plus provisioning state. <b>statistics</b> —(Optional) Display Gx-Plus statistics. <b>sync-state</b> —(Optional) Display Gx-Plus synchronization state.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear network-access gx-plus replay on page 1576</a></li> <li>• <a href="#">clear network-access gx-plus statistics on page 1577</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show network-access gx-plus state on page 1869</a> <a href="#">show network-access gx-plus statistics on page 1869</a> <a href="#">show network-access gx-plus sync-state on page 1869</a>
<b>Output Fields</b>	<p><a href="#">Table 136 on page 1868</a> lists the output fields for the <b>show network-access gx-plus</b> command. Output fields are listed in the approximate order in which they appear.</p>

*Table 136: show network-access gx-plus Output Fields*

Field Name	Field Description
Gx-plus state	State of the Gx-Plus application, including the following: <ul style="list-style-type: none"> <li>• Engine created</li> <li>• Partition configured</li> <li>• Configuration active</li> <li>• Diameter interface configured</li> <li>• Total number of entries—Number of provisioned, pending, and terminating subscribers.</li> <li>• Number of pending entries—Number of pending subscribers.</li> <li>• Number of pending logouts—Number of subscribers logging out.</li> </ul>
Sync-Event	Type of synchronization event.
Timeout	Number of times notification sent without response.

Table 136: show network-access gx-plus Output Fields (continued)

Field Name	Field Description
Gx-plus general counters	Number and state of general events.
Gx-plus sync-event counters	Number and state of synchronization events.

## Sample Output

### show network-access gx-plus state

```
user@host> show network-access gx-plus state
```

```
Gx-plus state:
Engine created           : yes
Partition configured    : yes
Configuration active     : yes
Diameter interface configured : yes
Total number of entries : 0
Number of pending entries : 0
Number of pending logouts : 0
```

### show network-access gx-plus statistics

```
user@host> show network-access gx-plus statistics
```

```
Gx-plus general counters:
Counter                               Value
engine created                       1
initial config: active                1
recovery: process restart             1
diameter-app initial config: success  1

Gx-plus sync-event counters:
Category    Counter    Value
warm-boot   activated   1

## show network-access nasreq statistics

<b>Syntax</b>	show network-access nasreq statistics
<b>Release Information</b>	Command introduced in Junos OS Release 16.1.
<b>Description</b>	Display information about the NASREQ protocol exchanges that are used to authenticate and authorize subscribers when they log in.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Diameter Network Access Server Application (NASREQ) on page 756</a></li> <li>• <a href="#">Configuring the Diameter Network Access Server Application (NASREQ) on page 757</a></li> <li>• <a href="#">Messages Used by Diameter Applications on page 674</a></li> </ul>
<b>Output Fields</b>	<a href="#">Table 137 on page 1870</a> lists the output fields for the <b>show network-access nasreq statistics</b> command. Output fields are listed in the approximate order in which they appear.

*Table 137: show network-access nasreq statistics Output Fields*

Field Name	Field Description
Authentication request attempts	Number of authentication requests forwarded to the NASREQ engine. Note that authentication includes authorization in one message exchange.
Authentication request failures	Number of authentication request failures at the NASREQ engine. This includes timeout failures of the request waiting in the transmit queue.
Authentication request messages sent	Number of authentication requests forwarded to the Diameter engine.
Authentication request message failures	Number of authentication requests failures at the Diameter engine.
Authentication request messages timeouts	Number of authentication requests that timed out waiting for a response from the NASREQ server.
Authentication denies failures	Number of authentication responses with an unsuccessful result-code.
Authentication grants received	Number of authentication responses with a successful result-code.
Authorization request attempts	Number of authorization requests to the NASREQ engine.
Authorization request failures	Number of authorization request failures at the NASREQ engine. This includes timeout failures of the request waiting in the transmit queue.
Authorization request messages sent	Number of authorization requests forwarded to the Diameter engine.

*Table 137: show network-access nasreq statistics Output Fields (continued)*

Field Name	Field Description
Authorization request message failures	Number of authorization requests failures at the Diameter engine.
Authorization request messages timeouts	Number of authorization requests that timed out waiting for a response from the NASREQ server.
Authorization denies failures	Number of authorization responses with an unsuccessful result-code.
Authorization grants received	Number of authorization responses with a successful result-code.
Session-terminate request attempts	Number of session-terminate requests forwarded to the NASREQ engine.
Session-terminate request failures	Number of session-terminate requests failures at the NASREQ engine. This includes timeout failures of the request waiting in the transmit queue.
Session-terminate request messages sent	Number of session-terminate requests forwarded to the Diameter engine.
Session-terminate request messages failures	Number of session-terminate requests failures at the Diameter engine.
Session-terminate request messages timeouts	Number of session-terminate requests that timed out waiting for a response from the NASREQ server.
Session-terminate response message failures	Number of session-terminate responses with an unsuccessful result-code.
Session-terminate response messages received	Number of session-terminate responses with a successful result-code.
Abort-session requests received	Number of abort-session requests received by the NASREQ engine.
Abort-session response-ack messages sent	Number of abort-session requests receiving an ACK response.
Abort-session response-nack messages sent	Number of abort-session requests receiving a NACK response.
Abort-session response message failures	Number of abort-session responses that failed transmission, either due to timeout in the transmit queue, or failed by the Diameter engine.
Number of NASREQ subscribers	Number of active subscribers that received NASREQ authorization.
Number of result-code-1xxx	Number of response messages with an informational result-code.
Number of result-code-2xxx	Number of response messages with a success result-code.
Number of result-code-3xxx	Number of response messages with a protocol-error result-code.
Number of result-code-4xxx	Number of response messages with an transient-error result-code.

Table 137: show network-access nasreq statistics Output Fields (continued)

Field Name	Field Description
Number of result-code-5xxx	Number of response messages with a permanent-error result-code.
Number of result-code-other	Number of response messages with an unregistered result-code.
Transmit queue time-outs	Number of request/responses that timed out waiting for Diameter engine resources.
Transmit message drops	Number of request/responses dropped.
Transmit message failures	Number of request/response failures at the Diameter engine.
Number of requests on the Tx queue	Number of requests/responses currently on the transmit queue.
Number of requests waiting for a response	Number of requests currently in the response queue waiting for a response.
Number of outstanding requests	Number of outstanding requests, including AAR and STR.
Total number of allocated messages	Number of currently allocated request/response messages.

## Sample Output

```

user@host> show network-access nasreq statistics
Authentication request attempts:4000
Authentication request failures:0
Authentication request messages sent:4000
Authentication request message failures:0
Authentication request messages timeouts:0
Authentication denies failures:0
Authentication grants received:4000
Authorization request attempts:4000
Authorization request failures:0
Authorization request messages sent:4000
Authorization request message failures:0
Authorization request messages timeouts:0
Authorization denies failures:0
Authorization grants received:4000
Session-terminate request attempts:1000
Session-terminate request failures:0
Session-terminate request messages sent:1000
Session-terminate request message failures:0
Session-terminate request messages timeouts:0
Session-terminate response messages failures:0
Session-terminate response messages received:1000
Abort-session requests received:1000
Abort-session response-ack messages sent:1000
Abort-session response-nack messages sent:0
Abort-session response message failures:0
Number of NASREQ subscribers:3000
Number of result-code-1xxx:0
Number of result-code-2xxx:5000
Number of result-code-3xxx:0

```

```
Number of result-code-4xxx:0
Number of result-code-5xxx:0
Number of result-code-other:0
Transmit queue time-outs:0
Transmit message drops:0
Transmit message failures:0
Number of requests on the Tx queue:0
Number of requests waiting for a response:0
Number of outstanding requests:0
Total number of allocated messages:0
```

## show network-access ocs

**Syntax** `show network-access ocs  
<state>  
<statistics [brief | detail | extensive]>`

**Release Information** Command introduced in Junos OS Release 16.2.

**Description** Display Online Charging System (OCS) provisioning state and statistics information.

**Options** **brief | detail | extensive**—(Optional) Display the specified level of output.

**state**—(Optional) Display OCS provisioning state.

**statistics**—(Optional) Display OCS statistics.

**Required Privilege Level** view

- Related Documentation**

**List of Sample Output** [show network-access ocs state on page 1875](#)  
[show network-access ocs statistics on page 1875](#)

**Output Fields** [Table 138 on page 1874](#) lists the output fields for the **show network-access ocs** command. Output fields are listed in the approximate order in which they appear.

*Table 138: show network-access ocs Output Fields*

Field Name	Field Description	Level of Output
Ocs state	<p>State of the OCS components, including the following:</p> <ul style="list-style-type: none"> <li>• <b>created</b>—Just created.</li> <li>• <b>dead</b>—Ready to be deleted.</li> <li>• <b>final</b>—Final interrogation in progress.</li> <li>• <b>idle</b>—Idle.</li> <li>• <b>initial</b>—Initial interrogation in progress.</li> <li>• <b>intermediate</b>—Intermediate interrogation in progress.</li> </ul>	All levels

Table 138: show network-access ocs Output Fields (continued)

Field Name	Field Description	Level of Output
Ocs general counters	Type and number of Diameter response and answer messages for OCS communication using the Gy protocol.	All levels

## Sample Output

### show network-access ocs state

```
user@host> show network-access ocs state
```

```
Ocs state:
Component      Value
state          active
active-configuration  yes
queue-state    normal
subscribers    2000
sub-in-idle    2000
```

### show network-access ocs statistics

```
user@host> show network-access ocs statistics
```

```
Ocs general counters:
Counter      Value
ccr-gy-i     4001
cca-gy-i     4001
ccr-gy-u     38001
cca-gy-u     38001
ccr-gy-t     2001
cca-gy-t     2001
asr          1
asa-ack      1
```

## show network-access pcrf

---

Syntax	<b>show network-access pcrf</b> <b>&lt;state&gt;</b> <b>&lt;statistics [brief   detail   extensive]&gt;</b>
Release Information	Command introduced in Junos OS Release 16.2.
Description	Display Policy and Charging Rules Function (PCRF) provisioning state and statistics information.
Options	<b>brief   detail   extensive</b> —(Optional) Display the specified level of output. <b>state</b> —(Optional) Display PCRF provisioning state. <b>statistics</b> —(Optional) Display PCRF statistics.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">pcrf on page 1272</a></li><li>• <a href="#">clear network-access pcrf on page 1579</a></li><li>• <a href="#">Understanding Gx Interactions Between the Router and the PCRF on page 722</a></li><li>• <a href="#">Understanding Rule Interactions Between the PCRF, PCEF, and OCS on page 736</a></li><li>• <a href="#">Understanding Upstream and Downstream Messages for the PCRF on page 742</a></li></ul>
List of Sample Output	<a href="#">show network-access pcrf state on page 1877</a> <a href="#">show network-access pcrf statistics on page 1877</a>
Output Fields	<a href="#">Table 139 on page 1877</a> lists the output fields for the <b>show network-access pcrf</b> command. Output fields are listed in the approximate order in which they appear.

*Table 139: show network-access pcrf Output Fields*

Field Name	Field Description	Level of Output
Pcrf state	State of the PCRF components: <ul style="list-style-type: none"> <li>• <b>active</b>—Installed services from local grant.</li> <li>• <b>created</b>—Just created.</li> <li>• <b>started</b>—Log in.</li> <li>• <b>local-active</b>—Services installed after local grant.</li> <li>• <b>local-deny</b>—Denied by local decision waiting for subscriber logout.</li> <li>• <b>local-grant</b>—Received local grant and installing services.</li> <li>• <b>grant</b>—Received remote grant and installing services.</li> <li>• <b>upd-from-local</b>—Received remote grant, in local-active state, and installing services.</li> <li>• <b>update</b>—Processing RAR-update.</li> <li>• <b>report</b>—Sending report.</li> <li>• <b>deny</b>—Received deny from remote and waiting for subscriber logout.</li> <li>• <b>failed</b>—GRES before active state or provisioning failed, waiting for subscriber logout.</li> <li>• <b>ocs-final-wait</b>—Waiting for OCS to complete final interrogation.</li> <li>• <b>logout</b>—Waiting for logout response.</li> <li>• <b>dead</b>—Received logout response or timed out waiting for logout response.</li> </ul>	All levels
Pcrf general counters	Type and number of Diameter response and answer messages for PCRF communication using the Gx protocol.	All levels
Pcrf diameter event counters	State and number of Diameter events.	All levels
Pcrf rule install counters	Result and number of rule installations.	All levels

## Sample Output

### show network-access pcrf state

```
user@host> show network-access pcrf state
```

```
Pcrf state:
Component      Value
state          active
active-configuration  yes
queue-state    normal
subscribers    2000
sub-in-idle    2000
```

### show network-access pcrf statistics

```
user@host> show network-access pcrf statistics
```

## Pcrf general counters:

Counter	Value
ccr-gx-i	4001
ccr-gx-i-retry	4
cca-gx-i	4001
ccr-gx-u	4001
cca-gx-u	4001
ccr-gx-t	2001
cca-gx-t	2001

## Pcrf diameter event counters:

Diameter event	Value
no peer for tx	4

## Pcrf rule install counters:

Result	Value
success	16004

## show network-access requests statistics

<b>Syntax</b>	<code>show network-access requests statistics</code>
<b>Release Information</b>	Command modified in Release 9.1 of Junos OS.
<b>Description</b>	Display authentication statistics for the configured authentication type.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><code>clear network-access requests statistics</code></li> </ul>
<b>Output Fields</b>	Table 140 on page 1879 lists the output fields for the network-access requests statistics command. Output fields are listed in the approximate order in which they appear.

Table 140: show network-access requests statistics Output Fields

Field Name	Field Description
Total requests received	Total number of authentication requests that the device received from clients.
Total responses sent	Total number of authentication responses that the device sent to the clients.
Success responses	Total number of clients that authenticated successfully.
Failure responses	Total number of clients that failed to authenticate.

## show network-access requests statistics

```
user@host> show network-access requests statistics
```

```
General authentication statistics
  Total requests received: 100
  Total responses sent: 70
Radius authentication statistics
  Total requests received: 40
  Success responses: 20
  Failure responses: 20
Radius reauthentication statistics
  Total requests received: 0
  Success responses: 0
  Failure responses: 0
LDAP authentication statistics
  Total requests received: 30
  Success responses: 15
  Failure responses: 15
Local authentication statistics
  Total requests received: 5
```

```
Success responses: 2
Failure responses: 3
Local re-authentication statistics
Total requests received: 0
Success responses: 0
Failure responses: 0
Securid authentication statistics
Total requests received: 15
Success responses: 3
Failure responses: 12
```

## show ppp address-pool

**Syntax** `show ppp address-pool pool-name <detail>`

**Release Information** Command introduced in Junos OS Release 7.5.

**Description** Display PPP address pool information.

**Options** *pool-name*—Address pool name.

**detail**—(Optional) Display detailed address pool information.

**Required Privilege Level** view

**Related Documentation**

- *Verifying and Managing PPP Configuration for Subscriber Management*

**List of Sample Output** [show ppp address-pool on page 1882](#)  
[show ppp address-pool detail on page 1882](#)

**Output Fields** [Table 141 on page 1881](#) lists the output fields for the **show ppp address-pool** command. Output fields are listed in the approximate order in which they appear.

*Table 141: show ppp address-pool Output Fields*

Field Name	Field Description	Level of Output
Address pool	Trace address pool code.	All levels
Address range	Range of sequentially ordered IP addresses contained in the address pool.	<b>detail</b>
Number of assigned addresses	Fixed IP address that is to be given to remote users when they dial in. This is a host-only IP address (subnet mask is 255.255.255.255) and is only for single connection receiver profiles.	All levels
Number of addresses configured	Number of IP addresses that are available for allocation and used by PPP sessions.	All levels
Assigned addresses	Addresses assigned to PPP sessions from the address pool.	<b>detail</b>

## Sample Output

### show ppp address-pool

```
user@host> show ppp address-pool  
Address pool ppp1  
Address range: 203.0.113.221 - 203.0.113.230  
Number of assigned addresses: 0  
Number of addresses configured: 10
```

### show ppp address-pool detail

```
user@host> show ppp address-pool ppp1 detail  
Address pool ppp1  
Address range: 203.0.113.221 - 203.0.113.230  
Number of assigned addresses: 2  
Number of addresses configured: 10  
Assigned addresses:  
    203.0.113.221  
    203.0.113.222
```

## show route

**List of Syntax**    [Syntax on page 1883](#)  
                           [Syntax \(EX Series Switches\) on page 1883](#)

**Syntax**

```
show route
<all>
<destination-prefix>
<logical-system (all | logical-system-name)>
<private>
<te-ipv4-prefix-ip te-ipv4-prefix-ip>
<te-ipv4-prefix-node-ip te-ipv4-prefix-node-ip>
<te-ipv4-prefix-node-iso te-ipv4-prefix-node-iso>
```

**Syntax (EX Series Switches)**

```
show route
<all>
<destination-prefix>
<private>
```

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                 Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                 Option **private** introduced in Junos OS Release 9.5.  
                                 Option **private** introduced in Junos OS Release 9.5 for EX Series switches.  
                                 Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.  
                                 Option **display-client-data** introduced in Junos OS Release 16.2R1 on MX80, MX104, MX240, MX480, MX960, MX2010, MX2020, vMX Series routers.  
                                 Options **te-ipv4-prefix-ip**, **te-ipv4-prefix-node-ip**, and **te-ipv4-prefix-node-iso** introduced in Junos OS Release 17.2R1 on MX Series and PTX Series.

**Description**    Display the active entries in the routing tables.

**Options**    **none**—Display brief information about all active entries in the routing tables.

**all**—(Optional) Display information about all routing tables, including private, or internal, routing tables.

**destination-prefix**—(Optional) Display active entries for the specified address or range of addresses.

**logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**private**—(Optional) Display information only about all private, or internal, routing tables.

**display-client-data** —(Optional) Display client id and cookie information for routes installed by the routing protocol process client applications.

**te-ipv4-prefix-ip** *te-ipv4-prefix-ip*—(Optional) Display IPv4 address of the traffic-engineering prefix, without the mask length if present in the routing table.

**te-ipv4-prefix-node-ip** *te-ipv4-prefix-node-ip*—(Optional) Display all prefixes that have originated from the traffic-engineering node. You can filter IPv4 node addresses from the traffic-engineered routes in the **lsdist.0** table.

**te-ipv4-prefix-node-iso** *te-ipv4-prefix-node-iso*—(Optional) Display all prefixes that have originated from the traffic-engineering node. You can filter IPv4 routes with the specified ISO circuit ID from the **lsdist.0** table.

**Output Fields**

[Table 142 on page 1884](#) describes the output fields for the **show route** command. Output fields are listed in the approximate order in which they appear.

*Table 142: show route Output Fields*

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).

Table 142: show route Output Fields (continued)

Field Name	Field Description
<i>number destinations</i>	Number of destinations for which there are routes in the routing table.
<i>number routes</i>	<p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive). A holddown route was once the active route and is no longer the active route. The route is in the holddown state because a protocol still has interest in the route, meaning that the interest bit is set. A protocol might have its interest bit set on the previously active route because the protocol is still advertising the route. The route will be deleted after all protocols withdraw their advertisement of the route and remove their interest bit. A persistent holddown state often means that the interested protocol is not releasing its interest bit properly.</li> </ul> <p>However, if you have configured advertisement of multiple routes (with the <b>add-path</b> or <b>advertise-inactive</b> statement), the holddown bit is most likely set because BGP is advertising the route as an active route. In this case, you can ignore the holddown state because nothing is wrong.</p> <ul style="list-style-type: none"> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul>
<i>destination-prefix</i>	<p>Route destination (for example:10.0.0.1/24). Sometimes the route information is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only. For example, 10.1.1.195:NoCtrlWord:1:1:Local/96): <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul>
<i>[ protocol, preference ]</i>	<p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>
<i>weeks:days hours:minutes:seconds</i>	How long the route been known (for example, <b>2w4d 13:11:14</b> , or 2 weeks, 4 days, 13 hours, 11 minutes, and 14 seconds).

Table 142: show route Output Fields (continued)

Field Name	Field Description
<b>metric</b>	Cost value of the indicated route. For routes within an AS, the cost is determined by the IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
<b>localpref</b>	Local preference value included in the route.
<b>from</b>	Interface from which the route was received.
<b>AS path</b>	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>
<b>encapsulated</b>	Extended next-hop encoding capability enabled for the specified BGP community for routing IPv4 traffic over IPv6 tunnels. When BGP receives routes without the tunnel community, IPv4-Over IPv6 tunnels are not created and BGP routes are resolved without encapsulation.
<b>Route Labels</b>	Stack of labels carried in the BGP route update.
<b>validation-state</b>	<p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>
<b>to</b>	<p>Next hop to the destination. An angle bracket (&gt;) indicates that the route is the selected route.</p> <p>If the destination is <b>Discard</b>, traffic is dropped.</p>

Table 142: show route Output Fields (continued)

Field Name	Field Description
via	<p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> <li>• <b>lsp-path-name</b>—Name of the LSP used to reach the next hop.</li> <li>• <b>label-action</b>—MPLS label and operation occurring at the next hop. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label). For VPNs, expect to see multiple <b>push</b> operations, corresponding to the inner and outer labels required for VPN routes (in the case of a direct PE-to-PE connection, the VPN route would have the inner label push only).</li> </ul>
Private unicast	(Enhanced subscriber management for MX Series routers) Indicates that an access-internal route is managed by enhanced subscriber management. By contrast, access-internal routes <i>not</i> managed by enhanced subscriber management are displayed with associated next-hop and media access control (MAC) address information.
balance	Distribution of the load based on the underlying operational interface bandwidth for equal-cost multipaths (ECMP) across the nexthop gateways in percentages.

## Sample Output

### show route

```

user@host> show route

inet.0: 11 destinations, 12 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

1:65500:1:10.0.0.20/240
    *[MVPN/70] 19:53:41, metric2 1
    Indirect
1:65500:1:10.0.0.40/240
    *[BGP/170] 19:53:29, localpref 100, from 10.0.0.30
    AS path: I
    > to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD
    [BGP/170] 19:53:26, localpref 100, from 10.0.0.33
    AS path: I
    > to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD
1:65500:1:10.0.0.60/240
    *[BGP/170] 19:53:29, localpref 100, from 10.0.0.30
    AS path: I
    > to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF
    [BGP/170] 19:53:25, localpref 100, from 10.0.0.33
    AS path: I
    > to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF

```

### show route (VPN)

The following sample output shows a VPN route with composite next hops enabled. The first **Push** operation corresponds to the outer label. The second **Push** operation corresponds to the inner label.

```
user@host> show route 192.0.2.0
```

```
13979:665001.inet.0: 871 destinations, 3556 routes (871 active, 0 holddown, 0 hidden)
```

```
+ = Active Route, - = Last Active, * = Both
```

```
192.0.2.0/24      [BGP/170] 00:28:32, localpref 100, from 10.9.9.160
                  AS path: 13980 ?, validation-state: unverified
                  > to 10.100.0.42 via ae2.0, Push 16, Push 300368(top)
                  [BGP/170] 00:28:28, localpref 100, from 10.9.9.169
                  AS path: 13980 ?, validation-state: unverified
                  > to 10.100.0.42 via ae2.0, Push 126016, Push 300368(top)

## show route extensive

<b>List of Syntax</b>	<a href="#">Syntax on page 1905</a> <a href="#">Syntax (EX Series Switches) on page 1905</a>
<b>Syntax</b>	<pre>show route extensive &lt;destination-prefix&gt; &lt;logical-system (all   logical-system-name)&gt;</pre>
<b>Syntax (EX Series Switches)</b>	<pre>show route extensive &lt;destination-prefix&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	Display extensive information about the active entries in the routing tables.
<b>Options</b>	<p><b>none</b>—Display all active entries in the routing table.</p> <p><b>destination-prefix</b>—(Optional) Display active entries for the specified address or range of addresses.</p> <p><b>logical-system (all   logical-system-name)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show route extensive on page 1912</a> <a href="#">show route extensive (Access Route) on page 1919</a> <a href="#">show route extensive (BGP PIC Edge) on page 1920</a> <a href="#">show route extensive (FRR and LFA) on page 1920</a> <a href="#">show route extensive (IS-IS) on page 1921</a> <a href="#">show route extensive (Route Reflector) on page 1921</a> <a href="#">show route label detail (Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 1922</a> <a href="#">show route label detail (Multipoint LDP with Multicast-Only Fast Reroute) on page 1922</a>
<b>Output Fields</b>	<p><a href="#">Table 143 on page 1905</a> describes the output fields for the <b>show route extensive</b> command. Output fields are listed in the approximate order in which they appear.</p>

*Table 143: show route extensive Output Fields*

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).

Table 143: show route extensive Output Fields (continued)

Field Name	Field Description
<i>number destinations</i>	Number of destinations for which there are routes in the routing table.
<i>number routes</i>	<p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive).</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul>
<i>route-destination</i> (entry, announced)	<p>Route destination (for example: 10.0.0.1/24). The <b>entry</b> value is the number of route for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul>
<b>TSI</b>	Protocol header information.
<b>label stacking</b>	<p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of two or more exits this router with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>
<b>[protocol, preference]</b>	<p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+—</b>A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>—</b>A hyphen indicates the last active route.</li> <li>• <b>*—</b>An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>

Table 143: show route extensive Output Fields (continued)

Field Name	Field Description
<b>Level</b>	(IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.
<b>Route Distinguisher</b>	IP subnet augmented with a 64-bit prefix.
<b>PMSI</b>	Provider multicast service interface (MVPN routing table).
<b>Next-hop type</b>	Type of next hop. For a description of possible values for this field, see the Output Field table in the <i>show route detail</i> command.
<b>Next-hop reference count</b>	Number of references made to the next hop.
<b>Flood nexthop branches exceed maximum message</b>	Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.
<b>Source</b>	IP address of the route source.
<b>Next hop</b>	Network layer address of the directly reachable neighboring system.
<b>via</b>	<p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul>
<b>Label-switched-path lsp-path-name</b>	Name of the LSP used to reach the next hop.
<b>Label operation</b>	MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).
<b>Offset</b>	Whether the metric has been increased or decreased by an offset value.
<b>Interface</b>	(Local only) Local interface name.
<b>Protocol next hop</b>	Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop.

Table 143: *show route extensive Output Fields (continued)*

Field Name	Field Description
<b>label-operation</b>	MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).
<b>Indirect next hops</b>	<p>When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved.</p> <p>When BGP PIC Edge is enabled, the output lines that contain <b>Indirect next hop: weight</b> follow next hops that the software can use to repair paths where a link failure occurs. The next-hop weight has one of the following values:</p> <ul style="list-style-type: none"><li>• 0x1 indicates active next hops.</li><li>• 0x4000 indicates passive next hops.</li></ul>
<b>State</b>	State of the route (a route can be in more than one state). See the Output Field table in the <i>show route detail</i> command.
<b>Session ID</b>	The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA).
<b>Weight</b>	<p>Weight for the backup path. If the weight of an indirect next hop is larger than zero, the weight value is shown.</p> <p>For sample output, see <b>show route table</b>.</p>

Table 143: show route extensive Output Fields (continued)

Field Name	Field Description
Inactive reason	<p>If the route is inactive, the reason for its current state is indicated. Typical reasons include:</p> <ul style="list-style-type: none"> <li>• <b>Active preferred</b>—Currently active route was selected over this route.</li> <li>• <b>Always compare MED</b>—Path with a lower multiple exit discriminator (MED) is available.</li> <li>• <b>AS path</b>—Shorter AS path is available.</li> <li>• <b>Cisco Non-deterministic MED selection</b>—Cisco nondeterministic MED is enabled and a path with a lower MED is available.</li> <li>• <b>Cluster list length</b>—Path with a shorter cluster list length is available.</li> <li>• <b>Forwarding use only</b>—Path is only available for forwarding purposes.</li> <li>• <b>IGP metric</b>—Path through the next hop with a lower IGP metric is available.</li> <li>• <b>IGP metric type</b>—Path with a lower OSPF link-state advertisement type is available.</li> <li>• <b>Interior &gt; Exterior &gt; Exterior via Interior</b>—Direct, static, IGP, or EBGP path is available.</li> <li>• <b>Local preference</b>—Path with a higher local preference value is available.</li> <li>• <b>Next hop address</b>—Path with a lower metric next hop is available.</li> <li>• <b>No difference</b>—Path from a neighbor with a lower IP address is available.</li> <li>• <b>Not Best in its group</b>—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process. When this reason is displayed, an additional reason is provided (typically one of the other reasons listed).</li> <li>• <b>Number of gateways</b>—Path with a higher number of next hops is available.</li> <li>• <b>Origin</b>—Path with a lower origin code is available.</li> <li>• <b>OSPF version</b>—Path does not support the indicated OSPF version.</li> <li>• <b>RIB preference</b>—Route from a higher-numbered routing table is available.</li> <li>• <b>Route distinguisher</b>—64-bit prefix added to IP subnets to make them unique.</li> <li>• <b>Route metric or MED comparison</b>—Route with a lower metric or MED is available.</li> <li>• <b>Route preference</b>—Route with a lower preference value is available.</li> <li>• <b>Router ID</b>—Path through a neighbor with a lower ID is available.</li> <li>• <b>Unusable path</b>—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved.</li> <li>• <b>Update source</b>—Last tiebreaker is the lowest IP address value.</li> </ul>
Local AS	Autonomous system (AS) number of the local routing device.
Age	How long the route has been known.
AI GP	Accumulated interior gateway protocol (AIGP) BGP attribute.
Metric	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
MED-plus-IGP	Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.
TTL-Action	<p>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.</p> <p>For sample output, see <b>show route table</b>.</p>

Table 143: show route extensive Output Fields (continued)

Field Name	Field Description
<b>Task</b>	Name of the protocol that has added the route.
<b>Announcement bits</b>	<p>List of protocols that are consumers of the route. Using the following output as an example, <b>Announcement bits (3): 0-KRT 5-Resolve tree 2 8-BGP RT Background</b> there are (3) announcement bits to reflect the three clients (protocols) that have state for this route: Kernel (0-KRT), 5 (resolution tree process 2), and 8 (BGP).</p> <p>The notation <b><i>n</i>-Resolve inet</b> indicates that the route is used for route resolution for next hops found in the routing table. <i>n</i> is an index used by Juniper Networks customer support only.</p>
<b>AS path</b>	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>
<b>validation-state</b>	<p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>
<b>FECs bound to route</b>	Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.
<b>AS path: I &lt;Originator&gt;</b>	(For route reflected output only) Originator ID attribute set by the route reflector.

Table 143: *show route extensive Output Fields (continued)*

Field Name	Field Description
<b>route status</b>	<p>Indicates the status of a BGP route:</p> <ul style="list-style-type: none"> <li>• <b>Accepted</b>—The specified BGP route is imported by the default BGP policy.</li> <li>• <b>Import</b>—The route is imported into a Layer 3 VPN routing instance.</li> <li>• <b>Import-Protect</b>—A remote instance egress that is protected.</li> <li>• <b>Multipath</b>—A BGP multipath active route.</li> <li>• <b>MultipathContrib</b>—The route is not active but contributes to the BGP multipath.</li> <li>• <b>Protect</b>—An egress route that is protected.</li> <li>• <b>Stale</b>—A route that is marked stale due to graceful restart.</li> </ul>
Primary Upstream	When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.
RPF Nexthops	When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.
Label	Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.
weight	Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.
VC Label	MPLS label assigned to the Layer 2 circuit virtual connection.
MTU	Maximum transmission unit (MTU) of the Layer 2 circuit.
VLAN ID	VLAN identifier of the Layer 2 circuit.
Cluster list	(For route reflected output only) Cluster ID sent by the route reflector.
Originator ID	(For route reflected output only) Address of router that originally sent the route to the route reflector.
Prefixes bound to route	Forwarding Equivalent Class (FEC) bound to this route. Applicable only to routes installed by LDP.
Communities	Community path attribute for the route. See the Output Field table in the <i>show route detail</i> command for all possible values for this field.
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).
control flags	Control flags: <b>none</b> or Site Down.
mtu	Maximum transmission unit (MTU) information.
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.

Table 143: show route extensive Output Fields (continued)

Field Name	Field Description
<b>status vector</b>	Layer 2 VPN and VPLS network layer reachability information (NLRI).
<b>Localpref</b>	Local preference value included in the route.
<b>Router ID</b>	BGP router ID as advertised by the neighbor in the open message.
<b>Primary Routing Table</b>	In a routing table group, the name of the primary routing table in which the route resides.
<b>Secondary Tables</b>	In a routing table group, the name of one or more secondary tables in which the route resides.
<b>Originating RIB</b>	Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of inet.0 resolving through inet.0 and inet.3, this field indicates which routing table, inet.0 or inet.3, provided the best path for a particular prefix.
<b>Node path count</b>	Number of nodes in the path.
<b>Forwarding nexthops</b>	Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.

## Sample Output

### show route extensive

```

user@host> show route extensive

## show static-subscribers sessions

<b>Syntax</b>	<b>show static-subscribers sessions</b> <b>&lt;group <i>group-name</i>&gt;</b> <b>&lt;interface <i>interface-name</i>&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 9.6.
<b>Description</b>	Display information about the subscriber sessions for all static subscribers, all static subscribers on an interface group, or a single subscriber on an interface.
<b>Options</b>	<p><b><i>group-name</i></b>—(Optional) Display session information for static subscribers on all interfaces in the specified group.</p> <p><b><i>interface-name</i></b>—(Optional) Display session information for the static subscriber on the specified in the specified group.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Subscribers on Static Interfaces Overview on page 774</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show static-subscribers sessions on page 1925</a> <a href="#">show static-subscribers sessions group on page 1925</a> <a href="#">show static-subscribers sessions interface on page 1926</a> <a href="#">show static-subscribers sessions interface (Pseudowire Interface) on page 1926</a> <a href="#">show static-subscribers sessions group (Pseudowire Interface) on page 1926</a>
<b>Output Fields</b>	Table 144 on page 1924 lists the output fields for the <b>show static-subscribers sessions</b> command. Output fields are listed in the approximate order in which they appear.

Table 144: show static-subscribers sessions Output Fields

Field Name	Field Description	Level of Output
<b>Interface</b>	Name of the interface.	None specified

Table 144: *show static-subscribers sessions Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>State</b>	State of the static subscriber session: <ul style="list-style-type: none"> <li>• <b>authenticating</b>—Subscriber is being authenticated.</li> <li>• <b>activating client</b>—Client is being activated.</li> <li>• <b>activating services</b>—Subscriber services are being activated.</li> <li>• <b>deactivating client</b>—Client is being deactivated.</li> <li>• <b>deactivating services</b>—Subscriber services are being deactivated.</li> <li>• <b>initializing</b>—Process is initializing.</li> <li>• <b>logged in</b>—Subscriber is logged in to the interface.</li> <li>• <b>logged out</b>—Subscriber is logged out of the interface.</li> <li>• <b>processing statistics</b>—Session statistics are being processed.</li> <li>• <b>terminating session</b>—Subscriber session is being terminated.</li> </ul>	None specified
<b>Group</b>	Name of the interface group to which the interface belongs.	None specified
<b>User Name</b>	Username used for the static subscriber. Can be the interface name.	None specified

## Sample Output

### show static-subscribers sessions

```
user@host> show static-subscribers sessions
```

```
Static subscriber information:
Interface      State           Group           User Name
ge-9/1/0.1     logged out      SS1             ge-9-1-0.1
ge-9/1/0.10    logged out      SS1             ge-9-1-0.10
ge-9/1/0.100   logged out      SS1             ge-9-1-0.100
ge-9/1/0.11    logged out      SS1             ge-9-1-0.11
ge-9/1/0.12    logged out      SS1             ge-9-1-0.12
ge-9/1/0.13    logged out      SS1             ge-9-1-0.13
ge-9/1/0.14    logged out      SS1             ge-9-1-0.14

ge-9/1/0.18    logged out      SS1             ge-9-1-0.18
ge-9/1/0.19    logged out      SS1             ge-9-1-0.19
ge-9/1/0.2     logged out      SS1             ge-9-1-0.2
ge-9/1/0.20    logged out      SS1             ge-9-1-0.20
ge-9/1/0.21    logged out      SS1             ge-9-1-0.21
```

### show static-subscribers sessions group

```
user@host> show static-subscribers sessions group boston
```

```
Interface      State           Group           User Name
ge-0/0/1.1     logged in       boston          ge-0/0/1.1
ge-0/0/1.2     logged in       boston          ge-0/0/1.2
```

**show static-subscribers sessions interface**

```
user@host> show static-subscribers sessions interface ge-0/0/1.1
```

Interface	State	Group	User Name
ge-0/0/1.1	logged in	foo	ge-0/0/1.1

**show static-subscribers sessions interface (Pseudowire Interface)**

```
user@host> show static-subscribers sessions interface ps100.4040
```

Static subscriber information:

Interface	State	Group	User Name
ps100.4040	logged in	foo	static-user:4000@jnpr.net

**show static-subscribers sessions group (Pseudowire Interface)**

```
user@host> show static-subscribers sessions group grp-1
```

Static subscriber information:

Interface	State	Group	User Name
ps100.4040	logged in	foo	static-user:4000@jnpr.net
ps100.4041	logged in	foo	static-user:4001@jnpr.net

## show subscribers

**Syntax**

```
show subscribers
<detail | extensive | terse>
<aci-interface-set-name aci-interface-set-name>
<address address>
<agent-circuit-identifier agent-circuit-identifier>
<agent-remote-identifier agent-remote-identifier>
<aggregation-interface-set-name interface-set-name>
<client-type client-type>
<count>
<id session-id <accounting-statistics>>
<interface interface <accounting-statistics>>
<logical-system logical-system>
<mac-address mac-address>
<physical-interface physical-interface-name>
<profile-name profile-name>
<routing-instance routing-instance>
<stacked-vlan-id stacked-vlan-id>
<subscriber-state subscriber-state>
<user-name user-name>
<vci vci-identifier>
<vpi vpi-identifier>
<vlan-id vlan-id>
```

**Release Information**

Command introduced in Junos OS Release 9.3.

Command introduced in Junos OS Release 9.3 for EX Series switches.

**client-type**, **mac-address**, **subscriber-state**, and **extensive** options introduced in Junos OS Release 10.2.

**count** option usage with other options introduced in Junos OS Release 10.2.

Command introduced in Junos OS Release 11.1 for the QFX Series.

Options **aci-interface-set-name** and **agent-circuit-identifier** introduced in Junos OS Release 12.2.

The **physical-interface** and **user-name** options introduced in Junos OS Release 12.3.

Options **vci** and **vpi** introduced in Junos OS Release 12.3R3 and supported in later 12.3Rx releases.

Options **vci** and **vpi** supported in Junos OS Release 13.2 and later releases. (Not supported in Junos OS Release 13.1.)

Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

Enhanced subscriber management supported in Junos OS Release 15.1R3 on MX Series routers.

**accounting-statistics** option added in Junos OS Release 15.1R3 and 17.4R1 on MX Series routers.

**aggregation-interface-set-name** option added in Junos OS Release 18.4R1 on MX Series routers.

**Description** Display information for active subscribers.

**Options** **detail | extensive | terse**—(Optional) Display the specified level of output.

**aci-interface-set-name**—(Optional) Display all dynamic subscriber sessions that use the specified agent circuit identifier (ACI) interface set. Use the ACI interface set name generated by the router, such as aci-1003-ge-1/0/0.4001, and not the actual ACI value found in the DHCP or PPPoE control packets.

**address**—(Optional) Display subscribers whose IP address matches the specified address. You must specify the IPv4 or IPv6 address prefix without a netmask (for example, 192.0.2.0). If you specify the IP address as a prefix with a netmask (for example, 192.0.2.0/32), the router displays a message that the IP address is invalid, and rejects the command.

**agent-circuit-identifier**—(Optional) Display all dynamic subscriber sessions whose ACI value matches the specified string. You can specify either the complete ACI string or a substring. To specify a substring, you must enter characters that form the beginning of the string, followed by an asterisk (\*) as a wildcard to substitute for the remainder of the string. The wildcard can be used only at the end of the specified substring; for example:

```
user@host1> show subscribers agent-circuit-identifier substring*
```

Junos OS Release	Substring Support
Junos OS Release 13.3R1	You can specify a substring without a wildcard.
Starting in Junos OS Release 14.1R1	You must specify the complete ACI string; you cannot specify a wildcard.
Starting in Junos OS Release 15.1R7, 16.1R7, 16.2R3, 17.1R3, 17.2R3, 17.3R3, 17.4R2, 18.1R2, 18.2R1	You can specify a substring, but you must include the wildcard character at the end of the substring.

**agent-remote-identifier**—(Optional) Display all dynamic subscriber sessions whose ARI value matches the specified string. You must specify the complete ACI string; you cannot specify a wildcard.

**aggregation-interface-set-name** *interface-set-name*—(Optional) Display summary information for the specified aggregation node interface set, including interface, VLAN ID, username and LS:RI.

**client-type**—(Optional) Display subscribers whose client type matches one of the following client types:

- **dhcp**—DHCP clients only.
- **dotlx**—DotLx clients only.
- **essm**—ESSM clients only.
- **fwauth**—FwAuth (authenticated across a firewall) clients only.
- **l2tp**—L2TP clients only.
- **mlppp**—MLPPP clients only.

- **ppp**—PPP clients only.
- **pppoe**—PPPoE clients only.
- **static**—Static clients only.
- **vlan**—VLAN clients only.
- **vlan-oob**—VLAN out-of-band (ANCP-triggered) clients only.
- **vpls-pw**—VPLS pseudowire clients only.
- **xauth**—Xauth clients only.

**count**—(Optional) Display the count of total subscribers and active subscribers for any specified option. You can use the **count** option alone or with the **address**, **client-type**, **interface**, **logical-system**, **mac-address**, **profile-name**, **routing-instance**, **stacked-vlan-id**, **subscriber-state**, or **vlan-id** options.

**id session-id**—(Optional) Display a specific subscriber session whose session ID matches the specified subscriber ID. You can display subscriber IDs by using the **show subscribers extensive** or the **show subscribers interface extensive** commands.

**id session-id accounting-statistics**—(Optional) Display accurate subscriber accounting statistics for a subscriber session with the specified ID. Requires the **actual-transmit-statistics** statement to be configured in the dynamic profile for the dynamic logical interface. If the statement is not configured, a value of 0 is displayed for accounting statistics.

**interface**—(Optional) Display subscribers whose interface matches the specified interface.

**interface accounting-statistics**—(Optional) Display subscriber accounting statistics for the specified interface. Requires the **actual-transmit-statistics** statement to be configured in the dynamic profile for the dynamic logical interface.

**logical-system**—(Optional) Display subscribers whose logical system matches the specified logical system.

**mac-address**—(Optional) Display subscribers whose MAC address matches the specified MAC address.

**physical-interface-name**—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose physical interface matches the specified physical interface.

**profile-name**—(Optional) Display subscribers whose dynamic profile matches the specified profile name.

**routing-instance**—(Optional) Display subscribers whose routing instance matches the specified routing instance.

**stacked-vlan-id**—(Optional) Display subscribers whose stacked VLAN ID matches the specified stacked VLAN ID.

**subscriber-state**—(Optional) Display subscribers whose subscriber state matches the specified subscriber state (ACTIVE, CONFIGURED, INIT, TERMINATED, or TERMINATING).

**user-name**—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose username matches the specified subscriber name.

**vci-identifier**—(MX Series routers with MPCs and ATM MICs with SFP only) (Optional) Display active ATM subscribers whose ATM virtual circuit identifier (VCI) matches the specified VCI identifier. The range of values is 0 through 255.

**vpi-identifier**—(MX Series routers with MPCs and ATM MICs with SFP only) (Optional) Display active ATM subscribers whose ATM virtual path identifier (VPI) matches the specified VPI identifier. The range of values is 0 through 65,535.

**vlan-id**—(Optional) Display subscribers whose VLAN ID matches the specified VLAN ID, regardless of whether the subscriber uses a single-tagged or double-tagged VLAN. For subscribers using a double-tagged VLAN, this option displays subscribers where the inner VLAN tag matches the specified VLAN ID. To display only subscribers where the specified value matches only double-tagged VLANs, use the **stacked-vlan-id** option to match the outer VLAN tag.

**NOTE:** Because of display limitations, logical system and routing instance output values are truncated when necessary.

**Output Fields** Table 145 on page 1932 lists the output fields for the **show subscribers** command. Output fields are listed in the approximate order in which they appear.

*Table 145: show subscribers Output Fields*

Field Name	Field Description
<b>Interface</b>	Interface associated with the subscriber. The router or switch displays subscribers whose interface matches or begins with the specified interface.  The * character indicates a continuation of addresses for the same session.
<b>IP Address/VLAN ID</b>	Subscriber IP address or VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i>  No IP address or VLAN ID is assigned to an L2TP tunnel-switched session. For these subscriber sessions the value is <b>Tunnel-switched</b> .
<b>User Name</b>	Name of subscriber.
<b>LS:RI</b>	Logical system and routing instance associated with the subscriber.
<b>Type</b>	Subscriber client type (DHCP, GRE, L2TP, PPP, PPPoE, STATIC-INTERFACE, VLAN).
<b>IP Address</b>	Subscriber IPv4 address.
<b>IP Netmask</b>	Subscriber IP netmask.  (MX Series) This field displays 255.255.255.255 by default. For tunneled or terminated PPP subscribers only, this field displays the actual value of Framed-IP-Netmask when the SDB_FRAMED_PROTOCOL attribute in the session database is equal to AUTHD_FRAMED_PROTOCOL_PPP. This occurs in the use case where the LNS generates access-internal routes when it receives Framed-IP-Netmask from RADIUS during authorization. When it receives Framed-Pool from RADIUS, the pool mask is ignored and the default /32 mask is used.
<b>Primary DNS Address</b>	IP address of primary DNS server.  This field is displayed with the <b>extensive</b> option only when the address is provided by RADIUS.
<b>Secondary DNS Address</b>	IP address of secondary DNS server.  This field is displayed with the <b>extensive</b> option only when the address is provided by RADIUS.
<b>IPv6 Primary DNS Address</b>	IPv6 address of primary DNS server.  This field is displayed with the <b>extensive</b> option only when the address is provided by RADIUS.
<b>IPv6 Secondary DNS Address</b>	IPv6 address of secondary DNS server.  This field is displayed with the <b>extensive</b> option only when the address is provided by RADIUS.
<b>Domain name server inet</b>	IP addresses for the DNS server, displayed in order of configuration.  This field is displayed with the <b>extensive</b> option only when the addresses are derived from the access profile or the global access configuration.

Table 145: show subscribers Output Fields (continued)

Field Name	Field Description
Domain name server inet6	IPv6 addresses for the DNS server, displayed in order of configuration.  This field is displayed with the <b>extensive</b> option only when the addresses are derived from the access profile or the global access configuration.
Primary WINS Address	IP address of primary WINS server.
Secondary WINS Address	IP address of secondary WINS server.
IPv6 Address	Subscriber IPv6 address, or multiple addresses.
IPv6 Prefix	Subscriber IPv6 prefix. If you are using DHCPv6 prefix delegation, this is the delegated prefix.
IPv6 User Prefix	IPv6 prefix obtained through NDRA.
IPv6 Address Pool	Subscriber IPv6 address pool. The IPv6 address pool is used to allocate IPv6 prefixes to the DHCPv6 clients.
IPv6 Network Prefix Length	Length of the network portion of the IPv6 address.
IPv6 Prefix Length	Length of the subscriber IPv6 prefix.
Logical System	Logical system associated with the subscriber.
Routing Instance	Routing instance associated with the subscriber.
Interface	(Enhanced subscriber management for MX Series routers) Name of the enhanced subscriber management logical interface, in the form <b>demux0.nnnn</b> (for example, <b>demux0.3221225472</b> ), to which access-internal and framed subscriber routes are mapped.
Interface Type	Whether the subscriber interface is <b>Static</b> or <b>Dynamic</b> .

Table 145: show subscribers Output Fields (continued)

Field Name	Field Description
<b>Interface Set</b>	<p>Internally generated name of the dynamic ACI or ALI interface set used by the subscriber session. The prefix of the name indicates the string received in DHCP or PPPoE control packets on which the interface set is based. For ALI interface sets, the prefix indicates that the value is configured as a trusted option to identify the subscriber line.</p> <p>The name of the interface set uses one of the following prefixes:</p> <ul style="list-style-type: none"> <li>• <b>aci</b>—ACI; for example, aci-1033-demux0.3221225524. This is the only prefix allowed for ACI interface sets.</li> <li>• <b>ari</b>—ARI; for example, ari-1033-demux0.3221225524.</li> <li>• <b>aci+ari</b>—Both the ACI and ARI; for example, aci+ari-1033-demux0.3221225524.</li> <li>• <b>noids</b>—Neither the ACI nor the ARI were received; for example, noids-1033-demux0.3221225524.</li> </ul> <p><b>NOTE:</b> ACI interface sets are configured with the <b>agent-circuit-identifier</b> autoconfiguration stanza. ALI interface sets are configured with the <b>line-identity</b> autoconfiguration stanza.</p> <p>Besides dynamic ACI and ALI interface sets, this field can be an interface set based on a substring of the ARI string. This occurs when the dynamic profile includes the predefined variable \$junos-pon-id-interface-set-name, and the profile is applied for a passive optical network (PON). The ARI string is inserted by the optical line terminal (OLT). The final substring in the string, unique for the PON, identifies individual subscriber circuits, and is used as the name of the interface set.</p>
<b>Interface Set Type</b>	Interface type of the ACI interface set: <b>Dynamic</b> . This is the only ACI interface set type currently supported.
<b>Interface Set Session ID</b>	Identifier of the dynamic ACI interface set entry in the session database.
<b>Underlying Interface</b>	Name of the underlying interface for the subscriber session.
<b>Dynamic Profile Name</b>	Dynamic profile used for the subscriber.
<b>Dynamic Profile Version</b>	Version number of the dynamic profile used for the subscriber.
<b>MAC Address</b>	MAC address associated with the subscriber.
<b>State</b>	Current state of the subscriber session ( <b>Init</b> , <b>Configured</b> , <b>Active</b> , <b>Terminating</b> , <b>Tunneled</b> ).
<b>L2TP State</b>	Current state of the L2TP session, <b>Tunneled</b> or <b>Tunnel-switched</b> . When the value is <b>Tunnel-switched</b> , two entries are displayed for the subscriber; the first entry is at the LNS interface on the LTS and the second entry is at the LAC interface on the LTS.
<b>Tunnel switch Profile Name</b>	Name of the L2TP tunnel switch profile that initiates tunnel switching.
<b>Local IP Address</b>	IP address of the local gateway (LAC).
<b>Remote IP Address</b>	IP address of the remote peer (LNS).
<b>VLAN Id</b>	VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> .

Table 145: show subscribers Output Fields (continued)

Field Name	Field Description
Stacked VLAN Id	Stacked VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> .
RADIUS Accounting ID	RADIUS accounting ID associated with the subscriber.
Agent Circuit ID	<p>For the <b>dhcp</b> client type, option 82 agent circuit ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.</p> <p>For the <b>vlan-oob</b> client type, the agent circuit ID or access-loop circuit identifier that identifies the subscriber line based on the subscriber-facing DSLAM interface on which the subscriber request originates.</p>
Agent Remote ID	<p>For the <b>dhcp</b> client type, option 82 agent remote ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.</p> <p>For the <b>vlan-oob</b> client type, the agent remote ID or access-loop remote identifier that identifies the subscriber line based on the NAS-facing DSLAM interface on which the subscriber request originates.</p>
Aggregation Interface-set Name	<p>Value of the \$junos-aggregation-interface-set-name predefined variable; one of the following:</p> <ul style="list-style-type: none"> <li>When the <b>hierarchical-access-network-detection</b> option is configured for the access lines and the value of the Access-Aggregation-Circuit-ID-ASCII attribute (TLV 0x0003) received either in the ANCP Port Up message or PPPoE PADR IA tags begins with a <b>#</b> character, then the variable takes the value of the remainder of the string after the <b>#</b> character.</li> <li>When the <b>hierarchical-access-network-detection</b> option is not configured, or if the string does not begin with the <b>#</b> character, then the variable takes the value specified with the <b>predefined-variable-defaults</b> statement.</li> </ul>
Accounting Statistics	Actual transmitted subscriber accounting statistics by session ID or interface. Service accounting statistics are not included. These statistics do not include overhead bytes or dropped packets; they are the accurate statistics used by RADIUS. The statistics are counted when the <b>actual-transmit-statistics</b> statement is included in the dynamic profile.
DHCP Relay IP Address	IP address used by the DHCP relay agent.
ATM VPI	(MX Series routers with MPCs and ATM MICs with SFP only) ATM virtual path identifier (VPI) on the subscriber's physical interface.
ATM VCI	(MX Series routers with MPCs and ATM MICs with SFP only) ATM virtual circuit identifier (VCI) for each VPI configured on the subscriber interface.
Login Time	Date and time at which the subscriber logged in.
DHCPV6 Options	<b>len</b> = number of hex values in the message. The hex values specify the type, length, value (TLV) for DHCPv6 options.
Server DHCP Options	<b>len</b> = number of hex values in the message. The hex values specify the type, length, value (TLV) for DHCP options.
ServerDHCPV6 Options	<b>len</b> = number of hex values in the message. The hex values specify the type, length, value (TLV) for DHCPv6 options.

Table 145: show subscribers Output Fields (continued)

Field Name	Field Description
DHCPV6 Header	len = number of hex values in the message. The hex values specify the type, length, value (TLV) for DHCPv6 options.
Effective shaping-rate	Actual downstream traffic shaping rate for the subscriber, in kilobits per second.
IPv4 Input Service Set	Input service set in access dynamic profile.
IPv4 Output Service Set	Output service set in access dynamic profile.
PCEF Profile	PCEF profile in access dynamic profile.
PCEF Rule/Rulebase	PCC rule or rulebase used in dynamic profile.
Dynamic configuration	Values for variables that are passed into the dynamic profile from RADIUS.
Service activation time	Time at which the first family in this service became active.
IPv4 rpf-check Fail Filter Name	Name of the filter applied by the dynamic profile to IPv4 packets that fail the RPF check.
IPv6 rpf-check Fail Filter Name	Name of the filter applied by the dynamic profile to IPv6 packets that fail the RPF check.
DHCP Options	len = number of hex values in the message. The hex values specify the type, length, value (TLV) for DHCP options, as defined in RFC 2132.
Session ID	ID number for a subscriber session.
Underlying Session ID	For DHCPv6 subscribers on a PPPoE network, displays the session ID of the underlying PPPoE interface.
Service Sessions	Number of service sessions (that is, a service activated using RADIUS CoA) associated with the subscribers.
Service Session ID	ID number for a subscriber service session.
Service Session Name	Service session profile name.
Session Timeout (seconds)	Number of seconds of access provided to the subscriber before the session is automatically terminated.
Idle Timeout (seconds)	Number of seconds subscriber can be idle before the session is automatically terminated.
IPv6 Delegated Address Pool	Name of the pool used for DHCPv6 prefix delegation.
IPv6 Delegated Network Prefix Length	Length of the prefix configured for the IPv6 delegated address pool.

Table 145: show subscribers Output Fields (continued)

Field Name	Field Description
<b>IPv6 Interface Address</b>	Address assigned by the Framed-Ipv6-Prefix AAA attribute. This field is displayed only when the predefined variable \$junos-ipv6-address is used in the dynamic profile.
<b>IPv6 Framed Interface Id</b>	Interface ID assigned by the Framed-Interface-Id AAA attribute.
<b>ADF IPv4 Input Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>ADF IPv4 Output Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>ADF IPv6 Input Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>ADF IPv6 Output Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>IPv4 Input Filter Name</b>	Name assigned to the IPv4 input filter (client or service session).
<b>IPv4 Output Filter Name</b>	Name assigned to the IPv4 output filter (client or service session).
<b>IPv6 Input Filter Name</b>	Name assigned to the IPv6 input filter (client or service session).
<b>IPv6 Output Filter Name</b>	Name assigned to the IPv6 output filter (client or service session).
<b>IFL Input Filter Name</b>	Name assigned to the logical interface input filter (client or service session).
<b>IFL Output Filter Name</b>	Name assigned to the logical interface output filter (client or service session).
<b>DSL type</b>	PPPoE subscriber's access line type reported by the PPPoE intermediate agent in a PADI or PADO packet in the Vendor-Specific-Tags TLV in subattribute DSL-Type (0x0091). The DSL type is one of the following types: <b>ADSL</b> , <b>ADSL2</b> , <b>ADSL2+</b> , <b>OTHER</b> , <b>SDSL</b> , <b>VDSL</b> , or <b>VDSL2</b> .
<b>Frame/Cell Mode</b>	<p>Mode type of the PPPoE subscriber's access line determined by the PPPoE daemon based on the received subattribute DSL-Type (0x0091):</p> <ul style="list-style-type: none"> <li>• <b>Cell</b>—When the DSL line type is one of the following: <b>ADSL</b>, <b>ADSL2</b>, or <b>ADSL2+</b>.</li> <li>• <b>Frame</b>—When the DSL line type is one of the following: <b>OTHER</b>, <b>SDSL</b>, <b>VDSL</b>, or <b>VDSL2</b>.</li> </ul> <p>The value is stored in the subscriber session database.</p>
<b>Overhead accounting bytes</b>	Number of bytes added to or subtracted from the actual downstream cell or frame overhead to account for the technology overhead of the DSL line type. The value is determined by the PPPoE daemon based on the received subattribute DSL-Type (0x0091). The value is stored in the subscriber session database.

Table 145: show subscribers Output Fields (continued)

Field Name	Field Description
<b>Actual upstream data rate</b>	Unadjusted upstream data rate for the PPPoE subscriber's access line reported by the PPPoE intermediate agent in a PADI or PADO packet in the Vendor-Specific-Tags TLV in subattribute Actual-Net-Data-Rate-Upstream (0x0081).
<b>Actual downstream data rate</b>	Unadjusted downstream data rate for the PPPoE subscriber's access line reported by the PPPoE intermediate agent in a PADI or PADO packet in the Vendor-Specific-Tags TLV in subattribute Actual-Net-Data-Rate-Downstream (0x0082).
<b>Adjusted downstream data rate</b>	Adjusted downstream data rate for the PPPoE subscriber's access line, calculated by the PPPoE daemon and stored in the subscriber session database.
<b>Adjusted upstream data rate</b>	Adjusted upstream data rate for the PPPoE subscriber's access line, calculated by the PPPoE daemon and stored in the subscriber session database.

## Sample Output

### show subscribers (IPv4)

```
user@host> show subscribers
```

Interface	IP Address/VLAN ID	User Name	LS:RI
ge-1/3/0.1073741824	10		default:default

## show subscribers summary

**Syntax** show subscribers summary  
 <all>  
 <detail | extensive | terse>  
 <count>  
 <physical-interface *physical-interface-name*>  
 <logical-system *logical-system* pic | port | routing-instance *routing-instance* | slot>

**Release Information** Command introduced in Junos OS Release 10.2.

**Description** Display summary information for subscribers.

**Options** **none**—Display summary information by state and client type for all subscribers.

**all**—(Optional) Display summary information by state, client type, and LS:RI.

**detail | extensive | terse**—(Not supported on MX Series routers) (Optional) Display the specified level of output.

**count**—(Not supported on MX Series routers) (Optional) Display the count of total subscribers and active subscribers for any specified option.

**logical-system *logical-system***—(Optional) Display subscribers whose logical system matches the specified logical system.

**physical-interface *physical-interface-name***—(M120, M320, and MX Series routers only) (Optional) Display a count of subscribers whose physical interface matches the specified physical interface, by subscriber state, client type, and LS:RI.

**pic**—(M120, M320, and MX Series routers only) (Optional) Display a count of subscribers by PIC number and the total number of subscribers.

**port**—(M120, M320, and MX Series routers only) (Optional) Display a count of subscribers by port number and the total number of subscribers.

**routing-instance *routing-instance***—(Optional) Display subscribers whose routing instance matches the specified routing instance.

**slot**—(M120, M320, and MX Series routers only) (Optional) Display a count of subscribers by FPC slot number and the total number of subscribers.

**NOTE:** Due to display limitations, logical system and routing instance output values are truncated when necessary.

**Required Privilege Level** view

**Output Fields** [Table 146 on page 1962](#) lists the output fields for the **show subscribers summary** command. Output fields are listed in the approximate order in which they appear.

*Table 146: show subscribers summary Output Fields*

Field Name	Field Description	Level of Output
<b>Subscribers by State</b>	Number of subscribers summarized by state. The summary information includes the following: <ul style="list-style-type: none"> <li>• Init—Number of subscriber currently in the initialization state.</li> <li>• Configured—Number of configured subscribers.</li> <li>• Active—Number of active subscribers.</li> <li>• Terminating—Number of subscribers currently terminating.</li> <li>• Terminated—Number of terminated subscribers.</li> <li>• Total—Total number of subscribers for all states.</li> </ul>	<b>detail none</b>
<b>Subscribers by Client Type</b>	Number of subscribers summarized by client type. Client types can include DHCP, GRE, L2TP, PPP, PPPOE, STATIC-INTERFACE, VLAN, and VLAN-OOB. Also displays the total number of subscribers for all client types (Total).	<b>detail extensive none</b>
<b>Subscribers by LS:RI</b>	Number of subscribers summarized by logical system:routing instance (LS:RI) combination. Also displays the total number of subscribers for all LS:RI combinations (Total).	<b>detail none</b>
<b>Subscribers by Connection Type</b>	Number of subscribers summarized by connection type, <b>Cross-connected</b> or <b>Terminated</b> .	<b>extensive</b>

Table 146: show subscribers summary Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Interface</b>	<p>Interface associated with the subscriber. The router or switch displays subscribers whose interface matches or begins with the specified interface.</p> <p>The * character indicates a continuation of addresses for the same session.</p> <p>For aggregated Ethernet interfaces, the output of the <b>summary (pic   port   slot)</b> options prefixes the interface name with ae0:.</p> <p>For pseudowire IFDs, this field displays both the pseudowire and the associated logical tunnel (LT) and redundant logical tunnel (RLT) anchor interface. For example:</p> <pre>ps0: lt-2/1/0 ps1: rlt0: lt-4/0/0</pre>	All levels
<b>Count</b>	<p>Count of subscribers displayed for each PIC, port, or slot when those options are specified with the <b>summary</b> option. For an aggregated Ethernet configuration, the total subscriber count does not equal the sum of the individual PIC, port, or slot counts, because each subscriber can be in more than one aggregated Ethernet link.</p> <p>Multiple pseudowire interfaces can share a given logical tunnel or redundant logical tunnel anchor interface. Starting in Junos OS Release 18.1R1, the field displays subscribers per individual pseudowire interface.</p> <p>In earlier releases, the field displays the same number of subscribers for all pseudowire interfaces that share the same tunnel interface as their anchor point.</p>	<b>detail extensive none</b>
<b>Total Subscribers</b>	Total number of subscribers for all physical interfaces, all PICs, all ports, or all LS:RI slots.	<b>detail extensive none</b>
<b>IP Address/VLAN ID</b>	Subscriber IP address or VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i>	<b>terse</b>
<b>User Name</b>	Name of subscriber.	<b>terse</b>
<b>LS:RI</b>	Logical system and routing instance associated with the subscriber.	<b>terse</b>

## show system subscriber-management route

---

**Syntax**    show system subscriber-management route  
              <family *family*>  
              <incomplete>  
              <level (brief | detail)>  
              <next-hop>  
              <prefix>  
              <route-type *type*>  
              <rrt-index *index*>  
              <summary>

**Release Information**    Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.  
                              Support for passing **Framed-Route** attributes from a RADIUS server to the router was added in Junos OS Release 17.2 on MX Series routers for enhanced subscriber management. This allows the tagged subscriber host routes to be imported to the routing table and advertised by BGP.

**Description**    Display information about how routes are mapped to specific enhanced subscriber management interfaces. You can customize the output by including one or more optional filters in the command. With the exception of the **summary** option, all filter options can be combined in a single command.

**Options**    **family *family***—(Optional) Display route mapping information for the specified protocol family: **inet** (IPv4) or **inet6** (IPv6).

**incomplete**—(Optional) Display route mapping information for incomplete routes that are missing elements required to add the routes to the routing table.

**level (brief | detail)**—(Optional) Display the specified level of output: **brief** or **detail**.

**next-hop**—(Optional) Display the next hop associated with the route entry.

**prefix *address***—(Optional) Use the same prefix and prefix length as the subscriber host address. Output includes attributes that originate in the Famed-Route record of an upstream RADIUS server (Tag, Metric, Preference).

**route-type *type***—(Optional) Display route mapping information for the specified route type: **access**, **access-internal**, **kernel**, or **local**.

**rrt-index *index***—(Optional) Display mapping information for the specified routing table index, in the range 0 through 65535. An **rrt-index** value of 0 (zero) denotes routes in the default routing table managed by enhanced subscriber management.

**summary**—(Optional) Display summary information about the routes managed by enhanced subscriber management.

**Required Privilege Level** view

**Output Fields** [Table 147 on page 1969](#) lists the output fields for the **show system subscriber-management route** command. Output fields are listed in the approximate order in which they appear.

*Table 147: show system subscriber-management route Output Fields*

Field Name	Field Description	Level of Output
<b>address</b>	IPv4 or IPv6 address associated with the route entry.	All levels
<b>Route Type</b>	One of the following route types: <ul style="list-style-type: none"> <li>• Access</li> <li>• Access-internal</li> <li>• Framed</li> <li>• Kernel</li> <li>• Local</li> </ul>	All levels
<b>Interface</b>	Name of the enhanced subscriber management interface associated with the route entry.	All levels
<b>Next-hop</b>	Next-hop associated with the route entry.	All levels
<b>Tag</b>	Reflects the Tag attribute used in the RADIUS Framed-Route type record.	All levels
<b>Metric</b>	Reflects the Metric attribute used in the RADIUS Framed-Route type record.	All levels
<b>Preference</b>	Reflects the Preference attribute used in the RADIUS Framed-Route type record.	All levels
<b>Rtt-index</b>	Value of the routing table index. A value of 0 (zero) denotes a route in the default routing table managed by enhanced subscriber management.	<b>detail</b>
<b>Bbe index</b>	Value of the interface index for the control plane.	<b>detail</b>
<b>Flow id</b>	Value of the route object index.	<b>detail</b>

## show system subscriber-management statistics

<b>Syntax</b>	show system subscriber-management statistics <all> <dhcp> <pppoe>
<b>Release Information</b>	Command introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management. Enhanced I/O Statistics introduced as part of Extensive output in Junos OS Release 15.1R4 on MX Series routers for enhanced subscriber management.
<b>Description</b>	Display statistics for the specified option. You can customize the output by including one or more optional filters in the command. With the exception of the <b>extensive</b> option, all filter options can be combined in a single command.
<b>Options</b>	<b>all</b> —(Optional) Display packet statistics for all protocol.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Understanding Dropped Packets and Untransmitted Traffic Using show Commands</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system subscriber-management statistics all on page 1974</a> <a href="#">show system subscriber-management statistics pppoe on page 1975</a> <a href="#">show system subscriber-management statistics dhcp on page 1975</a> <a href="#">show system subscriber-management statistics dhcp extensive on page 1976</a> <a href="#">show system subscriber-management statistics extensive on page 1978</a>
<b>Output Fields</b>	<a href="#">Table 148 on page 1973</a> lists the output fields for the <b>show system subscriber-management statistics</b> command. Output fields are listed in the approximate order in which they appear.

*Table 148: show system subscriber-management statistics Output Fields*

Field Name	Field Description
<b>Rx Statistics</b>	Statistics for packets received.
<b>Tx Statistics</b>	Statistics for packets sent.
<b>Enhanced I/O Statistics</b>	Statistics for visibility into packet drops from the queue.
<b>Error Statistics</b>	Includes connection packets, flow control, and messages and packets sent to and received from the daemon.

Table 148: show system subscriber-management statistics Output Fields (continued)

Field Name	Field Description
<b>ERA discards</b>	Event Rate Analyzer discards. For DHCP and PPPoE in advanced subscriber management, ERA packet discard counts are included for Discover, Solicit, and PADI packets .
<b>padis</b>	PPPoE Active Discovery Initiation (PADI) packets. PADI is the first step in the PPPoE establishment protocol.
<b>padrs</b>	PPPoE Active Discovery Request packets.
<b>ppp</b>	Point-to-Point Protocol packets.
<b>router solicitations</b>	Number of router solicitations sent or received. Router solicitations are sent to prompt all on-link routers to send it router advertisements.
<b>router advertisements</b>	Number of router advertisements sent or received.
<b>route solicit response packet</b>	Number of router solicitation responses sent or received.

## Sample Output

The following examples displays packet statistics accumulated for DHCP and PPPoE since the last time the session manager was cleared.

```

**General:**

Graceful Switchover	Enabled
Mastership	Master
Database	Available
Standby	Resync (75%)
Chassisd ISSU State	IDLE
ISSU State	IDLE
ISSU Wait	0

## test aaa authd-lite user

**Syntax** `test aaa authd-lite user username password password profile access-profile-name <port nas-port> <zero-stats>`

**Release Information** Command introduced in Junos OS Release 11.2.

**Description** Verify authd-lite subscriber access authentication, accounting, and address allocation configuration.

**NOTE:** The `test aaa` command supports all RADIUS-sourced attributes, both IETF standard attributes and Juniper Networks VSAs. Received attributes are displayed in the output. For information about standard RADIUS attributes, see [“RADIUS IETF Attributes Supported by the AAA Service Framework” on page 11](#). For information about Juniper Networks VSAs, see [“Juniper Networks VSAs Supported by the AAA Service Framework” on page 19](#).

**Options**

- username***—Specify the subscriber username to test.
- password password***—Specify the password associated with the username.
- profile access-profile-name***—Specify the access profile associated with the subscriber.
- port nas-port***—(Optional) Specify the NAS port used for the test.
- zero-stats***—(Optional) Specify that no accounting statistics are set for this test.

**List of Sample Output** [test aaa authd-lite user on page 1983](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request. For information about output fields related to authentication, accounting, and subscriber-specific information, see the [show network-access aaa statistics](#), [show network-access aaa statistics authentication](#), [show network-access aaa subscribers](#), and [show subscribers](#) commands.

The **test** command does not support volume-time accounting. If volume-time accounting is configured for the test subscriber, the **test** command replaces the statistics with time-only accounting statistics.

This command displays only attributes that are supported by Junos OS; these attributes appear even when their values are not set. The Virtual Router Name (LS:RI) field matches the Juniper Networks Virtual-Router VSA (26-1), if present; otherwise the field displays default:default. The displayed value for all other attributes that are not received is **<not set>**.

## Sample Output

### test aaa authd-lite user

The following example tests the configuration for authd-lite subscriber user1bt with a password of \$ABC123 and an access profile of employee12, and displays the resulting output:

```
user@host> test aaa authd-lite user user1bt password $ABC123 profile employee12
```

```

## test aaa dhcp user

**Syntax** `test aaa dhcp user username`  
`<agent-remote-id ari>`  
`<logical-system logical-system-name>`  
`<mac-address mac-address>`  
`<no-address-request>`  
`<option-82 option-82>`  
`<password password>`  
`<profile access-profile-name>`  
`<routing-instance routing-instance-name>`  
`<service-type service-type>`  
`<source-address source-address>`  
`<terminate-code code-value>`

**Release Information** Command introduced in Junos OS Release 11.2.  
Option **terminate-code** added in Junos OS Release 11.4.  
Option **agent-remote-id** added in Junos OS Release 14.1.  
Options **no-address-request** and **service-type** added in Junos OS Release 16.1.

**Description** Verify Dynamic Host Configuration Protocol (DHCP) subscriber access authentication, accounting, and address allocation configuration by creating a test pseudo session.

**NOTE:** The `test aaa` command supports all RADIUS-sourced attributes, both IETF standard attributes and Juniper Networks VSAs. Received attributes are displayed in the output. For information about standard RADIUS attributes, see [“RADIUS IETF Attributes Supported by the AAA Service Framework” on page 11](#). For information about Juniper Networks VSAs, see [“Juniper Networks VSAs Supported by the AAA Service Framework” on page 19](#).

**Options** ***username***—Subscriber username to test.

***agent-remote-id ari***—(Optional) Value of the DSL Forum Agent-Remote-Id (VSA 26–2).

***logical-system logical-system-name***—(Optional) Logical system in which the subscriber is authenticated. This is the logical system in the AAA LS:RI context for the subscriber. This context differs from the subscriber context, which is the LS:RI in which the subscriber is placed, by either the Virtual-Router VSA (26–1) or the Redirect-VRouter-Name VSA (26–25).

***mac-address mac-address***—(Optional) MAC address of the DHCP client.

***no-address-request***—(Optional) Request is sent for authentication without address allocation. Use for Layer 2-only scenarios where no address allocation request is needed.

**NOTE:** The `test aaa dhcp user` command tries to allocate an IPv4 address even when the subscriber is supposed to get only an IPv6 address. If that behavior is undesirable, include the `no-address-request` option when you issue the command.

**option-82** *option-82*—(Optional) DHCP relay agent information option (option-82) value.

**password** *password*—(Optional) Password associated with the username.

**profile** *access-profile-name*—(Optional) Access profile associated with the subscriber.

**routing-instance** *routing-instance-name*—(Optional) Routing instance in which the subscriber is authenticated. This is the routing instance in the AAA LS:RI context for the subscriber. This context differs from the subscriber context, which is the LS:RI in which the subscriber is placed, by either the Virtual-Router VSA (26-1) or the Redirect-VRouter-Name VSA (26-25). In the case of VSA 26-25, the subscriber is re-authenticated in the subscriber context.

**service-type** *service-type*—(Optional) Value of the Service Type RADIUS attribute [6] that is associated with the test user; either a number in the range 1 through 255 or one of the following strings that corresponds to an RFC-defined service type; the numbers are the values that are carried in the RADIUS attribute to specify the service:

administrative (6)	callback-nas-prompt (9)
authenticate-only (8)	framed (2)
call-check (10)	login (1)
callback-admin (11)	nas-prompt (7)
callback-framed (4)	outbound (5)
callback-login (3)	—

**source-address** *source-address*—(Optional) IP address of the outgoing interface.

**terminate-code** *code-value*—(Optional) Code associated with the subscriber termination.

**Required Privilege Level** view
