**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 9.4.

**Description** Configure Junos OS ANCP agent features.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**NOTE:** When you deactivate the ANCP protocol, the router does not perform a commit check to determine whether any ANCP or L2-BSA subscribers are present (active or inactive). Any subscribers that are active at the time of deactivation remain active.

---

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| Release Information      | Statement introduced in Junos OS Release 17.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Description              | <p>Set an asymmetric lease time for an address that is sent to the DHCP client instead of the actual lease time granted by the DHCP local server. The asymmetric lease time is shorter than the granted lease. Asymmetric leases require the DHCP client to renew the lease more frequently, at shorter intervals. If the client does not renew the short lease before it expires, the address is released sooner than if the original lease had been sent to the client, conserving address resources. Although you can configure the asymmetric lease on either the DHCP relay agent or the DHCP local server, in most situations, configuring the asymmetric lease on the relay agent is more useful.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Release Information      | Statement introduced in Junos OS Release 17.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Description              | <p>Set an asymmetric lease time for an address that is sent to the DHCPv6 client instead of the actual lease time granted by the DHCP local server. The asymmetric lease time is shorter than the granted lease. Asymmetric leases require the DHCP client to renew the lease more frequently, at shorter intervals. If the client does not renew the short lease before it expires, the address is released sooner than if the original lease had been sent to the client, conserving address resources. Although you can configure the asymmetric lease on either the DHCP relay agent or the DHCP local server, in most situations, configuring the asymmetric lease on the relay agent is more useful.</p>                                                                                                           |

| Description              | Configure how many attempts are made to reconfigure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces before reconfiguration is considered to have failed. A group configuration takes precedence over a DHCP local server configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>              | <p>Specify the number of times the DHCP relay agent attempts to send DHCP leasequery or bulk leasequery messages to the configured DHCP servers in the logical system/routing instance. DHCP relay agent resends the query message if the configured <b>timeout</b> value is reached, and either a confirmed reply or a reply from all configured DHCP servers has not been received. DHCP relay agent sends the subsequent messages only to the DHCP servers that have not replied to previous queries.</p> |
| <b>Options</b>                  | <p><b><i>number-of-attempts</i></b>—Number of times DHCP relay agent attempts to send the leasequery or bulk leasequery message.</p> <p>For the DHCP bulk leasequery messages, DHCP leasequery messages, DHCPv6 leasequery messages:</p> <p><b>Range:</b> 1 through 10</p> <p><b>Default:</b> 6</p> <p>For the DHCPv6 bulk leasequery messages:</p> <p><b>Range:</b> 1 through 720</p> <p><b>Default:</b> 360</p>                                                                                            |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                           |

## authentication (Static Subscribers)

**Syntax**

```
authentication {
  password password-string;
  username-include {
    delimiter delimiter-character;
    domain-name domain-name;
    interface;
    logical-system-name;
    routing-instance-name;
    user-prefix user-prefix-string;
    vlan-tags;
  }
}
```

**Hierarchy Level**

```
[edit logical-systems logical-system-name routing-instances routing-instances-name system
services static-subscribers],
[edit logical-systems logical-system-name routing-instances routing-instances-name system
services static-subscribers group group-name],
[edit logical-systems logical-system-name system services static-subscribers],
[edit logical-systems logical-system-name system services static-subscribers group
group-name],
[edit routing-instances routing-instances-name system services static-subscribers],
[edit routing-instances routing-instances-name system services static-subscribers group
group-name],
[edit system services static-subscribers],
[edit system services static-subscribers group group-name]
```

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** Specify the authentication parameters that trigger the Access-Request message to AAA for all static subscribers on interfaces configured at the **[edit system services static-subscribers interface]** hierarchy level, or for the static subscribers in a specific group. The group version of this statement overrides the global configuration.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level**

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

| Description         | <p>Set the order in which AAA tries different authentication methods when verifying that a client can access the router or switch. For each login attempt, AAA tries the authentication methods in order, from first to last.</p> <p>A given subscriber does not undergo both authentication and authorization as separate steps. When both <b>authentication-order</b> and <b>authorization-order</b> are specified, DHCP subscribers honor the configured authorization order, all other subscribers use the configured authentication-order.</p> <p>Starting in Junos OS Release 18.2R1, the <b>password</b> option can also be used to specify that local authentication and local authorization is attempted for individual subscribers that are configured with the <b>subscriber</b> statement at the <code>[edit access profile <i>profile-name</i>]</code> hierarchy level.</p> |
| Options             | <p><b><i>authentication-methods</i></b>—Ordered list of methods to use for authentication attempts. The list includes one or more of the following methods in any combination:</p> <ul style="list-style-type: none"> <li><b>nasreq</b>—Verify subscribers using the Diameter-based Network Access Server Requirements (NASREQ) protocol.</li> <li><b>none</b>—No authentication is performed. Grants authentication without examining the client credentials. Can be used, for example, when the Diameter function Gx-Plus is employed for notification during subscriber provisioning.</li> </ul>                                                                                                                                                                                                                                                                                      |

**NOTE:** Subscriber access management does not support the **none** option; authentication fails when this option is specified.

- password**—Verify the client using the information configured at the `[edit access profile profile-name client client-name]` hierarchy level.

Subscriber access management does not support the **password** option until Junos OS Release 18.2R1. Starting in Junos OS Release 18.2R1, this option is used to enable local authentication and optionally local authorization for individual subscribers. Local authentication is typically used when you do not have external authentication

and authorization servers. The password itself must be configured with the **subscriber** statement in the same access profile. Local authentication is performed when a subscriber logs in with a matching username; it succeeds if the subscribers login password matches the password in the profile.

If you do have external authentication and authorization servers, you can use local authentication as a backup authentication method. In this case, configure **password** anywhere other than first in the list of methods.

- **radius**—Verify the client using RADIUS authentication services.

**Default:** password

| Release Information      | Statement introduced in Junos OS Release 9.1.                                                                                                                                                                                                                                                                           |
| Description              | Specify a list of the RADIUS authentication servers used to authenticate DHCP, L2TP, and PPP clients. The servers in the list are also used as RADIUS dynamic-request servers, from which the router accepts and processes RADIUS disconnect requests, CoA requests, and dynamic service activations and deactivations. |
| Options                  | <i>ip-address</i> —IPv4 address.                                                                                                                                                                                                                                                                                        |
| Required Privilege Level | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.                                                                                                                                                                                                         |

## auto-configure (Demux)

```
Syntax auto-configure {
    address-ranges {
        dynamic-profile <dyn-prof-name> {
            network <ip-addr> {
                range <range-name> {
                    low <low-addr>;
                    high <high-addr>;
                }
            }
        }
    }
    authentication {
        password <password-string>;
        username-include {
            delimiter <delimiter-character>;
            domain-name <domain-name-string>;
            interface-name;
            auth-server-realm <auth-server-realm-string>;
            source-address;
            user-prefix <user-prefix-string>;
        }
    }
}
```

**Hierarchy Level** [edit interfaces *interface-name* unit *unit-number* demux inet]  
[edit interfaces *interface-name* unit *unit-number* demux inet6]

**Release Information** Statement introduced in Junos OS Release 18.1R1.

**Description** Enable the configuration of dynamic, auto-sensed subscriber interfaces for the demultiplexing (demux) interface options. The remaining statement is explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>         | Specify the information that the router includes in the Calling-Station-ID (RADIUS IETF attribute 31) that is passed to the RADIUS server during authentication and accounting. You can include one or more optional values in any combination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Default</b>             | The router displays the Calling-Station-ID set by the client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>             | <p><b>agent-circuit-id</b>—Include the agent circuit identifier (ACI) string, which uniquely identifies the subscriber's access node and the digital subscriber line (DSL) on the access node. The ACI string is stored in either the DHCP option 82 field of DHCP messages (for DHCP traffic), or in the DSL Forum Agent-Circuit-ID VSA [26-1] of PPPoE PADI and PADR control packets (for PPPoE traffic).</p> <p><b>agent-remote-id</b>—Include the agent remote identifier (ARI) string, which identifies the subscriber on the digital subscriber line access multiplexer (DSLAM) interface that initiated the service request. The ARI string is stored in either the DHCP option 82 field of DHCP messages (for DHCP traffic), or in the DSL Forum Agent-Remote-ID VSA [26-2] of PPPoE PADI and PADR control packets (for PPPoE traffic).</p> <p><b>interface-description</b>—Include the interface description value.</p> <p><b>interface-text-description</b>—Include the interface text description.</p> <p><b>mac-address</b>—Include the MAC address of the source device for the subscriber.</p> <p><b>nas-identifier</b>—Include the NAS-identifier (RADIUS IETF attribute 32), which specifies the name of the NAS that originated the authentication or accounting request.</p> <p><b>stacked-vlan</b>—Include the stacked VLAN tag value.</p> |

**vlan**—Include the VLAN tag value.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## **chap-challenge-in-request-authenticator (Subscriber Management)**

**Syntax** chap-challenge-in-request-authenticator;

**Hierarchy Level** [edit access profile *profile-name* radius [options](#)]

**Release Information** Statement introduced in Junos OS Release 15.1.

**Description** Configure the **authd** process to insert the random challenge generated by the NAS into the Request Authenticator field of Access-Request packets, if the challenge value is 16 bytes long.

If you enable the **chap-challenge-in-request-authenticator** statement and the random challenge is not 16 bytes long, **authd** ignores the statement and uses the default behavior, which inserts the random challenge as the CHAP-Challenge attribute (RADIUS attribute 60) in Access-Request packets.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

relay-option-82],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay group
group-name relay-option-82]
```

**Release Information**

Statement introduced in Junos OS Release 8.3.  
Statement introduced in Junos OS Release 12.3 for EX Series switches.  
**include-irb-and-l2** , **no-vlan-interface-name**, and **use-vlan-id** options added in Junos OS Release 14.1.

**Description**

Specify the Agent Circuit ID suboption (suboption 1) of the DHCP relay agent information option (option 82) to include in DHCP packets destined for a DHCP server. Optionally specify that the suboption includes a prefix, textual description, or VLAN tag.

**NOTE:** For Layer 3 interfaces, when you configure *relay-option-82* only, the Agent Circuit ID is the default. If no VLAN tags are configured, then the default is the logical interface device (IFL) name. For integrated routing and bridging (IRB) interfaces, the default is the Layer 2 IFL name and bridge domain name.

The interface to bridge domain relationship may be implicit (the interface is mapped to the bridge domain by the system based on VLAN tag) or explicit (the interface is mapped to the bridge domain by configuring it in the bridge domain definition). For the explicit case, tagging might not be relevant for the mapping.

The format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces that do not use virtual LANs (VLANs), stacked VLANs (S-VLANs), or bridge domains is as follows:

```
(fe | ge)-fpc/pic/port.subunit
```

**NOTE:** For remote systems, the *subunit* is required and is used to differentiate an interface for remote systems.

The format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces that use VLANs is as follows:

```
(fe | ge)-fpc/pic/port:vlan-id
```

The format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces that use S-VLANs is as follows:

```
(fe | ge)-fpc/pic/port:svlan-id-vlan-id
```

In the case of an IRB interface, the format displays the Layer 2 interface instead of the IRB interface along with the bridge domain name. For IRB interfaces (or other pseudo devices) the default format is as follows:

- IRB interfaces that use bridge domains but do not use VLANs or S-VLANs:

```
(fe | ge)-fpc/pic/port.subunit:bridge-domain-name
```

- IRB interfaces that use VLANs:

```
(fe | ge)-fpc/pic/port.subunit:vlan-name
```

To include the IRB interface name with the Layer 2 interface name, configure the **include-irb-and-l2** statement. The format is as follows:

- IRB interfaces that use bridge domains but do not use VLANs or S-VLANs:

```
(fe | ge)-fpc/pic/port:bridge-domain-name+irb.subunit
```

- IRB interfaces that use VLANs:

```
(fe | ge)-fpc/pic/port:vlan-name+irb.subunit
```

To include only the IRB interface name without the Layer 2 interface and bridge domain or VLAN, configure the **no-vlan-interface-name** statement. The format is as follows:

```
irb.subunit
```

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

## classification-key (DHCP Relay Agent)

**Syntax**

```
classification-key {
  circuit-id circuit-id;
  mac-address mac-address;
  remote-id remote-id;
}
```

**Hierarchy Level**

```
[edit bridge-domains name forwarding-options dhcp-relay dhcpv6 group name

```

**Release Information** Statement introduced in Junos OS Release 17.3.

**Description** Different mechanisms to identify a single household.

**Options**

- circuit-id**—Circuit-id as key
- mac-address**—MAC address of client
- remote-id**—Remote-id as key

**Required Privilege Level**

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

| <b>Description</b>              | Delete all DHCP clients or only the DHCP clients serviced by the specified group of interfaces when reconfiguration fails; that is, when the maximum number of retry attempts have been made without success. A group configuration takes precedence over a DHCP local server configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Default</b>                  | Restores the original client configuration when reconfiguration fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Description              | <p>Configure the method that the authenticator uses to access RADIUS authentication servers when there are multiple servers configured. Initially, a RADIUS client sends a request to a RADIUS authentication or accounting server. The router or switch, acting as the authenticator, waits for a response from the server before sending another request.</p> <p>When there are multiple RADIUS server connections configured for a client, the authenticator attempts to reach the different servers in the order that they are configured. If there is no response from the first RADIUS server, the authenticator attempts to reach the next RADIUS server. This process repeats until the client is either granted access or there are no more configured servers.</p> <p>If the <b>direct</b> method is configured, the authenticator always treats the first server in the list as the primary server. The authenticator moves on to the second server only if the attempt to reach the first server fails. If the <b>round-robin</b> method is configured, the server chosen first will be rotated based on which server was used last. The first server in the list is treated as a primary for the first authentication request, but for the second request, the second server configured is treated as primary, and so on. With this method, all of the configured servers receive roughly the same number of requests on average so that no single server has to handle all of the requests.</p> |
|                          | <p> <b>NOTE:</b> The round-robin access method is not recommended for use with EX Series switches.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Default                  | The <b>direct</b> option is the default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Options                  | <p><b>direct</b>—Use the direct access method. The authenticator contacts the first RADIUS server on the list for each request, the second server if the first one fails, and so on.</p> <p><b>round-robin</b>—Use the round-robin method. The authenticator contacts the first RADIUS server for the first request, the second server for the second request, and so on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | Configure the match criteria DHCP relay uses to uniquely identify DHCP subscribers or clients when primary identification fails. The options are mutually exclusive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Default</b>                  | By default, DHCP uses the <b>option60-and-option82</b> option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>                  | <p><b>incoming-interface</b>—(Optional) Allow only one client device to connect on the interface. If the client device changes, the router deletes the existing client binding and creates a binding for the newly connected device.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                                 | <p> <b>NOTE:</b> The <b>overrides client-discover-match incoming-interface</b> configuration deletes and replaces the existing binding when a new device connects. This action differs from the <b>overrides interface-client-limit 1</b> statement, which retains the existing binding rejects the newly connected client.</p>                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>         | <p>Specify the grace period that begins after an authenticated user terminates all sessions and connections. Authentication is not required if a new connection is initiated during the grace period by the same user.</p> <p>During this period, the router determines whether the subscriber is inactive by monitoring data traffic, both upstream from the user (ingress) and downstream to the user (egress). Control traffic is ignored. The subscriber is not considered idle as long as data traffic is detected in either direction. When no traffic is detected for the duration of the idle time out, non-DHCP subscribers (such as L2TP or PPP) are gracefully logged out, similarly to a RADIUS-initiated disconnect or a CLI-initiated logout; DHCP subscribers are disconnected.</p> <p>When you additionally configure the related <a href="#">client-idle-timeout-ingress-only</a> statement (MX Series only), the router monitors only ingress traffic to determine whether the subscriber is inactive; it does not monitor any egress traffic. The related <a href="#">client-session-timeout</a> statement terminates the subscriber session when the session timeout expires regardless of user activity.</p> <p>Client idle timeouts are most often used for residential services rather than business services. The most practical use case for this timeout is in a PPP access model. It is not practical for DHCP or DHCPv6 subscribers.</p> <p>Although you can use the <b>client-idle-timeout</b> statement for dynamically configured subscriber VLANs, this configuration is useful only in limited circumstances (such as IP over Ethernet without DHCP and with fixed addresses) and is not typically used. If you do use the idle timeout for VLANs, the timeout period starts when the VLAN is instantiated. It resets when a client session is created or an existing session is reactivated. When no traffic is detected on an authenticated VLAN for the duration of the timeout, the VLAN is considered inactive and is deleted. If no client sessions are ever created on the VLAN, then the VLAN is removed when the timeout expires.</p> |
| <b>Default</b>             | The timeout is not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>             | <p><b><i>minutes</i></b>—Number of minutes of idle time that elapse before the session is terminated. ## client-idle-timeout-ingress-only

---

**Syntax** client-idle-timeout-ingress-only;

**Hierarchy Level** [edit access profile *profile-name* session-options]

**Release Information** Statement introduced in Junos OS Release 16.2.

**Description** Specify that only ingress traffic is monitored for subscriber idle timeout processing for the duration of the idle timeout period that you specify with the [client-idle-timeout](#) statement. If no ingress traffic is received for the duration of the timeout, then the subscriber is gracefully logged out (non-DHCP subscribers) or disconnected (DHCP subscribers).

If you configure [client-idle-timeout](#) alone, then both ingress and egress traffic are monitored during the idle timeout. Monitoring only ingress traffic is useful in cases where the LNS sends traffic to the remote peer even when the peer is not up, such as when the LNS does not have PPP keepalives enabled and therefore does not detect that the peer is not up. Because the LAC monitors both ingress and egress traffic by default, in this situation it receives the egress traffic from the LNS and either does not log out the subscriber or delays detection of inactivity until the egress traffic ceases. When you specify that only ingress traffic is monitored in this case, the LAC can detect that the peer is inactive and then initiate logout.

| <b>Description</b>         | <p>Specify the amount of time after which user sessions are terminated, regardless of user activity (also known as a forced or hard authentication timeout).</p> <p>Alternatively, when you want subscribers to be identified as inactive before they are terminated, use the related statements, <a href="#">client-idle-timeout</a> and <a href="#">client-idle-timeout-ingress-only</a>. Use <a href="#">client-idle-timeout</a> alone to specify a period of time during which both ingress and egress subscriber data traffic is monitored; if no traffic is detected for the duration of the period, the subscriber is considered inactive and is terminated. Add the <a href="#">client-idle-timeout-ingress-only</a> statement to monitor only ingress traffic for the duration of the timeout set with the <a href="#">client-idle-timeout</a> statement.</p> <hr/> <div>  <p><b>BEST PRACTICE:</b> We recommend that you do not configure a session timeout for subscribers receiving voice services. Because the session timeout is a simple time-based timeout, it is likely to interrupt subscribers actively using a voice service and terminate their calls unexpectedly (from the subscriber viewpoint). This result is a particular concern for emergency services calls.</p> </div> <hr/> <p>Client session timeouts are most often used for residential services rather than business services. The most practical use case for this timeout is in a PPP access model when no voice services are offered. For DHCP or DHCPv6 subscribers, the session timeout is used as the DHCP lease timer if no other lease time configuration is present.</p> <p>Although you can use the <code>client-session-timeout</code> statement for dynamically configured subscriber VLANs, this configuration is useful only in limited circumstances (such as IP over Ethernet without DHCP and with fixed addresses) and is not typically used. If you do use the session timeout for VLANs, the timeout period starts when the VLAN is instantiated.</p> |
| <b>Default</b>             | The timeout is not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## commit-interval

---

**Syntax**    `commit-interval interval;`

**Hierarchy Level**    `[edit system services extensible-subscriber-services]`

**Release Information**    Statement introduced in Junos OS Release 15.1.

**Description**    Specify the interval at which Extensible Subscriber Services Manager issues requests for committing op script configurations. Requests that are received and processed within the interval are committed in a batch at the end of the interval. Requests that are processed after the interval are committed at the end of the next commit interval. When no operation script is to be committed, no request for committing operation script configurations is issued.

**Options**    *interval*—Length of the interval.  
                  **Range:** 10 through 3600 seconds  
                  **Default:** 20 seconds

**Required Privilege Level**    system—To view this statement in the configuration.  
                                      system-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1R3 on MX Series routers with MPCs                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | Enhanced subscriber management leverages system shared memory to improve performance and scaling. Since this memory is used by both the Junos configuration and enhanced subscriber management, you need to set an upper limit on the memory available to the Junos configuration, which in turn determines the allocation available for enhanced subscriber management. |

```

**Release Information** Statement introduced in Junos OS Release 16.1R1.

**Description** Delay sending a DHCPv6-advertise message to specified clients. The configured server sends the advertise message when the delay timer expires. If the client is already bound to another server when it receives this advertise message, the DHCPv6 server that delayed the message releases the client. You can change the delay value at any time, but the change applies only to clients from which a solicit is received after the change; the new value does not apply to clients for which the response is already delayed.

Configuring the delay on DHCPv6 local servers enables load-balancing among multiple local servers on the network. When a client sends a solicit message, the delay prevents more than one server from replying at the same time. The delay applies on a per-client basis. You can configure the clients affected based on DHCPv6 option 15 (user class identifier), option 16 (vendor class identifier), option 18 (interface identifier; ACI), or option 37 (ARI).

If the configured server receives a second solicit message from the client, that means that no other server has responded. In this case, the configured server immediately replies to the client. This behavior enables the server to act as a back-up for other servers on the network.

**Options**    *ascii-string*—Value of the option expressed as an ASCII string.

**based-on**—Specify the DHCPv6 option received in the solicit message that is compared with the configured value on the local server.

- **option-15**—DHCPv6 option 15, user class identifier.
- **option-16**—DHCPv6 option 16, vendor class identifier.
- **option-18**—DHCPv6 option 18, interface identifier, equivalent to the Agent Circuit ID.
- **option-37**—DHCPv6 option 37, the Agent Remote ID.

**seconds**—Time delay between receiving DHCPv6 solicit message and responding to the client with an advertise message.

**Range:** 1 through 30

**Default:** 3

**equals**—Specify that the received option value from the client must match the configured string.

*hexadecimal-string*—Value of the option expressed as a hexadecimal.

**not-equals**—Specify that the received option value from the client must not match the configured string.

**starts-with**—Specify that the received option value from the client must start with the configured string.

**Required Privilege Level**    system—To view this statement in the configuration.  
                                         system-control—To add this statement to the configuration.

```

**Release Information** Statement introduced in Junos OS Release 16.1R1.

**Description** Delay sending a DHCP-offer message to specified clients. The configured server sends the offer message when the delay timer expires. If the client is already bound to another server when it receives this offer message, the DHCPv4 server that delayed the message releases the client. You can change the delay value at any time, but the change applies only to clients from which an offer is received after the change; the new value does not apply to clients for which the response is already delayed.

Configuring the delay on DHCPv4 local servers enables load-balancing among multiple local servers on the network. When a client sends a discover message, the delay prevents more than one server from replying at the same time. The delay applies on a per-client

basis. You can configure the clients affected based on DHCPv4 option 60 (vendor class identifier), option 77 (user class identifier), or option 82 (ACI and ARI).

If the configured server receives a second discover message from the client, that means that no other server has responded. In this case, the configured server immediately replies to the client. This behavior enables the server to act as a back-up for other servers on the network.

**Options**    **ascii** *ascii-string*—Value of the option expressed as an ASCII string.

**based-on**—Specify the DHCPv4 option received in the discover message that is compared with the configured value on the local server.

- **option-60**—DHCPv4 option 60, vendor class identifier.
- **option-77**—DHCPv4 option 77, the user class identifier.
- **option-82**—DHCPv4 option 82, the ACI/ARI.

**delay-time** *seconds*—Time delay between receiving DHCPv4 discover message and responding to the client with an offer message.

**Range:** 1 through 30

**Default:** 3

**equals**—Specify that the received option value from the client must match the configured string.

**hexadecimal** *hexadecimal-string*—Value of the option expressed as a hexadecimal.

**not-equals**—Specify that the received option value from the client must not match the configured string.

**starts-with**—Specify that the received option value from the client must start with the configured string.

**Required Privilege**    system—To view this statement in the configuration.  
**Level**                    system-control—To add this statement to the configuration.

| Description              | Specify the address pool that assigns the IA_PD address. A pool specified by RADIUS VSA 26-161 takes precedence over the pool specified by this <b>delegated-pool</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Options                  | <b><i>pool-name</i></b> —Name of the address-assignment pool.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | <p>Configure the router to override the default behavior when the router receives a DHCPv4 Discover or DHCPv6 Solicit message while in a bound state. By default, DHCP maintains the existing client entry when DHCP receives a new Discover or Solicit message that has a client ID that matches the existing client. DHCP then processes the new message using the existing client entry.</p> <p>You use the <b>delete-binding-on-renegotiation</b> statement to override the default action, and to specify that DHCP tear down the existing matching client entry and to process the message as a new client entry.</p>                                                                                                                                                                                                                                                                                                                                |
|                                 | <p> <b>NOTE:</b> In Junos OS releases prior to 15.1, the DHCPv6 local server and relay agent use the opposite default behavior, and tear down the existing client entry when receiving a Solicit message while in a bound state. Starting in Junos OS release 15.1, the DHCPv6 local server and DHCPv6 relay agent default behavior is the same as DHCPv4 local server and relay agent—in all models, the default behavior is to maintain the existing client entry.</p>                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.<br/> system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>         | Specify the character used as the delimiter between the concatenated components of the username.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <b><i>delimiter-character</i></b> —Character that separates components that make up the concatenated username. You cannot use the semicolon (;) as a delimiter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Default:** . (period)

**NOTE:** When you include the [interface-description](#) in the username, the delimiter must not be a character that is part of the interface description. For example, if the text description is configured as “Backbone connection/PHL01”, you cannot use the forward slash (/) as the delimiter.

| Description         | Specify the character used as the delimiter between the concatenated components of the username. Use the statement at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels to configure DHCPv6 support.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Options             | <b><i>delimiter-character</i></b> —Character that separates components that make up the concatenated username. You cannot use the semicolon (;) as a delimiter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Default:** . (period)

**NOTE:** When you include the [interface-description](#) in the username, the delimiter must not be a character that is part of the interface description. For example, if the text description is configured as “Backbone connection/PHL01”, you cannot use the forward slash (/) as the delimiter.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## delimiter (Domain Map)

**Syntax** `delimiter [delimiter-character];`

**Hierarchy Level** [edit access [domain](#)]

**Release Information** Statement introduced in Junos OS Release 10.4.

**Description** Specify the characters that the router uses to separate usernames from domain names.

**Default** The @ character.

**Options** *delimiter-character*—One or more characters used as delimiters. You can specify a maximum of eight delimiters. You cannot use the semicolon (;) as a delimiter. Do not include spaces between characters.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## demux (Interfaces)

```

Syntax  demux {
        inet {
            address source;
            auto-configure {
                address-ranges {
                    dynamic-profile <dyn-prof-name> {
                        network <ip-addr> {
                            range <range-name> {
                                low <low-addr>;
                                high <high-addr>;
                            }
                        }
                    }
                }
            }
            authentication {
                password <password-string>;
                username-include {
                    delimiter <delimiter-character>;
                    domain-name <domain-name-string>;
                    interface-name;
                    auth-server-realm <auth-server-realm-string>;
                    source-address;
                    user-prefix <user-prefix-string>;
                }
            }
        }
    }
}

```

**Hierarchy Level** [edit interfaces *interface-name* unit *unit-number*]

**Release Information** Statement introduced in Junos OS Release 18.1R1.

**Description** Configure demultiplexing (demux) interface options. The remaining statement is explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## dhcp-attributes (Address-Assignment Pools)

**Syntax**

```
dhcp-attributes {
  boot-file filename;
  boot-server (address | hostname);
  dns-server [ ipv6-address ];
  domain-name domain-name;
  exclude-prefix-len exclude-prefix-length;
  grace-period seconds;
  maximum-lease-time seconds;
  name-server [ server-list ];
  netbios-node-type node-type;
  option {
    [ (id-number option-type option-value)
      (id-number array option-type option-value) ];
  }
  option-match {
    option-82 {
      circuit-id value range named-range;
      remote-id value range named-range;
    }
  }
  preferred-lifetime seconds;
  router [ router-address ];
  server-identifier ip4-address;
  sip-server-address [ ipv6-address ];
  sip-server-domain-name domain-name;
  t1-percentage percentage;
  t1-renewal-time;
  t2-percentage percentage;
  t2-rebinding-time;
  tftp-server address;
  valid-lifetime seconds;
  wins-server [ servers ];
}
```

**Hierarchy Level** [edit access address-assignment **pool** *pool-name* **family** *family*]

**Release Information** Statement introduced in Junos OS Release 9.0.  
Statement introduced in Junos OS Release 12.3 for EX Series switches.  
**exclude-prefix-len** statement introduced in Junos OS Release 17.3 for MX Series.

**Description** Configure DHCP attributes for the protocol family in a specific address pool. The attributes determine options and behaviors for the DHCP clients.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Options** **exclude-prefix-len** *exclude-prefix-length*—Specify the length of the IPv6 prefix to be excluded from the delegated prefix.

**Range:** 1 through 128

**Release Information** Statement introduced in Junos OS Release 9.0.  
 Statement introduced in Junos OS Release 12.1 for EX Series switches.  
 Statement introduced in Junos OS Release 13.2X51 for the QFX Series.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Configure Dynamic Host Configuration Protocol (DHCP) local server options on the router or switch to enable the router or switch to function as an extended DHCP local server. The DHCP local server receives DHCP request and reply packets from DHCP clients and then responds with an IP address and other optional configuration information to the client.

The extended DHCP local server is incompatible with the DHCP server on J Series routers and, therefore, is not supported on J Series routers. Also, the DHCP local server and the DHCP/BOOTP relay server, which are configured under the **[edit forwarding-options helpers]** hierarchy level, cannot both be enabled on the router or switch at the same time. The extended DHCP local server is fully compatible with the extended DHCP relay feature.

The **dhcpv6** stanza configures the router or switch to support Dynamic Host Configuration Protocol for IPv6 (DHCPv6). The DHCPv6 local server is fully compatible with the extended DHCP local server and the extended DHCP relay feature.

**NOTE:** When you configure the **dhcp-local-server** statement at the routing instance hierarchy level, you must use a routing instance type of **virtual-router**.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** system—To view this statement in the configuration.  
 system-control—To add this statement to the configuration.

**Release Information** Statement introduced in Junos OS Release 8.3.  
 Statement introduced in Junos OS Release 12.1 for EX Series switches.  
 Statement introduced in Junos OS Release 13.2X51 for the QFX Series.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Configure extended Dynamic Host Configuration Protocol (DHCP) relay and DHCPv6 relay options on the router or switch to enable the router (or switch) to function as a DHCP relay agent. A DHCP relay agent forwards DHCP request and reply packets between a DHCP client and a DHCP server.

DHCP relay supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide subscriber authentication or client authentication. You can attach dynamic profiles and configure authentication support on a global basis or for a specific group of interfaces.

The extended DHCP and DHCPv6 relay agent options configured with the **dhcp-relay** and **dhcpv6** statements are incompatible with the DHCP/BOOTP relay agent options configured with the **bootp** statement. As a result, the extended DHCP or DHCPv6 relay agent and the DHCP/BOOTP relay agent cannot both be enabled on the router (or switch) at the same time.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Enable DHCP services on the device. DHCP services automate network-parameter assignment to network devices. The DHCP service process is enabled by default. However, by default, IP-MAC bindings in the DHCP snooping database do not persist through device reboots. You can improve performance after rebooting by configuring the IP-MAC bindings to persist, by configuring a storage location for the DHCP database file. When specifying the location for the DHCP database, you must also specify how frequently the switch writes the database entries into the DHCP snooping database file.</p> <p>The remaining statements are explained separately. Search for a statement in <a href="#">CLI Explorer</a> or click a linked statement in the Syntax section for details.</p>                                    |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Release Information** Statement introduced in Junos OS Release 9.6.  
 Statement introduced in Junos OS Release 12.3 for EX Series switches.

**Description** Configure DHCPv6 local server options on the router or switch to enable the router or switch to function as a server for the DHCP protocol for IPv6. The DHCPv6 local server sends and receives packets using the IPv6 protocol and informs IPv6 of the routing requirements of router clients. The local server works together with the AAA service framework to control subscriber access (or DHCP client access) and accounting.

The DHCPv6 local server is fully compatible with the extended DHCP local server and DHCP relay agent.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** system—To view this statement in the configuration.  
 system-control—To add this statement to the configuration.

**Release Information** Statement introduced in Junos OS Release 11.4.  
 Statement introduced in Junos OS Release 12.3 for EX Series switches.  
 Support for **forward-snooped-clients** introduced in Junos OS Release 15.1X53-D56 for EX Series switches and Junos OS Release 17.1R1.

**Description** Configure DHCPv6 relay options on the router or switch and enable the router or switch to function as a DHCPv6 relay agent. A DHCPv6 relay agent forwards DHCPv6 request and reply packets between a DHCPv6 client and a DHCPv6 server.

The DHCPv6 relay agent server is fully compatible with the extended DHCP local server and DHCP relay agent. However, the options configured with the **dhcpv6** statement are incompatible with the DHCP/BOOTP relay agent options configured with the **bootp** statement. As a result, the DHCPv6 relay agent and the DHCP/BOOTP relay agent cannot be enabled on the router or switch at the same time.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

```

Hierarchy Level [\[edit\]](#)

**Release Information** Statement introduced in Junos OS Release 9.6.  
**product-name** option added in Junos OS Release 18.3R1 on MX Series routers.

**Description** Configure the Diameter base protocol for subscriber management.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Options** **product-name** *name*—Name of a product to advertise in the Capability Exchange Request and Capability-Exchange Answer messages to a Diameter peer. The name is included in the Diameter AVP Product-Name (269). If you change the product-name, the MX

series router acting as a BNG disconnects all existing connections to Diameter peers and reconnects to those peers using the new product name.

**Default:** JUNOS

| Release Information      | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Description              | <p>Specify the address of the DNS server that is used to resolve IPv6 DNS names. You can use RADIUS to provide the address dynamically in the \$junos-ipv6-dns-server variable within Access-Accept messages, or you can statically configure up to three IPv6 addresses.</p> <p>You can also specify the maximum time in seconds for which the DNS server address remains valid. The device can use the recursive DNS server address for DNS name resolution until the time specified expires.</p>                                                                                                                                                                                                                                                                                         |
| Options                  | <p><b>\$junos-ipv6-dns-server-address</b>—Dynamically receive the address of the DNS server from RADIUS in Access-Accept messages.</p> <p><b><i>dns-server-address</i></b>—IPv6 address of the DNS server. You can configure up to three DNS server addresses.</p> <p><b>lifetime <i>seconds</i></b>—Maximum time for which the recursive DNS server address remains valid.</p> <p><b>Range:</b> 0 through 4,294,967,295 seconds</p> <p><b>Default:</b> 1800 seconds</p> <p><b>Values:</b> 0 indicates that the advertised recursive DNS server address is no longer valid and that this recursive DNS server address entry can be deleted. A value of 4,294,967,295 seconds indicates an infinite lifetime and a persistent entry in the device for this recursive DNS server address.</p> |
| Required Privilege Level | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Description         | Specify the domain name that is concatenated with the username during the subscriber authentication or client authentication process. Use the statement at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels to configure DHCPv6 support.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Options             | <i>domain-name-string</i> —Domain name formatted string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

## domain-name (Interfaces)

**Syntax** `domain-name domain-name-string;`

**Hierarchy Level** [edit interfaces *interface-name* unit *unit-number* demux inet auto-configure address-range authentication username-include]  
 [edit interfaces *interface-name* unit *unit-number* demux inet6 auto-configure address-range authentication username-include]

**Release Information** Statement introduced in Junos OS Release 18.1R1.

**Description** Specify the domain name that is concatenated with the username during the subscriber authentication process.

**Options** *domain-name-string*—The domain name formatted string.

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Specify a recommended shaping rate to be applied to downstream traffic on an interface.</p> <p>For ANCP interfaces, this configured rate is used as the default value for the Juniper VSA Downstream-Calculated-Qos-Rate (26–141) when the router has not received and processed the attributes from the access node.</p> <p>For L2TP, the rate is configured on an underlying PPPoE logical interface for a subscriber on an MX Series router acting as a LAC. When the subscriber is tunneled, this rate, referred to as speed for L2TP, is sent to the LNS in the ICCN message as AVP 24.</p> |
| <b>Options</b>                  | <p><b>rate</b>—Traffic rate in bits per second.</p> <p><b>Range:</b> 1000 through 4,294,967,295 bits per second</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Release Information      | Statement introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Description              | <p>Configure the Policy and Charging Rule Function (PCRF) or Online Charging System (OCS) partition to the draining state to make substantial configuration changes quickly. To log out all subscribers quickly and immediately, issue the <b>clear network-access pcrf subscribers</b> command.</p> <p>After you set draining for either of the PCRF or OCS partitions, any new subscriber logins are denied, and the time limit you set in the <a href="#">draining-response-timeout</a> statement is used instead of the <a href="#">logout-response-timeout</a> time limit.</p> <p>After the partition has drained, you must issue the <a href="#">clear network-access pcrf</a> or <a href="#">clear network-access ocs statistics</a> command to clear out the respective partition's subscribers and wait for all of the subscribers to log out before you can make configuration changes and resume normal operations.</p> |
| Required Privilege Level | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 17.3R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | Assigns the specified dual-stack group to both legs (DHCP and DHCPv6) of the DHCP dual stack. The dual-stack group defines the common configuration settings for DHCP and DHCPv6 subscribers on both legs. These settings take precedence over all other configurations, such as those specified in global, group, or interface settings.                                                                                                                                                                                              |
| <b>Options</b>                  | <b><i>dual-stack-group-name</i></b> —Name of the globally configured dual-stack group.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | Assigns the specified dual-stack group to both legs (DHCP and DHCPv6) of the DHCP dual stack. The dual-stack group defines the common configuration settings for DHCP and DHCPv6 subscribers on both legs. These settings take precedence over all other configurations, such as those specified in global, group, or interface settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Release Information** Statement introduced in Junos OS Release 15.1.

**Description** Specifies common configuration settings that are used for both legs (DHCP and DHCPv6) of the DHCP dual stack, and names the dual stack group.

The group is assigned to each leg of the DHCP dual-stack with the [dual-stack](#) statement in the [overrides](#) stanza. When applied, the dual-stack configuration takes precedence over all other configurations, such as those specified in global, group, or interface settings.

**Options** *name*—Name of the dual-stack group.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement in the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 18.1R1 on MX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | <p>Configure JSRC provisioning for dual-stack subscribers so that it reports information about the separate stacks for a given subscriber, using a single JSRC session. By default (and in all cases for releases earlier than Junos OS Release 18.1R1), the DHCPv4 and DHCPv6 stacks are treated as a single subscriber; the remote SRC peer (SAE) is not informed about whether only one family or both families are active. The statistics are reported as an aggregate of both families rather than separated by family.</p> <p>When you configure dual-stack support for JSRC, Diameter AA-Request (AAR) provisioning messages sent to the SAE include Diameter AVPs (IANA enterprise number 2636) to convey the IPv4 and IPv6 addressing information that is available in the session database. For IPv4, that includes Framed-IP-Address (AVP 8) and Framed-IP-Netmask (AVP 9). For IPv6, that includes Framed-IPv6-Address (AVP 168), Framed-IPv6-Prefix (AVP 97), Delegated-IPv6-Prefix (AVP 123), Juniper-IPv6-Ndra-Prefix (AVP 2200), and Juniper-Framed-IPv6-Netmask (AVP 2201). JSRC also includes information about the access line if it is available in the session database, by means of Juniper-Agent-Circuit-Id (AVP 2202) and Juniper-Remote-Circuit-Id (AVP 2203).</p> <p>When the first network family is activated, JSRC sends the addresses for only that family in the initial request to the provisioning server. When the second network family is activated, the AAR message includes the Juniper-Request-Type AVP (2050) with a value of 4 to signify family activation. When the next-to-last family is deactivated, the same AVP is sent with a value of 5 to signify the deactivation.</p> |
| <b>Default</b>                  | Disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                     |
| <b>Description</b>              | Configure the router to send accounting reports to both the RADIUS accounting server configured in the access profile for the wholesaler and the RADIUS accounting server configured in the access profile for the retailer.                       |
| <b>Default</b>                  | The router sends accounting reports to the accounting servers that are in the context in which the subscriber is authenticated.                                                                                                                    |

**Release Information** Statement introduced in Junos OS Release 12.3.  
Statement updated in Junos OS Release 17.4.

**Description** Configure the exact match criteria used with the DHCP relay agent selective processing feature. DHCP relay agent compares the configured match string with the option-specific string received in DHCP client packets. If there is an exact left-to-right match, DHCP performs the action you define for the match criteria.

You can configure an unlimited number of match strings. Match strings do not support wildcard attributes.

The **local-server-group** option is not supported for DHCPv6 relay agent.

**Options** *ascii-string*—ASCII string of 1 through 255 alphanumeric characters.

*hexadecimal-string*—Hexadecimal string of 1 through 255 hexadecimal characters (0 through 9, a through f, A through F).

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Release Information** Statement introduced in Junos OS Release 9.1.  
 Statement introduced in Junos OS Release 9.1 for EX Series switches.  
**downstream-calculated-qos-rate**, **dsl-forum-attributes**, and **upstream-calculated-qos-rate** options added in Junos OS Release 11.4.  
**cos-shaping-rate** and **filter-id** options added in Junos OS Release 13.2.  
**pppoe-description** option added in Junos OS Release 14.2.  
**virtual-router** option added in Junos OS Release 15.1.  
**first-relay-ipv4-address** and **first-relay-ipv6-address** options added in Junos OS Release 16.1.  
**acc-loop-encap** and **acc-loop-remote-id** options added in Junos OS Release 16.1R4.  
**access-request** option support for all tunnel attributes added in Junos OS Release 15.1R7, 16.1R5, 16.2R2, 17.1R2, 17.2R2, and 17.3R1 for MX Series.  
**packet-type**, **standard-attribute**, **vendor-attribute**, and **vendor-id** options added in Junos OS Release 18.1R1.

**Description** Configure the router or switch to exclude the specified attributes from being sent in the specified type of RADIUS message. Exclusion can be useful, for example, for attributes that do not change values over the lifetime of a subscriber. By not sending these attributes, you reduce the packet size without losing information. Contrast this behavior with that provided by the **ignore** statement.

You can specify attribute exclusion for multiple RADIUS message types by enclosing the message types, separated by spaces, within brackets ([ ]). You do not need brackets when specifying a single message type.

Starting in Junos OS Release 18.1R1, you can specify standard RADIUS attributes with the attribute number. You can specify VSAs with the IANA-assigned vendor ID and the VSA number. With this flexible configuration method, you can configure any standard attribute and VSA supported by your platform to be excluded. The configuration has no effect if you configure unsupported attributes, vendors, and VSAs.

The legacy method allows you to configure only those attributes and VSAs for which the statement syntax includes a specific option. Consequently, you can use the legacy method to exclude only a subset of all attributes that can be received in Access-Accept messages.

Not all attributes are available in all types of RADIUS messages.

**NOTE:** If you exclude an attribute from Acct-Off messages, the attributes are then excluded from Interim-Acct messages.

**NOTE:** VSAs with dedicated option names include Juniper Networks (IANA vendor ID 4874) and DSL Forum (vendor ID 3561) VSAs.

**Options** RADIUS attribute—RADIUS standard attribute or VSA:

- **acc-aggr-cir-id-asc**—Exclude Juniper Networks VSA 26-112, Acc-Aggr-Cir-Id-Asc.
- **acc-aggr-cir-id-bin**—Exclude Juniper Networks VSA 26-111, Acc-Aggr-Cir-Id-Bin.
- **acc-loop-cir-id**—Exclude Juniper Networks VSA 26-110, Acc-Loop-Cir-Id.
- **acc-loop-encap**—Exclude Juniper Networks VSA 26-183, Acc-Loop-Encap.
- **acc-loop-remote-id**—Exclude Juniper Networks VSA 26-182, Acc-Loop-Remote-Id.
- **accounting-authentic**—Exclude RADIUS attribute 45, Acct-Authentic.
- **accounting-delay-time**—Exclude RADIUS attribute 41, Acct-Delay-Time.
- **accounting-session-id**—Exclude RADIUS attribute 44, Acct-Session-Id.
- **accounting-terminate-cause**—Exclude RADIUS attribute 49, Acct-Terminate-Cause.
- **acct-request-reason**—Exclude Juniper Networks VSA 26-210, Acct-Request-Reason.
- **acct-tunnel-connection**—Exclude RADIUS attribute 68, Acct-Tunnel-Connection.
- **act-data-rate-dn**—Exclude Juniper Networks VSA 26-114, Act-Data-Rate-Dn.
- **act-data-rate-up**—Exclude Juniper Networks VSA 26-113, Act-Data-Rate-Up.
- **act-interlv-delay-dn**—Exclude Juniper Networks VSA 26-126, Act-Interlv-Delay-Dn.
- **act-interlv-delay-up**—Exclude Juniper Networks VSA 26-124, Act-Interlv-Delay-Up.
- **att-data-rate-dn**—Exclude Juniper Networks VSA 26-118, Att-Data-Rate-Dn.
- **att-data-rate-up**—Exclude Juniper Networks VSA 26-117, Att-Data-Rate-Up.
- **called-station-id**—Exclude RADIUS attribute 30, Called-Station-Id.
- **calling-station-id**—Exclude RADIUS attribute 31, Calling-Station-Id.
- **chargeable-user-identity**—Exclude RADIUS attribute 89, Chargeable-User-Identity.
- **class**—Exclude RADIUS attribute 25, Class.
- **cos-shaping-rate**—Exclude Juniper Networks VSA 26-177, Cos-Shaping-Rate.
- **delegated-ipv6-prefix**—Exclude RADIUS attribute 123, Delegated-IPv6-Prefix.
- **dhcp-gi-address**—Exclude Juniper Networks VSA 26-57, DHCP-GI-Address.
- **dhcp-header**—Exclude Juniper Networks VSA 26-208, DHCP-Header.
- **dhcp-mac-address**—Exclude Juniper Networks VSA 26-56, DHCP-MAC-Address.
- **dhcp-options**—Exclude Juniper Networks VSA 26-55, DHCP-Options.
- **dhcpv6-header**—Exclude Juniper Networks VSA 26-209, DHCPv6-Header.
- **dhcpv6-options**—Exclude Juniper Networks VSA 26-207, DHCPv6-Options.
- **dynamic-iflset-name**—Exclude Juniper Networks VSA 26-130, Qos-Set-Name.
- **downstream-calculated-qos-rate**—Exclude Juniper Networks VSA 26-141.

- **dsl-forum-attributes**—Exclude DSL Forum VSA (vendor ID 3561) as described in RFC 4679, *DSL Forum Vendor-Specific RADIUS Attributes*.
- **dsl-line-state**—Exclude Juniper Networks VSA 26-127, DSL-Line-State.
- **dsl-type**—Exclude Juniper Networks VSA 26-128, DSL-Type.
- **event-timestamp**—Exclude RADIUS attribute 55, Event-Timestamp.
- **filter-id**—Exclude RADIUS attribute 11, Filter-Id.
- **first-relay-ipv4-address** —Exclude Juniper Networks VSA 26-189, DHCP-First-Relay-IPv4-Address.
- **first-relay-ipv6-address** —Exclude Juniper Networks VSA 26-190, DHCP-First-Relay-IPv6-Address.
- **framed-interface-id**—Exclude RADIUS attribute 96, Framed-Interface-ID.
- **framed-ip-address**—Exclude RADIUS attribute 8, Framed-IP-Address.
- **framed-ip-netmask**—Exclude RADIUS attribute 9, Framed-IP-Netmask.
- **framed-ip-route**—Exclude RADIUS attribute 22, Framed-Route.
- **framed-ipv6-address**—Exclude RADIUS attribute 168, Framed-IPv6-Address.
- **framed-ipv6-pool**—Exclude RADIUS attribute 100, Framed-IPv6-Pool.
- **framed-ipv6-prefix**—Exclude RADIUS attribute 97, Framed-IPv6-Prefix.
- **framed-ipv6-route**—Exclude RADIUS attribute 99, Framed-IPv6-Route.
- **framed-pool**—Exclude RADIUS attribute 88, Framed-Pool.
- **input-filter**—Exclude Juniper Networks VSA 26-10, Ingress-Policy-Name.
- **input-gigapackets**—Exclude Juniper Networks VSA 26-42, Acct-Input-Gigapackets.
- **input-gigawords**—Exclude RADIUS attribute 52, Acct-Input-Gigawords.
- **input-ipv6-gigawords**—Exclude Juniper Networks VSA 26-155, Acct-Input-IPv6-Gigawords.
- **input-ipv6-octets**—Exclude Juniper Networks VSA 26-151, Acct-Input-IPv6-Octets.
- **input-ipv6-packets**—Exclude Juniper Networks VSA 26-153, Acct-Input-IPv6-Packets.
- **interface-description**—Exclude Juniper Networks VSA 26-53, Interface-Desc.
- **l2c-downstream-data**—Exclude Juniper Networks VSA 26-93, L2C-Down-Stream-Data.
- **l2c-upstream-data**—Exclude Juniper Networks VSA 26-92, L2C-Up-Stream-Data.
- **l2tp-rx-connect-speed**—Exclude Juniper Networks VSA 26-163, Rx-Connect-Speed.
- **l2tp-tx-connect-speed**—Exclude Juniper Networks VSA 26-162, Tx-Connect-Speed.
- **max-data-rate-dn**—Exclude Juniper Networks VSA 26-120, Max-Data-Rate-Dn.
- **max-data-rate-up**—Exclude Juniper Networks VSA 26-119, Max-Data-Rate-Up.
- **max-interlv-delay-dn**—Exclude Juniper Networks VSA 26-125, Max-Interlv-Delay-Dn.

- **max-interlv-delay-up**—Exclude Juniper Networks VSA 26-123, Max-Interlv-Delay-Up.
- **min-data-rate-dn**—Exclude Juniper Networks VSA 26-116, Min-Data-Rate-Dn.
- **min-data-rate-up**—Exclude Juniper Networks VSA 26-115, Min-Data-Rate-Up.
- **min-lp-data-rate-dn**—Exclude Juniper Networks VSA 26-122, Min-Lp-Data-Rate-Dn.
- **min-lp-data-rate-up**—Exclude Juniper Networks VSA 26-121, Min-Lp-Data-Rate-Up.
- **nas-identifier**—Exclude RADIUS attribute 32, NAS-Identifier.
- **nas-port**—Exclude RADIUS attribute 5, NAS-Port.
- **nas-port-id**—Exclude RADIUS attribute 87, NAS-Port-Id.
- **nas-port-type**—Exclude RADIUS attribute 61, NAS-Port-Type.
- **output-filter**—Exclude Juniper Networks VSA 26-11, Egress-Policy-Name.
- **output-gigapackets**—Exclude Juniper Networks VSA 26-43, Acct-Output-Gigapackets.
- **output-gigawords**—Exclude RADIUS attribute 53, Acct-Output-Gigawords.
- **output-ipv6-gigawords**—Exclude Juniper Networks VSA 26-156, Acct-Output-IPv6-Gigawords.
- **output-ipv6-octets**—Exclude Juniper Networks VSA 26-152, Acct-Output-IPv6-Octets.
- **output-ipv6-packets**—Exclude Juniper Networks VSA 26-154, Acct-Output-IPv6-Packets.
- **packet-type**—Specify the RADIUS message type to exclude; term required when excluding a standard attribute or VSA by number rather than name. You can enclose multiple values in square brackets to specify a list of message types. Message types include Access-Request, Accounting-Off, Accounting-Off, Accounting-Start, and Accounting-Stop.
- **pppoe-description**—Exclude Juniper Networks VSA 26-24, PPPoE-Description.
- **standard-attribute *number***—RADIUS standard attribute number supported by your platform. If you configure an unsupported attribute, that configuration has no effect. When you use this option, you must use the **packet-type** term to specify the message from which the attribute is excluded.
- **tunnel-assignment-id**—Exclude RADIUS attribute 82, Tunnel-Assignment-ID.
- **tunnel-client-auth-id**—Exclude RADIUS attribute 90, Tunnel-Client-Auth-ID.
- **tunnel-client-endpoint**—Exclude RADIUS attribute 66, Tunnel-Client-Endpoint.
- **tunnel-medium-type**—Exclude RADIUS attribute 65, Tunnel-Medium-Type.
- **tunnel-server-auth-id**—Exclude RADIUS attribute 91, Tunnel-Server-Auth-ID.
- **tunnel-server-endpoint**—Exclude RADIUS attribute 67, Tunnel-Server-Endpoint.
- **tunnel-type**—Exclude RADIUS attribute 64, Tunnel-Type.
- **upstream-calculated-qos-rate**—Exclude Juniper Networks VSA 26-142

- **vendor-attribute *vsa-number***—Number identifying a VSA belonging to the specified vendor; both must be supported by your platform. If you configure an unsupported VSA, that configuration has no effect. When you use this option, you must use the **packet-type** term to specify the message from which the attribute is excluded.
- **vendor-id *id-number***—IANA vendor ID supported by your platform. If you configure an unsupported vendor ID, that configuration has no effect.
- **virtual-router**—Exclude Juniper Networks VSA 26-1.

RADIUS message type:

- **access-request**—RADIUS Access-Request messages.
- **accounting-off**—RADIUS Accounting-Off messages.
- **accounting-on**—RADIUS Accounting-On messages.
- **accounting-start**—RADIUS Accounting-Start messages.
- **accounting-stop**—RADIUS Accounting-Stop messages.

## family (Address-Assignment Pools)

**Syntax**

```
family family {
  dhcp-attributes {
    [protocol-specific attributes]
  }
  excluded-address ip-address;
  excluded-range name low minimum-value high maximum-value;
  host hostname {
    hardware-address mac-address;
    ip-address ip-address;
  }
  network ip-prefix / <prefix-length>;
  prefix ipv6-prefix;
  range range-name {
    high upper-limit;
    low lower-limit;
    prefix-length prefix-length;
  }
}
```

**Hierarchy Level** [edit access address-assignment [pool pool-name](#)]

**Release Information** Statement introduced in Junos OS Release 9.0.  
Statement introduced in Junos OS Release 12.3 for EX Series switches.

**Description** Configure the protocol family for the address-assignment pool.

**NOTE:** Subordinate statement support depends on the platform. See individual statement topics for more detailed support information.

**Options** *family*—Protocol family:

- **inet**—Internet Protocol version 4 suite
- **inet6**—Internet Protocol version 6 suite

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| Release Information      | Statement introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Description              | <p>Configure the amount of time in seconds before an Online Charging System (OCS) partition stops attempting to send the final interrogation during the subscriber logout process. When a subscriber starts to log out, the OCS sends a final interrogation. If there is no response within 24 hours, then the system continues and starts sending a logout message to the Policy and Charging Rule Function (PCRF). If there is no response within the next 24 hours, then the subscriber logout proceeds.</p>                                                                |
|                          | <p> <b>NOTE:</b> Any configuration changes made to this statement apply to all subscribers currently waiting to log out within a 60 second period.</p>                                                                                                                                                                                                                                                                                                                                        |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>Enable subscriber traffic to flow before the first interrogation with the Online Charging System (OCS) occurs.</p> <p>Wireline customers often control user services solely through the Policy Control and Charging Rules Function (PCRF) and use the OCS as a convenient real-time usage monitoring mechanism rather than as an enforcement unit. To decrease the number of possible erroneous OCS configurations, include the <b>force-continue</b> statement to force the broadband Policy and Charging Enforcement Function (BPCEF) to limit the impact of negative responses from the OCS and quota expirations, and to prevent sending OCS notifications for affected rating groups. Whenever the PCEF receives a negative response to any reported group, it stops reporting this group to the OCS.</p> |
|                                 | <p> <b>NOTE:</b> The <b>force-continue</b> state is required; you must configure it in the OCS partition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Description              | Forward specified DHCP client packets, without creating a new subscriber session, when you use DHCP relay selective processing feature. You can configure the forwarding operation globally or for a group of interfaces, and for either DHCP or DHCPv6 relay agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|                          | <div>  <p><b>NOTE:</b> When you use the <a href="#">forward-only</a> action, the only configured <a href="#">overrides</a> operation supported is the <a href="#">trust-option-82</a> option. DHCP relay agent ignores all other configured <a href="#">overrides</a> options.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## forwarding (Diameter Network Element)

**Syntax**

```
forwarding {
  route dne-route-name {
    destination realm realm-name <host hostname>;
    function function-name <partition partition-name>;
    metric route-metric;
  }
}
```

**Hierarchy Level** [edit diameter [network-element](#) *element-name*]

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** Define the criteria that specify which destinations are reachable through the Diameter network element.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | Configure the value of the 3GPP-GGSN-MCC-MNC AVP value to include in all CCR-GY messages. The value is the mobile country code (MCC) and mobile network code (MNC) of the network that the GGSN belongs to. The combined MCC and MNC uniquely identify the mobile network operator.                                                                                                                                                                  |
| <b>Options</b>                  | <b><i>ggsn-mcc-mnc</i></b> —Value of the mobile network country and network codes to include in all CCR-GY messages.                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | <p>Configure global attributes and data elements of the 3rd Generation Partnership Project (3GPP) Diameter credit control service charging system for the Online Charging System (OCS), which interacts with the Policy and Charging Enforcement Function (PCEF). The PCEF optionally reports usage and receives additional authorizations from the OCS using the 3GPP Gy protocol. Broadband PCEF (BPCEF) interactions with the OCS use online session charging with centralized unit determination and centralized rating.</p> <p>The remaining statement is explained separately. Search for a statement in <a href="#">CLI Explorer</a> or click a linked statement in the Syntax section for details.</p> |

**Release Information** Statement introduced in Junos OS Release 8.3.  
 Support at the [edit ... *dhcpv6*] hierarchy levels introduced in Junos OS Release 11.4.  
 Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description** Specify the name of a group of interfaces that have a common DHCP or DHCPv6 relay agent configuration. A group must contain at least one interface. Use the statement at the [edit ... *dhcpv6*] hierarchy levels to configure DHCPv6 support.

**Options** *group-name*—Name of a group of interfaces that have a common DHCP or DHCPv6 relay agent configuration.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

## group (Static Subscribers)

**Syntax**

```
group group-name {
  access-profile profile-name;
  dynamic-profile profile-name {
    aggregate-clients (merge | replace);
  }
  authentication {
    password password-string;
    username-include {
      delimiter delimiter-character;
      domain-name domain-name;
      interface;
      logical-system-name;
      routing-instance-name;
      user-prefix user-prefix-string;
      vlan-tags;
    }
  }
  interface interface-name <exclude> <upto upto-interface-name>;
}
```

**Hierarchy Level** [edit logical-systems *logical-system-name* system services [static-subscribers](#)],  
 [edit logical-systems *logical-system-name* routing-instances *routing-instances-name* system  
 services [static-subscribers](#)],  
 [edit routing-instances *routing-instances-name* system services [static-subscribers](#)],  
 [edit system services [static-subscribers](#)]

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** Configure a static subscriber group with values that override the values configured at the **[edit system services static-subscribers]** hierarchy level for subscribers outside the group. Includes the subscriber access and dynamic profiles, the authentication parameters that trigger the Access-Request message to AAA for static subscribers in the group, and the statically configured interfaces that form the group.

**NOTE:** The logical system and routing instance in which the group is configured must match the logical system and routing instance where the static interfaces are configured.

**Options** *group-name*—Name of a group that defines authentication parameters for static subscribers to override the global authentication configuration.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## gsmp-syn-timeout (ANCP)

---

**Syntax** `gsmp-syn-timeout seconds;`

**Hierarchy Level** [edit protocols [ancp](#)]

**Release Information** Statement introduced in Junos OS Release 13.3.

**Description** Configure the maximum period that the ANCP agent waits before sending a SYN message to an ANCP neighbor to negotiate the adjacency. If the neighbor sends a SYN message during this period, the ANCP agent uses the partition information in the neighbor's message when generating its own initial SYN message to the neighbor. The agent does not wait for the period to expire if it receives a SYN message from the neighbor.

**Options** *seconds*—Number of seconds the ANCP agent waits.  
**Range:** 1 through 60 seconds  
**Default:** 60 seconds

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Enable the ANCP agent to learn partition ID information from neighbors, in support of nonzero ANCP partition IDs. This statement forces the ANCP agent to delay sending a SYN message during adjacency negotiation for a configurable period. When the neighbor sends a SYN message to the ANCP agent during that period, the agent learns the partition ID information from the neighbor and uses that information when it sends its own SYN message. If the agent does not receive the message during the period, then it sends a SYN message to the neighbor when the period times out. |
| <b>Default</b>                  | This statement is disabled. The ANCP agent does not wait before sending the initial SYN message and does not support nonzero partition IDs.                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | Configure an address-assignment pool that is currently in use to be unavailable for further address allocation. When a pool is in the hold-down state, the pool is no longer used to allocate IP addresses for subscribers. Current subscribers who previously obtained an address from the pool are not affected; they can continue to renew their leases. As each of these users disconnects, their address is not reallocated. The pool becomes inactive when all subscribers have disconnected and their addresses are returned to the pool. |

| Release Information      | Command introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Description              | <p>Supports the addition of vendor-specific hostname in the option 82, suboption 9 field of DHCPv4 control messages on server-facing interfaces. The hostname can be a string of characters such as <b>Juniper-AB-1</b>.</p> <p>Junos OS automatically adds the remaining vendor-specific information as per RFC 4243, <i>Vendor-Specific Information Suboption for the Dynamic Host Configuration Protocol (DHCP) Relay Agent Option</i>. The Juniper Networks enterprise ID is 2636. The hostname is option-data 1 (the location is option-data 2). The DHCPv4 relay strips the suboption data from replies from the server before it relays the packets out the client facing interface.</p> <p>This feature can be useful, in conjunction with operator-developed tools, for troubleshooting DHCP servers and providing service assurances. For example, a central DHCP server can log the information, and operators can query the hostname to track and troubleshoot subscriber IP information and network attachment points.</p> |

## ignore (RADIUS Attributes)

**Syntax**

```
ignore {
  dynamic-iflset-name;
  framed-ip-netmask;
  idle-timeout;
  input-filter;
  logical-system-routing-instance;
  output-filter;
  session-timeout;
  standard-attribute number;
  vendor-id id-number {
    vendor-attribute vsa-number;
  }
}
```

**Hierarchy Level** [edit access profile *profile-name* radius **attributes**]

**Release Information** Statement introduced in Junos OS Release 9.1.  
Statement introduced in Junos OS Release 9.1 for EX Series switches.  
**idle-timeout**, **session-timeout**, **standard-attribute**, **vendor-attribute**, and **vendor-id** options added in Junos OS Release 18.1R1.

**Description** Configure the router or switch to ignore the specified attributes in RADIUS Access-Accept messages. Standard attributes and VSAs received in RADIUS messages take precedence over internally provisioned attribute values. Ignoring the attributes enables your internally provisioned values to be used instead. Contrast this behavior with that provided by the **exclude** statement.

Starting in Junos OS Release 18.1R1, you can specify RADIUS standard attributes with the attribute number. You can specify vendor-specific attributes (VSAs) with the IANA-assigned vendor ID and the VSA number. With this flexible configuration method, you can configure any standard attribute and VSA supported by your platform to be ignored. The configuration has no effect if you can configure unsupported attributes, vendors, and VSAs.

The legacy method allows you to configure only those attributes and VSAs for which the statement syntax includes a specific option. Consequently, you can use the legacy method to ignore only a subset of all attributes that can be received in Access-Accept messages.

**Options** **dynamic-iflset-name**—Ignore Juniper Networks VSA 26-130, Qos-Set-Name.

**framed-ip-netmask**—Ignore RADIUS attribute 9, Framed-IP-Netmask.

**idle-timeout**—Ignore RADIUS attribute 28, Idle-Timeout.

**input-filter**—Ignore Juniper Networks VSA 26-10, Ingress-Policy-Name.

**logical-system-routing-instance**—Ignore Juniper Networks VSA 26-1.

**output-filter**—Ignore Juniper Networks VSA 26-11, Egress-Policy-Name.

**session-timeout**—Ignore RADIUS attribute 27, Session-Timeout.

**standard-attribute *number***—RADIUS standard attribute number supported by your platform. You can enclose multiple values in square brackets to specify a list of attributes. If you configure an unsupported attribute, that configuration has no effect.

**Range:** 1 through 255

**vendor-attribute *vsa-number***—Number identifying a VSA belonging to the specified vendor; both must be supported by your platform. You can enclose multiple values in square brackets to specify a list of VSAs. If you configure an unsupported VSA, that configuration has no effect.

**Range:** 1 through 255

**vendor-id *id-number***—IANA vendor ID supported by your platform. If you configure an unsupported vendor ID, that configuration has no effect.

**Range:** 1 through 16777215

| Release Information | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**NOTE:** The EX Series switches that support the `include-irb-and-l2` statement are the EX4300, EX4600, and EX9200 switches.

**Description** Include both the integrated routing and bridging (IRB) interface name and Layer 2 interface name in the **circuit-id** or **remote-id** value in the DHCP option 82 information. VLAN tags are global.

For leasequery and bulk leasequery operations that involve integrated routing and bridging (IRB) interfaces, you must configure DHCP relay agent to include the layer 2 interface name along with IRB name in the circuit ID of option 82. DHCP relay agent uses the layer 2 interface name when using leasequery or bulk leasequery to restore the lease database.

When you configure the **include-irb-and-l2** statement without including the **no-vlan-interface** statement, the format is as follows:

- Bridge domain:

```
(fe | ge)-fpc/pic/port.subunit:bridge-domain-name+irb.subunit
```

- VLAN:

```
(fe | ge)-fpc/pic/port.subunit:vlan-name+irb.subunit
```

**NOTE:** For remote systems, the *subunit* is required and is used to differentiate an interface.

When you configure both the **include-irb-and-l2** statement and the **use-vlan-id** statement, the format is as follows:

```
(fe | ge)-fpc/pic/port.subunit:svlan-id-vlan-id+irb.subunit
```

**NOTE:** The *svlan-id-vlan-id* represents the VLANs associated with the bridge domain.

When you configure both the **include-irb-and-l2** and **no-vlan-interface-name** statements, the format is as follows:

```
(fe | ge)-fpc/pic/port.subunit+irb.subunit
```

When you configure both the **include-irb-and-l2** and **use-interface-description** statements, the format displays the description for the Layer 2 interface:

```
l2_descr:vlan-name+irb.subunit
```

If you configure both the **include-irb-and-l2** and **use-interface-description** statements, and no description for the Layer 2 interface is found, the format displays the Layer 2 logical interface name:

```
(fe | ge)-fpc/pic/port.subunit:vlan-name+irb.subunit
```

When you configure the **include-irb-and-l2** statement with both the **no-vlan-interface-name** and **use-interface-description** statements, the format displays as follows:

```
l2_descr+irb.subunit
```

If you configure the **include-irb-and-l2** statement with both the **no-vlan-interface-name** and **use-interface-description** statements, and no description is found for the Layer 2 interface, the format displays as follows:

```
(fe | ge)-fpc/pic/port.subunit+irb.subunit
```

| <b>Description</b>              | Specify that the DHCP server include option 82 information in NAK and forcerenew messages when you configure secure communications between the DHCP server and DHCP clients that are in different VRFs. You can configure support globally, for a group of interfaces, or for a specific interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                  | <p><b>forcerenew</b>—Include option 82 in DHCP forcerenew messages.</p> <p><b>nak</b>—Include option 82 in DHCP NAK messages.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## interface (DHCP Relay Agent)

**Syntax**

```
interface dhcp-interface-name {
  access-profile profile-name;
  exclude;
  overrides {
    allow-no-end-option;
    allow-snooped-clients;
    always-write-giaddr;
    always-write-option-82;
    asymmetric-lease-time seconds;
    asymmetric-prefix-lease-time seconds;
    client-discover-match <option60-and-option82 | incoming-interface>;
    client-negotiation-match incoming-interface;
    disable-relay;
    dual-stack dual-stack-group-name;
    interface-client-limit number;
    layer2-unicast-replies;
    no-allow-snooped-clients;
    proxy-mode;
    relay-source;
    replace-ip-source-with;
    send-release-on-delete;
    trust-option-82;
  }
  service-profile dynamic-profile-name;
  short-cycle-protection <lockout-min-time seconds> <lockout-max-time seconds>;
  trace;
  upto upto-interface-name;
}
```

[edit routing-instances routing-instance-name forwarding-options dhcp-relay ...]
```

**Release Information**

Statement introduced in Junos OS Release 8.3.

Options **upto** and **exclude** introduced in Junos OS Release 9.1.

Support at the **[edit ... dhcpv6]** hierarchy levels introduced in Junos OS Release 11.4.

Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description**

Specify one or more interfaces, or a range of interfaces, that are within a specified group on which the DHCP or DHCPv6 relay agent is enabled. You can repeat the **interface interface-name** statement to specify multiple interfaces within a group, but you cannot specify the same interface in more than one group. Also, you cannot use an interface that is being used by the DHCP local server. Use the statement at the **[edit ... dhcpv6]** hierarchy levels to configure DHCPv6 support.

EX Series switches do not support DHCPv6.

**NOTE:** DHCP values are supported in integrated routing and bridging (IRB) configurations. When you configure an IRB interface in a network that is using DHCP, the DHCP information (for example, authentication, address assignment, and so on) is propagated in the associated bridge domain. This enables the DHCP server to configure client IP addresses residing within the bridge domain. IRB currently only supports static DHCP configurations. .

**Options**    **exclude**—Exclude an interface or a range of interfaces from the group. This option and the **overrides** option are mutually exclusive.

**interface-name**—Name of the interface. You can repeat this option multiple times.

**overrides**—Override the specified default configuration settings for the interface. The **overrides** statement is described separately.

**upto-interface-name**—Upper end of the range of interfaces; the lower end of the range is the interface-name entry. The interface device name of the **upto-interface-name** must be the same as the device name of the **interface-name**.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                         interface-control—To add this statement to the configuration.

## interface (Dynamic Router Advertisement)

**Syntax**

```
interface interface-name {
  current-hop-limit number;
  default-lifetime seconds;
  dns-server-address
  (managed-configuration | no-managed-configuration);
  max-advertisement-interval seconds;
  min-advertisement-interval seconds;
  (other-stateful-configuration | no-other-stateful-configuration);
  prefix prefix {
    (autonomous | no-autonomous);
    (on-link | no-on-link);
    preferred-lifetime seconds;
    valid-lifetime seconds;
  }
  reachable-time milliseconds;
  retransmit-timer milliseconds;
}
```

**Hierarchy Level** [edit dynamic-profiles protocols router-advertisement]

**Release Information** Statement introduced in Junos OS Release 10.1.

**Description** Dynamically configure router advertisement properties on an interface. To dynamically configure interface properties, include the *\$junos-interface-name* dynamic variable for the interface name.

**Options** *interface-name*—Name of an interface. Specify the *\$junos-interface-name* dynamic variable or the full, static interface name, including the physical and logical address components.

**NOTE:** Even though you can specify the static interface name when defining the interface, we recommend using dynamic variable when configuring this statement.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level**

| Release Information      | <p>Statement introduced in Junos OS Release 9.6.</p> <p>Support for IPv6 and IPv4 demux static interfaces introduced in Junos OS Release 11.2.</p> <p>Support for pseudowire interfaces over logical tunnels introduced in Junos OS Release 18.3R1.</p>                                                                                                                                                                                                                                                                                                                                                                           |
| Description              | Specify one or more interfaces, or a range of interfaces, that are within a specified group on which static subscribers are created. You can repeat the <b>interface <i>interface-name</i></b> statement to specify multiple interfaces within a group. You must configure each interface in only one group.                                                                                                                                                                                                                                                                                                                      |
|                          | <div>  <p><b>NOTE:</b> The logical system and routing instance in which the static interfaces are configured must match the logical system and routing instance where the group is configured.</p> </div>                                                                                                                                                                                                                                                                                                                                      |
| Options                  | <p><b>exclude</b>—(Optional) Exclude an interface or a range of interfaces from the group.</p> <p><b><i>interface-name</i></b>—Name of the interface on which static subscribers are created. If you do not specify a unit number for the interface, then .0 is assumed. For example, <b>ge-0/1/0</b> is interpreted as <b>ge-0/1/0.0</b>.</p> <p><b><i>upto-interface-name</i></b>—(Optional) The upper end of the range of interfaces; the lower end of the range is the <i>interface-name</i> entry. The interface device name of <i>upto-interface-name</i> must be the same as the device name of <i>interface-name</i>.</p> |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Specify that a modified version of the interface name is included as part of the username created for all static subscribers or for the static subscribers in a specified group. The group version of the statement takes precedence over the global version. The username is also sent to RADIUS in the Access-Request message. The interface name is modified by replacing the "/" character with the "-" character. For example, ge-0/1/2.50 is converted to ge-0-1-2.50.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Description         | Set the maximum number of DHCP subscribers or DHCP clients per interface allowed for a specific group or for all groups. A group specification takes precedence over a global specification for the members of that group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Default             | No limit                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Options**    *number*—Maximum number of clients allowed.

**Range:** 1 through 500,000

**Required Privilege**    system—To view this statement in the configuration.

**Level**    system-control—To add this statement to the configuration.

| Description         | <p>Set the maximum number of DHCP (or DHCPv6) subscribers or clients per interface allowed for a specific group or for all groups. A group specification takes precedence over a global specification for the members of that group. Use the statement at the <b>[edit ... dhcpv6]</b> hierarchy levels to configure DHCPv6 support.</p> <p>M120 and M320 routers do not support DHCPv6.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Default             | No limit                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## **interface-delete (Subscriber Management or DHCP Client Management)**

**Syntax** interface-delete;

**Hierarchy Level** [edit system services subscriber-management [maintain-subscriber](#)]

**Release Information** Statement introduced in Junos OS Release 11.1.  
 Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** On router—Configure the router to maintain, rather than log out, subscribers when the subscriber interface is deleted. By default, the router logs out subscribers when the subscriber interface is deleted.

On switch—Configure the switch to maintain rather than log out DHCP clients when the client interface is deleted. By default, the switch logs out DHCP clients when the client interface is deleted.

**Required Privilege Level** system—To view this statement in the configuration.  
 system-control—To add this statement to the configuration.

| Description              | <p>Specify that the interface description for the device (physical) interface or the logical interface is concatenated with the username during the subscriber authentication or DHCP client authentication process. Use the statement at the <b>[edit ... dhcpv6]</b> hierarchy levels to configure DHCPv6 support.</p> <p>The interface description is configured using the <b>description</b> statement at the <b>[edit interfaces <i>interface-name</i>]</b> hierarchy level. The delimiter is configured with the <a href="#">delimiter</a> statement at the <b>[edit system services dhcp-local-server ... <a href="#">username-include</a>]</b> hierarchy level.</p> <p>.....</p> <div>  <p><b>NOTE:</b> The username delimiter must not be a character that is part of the interface description. For example, if the description includes a forward slash (/), then the delimiter must not be a forward slash. The default delimiter is a period.</p> </div> <p>.....</p> |
| Options                  | <p><b>device-interface</b>—Use the text description configured for the device (physical) interface.</p> <p><b>logical-interface</b>—Use the text description configured for the logical interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Release Information      | Statement introduced in Junos OS Release 17.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Description              | <p>Specify that the interface description for the device (physical) interface or the logical interface is concatenated with the username during the subscriber authentication or DHCP client authentication process. Use the statement at the [edit ... <a href="#">dhcpv6</a>] hierarchy levels to configure DHCPv6 support.</p> <p>The interface description is configured using the <b>description</b> statement at the [edit <b>interfaces</b> <i>interface-name</i>] hierarchy level. The delimiter is configured with the <a href="#">delimiter</a> statement at the [edit forwarding-options dhcp-relay ... <a href="#">username-include</a>] hierarchy level.</p>                                                                                                                                                                                                                                                                                                                    |
|                          | <p> <b>NOTE:</b> The username delimiter must not be a character that is part of the interface description. For example, if the description includes a forward slash (/), then the delimiter must not be a forward slash. The default delimiter is a period.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Options                  | <p><b>device-interface</b>—Description of the physical interface.</p> <p><b>logical-interface</b>—Description of the logical interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>         | <p>Specify the information that is excluded from the interface description that the device passes to RADIUS for inclusion in the RADIUS attributes such as NAS-Port-ID (87) or Calling-Station-ID (31).</p> <p>The default format for nonchannelized interfaces is as follows:</p> <p><b><i>interface-type-slot/adapter/port.subinterface[:svlan-vlan]</i></b></p> <p>For example, consider physical interface ge-1/2/0, with a subinterface of 100 and SVLAN identifier of 100. The interface description used in the NAS-Port-ID is ge-1/2/0.100:100. If you exclude the subinterface, the description becomes ge-1/2/0:100.</p> <p>The default format for channelized interfaces is as follows:</p> <p><b><i>interface-type-slot/adapter/channel.subinterface[:svlan-vlan]</i></b></p> <p>The channel information (logical port number) is determined by this formula:</p> <p>Logical port number = 100 + (<i>actual-port-number</i> x 20) + <i>channel-number</i>.</p> <p>For example, consider a channelized interface 3 on port 2 where the:</p> <ul style="list-style-type: none"> <li>Physical interface is xe-0/1/2:3.</li> <li>Subinterface is 4.</li> <li>SVLAN is 5.</li> <li>VLAN is 6.</li> </ul> <p>Using the formula, the logical port number = 100 + (2 x 20) + 3 = 143. Consequently, the default interface description is xe-0/1/143.4-5.6. If you exclude the channel information, the description becomes xe-0/1/2.4-5.6.</p> |
| <b>Options</b>             | <b>exclude-adapter</b> —(Optional) Exclude the adapter from the interface description.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**exclude-channel**—(Optional) Exclude the channel information from the interface description.

**exclude-sub-interface**—(Optional) Exclude the subinterface from the interface description.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## interface-name

**Syntax** interface-name;

**Hierarchy Level**

```
[edit interfaces interface-name unit unit-number demux inet auto-configure address-range authentication username-include]
[edit interfaces interface-name unit unit-number demux inet6 auto-configure address-range authentication username-include]
```

**Release Information** Statement introduced in Junos OS Release 18.1R1.

**Description** Append the interface name for the demultiplexing (demux) interface options to the username string used for authentication.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| Description         | <p>Configure extended DHCP tracing operations that can be enabled on a specific interface or group of interfaces.</p> <p>Replaces deprecated <b>interface-traceoptions</b> statements at the [edit forwarding-options dhcp-relay] and [edit system services dhcp-local-server] hierarchy levels.</p> <p>To enable the tracing operation on the specific interfaces, you use the <b>interface <i>interface-name</i> trace</b> statement.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Options             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all events</li> <li>• <b>packet</b>—Trace packet and option decoding operations</li> <li>• <b>state</b>—Trace changes in state</li> </ul> <p><b>level</b>—Level of tracing to perform; also known as severity level. The option you configure enables tracing of events at that level and all higher (more restrictive) levels. You can specify any of the following levels:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Match messages of all levels.</li> <li>• <b>error</b>—Match error messages.</li> </ul> |

- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages. This is the lowest (least restrictive) severity level; when you configure **verbose**, messages at all higher levels are traced. Therefore, the result is the same as when you configure **all**.
- **warning**—Match warning messages.

**Default:** error

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** *sizek* to specify KB, *sizem* to specify MB, or *sizeg* to specify GB

**Range:** 10240 through 1073741824

**world-readable**—(Optional) Enable unrestricted file access.

**Hierarchy Level** [edit [dynamic-profiles](#) *profile-name*]

**Release Information** Statement introduced in Junos OS Release 9.2.

**Description** Define interfaces for dynamic client profiles.

**Options** *interface-name*—The interface variable (`$junos-interface-ifd-name`). The interface variable is dynamically replaced with the interface the DHCP client accesses when connecting to the router.

**NOTE:** Though we do not recommend it, you can also enter the specific name of the interface you want to assign to the dynamic profile.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure the extended DHCP local server to use the IP address method to determine which address-assignment pool to use. The local server uses the IP address in the gateway IP address if one is present in the DHCP client PDU. If no gateway IP address is present, the local server uses the IP address of the receiving interface to find the address-assignment pool. The DHCP local server uses this method by default when no method is explicitly specified.</p>                                               |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Configure an IP connectivity access network (IP-CAN) value according to what best fits your operating environment and access network. The Policy and Charging Rules Function (PCRF) partition requires that you configure this statement. The Policy Control and Charging (PCC) enables a centralized control to ensure that the service sessions (IP-CAN sessions) are provided with appropriate bandwidth and QoS.</p> <p>An IP-CAN bearer is the IP transmission path of defined capacity, delay, and bit error rate. An IP-CAN session incorporates one or more IP-CAN bearers. Support for multiple IP-CAN bearers per IP-CAN session is IP-CAN specific. An IP-CAN session exists as long as the related IPv4 address or IPv6 prefix is assigned and announced to the IP network.</p> <p>If an IP-CAN session is modified, the Policy and Charging Enforcement Function (PCEF) first uses the event trigger to determine whether to request the PCC rules for the modified IP-CAN session from the PCRF. Then upon reception of updated PCC rules from the PCRF, the PCEF activates, modifies, or removes the PCC rules as indicated by the PCRF.</p> |
| <b>Options</b>                  | <p><b><i>number</i></b>—Identifier of the IP-CAN value used for your operating environment and access network.</p> <p><b>Default:</b> 77</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## jsrc (JSRC)

---

**Syntax**

```
jsrc {  
  dualstack-support;  
  partition partition-name {  
    diameter-instance instance-name;  
    destination-host hostname;  
    destination-realm realm-name;  
  }  
}
```

**Hierarchy Level** [edit]

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** Configure JSRC to interact with an SAE in an SRC environment to authorize and provision subscribers.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Related Documentation**

- [JSRC Configuration Overview on page 766](#)

## jsrc (Access Profile)

**Syntax**

```
jsrc {
  attributes {
    exclude {
      user-name [ authorization-request | provisioning-request ];
    }
  }
}
```

**Hierarchy Level** [edit access profile *profile-name*]

**Release Information** Statement introduced in Junos OS Release 14.2.

**Description** Specify JSRC settings in an access profile.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>Configure AAA to add Juniper Networks DSL VSAs to the RADIUS authentication and accounting request messages for subscribers. If the router has not received and processed the corresponding ANCP attributes from the access node, then AAA provides only the following in these RADIUS messages:</p> <ul style="list-style-type: none"> <li>• Downstream-Calculated-QoS-Rate (IANA 4874, 26-141)—Default configured advisory transmit speed.</li> <li>• Upstream-Calculated-QoS-Rate (IANA 4874, 26-142)—Default configured advisory receive speed.</li> </ul> |
| <b>Default</b>                  | The Juniper Networks DSL VSAs are not added to the RADIUS authentication and accounting request messages. However, the DSL Forum VSA—if available—is added to RADIUS messages by default.                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>              | Override the setting of the broadcast bit in DHCP request packets and instead use the Layer 2 unicast transmission method to transmit DHCP Offer reply packets and DHCP ACK reply packets from the DHCP server to DHCP clients during the discovery process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | <p>Specify that the <b>jdhcpd</b> process keeps the incoming circuit ID and prepends the ID with the locally generated ID (in the format, <b>generated-id + incoming-id</b>) before sending the leasequery packet to the DHCP server.</p> <p>This configuration is required for leasequery and bulk leasequery operations when subscriber authentication is based on the circuit ID, and enables leasequery and bulk leasequery to restore the agent circuit identifier/agent remote identifier (ACI/ARI) pair and to use the circuit ID to authenticate subscribers.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Release Information      | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Description              | Configure the minimum DHCP lease time allowed in your subscriber access network. If a third-party DHCP server or address pool provides a client lease that is less than the configured threshold, the router performs the action specified by the <b>violation-action</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.2.                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | Designate a secondary address-assignment pool that is linked to the pool being configured. When the pool being configured has no addresses available for allocation, the secondary pool can be searched for a free address. You can configure a chain of linked pools, but you cannot directly link more than one pool to or from any other pool. Each linked pool in the chain serves as a backup pool for the pool immediately before it in the chain. |
| <b>Options</b>                  | <i>pool-name</i> —Name assigned to the secondary address-assignment pool.                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>              | <p>Change how the search for an available address is performed. When you include this statement, all ranges in the matching pool are searched, but only from the last-saved next address to the highest address in the range. The same search is performed as necessary in a linked pool, through the end of the chain of pools. Then the search begins again at the first pool in the chain; all ranges are searched in each pool, but this time the entire range is searched, from the lowest to the highest address in the range.</p> <p>This nondefault behavior enables addresses to be assigned non-contiguously, meaning that a free address can be allocated from farther down the chain of linked pools even when free addresses are available in the matching pool or the first pool in the chain. This may be desirable if you configure your RADIUS server to use the IP address alone to identify subscribers.</p> <p>For example, without this statement, a subscriber can disconnect and that address can be assigned to the next subscriber. The Acct-Start for the second subscriber is sent before the Acct-Stop is sent for the disconnected subscriber. When the Acct-Stop is received, the new subscriber, identified only by the IP address, may be disconnected.</p> <p>You can avoid this situation by either including the <b>linked-pool-aggregation</b> statement or configuring your RADIUS server to use the subscriber session ID (instead of the IP address) for identification.</p> |

| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 17.1.</p> <p>This statement is no longer supported as of Junos OS Release 18.4R1</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | <p>Configure local reporting of service accounting statistics according to the specified flat-file profile, which determines the accounting statistics and nonstatistical parameters that are collected and reported in the local flat file. This configuration collects the running total service statistics per interface family. Because the statistics are maintained in the Routing Engine in a statistics database, they are not affected by a line-card restart, a graceful Routing Engine switchover, or a unified in-service software upgrade (ISSU). The statistics counters are reset when the router reboots.</p> <p>Collecting service statistics into a local flat file is useful when you do not need to send the information to RADIUS, such as when you are using the information for internal monitoring and need an accurate record for analytics.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 20px;"> <p> <b>NOTE:</b> Starting in Junos OS Release 18.4R1, this statement is no longer supported. If included in a configuration, it is ignored.</p> </div> |
| <b>Options</b>                  | <i>profile-name</i> —Name of the flat-file profile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Release Information</b>      | Command introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | <p>Supports the addition of a vendor-specific location in the option 82, suboption 9 field of DHCPv4 control messages on server-facing interfaces. The location should be specified as interface, vlan ID, and if applicable, svlan ID. For example, <code>&lt;ifd-name&gt;:&lt;vlan&gt;</code> (ae0:100) or <code>&lt;ifd-name&gt;:&lt;svlan&gt; -&lt;vlan&gt;</code> (ae0:100-10).</p> <p>Junos OS automatically adds the remaining vendor-specific information as per RFC 4243, <i>Vendor-Specific Information Suboption for the Dynamic Host Configuration Protocol (DHCP) Relay Agent Option</i>. The Juniper Networks enterprise ID is 2636. The the location is option-data 2 (the hostname is option-data 1). The DHCPv4 relay strips the suboption data from replies from the server before it relays the packets out the client facing interface.</p> <p>This feature can be useful, in conjunction with operator-developed tools, for troubleshooting DHCP servers and providing service assurances. For example, a central DHCP server can log the information, and operators can query the hostname to track and troubleshoot subscriber IP information and network attachment points.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## location (DHCPv6 Relay Agent)

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Release Information</b>      | Command introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | <p>Supports the addition of a vendor-specific location in the vendor-specific option (17) of DHCPv6 control messages on server-facing interfaces. The location should be specified as interface, vlan ID, and if applicable, svlan ID. For example, <code>&lt;ifd-name&gt;:&lt;vlan&gt;</code> (ae0:100) or <code>&lt;ifd-name&gt;:&lt;svlan&gt; -&lt;vlan&gt;</code> (ae0:100-10).</p> <p>Junos automatically adds the remaining vendor-specific information as per RFC 4243, <i>Vendor-Specific Information Suboption for the Dynamic Host Configuration Protocol (DHCP) Relay Agent Option</i>. The Juniper Networks enterprise ID is 2636. The the location is option-data 2 (the hostname is option-data 1). The DHCPv6 relay strips the suboption data from replies from the server before it relays the packets out the client facing interface.</p> <p>This feature can be useful, in conjunction with operator-developed tools, for troubleshooting DHCP servers and providing service assurances. For example, a central DHCP server can log the information, and operators can query the hostname to track and troubleshoot subscriber IP information and network attachment points.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Specify that the name of the logical system is included as part of the username created for all static subscribers or for the static subscribers in a specified group. The group version of the statement takes precedence over the global version. The username is also sent to RADIUS in the Access-Request message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>              | Specify that the logical system name be concatenated with the username during the subscriber authentication or DHCP client process. No logical system name is concatenated if the configuration is in the default logical system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Description         | <p>Specify that the logical system name is concatenated with the username during the subscriber authentication or client authentication process. No logical system name is concatenated if the configuration is in the default logical system. Use the statement at the <b>[edit ... dhcpv6]</b> hierarchy levels to configure DHCPv6 support.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## logout-response-timeout (PCRF Partition)

**Syntax** `logout-response-timeout seconds;`

**Hierarchy Level** [edit access [pcrf partition](#) *partition-name*]

**Release Information** Statement introduced in Junos OS Release 16.2.

**Description** Configure the amount of time in seconds before a Policy and Charging Rule Function (PCRF) partition stops attempting to send a subscriber logout.

If you set [draining](#) and the [draining-response-timeout](#) statements for the PCRF partition, any new subscriber logins are denied, and the time limit you set in the [draining-response-timeout](#) statement is used instead of the [logout-response-timeout](#) time limit.

**NOTE:** Any configuration changes made to this statement apply to all subscribers currently waiting to log out within a 60 second period.

**Options** **seconds**—Number of seconds to wait before a PCRF partition stops attempting to send a subscriber logout.

**Default:** 7200

**Range:** 0 through 86,400 seconds (24 hours)

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | <p>Configure the router to maintain, rather than log out, DHCP relay and DHCP local server based subscribers when the specified type of event occurs.</p> <p>For example, by default, the router logs out DHCP subscribers when an interface delete event occurs, such as a line card reboot or failure. You would specify the <b>interface-delete</b> option to ensure that the router maintains subscribers during line card reboots or failures. However, this option does not maintain subscribers during router reboots or failures.</p> <p>This statement provides a global configuration for the router, which applies to all DHCP local server and DHCP relay clients in all routing instances.</p> |
|                                 | <p> <b>NOTE:</b> The <b>maintain-subscriber</b> statement and <b>remove-when-no-subscribers</b> statement are mutually exclusive. You cannot specify that dynamically configured VLAN interfaces are removed when no subscribers exist when the router is also configured to maintain subscribers.</p>                                                                                                                                                                                                                                                                                                                   |

## map (Domain Map)

**Syntax**

```
map domain-map-name {
  aaa-logical-system logical-system-name {
    aaa-routing-instance routing-instance-name;
  }
  aaa-routing-instance routing-instance-name;
  access-profile profile-name;
  address-pool pool-name;
  dynamic-profile profile-name;
  padn destination-address {
    mask destination-mask;
    metric route-metric;
  }
  strip-domain;
  strip-username (left-to-right | right-to-left);
  override-password password;
  target-logical-system logical-system-name {
    target-routing-instance routing-instance-name;
  }
  target-routing-instance routing-instance-name;
  tunnel-profile profile-name;
  tunnel-switch-profile profile-name;
}
```

**Hierarchy Level** [edit access **domain**]

**Release Information** Statement introduced in Junos OS Release 10.4.  
**override-password** and **strip-username** options introduced in Junos OS Release 15.1.  
 wildcard character introduced in Junos OS Release 16.1.

**Description** Specify the domain map to use to map options and parameters to subscriber sessions based on the subscriber domain.

**Options** **domain-map-name**—Name of the domain map. The name is the same as the subscriber domain to which it will apply. For example, for the username **user1@example.com**, the domain map name is **example.com**.

- **\*** —Use the asterisk wildcard character in the **domain-map-name** to specify a wildcard domain map, which enables mapping based on a partial match (for example, **xyz\*northern.example.com**). The router performs the wildcard lookup when there is no exact match for the subscriber domain name. The wildcard can appear anywhere within the domain name string, and can match zero or more characters. The asterisk is the only wildcard character, and only one wildcard is supported in a domain map name. If you include multiple asterisks, the first asterisk is treated as the wildcard character and the others are treated as non-wildcard characters.

- **default**—Use a domain map name of **default** to specify the domain map that the router uses when there is no exact or wildcard match for the domain or realm name in the subscriber username.
- **none**—Use a domain map name of **none** to specify the domain map the router uses when a subscriber username does not have a domain or realm name.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## mask (Domain Map)

---

**Syntax** `mask destination-mask;`

**Hierarchy Level** [edit access domain [map](#) *domain-map-name* [padn](#) *destination-address*]

**Release Information** Statement introduced in Junos OS Release 10.4.

**Description** Configure the IP mask of the destination used in the PADN parameters for a domain map.

**Options** *destination-mask*—Subnet mask of the destination.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Release Information</b>                                                     | Statement introduced in Junos OS Release 15.1R3 for MX Series routers with MPCs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                      |                  |                    |                |                                                       |     |                                               |                                                                                |                                         |                                                                                      |                                                                                |                                          |                                               |
| <b>Description</b>                                                             | <p>Specify the maximum amount of system shared memory that is available for the Junos OS configuration database.</p> <p>JUNOS OS processes map shared memory into their process space. For example, on MX240 through MX10003 routers, processes can map up to 1GB of shared memory. Enhanced subscriber management processes contend for shared memory with the JUNOS OS configuration database. Shared memory that is not assigned to the configuration database is automatically available to enhanced subscriber management. By default, the configuration database tries to reserve 80 percent of the shared memory map, leaving insufficient space for subscriber management to function.</p> <p>The majority of configurations require much less than 300MB of mapped space. An appropriate database size enables subscriber management to operate and scale optimally. In some circumstances, you must limit the size of the database to increase the amount of shared memory available to subscriber management. In other circumstances, we recommend that you allow the router to determine the appropriate size and that you do not configure a maximum size.</p> <ul style="list-style-type: none"> <li>For MX5, MX10, MX40, MX80, and MX104 routers, you must always configure the maximum size to be no more than 100MB, regardless of the which Junos OS release is running and regardless of Routing Engine RAM.</li> <li>For MX240, MX480, MX960, MX2008, MX2010, MX2020, and MX10003 routers, the decision whether to explicitly configure a maximum size and what that size is, depends on the Junos OS release and the amount of RAM in the Routing Engines:</li> </ul> <table border="1"> <thead> <tr> <th>Junos OS Release</th><th>Routing Engine RAM</th><th>Recommendation</th></tr> </thead> <tbody> <tr> <td>Release 17.4R1 and earlier releases<br/>Release 18.1R1</td><td>Any</td><td>Configure maximum size to no more than 300MB.</td></tr> <tr> <td>Release 17.4R2 and higher 17.4x releases<br/>Release 18.1R2 and higher releases</td><td>Routing Engines have at least 32GB each</td><td>Allow the router to determine the appropriate size. **BEST PRACTICE:** You must reboot the device before a change in `max-db-size` value takes effect. By setting this value as part of your initial configuration, you can avoid multiple reboots.

**Options** **size**— Specifies the portion of system shared memory, in megabytes (MB), that is allocated for the Junos configuration database.

**Syntax:** `size M` to specify MB

**Default:** 698,343,424 bytes, only when running Junos OS Release 17.4 R1, enhanced IP network services and enhanced subscriber management are enabled, and both Routing Engines in the chassis have at least 32 GB of RAM. Otherwise, there is no default value.

**Required Privilege Level** **admin**—To view this statement in the configuration.  
**admin-control**—To add this statement to the configuration.

| <b>Description</b>              | <p>Specify the maximum number of empty replies that the DHCP local server sends to a specific requestor. When the maximum number is reached, the DHCP server closes the connection.</p> <p>An empty reply is a response sent from the DHCP local server that contains no bindings or has an option status code error. Empty replies are often the response to an unauthorized requestor that has sent an invalid or incorrect query that produces no binding information. By limiting the number of empty replies that the DHCP local server can send, you prevent the connection from being consumed by an unauthorized or malicious requester, and free up the DHCP local server to support legitimate requestors.</p> |
| <b>Options</b>                  | <p><b><i>number-of-replies</i></b>—Number of empty replies the DHCP local server sends before the connection is terminated.</p> <p><b>Range:</b> 1 through 100</p> <p><b>Default:</b> 5</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## nas-port-extended-format

**Syntax**

```
nas-port-extended-format {
  adapter-width width;
  ae-width width;
  port-width width;
  pw-width width;
  slot-width width;
  stacked-vlan-width width;
  vlan-width width;
  atm {
    adapter-width width;
    port-width width;
    slot-width width;
    vci-width width;
    vpi-width width;
  }
}
```

**Hierarchy Level** [edit access profile *profile-name* radius [options](#)]

**Release Information** Statement introduced in Junos OS Release 9.1.  
 Statement introduced in Junos OS Release 9.1 for EX Series switches.  
**ae-width** option added in Junos OS Release 12.1.  
**atm** option added in Junos OS Release 12.3R3 and supported in later 12.3Rx releases.  
**atm** option supported in Junos OS Release 13.2 and later releases. (Not supported in Junos OS Release 13.1.)  
**pw-width** option added in Junos OS Release 15.1.

**Description** Configure the RADIUS client to use the extended format for RADIUS attribute 5 (NAS-Port) and specify the width of the fields in the NAS-Port attribute.

**Options**

- adapter-width *width***—Number of bits in the adapter field.
- ae-width *width***—Number of bits in the aggregated Ethernet identifier field.
- port-width *width***—Number of bits in the port field.
- pw-width *width***—Number of bits in the pseudowire field. Appears in the Cisco NAS-Port-Info AVP (100).
- slot-width *width***—Number of bits in the slot field.
- stacked-vlan-width *width***—Number of bits in the SVLAN ID field.
- vlan-width *width***—Number of bits in the VLAN ID field.

NOTE: The total of the widths must not exceed 32 bits, or the configuration will fail.

## nas-port-extended-format (Interfaces)

**Syntax**

```
nas-port-extended-format {
  adapter-width width;
  ae-width width;
  port-width width;
  slot-width width;
  stacked;
  stacked-vlan-width width;
  vci-width width;
  vlan-width width;
  vpi-width width;
}
```

**Hierarchy Level** [edit interfaces *interface-name* radius-options **nas-port-options** *nas-port-options-name*]

**Release Information** Statement introduced in Junos OS Release 12.3.  
Options **vci-width** and **vpi-width** introduced in Junos OS Release 12.3R3 and supported in later 12.3Rx releases.  
Options **vci-width** and **vpi-width** supported in Junos OS Release 13.2 and later releases. (Not supported in Junos OS Release 13.1.)

**Description** Configure the RADIUS client to use the extended format for RADIUS attribute 5 (NAS-Port) and specify the width of the fields in the NAS-Port attribute.

**Options**

- adapter-width *width***—Number of bits in the adapter field.
- ae-width *width***—Number of bits in the aggregated Ethernet identifier field.
- port-width *width***—Number of bits in the port field.
- slot-width *width***—Number of bits in the slot field.
- stacked**—Include stacked VLAN IDs, in addition to VLAN IDs, in the NAS-Port extended format.
- stacked-vlan-width *width***—Number of bits in the SVLAN ID field.
- vci-width *width***—Number of bits in the ATM virtual circuit identifier (VCI) field.
- vlan-width *width***—Number of bits in the VLAN ID field.
- vpi-width *width***—Number of bits in the ATM virtual path identifier (VPI) field.

**NOTE:** Each field can be 0 through 32 bits wide; however, the total of the widths of all fields must not exceed 32 bits, or the configuration fails.

The router may truncate the values of individual fields depending on the bit width you specify.

## nas-port-id-format (Subscriber Management)

**Syntax**

```
nas-port-id-format {
  agent-circuit-id;
  agent-remote-id;
  interface-description;
  interface-text-description;
  nas-identifier;
  order {
    agent-circuit-id;
    agent-remote-id;
    interface-description;
    interface-text-description;
    nas-identifier;
    postpend-vlan-tags;
  }
  postpend-vlan-tags;
}
```

**Hierarchy Level** [edit access profile *profile-name* radius [options](#)]

**Release Information** Statement introduced in Junos OS Release 11.4.  
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.  
Options **interface-text-description**, **order**, and **postpend-vlan-tags** introduced in Junos OS Release 15.1.

**Description** Specify the optional information that the router includes in the NAS-Port-ID (RADIUS attribute 87) that is passed to the RADIUS server during authentication and accounting. You can include any combination of the optional values.

When you specify the values for the NAS-Port-ID, you can configure the values to appear in either the default order or a custom order of your choice.

**NOTE:** The default and custom order methods are mutually exclusive. The configuration fails if you attempt to configure a NAS-Port-ID that includes values in both types of orders.

To specify that the optional values appear in the default order in the NAS-Port-ID, configure the values directly under the **nas-port-id-format** statement. The default order is as follows, in which the # character is the delimiter:

```
nas-identifier # interface-description # interface-text-description # agent-circuit-id #
agent-remote-id # postpend-vlan-tags
```

To specify a custom order for the NAS-Port-ID string, you use the **order** option. Include the **order** option before each optional value you want to include in the string, in the order

in which you want the options to appear. For example, the configuration, **order interface-text-description order nas-identifier order agent-remote-id** produces the following NAS-Port-ID, in which the **#** character is the delimiter:

**interface-text-description # nas-identifier # agent-remote-id**

**Default** The router includes the interface description in the NAS-Port-ID when no optional values are specified.

**Options** **agent-circuit-id**—Include the agent circuit ID from either DHCP option 82 or the DSL forum VSAs.

**agent-remote-id**—Include the agent remote ID from either DHCP option 82 or the DSL forum VSAs.

**interface-description**—Include the interface description (interface identifier).

**interface-text-description**—Include the textual interface description (the text description that is statically configured in the CLI).

**nas-identifier**—Include the NAS identifier value (RADIUS attribute 32).

**order**—Specify the optional values you want to include in the NAS-Port-ID and the customized order in which you want the values to appear. You must include the **order** option before each optional value (for example, **order agent-circuit-id order interface-description**).

**postpend-vlan-tags**—Include the VLAN tags. The router includes the tags in the format **:<outer-tag>-<inner-tag>** for a double-tagged VLAN, or **:<outer-tag>** for a single-tagged VLAN.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

        vlan-ranges (any | low-tag-high-tag);
    }
```

Hierarchy Level [edit interfaces *interface-name* **radius-options**]

Release Information Statement introduced in Junos OS Release 12.3.

**Description** Create a NAS-Port options definition to configure the NAS-Port-Type (61) RADIUS IETF attribute, and an extended format for the NAS-Port (5) RADIUS IETF attribute, on a per-physical interface, per-VLAN, or per-stacked VLAN (S-VLAN) basis. Each NAS-Port options definition includes the NAS-Port extended format, the NAS-Port-Type, and either the VLAN range of subscribers or the S-VLAN range of subscribers to which the definition applies.

**NOTE:** You can configure a maximum of 16 NAS-Port options definitions per physical interface. Each definition can include a maximum of 32 VLAN ranges or 32 S-VLAN ranges, but cannot include a combination of VLAN ranges and S-VLAN ranges.

**Options** *nas-port-options-name*—Name of the NAS-Port options definition.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| Release Information | Statement introduced in Junos OS Release 12.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Description         | Specify the port type used to authenticate subscribers. The router includes the port type in the NAS-Port-Type (61) RADIUS IETF attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Default             | If you do not include the <b>nas-port-type</b> statement at the <code>[edit interfaces <i>interface-name</i> radius-options <b>nas-port-options</b> <i>nas-port-options-name</i>]</code> hierarchy level, the global value configured for <b>nas-port-type</b> at the <code>[edit access profile <i>profile-name</i> radius options]</code> hierarchy level takes effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b> | Statement introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>         | <p>Specify the destination and transmission parameters for the Diameter Network Access Server Requirements (NASREQ) protocol.</p> <p>NASREQ is a Diameter-based authentication and authorization protocol. The NASREQ client has two queues, the transmit queue and response queue. The transmit queue stores outbound packets until sent to Diameter, and includes requests and responses. The response queue stores request packets until Diameter responds to the request, and includes only requests waiting for a response.</p> <p>The following configuration options control transmission flow and use of the queues:</p> <ul style="list-style-type: none"> <li>• <b>max-outstanding-requests</b> option specifies the maximum number of requests (includes AAR and STR) that the NASREQ client sends to Diameter for wireline transmissions. Effectively, this is the maximum count of requests on the response-queue (the maximum number of in-flight requests for which there has not been a response or timeout); it does not include sent responses.</li> <li>• The <b>request-retry</b> option specifies how many times the NASREQ client retries transmitting a packet to the Diameter server when a timeout is received from the Diameter server for the request.</li> <li>• The <b>timeout</b> option specifies the number of seconds that an outbound packet remains in the transmit queue before it is declared to have timed out. The NASREQ client does not transmit packets that have timed out. The timeout value applies to all packets in the transmit queue, including both requests and responses to be sent. Diameter manages packets that time out after transmission.</li> </ul> |
| <b>Options</b>             | <p><b><i>number</i></b>—Maximum number of requests that the NASREQ client sends to Diameter.</p> <p><b>Range:</b> 20 through 100</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**retries**—Number of times to re-send a timeout request to Diameter after the initial request. This value applies only to requests in the response queue. A value of 0 indicates to try transmission once and then do not retry.

**Range:** 0 through 3

**seconds**—Number of seconds that an outbound packet remains in the transmit queue before it is declared to have timed out.

**Range:** 5 through 30

## neighbor (Define ANCP)

**Syntax**

```
neighbor ip-address {
  adjacency-loss-hold-time seconds;
  adjacency-timer;
  auto-configure-trigger interface interface-name;
  ietf-mode;
  maximum-discovery-table-entries entry-number;
  pre-ietf-mode;
}
```

**Hierarchy Level** [edit protocols [ancp](#)]

**Release Information** Statement introduced in Junos OS Release 9.4.

**Description** Configure an ANCP neighbor with which the ANCP agent on the router forms an adjacency for reporting and shaping traffic.

**Options** *ip-address*—IP address of the ANCP neighbor.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

## network-element (Diameter Base Protocol)

```
Syntax  network-element element-name {
        dne-origin realm realm-name <host hostname>
        forwarding {
            route dne-route-name {
                destination realm realm-name <host hostname> ;
                function [function-name] <partition partition-name>;
                metric route-metric;
            }
        }
        function function-name;
        peer peer-name {
            priority priority-number;
        }
    }
```

Hierarchy Level [edit [diameter](#)]

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** Specify the transport layer Diameter configuration. The Diameter network element includes a list of routes reachable through the Diameter instance, associated functions, and prioritized Diameter peers.

**Options** *element-name*—Name of the network element.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## no-unsolicited-ra (Enhanced Subscriber Management)

---

**Syntax** no-unsolicited-ra;

**Hierarchy Level** [edit system services subscriber-management [overrides](#)]

**Release Information** Statement introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.

**Description** Disable the default transmission and periodic refresh of unsolicited Router Advertisement messages by the router when the subscriber interface is created, and at configured periodic intervals thereafter. When you include the **no-unsolicited-ra** statement, the router sends Router Advertisement messages and associated periodic refresh messages only when it receives a Router Solicitation message from the subscriber.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## no-vlan-interface-name

**Syntax** no-vlan-interface-name;

**Hierarchy Level**

```
[edit forwarding-options dhcp-relay dhcpv6 (relay-agent-interface-id |
relay-agent-remote-id)],
[edit forwarding-options dhcp-relay dhcpv6 group group-name (relay-agent-interface-id |
relay-agent-remote-id)],
[edit forwarding-options dhcp-relay relay-option-82 (circuit-id | remote-id)],
[edit forwarding-options dhcp-relay group group-name relay-option-82 (circuit-id |
remote-id)],
[edit logical-systems logical-system-name ... forwarding-options dhcp-relay dhcpv6
(relay-agent-interface-id | relay-agent-remote-id)],
[edit logical-systems logical-system-name ... forwarding-options dhcp-relay ... relay-option-82
(circuit-id | remote-id)],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay dhcpv6
(relay-agent-interface-id | relay-agent-remote-id)],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay ...
relay-option-82 (circuit-id | remote-id)],
[edit vlans vlan-name forwarding-options dhcp-security dhcpv6-options option-18],
[edit vlans vlan-name forwarding-options dhcp-security dhcpv6-options option-37]
```

**Release Information** Statement introduced in Junos OS Release 14.1.

**NOTE:** The EX Series switches that support the **no-vlan-interface-name** statement are the EX4300, EX4600, and EX9200 switches.

**Description** When you do not want bridge domain or VLAN tag information, do not include the VLAN ID nor the VLAN interface name (the default) in the circuit or remote ID value in the DHCP option 82 information.

**NOTE:** The **no-vlan-interface-name** statement is mutually exclusive with the **use-interface-description** and **use-vlan-id** statements.

When you configure the **no-vlan-interface-name** statement only, the format displays only the Layer 3 interface:

```
irb.subunit
```

**NOTE:** The *subunit* is required and used to differentiate the interface for remote systems.

When you configure the **no-vlan-interface-name** and **use-interface-description** statements, the format displays the IRB interface description:

```
irb_descr
```

If you configure the **no-vlan-interface-name** and **use-interface-description** statements, and no description for the IRB interface is found, the format displays the IRB interface name:

```
irb.subunit
```

When you configure the **no-vlan-interface-name** and **include-irb-and-l2** statements, the format displays the Layer 2 logical interface name and the IRB interface name:

```
(fe | ge)-fpc/pic/port.subunit+irb.subunit
```

When you configure the **no-vlan-interface-name**, **include-irb-and-l2** and **use-interface-name** statements, the format displays the Layer 2 interface description and the IRB interface name:

```
l2_descr+irb.subunit
```

If you configure the **no-vlan-interface-name**, **include-irb-and-l2** and **use-interface-name** statements, and no description for the Layer 2 interface is found, the format displays the Layer 2 logical interface name and the IRB interface name:

```
(fe | ge)-fpc/pic/port.subunit+irb.subunit
```

**Hierarchy Level** [edit access]

**Release Information** Statement introduced in Junos OS Release 16.2.

**Description** Configure the Online Charging System (OCS) global attributes and partition. The OCS interacts with the Policy and Charging Enforcement Function (PCEF). The PCEF optionally reports usage and receives additional authorizations from the OCS using the 3rd Generation Partnership Project (3GPP) Gy protocol. Broadband PCEF (BPCEF) interactions with the OCS use online session charging with centralized unit determination and centralized rating.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | <p>For IPv4 and IPv6 dual-stack PPP subscribers, enables on-demand allocation and de-allocation of an IPv4 address after initial PPP authentication for a subscriber who does not have an existing IPv4 address.</p> <p>Configuration changes take effect as follows:</p> <ul style="list-style-type: none"> <li>• When you change this setting for a dynamic PPP interface (at the <b>[edit dynamic-profiles]</b> hierarchy level), the change takes effect only for new subscriber logins.</li> <li>• When you change this setting for a static PPP interface (at the <b>[edit interfaces pp0]</b> hierarchy level), the subscribers on the interface are logged out.</li> <li>• When you change this setting globally (at the <b>[edit protocols ppp-service]</b> hierarchy level), the change takes effect only for new subscriber logins.</li> </ul> <p>If you enable on-demand allocation at both the interface and global levels, the global configuration takes precedence and changes take effect for new subscriber logins.</p> |
| <b>Default</b>                  | This functionality is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 17.3R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | <p>Enables an address or prefix to be allocated on demand when a dual-stack subscriber session is established. Starting in Junos OS Release 18.1R1, when reauthentication is configured, enables per-family address allocation as each family's DHCP session is established. In earlier releases, applies only to the second family of the dual stack.</p> <p> <b>NOTE:</b> You must configure <code>on-demand-address-allocation</code> if you also configure reauthentication for dual-stack, single-session DHCP subscribers. This is true whether you enable reauthentication with the <code>reauthenticate</code> statement or the Reauthenticate-On-Renew VSA (26-206).</p>                                                                                                                        |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## option-16 (DHCP Relay Agent)

**Syntax**

```

option-16 {
  default-action {
    drop drop;
    forward-only forward-only;
  }
  equals {
    ascii name {
      drop drop;
      forward-only forward-only;
    }
    hexadecimal name {
      drop drop;
      forward-only forward-only;
    }
  }
  not-present {
    drop drop;
    forward-only forward-only;
  }
  equals {
    ascii name {
      drop drop;
      forward-only forward-only;
    }
    hexadecimal name {
      drop drop;
      forward-only forward-only;
    }
  }
}

```

## option-60 (DHCP Relay Agent)

**Syntax**

```

option-60 {
  default-action {
    drop drop;
    forward-only forward-only;
    local-server-group local-server-group;
  }
  equals {
    ascii name {
      drop drop;
      forward-only forward-only;
      local-server-group local-server-group;
    }
    hexadecimal name {
      drop drop;
      forward-only forward-only;
      local-server-group local-server-group;
    }
  }
  not-present {
    drop drop;
    forward-only forward-only;
    local-server-group local-server-group;
  }
  equals {
    ascii name {
      drop drop;
      forward-only forward-only;
      local-server-group local-server-group;
    }
    hexadecimal name {
      drop drop;
      forward-only forward-only;
      local-server-group local-server-group;
    }
  }
}

| Description              | <p>Specify the option 82 that is concatenated with the username during the subscriber authentication or client authentication process. You can specify either, both, or neither the Agent Circuit ID and the Agent Remote ID suboptions. If you specify both, the Agent Circuit ID is supplied first, followed by a delimiter, and then the Agent Remote ID. If neither suboption is supplied, the raw payload of option 82 is concatenated to the username.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                          | <p> <b>NOTE:</b> The option 82 value used in creating the username is based on the option 82 value that is encoded in the outgoing (relayed) PDU.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>              | <p>Specify the type of Option 82 information from the client PDU that is concatenated with the username during the subscriber authentication or DHCP client authentication process. You can specify either, both, or neither of the Agent Circuit ID and Agent Remote ID suboptions. If you specify both, the Agent Circuit ID is supplied first, followed by a delimiter, and then the Agent Remote ID. If you specify that neither suboption is supplied, the raw payload of Option 82 from the PDU is concatenated to the username.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Description              | <p>Configure the extended DHCP local server to use the option 82 value in the DHCP client DHCP PDU together with the ip-address-first method to determine which address-assignment pool to use. You must configure the <b>ip-address-first</b> statement before configuring the <b>option-82</b> statement. The DHCP local server first determines which address-assignment pool to use based on the ip-address-first method. Then, the local server matches the option 82 value in the client PDU with the option 82 configuration in the address-assignment pool. This statement is supported for IPv4 address-assignment pools only.</p> |

| <b>Description</b>              | <p>Specify a list of match criteria used to determine which named address range in the address-assignment pool to use. The extended DHCP local server matches this information to the match criteria specified in the client PDUs. For example, for option 82 match criteria, the server matches the option 82 value in the user PDU to the specified option 82 string and uses the named range associated with the string.</p> <p>The remaining statements are explained separately. Search for a statement in <a href="#">CLI Explorer</a> or click a linked statement in the Syntax section for details.</p> |

| Release Information      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                               |
| Description              | <p>Specify the hostname and realm of the endpoint node that originates Diameter messages for the Diameter instance. The Diameter instance supplies these values to be conveyed by the Origin-Realm-AVP and Origin-Host-AVP for all messages sent by the Diameter instance.</p> <hr/> <div> <b>NOTE:</b> Both the host and realm are mandatory.</div> <hr/> |
| Options                  | <p><b>host <i>hostname</i></b>—Name of the message origin host that is supplied as the value of the Origin-Host AVP for all Diameter messages in the Diameter master instance.</p> <p><b>realm <i>realm-name</i></b>—Name of the message origin realm, that is supplied as the value of the Origin-Realm AVP for all Diameter messages in the Diameter master instance.</p>                                                                 |
| Required Privilege Level | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                  |

| Release Information      | Statement introduced in Junos OS Release 16.1.<br>Statement deprecated in Junos OS Release 17.4R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |             |        |                                                                                                                                                                                                                             |
| Description              | <p>Adjust the number of frame overhead bytes by the specified number of bytes in the actual downstream rate reported in the ANCP Port Up message for an access line of DSL type OTHER. The ANCP agent reports the adjusted value to CoS. The adjusted value accounts for the traffic encapsulation overhead.</p> <p>The router reports some access technology types—such as Gigabit passive optical network (GPON) lines—as DSL type OTHER.</p> <div>  <p><b>NOTE:</b> Starting in Junos OS Release 17.4R1, this statement is deprecated and replaced by the <code>other-overhead-bytes</code> option of the <code>access-line</code> statement at the <code>[edit system]</code> hierarchy level. The ANCP agent ignores the <code>other-bytes</code> statement if it is present. This means that when you upgrade from Junos OS Release 17.3 or earlier with an existing configuration, you must reconfigure your adjustment with the <code>access-line</code> statement.</p> </div> |         |             |        |                                                                                                                                                                                                                             |
| Options                  | <p><b>bytes</b>—Number of bytes added to or subtracted from the actual downstream frame overhead.</p> <p><b>Range:</b> -100 through 100 bytes</p> <p><b>Default:</b> 0 bytes</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |         |             |        |                                                                                                                                                                                                                             |

| Release Information      | Statement introduced in Junos OS Release 16.1.<br>Statement deprecated in Junos OS Release 17.4R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |             |        |                                                                                                                                                                                                                              |
| Description              | <p>Adjust the actual downstream rate for an access line of DSL type OTHER received in the ANCP Port Up message by multiplying the rate by the specified percentage. The ANCP agent reports the adjusted rate to CoS.</p> <p>The router reports some access technology types—such as Gigabit passive optical network (GPON) lines—as DSL type OTHER.</p>                                                                                                                                                                                                                                                               |         |             |        |                                                                                                                                                                                                                              |
|                          | <p> <b>NOTE:</b> Starting in Junos OS Release 17.4R1, this statement is deprecated and replaced by the <code>other-overhead-adjust</code> option of the <code>access-line</code> statement at the <code>[edit system]</code> hierarchy level. The ANCP agent ignores the <code>other-overhead-adjust</code> statement if it is present. This means that when you upgrade from Junos OS Release 17.3 or earlier with an existing configuration, you must reconfigure your adjustment with the <code>access-line</code> statement.</p> |         |             |        |                                                                                                                                                                                                                              |
| Options                  | <p><b>percentage</b>—Percentage by which to multiply the rate.</p> <p><b>Range:</b> 80 through 100 percent</p> <p><b>Default:</b> 100 percent</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |         |             |        |                                                                                                                                                                                                                              |

| Release Information      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Description              | <p>Prevent ANCP from performing an adjustment on the actual downstream data rate that ANCP receives from the DSLAM for the difference between the customer premise equipment (CPE) protocol overhead and the B-RAS protocol overhead. You include this statement when you want CoS to perform the adjustment on the data rate from the DSLAM according to the overhead accounting configuration in a CoS traffic control profile.</p> <p>When this statement is not configured (the default condition), ANCP makes the traffic rate adjustment according to the configuration of the <b>qos-adjust-line-type</b> statements and reports that rate to CoS. CoS then applies (if configured) the adjustment set by the <b>overhead-accounting</b> statement in the CoS traffic profile.</p> |
|                          | <p> <b>NOTE:</b> ANCP reports a traffic rate to CoS only if the <b>qos-adjust</b> statement at the [edit protocols ancp] hierarchy level has been configured.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

```

**Release Information**

Statement introduced in Junos OS Release 9.2.

Statement introduced in Junos OS Release 12.1 for EX Series switches.

Support for the **allow-no-end** option introduced in Junos OS Release 14.1X53-D15 for EX Series switches.

Statement introduced in Junos OS Release 12.3X48-D10 for SRX Series devices.

**Description** Override the default configuration settings for the extended DHCP local server. Specifying the **overrides** statement with no subordinate statements removes all DHCP local server overrides at that hierarchy level.

- To override global DHCP local server configuration options, include the **overrides** statement and its subordinate statements at the **[edit system services dhcp-local-server]** hierarchy level.
- To override configuration options for a named group of interfaces, include the statements at the **[edit system services dhcp-local-server group group-name]** hierarchy level.
- To override configuration options for a specific interface within a named group of interfaces, include the statements at the **[edit system services dhcp-local-server group group-name interface interface-name]** hierarchy level.
- Use the **[edit system services dhcp-local-server dhcpv6]** hierarchy level to override DHCPv6 configuration options.

**NOTE:** By default, `jdhcp` does not process DHCPINFORM message. Only after you enable the overrides command using the `set system services dhcp-local-server overrides process-inform` statement, `jdhcp` starts processing the DHCPINFORM message.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

The [interface-client-limit](#) statement is not supported in the **[edit system services dhcp-local-server dhcpv6]** hierarchy level.

The [asymmetric-prefix-lease-time](#), [delegated-pool](#), [multi-address-embedded-option-response](#), and [rapid-commit](#) statements are supported in the **[edit system services dhcp-local-server dhcpv6 ...]** hierarchy level only.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

```

**Release Information** Statement introduced in Junos OS Release 8.3.  
Support at the **[edit ... dhcpv6]** hierarchy levels introduced in Junos OS Release 11.4.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description** Override the default configuration settings for the extended DHCP relay agent. Specifying the **overrides** statement with no subordinate statements removes all DHCP relay agent overrides at that hierarchy level. Use the statement at the **[edit ... dhcpv6]** hierarchy levels to configure DHCPv6 support.

M120 and M320 routers do not support DHCPv6.

The following statements are supported at both the **[edit ... dhcp-relay]** and **[edit ... dhcpv6]** hierarchy levels.

- **allow-snooped-clients**
- **asymmetric-lease-time**
- **delete-binding-on-renegotiation**
- **dual-stack**
- **interface-client-limit**
- **no-allow-snooped-clients**
- **no-bind-on-request**
- **relay-source**
- **send-release-on-delete**

The following statements are supported at the **[edit ... dhcpv6]** hierarchy levels only.

- **asymmetric-prefix-lease-time**

All other statements are supported at the **[edit ... dhcp-relay]** hierarchy levels only.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

      }
    }
    log-type (debug | info | notice);
  }
}
```

Hierarchy Level [edit system services [subscriber-management](#)]

**Release Information** Statement introduced in Junos OS Release 15.1R3 on MX Series routers for enhanced subscriber management.  
**ra-initial-interval-max** and **ra-initial-interval-min** options added in Junos OS Release 18.2R1 on MX Series routers.  
**ipoe-dynamic-arp-enable** and **receive-gratuitous-arp** options added in Junos OS Release 18.4R1 on MX Series routers.

**Description** Override the default configuration settings for the Junos OS enhanced subscriber management software for subscriber management.

**Options** **ra-initial-interval-max *seconds***—Specify the high end of the range from which the router randomly selects an interval for sending the first three unsolicited IPv6 router advertisement messages. You must also configure the **ra-initial-interval-min** option.  
**Range:** 1 through 16

**ra-initial-interval-min *seconds***—Specify the low end of the range from which the router randomly selects an interval for sending the first three unsolicited IPv6 router advertisement messages. You must also configure the **ra-initial-interval-max** option.

**BEST PRACTICE:** Always configure the value of `ra-initial-interval-min` to be less than or equal to the value of `ra-initial-interval-max`. If you configure the values to be the same, the initial router advertisement intervals are constant and not randomized.

**Range:** 1 through 16

**ipoe-dynamic-arp-enable**—Enable dynamic ARP to resolve the MAC address for IPv4 framed host (32-bit) routes. By default the framed route is permanently associated with the source MAC address received in the packet that triggered creation of the dynamic VLAN.

**receive-gratuitous-arp**—Enable the router to compare the source MAC address received in a gratuitous ARP request or reply packet with the value in the ARP cache. The router updates the cache with the received MAC address when it determines this address is different from the cache entry.

This situation occurs when an IPv4 address is moved to a different device. The device broadcasts a gratuitous ARP reply packet with its MAC address as the source MAC address. When the **receive-gratuitous-arp** option is configured, the router compares the MAC addresses and updates the cache to associate the IPv4 address with the new MAC address.

If the **receive-gratuitous-arp** option is not configured, the router does not accept the gratuitous ARP request or reply packet and cannot quickly learn about the new address. Instead, the original dynamic ARP entry in the cache eventually times out. Before deleting the entry, the router sends an ARP request for the target IP address. The client responds with the new MAC address. This delay in learning about the new address means there is a period during which the MAC address in the ARP cache does not match the address in the new device's NIC.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## partition

---

**Syntax**

```
partition partition-name {  
    diameter-instance instance-name;  
    destination-host hostname;  
    destination-realm realm;  
}
```

**Hierarchy Level** [edit [jsrc](#)]

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** Configure a JSRC partition.

**Options** *partition-name*—Name of the JSRC partition.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| Release Information      | Statement introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                 |
| Description              | Define the NASREQ partition by specifying the destination host and realm where the application resides. Only the master routing instance is supported for the application partition.                                                                                                                                                                                                                                           |
| Options                  | <p><b>diameter-instance master</b>—Specifies that the master Diameter instance is used. <b>master</b> is the only supported value.</p> <p><b>hostname</b>—Name of the host where the NASREQ server application resides; generally, this value is not set unless needed.</p> <p><b>partition-name</b>—Name of the NASREQ partition.</p> <p><b>realm-name</b>—Name of the realm where the NASREQ server application resides.</p> |
| Required Privilege Level | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                     |

## partition (OCS)

**Syntax**

```
partition partition-name {
  called-station-id station-name;
  charging-id number;
  destination-host ocs-hostname;
  destination-realm ocs-realm-name;
  diameter-instance;
  draining;
  draining-response-timeout seconds;
  final-response-timeout seconds;
  force-continue;
  ggsn-address address;
  ggsn-mcc-mnc ggsn-mcc-mnc;
  max-outstanding-requests number;
  send-origin-state-id number;
  user-name-include {
    base-interface-name;
    delimiter delimiter-character;
    domain-name domain-name;
    interface-name;
    mac-address;
    nas-port-id;
    origin-host;
    origin-realm;
    user-name;
    user-prefix prefix;
  }
}
```

**Hierarchy Level** [edit access [ocs](#)]

**Release Information** Statement introduced in Junos OS Release 16.2.

**Description** Configure an Online Charging System (OCS) partition (a specific logical system: routing instance context) and its parameters to define user ID information, destination host and realm names, and number of outstanding requests to the OCS, and control subscriber traffic flow before the first interrogation with the OCS. The OCS that interacts with the Policy and Charging Enforcement Function (PCEF). Broadband PCEF (BPCEF) interactions with the OCS use online session charging with centralized unit determination and centralized rating.

**Options** *partition-name*—Name of the OCS partition. You can define only one partition for the OCS.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege** admin—To view this statement in the configuration.  
**Level** admin-control—To add this statement to the configuration.

## partition (PCRF)

**Syntax**

```
partition partition-name {
  destination-host pcrf-hostname;
  destination-realm pcrf-realm-name;
  diameter-instance;
  draining;
  draining-response-timeout seconds;
  ip-can-type number;
  local-decision (deny | grant) timeout seconds;
  logout-response-timeout seconds;
  max-outstanding-requests number;
  report-local-rule;
  report-resource-allocation;
  report-successful-resource-allocation;
  send-dyn-subscription-indicator;
  send-network-family-indicator;
  send-origin-state-id;
  subscription-id-data-include {
    base-interface-name;
    delimiter delimiter-character;
    domain-name name;
    interface-name;
    mac-address;
    nas-port-id;
    origin-host;
    origin-realm;
    user-name;
    user-prefix prefix;
    vlan-tags;
  }
  subscription-id-type number;
  update-response-timeout seconds;
}
```

**Hierarchy Level** [edit access [pcrf](#)]

**Release Information** Statement introduced in Junos OS Release 16.2.

**Description** Configure a Policy and Charging Rules Function (PCRF) partition (a specific logical system:routing instance context) and its parameters to define subscription ID information, destination host and realm names, and reporting for rules and resources. The PCRF is a centralized policy decision point that deploys business policy rules to allocate broadband network resources and manages flow-based charges for subscribers and services.

**Options** *partition-name*—Name of the PCRF partition. You can define only one partition for the PCRF.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

| Release Information      | Statement introduced in Junos OS Release 9.6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Description              | Specify the password that is sent to AAA for user login for all static subscribers on interfaces configured at the <b>[edit system services static-subscribers interface]</b> hierarchy level, or for the subscribers in a specified group. The group version of the statement takes precedence over the global version.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Options                  | <b><i>password-string</i></b> —String that defines the password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

            send-origin-state-id;
            subscription-id-data-include {
                base-interface-name;
                delimiter delimiter-character;
                domain-name name;
                interface-name;
                mac-address;
                nas-port-id;
                origin-host;
                origin-realm;
                user-name;
                user-prefix prefix;
                vlan-tags;
            }
            subscription-id-type number;
            update-response-timeout seconds;
        }
    }
```

Hierarchy Level [edit access]

Release Information Statement introduced in Junos OS Release 16.2.

**Description** Configure the Policy and Charging Rules Function (PCRF) global attributes, rules, parameters, and partition to authorize and provision subscribers. PCRF is a centralized policy decision point that deploys business policy and charging rules to allocate broadband network resources and manages flow-based charges for subscribers and services. PCRF pushes the rules down to the Policy and Charging Enforcement Function (PCEF) using the 3GPP Gx protocol and online policy interface.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level**    admin—To view this statement in the configuration.  
                                      admin-control—To add this statement to the configuration.

## peer (Diameter Base Protocol)

---

**Syntax**

```
peer peer-name {  
    address ip-address;  
    connect-actively {  
        port port-number;  
        transport transport-name;  
    }  
    logical-system logical-system-name <routing-instance routing-instance-name>;  
    peer-origin realm realm-name host hostname;  
    routing-instance routing-instance-name;  
    send-origin-state-id;  
}
```

**Hierarchy Level** [edit [diameter](#)]

**Release Information** Statement introduced in Junos OS Release 9.6.

**Description** Configure peer-specific Origin-Realm and Origin-Name AVP values to include in the CER, DWR, DWA, DPR, and DPA messages of this peer.

**Options** *peer-name*—Name of the peer.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## pool (Address-Assignment Pools)

```
Syntax pool pool-name {
    active-drain;
    family family {
        dhcp-attributes {
            [ protocol-specific attributes ]
        }
        excluded-address ip-address;
        excluded-range name low minimum-value high maximum-value;
        host hostname {
            hardware-address mac-address;
            ip-address ip-address;
        }
        network ip-prefix /<prefix-length>;
        prefix ipv6-prefix;
        range range-name {
            high upper-limit;
            low lower-limit;
            prefix-length prefix-length;
        }
    }
    hold-down;
    link pool-name;
}
```

Hierarchy Level [edit access [address-assignment](#)]

**Release Information** Statement introduced in Junos OS Release 9.0.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description** Configure the name of an address-assignment pool.

**NOTE:** Subordinate statement support depends on the platform. See individual statement topics for more detailed support information.

**Options** *pool-name*—Name assigned to the address-assignment pool.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| Release Information      | Statement introduced in Junos OS Release 15.1 for MX Series routers.                                                                                                                                                                                                                                                                                                                                                        |
| Description              | Configure the password to use with the RADIUS server for logical line identification (LLID) preauthentication requests. If you do not configure a separate UDP password for preauthentication purposes, the same password that you configure for authentication messages by including the <b>secret <i>password</i></b> statement is used. The secret password used by the local router must match that used by the server. |
| Options                  | <b><i>password</i></b> —Password to use. To include spaces enclose the character string in quotation marks.                                                                                                                                                                                                                                                                                                                 |
| Required Privilege Level | system—To view this statement in the configuration.<br>system-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                           |

| Description              | <p>Add a prefix to the DHCP base option 82 Agent Circuit ID (suboption 1) or Agent Remote ID (suboption 2) information, or to the DHCPv6 option 18 (Relay Agent Interface-ID) or option 37 (Relay Agent Remote-ID) information in DHCP packets that DHCP relay agent sends to a DHCP server. The prefix can consist of any combination of the hostname, logical system name, and routing instance name.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Hierarchy Level [\[edit access\]](#)

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Configure a subscriber access profile that includes subscriber access, L2TP, or PPP properties.

**Options** *profile-name*—Name of the profile.

For CHAP, the name serves as the mapping between peer identifiers and CHAP secret keys. This entity is queried for the secret key whenever a CHAP challenge or response is received.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Release Information** Statement introduced in Junos OS Release 11.4.  
 Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description** Enable the processing of DHCP information request messages (DHCPINFORM for DHCPv4 and INFORMATION-REQUEST for DHCPv6) sent from the client to request DHCP options. For DHCP local servers, the messages are also passed to the configured server list.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Default** Information request messages are not processed.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

```

**Release Information** Statement introduced in Junos OS Release 17.3.

**Description** Select family as protocol master. In some customer use cases, CPE devices have reachability to multiple BNG routers for load sharing. The CPE's DHCP client broadcasts a DHCP protocol handshake to the reachable routers; more than one router may respond. In a DHCP dual-stack environment, the DHCPv4 and DHCPv6 protocol handshakes are independent of each other, meaning that each arm of the subscriber session could connect to a different router. You can avoid this situation by specify the master protocol. For a given dual-stack subscriber, this configuration causes the rejection of any binding attempt from the secondary address family client when a binding is not currently active for the master protocol family. If bindings are currently active for both arms when the master protocol family binding is released or deleted, then the binding for the secondary address family is also torn down.

**Options** **inet**—INET family has protocol master behavior.

**inet6**—INET6 family has protocol master behavior.

**Required Privilege Level** **system**—To view this statement in the configuration.  
**system-control**—To add this statement to the configuration.

| Release Information      | Statement introduced in Junos OS Release 9.2.<br>Support at the [edit dynamic-profiles <i>profile-name</i> protocols mld] and [edit dynamic-profiles <i>profile-name</i> protocols router-advertisement] hierarchy levels introduced in Junos OS Release 10.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Description              | <p>Enable Internet Group Management Protocol (IGMP) or Multicast Listener Discovery (MLD) Protocol on the router and configure interface-specific values on dynamic interfaces for each protocol.</p> <p>PIM and MLD manage multicast groups by establishing, maintaining, and removing groups on a subnet. Multicast routing devices use these protocols to learn which groups have members on each of their attached physical networks. Enable IGMP for the router to receive IPv4 or IPv6 multicast traffic. Enable MLD for the router to receive IPv6 multicast traffic. MLD is needed only for IPv6 networks.</p> <p>You can also use this statement to enable router advertisement for IPv6 Neighbor Discovery protocol and configure interface-specific values on dynamic interfaces.</p> <p>You can configure these protocols in a dynamic client profile or a dynamic service profile.</p> <p>The remaining statements are explained separately. Search for a statement in <a href="#">CLI Explorer</a> or click a linked statement in the Syntax section for details.</p> |
| Default                  | IGMP is disabled on the router. IGMP is automatically enabled on all broadcast interfaces when you configure Protocol Independent Multicast (PIM) or Distance Vector Multicast Routing Protocol (DVMRP).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b>              | Configure AAA to use the specified application for subscriber service provisioning.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                  | <p><b>gx-plus</b>—Specify Gx-Plus as the application used to communicate with a PCRF server for subscriber service provisioning. Sets the Subscription-Id-Type Diameter AVP sub-attribute (450) to 4 (END_USER_PRIVATE) and sets the Subscription-Id-Data Diameter AVP sub-attribute (444) to <b>reserved</b>. Both of these sub-attributes are conveyed in the Diameter AVP Subscription-ID (443) by a CCR-I message.</p> <p><b>jsrc</b>—Specify JSRC as the application used to communicate with the SAE for subscriber service provisioning. JSRC is used in an SRC environment to request services from the SAE for an authenticated subscriber. JSRC attempts to activate these services. If successful, JSRC returns an ACK message. If unsuccessful, the subscriber is denied access.</p> <p><b>pcrf</b>—Specify Policy Control and Charging Rules Function (PCRF) as the application used to request provisioning from the PCRF server over the Gx protocol. If you change this configuration, any existing subscriber sessions are unaffected.</p> |

| <b>Release Information</b>                            | Statement introduced in Junos OS Release 9.4.<br>Subordinate statements deprecated in Junos OS Release 17.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>                                    | <p>Specify that the ANCP agent reports data rates for downstream traffic to CoS. When this statement is not configured, the ANCP agent does not report traffic rates to CoS.</p> <p>For Junos OS Release 17.3 and earlier releases, configure the values by which the actual downstream data rates are adjusted. The remaining statements are explained separately. Search for a statement in <a href="#">CLI Explorer</a> or click a linked statement in the Syntax section for details.</p> <p>Starting in Junos OS Release 17.4, all of the previously supported subordinate statements are deprecated. The ANCP agent ignores them if they are present. This means that when you upgrade from Junos OS Release 17.3 or earlier with an existing configuration, you must reconfigure your adjustments with the <a href="#">access-line</a> statement at the <b>[edit system]</b> hierarchy level.</p> |

| Description              | Configure an adjustment factor that is applied globally to the downstream and upstream data rates reported by the ANCP agent for all subscribers on an ADSL2 line. The ANCP agent reports the adjusted rate only to AAA.                                                                                                                                                                                                                                                                                                                                                                                            |         |             |        |                                                                                                                                                                                                                                     |
|                          | <p> <b>NOTE:</b> Starting in Junos OS Release 17.4R1, this statement is deprecated and replaced by the <code>adsl2-total-adjust</code> option of the <a href="#">access-line</a> statement at the <code>[edit system]</code> hierarchy level. The ANCP agent ignores the <code>qos-adjust-adsl2</code> statement if it is present. This means that when you upgrade from Junos OS Release 17.3 or earlier with an existing configuration, you must reconfigure your adjustment with the <a href="#">access-line</a> statement.</p> |         |             |        |                                                                                                                                                                                                                                     |

| Release Information      | Statement introduced in Junos OS Release 16.1.<br>Statement deprecated in Junos OS Release 17.4R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |         |             |        |                                                                                                                                                                                                                     |
| Description              | <p>Configure an adjustment factor that is applied globally to the downstream and upstream data rates reported by the ANCP agent for all subscribers on an access line of DSL type OTHER. The ANCP agent reports the adjusted rate only to AAA.</p> <p>The router reports some access technology types—such as Gigabit passive optical network (GPON) lines—as DSL type OTHER.</p>                                                                                                                                                                                                                             |         |             |        |                                                                                                                                                                                                                     |
|                          | <p> <b>NOTE:</b> Starting in Junos OS Release 17.4R1, this statement is deprecated and replaced by the <code>other-total-adjust</code> option of the <code>access-line</code> statement at the <code>[edit system]</code> hierarchy level. The ANCP agent ignores the <code>qos-adjust-other</code> statement if it is present. This means that when you upgrade from Junos OS Release 17.3 or earlier with an existing configuration, you must reconfigure your adjustment with the <code>access-line</code> statement.</p> |         |             |        |                                                                                                                                                                                                                     |

| Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Configure an adjustment factor that is applied globally to the downstream and upstream data rates reported by the ANCP agent for all subscribers on an SDSL line. The ANCP agent reports the adjusted rate only to AAA.                                                                                                    |         |             |        |                                                                                                                                                                                                                          |
| <div>  <p><b>NOTE:</b> Starting in Junos OS Release 17.4R1, this statement is deprecated and replaced by the <code>sdsl-total-adjust</code> option of the <code>access-line</code> statement at the <code>[edit system]</code> hierarchy level. The ANCP agent ignores the <code>qos-adjust-sdsl</code> statement if it is present. This means that when you upgrade from Junos OS Release 17.3 or earlier with an existing configuration, you must reconfigure your adjustment with the <code>access-line</code> statement.</p> </div> |                                                                                                                                                                                                                                                                                                                            |         |             |        |                                                                                                                                                                                                                          |

## qos-adjust-vdsl

**Syntax** `qos-adjust-vdsl adjustment-factor;`

**Hierarchy Level** `[edit protocols ancp]`

**Release Information** Statement introduced in Junos OS Release 11.4.  
Statement deprecated in Junos OS Release 17.4R1.

**Description** Configure an adjustment factor that is applied globally to the downstream and upstream data rates reported by the ANCP agent for all subscribers on a VDSL line. The ANCP agent reports the adjusted rate only to AAA.

**NOTE:** Starting in Junos OS Release 17.4R1, this statement is deprecated and replaced by the `vdsl-total-adjust` option of the [access-line](#) statement at the `[edit system]` hierarchy level. The ANCP agent ignores the `qos-adjust-vdsl` statement if it is present. This means that when you upgrade from Junos OS Release 17.3 or earlier with an existing configuration, you must reconfigure your adjustment with the [access-line](#) statement.

**Options** *adjustment-factor*—Adjustment factor applied to upstream and downstream data rates for the DSL type.

**Range:** 0 through 100 percent

**Default:** 100 percent

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Configure an adjustment factor that is applied globally to the downstream and upstream data rates reported by the ANCP agent for all subscribers on a VDSL2 line. The ANCP agent reports the adjusted rate only to AAA.                                                                                                     |         |             |        |                                                                                                                                                                                                                           |
| <div>  <p><b>NOTE:</b> Starting in Junos OS Release 17.4R1, this statement is deprecated and replaced by the <code>vdsl2-total-adjust</code> option of the <code>access-line</code> statement at the <code>[edit system]</code> hierarchy level. The ANCP agent ignores the <code>qos-adjust-vdsl2</code> statement if it is present. This means that when you upgrade from Junos OS Release 17.3 or earlier with an existing configuration, you must reconfigure your adjustment with the <code>access-line</code> statement.</p> </div> |                                                                                                                                                                                                                                                                                                                             |         |             |        |                                                                                                                                                                                                                           |
