| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.2.                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | Configure the number of client alive messages that can be sent without sshd receiving any messages back from the client. If this threshold is reached while client alive messages are being sent, sshd will disconnect the client, terminating the session. Client alive messages are sent through the encrypted channel. Use in conjunction with <a href="#">client-alive-interval</a> to disconnect unresponsive SSH clients. |
| <b>Default</b>                  | 3 messages                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.0.<br>Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | <p>Configure the method that the authenticator uses to access RADIUS authentication servers when there are multiple servers configured. Initially, a RADIUS client sends a request to a RADIUS authentication or accounting server. The router or switch, acting as the authenticator, waits for a response from the server before sending another request.</p> <p>When there are multiple RADIUS server connections configured for a client, the authenticator attempts to reach the different servers in the order that they are configured. If there is no response from the first RADIUS server, the authenticator attempts to reach the next RADIUS server. This process repeats until the client is either granted access or there are no more configured servers.</p> <p>If the <b>direct</b> method is configured, the authenticator always treats the first server in the list as the primary server. The authenticator moves on to the second server only if the attempt to reach the first server fails. If the <b>round-robin</b> method is configured, the server chosen first will be rotated based on which server was used last. The first server in the list is treated as a primary for the first authentication request, but for the second request, the second server configured is treated as primary, and so on. With this method, all of the configured servers receive roughly the same number of requests on average so that no single server has to handle all of the requests.</p> |
|                                 | <p> <b>NOTE:</b> The <b>round-robin</b> access method is not recommended for use with EX Series switches.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Default</b>                  | The <b>direct</b> option is the default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <p><b>direct</b>—Use the direct access method. The authenticator contacts the first RADIUS server on the list for each request, the second server if the first one fails, and so on.</p> <p><b>round-robin</b>—Use the round-robin method. The authenticator contacts the first RADIUS server for the first request, the second server for the second request, and so on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | <p>Define an SNMP community. An SNMP community authorizes SNMP clients based on the source IP address of incoming SNMP request packets. A community also defines which MIB objects are available and the operations (read-only or read-write) allowed on those objects.</p>                                                                                    |
|                                 | <p> <b>NOTE:</b> The <b>authorization read-write</b> option is not supported on the QFX3000 QFabric system.</p>                                                                                                                                                             |
|                                 | <p>The SNMP client application specifies an SNMP community name in <b>Get</b>, <b>GetBulk</b>, <b>GetNext</b>, and <b>Set</b> SNMP requests.</p>                                                                                                                                                                                                               |
| <b>Default</b>                  | If you omit the <b>community</b> statement, all SNMP requests are denied.                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <p><b>community-name</b>—Community string. If the name includes spaces, enclose it in quotation marks (" ").</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>                                                                                                                                                   |

## custom-options

**Syntax**

```
custom-options {
  banner-message string;
  footer-bgcolor color;
  footer-message string;
  footer-text-color color;
  form-header-bgcolor color;
  form-header-message string;
  form-header-text-color color;
  form-reset-label label name;
  form-submit-label label name;
  header-bgcolor color;
  header-logo filename;
  header-message string;
  header-text-color color;
  post-authentication-url url-string;
}
```

**Hierarchy Level** [edit services [captive-portal](#)]

**Release Information** Statement introduced in Junos OS Release 10.1 for EX Series switches.

**Description** Specify the design elements of a captive portal login page.

**Options** **banner-message**—The first screen displayed before the captive portal login page is displayed—for example, a disclaimer message.

**Range:** 1–2047 characters

**footer-bgcolor** —The hexadecimal color code for the color of the footer bar across the bottom of the captive portal login page—for example, #2E8B57 (sea green).

**Values:** # symbol followed by six characters.

**footer-message**—Text message displayed in the footer bar across the bottom of the captive portal login page.

**Range:** 1–2047 characters

**Default:** Copyright ©2010, Juniper Networks Inc.

**footer-text-color** — Color of the text in the footer.

**Default:** The default color is white.

**form-header-bgcolor** —The hexadecimal color code for the background color of the header bar across the top of the form area of the captive portal login page.

**Values:** # symbol followed by six characters.

**form-header-message**—Text message displayed in the header bar across the top of the form area of the captive portal login page.

**Range:** 1–255 characters

**Default:** Captive Portal User Authentication

**form-header-text-color**—Color of the text in the form header.

**Default:** The default color is black.

**form-reset-label**—Label displayed in the button that the user can select to clear the username and password fields on the form.

**Range:** 1–255 characters

**Default:** Reset

**form-submit-label** —Label displayed in the button that the user selects to submit their login information—for example, **Log In** .

**Range:** 1–255 characters

**Default:** Log In

**header-bgcolor**—The hexadecimal color code for the color of the header bar across the top of the captive portal login page.

**Values:** # symbol followed by six characters.

**header-logo**—Filename of the file containing the image of the logo displayed at the top of the captive portal login page. The image file can be in GIF, JPEG, or PNG format.

**Default:** The Juniper Networks logo

**header-message**—Text displayed in the header bar across the bottom of the captive portal login page.

**Range:** 1–2047 characters

**Default:** User Authentication

**header-text-color**—Color of the text in the header.

**Default:** The default color is white.

**post-authentication-url**—URL to which the users are directed upon successful authentication—for example **www.mycafe.com**.

**Range:** 1–255 characters

**Default:** The page originally requested by the user.

| <b>Description</b>         | Specify the character used as the delimiter between the concatenated components of the username.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <b><i>delimiter-character</i></b> —Character that separates components that make up the concatenated username. You cannot use the semicolon (;) as a delimiter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Default:** . (period)

**NOTE:** When you include the *interface-description* in the username, the delimiter must not be a character that is part of the interface description. For example, if the text description is configured as “Backbone connection/PHL01”, you cannot use the forward slash (/) as the delimiter.

| <b>Description</b>         | Specify the character used as the delimiter between the concatenated components of the username. Use the statement at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels to configure DHCPv6 support.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>             | <b><i>delimiter-character</i></b> —Character that separates components that make up the concatenated username. You cannot use the semicolon (;) as a delimiter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Default:** . (period)

**NOTE:** When you include the *interface-description* in the username, the delimiter must not be a character that is part of the interface description. For example, if the text description is configured as “Backbone connection/PHL01”, you cannot use the forward slash (/) as the delimiter.

| Release Information      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Description              | <p>Specify the operational mode commands that the user is denied permission to issue even though the permissions set with the <b>permissions</b> statement would allow it.</p> <p>When specifying extended regular expressions using the <b>allow/deny-commands</b> and <b>allow/deny-configuration</b> statements, each expression separated by a pipe ( ) symbol must be a complete standalone expression, and must be enclosed in parentheses ( ). Do not use spaces between regular expressions separated with parentheses and connected with the pipe ( ) symbol.</p> |
| Default                  | If you omit this statement and the <b>allow-commands</b> statement, users can issue only those commands for which they have access privileges through the <b>permissions</b> statement.                                                                                                                                                                                                                                                                                                                                                                                    |
| Options                  | <p><b>regular-expression</b>—Extended (modern) regular expression as defined in POSIX 1003.2.</p> <p>If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.</p>                                                                                                                                                                                                                                                                                                                                                  |

| Release Information | Statement introduced in Junos OS Release 18.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Description         | <p>Configure authorizations for operational mode commands using regular expressions. You can use the <b>deny-commands-regexps</b> statement to explicitly deny authorization for commands that would otherwise be permitted by an access privilege level.</p> <p>For <b>allow/deny-commands-regexps</b> statements, you configure a set of strings in which each string is a regular expression, enclosed in double quotes and separated with a space operator. Each string is evaluated against the full path of the command, which provides faster matching than the <b>allow/deny-command</b> statements. You can also include values for variables in the regular expressions, which is not supported using <b>allow/deny-commands</b>.</p> <p>Expressions configured with this statement take precedence over <b>allow-commands-regexps</b> if the two statements are used in the same login class definition.</p> |
|                     | <p> <b>NOTE:</b> The <b>allow/deny-commands</b> and <b>allow/deny-commands-regexps</b> statements are mutually exclusive and cannot be configured together for a login class. At a given point in time, a login class can include either the <b>allow/deny-commands</b> statement, or the <b>allow/deny-commands-regexps</b> statement. If you have existing configurations using the <b>allow/deny-commands</b> statements, using the same configuration options with the <b>allow/deny-commands-regexps</b> statements might not produce the same results, as the search and match methods differ in the two forms of these statements.</p>                                                                                                                                                                                        |
|                     | <p>Authorizations can also be configured remotely by specifying Juniper Networks vendor-specific TACACS+ attributes in your authentication server's configuration. For a remote user, when the authorization parameters are configured both remotely and locally, authorization parameters configured remotely and locally are both considered together for authorization. For a local user, only the authorization parameters configured locally for the class are considered.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Default             | If you do not configure authorizations for operational mode commands using <b>allow/deny-commands</b> or <b>allow/deny-commands-regexps</b> , users can edit only those commands for which they have access privileges set with the <b>permissions</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                                 |                                                                                                                                                                                                                                                             |

| Release Information      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Description              | <p>Explicitly deny configuration access to the specified levels in the hierarchy even if the permissions set with the <b>permissions</b> statement grant such access by default. Note that the user cannot view a particular hierarchy if configuration access is denied for that hierarchy.</p> <p>When specifying extended regular expressions using the <b>allow/deny-commands</b> and <b>allow/deny-configuration</b> statements, each expression separated by a pipe ( ) symbol must be a complete standalone expression, and must be enclosed in parentheses ( ). Do not use spaces between regular expressions separated with parentheses and connected with the pipe ( ) symbol.</p>                                                                   |
|                          | <p> <b>NOTE:</b> The <b>allow/deny-configuration</b> and <b>allow/deny-configuration-regexps</b> statements are mutually exclusive and cannot be configured together for a login class. At a given point in time, a login class can include either the <b>allow/deny-configuration</b> statement, or the <b>allow/deny-configuration-regexps</b> statement. If you have existing configurations using the <b>allow/deny-configuration</b> statements, using the same configuration options with the <b>allow/deny-configuration-regexps</b> statements might not produce the same results, as the search and match methods differ in the two forms of these statements.</p> |
| Default                  | If you omit this statement and the <b>allow-configuration</b> statement, users can edit those levels in the configuration hierarchy for which they have access privileges through the <b>permissions</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Options                  | <b>regular-expression</b> —Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Required Privilege Level | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Release Information      | Statement introduced in Junos OS Release 11.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Description              | <p>Explicitly deny configuration access to specified hierarchies using regular expressions even if the permissions set with the <b>permissions</b> statement allow that access.</p> <p>Expressions configured with this statement take precedence over <b>allow-configuration-regexps</b> if the two statements are used in the same login class definition.</p> <div>  <p><b>NOTE:</b> The <b>allow/deny-configuration</b> and <b>allow/deny-configuration-regexps</b> statements are mutually exclusive and cannot be configured together for a login class. At a given point in time, a login class can include either the <b>allow/deny-configuration</b> statement, or the <b>allow/deny-configuration-regexps</b> statement. If you have existing configurations using the <b>allow/deny-configuration</b> statements, using the same configuration options with the <b>allow/deny-configuration-regexps</b> statements might not produce the same results, as the search and match methods differ in the two forms of these statements.</p> </div> |
| Default                  | If you do not configure this statement or the <b>deny-configuration-regexps</b> statement, users can edit only those commands for which they have access privileges set with the <b>permissions</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Options                  | <p><b>regular expression</b>—Extended (modern) regular expression as defined in POSIX 1003.2.</p> <p>If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks. Enter as many expressions as needed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Required Privilege Level | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## deny-configuration-regexps

|                                 |                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>deny-configuration-regexps "regular expression 1" "regular expression 2";</code>                                                                                                                                                                                                                                                                           |
| <b>Hierarchy Level</b>          | <code>[edit system login class class-name]</code>                                                                                                                                                                                                                                                                                                                |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.2.<br>Statement introduced in Junos OS Release 11.2 for SRX Series devices.                                                                                                                                                                                                                                          |
| <b>Description</b>              | <p>Explicitly deny configuration access to specified hierarchies using regular expressions even if the permissions set with the <b>permissions</b> statement allow that access.</p> <p>Expressions configured with this statement take precedence over <b>allow-configuration-regexps</b> if the two statements are used in the same login class definition.</p> |
| <b>Default</b>                  | If you do not configure this statement or the <b>deny-configuration-regexps</b> statement, users can edit only those commands for which they have access privileges set with the <b>permissions</b> statement.                                                                                                                                                   |
| <b>Options</b>                  | <p><i>regular expression</i>—Extended (modern) regular expression as defined in POSIX 1003.2.</p> <p>If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.</p>                                                                                                                                        |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                     |

## destination

---

**Syntax**     `destination id-number {  
                  address ip-address ;  
                  max-tx-buffers number ;  
                  }`

**Hierarchy Level**     `[edit access radsec]`

**Release Information**     Statement introduced in Junos OS Release 19.1R1.

**Description**     Define the RADSEC server as a destination for RADIUS traffic. Traffic that is destined for a RADIUS server can then be redirected to the RADSEC destination. RADSEC destinations are identified by a unique numeric ID. You can configure multiple RADSEC destinations with different parameters pointing to the same RADSEC server.

**Options**     *id-number*—Globally unique ID number for the RADSEC destination.

*address ip-address*—IP address of the RADSEC server.

*max-tx-buffers number*—Maximum number of packets buffered on transmission.

**NOTE:** The buffer allocation should be able to accommodate the *max-outstanding-requests* for mapped RADIUS servers configured at the `[edit access radius-server]` hierarchy level.

---

**Range:** 32 through 32000

**Default:** 100

**Required Privilege Level**     `admin`—To view this statement in the configuration.  
                                      `admin-control`—To add this statement to the configuration.

## destination (Accounting)

```
Syntax destination {
    radius {
        server {
            server-address {
                accounting-port port-number;
                retry number;
                routing-instance (Accounting and Authentication) routing-instance;
                secret password;
                source-address address;
                source-address-inet6 IPv6-source-address;
                timeout seconds;
            }
        }
    }
    tacplus {
        server {
            server-address {
                port port-number;
                routing-instance (Accounting and Authentication) routing-instance;
                secret password;
                single-connection;
                timeout seconds;
            }
        }
    }
}
```

**Hierarchy Level** [edit system **accounting**]

**Release Information** Statement introduced before Junos OS Release 7.4.  
**radius** statement added in Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.1 for the QFX Series.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Configure the authentication server.

**Options** **source-address-inet6 IPv6-source-address**—A valid IPv6 address configured on one of the routers or switch interfaces.

The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
 system-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Enable failure detection. The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. For example, the timers can adapt to a higher value if the adjacency fails, or a neighbor can negotiate a higher value for a timer than the one configured.</p> <p>The remaining statements are explained separately. Search for a statement in <a href="#">CLI Explorer</a> or click a linked statement in the Syntax section for details.</p>                                                                                                                                                                                                                          |

    }

```

**Hierarchy Level** [edit system services]  
 [edit logical-systems *logical -system-name* system services]

**Release Information** Statement introduced before Junos OS Release 7.4.  
 The **logical-systems** option is introduced in Junos OS Release 18.4R1.

**Description** Configure a router, or a switch as a DHCP server. A DHCP server can allocate network addresses and deliver configuration information to client hosts on a TCP/IP network.

The remaining statements are explained separately.

**Release Information** Statement introduced in Junos OS Release 9.0.  
 Statement introduced in Junos OS Release 12.1 for EX Series switches.  
 Statement introduced in Junos OS Release 13.2X51 for the QFX Series.  
 Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Configure Dynamic Host Configuration Protocol (DHCP) local server options on the router or switch to enable the router or switch to function as an extended DHCP local server. The DHCP local server receives DHCP request and reply packets from DHCP clients and then responds with an IP address and other optional configuration information to the client.

The extended DHCP local server is incompatible with the DHCP server on J Series routers and, therefore, is not supported on J Series routers. Also, the DHCP local server and the DHCP/BOOTP relay server, which are configured under the **[edit forwarding-options helpers]** hierarchy level, cannot both be enabled on the router or switch at the same time. The extended DHCP local server is fully compatible with the extended DHCP relay feature.

The **dhcpv6** stanza configures the router or switch to support Dynamic Host Configuration Protocol for IPv6 (DHCPv6). The DHCPv6 local server is fully compatible with the extended DHCP local server and the extended DHCP relay feature.

**NOTE:** When you configure the **dhcp-local-server** statement at the routing instance hierarchy level, you must use a routing instance type of **virtual-router**.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure extended Dynamic Host Configuration Protocol (DHCP) relay and DHCPv6 relay options on the router or switch to enable the router (or switch) to function as a DHCP relay agent. A DHCP relay agent forwards DHCP request and reply packets between a DHCP client and a DHCP server.</p> <p>DHCP relay supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide subscriber authentication or client authentication. You can attach dynamic profiles and configure authentication support on a global basis or for a specific group of interfaces.</p> <p>The extended DHCP and DHCPv6 relay agent options configured with the <b>dhcp-relay</b> and <b>dhcpv6</b> statements are incompatible with the DHCP/BOOTP relay agent options configured with the <b>bootp</b> statement. As a result, the extended DHCP or DHCPv6 relay agent and the DHCP/BOOTP relay agent cannot both be enabled on the router (or switch) at the same time.</p> <p>The remaining statements are explained separately. Search for a statement in <a href="#">CLI Explorer</a> or click a linked statement in the Syntax section for details.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Release Information** Statement introduced in Junos OS Release 9.6.  
 Statement introduced in Junos OS Release 12.3 for EX Series switches.

**Description** Configure DHCPv6 local server options on the router or switch to enable the router or switch to function as a server for the DHCP protocol for IPv6. The DHCPv6 local server sends and receives packets using the IPv6 protocol and informs IPv6 of the routing requirements of router clients. The local server works together with the AAA service framework to control subscriber access (or DHCP client access) and accounting.

The DHCPv6 local server is fully compatible with the extended DHCP local server and DHCP relay agent.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** system—To view this statement in the configuration.  
 system-control—To add this statement to the configuration.

**Release Information** Statement introduced in Junos OS Release 11.4.  
 Statement introduced in Junos OS Release 12.3 for EX Series switches.  
 Support for **forward-snooped-clients** introduced in Junos OS Release 15.1X53-D56 for EX Series switches and Junos OS Release 17.1R1.

**Description** Configure DHCPv6 relay options on the router or switch and enable the router or switch to function as a DHCPv6 relay agent. A DHCPv6 relay agent forwards DHCPv6 request and reply packets between a DHCPv6 client and a DHCPv6 server.

The DHCPv6 relay agent server is fully compatible with the extended DHCP local server and DHCP relay agent. However, the options configured with the **dhcpv6** statement are incompatible with the DHCP/BOOTP relay agent options configured with the **bootp** statement. As a result, the DHCPv6 relay agent and the DHCP/BOOTP relay agent cannot be enabled on the router or switch at the same time.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

[edit logical-systems name interfaces name unit name family inet6]
[edit tenants tenant-name interfaces name unit name family inet6]
```

**Release Information** Statement introduced in Junos OS Release 12.1X45-D10.  
The **logical-systems** and **tenants** options are introduced in Junos OS Release 18.4R1.

**Description** Configure the Dynamic Host Configuration Protocol version 6 (DHCPv6) client.

**NOTE:** Starting in Junos OS Release 18.1R1, DHCPv4 and DHCPv6 clients are supported on management interfaces (fxp0 and em0) configured in the non-default management routing instance, **mgmt\_junos**.

**Options**

- client-ia-type**— Identity association type for DHCPv6 client. This statement is mandatory.
- client-identifier duid-type**— Identity a client by a client-identifier value. This statement is mandatory.
- client-type**— Identify the type of DHCPv6 client. This statement is mandatory.
- rapid-commit**— The use of the two-message exchange for address assignment.
- req-option**— Specify options requested by the DHCPv6 client.
- retransmission-attempt number**— Specify the number of times the device retransmits a DHCPv6 client packet if a DHCPv6 server fails to respond. After the specified number of attempts, no further attempts at reaching a server are made.

**update-router-advertisement**— Specify the interface used to delegate prefixes.

**update-server**— Propagate TCP/IP settings to the DHCPv6 server.

For detailed information about these commands, see [CLI Explorer](#).

## dhcp-attributes (Access IPv6 Address Pools)

**Syntax**

```
dhcp-attributes {
  dns-server ipv6-address;
  grace-period seconds;
  maximum-lease-time (seconds | infinite);
  option dhcp-option-identifier-code {
    array {
      byte [8-bit-value];
      flag [ false| off |on |true];
      integer [32-bit-numeric-values];
      ip-address [ip-address];
      short [signed-16-bit-numeric-value];
      string [character string value];
      unsigned-integer [unsigned-32-bit-numeric-value];
      unsigned-short [16-bit-numeric-value];
    }
    byte 8-bit-value;
    flag ( false | off | on | true);
    integer 32-bit-numeric-values;
    ip-address ip-address;
    short signed-16-bit-numeric-value;
    string character string value;
    unsigned-integer unsigned-32-bit-numeric-value;
    unsigned-short 16-bit-numeric-value;
  }
  propagate-ppp-settings [interface-name];
  sip-server-address ipv6-address;
  sip-server-domain-name domain-name;
}
```

**Hierarchy Level** [edit access address-assignment pool *pool-name* family inet6]

**Release Information** Statement introduced in Junos OS Release 10.4.

**Description** Configure attributes for address pools that can be used by different clients.

- Options**
- **dns-server *IPv6-address***—Specify a DNS server to which clients can send DNS queries.
  - **grace-period *seconds***—Specify the grace period offered with the lease.

**Range:** 0 through 4,294,967,295 seconds

**Default:** 0 (no grace period)

- **maximum-lease-time *seconds***—Specify the maximum length of time in seconds for which a client can request and hold a lease on a DHCP server.

**Range:** 30 through 4,294,967,295 seconds

**Default:** 86,400 seconds (24 hours)

- **option *dhcp-option-identifier-code***—Specify the DHCP option identifier code.
- **propagate-ppp-settings [*interface-name***—Specify PPP interface name for propagating DNS or WINS settings.
- **sip-server-address *IPv6-address***—Specify the IPv6 address of the SIP outbound proxy server.
- **sip-server-domain-name *domain-name***—Specify the domain name of the SIP outbound proxy server.

## domain (Domain Map)

**Syntax**

```

domain {
  delimiter [delimiter-character];
  map domain-map-name {
    aaa-logical-system logical-system-name {
      aaa-routing-instance routing-instance-name;
    }
    aaa-routing-instance routing-instance-name;
    access-profile profile-name;
    address-pool pool-name;
    dynamic-profile profile-name;
    padn destination-address {
      mask destination-mask;
      metric route-metric;
    }
    strip-domain;
    target-logical-system logical-system-name {
      target-routing-instance routing-instance-name;
    }
    target-routing-instance routing-instance-name;
    tunnel-profile profile-name;
  }
  parse-direction (left-to-right | right-to-left);
  parse-order (domain-first | realm-first);
  realm-delimiter [delimiter-character];
  realm-parse-direction (left-to-right | right-to-left);
}

```

**Hierarchy Level** [edit access]

**Release Information** Statement introduced in Junos OS Release 10.4.

**Description** Configure a domain map, which is used to map access options and session parameters for subscriber sessions.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.3.<br>Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.                                                                                                                                                                                                                 |
| <b>Description</b>              | Configure an IPv6 address for a DNS name server. You can configure an address globally for a routing instance at the <b>[edit access]</b> hierarchy level or for an access profile at the <b>[edit access profile <i>profile-name</i>]</b> hierarchy level. You can configure more than one address by including the statement multiple times. |
| <b>Options</b>                  | <b><i>dns-address</i></b> —IPv6 address of the DNS name server.                                                                                                                                                                                                                                                                                |

| Description         | Specify the domain name that is concatenated with the username during the subscriber authentication or client authentication process. Use the statement at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels to configure DHCPv6 support.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Options             | <i>domain-name-string</i> —Domain name formatted string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## domain-search

**Syntax** domain-search [ *domain-list* ];

**Hierarchy Level**

```
[edit system],
[edit system services dhcp],
[edit system services dhcp],
[edit system services dhcp pool],
[edit system services dhcp static-binding]
```

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure a list of domains to search (in the case where you want to configure access to multiple DNS servers for redundancy, and/or to resolve hosts that the previous server could not).

**Options** **domain-list**—List of domain servers to search. The list can contain up to six domain names, separated by a space, with a total of up to 256 characters. For example to search **domain1.net**, and if it fails to resolve the host, **domain2.net**, and if fails to resolve the host, **domain3.net**, you would configure the following domain list at the **domain-search** hierarchy level:

```
[edit system]
set domain-search [domain1.net domain2.net domain3.net]
```

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

| <b>Description</b>              | Drop (discard) specified DHCP client packets when you use DHCP relay agent selective processing. You can configure the drop operation globally or for a group of interfaces, and for either DHCP or DHCPv6 relay agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Release Information** Statement introduced in Junos OS Release 9.0.  
 Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description** Configure a group of interfaces that have a common configuration, such as authentication parameters. A group must contain at least one interface.

**Options** *group-name*—Name of the group.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** system—To view this statement in the configuration.  
 system-control—To add this statement to the configuration.

**Release Information** Statement introduced in Junos OS Release 8.3.  
 Support at the [edit ... *dhcpv6*] hierarchy levels introduced in Junos OS Release 11.4.  
 Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description** Specify the name of a group of interfaces that have a common DHCP or DHCPv6 relay agent configuration. A group must contain at least one interface. Use the statement at the [edit ... *dhcpv6*] hierarchy levels to configure DHCPv6 support.

**Options** *group-name*—Name of a group of interfaces that have a common DHCP or DHCPv6 relay agent configuration.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Enable the switch to ignore Extensible Authentication Protocol over LAN (EAPoL)-Start messages received from a client that has been authenticated so that the switch does not trigger re-authentication. The switch typically attempts to restart the authentication procedure by contacting the authentication server when it receives an EAPoL-Start message from a client—even for authenticated clients. You can configure the <b>eapol-block</b> statement to help prevent unnecessary downtime that can occur when the switch waits for a response from the authentication server.</p> <p>If you configure the switch to block EAPoL-Start messages, when the switch receives an EAPoL-Start message from an authenticated client, the switch ignores the message and does not attempt to contact the authentication server for reauthentication. The existing authentication session that was established for the client remains open.</p> <p>The EAPoL-Start messages are blocked only if the client is in the authenticated state. EAPoL-Start messages from new clients are accepted.</p> |
| <b>Default</b>             | <p>If the <b>eapol-block</b> statement is not configured, the switch attempts to contact the authentication server to authenticate the client when it receives an EAPoL-Start message.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>             | <p><b>server-fail seconds</b>—Configure the switch to ignore EAP-Start messages received from a client that has been authenticated using server fail fallback or server reject VLAN methods. Configure the time interval, in seconds, during which the switch will not attempt to contact the authentication server to re-authenticate a client that has already been authenticated using server fail fallback.</p> <p><b>Default:</b> 120 seconds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**Range:** 120 through 65,535 seconds.

**mac-radius (EX4300 and EX9200 switches only)**—Configure the switch to ignore EAP-Start messages received from a client that has been authenticated using MAC RADIUS authentication. The **mac-radius** option is also valid for clients authenticated using central Web authentication (CWA).

**captive-portal (EX4300 and EX9200 switches only)**—Configure the switch to ignore EAP-Start messages received from a client that has been authenticated using captive portal authentication.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## elin

**Syntax** `elin number;`

**Hierarchy Level** [edit protocols **lldp-med** **interface** (all | *interface-name* **location**)]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** For Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED), configure the Emergency Line Identification Number (ELIN) as location information. Location information is advertised from the switch to the MED device and is used during emergency calls to identify the location of the MED device.

**Default** Disabled.

**Options** *number*—Configure a 10-digit number (area code and telephone number).

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Release Information** Statement introduced in Junos OS Release 9.1.  
Statement introduced in Junos OS Release 9.1 for EX Series switches.  
**downstream-calculated-qos-rate**, **dsl-forum-attributes**, and **upstream-calculated-qos-rate** options added in Junos OS Release 11.4.  
**cos-shaping-rate** and **filter-id** options added in Junos OS Release 13.2.  
**pppoe-description** option added in Junos OS Release 14.2.  
**virtual-router** option added in Junos OS Release 15.1.  
**first-relay-ipv4-address** and **first-relay-ipv6-address** options added in Junos OS Release 16.1.  
**acc-loop-encap** and **acc-loop-remote-id** options added in Junos OS Release 16.1R4.  
**access-request** option support for all tunnel attributes added in Junos OS Release 15.1R7, 16.1R5, 16.2R2, 17.1R2, 17.2R2, and 17.3R1 for MX Series.  
**packet-type**, **standard-attribute**, **vendor-attribute**, and **vendor-id** options added in Junos OS Release 18.1R1.

**Description** Configure the router or switch to exclude the specified attributes from being sent in the specified type of RADIUS message. Exclusion can be useful, for example, for attributes that do not change values over the lifetime of a subscriber. By not sending these attributes, you reduce the packet size without losing information. Contrast this behavior with that provided by the **ignore** statement.

You can specify attribute exclusion for multiple RADIUS message types by enclosing the message types, separated by spaces, within brackets ([ ]). You do not need brackets when specifying a single message type.

Starting in Junos OS Release 18.1R1, you can specify standard RADIUS attributes with the attribute number. You can specify VSAs with the IANA-assigned vendor ID and the VSA number. With this flexible configuration method, you can configure any standard attribute and VSA supported by your platform to be excluded. The configuration has no effect if you configure unsupported attributes, vendors, and VSAs.

The legacy method allows you to configure only those attributes and VSAs for which the statement syntax includes a specific option. Consequently, you can use the legacy method to exclude only a subset of all attributes that can be received in Access-Accept messages.

Not all attributes are available in all types of RADIUS messages.

**NOTE:** If you exclude an attribute from Acct-Off messages, the attributes are then excluded from Interim-Acct messages.

---

**NOTE:** VSAs with dedicated option names include Juniper Networks (IANA vendor ID 4874) and DSL Forum (vendor ID 3561) VSAs.

---

**Options** RADIUS attribute—RADIUS standard attribute or VSA:

- **acc-aggr-cir-id-asc**—Exclude Juniper Networks VSA 26-112, Acc-Aggr-Cir-Id-Asc.
- **acc-aggr-cir-id-bin**—Exclude Juniper Networks VSA 26-111, Acc-Aggr-Cir-Id-Bin.
- **acc-loop-cir-id**—Exclude Juniper Networks VSA 26-110, Acc-Loop-Cir-Id.
- **acc-loop-encap**—Exclude Juniper Networks VSA 26-183, Acc-Loop-Encap.
- **acc-loop-remote-id**—Exclude Juniper Networks VSA 26-182, Acc-Loop-Remote-Id.
- **accounting-authentic**—Exclude RADIUS attribute 45, Acct-Authentic.
- **accounting-delay-time**—Exclude RADIUS attribute 41, Acct-Delay-Time.
- **accounting-session-id**—Exclude RADIUS attribute 44, Acct-Session-Id.
- **accounting-terminate-cause**—Exclude RADIUS attribute 49, Acct-Terminate-Cause.
- **acct-request-reason**—Exclude Juniper Networks VSA 26-210, Acct-Request-Reason.
- **acct-tunnel-connection**—Exclude RADIUS attribute 68, Acct-Tunnel-Connection.
- **act-data-rate-dn**—Exclude Juniper Networks VSA 26-114, Act-Data-Rate-Dn.
- **act-data-rate-up**—Exclude Juniper Networks VSA 26-113, Act-Data-Rate-Up.
- **act-interlv-delay-dn**—Exclude Juniper Networks VSA 26-126, Act-Interlv-Delay-Dn.
- **act-interlv-delay-up**—Exclude Juniper Networks VSA 26-124, Act-Interlv-Delay-Up.
- **att-data-rate-dn**—Exclude Juniper Networks VSA 26-118, Att-Data-Rate-Dn.
- **att-data-rate-up**—Exclude Juniper Networks VSA 26-117, Att-Data-Rate-Up.
- **called-station-id**—Exclude RADIUS attribute 30, Called-Station-Id.
- **calling-station-id**—Exclude RADIUS attribute 31, Calling-Station-Id.
- **chargeable-user-identity**—Exclude RADIUS attribute 89, Chargeable-User-Identity.
- **class**—Exclude RADIUS attribute 25, Class.
- **cos-shaping-rate**—Exclude Juniper Networks VSA 26-177, Cos-Shaping-Rate.
- **delegated-ipv6-prefix**—Exclude RADIUS attribute 123, Delegated-IPv6-Prefix.
- **dhcp-gi-address**—Exclude Juniper Networks VSA 26-57, DHCP-GI-Address.
- **dhcp-header**—Exclude Juniper Networks VSA 26-208, DHCP-Header.
- **dhcp-mac-address**—Exclude Juniper Networks VSA 26-56, DHCP-MAC-Address.
- **dhcp-options**—Exclude Juniper Networks VSA 26-55, DHCP-Options.
- **dhcpv6-header**—Exclude Juniper Networks VSA 26-209, DHCPv6-Header.
- **dhcpv6-options**—Exclude Juniper Networks VSA 26-207, DHCPv6-Options.
- **dynamic-iflset-name**—Exclude Juniper Networks VSA 26-130, Qos-Set-Name.
- **downstream-calculated-qos-rate**—Exclude Juniper Networks VSA 26-141.

- **dsl-forum-attributes**—Exclude DSL Forum VSA (vendor ID 3561) as described in RFC 4679, *DSL Forum Vendor-Specific RADIUS Attributes*.
- **dsl-line-state**—Exclude Juniper Networks VSA 26-127, DSL-Line-State.
- **dsl-type**—Exclude Juniper Networks VSA 26-128, DSL-Type.
- **event-timestamp**—Exclude RADIUS attribute 55, Event-Timestamp.
- **filter-id**—Exclude RADIUS attribute 11, Filter-Id.
- **first-relay-ipv4-address** —Exclude Juniper Networks VSA 26-189, DHCP-First-Relay-IPv4-Address.
- **first-relay-ipv6-address** —Exclude Juniper Networks VSA 26-190, DHCP-First-Relay-IPv6-Address.
- **framed-interface-id**—Exclude RADIUS attribute 96, Framed-Interface-ID.
- **framed-ip-address**—Exclude RADIUS attribute 8, Framed-IP-Address.
- **framed-ip-netmask**—Exclude RADIUS attribute 9, Framed-IP-Netmask.
- **framed-ip-route**—Exclude RADIUS attribute 22, Framed-Route.
- **framed-ipv6-address**—Exclude RADIUS attribute 168, Framed-IPv6-Address.
- **framed-ipv6-pool**—Exclude RADIUS attribute 100, Framed-IPv6-Pool.
- **framed-ipv6-prefix**—Exclude RADIUS attribute 97, Framed-IPv6-Prefix.
- **framed-ipv6-route**—Exclude RADIUS attribute 99, Framed-IPv6-Route.
- **framed-pool**—Exclude RADIUS attribute 88, Framed-Pool.
- **input-filter**—Exclude Juniper Networks VSA 26-10, Ingress-Policy-Name.
- **input-gigapackets**—Exclude Juniper Networks VSA 26-42, Acct-Input-Gigapackets.
- **input-gigawords**—Exclude RADIUS attribute 52, Acct-Input-Gigawords.
- **input-ipv6-gigawords**—Exclude Juniper Networks VSA 26-155, Acct-Input-IPv6-Gigawords.
- **input-ipv6-octets**—Exclude Juniper Networks VSA 26-151, Acct-Input-IPv6-Octets.
- **input-ipv6-packets**—Exclude Juniper Networks VSA 26-153, Acct-Input-IPv6-Packets.
- **interface-description**—Exclude Juniper Networks VSA 26-53, Interface-Desc.
- **l2c-downstream-data**—Exclude Juniper Networks VSA 26-93, L2C-Down-Stream-Data.
- **l2c-upstream-data**—Exclude Juniper Networks VSA 26-92, L2C-Up-Stream-Data.
- **l2tp-rx-connect-speed**—Exclude Juniper Networks VSA 26-163, Rx-Connect-Speed.
- **l2tp-tx-connect-speed**—Exclude Juniper Networks VSA 26-162, Tx-Connect-Speed.
- **max-data-rate-dn**—Exclude Juniper Networks VSA 26-120, Max-Data-Rate-Dn.
- **max-data-rate-up**—Exclude Juniper Networks VSA 26-119, Max-Data-Rate-Up.
- **max-interlv-delay-dn**—Exclude Juniper Networks VSA 26-125, Max-Interlv-Delay-Dn.

- **max-interlv-delay-up**—Exclude Juniper Networks VSA 26-123, Max-Interlv-Delay-Up.
- **min-data-rate-dn**—Exclude Juniper Networks VSA 26-116, Min-Data-Rate-Dn.
- **min-data-rate-up**—Exclude Juniper Networks VSA 26-115, Min-Data-Rate-Up.
- **min-lp-data-rate-dn**—Exclude Juniper Networks VSA 26-122, Min-Lp-Data-Rate-Dn.
- **min-lp-data-rate-up**—Exclude Juniper Networks VSA 26-121, Min-Lp-Data-Rate-Up.
- **nas-identifier**—Exclude RADIUS attribute 32, NAS-Identifier.
- **nas-port**—Exclude RADIUS attribute 5, NAS-Port.
- **nas-port-id**—Exclude RADIUS attribute 87, NAS-Port-Id.
- **nas-port-type**—Exclude RADIUS attribute 61, NAS-Port-Type.
- **output-filter**—Exclude Juniper Networks VSA 26-11, Egress-Policy-Name.
- **output-gigapackets**—Exclude Juniper Networks VSA 26-43, Acct-Output-Gigapackets.
- **output-gigawords**—Exclude RADIUS attribute 53, Acct-Output-Gigawords.
- **output-ipv6-gigawords**—Exclude Juniper Networks VSA 26-156, Acct-Output-IPv6-Gigawords.
- **output-ipv6-octets**—Exclude Juniper Networks VSA 26-152, Acct-Output-IPv6-Octets.
- **output-ipv6-packets**—Exclude Juniper Networks VSA 26-154, Acct-Output-IPv6-Packets.
- **packet-type**—Specify the RADIUS message type to exclude; term required when excluding a standard attribute or VSA by number rather than name. You can enclose multiple values in square brackets to specify a list of message types. Message types include Access-Request, Accounting-Off, Accounting-Off, Accounting-Start, and Accounting-Stop.
- **pppoe-description**—Exclude Juniper Networks VSA 26-24, PPPoE-Description.
- **standard-attribute *number***—RADIUS standard attribute number supported by your platform. If you configure an unsupported attribute, that configuration has no effect. When you use this option, you must use the **packet-type** term to specify the message from which the attribute is excluded.
- **tunnel-assignment-id**—Exclude RADIUS attribute 82, Tunnel-Assignment-ID.
- **tunnel-client-auth-id**—Exclude RADIUS attribute 90, Tunnel-Client-Auth-ID.
- **tunnel-client-endpoint**—Exclude RADIUS attribute 66, Tunnel-Client-Endpoint.
- **tunnel-medium-type**—Exclude RADIUS attribute 65, Tunnel-Medium-Type.
- **tunnel-server-auth-id**—Exclude RADIUS attribute 91, Tunnel-Server-Auth-ID.
- **tunnel-server-endpoint**—Exclude RADIUS attribute 67, Tunnel-Server-Endpoint.
- **tunnel-type**—Exclude RADIUS attribute 64, Tunnel-Type.
- **upstream-calculated-qos-rate**—Exclude Juniper Networks VSA 26-142

- **vendor-attribute vsa-number**—Number identifying a VSA belonging to the specified vendor; both must be supported by your platform. If you configure an unsupported VSA, that configuration has no effect. When you use this option, you must use the **packet-type** term to specify the message from which the attribute is excluded.
- **vendor-id id-number**—IANA vendor ID supported by your platform. If you configure an unsupported vendor ID, that configuration has no effect.
- **virtual-router**—Exclude Juniper Networks VSA 26-1.

RADIUS message type:

- **access-request**—RADIUS Access-Request messages.
- **accounting-off**—RADIUS Accounting-Off messages.
- **accounting-on**—RADIUS Accounting-On messages.
- **accounting-start**—RADIUS Accounting-Start messages.
- **accounting-stop**—RADIUS Accounting-Stop messages.

| <b>Description</b>              | <p>Allows you to exclude select IPv4 or IPv6 addresses from a DHCP address pool. Within a configured address pool, you can specifically exclude up to 20 addresses. Junos OS will not assign these excluded addresses to any clients. If you configure an excluded address that has already been assigned to a DHCP client, that excluded address will be revoked from the client.</p> <p>.....</p> <div>  <p><b>NOTE:</b> Excluded addresses must match the address family of the configured address pool. For example, you cannot exclude an IPv4 address within an IPv6 address pool.</p> <p>.....</p> </div> |
| <b>Required Privilege Level</b> | <p>access—To view this statement in the configuration.</p> <p>access-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Description</b>              | Configure the action the router (or switch) takes when a liveness detection failure occurs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>                  | <p><b>Default:</b> <code>clear-binding</code></p> <p><b>clear-binding</b>—The DHCP client session is cleared when a liveness detection failure occurs, except when <code>maintain-subscribers interface-delete</code> setting is configured and active.</p> <p><b>clear-binding-if-interface-up</b>—The DHCP client session is cleared only when a liveness detection failure occurs and the local interface is detected as being up. Use this setting to distinguish failures from between a liveness detection failure due to a local network error, and a host disconnecting from the network. If the client binding is in the maintain-binding Finite State Machine (FSM) state when the liveness detection failure detection occurs, then the binding is not deleted. Not supported for Layer 2 ARP/ND liveness detection on MX Series routers.</p> <p><b>log-only</b>—A message is logged to indicate the event; no action is taken and DHCP is left to manage the failure and maintain the client binding. Not supported for Layer 2 ARP/ND liveness detection on MX Series routers.</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## family (Security Forwarding Options)

---

**Syntax**

```
family {
  inet6 {
    mode (drop | flow-based | packet-based);
  }
  iso {
    mode packet-based;
  }
  mpls {
    mode packet-based;
  }
}
```

**Hierarchy Level** [edit security forwarding-options]

**Release Information** Statement introduced in Junos OS Release 8.5.

**Description** Determine the protocol family to be used for packet forwarding.

**NOTE:** Packet-based processing is not supported on the following SRX Series devices: SRX5400, SRX5600, and SRX5800.

**Options** The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

    security (alert | any | critical | emergency | error | info | none | notice | warning);
    structured-data {
        brief;
    }
    user (alert | any | critical | emergency | error | info | none | notice | warning);
}
```

**Hierarchy Level** [edit system syslog]

**Release Information** Statement introduced before Junos OS Release 12.1X47 for SRX Series.

**Description** Specify the file in which to log data.

- Options**
- *filename*—Specify the name of the file in which to log data.
  - *allow-duplicates*—Do not suppress the repeated messages.
  - *any*—Specify all facilities information.
    - *alert*—Specify the conditions that should be corrected immediately.

- *critical*—Specify the critical conditions.
- *emergency*—Specify the conditions that cause security functions to stop.
- *error*—Specify the general error conditions.
- *info*—Specify the information about normal security operations.
- *none*—Do not specify any messages.
- *notice*—Specify the conditions that should be handled specifically.
- *warning*—Specify the general warning conditions.
- *archive*—Specify the archive file information.
  - *archive-sites*—Specify a list of destination URLs for the archived log files.
    - *url*—Specify the primary and failover URLs to receive archive files.
  - *binary-data*—Mark file such that it contains binary data.
  - *no-binary-data*—Do not mark the file such that it contains binary data.
  - *files*—Specify the number of files to be archived. Range: 1 through 1000 files.
  - *size*—Specify the size of files to be archived. Range: 65,536 through 1,073,741,824 bytes.
  - *world-readable*—Allow any user to read the log file.
  - *no-world-readable*—Do not allow any user to read the log file.
  - *start-time*—Specify the start time for file transmission. Enter the start time in the yyyy-mm-dd.hh:mm format.
  - *transfer-interval*—Specify the frequency at which to transfer the files to archive sites.
- *authorization*—Specify the authorization system.
- *change-log*—Specify the configuration change log.
- *conflict-log*—Specify the configuration conflict log.
- *daemon*—Specify the various system processes.
- *dfc*—Specify the dynamic flow capture.
- *explicit-priority*—Include the priority and facility in messages.
- *external*—Specify the local external applications.
- *firewall*—Specify the firewall filtering system.
- *ftp*—Specify the FTP process.
- *interactive-commands*—Specify the commands executed by the UI.
- *kernel*—Specify the kernel information.
- *match*—Specify the regular expression for lines to be logged.
- *ntp*—Specify the NTP process.

- *pfe*—Specify the Packet Forwarding Engine.
- *security*—Specify the security-related information.
- *structured-data*—Log the messages in structured log format.
  - *brief*—Omit English language text from the end of the logged message.
- *user*—Specify the user processes.
  - *info*—Specify the informational messages.

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                          |
| <b>Description</b>              | Specify the maximum number of log files to be used for accounting data.                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <i>number</i> —The maximum number of files. When a log file (for example, <b>profilelog</b> ) reaches its maximum size, it is renamed <b>profilelog.0</b> , then <b>profilelog.1</b> , and so on, until the maximum number of log files is reached. Then the oldest log file is overwritten. The minimum value for <i>number</i> is 3 and the default value is 10. |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                            |

| Release Information      | <p>Statement introduced in Junos OS Release 15.1X49-D80.</p> <p>Starting with Junos OS Release 17.3R1, on all SRX Series devices and vSRX instances, the CLI option <b>dhcp-clinet</b> at [edit interfaces <b>interface-name</b> unit <b>logical-unit-number</b> family <b>inet</b>] hierarchy is changed to <b>dhcp</b> to keep consistent with other Junos platforms. There is no change in the functionality with the changed CLI option <b>dhcp</b>.</p> |
| Description              | Forces the DHCP client to send a DHCP discover packet after one to three failed <b>dhcp-request</b> attempts. The <b>force-discover</b> option ensures that the DHCP server will assign the same or a new IP address to the client.                                                                                                                                                                                                                          |
| Required Privilege Level | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                      |

| <b>Description</b>              | <p>Configure how DHCP relay agent filters and handles DHCP snooped packets on the specified interfaces. The router or switch determines the DHCP snooping action to perform based on a combination of the <b>forward-snooped-clients</b> configuration and the configuration of either the <b>allow-snooped-clients</b> statement or the <b>no-allow-snooped-clients</b> statement.</p> <p>The router (or switch) also uses this statement to determine how to handle snooped BOOTREPLY packets received on non-configured interfaces.</p>                           |
| <b>Options</b>                  | <p><b>all-interfaces</b>—Perform the action on all interfaces.</p> <p><b>Default:</b> On EX Series switches, the action is performed on all interfaces by default.</p> <p><b>configured-interfaces</b>—Perform the action only on interfaces that are configured as part of an interface group.</p> <p><b>non-configured-interfaces</b>—Perform the action only on interfaces that are not part of a group.</p>                                                                                                                                                      |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## forwarding-options (Security)

**Syntax**

```
forwarding-options {
  family {
    inet6 {
      mode (drop | flow-based | packet-based);
    }
    iso {
      mode packet-based;
    }
    mpls {
      mode packet-based;
    }
  }
}
```

**Hierarchy Level** [edit security]

**Release Information** Statement introduced in Junos OS Release 8.5 .

**Description** Determine how the **inet6**, **iso**, and **mpls** protocol families manage security forwarding options.

### NOTE:

- Packet-based processing is not supported on the following SRX Series devices: SRX5400, SRX5600, and SRX5800.
- On SRX Series devices, the default mode for processing traffic is flow mode. To configure an SRX Series device as a border router, you must change the mode from flow-based processing to packet-based processing. Use the `set security forwarding-options family mpls mode packet-based` statement to configure the SRX device to packet mode. You must reboot the device for the configuration to take effect.

**Options** The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

## hostkey-algorithm

**Syntax**

```
hostkey-algorithm {
  (no-ssh-dss | ssh-dss);
  (no-ssh-rsa | ssh-rsa);
  (no-ssh-ecdsa | ssh-ecdsa);
  (no-ssh-ed25519 | ssh-ed25519);
}
```

**Hierarchy Level** [edit system services ssh]

**Release Information** Statement introduced in Junos OS Release 11.2.

**Description** Allow or disallow a host-key algorithm to authenticate another host through SSH protocol. The host-key uses RSA, ECDSA, ED25519, and DSS algorithms.

The following are the behaviors when the **hostkey-algorithm** option is configured with SSH client and SSH server:

- On SSH client the host-key algorithms that are supported when talking to a server are:
  - a. RSA: Equal or greater-than to 1024 bit
  - b. ECDSA: 256, 384, or 521 bit
  - c. ED25519: 256 bit
  - d. DSS: 1024 bit
- On SSH server the host-key algorithms that are generated and stored are:
  - a. RSA: 2048 bit
  - b. ECDSA: 256 bit
  - c. ED25519: 256 bit
  - d. DSS: 1024 bit

- Options**
- **ssh-ecdsa**—Allow generation of an ECDSA host-key. Key pair sizes of 256, 384, or 521 bits are compatible with ECDSA.
  - **ssh-dss**—Allow generation of a 1024-bit DSA host-key.

**NOTE:** DSA keys are not supported in FIPS, so the **ssh-dss** option is not available on systems operating in FIPS mode.

- **ssh-rsa**—Allow generation of RSA host-key. Key pair sizes greater than or equal to 1024 are compatible with RSA.

- **no-ssh-dss**—Do not allow generation of a 1024-bit Digital Signature Algorithm (DSA) host-key.
- **no-ssh-ecdsa**—Do not allow generation of an Elliptic Curve Digital Signature Algorithm (ECDSA) host-key.
- **no-ssh-rsa**—Do not allow generation of an RSA host-key.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

---

## http

---

**Syntax**

```
http {  
    interfaces [ interface-names ];  
    port port;  
}
```

**Hierarchy Level** [edit [system services web-management](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure the port and interfaces for HTTP service, which is unencrypted.

**Options** **interfaces [ *interface-names* ]**—Name of one or more interfaces on which to allow the HTTP service. By default, HTTP access is allowed through built-in Fast Ethernet or Gigabit Ethernet interfaces only.

The remaining statement is explained separately. See [CLI Explorer](#).

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

| Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | For a login class, configure the maximum time that a session can be idle before the user is logged out of the router or switch. The session times out after remaining at the CLI operational mode prompt for the specified time. |
| Default                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | If you omit this statement, a user is never forced off the system after extended idle times.                                                                                                                                     |
| <div> <b>NOTE:</b> After you log in to a device from a shell prompt such as <code>csch</code>, if you start another program to run in the foreground of the CLI, the idle timer control is stopped from being computed. The calculation of idle time of the CLI session is restarted only after the foreground process exits and the control is returned to the shell prompt. When the restart of the idle-timer occurs, if no interaction from the user occurs on the shell, the user is automatically logged out after the expiry of the idle timeout value.</div> |                                                                                                                                                                                                                                  |

## ignore (RADIUS Attributes)

**Syntax**

```
ignore {
    dynamic-iflset-name;
    framed-ip-netmask;
    idle-timeout;
    input-filter;
    logical-system-routing-instance;
    output-filter;
    session-timeout;
    standard-attribute number;
    vendor-id id-number {
        vendor-attribute vsa-number;
    }
}
```

**Hierarchy Level** [edit access profile *profile-name* radius **attributes**]

**Release Information** Statement introduced in Junos OS Release 9.1.  
Statement introduced in Junos OS Release 9.1 for EX Series switches.  
**idle-timeout**, **session-timeout**, **standard-attribute**, **vendor-attribute**, and **vendor-id** options added in Junos OS Release 18.1R1.

**Description** Configure the router or switch to ignore the specified attributes in RADIUS Access-Accept messages. Standard attributes and VSAs received in RADIUS messages take precedence over internally provisioned attribute values. Ignoring the attributes enables your internally provisioned values to be used instead. Contrast this behavior with that provided by the **exclude** statement.

Starting in Junos OS Release 18.1R1, you can specify RADIUS standard attributes with the attribute number. You can specify vendor-specific attributes (VSAs) with the IANA-assigned vendor ID and the VSA number. With this flexible configuration method, you can configure any standard attribute and VSA supported by your platform to be ignored. The configuration has no effect if you can configure unsupported attributes, vendors, and VSAs.

The legacy method allows you to configure only those attributes and VSAs for which the statement syntax includes a specific option. Consequently, you can use the legacy method to ignore only a subset of all attributes that can be received in Access-Accept messages.

**Options** **dynamic-iflset-name**—Ignore Juniper Networks VSA 26-130, Qos-Set-Name.

**framed-ip-netmask**—Ignore RADIUS attribute 9, Framed-IP-Netmask.

**idle-timeout**—Ignore RADIUS attribute 28, Idle-Timeout.

**input-filter**—Ignore Juniper Networks VSA 26-10, Ingress-Policy-Name.

**logical-system-routing-instance**—Ignore Juniper Networks VSA 26-1.

**output-filter**—Ignore Juniper Networks VSA 26-11, Egress-Policy-Name.

**session-timeout**—Ignore RADIUS attribute 27, Session-Timeout.

**standard-attribute *number***—RADIUS standard attribute number supported by your platform. You can enclose multiple values in square brackets to specify a list of attributes. If you configure an unsupported attribute, that configuration has no effect.

**Range:** 1 through 255

**vendor-attribute *vsa-number***—Number identifying a VSA belonging to the specified vendor; both must be supported by your platform. You can enclose multiple values in square brackets to specify a list of VSAs. If you configure an unsupported VSA, that configuration has no effect.

**Range:** 1 through 255

**vendor-id *id-number***—IANA vendor ID supported by your platform. If you configure an unsupported vendor ID, that configuration has no effect.

**Range:** 1 through 16777215

**Options** **dynamic-iflset-name**—Ignore Juniper Networks VSA 26-130, Qos-Set-Name.

**framed-ip-netmask**—Ignore RADIUS attribute 9, Framed-IP-Netmask.

**idle-timeout**—Ignore RADIUS attribute 28, Idle-Timeout.

**input-filter**—Ignore Juniper Networks VSA 26-10, Ingress-Policy-Name.

**logical-system-routing-instance**—Ignore Juniper Networks VSA 26-1.

**output-filter**—Ignore Juniper Networks VSA 26-11, Egress-Policy-Name.

**session-timeout**—Ignore RADIUS attribute 27, Session-Timeout.

**standard-attribute *number***—RADIUS standard attribute number supported by your platform. You can enclose multiple values in square brackets to specify a list of attributes. If you configure an unsupported attribute, that configuration has no effect.

**Range:** 1 through 255

**vendor-attribute *vsa-number***—Number identifying a VSA belonging to the specified vendor; both must be supported by your platform. You can enclose multiple values in square brackets to specify a list of VSAs. If you configure an unsupported VSA, that configuration has no effect.

**Range:** 1 through 255

**vendor-id *id-number***—IANA vendor ID supported by your platform. If you configure an unsupported vendor ID, that configuration has no effect.

**Range:** 1 through 16777215

| <b>Release Information</b>      | Statement introduced in Junos OS Release 17.3R1 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>              | Ignore the port-bounce command contained in a Change of Authorization (CoA) request. CoA requests are RADIUS messages that are used to dynamically modify an authenticated user session already in progress. CoA requests are sent from the authentication, authorization, and accounting (AAA) server to the switch, and are typically used to change the VLAN for the host based on device profiling. End devices such as printers do not have a mechanism to detect the VLAN change, so they do not renew the lease for their DHCP address in the new VLAN. The port bounce feature is used to force the end device to initiate DHCP re-negotiation by causing a link flap on the authenticated port. There is no configuration required to enable the port bounce feature. |
| <b>Default</b>                  | The port bounce feature is supported by default. If you do not configure the <b>ignore-port-bounce</b> statement, the switch responds to a port-bounce command by flapping the link to re-initiate DHCP negotiation for the end device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Description              | <p>Configure the extended DHCP local server to use the IP address method to determine which address-assignment pool to use. The local server uses the IP address in the gateway IP address if one is present in the DHCP client PDU. If no gateway IP address is present, the local server uses the IP address of the receiving interface to find the address-assignment pool. The DHCP local server uses this method by default when no method is explicitly specified.</p>                                               |

| Release Information | Statement introduced in Junos OS Release 14.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**NOTE:** The EX Series switches that support the `include-irb-and-l2` statement are the EX4300, EX4600, and EX9200 switches.

**Description** Include both the integrated routing and bridging (IRB) interface name and Layer 2 interface name in the **circuit-id** or **remote-id** value in the DHCP option 82 information. VLAN tags are global.

For leasequery and bulk leasequery operations that involve integrated routing and bridging (IRB) interfaces, you must configure DHCP relay agent to include the layer 2 interface name along with IRB name in the circuit ID of option 82. DHCP relay agent uses the layer 2 interface name when using leasequery or bulk leasequery to restore the lease database.

When you configure the **include-irb-and-l2** statement without including the **no-vlan-interface** statement, the format is as follows:

- Bridge domain:

```
(fe | ge)-fpc/pic/port.subunit:bridge-domain-name+irb.subunit
```

- VLAN:

```
(fe | ge)-fpc/pic/port.subunit:vlan-name+irb.subunit
```

**NOTE:** For remote systems, the *subunit* is required and is used to differentiate an interface.

When you configure both the **include-irb-and-l2** statement and the **use-vlan-id** statement, the format is as follows:

```
(fe | ge)-fpc/pic/port.subunit:svlan-id-vlan-id+irb.subunit
```

**NOTE:** The *svlan-id-vlan-id* represents the VLANs associated with the bridge domain.

When you configure both the **include-irb-and-l2** and **no-vlan-interface-name** statements, the format is as follows:

```
(fe | ge)-fpc/pic/port.subunit+irb.subunit
```

When you configure both the **include-irb-and-l2** and **use-interface-description** statements, the format displays the description for the Layer 2 interface:

```
l2_descr:vlan-name+irb.subunit
```

If you configure both the **include-irb-and-l2** and **use-interface-description** statements, and no description for the Layer 2 interface is found, the format displays the Layer 2 logical interface name:

```
(fe | ge)-fpc/pic/port.subunit:vlan-name+irb.subunit
```

When you configure the **include-irb-and-l2** statement with both the **no-vlan-interface-name** and **use-interface-description** statements, the format displays as follows:

```
l2_descr+irb.subunit
```

If you configure the **include-irb-and-l2** statement with both the **no-vlan-interface-name** and **use-interface-description** statements, and no description is found for the Layer 2 interface, the format displays as follows:

```
(fe | ge)-fpc/pic/port.subunit+irb.subunit
```

|                                 |                                                             |

## interface (DHCP Relay Agent)

**Syntax**

```
interface dhcp-interface-name {
  access-profile profile-name;
  exclude;
  overrides {
    allow-no-end-option
    allow-snooped-clients;
    always-write-giaddr;
    always-write-option-82;
    asymmetric-lease-time seconds;
    asymmetric-prefix-lease-time seconds;
    client-discover-match <option60-and-option82 | incoming-interface>;
    client-negotiation-match incoming-interface;
    disable-relay;
    dual-stack dual-stack-group-name;
    interface-client-limit number;
    layer2-unicast-replies;
    no-allow-snooped-clients;
    proxy-mode;
    relay-source
    replace-ip-source-with;
    send-release-on-delete;
    trust-option-82;
  }
  service-profile dynamic-profile-name;
  short-cycle-protection <lockout-min-time seconds> <lockout-max-time seconds>;
  trace;
  upto upto-interface-name;
}
```

**Hierarchy Level**

 forwarding-options dhcp-relay ...],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay ...]
```

**Release Information**

Statement introduced in Junos OS Release 8.3.  
Options **upto** and **exclude** introduced in Junos OS Release 9.1.  
Support at the **[edit ... dhcpv6]** hierarchy levels introduced in Junos OS Release 11.4.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description**

Specify one or more interfaces, or a range of interfaces, that are within a specified group on which the DHCP or DHCPv6 relay agent is enabled. You can repeat the **interface interface-name** statement to specify multiple interfaces within a group, but you cannot specify the same interface in more than one group. Also, you cannot use an interface that is being used by the DHCP local server. Use the statement at the **[edit ... dhcpv6]** hierarchy levels to configure DHCPv6 support.

EX Series switches do not support DHCPv6.

**NOTE:** DHCP values are supported in integrated routing and bridging (IRB) configurations. When you configure an IRB interface in a network that is using DHCP, the DHCP information (for example, authentication, address assignment, and so on) is propagated in the associated bridge domain. This enables the DHCP server to configure client IP addresses residing within the bridge domain. IRB currently only supports static DHCP configurations. .

**Options** **exclude**—Exclude an interface or a range of interfaces from the group. This option and the **overrides** option are mutually exclusive.

**interface-name**—Name of the interface. You can repeat this option multiple times.

**overrides**—Override the specified default configuration settings for the interface. The **overrides** statement is described separately.

**upto-interface-name**—Upper end of the range of interfaces; the lower end of the range is the interface-name entry. The interface device name of the **upto-interface-name** must be the same as the device name of the **interface-name**.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## interface (LLDP)

**Syntax**

```
interface (all | interface-name) {
  disable;
  power-negotiation {
    disable;
  }
}
```

**Hierarchy Level** [edit protocols [lldp](#)]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure Link Layer Discovery Protocol (LLDP) on all interfaces or on a specific interface.

**NOTE:** On EX4300 switches, LLDP cannot be configured on the me0 or vme interface. Issuing the command `set protocols lldp interface me0` generates the following error message:

```
error: name: 'me0': Invalid interface
error: statement creation failed: interface
```

Issuing the command `set protocols lldp interface vme` generates the following error message:

```
error: name: 'vme': Invalid interface
error: statement creation failed: interface
```

**Default** None

**Options** **all**—All interfaces on the switch.

***interface-name***—Name of a specific interface.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## interface (LLDP-MED)

**Syntax**

```
interface (all | interface-name) {
  disable;
  location {
    elin number;
    civic-based {
      what number;
      country-code code;
      ca-type {
        number {
          ca-value value;
        }
      }
    }
  }
}
```

**Hierarchy Level** [edit protocols [lldp-med](#)]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) on all interfaces or on a specific interface.

**Default** Not enabled

**Options** **all**—All interfaces on the switch.

***interface-name***—Name of a specific interface.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| Description         | Set the maximum number of DHCP subscribers or DHCP clients per interface allowed for a specific group or for all groups. A group specification takes precedence over a global specification for the members of that group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Default             | No limit                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Options**    *number*—Maximum number of clients allowed.

**Range:** 1 through 500,000

**Required Privilege**    system—To view this statement in the configuration.

**Level**    system-control—To add this statement to the configuration.

## **interface-delete (Subscriber Management or DHCP Client Management)**

**Syntax** interface-delete;

**Hierarchy Level** [edit system services subscriber-management maintain-subscriber]

**Release Information** Statement introduced in Junos OS Release 11.1.  
 Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** On router—Configure the router to maintain, rather than log out, subscribers when the subscriber interface is deleted. By default, the router logs out subscribers when the subscriber interface is deleted.

On switch—Configure the switch to maintain rather than log out DHCP clients when the client interface is deleted. By default, the switch logs out DHCP clients when the client interface is deleted.

**Required Privilege Level** system—To view this statement in the configuration.  
 system-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Specify the information that is excluded from the interface description that the device passes to RADIUS for inclusion in the RADIUS attributes such as NAS-Port-ID (87) or Calling-Station-ID (31).</p> <p>The default format for nonchannelized interfaces is as follows:</p> <p><b><i>interface-type-slot/adapter/port.subinterface[:svlan-vlan]</i></b></p> <p>For example, consider physical interface ge-1/2/0, with a subinterface of 100 and SVLAN identifier of 100. The interface description used in the NAS-Port-ID is ge-1/2/0.100:100. If you exclude the subinterface, the description becomes ge-1/2/0:100.</p> <p>The default format for channelized interfaces is as follows:</p> <p><b><i>interface-type-slot/adapter/channel.subinterface[:svlan-vlan]</i></b></p> <p>The channel information (logical port number) is determined by this formula:</p> <p>Logical port number = 100 + (<i>actual-port-number</i> x 20) + <i>channel-number</i>.</p> <p>For example, consider a channelized interface 3 on port 2 where the:</p> <ul style="list-style-type: none"> <li>Physical interface is xe-0/1/2:3.</li> <li>Subinterface is 4.</li> <li>SVLAN is 5.</li> <li>VLAN is 6.</li> </ul> <p>Using the formula, the logical port number = 100 + (2 x 20) + 3 = 143. Consequently, the default interface description is xe-0/1/143.4-5.6. If you exclude the channel information, the description becomes xe-0/1/2.4-5.6.</p> |
| <b>Options</b>             | <b>exclude-adapter</b> —(Optional) Exclude the adapter from the interface description.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**exclude-channel**—(Optional) Exclude the channel information from the interface description.

**exclude-sub-interface**—(Optional) Exclude the subinterface from the interface description.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## interface-name (DHCP Local Server)

**Syntax** interface-name;

**Hierarchy Level**

```
[edit logical-systems logical-system-name routing-instances routing-instance-name system
services dhcp-local-server ...],
[edit logical-systems logical-system-name system services dhcp-local-server ...],
[edit routing-instances routing-instance-name system services dhcp-local-server ...],
[edit system services dhcp-local-server authentication username-include],
[edit system services dhcp-local-server dhcpv6 authentication username-include],
[edit system services dhcp-local-server dhcpv6 group group-name authentication
username-include],
[edit system services dhcp-local-server group group-name authentication username-include]
```

**Release Information** Statement introduced in Junos OS Release 11.4.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** Specify that the interface name is concatenated with the username during the subscriber authentication or DHCP client authentication process. Use the statement at the **[edit ... dhcpv6]** hierarchy levels to configure DHCPv6 support.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| Syntax              | <pre> interface-traceoptions {   file {     filename ;     files number;     match regular-expression;     size maximum-file-size;     (world-readable   no-world-readable);   }   flag flag;   level (all   error   info   notice   verbose   warning);   no-remote-trace; } </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Hierarchy Level     | <pre> [edit routing-instances routing-instance-name system services dhcp-local-server], [edit system services dhcp-local-server] </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Release Information | Statement introduced in Junos OS Release 10.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Description         | Configure extended DHCP local server tracing operations that can be enabled on a specific interface or group of interfaces. You use the <b>interface interface-name trace</b> statement at the <b>[edit system services group group-name]</b> hierarchy level to enable the tracing operation on the specific interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Options             | <p><b>file-name</b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks (" "). All files are placed in a file named <b>jdhcpd</b> in the directory <b>/var/log</b>. If you include the <b>file</b> statement, you must specify a filename.</p> <p><b>files number</b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all events</li> <li>• <b>dhcpv6-packet</b>—Trace DHCPv6 packet decoding operations.</li> <li>• <b>dhcpv6-packet-option</b>—Trace DHCPv6 option decoding operations.</li> <li>• <b>dhcpv6-state</b>—Trace changes in state for DHCPv6 operations.</li> <li>• <b>packet</b>—Trace packet decoding operations</li> </ul> |

- **packet-option**—Trace DHCP option decoding operations
- **state**—Trace changes in state

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

|                                 |                                                                  |
|---------------------------------|------------------------------------------------------------------|
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.           |
|                                 | interface-control—To add this statement to the configuration.    |

| <b>Description</b>         | <p>Specify the information that is excluded from the interface description that the device passes to RADIUS for inclusion in the RADIUS attributes such as NAS-Port-ID (87) or Calling-Station-ID (31).</p> <p>The default format for nonchannelized interfaces is as follows:</p> <p><b><i>interface-type-slot/adapter/port.subinterface[:svlan-vlan]</i></b></p> <p>For example, consider physical interface ge-1/2/0, with a subinterface of 100 and SVLAN identifier of 100. The interface description used in the NAS-Port-ID is ge-1/2/0.100:100. If you exclude the subinterface, the description becomes ge-1/2/0:100.</p> <p>The default format for channelized interfaces is as follows:</p> <p><b><i>interface-type-slot/adapter/channel.subinterface[:svlan-vlan]</i></b></p> <p>The channel information (logical port number) is determined by this formula:</p> <p>Logical port number = 100 + (<i>actual-port-number</i> x 20) + <i>channel-number</i>.</p> <p>For example, consider a channelized interface 3 on port 2 where the:</p> <ul style="list-style-type: none"> <li>Physical interface is xe-0/1/2:3.</li> <li>Subinterface is 4.</li> <li>SVLAN is 5.</li> <li>VLAN is 6.</li> </ul> <p>Using the formula, the logical port number = 100 + (2 x 20) + 3 = 143. Consequently, the default interface description is xe-0/1/143.4-5.6. If you exclude the channel information, the description becomes xe-0/1/2.4-5.6.</p> |
| <b>Options</b>             | <b>exclude-adapter</b> —(Optional) Exclude the adapter from the interface description.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**exclude-channel**—(Optional) Exclude the channel information from the interface description.

**exclude-sub-interface**—(Optional) Exclude the subinterface from the interface description.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Configure AAA to add Juniper Networks DSL VSAs to the RADIUS authentication and accounting request messages for subscribers. If the router has not received and processed the corresponding ANCP attributes from the access node, then AAA provides only the following in these RADIUS messages:</p> <ul style="list-style-type: none"><li>• Downstream-Calculated-QoS-Rate (IANA 4874, 26-141)—Default configured advisory transmit speed.</li><li>• Upstream-Calculated-QoS-Rate (IANA 4874, 26-142)—Default configured advisory receive speed.</li></ul> |
| <b>Default</b>                  | The Juniper Networks DSL VSAs are not added to the RADIUS authentication and accounting request messages. However, the DSL Forum VSA—if available—is added to RADIUS messages by default.                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Release Information</b> | Statement introduced in Junos OS Release 11.2. Support for curve25519-sha256 added in Junos OS Release 12.1X47-D10.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>         | Specify the set of Diffie-Hellman key exchange methods that the SSH server can use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>             | <p>One or more of the following Diffie-Hellman key exchange methods:</p> <ul style="list-style-type: none"> <li>• <b>curve25519-sha256</b>—The EC Diffie-Hellman key exchange method on Curve25519 with SHA2-256.</li> <li>• <b>dh-group1-sha1</b>—The Diffie-Hellman group1 algorithm using SHA-1.</li> <li>• <b>dh-group14-sha1</b>—The Diffie-Hellman group14 algorithm using SHA-1.</li> <li>• <b>ecdh-sha2-nistp256</b>—The ECDH key exchange method with ephemeral keys generated on the nistp256 curve.</li> <li>• <b>ecdh-sha2-nistp384</b>—The ECDH key exchange method with ephemeral keys generated on the nistp384 curve.</li> <li>• <b>ecdh-sha2-nistp521</b>—The ECDH key exchange method with ephemeral keys generated on the nistp521 curve.</li> <li>• <b>group-exchange-sha1</b>—The group exchange algorithm using SHA-1.</li> <li>• <b>group-exchange-sha2</b>—The group exchange algorithm using SHA-2.</li> </ul> |

**NOTE:** The key-exchange represents a set. To configure key-exchange:

```
user@host#set system services ssh key-exchange [ecdh-sha2-nistp256
group-exchange-sha1]
```

**NOTE:** [Table 53 on page 1084](#) shows the supportability of Diffie-Hellman key exchange methods on FIPS mode.

*Table 53: Supportability of Diffie-Hellman key exchange methods on FIPS mode*

| Diffie-Hellman key exchange methods | Supported on FIPS mode |
|-------------------------------------|------------------------|
| curve25519-sha256                   | No                     |
| dh-group1-sha1                      | No                     |
| dh-group14-sha1                     | Yes                    |
| ecdh-sha2-nistp256                  | Yes                    |
| ecdh-sha2-nistp384                  | Yes                    |
| ecdh-sha2-nistp521                  | Yes                    |
| group-exchange-sha1                 | No                     |
| group-exchange-sha2                 | No                     |

**Required Privilege Level** system—To view this statement in the configuration.

| <b>Description</b>              | Override the setting of the broadcast bit in DHCP request packets and instead use the Layer 2 unicast transmission method to transmit DHCP Offer reply packets and DHCP ACK reply packets from the DHCP server to DHCP clients during the discovery process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## lldp

**Syntax**

```
lldp {
  advertisement-interval seconds;
  disable;
  hold-multiplier number;
  interface (all | [interface-name]) {
    disable;
    power-negotiation {
      disable;
    }
  }
  lldp-configuration-notification-interval seconds;
  management-address ip-management-address;
  mau-type
  netbios-snooping;
  no-tagging;
  ptopo-configuration-maximum-hold-time seconds;
  ptopo-configuration-trap-interval seconds;
  traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable>
      <no-stamp> <replace>;
    flag flag <disable>;
  }
  transmit-delay seconds;
  vlan-name-tlv-option (name | vlan-id);
}
```

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.  
Statement introduced in Junos OS Release 11.1 for QFX Series.

**Description** Configure Link Layer Discovery Protocol (LLDP). The switch uses LLDP to advertise its identity and capabilities on a LAN, as well as to receive information about other network devices. LLDP is defined in the IEEE standard 802.1AB-2005.

The remaining statements are explained separately. See [CLI Explorer](#).

**NOTE:** The `transmit-delay` and `netbios-snooping` options are not available on QFabric systems.

**NOTE:** On EX4300 switches, LLDP cannot be configured on the `me0` or `vme0` interface. Issuing the command `set protocols lldp interface me0` generates the following error message:

```
error: name: 'me0': Invalid interface
error: statement creation failed: interface
```

Issuing the command `set protocols lldp interface vme` generates the following error message:

```
error: name: 'vme': Invalid interface
error: statement creation failed: interface
```

.....

**Default** LLDP is enabled.

The following statements have default values:

- **advertisement-interval**—The default value is 30 seconds. The allowable range is from 5 through 32768 seconds.
- **hold-multiplier**—The default values is 4. The allowable range is from 2 through 10.
- **ptopo-configuration-maximum-hold-time**—The default value is 300 seconds. The allowable range is from 1 through 2147483647 seconds.
- **transmit-delay**—The default values is 2 seconds. The allowable range is from 1 through 8192 seconds.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## lldp-med (Ethernet Switching)

**Syntax**

```
lldp-med {
  disable;
  fast-start number;
  interface (all | interface-name) {
    disable;
    location {
      elin number;
      civic-based {
        what number;
        country-code code;
        ca-type {
          number {
            ca-value value;
          }
        }
      }
    }
  }
}
```

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure Link Layer Discovery Protocol–Media Endpoint Discovery. LLDP-MED is an extension of LLDP. The switch uses LLDP-MED to support device discovery of VoIP telephones and to create location databases for these telephone locations for emergency services. LLDP-MED is defined in the standard ANSI/TIA-1057 by the Telecommunications Industry Association (TIA).

The remaining statements are explained separately. See [CLI Explorer](#).

**Default** Disabled.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| Release Information      | Statement introduced in Junos OS Release 15.1R5 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Description              | Configure the interval between transmissions to be made during a fast transmission period. A device that is enabled with Link Layer Discovery Protocol (LLDP) transmits LLDP packets to neighboring nodes at a specified time interval. Fast transmission periods are initiated when a new neighbor is detected, and cause LLDP packets to be transmitted at a shorter time interval than during normal operation of the protocol. The fast transmission period ensures that more than one LLDP packet is transmitted when a new neighbor is detected. The first transmission is immediate, and the subsequent transmissions occur at the specified fast transmission (TX) interval. |
| Options                  | <b>seconds</b> —Specify the number of seconds between transmissions that occur during the fast transmission period.<br><b>Range:</b> 1 through 8 seconds<br><b>Default:</b> 1 second                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## location

**Syntax**

```
location {
  altitude feet;
  building name;
  country-code code;
  floor number;
  hcoord horizontal-coordinate;
  lata service-area;
  latitude degrees;
  longitude degrees;
  npa-nxx number;
  postal-code postal-code;
  rack number;
  vcoord vertical-coordinate;
}
```

**Hierarchy Level** [edit system]

**Release Information** Statement introduced in Junos OS Release 8.5.

**Description** Configure the physical location of the device.

- Options**
- **altitude *feet***—Number of feet above sea level.
  - **building *name***—Name of building. The name of the building can be 1 to 28 characters in length. If the string contains spaces, enclose it in quotation marks (" ").
  - **country-code *code***—Two-letter country code.
  - **floor *number***—Floor number in the building.
  - **hcoord *horizontal-coordinate***—Bellcore Horizontal Coordinate.
  - **lata *service-area***—Long-distance service area.
  - **latitude *degrees***—Latitude in degree format.
  - **longitude *degrees***—Longitude in degree format.
  - **npa-nxx *number***—First six digits of the phone number (area code and exchange).
  - **postal-code *postal-code***—Zip code or Postal code.
  - **rack *number***—Rack number.
  - **vcoord *vertical-coordinate***—Bellcore Vertical Coordinate.

**Required Privilege Level**

system—To view this statement in the configuration.

system-control—To add this statement to the configuration.

## location (SNMP)

## location (LLDP-MED)

**Syntax**

```
location {
  elin number;
  civic-based {
    what number;
    country-code code;
    ca-type {
      number {
        ca-value value;
      }
    }
  }
}
```

**Hierarchy Level** [edit protocols [lldp-med interface](#) (all | *interface-name*)]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** For Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED), configure the location information. Location information is advertised from the switch to the MED. This information is used during emergency calls to identify the location of the MED.

The remaining statements are explained separately. See [CLI Explorer](#).

**Default** Disabled.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## login

**Syntax**

```
login {
  announcement text;
  class class-name {
    allow-commands "regular-expression";
    allow-configuration-regexps "regular expression 1" "regular expression 2";
    cli {
      prompt name;
    }
    configuration-breadcrumbs;
    deny-commands "regular-expression";
    ( deny-configuration | deny-configuration-regexps ) "regular expression 1" "regular
      expression 2 ";
    idle-timeout minutes;
    login-script filename;
    login-tip;
    permissions [ permissions ];
  }
  message text;
  password {
    change-type (set-transitions | character-set);
    format (md5 | sha1 | des);
    maximum-length length;
    minimum-changes number;
    minimum-length length;
  }
  retry-options {
    backoff-threshold number;
    backoff-factor seconds;
    minimum-time seconds;
    tries-before-disconnect number;
  }
  user username {
    authentication {
      cli {
        prompt name;
      }
      class class-name;
      (encrypted-password "password" | plain-text-password);
      full-name complete-name;
      load-key-file URL filename;
      ssh-dsa "public-key" <from hostname>;
      ssh-rsa "public-key" <from hostname>;
      uid uid-value;
    }
  }
}
```

**Hierarchy Level** [edit system]

**Release Information** Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure user access to the router or switch.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Related Documentation** • [Defining Junos OS Login Classes on page 51](#)

## login-alarms

**Syntax** login-alarms;

**Hierarchy Level** [edit system login class *class-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Show system alarms automatically when an **admin** user logs in to the router or switch.

**Options** *class-name*—Login class name.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Related Documentation** • [Configuring System Alarms to Appear Automatically Upon Login on page 54](#)

## login-script (Op Scripts)

---

|                                 |                                                                                                                                         |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | login-script <i>filename</i> ;                                                                                                          |

| Release Information      | Statement introduced in Junos OS Release 17.4R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Description              | Enable the <b>log-key-changes</b> to log the authorised SSH keys. When the <b>log-key-changes</b> configuration statement is enabled and committed, Junos OS logs the changes to the set of authorized SSH keys for each user (including the keys that were added or removed). Junos OS logs the differences since the last time the <b>log-key-changes</b> configuration statement was enabled. If the <b>log-key-changes</b> configuration statement was never enabled, then Junos OS logs all the authorized SSH keys. |

| Description              | <p>Configure MAC RADIUS authentication for specific interfaces. MAC RADIUS authentication allows LAN access to permitted MAC addresses. When a new MAC address appears on an interface, the switch consults the RADIUS server to check whether the MAC address is a permitted address. If the MAC address is configured on the RADIUS server, the device is allowed access to the LAN.</p> <p>If MAC RADIUS is configured, the switch first tries to get a response from the host for 802.1X authentication. If the host is unresponsive, the switch attempts to authenticate using MAC RADIUS.</p> <p>To restrict authentication to MAC RADIUS only, use the <b>restrict</b> option. In restrictive mode, all 802.1X packets are eliminated and the attached device on the interface is considered a nonresponsive host.</p> |
| Options                  | <p><b>flap-on-disconnect</b>—(Optional) When the RADIUS server sends a disconnect message to a supplicant, the switch resets the interface on which the supplicant is authenticated. If the interface is configured for multiple supplicant mode, the switch resets all the supplicants on the specified interface. This option takes effect only when the <b>restrict</b> option is also set.</p> <p><b>restrict</b>—(Optional) Restricts authentication to MAC RADIUS only. When <b>mac-radius restrict</b> is configured the switch drops all 802.1X packets. This option is useful when no other 802.1X authentication methods, such as guest VLAN, are needed on the interface, and eliminates the delay that occurs while the switch determines that a connected device is a non-802.1X-enabled host.</p>               |

**NOTE:** The *macs* configuration statement represents a set. Therefore, it must be configured as shown in the following example.

```
user@host#set system services ssh macs [hmac-md5 hmac-sha1]
```

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.5 for EX Series switches.<br>Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.<br>Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                         |
| <b>Description</b>              | Specify the management address to be used in LLDP Management Address type, length, and value (TLV) messages. The Management Address TLV typically contains the IPv4 or IPv6 management addresses of the local system. Only out-of-band management addresses must be used for the management-address. Other remote managers can use this address to obtain information related to the local device. |
| <b>Default</b>                  | The LLDP Management Address TLV uses the IP address of the switch's management Ethernet interface ( <b>me0</b> ), or the IP address of the virtual management Ethernet (VME) interface if the switch is a Virtual Chassis member.                                                                                                                                                                  |
| <b>Options</b>                  | <i>ip-management-address</i> —You can specify either an IPv4 or an IPv6 management address for the switch.                                                                                                                                                                                                                                                                                         |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | <p>Master password for \$8\$-based password-encryption. The master password is used as input to the password based key derivation function (PBKDF2) to generate an encryption key. The key is used as input to the Advanced Encryption Standard in Galois/Counter Mode (AES256-GCM). The plain text that the user enters is processed by the encryption algorithm (with key) to produce the encrypted text (cipher text).</p>                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                  | <p><b>plain-text-password</b>—Set the master password with plain text. The password quality is evaluated for strength, and the device gives feedback if weak passwords are used.</p> <p><b>iteration-count</b>—The number of iterations to use for the PBKDF2 hash function. The iteration count slows the hashing count, thus slowing attacker guesses.</p> <p><b>Default:</b> 100</p> <p><b>Range:</b> 10-10000</p> <p><b>pseudorandom-function</b>—Choose the algorithm to use for unpredictable number generation</p> <p><b>Values:</b></p> <ul style="list-style-type: none"> <li>• <b>hmac-sha1</b>—Hash-based MAC using secure hash algorithm-1 (SHA-1)</li> <li>• <b>hmac-sha2-256</b>—256-bits of hash-based MAC using SHA-2</li> <li>• <b>hmac-sha2-512</b>—512-bits of hash-based MAC using SHA-2</li> </ul> |
| <b>Required Privilege Level</b> | admin                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Description              | <p>Limit the number of outstanding requests that the Diameter-based application (function) can retry to a remote server when the requests are improperly answered. Too many requests risks overloading the server and increases the chance of losing messages.</p> <p>The <b>gx-plus</b> statement limits retries from the Gx-Plus function to the Gx-Plus server using the Gx and JSRC protocols. The <b>ocs</b> statement limits retries from the OCS function to the OCS server using the Gy protocol. The <b>pcrf</b> statement limits retries from the PCRF function to the PCRF server using the Gx protocol.</p> |

| Description              | <p>Configure the switch to advertise information about the medium attachment unit (MAU) type. The MAU is a transceiver that interconnects the attachment unit interface (AUI) port on an attached host computer to an Ethernet cable. MAU types are defined in the IEEE 802.3 standard.</p> <p>The MAU type is included in the MAC/PHY Configuration Status type, length, and value (TLV) message. TLVs are used by LLDP-capable devices to transmit information to neighbor devices. The MAC/PHY Configuration Status TLV is an organizationally defined TLV that advertises information about the physical interface. In addition to the MAU type, the MAC/PHY Configuration Status TLV also includes information such as autonegotiation status, support and advertised capabilities.</p> <p>The MAU type cannot be changed by configuration; however, you must configure the <b>mau-type</b> statement to include the MAU type value in the MAC/PHY Configuration Status TLV.</p> |
| Default                  | If the <b>mau-type</b> statement is not configured, the MAU type field of the MAC/PHY Configuration Status TLV contains the value <b>Unknown</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 18.4R1 for ACX Series, EX Series, QFX Series, MX Series, PTX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | <p>Specify the maximum password lifetime in days. A user who has the required permissions is able to control the maximum lifetime of a password. If the age of the password reaches the maximum lifetime configured, the password expires and has to be changed. If your password has expired, you cannot commit the configuration until the password is changed. Password expiry is applicable only for local user accounts.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                                 | <p> <b>NOTE:</b> You cannot configure the same password every time the password expires. Older passwords cannot be configured on password expiry. Therefore, <code>maximum-lifetime</code> can be committed only after configuring <code>minimum-reuse</code>, else commit fails and error is displayed on commit.</p> <p>If <code>maximum-lifetime</code> is configured, password expiry validation check is performed at the time of login and at the time of commit based on the password timestamp. For passwords configured before <code>minimum-reuse</code> configuration is committed, the timestamp of the passwords is the time at which any configuration under system login hierarchy is committed following the commit for <code>minimum-reuse</code>. For passwords configured after <code>minimum-reuse</code> configuration is committed, the timestamp of the passwords is the time at which those passwords are committed.</p> |
| <b>Options</b>                  | <p><b>days</b>—The maximum duration of a password where the password expires after the maximum duration is reached.</p> <p><b>Range:</b> 30-365</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## mib-profile

---

**Syntax** `mib-profile profile-name {  
    file filename;  
    interval minutes;  
    object-names {  
        mib-object-name;  
    }  
    operation operation-name;  
}`

**Hierarchy Level** [edit accounting-options]

**Release Information** Statement introduced in Junos OS Release 8.2.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Create a MIB profile to collect selected MIB statistics and write them to a file in the `/var/log` directory.

**NOTE:** Do not configure MIB objects related to interface octets or packets for a MIB profile, because it can cause the SNMP walk or a CLI show command to time out.

**Options** *profile-name*—Name of the MIB statistics profile.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | <p>Specify the minimum number of character sets (or character set changes) required in plain-text passwords. Newly created passwords must meet this requirement.</p> <p>This statement is used in combination with the <b>change-type</b> statement. If the change-type is <b>character-sets</b>, then the number of character sets included in the password is checked against the specified minimum. If change-type is <b>set-transitions</b>, then the number of character set changes in the password is checked against the specified minimum.</p> |
| <b>Default</b>                  | For Junos OS, the minimum number of changes is 1. For Junos-FIPS Software, the minimum number of changes is 3.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                  | <i>number</i> —The minimum number of character sets (or character set changes) required for the password.                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 18.3R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | <p>Specify the minimum number of character changes between old and new passwords. Newly created passwords must meet this requirement. A user who has the required permissions is able to configure the number of character changes between passwords. If the number of character changes between the old password and new password is greater than or equal to the configured value for minimum number of character changes, new password is accepted and if it is less, new password is rejected.</p> |
| <b>Options</b>                  | <p><b>number</b>—The minimum number of character changes between old and new passwords.<br/><b>Range:</b> 4 to 15 characters</p>                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.<br/>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>              | <p>Configure the minimum intervals at which the local routing device transmits hello packets and then expects to receive a reply from a neighbor with which it has established a BFD session. This value represents the minimum interval at which the local routing device transmits hello packets as well as the minimum interval that the routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the <b>transmit-interval</b> <b>minimal-interval</b> and <b>minimum-receive-interval</b> statements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | <p>Specify the minimum number of characters required in plain-text passwords. Newly created passwords must meet this requirement.</p> <p>This statement can be used in combination with all of the other requirement options for plain-text passwords, such as <b>minimum-upper-cases</b>, <b>minimum-punctuations</b>, <b>minimum-lower-cases</b>, and so on.</p> <p>Using several password minimum requirement options will cause the <b>minimum-length</b> to be reset if the total sum of the required minimums exceeds the <b>minimum-length</b> setting.</p> |
| <b>Default</b>                  | For Junos OS, the minimum number of characters for plain-text passwords is six. For Junos-FIPS software, the minimum number of characters for plain-text passwords is 10.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                  | <b>length</b> —The minimum number of characters the password must include.<br><b>Range:</b> 6 to 20 characters                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 18.4R1 for ACX Series, EX Series, QFX Series, MX Series, PTX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | <p>Specify the minimum password lifetime in days. A user who has the required permissions is able to control the minimum lifetime of a password. You cannot change the password if the age of the password does not exceed the minimum lifetime value configured. When you change a password, the age of the existing password is retrieved based on the time at which the password was configured and the current time is fetched. If the age of the password is less than or equal to the configured value for <b>minimum-lifetime</b>, the new password is not accepted and error message is displayed. If the age of the password is more than the configured value for <b>minimum-lifetime</b>, the new password is accepted. .</p>                                                                                                                                                                            |
|                                 | <p> <b>NOTE:</b> <b>minimum-lifetime</b> can be committed only after configuring <b>minimum-reuse</b> as minimum lifetime works in coordination with password history requirements, else commit fails and error is displayed on commit.</p> <p>If <b>minimum-lifetime</b> is configured, password change for a user is accepted or rejected based on the timestamp of the current password for that user. For passwords configured before <b>minimum-reuse</b> configuration is committed, the timestamp of the passwords is the time at which any configuration under system login hierarchy is committed following the commit for <b>minimum-reuse</b>. For passwords configured after <b>minimum-reuse</b> configuration is committed, the timestamp of the passwords is the time at which those passwords are committed.</p> |
| <b>Options</b>                  | <p><b>days</b>—The minimum duration of a password. You cannot change the password until the minimum duration is reached.</p> <p><b>Range:</b> 1-30 days</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Release Information      | Statement introduced in Junos OS Release 12.1.<br>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Description              | <p>Specify the minimum number of lower-case letters required in plain-text passwords. Newly created passwords must meet this requirement.</p> <p>This statement can be used in combination with all of the other requirement options for plain-text passwords, such as <b>minimum-length</b>, <b>minimum-punctuations</b>, <b>minimum-upper-cases</b>, and so on.</p> <p>Using several password minimum requirement options will cause the <b>minimum-length</b> to be reset if the total sum of the required minimums exceeds the <b>minimum-length</b> setting.</p> |
| Options                  | <i>number</i> —The minimum number of lower-case letters required for the password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 18.3R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | <p>Specify the the number of old passwords which should not match the new password. Newly created passwords must meet this requirement. A user who has the required permissions is able to control the number of old passwords that need to be compared. The number of old passwords to compare with the new password depends on the value configured. If a match is found between the new password and any of the old passwords, Junos OS device rejects the new password and aborts. If the new password is different from the configured number of old passwords, new password is accepted.</p> |
| <b>Options</b>                  | <p><b>number</b>—The minimum number of old passwords which should not match the new password.</p> <p><b>Range:</b> 1 to 20 passwords</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.1.<br>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | <p>Specify the minimum number of punctuation class characters required in plain-text passwords. Newly created passwords must meet this requirement.</p> <p>This statement can be used in combination with all of the other requirement options for plain-text passwords, such as <b>minimum-length</b>, <b>minimum-upper-cases</b>, <b>minimum-lower-cases</b>, and so on.</p> <p>Using several password minimum requirement options will cause the <b>minimum-length</b> to be reset if the total sum of the required minimums exceeds the <b>minimum-length</b> setting.</p> |
| <b>Options</b>                  | <i>number</i> —The minimum number of punctuation class characters required for the password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Description              | <p>Specify the minimum number of upper-case letters required in plain-text passwords. Newly created passwords must meet this requirement.</p> <p>This statement can be used in combination with all of the other requirement options for plain-text passwords, such as <b>minimum-length</b>, <b>minimum-punctuations</b>, <b>minimum-lower-cases</b>, and so on.</p> <p>Using several password minimum requirement options will cause the <b>minimum-length</b> to be reset if the total sum of the required minimums exceeds the <b>minimum-length</b> setting.</p> |
| Options                  | <i>number</i> —The minimum number of upper-case letters required for the password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Description</b>              | <p>To set the minimum allowed number of seconds in the secs field of the BOOTP message, include the minimum-wait-time statement. This setting configures a minimum number of seconds since the client sent its first BOOTP request. BOOTP messages that have a smaller number in the secs field than the allowed minimum are not forwarded. The default value for the minimum wait time is zero (0).</p> <p>The default value for the minimum wait time is zero (0) seconds. If the minimum wait time is 0 and the secs field in the BOOTP request message is 0, the device forwards the packet.</p> |
| <b>Options</b>                  | <p><b><i>seconds</i></b>—Minimum wait time the BOOTP client has waited before packets are forwarded.</p> <p><b>Range:</b> 0 to 30,000</p> <p><b>Default:</b> 0</p>                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b> | Statement introduced in Junos OS Release 18.3R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>         | <p>Configure multi-domain authentication to restrict the number of authenticated data and VoIP sessions on the port. Multi-domain authentication is an extension of multiple supplicant mode for 802.1X authentication, and is designed to support VoIP and data clients on the same interface. The interface is divided into two domains; one is the data domain and the other is the voice domain.</p> <p>In multiple supplicant mode, any number of VoIP or data sessions can be authenticated; the number of sessions can be restricted using MAC limiting, but there is no way to apply the limit specifically to either data or VoIP sessions. Multi-domain authentication maintains separate session counts based on the domain type.</p> <p>The data device can be authenticated using 802.1X authentication or MAC RADIUS authentication. Multi-domain authentication does not enforce the order of authentication. For best results, the VoIP device should be authenticated before the data device.</p> <p>You can configure the maximum number of authenticated data sessions allowed on the interface using the <b>max-data-session</b> statement. The number of VoIP sessions is not configurable; only one authenticated VoIP session is allowed.</p> <p>If a new client attempts to authenticate on the interface after the maximum session count has been reached, the default action is to drop the packet and generate an error log message. You can also configure the action to shut down the interface. The port can be manually recovered from the down state by issuing the <b>clear dot1x recovery-timeout</b> command, or can recover automatically after a recovery timeout period. To configure automatic recovery, use the <b>recovery-timeout</b> option.</p> |
| <b>Options</b>             | <p><b>max-data-session <i>max-data-sessions</i></b>—The number of authenticated data sessions are allowed in the data domain on the 802.1X interface.</p> <p><b>Range:</b> 1 through 1,000 sessions</p> <p><b>Default:</b> 1</p> <p><b>packet-action (drop-and-log   shutdown)</b>—Define the action the switch should take on packets that exceed the limit of authenticated sessions allowed on the interface. The number of data sessions is configured using the <b>max-data-session</b> option. number of VoIP sessions is not configurable; only one authenticated VoIP session is allowed.

- **drop-and-log**—Drop the packet and generate an error syslog message.
- **shutdown**—Shut down the interface.

**Default:** The default packet action is to drop the packet and generate an error syslog message.

**recovery-timeout seconds**—If you configure the packet action with the shutdown option and you enable the recovery timeout, the interface is temporarily disabled when the maximum number of authenticated sessions is reached. The interface will recover automatically after the number of seconds specified.

**Range:** 60 through 3600 seconds

**Default:** none

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## multicast-client

**Syntax** multicast-client <address>;

**Hierarchy Level** [edit system ntp]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** For NTP, configure the SRX Series device to listen for multicast messages on the local network to discover other servers on the same subnet.

**Options** **address**—(Optional) One or more IP addresses. If you specify addresses, the SRX Series device joins those multicast groups.

**Default:** 224.0.1.1.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## nas-port-extended-format

**Syntax**

```
nas-port-extended-format {
  adapter-width bits;
  ae-width bits;
  atm {
    adapter-width bits;
    port-width bits;
    slot-width bits;
    vci-width bits;
    vpi-width bits;
  }
  port-width bits;
  pw-width bits;
  slot-width bits;
  stacked-vlan-width bits;
  vlan-width bits;
}
```

**Hierarchy Level** [edit access profile *profile-name* radius [options](#)]

**Release Information** Statement introduced in Junos OS Release 9.1.  
 Statement introduced in Junos OS Release 9.1 for EX Series switches.  
**ae-width** option added in Junos OS Release 12.1.  
**atm** option added in Junos OS Release 12.3R3 and supported in later 12.3Rx releases.  
**atm** option supported in Junos OS Release 13.2 and later releases. (Not supported in Junos OS Release 13.1.)  
**pw-width** option added in Junos OS Release 15.1.

**Description** Configure the RADIUS client to use the extended format for RADIUS attribute 5 (NAS-Port) and specify the width in bits of the fields in the NAS-Port attribute.

The NAS-Port attribute specifies the physical port number of the NAS that is authenticating the user, and is formed by a combination of the physical port's slot number, port number, adapter number, VLAN ID, and S-VLAN ID. The NAS-Port extended format specifies the number of bits (bit width) for each field in the NAS-Port attribute: slot, adapter, port, aggregated, Ethernet, VLAN, and S-VLAN.

**NOTE:** The combined total of the widths of all fields for a subscriber must not exceed 32 bits, or the configuration fails. The router may truncate the values of individual fields depending on the bit width you specify.

**Options** **adapter-width *width***—Number of bits in the adapter field.

**ae-width *width***—(Ethernet subscribers only) Number of bits in the aggregated Ethernet identifier field.

**atm**—Specify width for fields for ATM subscribers.

**port-width *width***—Number of bits in the port field.

**pw-width *width***—(Ethernet subscribers only) Number of bits in the pseudowire field.  
Appears in the Cisco NAS-Port-Info AVP (100).

**slot-width *width***—Number of bits in the slot field.

**stacked-vlan-width *width***—Number of bits in the SVLAN ID field.

**vci-width *width***—(ATM subscribers only) Number of bits in the ATM virtual circuit identifier (VCI) field.

**vlan-width *width***—Number of bits in the VLAN ID field.

**vpi-width *width***—(ATM subscribers only) Number of bits in the ATM virtual path identifier (VPI) field.

**NOTE:** The total of the widths must not exceed 32 bits, or the configuration will fail.

## nas-port-extended-format

**Syntax**

```
nas-port-extended-format {
  adapter-width bits;
  ae-width bits;
  atm {
    adapter-width bits;
    port-width bits;
    slot-width bits;
    vci-width bits;
    vpi-width bits;
  }
  port-width bits;
  pw-width bits;
  slot-width bits;
  stacked-vlan-width bits;
  vlan-width bits;
}
```

**Hierarchy Level** [edit access profile *profile-name* radius [options](#)]

**Release Information** Statement introduced in Junos OS Release 9.1.  
 Statement introduced in Junos OS Release 9.1 for EX Series switches.  
**ae-width** option added in Junos OS Release 12.1.  
**atm** option added in Junos OS Release 12.3R3 and supported in later 12.3Rx releases.  
**atm** option supported in Junos OS Release 13.2 and later releases. (Not supported in Junos OS Release 13.1.)  
**pw-width** option added in Junos OS Release 15.1.

**Description** Configure the RADIUS client to use the extended format for RADIUS attribute 5 (NAS-Port) and specify the width in bits of the fields in the NAS-Port attribute.

The NAS-Port attribute specifies the physical port number of the NAS that is authenticating the user, and is formed by a combination of the physical port's slot number, port number, adapter number, VLAN ID, and S-VLAN ID. The NAS-Port extended format specifies the number of bits (bit width) for each field in the NAS-Port attribute: slot, adapter, port, aggregated, Ethernet, VLAN, and S-VLAN.

**NOTE:** The combined total of the widths of all fields for a subscriber must not exceed 32 bits, or the configuration fails. The router may truncate the values of individual fields depending on the bit width you specify.

**Options** **adapter-width *width***—Number of bits in the adapter field.

**ae-width *width***—(Ethernet subscribers only) Number of bits in the aggregated Ethernet identifier field.

**atm**—Specify width for fields for ATM subscribers.

**port-width *width***—Number of bits in the port field.

**pw-width *width***—(Ethernet subscribers only) Number of bits in the pseudowire field.  
Appears in the Cisco NAS-Port-Info AVP (100).

**slot-width *width***—Number of bits in the slot field.

**stacked-vlan-width *width***—Number of bits in the SVLAN ID field.

**vci-width *width***—(ATM subscribers only) Number of bits in the ATM virtual circuit identifier (VCI) field.

**vlan-width *width***—Number of bits in the VLAN ID field.

**vpi-width *width***—(ATM subscribers only) Number of bits in the ATM virtual path identifier (VPI) field.

**NOTE:** The total of the widths must not exceed 32 bits, or the configuration will fail.

| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.</p> <p>Options <b>interface-text-description</b>, <b>order</b>, and <b>postpend-vlan-tags</b> introduced in Junos OS Release 15.1.</p>                                                                                                                             |
| <b>Description</b>         | <p>Specify the optional information that the router includes in the NAS-Port-ID (RADIUS attribute 87) that is passed to the RADIUS server during authentication and accounting. You can include any combination of the optional values.</p> <p>When you specify the values for the NAS-Port-ID, you can configure the values to appear in either the default order or a custom order of your choice.</p> |

**NOTE:** The default and custom order methods are mutually exclusive. The configuration fails if you attempt to configure a NAS-Port-ID that includes values in both types of orders.

To specify that the optional values appear in the default order in the NAS-Port-ID, configure the values directly under the **nas-port-id-format** statement. The default order is as follows, in which the **#** character is the delimiter:

```
nas-identifier # interface-description # interface-text-description # agent-circuit-id #
agent-remote-id # postpend-vlan-tags
```

To specify a custom order for the NAS-Port-ID string, you use the **order** option. Include the **order** option before each optional value you want to include in the string, in the order in which you want the options to appear. For example, the configuration, **order interface-text-description order nas-identifier order agent-remote-id** produces the following NAS-Port-ID, in which the **#** character is the delimiter:

```
interface-text-description # nas-identifier # agent-remote-id
```

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>                  | The router includes the interface description in the NAS-Port-ID when no optional values are specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>                  | <p><b>agent-circuit-id</b>—Include the agent circuit ID from either DHCP option 82 or the DSL forum VSAs.</p> <p><b>agent-remote-id</b>—Include the agent remote ID from either DHCP option 82 or the DSL forum VSAs.</p> <p><b>interface-description</b>—Include the interface description (interface identifier).</p> <p><b>interface-text-description</b>—Include the textual interface description (the text description that is statically configured in the CLI).</p> <p><b>nas-identifier</b>—Include the NAS identifier value (RADIUS attribute 32).</p> <p><b>order</b>—Specify the optional values you want to include in the NAS-Port-ID and the customized order in which you want the values to appear. You must include the <b>order</b> option before each optional value (for example, <b>order agent-circuit-id order interface-description</b>).</p> <p><b>postpend-vlan-tags</b>—Include the VLAN tags. The router includes the tags in the format <b>:&lt;outer-tag&gt;-&lt;inner-tag&gt;</b> for a double-tagged VLAN, or <b>:&lt;outer-tag&gt;</b> for a single-tagged VLAN.</p> |

## nas-port-type (Subscriber Management)

**Syntax**

```
nas-port-type {
  ethernet {
    port-type;
  }
}
```

**Hierarchy Level** [edit access profile *profile-name* radius [options](#)]

**Release Information** Statement introduced in Junos OS Release 11.4.  
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description** Specify the port type used to authenticate subscribers. The router includes the port type in RADIUS attribute 61 (NAS-Port-Type attribute).

**NOTE:** This statement is ignored if the [ethernet-port-type-virtual](#) statement is included in the same access profile.

**Default** The router uses a port type of **ethernet**.

**Options** *port-type*—One of the following port types:

- *value*—A value from 0-65535
- **adsl-cap**—Asymmetric DSL, carrierless amplitude phase (CAP) modulation
- **adsl-dmt**—Asymmetric DSL, discrete multitone (DMT)
- **async**—Asynchronous
- **cable**—Cable
- **ethernet**—Ethernet
- **fddi**—Fiber Distributed Data Interface
- **g3-fax**—G.3 Fax
- **hdlc-clear-channel**—HDLC Clear Channel
- **iapp**—Inter-Access Point Protocol (IAPP)
- **isdsl**—ISDN DSL
- **isdsl-sync**—ISDN Synchronous
- **isdsl-async-v110**—ISDN Async V.110
- **isdsl-async-v120**—ISDN Async V.120

- **piafs**—Personal Handyphone System (PHS) Internet Access Forum Standard
- **sdsl**—Symmetric DSL
- **sync**—Synchronous
- **token-ring**—Token Ring
- **virtual**—Virtual
- **wireless**—Other wireless
- **wireless-1x-ev**—Wireless 1xEV
- **wireless-cdma2000**—Wireless code division multiple access (CDMA) 2000
- **wireless-ieee80211**—Wireless 802.11
- **wireless-umts**—Wireless universal mobile telecommunications system (UMTS)
- **x25**—X.25
- **x75**—X.75
- **xdsl**—DSL of unknown type

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## neighbor-discovery-router-advertisement (Access)

**Syntax** neighbor-discovery-router-advertisement *ndra-pool-name*;

**Hierarchy Level** [edit access address-assignment]

**Release Information** Statement introduced in Junos OS Release 10.4.

**Description** Configure the name of the address-assignment pool used to assign the router advertisement prefix.

**Options** *ndra-pool-name*—Name of the address assignment pool.

**Required Privilege Level** access—To view this statement in the configuration.  
access-control—To add this statement to the configuration.

| Release Information | Statement introduced in Junos OS Release 14.1X53-D40 and Release 15.1R5 and Release 16.1R3 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Description         | <p>Configure the type of Link Layer Discovery Protocol (LLDP) neighbor port information that the switch displays in the <b>Port info</b> field in the output of the <a href="#">show lldp neighbors</a> CLI command.</p> <p>Devices in a network use LLDP to learn about and identify neighbor devices. LLDP-capable devices transmit information in type, length, and value (TLV) messages to neighbor devices.</p> <p>The <b>Port info</b> field of the <b>show lldp neighbors</b> command displays the port information received from LLDP neighbors. This information is sent from the LLDP neighbor to the switch in a type, length, and value (TLV) message. You can use the <b>neighbor-port-info-display</b> CLI statement to configure the switch to display the information contained in either the Port Description TLV or the Port Identification TLV.</p> <p>By default, the information contained in the Port Description TLV is used for the port information and is displayed in the <b>Port info</b> field. The Port Description TLV contains the textual description of the logical unit or the port. The description for the logical unit is used, if available; otherwise, the description for the physical interface (port) is used. For example, LAG member interfaces do not contain a logical unit; therefore, only the description configured on the physical interface is used.</p> <p>The Port Identification TLV contains the identifier for the neighbor port. The SNMP index of the interface is used as the port identifier.</p> |
| Default             | On EX Series switches, the <b>Port info</b> field in the output of the <b>show lldp neighbors</b> CLI command displays the Port Description TLV.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Options             | <p><b>port-description</b>—Configure this option to display the Port Description TLV in the <b>Port info</b> field of the <b>show lldp neighbors</b> CLI command.</p> <p><b>port-id</b>—Configure this option to display the Port Identification TLV in the <b>Port info</b> field of the <b>show lldp neighbors</b> CLI command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>              | <p>Dynamically configure the next-hop address for an access route. Access routes are typically unnumbered interfaces.</p> <p>The next-hop gateway can be specified explicitly in the framed route, as either the subscriber's fixed address (common for business subscribers) or 0.0.0.0. Alternatively, the absence of the gateway address implies address 0.0.0.0. The address 0.0.0.0, whether implicit or explicitly configured, resolves to the subscriber's assigned address (host route).</p> <p>If the RADIUS Framed-Route attribute (22) or Framed-IPv6-Route attribute [99] does not specify the next-hop gateway—as is common—the variable representing the next-hop automatically resolves to the subscriber's IP address.</p> |
| <b>Options</b>                  | <p><i>next-hop</i>—Either the specific next-hop address you want to assign to the access route or one of the following next-hop address predefined variables.</p> <ul style="list-style-type: none"> <li>For IPv4 access routes, use the variable, <b>\$junos-framed-route-nexthop</b>. The route prefix variable is dynamically replaced with the value in Framed-Route RADIUS attribute [22].</li> <li>For IPv6 access routes, use the variable, <b>\$junos-framed-route-ipv6-nexthop</b>. The variable is dynamically replaced with the value in Framed-IPv6-Route RADIUS attribute [99].</li> </ul>                                                                                                                                    |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## no-vlan-interface-name

**Syntax** no-vlan-interface-name;

**Hierarchy Level**

```
[edit forwarding-options dhcp-relay dhcpv6 (relay-agent-interface-id |
relay-agent-remote-id)],
[edit forwarding-options dhcp-relay dhcpv6 group group-name (relay-agent-interface-id |
relay-agent-remote-id)],
[edit forwarding-options dhcp-relay relay-option-82 (circuit-id | remote-id)],
[edit forwarding-options dhcp-relay group group-name relay-option-82 (circuit-id |
remote-id)],
[edit logical-systems logical-system-name ... forwarding-options dhcp-relay dhcpv6
(relay-agent-interface-id | relay-agent-remote-id)],
[edit logical-systems logical-system-name ... forwarding-options dhcp-relay ... relay-option-82
(circuit-id | remote-id)],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay dhcpv6
(relay-agent-interface-id | relay-agent-remote-id)],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay ...
relay-option-82 (circuit-id | remote-id)],
[edit vlans vlan-name forwarding-options dhcp-security dhcpv6-options option-18],
[edit vlans vlan-name forwarding-options dhcp-security dhcpv6-options option-37]
```

**Release Information** Statement introduced in Junos OS Release 14.1.

**NOTE:** The EX Series switches that support the **no-vlan-interface-name** statement are the EX4300, EX4600, and EX9200 switches.

**Description** When you do not want bridge domain or VLAN tag information, do not include the VLAN ID nor the VLAN interface name (the default) in the circuit or remote ID value in the DHCP option 82 information.

**NOTE:** The **no-vlan-interface-name** statement is mutually exclusive with the **use-interface-description** and **use-vlan-id** statements.

When you configure the **no-vlan-interface-name** statement only, the format displays only the Layer 3 interface:

```
irb.subunit
```

**NOTE:** The *subunit* is required and used to differentiate the interface for remote systems.

When you configure the **no-vlan-interface-name** and **use-interface-description** statements, the format displays the IRB interface description:

```
irb_descr
```

If you configure the **no-vlan-interface-name** and **use-interface-description** statements, and no description for the IRB interface is found, the format displays the IRB interface name:

```
irb.subunit
```

When you configure the **no-vlan-interface-name** and **include-irb-and-l2** statements, the format displays the Layer 2 logical interface name and the IRB interface name:

```
(fe | ge)-fpc/pic/port.subunit+irb.subunit
```

When you configure the **no-vlan-interface-name**, **include-irb-and-l2** and **use-interface-name** statements, the format displays the Layer 2 interface description and the IRB interface name:

```
l2_descr+irb.subunit
```

If you configure the **no-vlan-interface-name**, **include-irb-and-l2** and **use-interface-name** statements, and no description for the Layer 2 interface is found, the format displays the Layer 2 logical interface name and the IRB interface name:

```
(fe | ge)-fpc/pic/port.subunit+irb.subunit
```

## ntp

**Syntax**

```
ntp {
  authentication-key key-number type md5 value <password>;
  boot-server <address>;
  broadcast <address> <key key-number> <routing-instance routing-instance-name> <version value> <ttl value>;
  broadcast-client;
  multicast-client <address>;
  peer address <key key-number> <version value> <prefer>;
  server address <key key-number> <version value> <prefer>;
  source-address source-address <routing-instance routing-instance-name>;
  trusted-key [key-numbers];
}
```

**Hierarchy Level** [edit system]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Configure Network Time Protocol (NTP) on the SRX Series device.

The remaining statements are explained separately.

**NOTE:** There must be no space in the password for configuring the Network Time Protocol (NTP) authentication-key.

**Required Privilege Level**

- system—To view this statement in the configuration.
- system-control—To add this statement to the configuration.

## object-names

---

Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | Configure one or more user-defined options that are not included in the Junos default implementation of the DHCP server. For example, if a client requests a DHCP option that is not included in the DHCP server, you can create a user-defined option that enables the server to respond to the client's request.                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <ul style="list-style-type: none"> <li>• <b>id-number</b>—Any whole number. The ID number is used to index the option and must be unique across a DHCP server.</li> <li>• <b>option-type</b>—Any of the following types: <b>byte</b>, <b>byte-stream</b>, <b>flag</b>, <b>integer</b>, <b>ip-address</b>, <b>short</b>, <b>string</b>, <b>unsigned-integer</b>, <b>unsigned-short</b>.</li> <li>• <b>array</b>—An option can include an array of values.</li> <li>• <b>option-value</b>—Value associated with an option. The option value must be compatible with the option type (for example, an <b>On</b> or <b>Off</b> value for a <b>flag</b> type).</li> </ul> |
| <b>Required Privilege Level</b> | <p><b>system</b>—To view this statement in the configuration.</p> <p><b>system-control</b>—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## option-60 (DHCP Relay Agent)

**Syntax**

```

option-60 {
  default-action {
    drop drop;
    forward-only forward-only;
    local-server-group local-server-group;
  }
  equals {
    ascii name {
      drop drop;
      forward-only forward-only;
      local-server-group local-server-group;
    }
    hexadecimal name {
      drop drop;
      forward-only forward-only;
      local-server-group local-server-group;
    }
  }
  not-present {
    drop drop;
    forward-only forward-only;
    local-server-group local-server-group;
  }
  equals {
    ascii name {
      drop drop;
      forward-only forward-only;
      local-server-group local-server-group;
    }
    hexadecimal name {
      drop drop;
      forward-only forward-only;
      local-server-group local-server-group;
    }
  }
}

```

| <b>Description</b>              | <p>Specify the type of Option 82 information from the client PDU that is concatenated with the username during the subscriber authentication or DHCP client authentication process. You can specify either, both, or neither of the Agent Circuit ID and Agent Remote ID suboptions. If you specify both, the Agent Circuit ID is supplied first, followed by a delimiter, and then the Agent Remote ID. If you specify that neither suboption is supplied, the raw payload of Option 82 from the PDU is concatenated to the username.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Description              | Configure the extended DHCP local server to use the option 82 value in the DHCP client DHCP PDU together with the ip-address-first method to determine which address-assignment pool to use. You must configure the <b>ip-address-first</b> statement before configuring the <b>option-82</b> statement. The DHCP local server first determines which address-assignment pool to use based on the ip-address-first method. Then, the local server matches the option 82 value in the client PDU with the option 82 configuration in the address-assignment pool. This statement is supported for IPv4 address-assignment pools only. |
| Required Privilege Level | system—To view this statement in the configuration.<br>system-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Description              | Specify the option 82 that is concatenated with the username during the subscriber authentication or client authentication process. You can specify either, both, or neither the Agent Circuit ID and the Agent Remote ID suboptions. If you specify both, the Agent Circuit ID is supplied first, followed by a delimiter, and then the Agent Remote ID. If neither suboption is supplied, the raw payload of option 82 is concatenated to the username.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                          | <p> <b>NOTE:</b> The option 82 value used in creating the username is based on the option 82 value that is encoded in the outgoing (relayed) PDU.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>         | Configure a router or switch running the Junos OS behind a firewall to communicate with client management applications on the other side of the firewall.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Default</b>             | To configure transmission of the router's or switch's device ID to the application, include the <b>device-id</b> statement at the <b>[edit system services]</b> hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>             | <p><b>client-id</b>—Identifies the <b>outbound-ssh</b> configuration stanza on the router or switch. Each <b>outbound-ssh</b> stanza represents a single outbound SSH connection. This attribute is not sent to the client.</p> <p><b>device-id</b>—Identifies the router or switch to the client during the initiation sequence.</p> <p><b>keep-alive</b>—(Optional) When configured, specifies that the router or switch send keepalive messages to the management server. To configure the keepalive message, you must set both the <b>timeout</b> and <b>retry</b> attributes.</p>                                             |

**reconnect-strategy**—(Optional) Specify the method the router or switch uses to reestablish a disconnected outbound SSH connection. Two methods are available:

- **in-order**—Specify that the router or switch first attempt to establish an outbound SSH session based on the management server address list. The router or switch attempts to establish a session with the first server on the list. If this connection is not available, the router or switch attempts to establish a session with the next server, and so on down the list until a connection is established.
- **sticky**—Specify that the router or switch first attempt to reconnect to the management server that it was last connected to. If the connection is unavailable, it attempts to establish a connection with the next client on the list and so forth until a connection is made.

**retry**—Number of keepalive messages the router or switch sends without receiving a response from the client before the current SSH connection is disconnected. The default is three messages.

**secret**—(Optional) Router's or switch's public SSH host key. If added to the **outbound-ssh** statement, during the initialization of the outbound SSH service, the router or switch passes its public key to the management server. This is the recommended method of maintaining a current copy of the router's or switch's public key.

**timeout**—Length of time that the Junos server waits for data before sending a keep alive signal. The default is 15 seconds.

When reconnecting to a client, the router or switch attempts to reconnect to the client based on the **retry** and **timeout** values for each client listed.

**address**—Hostname or the IPv4 address or IPv6 address of the NSM application server. You can list multiple clients by adding each client's IP address or hostname along with the following connection parameters:

- **port**—Outbound SSH port for the client. The default is port 22.
- **retry**—Number of times the router or switch attempts to establish an outbound SSH connection before giving up. The default is three tries.
- **timeout**—Length of time that the router or switch attempts to establish an outbound SSH connection before giving up. The default is fifteen seconds.

**NOTE:** Starting with Release 15.1, Junos OS supports outbound-SSH connections with devices having IPv6 addresses.

**filename**—(Optional) By default, the filename of the log file used to record the trace options is the name of the traced process (for example, **mib2d** or **snmpd**). Use this option to override the default value.

**files**—(Optional) Maximum number of trace files generated. By default, the maximum number of trace files is 10. Use this option to override the default value.

When a trace file reaches its maximum size, the system archives the file and starts a new file. The system archives trace files by appending a number to the filename in sequential order from 1 to the maximum value (specified by the default value or the options value set here). Once the maximum value is reached, the numbering sequence is restarted at 1, overwriting the older file.

**size**—(Optional) Maximum size of the trace file in kilobytes (KB). Once the maximum file size is reached, the system archives the file. The default value is 1000 KB. Use this option to override the default value.

**match**—(Optional) When used, the system only adds lines to the trace file that match the regular expression specified. For example, if the match value is set to **=error**, the system only records lines to the trace file that include the string **error**.

**services**—Services available for the session. Currently, NETCONF is the only service available.

**world-readable | no-world-readable**—(Optional) Whether the files are accessible by the originator of the trace operation only or by any user. By default, log files are only accessible by the user that started the trace operation (**no-world-readable**).

**all | configuration | connectivity**—(Optional) Type of tracing operation to perform.

**all**—Log all events.

**configuration**—Log all events pertaining to the configuration of the router or switch.

**connectivity**—Log all events pertaining to the establishment of a connection between the client server and the router or switch.

**no-remote-trace**—(Optional) Disable remote tracing.

## outbound-ssh

**Syntax**

```

outbound-ssh {
  client client-id {
    address address {
      port port-number;
      retry number;
      timeout seconds;
    }
    device-id device-id;
    keep-alive {
      retry number;
      timeout seconds;
    }
    reconnect-strategy (in-order | sticky);
    secret password;
    services netconf;
  }
  traceoptions {
    file filename <files number> <match regex> <size size> <world-readable |
      no-world-readable>;
    flag flag;
    no-remote-trace;
  }
}

```

**Hierarchy Level** [edit system services]

**Release Information** Statement introduced in Junos OS Release 10.4.  
Support for IPv6 address added in Junos OS Release 12.1X47-D15.

**Description** Initiate outbound SSH connections.

**Options** **client *client-id***—Defines a device-initiated connection. This value serves to uniquely identify the outbound-ssh configuration stanza. Each outbound-ssh stanza represents a single outbound SSH connection. Thus, the administrator is free to assign the client-id any meaningful unique value.

**address *address***—Specifies the IPv4 or IPv6 address or hostname of the client.

**port *port-number***—Specifies the port at which a server listens for outbound SSH connection requests.

**retry *number***—Specifies the maximum number of connection attempts a device can make to the specified IP address. The default is three attempts.

**timeout *seconds***—Specifies how long the application waits between attempts to reconnect to the specified IP address, in seconds. The default is 15 seconds.

**device *device-id***—Identifies the device to the management client. Each time the device establishes an outbound SSH connection, it first sends an initiation sequence (*device-id*) to the management client.

**keep-alive**—Enables the device to send SSH protocol keepalive messages to the client application. The **timeout** statement specifies how long the device waits to receive data before sending a request for acknowledgment from the application. The default is 15 seconds. The **retry** statement specifies how many keepalive messages the router sends without receiving a response from the client. When that number is exceeded, the device disconnects from the application, ending the outbound SSH connection. The default is three retries.

**reconnect-strategy (in-order|sticky)**—Specifies how the device reconnects to the server after a connection is dropped.

**in-order**—Configures the device to reconnect to the first configured server. If this server is unavailable, the device tries to connect to the next configured server. This process repeats until a connection is completed.

**sticky**—Configures the device to reconnect to the server from which it disconnected.

**secret *password***—Sends the device's public SSH host key when the device connects to the client.

**services *netconf***—Configures the application to accept NETCONF as an available service.

|                                 |                                                            |

**Release Information** Statement introduced in Junos OS Release 9.2.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.  
Support for the **allow-no-end** option introduced in Junos OS Release 14.1X53-D15 for EX Series switches.  
Statement introduced in Junos OS Release 12.3X48-D10 for SRX Series devices.

**Description** Override the default configuration settings for the extended DHCP local server. Specifying the **overrides** statement with no subordinate statements removes all DHCP local server overrides at that hierarchy level.

- To override global DHCP local server configuration options, include the **overrides** statement and its subordinate statements at the **[edit system services dhcp-local-server]** hierarchy level.
- To override configuration options for a named group of interfaces, include the statements at the **[edit system services dhcp-local-server group *group-name*]** hierarchy level.
- To override configuration options for a specific interface within a named group of interfaces, include the statements at the **[edit system services dhcp-local-server group *group-name* interface *interface-name*]** hierarchy level.
- Use the **[edit system services dhcp-local-server dhcpv6]** hierarchy level to override DHCPv6 configuration options.

**NOTE:** By default, `jdhcp` does not process DHCPINFORM message. Only after you enable the overrides command using the `set system services dhcp-local-server overrides process-inform` statement, `jdhcp` starts processing the DHCPINFORM message.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

The [interface-client-limit](#) statement is not supported in the **[edit system services dhcp-local-server dhcpv6]** hierarchy level.

The [asymmetric-prefix-lease-time](#), [delegated-pool](#), [multi-address-embedded-option-response](#), and [rapid-commit](#) statements are supported in the **[edit system services dhcp-local-server dhcpv6 ...]** hierarchy level only.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Release Information**

Statement introduced in Junos OS Release 8.3.  
 Support at the **[edit ... dhcpv6]** hierarchy levels introduced in Junos OS Release 11.4.  
 Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description**

Override the default configuration settings for the extended DHCP relay agent. Specifying the **overrides** statement with no subordinate statements removes all DHCP relay agent overrides at that hierarchy level. Use the statement at the **[edit ... dhcpv6]** hierarchy levels to configure DHCPv6 support.

M120 and M320 routers do not support DHCPv6.

The following statements are supported at both the **[edit ... dhcp-relay]** and **[edit ... dhcpv6]** hierarchy levels.

- `allow-snooped-clients`
- `asymmetric-lease-time`
- `delete-binding-on-renegotiation`
- `dual-stack`
- `interface-client-limit`
- `no-allow-snooped-clients`
- `no-bind-on-request`
- `relay-source`
- `send-release-on-delete`

The following statements are supported at the `[edit ... dhcpv6]` hierarchy levels only.

- `asymmetric-prefix-lease-time`

All other statements are supported at the `[edit ... dhcp-relay]` hierarchy levels only.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

| <b>Release Information</b> | Statement introduced in Junos OS Release 15.1X49-D100.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>         | Override the default configuration settings for the extended DHCP relay agent. Specifying the <b>overrides</b> statement with no subordinate statements removes all DHCP relay agent overrides at that hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>             | <p><b>allow-no-end-option</b>—Accept packets without end-of-option.</p> <p><b>asymmetric-lease-time</b>—Provides a way to send the DHCP client a lease that is shorter than the actual lease granted by the DHCP local server.<br/> <b>Range:</b> 600 through 86,400 seconds.</p> <p><b>bootp-support</b>—Allows send bootp request from a remote client to a DHCP server for an IP address.</p> <p><b>delete-binding-on-renegotiation</b>—Allows DHCP relay agent to delete binding information for a specific client when a DHCP DISCOVER packet is received from the client.</p> <p><b>disable-relay</b>—Disable DHCP relay processing.</p> <p><b>dual-stack</b>—Specify the dual stack group to use.</p> <p><b>no-bind-on-request</b>—Explicitly disable automatic binding of received DHCP request messages that have no entry in the database (stray requests).</p> <p><b>relay-source</b>—Specify the interface for relay source.</p> <p><b>send-release-on-delete</b>—Always send RELEASE to the server when a binding is deleted.</p> |

**trust-option-82**—Allow processing of DHCP client packets that have a gateway IP address giaddr of 0 and contain option 82 information.

**user-defined-option-82**—Specify user defined description for option-82.

The remaining statements are explained separately. see [CLI Explorer](#).

| Release Information      | Statement introduced in Junos OS Release 12.2 for EX Series switches.                                                                                                                                                                                                                                                                                               |
| Description              | Configure the password to connect the switch to the Junos Pulse Access Control Service network access control (NAC) device. This password must match the password specified on the Access Control Service through its administrative interface.                                                                                                                     |
| Options                  | <b><i>password</i></b> —A string of up to 200 alphanumeric characters bounded by quotation marks. Spaces are allowed, but special characters, such as <code>?</code> , are not allowed.                                                                                                                                                                             |
| Required Privilege Level | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                 |

**Hierarchy Level** [edit system [login](#)]

**Release Information** Statement introduced in Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure special requirements such as character length and encryption format for plain-text passwords. Newly created passwords must meet these requirements.

Using several password minimum requirement options will cause the **minimum-length** to be reset if the total sum of the required minimums exceeds the **minimum-length** setting.

The individual statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
 system-control—To add this statement to the configuration.

| <b>Description</b>              | For NTP, configure the SRX Series device to operate in symmetric active mode with the remote system at the specified address. In this mode, the SRX Series device and the remote system can synchronize with each other. This configuration is useful in a network in which either the SRX Series device or the remote system might be a better source of time.                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b>address</b>—Address of the remote system. You must specify an address, not a hostname.</p> <p><b>key key-number</b>—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number.</p> <p><b>Range:</b> Any unsigned 32-bit integer</p> <p><b>prefer</b>—(Optional) Mark the remote system as the preferred host, which means that if all other factors are equal, this remote system is chosen for synchronization among a set of correctly operating systems.</p> <p><b>version value</b>—(Optional) Specify the NTP version number to be used in outgoing NTP packets.</p> <p><b>Range:</b> 1 through 4</p> <p><b>Default:</b> 4</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | For J Series Services Routers and EX Series switches only. Configure a pool of IP addresses for DHCP clients on a subnet. When a client joins the network, the DHCP server dynamically allocates an IP address from this pool.                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <p><b>address-range</b>—Lowest and highest IP addresses in the pool that are available for dynamic address assignment. If no range is specified, the pool will use all available addresses within the subnet specified. (Broadcast addresses, interface addresses, and excluded addresses are not available.)</p> <p><b>exclude-address</b>—Addresses within the range that are not used for dynamic address assignment. You can exclude one or more addresses within the range.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Description              | Add a prefix to the DHCP base option 82 Agent Circuit ID (suboption 1) or Agent Remote ID (suboption 2) information, or to the DHCPv6 option 18 (Relay Agent Interface-ID) or option 37 (Relay Agent Remote-ID) information in DHCP packets that DHCP relay agent sends to a DHCP server. The prefix can consist of any combination of the hostname, logical system name, and routing instance name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Description</b>              | Allows you to configure DHCPv6 client preferred prefix length. If preferred-prefix-length is configured, the DHCPv6 client checks the prefix length in the ADVERTISE packet and if the check fails, a sysolg is created.                                                                                                                                                                                                                                          |

| Description              | Configure AAA to use the specified application for subscriber service provisioning.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Options                  | <p><b>gx-plus</b>—Specify Gx-Plus as the application used to communicate with a PCRF server for subscriber service provisioning. Sets the Subscription-Id-Type Diameter AVP sub-attribute (450) to 4 (END_USER_PRIVATE) and sets the Subscription-Id-Data Diameter AVP sub-attribute (444) to <b>reserved</b>. Both of these sub-attributes are conveyed in the Diameter AVP Subscription-ID (443) by a CCR-I message.</p> <p><b>jsrc</b>—Specify JSRC as the application used to communicate with the SAE for subscriber service provisioning. JSRC is used in an SRC environment to request services from the SAE for an authenticated subscriber. JSRC attempts to activate these services. If successful, JSRC returns an ACK message. If unsuccessful, the subscriber is denied access.</p> <p><b>pcrf</b>—Specify Policy Control and Charging Rules Function (PCRF) as the application used to request provisioning from the PCRF server over the Gx protocol. If you change this configuration, any existing subscriber sessions are unaffected.</p> |
| Required Privilege Level | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## radius

**Syntax**

```
radius {
  accounting-server [server-addresses];
  authentication-server [server-addresses];
}
```

**Hierarchy Level** [edit access profile *profile-name*]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the RADIUS servers for authentication and for accounting. To configure multiple RADIUS servers, include multiple **radius** statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.

The remaining statements are explained separately. See [CLI Explorer](#).

**NOTE:** The [edit access] hierarchy is not available on QFabric systems.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Description</b>              | Configure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces to be reconfigured when a RADIUS-initiated disconnect is received by the DHCP client or group of clients. A group configuration takes precedence over a DHCP local server configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Default</b>                  | The client is deleted when a RADIUS-initiated disconnect is received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## radius-options (edit system)

**Syntax**

```
radius-options {
  attributes {
    nas-ip-address ip-address;
  }
  enhanced-accounting;
  password-protocol mschap-v2;
}
```

**Hierarchy Level** [edit system]

**Release Information**

Statement introduced in Junos OS Release 8.3.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 MS-CHAPv2 password protocol configuration option introduced in Junos OS Release 9.2.  
 MS-CHAPv2 password protocol configuration option introduced in Junos OS Release 9.2 for EX Series switches.  
 Statement introduced in Junos OS Release 11.1 for the QFX Series.  
 Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.

**NOTE:** The **radius-options** statement is not available on QFabric systems.

**enhanced-accounting** statement introduced in Junos OS Release 14.1.

**Description** Configure RADIUS options for the NAS-IP address for outgoing RADIUS packets and password protocol used in RADIUS packets.

**Options**

**enhanced-accounting**—View the attribute values of a logged in user.

**nas-ip-address *ip-address***—IP address of the network access server (NAS) that requests user authentication.

**password-protocol *mschap-v2***—Protocol MS-CHAPv2, used for password authentication and password changing.

**Required Privilege Level**

system—To view this statement in the configuration.  
 system-control—To add this statement to the configuration.

| Release Information | Statement introduced in Junos OS Release 8.5. Support for IPv6 source address added in Junos OS Release 12.1X47-D15 for SRX1500, SRX5400, SRX5600, and SRX5800 devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Description         | <p>Configure RADIUS server address for subscriber access management, Layer 2 Tunnelling Protocol (L2TP), or (Point-to-Point Protocol (PPP).</p> <p>To configure multiple RADIUS servers, include multiple <b>radius-server</b> statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Options             | <ul style="list-style-type: none"><li>• <b>server-address</b>—Address of the RADIUS server.</li><li>• <b>accounting-port port-number</b>—RADIUS server accounting port number.<br/><b>Range:</b> 1 through 65,335 files<br/><b>Default:</b> 1813</li><li>• <b>port port-number</b>—RADIUS server authentication port number.<br/><b>Range:</b> 1 through 65,335 files<br/><b>Default:</b> 1812</li><li>• <b>retry value</b>—Number of times that the router is allowed to attempt to contact a RADIUS server.<br/><b>Range:</b> 1 through 10<br/><b>Default:</b> 3</li><li>• <b>secret password</b>—Password to use; it can include spaces if the character string is enclosed in quotation marks.</li><li>• <b>max-outstanding-requests value</b>—Maximum number of outstanding requests in flight to server.<br/><b>Range:</b> 1 through 65,335 files</li></ul> |

- **source-address *source-address***—Valid IPv4 or IPv6 address configured on one of the router or switch interfaces.
- **timeout *seconds***—Amount of time to wait.

**Range:** 1 through 90 seconds

**Default:** 3 seconds

**Required Privilege** system—To view this statement in the configuration.  
**Level** system-control—To add this statement to the configuration.

## radius-server (System)

**Syntax**

```
radius-server {
  server-address {
    accounting-port port-number;
    port number;
    retry number;
    routing-instance routing-instance-name;
    secret password;
    source-address source-address;
    timeout seconds;
  }
}
```

**Hierarchy Level** [edit system]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Configure a RADIUS server for Point-to-Point Protocol (PPP).

To configure multiple RADIUS servers, include multiple **radius-server** statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.

**Options** **server-address**—Address of the RADIUS authentication server.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege** system—To view this statement in the configuration.  
**Level** system-control—To add this statement to the configuration.

## radsec

**Syntax**

```
radsec {
  destination id-number {
    address ip-address ;
    max-tx-buffers number ;
    id-reuse-timeout seconds;
    port port-number;
    source-address ip-address;
    tls-certificate certificate-name;
    tls-force-ciphers [medium | low ];
    tls-min-version [v1.1 | v1.2];
    tls-peer-name x0.radsec.com
    tls-timeout seconds;
  }
}
```

**Hierarchy Level** [edit access]

**Release Information** Statement introduced in Junos OS Release 19.1R1.

**Description** Configure RADIUS over TLS, also known as RADSEC, to redirect regular RADIUS traffic to remote RADIUS servers connected over TLS. The TLS connection provides encryption, authentication, and data integrity for the exchange of RADIUS messages.

TLS relies on certificates and private-public key exchange pairs to secure the transmission of data between the RADSEC client and server. The RADSEC destination uses local certificates that are dynamically acquired from the Junos PKI infrastructure.

To enable RADSEC, you must specify the name of the local certificate. If a certificate is not available, or if the certificate was revoked, the RADSEC destination attempts to retrieve it every 300 seconds.

**Default** RADSEC is not enabled by default.

**Options** **source-address *ip-address***—Source IP address of the dynamic request.

**id-reuse-timeout *seconds***—Response timeout after which the RADIUS ID field value can be reused.

**Default:** 120 seconds

**port *port-number***—(Optional) Port number of the RADSEC server.

**Default:** 2083

**source-port *port-number***—(Optional) Source port to include in RADIUS messages.

**tls-certificate**—Provide the name of the local certificate.

**tls-force-ciphers** [**low** | **medium**](Optional) Allow lower-grade ciphers than the default.

**tls-min-version** [**v1.1** | **v1.2**](Optional) Configure TLS version to limit the lowest supported versions of TLS that are enabled for SSL connections.

**Default:** v1.2

**tls-peer-name** *name*—Certified name of the RADSEC server.

**tls-timeout** *seconds*—Timeout for TLS negotiation.

**Default:** 5 seconds

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Related Documentation**

- *RADIUS over TLS (RADSEC)*

## radsec-destination

**Syntax** radsec-destination *id-number*;

**Hierarchy Level** [edit access [radius-server](#) *server-address*]  
[edit access profile *profile-name* [radius-server](#) *server-address*],

**Release Information** Statement introduced in Junos OS Release 19.1R1 for EX Series switches.

**Description** Configure a RADIUS over TLS (RADSEC) server as the destination for RADIUS traffic. The RADIUS traffic is redirected from the RADIUS server to the RADSEC destination. You can redirect more than one RADIUS server to the same RADSEC destination.

**Options** *id-number*—The unique ID number for the RADSEC destination.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Related Documentation**

- *RADIUS over TLS (RADSEC)*

| <b>Description</b>              | <p>Configure DHCPv6 local server to recognize the Rapid Commit option (DHCPv6 option 14) in DHCPv6 solicit messages sent from the DHCPv6 client. When rapid commit is enabled for both DHCPv6 local server and the DHCPv6 client, a two-message handshake is used instead of the standard four-message handshake. You can enable rapid commit support on DHCPv6 local server globally, for a named group, or for a specific interface.</p>                                                                                                                                                                                                                                                                                    |
| <b>Default</b>                  | Rapid commit support is not enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.<br>Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                  |
| <b>Description</b>              | Configure the maximum number of connections attempts per minute, per protocol (either IPv6 or IPv4) on an access service. For example, a rate limit of 10 allows 10 IPv6 telnet session connection attempts per minute and 10 IPv4 telnet session connection attempts per minute.                                                                                                                |
| <b>Default</b>                  | 150 connections                                                                                                                                                                                                                                                                                                                                                                                  |

[edit system services dhcp-local-server dhcpv6 group group-name]
```

**Release Information**

Statement introduced in Junos OS Release 10.0.

Support at the **[edit ... dhcpv6 ...]** hierarchy levels introduced in Junos OS Release 10.4.

Statement introduced in Junos OS Release 12.1 for EX Series switches.

**support-option-pd-exclude** statement introduced in Junos OS Release 17.3 for the MX Series.

**Description**

Enable dynamic reconfiguration triggered by the DHCP local server of all DHCP clients or only the DHCP clients serviced by the specified group of interfaces. A group configuration takes precedence over a DHCP local server configuration. The **strict** statement is available only for DHCPv6.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

| Release Information | Statement introduced in Junos OS Release 10.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Description         | Enable dynamic reconfiguration triggered by the DHCP local server of all DHCP clients or only the DHCP clients serviced by the specified group of interfaces. A group configuration takes precedence over a DHCP local server configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Options             | <p><b>attempts <i>number</i></b>—Configure maximum number of attempts to reconfigure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces before reconfiguration is considered to have failed. A group configuration takes precedence over a DHCP local server configuration.</p> <p><b>Range:</b> 1 through 10 attempts</p> <p><b>Default:</b> 8 attempts</p> <p><b>clear-on-abort</b> —Delete all DHCP clients or only the DHCP clients serviced by the specified group of interfaces when reconfiguration fails; that is, when the maximum number of retry attempts have been made without success. A group configuration takes precedence over a DHCP local server configuration.</p> <p><b>strict</b> —Configure the system to only allow packets that contain the reconfigure accept option.</p> <p><b>timeout <i>seconds</i></b>—Configure the initial value in seconds between attempts to reconfigure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces. Each successive attempts doubles the interval between attempts. For example, if the first value is 2, the first retry is attempted 2 seconds after the first attempt fails. The second retry is attempted 4 seconds after the first retry fails. The third retry is attempted 8 seconds after the second retry fails, and so on. A group configuration takes precedence over a DHCP local server configuration.</p> <p><b>Range:</b> 1 through 10 seconds</p> <p><b>Default:</b> 2 seconds</p> |

**token *token-name***—Configure a plain-text token for all DHCP clients or only the clients specified by the specified group of interfaces. The default is null (empty string).

**trigger** — Specify DHCP reconfigure trigger.

|                           |                                                            |
|---------------------------|------------------------------------------------------------|
| <b>Required Privilege</b> | system—To view this statement in the configuration.        |
| <b>Level</b>              | system-control—To add this statement to the configuration. |

|                              |                                                                                                                                                                                 |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 16.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | <p>Enable additive logic (that is, deny all by default / allow some as specified) to be used in regular expressions.</p> <p>This statement changes the behavior of existing regular expressions so that all configuration hierarchies are denied by default and must be explicitly allowed using the <b>allow-configuration-regexps</b> statement.</p> <p>For example, to grant users in a named user class access to a specific configuration hierarchy, but deny access to all other configuration hierarchies, enable the <b>regex-additive-logic</b> statement and configure an <b>allow-configuration-regexps</b> statement that includes the specific configuration hierarchy to which you want to allow access. When a user logs in, only the specified configuration hierarchy is visible.</p> |
| <b>Default</b>                  | By default, this statement is disabled; configuration hierarchies not explicitly denied with a <b>deny-configuration-regexps</b> statement are visible to the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Required Privilege Level</b> | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Release Information</b> | Statement introduced in Junos OS Release 15.1R3 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Description</b>         | <p>Configure a URL that redirects unauthenticated hosts to a central Web authentication (CWA) server. The CWA server provides a web portal where the user can enter a username and password. If these credentials are validated by the CWA server, the user is authenticated and is allowed access to the network.</p> <p>The redirect URL for central Web authentication can be configured centrally on the AAA server or locally on the switch. Use the <b>redirect-url</b> statement to configure the redirect URL locally on the interface connecting the host to the switch.</p> <p>The redirect URL and a dynamic firewall filter must both be present for the central Web authentication process to be triggered. For more information about configuring the redirect URL and the dynamic firewall filter for central Web authentication, see <a href="#">“Configuring Central Web Authentication” on page 384</a>.</p> |
| <b>Default</b>             | Disabled. The redirect URL is not enabled for central Web authentication by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>             | <p><b>url</b>—The URL that redirects the host to the server that will handle central web authentication. The redirect URL must use the HTTP or HTTPS protocol and include an IP address or website name. The following are examples of valid redirect URL formats:</p> <ul style="list-style-type: none"> <li>• <code>http://www.example.com</code></li> <li>• <code>https://www.example.com</code></li> <li>• <code>http://10.10.10.10</code></li> <li>• <code>https://10.10.10.10</code></li> <li>• <code>http://www.example.com/login.html</code></li> <li>• <code>https://www.example.com/login.html</code></li> <li>• <code>http://10.10.10.10/login.html</code></li> <li>• <code>https://10.10.10.10/login.html</code></li> </ul>                                                                                                                                                                                        |

**NOTE:** When the dynamic firewall filter is configured using the special Filter-ID attribute `JNPR_RSVD_FILTER_CWA`, the CWA redirect URL must include the IP address of the AAA server, for example, `https://10.10.10.10`.

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

**Release Information** Statement introduced in Junos OS Release 9.6.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** Specify that the DHCPv6 Relay Agent Interface-ID option (option 18) in the client PDU name is concatenated with the username during the subscriber authentication or DHCP client authentication process.

**Required Privilege** system—To view this statement in the configuration.  
**Level** system-control—To add this statement to the configuration.

| <b>Description</b>              | Specify that the DHCPv6 Relay Agent Remote-ID option (option 37) in the client PDU name is concatenated with the username during the subscriber authentication or DHCP client authentication process. In order to generate an ASCII version of the username, the router concatenates only the remote-id portion of option 37 to the username, and ignores the enterprise number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Description              | Specify that the DHCPv6 Relay Agent Remote-ID option (option 37) in the client PDU name is concatenated with the username during the subscriber authentication or client authentication process. In order to generate an ASCII version of the username, the router concatenates only the remote-id portion of option 37 to the username, and ignores the enterprise number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## relay-option (DHCP Relay Agent)

**Syntax**

```

relay-option {
  option-number option-number;
  default-action {
    drop;
    forward-only;
    local-server-group local-server-group;
    relay-server-group relay-server-group;
  }
  equals (ascii ascii-string | hexadecimal hexadecimal-string) {
    drop;
    forward-only;
    local-server-group local-server-group;
    relay-server-group relay-server-group;
  }
  starts-with (ascii ascii-string | hexadecimal hexadecimal-string) {
    drop;
    forward-only;
    local-server-group local-server-group;
    relay-server-group relay-server-group;
  }
}

```

**Hierarchy Level**

```

[edit forwarding-options dhcp-relay],
[edit forwarding-options dhcp-relay dhcpv6],
[edit forwarding-options dhcp-relay group group-name],
[edit forwarding-options dhcp-relay dhcpv6 group group-name],
[edit logical-systems logical-system-name forwarding-options dhcp-relay ...],
[edit logical-systems logical-system-name routing-instances routing-instance-name
  forwarding-options dhcp-relay ...],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay ...]

```

**Release Information** Statement introduced in Junos OS Release 12.3.  
Statement introduced in Junos OS Release 12.3 for EX Series switches.

**Description** Configure the extended DHCP relay agent selective processing that is based on DHCP options in DHCP client packets and specify the action to perform on client traffic. You can configure support globally or for a named group of interfaces, and for either DHCP or DHCPv6 relay agent.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## relay-option-82

**Syntax**

```

relay-option-82 {
  circuit-id {
    include-irb-and-l2;
    keep-incoming-circuit-id ;
    no-vlan-interface-name;
    prefix prefix;
    use-interface-description (logical | device);
    use-vlan-id;
  }
  remote-id {
    include-irb-and-l2;
    keep-incoming-remote-id ;
    no-vlan-interface-name;
    prefix prefix;
    use-interface-description (logical | device);
    use-vlan-id;
  }
  server-id-override
  vendor-specific{
    host-name;
    location;
  }
}

```

**Hierarchy Level**

```

[edit forwarding-options dhcp-relay],
[edit forwarding-options dhcp-relay group group-name],
[edit logical-systems logical-system-name forwarding-options dhcp-relay],
[edit logical-systems logical-system-name forwarding-options dhcp-relay group group-name],
[edit logical-systems logical-system-name routing-instances routing-instance-name
 forwarding-options dhcp-relay],
[edit logical-systems logical-system-name routing-instances routing-instance-name
 forwarding-options dhcp-relay group group-name],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay group
 group-name]

```

**Release Information** Statement introduced in Junos OS Release 8.3.  
Statement introduced in Junos OS Release 12.3 for EX Series switches.

**Description** Enable or disable the insertion of the DHCP relay agent information option (option 82) in DHCP packets destined for a DHCP server.

To enable insertion of option 82 information in DHCP packets, you must specify at least one of the **circuit-id** or **remote-id** statements.

You can use the **relay-option-82** statement and its subordinate statements at the **[edit forwarding-options dhcp-relay]** hierarchy level to control insertion of option 82 information

globally, or at the `[edit forwarding-options dhcp-relay group group-name]` hierarchy level to control insertion of option 82 information for a named group of interfaces.

To restore the default behavior (option 82 information is not inserted into DHCP packets), use the `delete relay-option-82` statement.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

| <b>Description</b>              | Relay DHCP client packets to the specified group of DHCP servers when you use the DHCP relay selective processing feature. You can configure the relay operation globally or for a group of interfaces, and for either DHCP or DHCPv6 relay agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>                  | <i>relay-server-group</i> —Name of DHCP server group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Release Information** Command introduced before Junos OS Release 9.2

**Description** Restart a Junos OS process.

**CAUTION:** Never restart a software process unless instructed to do so by a customer support engineer. A restart might cause the router to drop calls and interrupt transmission, resulting in possible loss of data.

- Options**
- application-identification—(Optional) Restart the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.
  - application-security—(Optional) Restart the application security process.
  - audit-process—(Optional) Restart the RADIUS accounting process that gathers statistical data that can be used for general network monitoring, for analyzing and tracking usage patterns, and for billing a user based upon the amount of time used or the type of services accessed.
  - chassis-control—(Optional) Restart the chassis management process.
  - class-of-service—(Optional) Restart the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.
  - commitd-service—(Optional) Restart the committed services.
  - database-replication—(Optional) Restart the database replication process.
  - datapath-trace-service—(Optional) Restart the Restart the packet path tracing process.

- `ddns`—(Optional) Restart the dynamic domain name system, which dynamically updates IP addresses for registered domain names.
- `dhcp`—(Optional) Restart the software process for a Dynamic Host Configuration Protocol (DHCP) server. A DHCP server allocates network IP addresses and delivers configuration settings to client hosts without user intervention.
- `dhcp-service`—(Optional) Restart the Dynamic Host Configuration Protocol process.
- `disk-monitoring`—(Optional) Restart disk monitoring, which checks the health of the hard disk drive on the Routing Engine.
- `dynamic-flow-capture`—(Optional) Restart the dynamic flow capture (DFC) process, which controls DFC configurations on PIC3 monitoring services cards.
- `ethernet-connectivity-fault-management`—(Optional) Restart the process that provides IEEE 802.1ag Operation, Administration, and Maintenance (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.
- `ethernet-link-fault-management`—(Optional) Restart the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.
- `event-processing`—(Optional) Restart the event process (`eventd`).
- `extensible-subscriber-services`—(Optional) Restart the extensible subscriber services process.
- `fipsd`—(Optional) Restart the `fipsd` services.
- `firewall`—(Optional) Restart the firewall management process, which manages the firewall configuration and accepts or rejects packets that are transiting an interface on a router or switch.
- `firewall-authentication-service`—(Optional) Restart the firewall authentication service process.
- `general-authentication-service`—(Optional) Restart the general authentication process.
- `gprs-process`—(Optional) Restart the General Packet Radio Service (GPRS) process.
- `gracefully`—(Optional) Restart the software process.
- `idp-policy`—(Optional) Restart the intrusion detection and prevention (IDP) protocol process.
- `immediately`—(Optional) Immediately restart the software process.
- `interface-control`—(Optional) Restart the interface process, which controls the router's or switch's physical interface devices and logical interfaces.
- `ipmi`—(Optional) Restart the intelligent platform management interface process.
- `ipsec-key-management`—(Optional) Restart the IPsec key management process.
- `jflow-service`—(Optional) Restart `jflow` service process.
- `jnu-management`—(Optional) Restart `jnu` management process.
- `jnx-wmicd-service`—(Optional) Restart `jnx wmicd` service process.

- `jsrp-service`—(Optional) Restart the Juniper Services Redundancy Protocol (jsrdp) process, which controls chassis clustering.
- `kernel-replication`—(Optional) Restart the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.
- `lACP`—(Optional) Restart the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link. The LACP process allows link aggregation control instances to reach agreement on the identity of the LAG to which a link belongs, moves the link to that LAG, and enables the transmission and reception processes for the link to function in an orderly manner.
- `l2cpd-service`—(SRX5400, SRX5600, and SRX5800 devices only) (Optional) Restart the Layer 2 Control Protocol (L2CP) process, which enables features such as L2 protocol tunneling and nonstop bridging.
- `l2-learning`—(Optional) Restart the Layer 2 (L2) address flooding and learning process.
- `license-service`—(Optional) Restart the feature license management process.
- `logical-system-service`—(Optional) Restart the logical system service process.
- `mib-process`—(Optional) Restart the MIB version II process, which provides the router's MIB II agent.
- `mountd-service`—(Optional) Restart the service for Network File System (NFS) mount requests.
- `named-service`—(Optional) Restart the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.
- `network-security`—(Optional) Restart the network security process.
- `network-security-trace`—(Optional) Restart the network security trace process.
- `nfsd-service`—(Optional) Restart the remote NFS server process, which provides remote file access for applications that need NFS-based transport.
- `ntpd-service`—(Optional) Restart the Network Time Protocol (NTP) process.
- `pgm`—(Optional) Restart the process that implements the Pragmatic General Multicast (PGM) protocol for assisting in the reliable delivery of multicast packets.
- `pic-services-logging`—(Optional) Restart the logging process for some PICs. With this process, also known as `fsad` (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.
- `pki-service`—(Optional) Restart the public key infrastructure (PKI) service process.
- `profillerd`—(Optional) Restart the profiler process.
- `remote-operations`—(Optional) Restart the remote operations process, which provides the ping and traceroute MIBs.
- `rest-api`—(Optional) Restart the rest api process.
- `routing`—(Optional) Restart the routing protocol process (`rpd`).

- **sampling**—(Optional) Restart the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.
- **sampling-route-record**—(Optional) Restart the sampling route record process.
- **scc-chassisd**—(Optional) Restart the scc chassisd process.
- **secure-neighbor-discovery**—(Optional) Restart the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.
- **security-intelligence**—(Optional) Restart security intelligence process.
- **security-log**—(Optional) Restart the security log process.
- **service-deployment**—(Optional) Restart the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.
- **services**—(Optional) Restart a service.
- **simple-mail-client-service**—(Optional) Restart the simple mail client service process.
- **snmp**—(Optional) Restart the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.
- **static-routed**—(Optional) Restart the static routed process.
- **soft**—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.
- **statistics-service**—(Optional) Restart the process that manages the Packet Forwarding Engine statistics.
- **subscriber-management**—(Optional) Restart the subscriber management process.
- **subscriber-management-helper**—(Optional) Restart the subscriber management helper process.
- **system-log-vital**—(Optional) Restart system log vital process.
- **tunnel-oamd**—(Optional) Restart the tunnel OAM process for L2 tunneled networks.
- **uac-service**—(Optional) Restart the Unified Access Control (UAC) process.
- **user-ad-authentication**—(Optional) Restart User ad Authentication process
- **vrrp**—(Optional) Restart the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.
- **web-management**—(Optional) Restart the Web management process.

**Required Privilege Level**    reset

**Related Documentation** • [Restart Commands Overview](#)

**List of Sample Output** [restart interfaces on page 1303](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### restart interfaces

```
user@host> restart interfaces
interfaces process terminated
interfaces process restarted
```

## retransmission-attempt

**Syntax** `retransmission-attempt number;`

**Hierarchy Level** [edit interfaces *interface-name* unit *logical-unit-number* family inet dhcp]

**Release Information** Statement introduced in Junos OS Release 8.5 for J Series devices.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 9.2 for SRX Series devices.  
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Specify the number of times the device retransmits a Dynamic Host Control Protocol (DHCP) packet if a DHCP server fails to respond. After the specified number of attempts, no further attempts at reaching a server are made.

**Options** *number*—Number of retransmit attempts.  
**Range:** 0 through 6  
**Default:** 4

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| Description              | Specify the number of times that the router or switch is allowed to attempt to contact a RADIUS authentication or accounting server. You can override the retry limit for accounting servers with the <i>accounting-retry</i> statement.                                                                                                                                                                                                                                                               |
|                          | <div>  <p><b>NOTE:</b> To successfully set a retry limit for the accounting servers different from the authentication servers, you must configure both the <i>accounting-retry</i> and <i>accounting-timeout</i> statements. If you configure only one of these statements, then the value you configure is ignored in favor of the values configured with the <i>retry</i> and <i>timeout</i> statements.</p> </div> |
|                          | <div>  <p><b>NOTE:</b> The maximum retry duration (the number of retries times the length of the timeout) cannot exceed 2700 seconds. An error message is displayed if you configure a longer duration.</p> </div>                                                                                                                                                                                                  |

| <b>Description</b>         | <p>Configure the authentication methods for the root-level user, whose username is <b>root</b>.</p> <p>You can use the <b>load-key-file URL:filename</b> statement to load an SSH key file that was previously generated using <b>ssh-keygen</b>.</p> <p>Optionally, you can use the <b>ssh-dsa</b>, <b>ssh-ecdsa</b>, or <b>ssh-rsa</b> statements to directly configure SSH RSA, DSA, or ECDSA keys to authenticate root logins. You can configure more than one public key for SSH authentication of root logins as well as for user accounts. When a user logs in as root, the public keys are referenced to determine whether the private key matches any of them.</p> <p>To view the SSH key entries, use the configuration mode <b>show</b> command. For example:</p> <pre> [edit system] user@host# set root-authentication load-key-file my-host::ssh/id_dsa.pub .file.19692   0 KB   0.3 kB/s   ETA: 00:00:00   100% [edit system] user@host# show root-authentication {   ssh-rsa "ABC123 user@domain.net"; #   SECRET-DATA } </pre> |
| <b>Options</b>             | <p><b>encrypted-password "password"</b>—MD5 or other encrypted authentication. Specify the MD5 or other password. You can specify only one encrypted password.</p> <p>You cannot configure a blank password for <b>encrypted-password</b> using blank quotation marks (" "). You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.</p> <p><b>load-key-file URL:filename</b>—Load an SSH key file that was previously generated using <b>ssh-keygen</b>. The <b>URL:filename</b> is the path to the file's location and name. When using</p>                                                                                                                                                                                                                                                                                                                                                                                                                 |

this option, the contents of the key file are copied into the configuration immediately after entering the **load-key-file *URL:filename*** statement. This command loads RSA (SSH version 2) and DSA (SSH version 2) public keys.

**no-public-keys**—Disables SSH public key based authentication.

**plain-text-password**—Plain-text password. The CLI prompts you for the password and then encrypts it. The CLI displays the encrypted version, and the software places the encrypted version in its user database. You can specify only one plain-text password.

**ssh-eccdsa "*public/private-key*"**—SSH ECDSA (variant of DSA that uses elliptic curve cryptography) public key. You can specify one or more public keys.

**ssh-dsa "*public-key*"**—SSH version 2 authentication. Specify the DSA (SSH version 2) public key. You can specify one or more public keys.

**ssh-rsa "*public-key*"**—SSH version 2 authentication. Specify the RSA (SSH version 2) public key. You can specify one or more public keys.
