#### YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

#### END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <https://support.juniper.net/support/eula/>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

# Table of Contents

	About the Documentation . . . . .	xli
	Documentation and Release Notes . . . . .	xli
	Using the Examples in This Manual . . . . .	xli
	Merging a Full Example . . . . .	xlii
	Merging a Snippet . . . . .	xlii
	Documentation Conventions . . . . .	xliii
	Documentation Feedback . . . . .	xlvi
	Requesting Technical Support . . . . .	xlvi
	Self-Help Online Tools and Resources . . . . .	xlvi
	Creating a Service Request with JTAC . . . . .	xlvi
<b>Chapter 1</b>	<b>Login Classes and Login Settings . . . . .</b>	<b>47</b>
	Junos OS Login Classes Overview . . . . .	47
	Junos OS Login Classes Overview . . . . .	47
	Permission Bits . . . . .	48
	Denying or Allowing Individual Commands . . . . .	50
	Defining Junos OS Login Classes . . . . .	51
	Example: Creating Login Classes with Specific Privileges . . . . .	51
	Junos OS Login Settings . . . . .	52
	Configuring Junos OS to Display a System Login Announcement . . . . .	53
	Configuring System Alarms to Appear Automatically Upon Login . . . . .	54
	Configuring Login Tips . . . . .	55
	Examples: Configuring Time-Based User Access . . . . .	55
	Configuring the Timeout Value for Idle Login Sessions . . . . .	56
	Login Retry Options . . . . .	57
	Limiting the Number of User Login Attempts for SSH and Telnet Sessions . . . . .	58
	Example: Configuring Login Retry Options . . . . .	59

<b>Chapter 2</b>	<b>User Accounts . . . . .</b>	<b>65</b>
	Junos OS User Accounts . . . . .	65
	Junos OS User Accounts Overview . . . . .	65
	Junos-FIPS Crypto Officer and User Accounts Overview . . . . .	67
	Crypto Officer User Configuration . . . . .	67
	FIPS User Configuration . . . . .	67
	Example: Configuring User Accounts . . . . .	68
	Example: Configuring New Users . . . . .	68
	Configuring Junos OS User Accounts by Using a Configuration Group . . . . .	74
	Junos OS Administrative Roles . . . . .	77
	Understanding Administrative Roles . . . . .	78
	Example: Configuring Administrative Roles . . . . .	80
	Configuring a Local Administrator Account . . . . .	87
	Junos OS User Access Privileges . . . . .	88
	Understanding Junos OS Access Privilege Levels . . . . .	88
	Junos OS Login Class Permission Flags . . . . .	88
	Allowing or Denying Individual Commands for Junos OS Login Classes . . . . .	92
	Example: Configuring User Permissions with Access Privilege Levels . . . . .	93
	Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands, Configuration Statements, and Hierarchies . . . . .	97
	Understanding Regular Expressions . . . . .	97
	Specifying Regular Expressions . . . . .	99
	Regular Expressions Operators . . . . .	101
	Regular Expression Examples . . . . .	104
	Examples of Defining Access Privileges Using allow-configuration and deny-configuration Statements . . . . .	106
	Example: Using Additive Logic With Regular Expressions to Specify Access Privileges . . . . .	108
	Example: Configuring User Permissions with Access Privileges for Operational Mode Commands . . . . .	110
	Example: Configuring User Permissions with Access Privileges for Configuration Statements and Hierarchies . . . . .	123
<b>Chapter 3</b>	<b>Passwords for User Access . . . . .</b>	<b>137</b>
	Root Password . . . . .	137
	Configuring the Root Password . . . . .	138
	Example: Configuring a Plain-Text Password for Root Logins . . . . .	139
	Example: Configuring SSH Authentication for Root Logins . . . . .	142
	Recovering Root Password . . . . .	142
	Recovering the Root Password . . . . .	142
	Recovering the Root Password on Junos OS with Upgraded FreeBSD . . . . .	145
	Troubleshooting Loss of the Root Password . . . . .	148
	Plain-Text Passwords . . . . .	150
	Changing the Requirements for Junos OS Plain-Text Passwords . . . . .	150
	Example: Changing the Requirements for Junos OS Plain-Text Passwords . . . . .	151

	Master Password for Configuration Encryption . . . . .	153
	Hardening Shared Secrets in Junos OS . . . . .	153
	Understanding Hardening Shared Secrets . . . . .	153
	Using Trusted Platform Module to Bind Secrets on SRX Series Devices . . . . .	155
	Limitations . . . . .	156
	Enabling the TPM . . . . .	156
	Verifying the Status of the TPM . . . . .	157
	Changing the Master Encryption Password . . . . .	157
<b>Chapter 4</b>	<b>User Authentication . . . . .</b>	<b>159</b>
	Junos OS User Authentication Overview . . . . .	159
	Junos OS User Authentication Methods . . . . .	159
	Configuring Local User Template Accounts for User Authentication . . . . .	160
	Configuring Remote Template Accounts for User Authentication . . . . .	162
	Example: Creating Template Accounts . . . . .	163
	Understanding Remote Authentication Servers . . . . .	165
	Authentication Order for RADIUS, TACACS+, and Local Password . . . . .	166
	Junos OS Authentication Order for RADIUS, TACACS+, and Password	
	Authentication . . . . .	167
	Using RADIUS or TACACS+ Authentication . . . . .	167
	Using Local Password Authentication . . . . .	168
	Order of Authentication Attempts . . . . .	168
	Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and	
	Local Password Authentication . . . . .	173
	Example: Configuring Authentication Order . . . . .	175
	Example: Configuring System Authentication for RADIUS, TACACS+, and	
	Password Authentication . . . . .	178
	RADIUS Authentication . . . . .	180
	Configuring RADIUS Server Authentication . . . . .	180
	Why Use RADIUS . . . . .	180
	Configuring RADIUS Server Details . . . . .	181
	Configuring RADIUS To Use the Management Instance . . . . .	185
	Example: Configuring a RADIUS Server for System Authentication . . . . .	186
	Example: Configuring RADIUS Authentication . . . . .	188
	Configuring RADIUS Authentication (QFX Series or OCX Series) . . . . .	190
	Configuring RADIUS Server Details . . . . .	190
	Configuring MS-CHAPv2 for Password-Change Support . . . . .	191
	Specifying a Source Address for the Junos OS to Access External	
	RADIUS Servers . . . . .	192
	Juniper Networks Vendor-Specific RADIUS Attributes . . . . .	192
	Juniper-Switching-Filter VSA Match Conditions and Actions . . . . .	195
	Understanding RADIUS Accounting . . . . .	197
	Configuring RADIUS System Accounting . . . . .	198
	Configuring Auditing of User Events on a RADIUS Server . . . . .	198
	Specifying RADIUS Server Accounting and Auditing Events . . . . .	199
	Configuring RADIUS Server Accounting . . . . .	199

TACACS+ Authentication . . . . .	201
Configuring TACACS+ Authentication . . . . .	202
Configuring TACACS+ Server Details . . . . .	202
Configuring TACACS+ to Use the Management Instance . . . . .	203
Specifying a Source Address for the Junos OS to Access External TACACS+ Servers . . . . .	204
Configuring the Same Authentication Service for Multiple TACACS+ Servers . . . . .	204
Configuring Juniper Networks Vendor-Specific TACACS+ Attributes . .	205
Example: Configuring a TACACS+ Server for System Authentication . . . .	205
Configuring Periodic Refresh of the TACACS+ Authorization Profile . . . .	208
Using Regular Expressions on a RADIUS or TACACS+ Server to Allow or Deny Access to Commands . . . . .	210
Juniper Networks Vendor-Specific TACACS+ Attributes . . . . .	212
Configuring TACACS+ System Accounting . . . . .	214
Specifying TACACS+ Auditing and Accounting Events . . . . .	214
Configuring TACACS+ Server Accounting . . . . .	214
Configuring TACACS+ To Use the Management Instance . . . . .	216
Configuring TACACS+ Accounting on a TX Matrix Router . . . . .	216
Authentication for Routing Protocols . . . . .	217
Junos OS Authentication Methods for Routing Protocols . . . . .	218
Example: Configuring the Authentication Key for BGP and IS-IS Routing Protocols . . . . .	218
Configuring BGP . . . . .	219
Configuring IS-IS . . . . .	219
Configuring the Authentication Key Update Mechanism for BGP and LDP Routing Protocols . . . . .	220
Configuring Authentication Key Updates . . . . .	221
Configuring BGP and LDP for Authentication Key Updates . . . . .	221
<b>Chapter 5 Remote Access Management . . . . .</b>	<b>223</b>
Remote Access Overview . . . . .	223
System Services Overview . . . . .	223
Configuring Telnet Service for Remote Access to a Router or Switch . . . .	224
Configuring FTP Service for Remote Access to the Router or Switch . . . .	225
Configuring Finger Service for Remote Access to the Router . . . . .	225
Configuring SSH Service for Remote Access to the Router or Switch . . . .	226
Configuring the Root Login Through SSH . . . . .	227
Configuring the SSH Protocol Version . . . . .	228
Configuring the Client Alive Mechanism . . . . .	228
Configuring the SSH Fingerprint Hash Algorithm . . . . .	228
The telnet Command . . . . .	229
The ssh Command . . . . .	230
Configuring SSH Host Keys for Secure Copying of Data . . . . .	231
Configuring SSH Known Hosts . . . . .	231
Configuring Support for SCP File Transfer . . . . .	232
Updating SSH Host Key Information . . . . .	232
Configuring the SSH Service to Support Legacy Cryptography . . . . .	233

Configuring Outbound SSH Service . . . . .	235
Configuring the Device Identifier for Outbound SSH Connections . . . . .	236
Sending the Public SSH Host Key to the Outbound SSH Client . . . . .	236
Configuring Keepalive Messages for Outbound SSH Connections . . . . .	237
Configuring a New Outbound SSH Connection . . . . .	238
Configuring the Outbound SSH Client to Accept NETCONF as an Available Service . . . . .	238
Configuring Outbound SSH Clients . . . . .	238
Configuring NETCONF-Over-SSH Connections on a Specified TCP Port . . . . .	238
Configuring Password Retry Limits for Telnet and SSH Access . . . . .	239
Example: Configuring a Filter to Block Telnet and SSH Access . . . . .	240
Secure Web Access for Remote Management . . . . .	246
Secure Web Access Overview . . . . .	246
Generating SSL Certificates for Secure Web Access (SRX Series Devices) . . . . .	247
Generating SSL Certificates to Be Used for Secure Web Access (EX Series Switch) . . . . .	247
Generating a Self-Signed SSL Certificate Automatically . . . . .	248
Manually Generating Self-Signed SSL Certificates . . . . .	248
Deleting Self-Signed Certificates (CLI Procedure) . . . . .	249
Understanding Self-Signed Certificates on EX Series Switches . . . . .	249
Manually Generating Self-Signed Certificates on Switches (CLI Procedure) . . . . .	250
Generating a Public-Private Key Pair on Switches . . . . .	251
Generating Self-Signed Certificates on Switches . . . . .	251
Example: Configuring Secure Web Access . . . . .	252
<b>Chapter 6 Access Control on Switches . . . . .</b>	<b>255</b>
Access Control and Authentication on Switching Devices . . . . .	255
Understanding Authentication on Switches . . . . .	256
Sample Authentication Topology . . . . .	256
802.1X Authentication . . . . .	257
MAC RADIUS Authentication . . . . .	259
Captive Portal Authentication . . . . .	259
Static MAC Bypass of Authentication . . . . .	260
Fallback of Authentication Methods . . . . .	261
Understanding Access Control on Switches . . . . .	262
Understanding Authentication Session Timeout . . . . .	264
Controlling Authentication Session Timeouts (CLI Procedure) . . . . .	265
Preventing Unauthorized Access to EX Series Switches Using Unattended Mode for U-Boot . . . . .	267
Understanding Unattended Mode for U-Boot on EX Series Switches . . . . .	267
Using Unattended Mode for U-Boot to Prevent Unauthorized Access . . . . .	268
Configuring the Boot Loader Password . . . . .	269
Configuring Unattended Mode for U-Boot . . . . .	270
Accessing the U-Boot CLI . . . . .	270

RADIUS Server Configuration for Authentication . . . . .	270
Specifying RADIUS Server Connections on Switches (CLI Procedure) . . . . .	271
Configuring MS-CHAPv2 to Provide Password-Change Support (CLI Procedure) . . . . .	272
Configuring MS-CHAPv2 for Password-Change Support . . . . .	273
Understanding Server Fail Fallback and Authentication on Switches . . . . .	274
Configuring RADIUS Server Fail Fallback (CLI Procedure) . . . . .	275
802.1X Authentication . . . . .	277
802.1X for Switches Overview . . . . .	277
How 802.1X Authentication Works . . . . .	277
802.1X Features Overview . . . . .	278
802.1X Authentication on Trunk Ports . . . . .	279
Configuring 802.1X Interface Settings (CLI Procedure) . . . . .	280
Understanding RADIUS-Initiated Changes to an Authorized User Session . . . . .	282
Disconnect Messages . . . . .	282
Change of Authorization Messages . . . . .	283
CoA Request Port Bounce . . . . .	283
Error-Cause Codes . . . . .	284
Filtering 802.1X Supplicants by Using RADIUS Server Attributes . . . . .	285
Configuring Firewall Filters on the RADIUS Server . . . . .	286
Applying a Locally Configured Firewall Filter from the RADIUS Server . . . . .	289
Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch . . . . .	290
Understanding Dynamic Filters Based on RADIUS Attributes . . . . .	294
Understanding Dynamic VLAN Assignment Using RADIUS Attributes . . . . .	295
Understanding Guest VLANs for 802.1X on Switches . . . . .	296
Example: Configuring 802.1X Authentication Options When the RADIUS Server Is Unavailable to an EX Series Switch . . . . .	297
Example: Configuring Fallback Options on EX Series Switches for EAP-TTLS Authentication and Odyssey Access Clients . . . . .	303
Monitoring 802.1X Authentication . . . . .	308
Verifying 802.1X Authentication . . . . .	309
Troubleshooting Authentication of End Devices on EX Series Switches . . . . .	310
MAC RADIUS Authentication . . . . .	312
Configuring MAC RADIUS Authentication (CLI Procedure) . . . . .	313
Example: Configuring MAC RADIUS Authentication on an EX Series Switch . . . . .	314
802.1X and RADIUS Accounting . . . . .	320
Understanding 802.1X and RADIUS Accounting on Switches . . . . .	320
RADIUS Accounting Process . . . . .	320
Supported RADIUS Attributes . . . . .	321
Configuring 802.1X RADIUS Accounting (CLI Procedure) . . . . .	323
Example: Setting Up 802.1X for Single-Supplicant or Multiple-Supplicant Configurations on an EX Series Switch . . . . .	325
Example: Setting Up 802.1X in Conference Rooms to Provide Internet Access to Corporate Visitors on an EX Series Switch . . . . .	331

Interfaces Enabled for 802.1X or MAC RADIUS Authentication . . . . .	337
Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants by Using RADIUS Server Attributes on an EX Series Switch . . . . .	337
Example: Applying Firewall Filters to Multiple Supplicants on Interfaces Enabled for 802.1X or MAC RADIUS Authentication . . . . .	344
Example: Applying Firewall Filters to Multiple Supplicants on Interfaces Enabled for 802.1X or MAC RADIUS Authentication on EX Series Switches with ELS Support . . . . .	350
Static MAC Bypass of 802.1X and MAC RADIUS Authentication . . . . .	355
Configuring Static MAC Bypass of 802.1X and MAC RADIUS Authentication (CLI Procedure) . . . . .	356
Example: Configuring Static MAC Bypass of 802.1X and MAC RADIUS Authentication on an EX Series Switch . . . . .	356
Captive Portal Authentication . . . . .	361
Example: Setting Up Captive Portal Authentication on an EX Series Switch . . . . .	361
Configuring Captive Portal Authentication (CLI Procedure) . . . . .	366
Configuring Secure Access for Captive Portal . . . . .	367
Enabling an Interface for Captive Portal . . . . .	367
Configuring Bypass of Captive Portal Authentication . . . . .	368
Designing a Captive Portal Authentication Login Page on Switches . . . . .	368
Configuring Captive Portal Authentication (CLI Procedure) on an EX Series Switches with ELS Support . . . . .	371
Configuring Secure Access for Captive Portal . . . . .	371
Enabling an Interface for Captive Portal . . . . .	372
Configuring Bypass of Captive Portal Authentication . . . . .	372
Example: Setting Up Captive Portal Authentication on an EX Series Switch with ELS Support . . . . .	372
Flexible Authentication Order on EX Series Switches . . . . .	377
Configuring Flexible Authentication Order . . . . .	377
Configuring EAPoL Block to Maintain an Existing Authentication Session . .	380
Central Web Authentication . . . . .	381
Understanding Central Web Authentication . . . . .	381
Central Web Authentication Process . . . . .	382
Dynamic Firewall Filters for Central Web Authentication . . . . .	383
Redirect URL for Central Web Authentication . . . . .	383
Configuring Central Web Authentication . . . . .	384
Configuring Dynamic Firewall Filters for Central Web Authentication . . . . .	384
Configuring the Redirect URL for Central Web Authentication . . . . .	385
Guidelines for Configuring Central Web Authentication . . . . .	386
Centralized Access Control to Network Resources on EX Series Switches . . . .	387
Understanding Centralized Network Access Control and EX Series Switches . . . . .	387
NAC Using Any RADIUS Server and Access Policies Defined on the Local Switch . . . . .	387
Centralized NAC Using Junos Pulse Access Control Service . . . . .	388

	Captive Portal Authentication .....	389
	Configuring an EX Series Switch to Use Junos Pulse Access Control Service for Network Access Control (CLI Procedure) .....	389
	Configuring the EX Series Switch for Captive Portal Authentication with Junos Pulse Access Control Service (CLI Procedure) .....	392
	VoIP on EX Series Switches .....	393
	Understanding 802.1X and VoIP on EX Series Switches .....	394
	Multi Domain 802.1X Authentication .....	395
	Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch .....	396
	Example: Configuring VoIP on an EX Series Switch Without Including LLDP-MED Support .....	404
	Example: Configuring VoIP on an EX Series Switch Without Including LLDP-MED Support .....	409
	Example: Configuring VoIP on an EX Series Switch Without Including 802.1X Authentication .....	414
	Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch with ELS Support .....	421
<b>Chapter 7</b>	<b>Device Discovery .....</b>	<b>431</b>
	Device Discovery Using LLDP and LLDP-MED on Switches .....	431
	Understanding LLDP .....	431
	Configuring LLDP (CLI Procedure) .....	432
	Enabling LLDP on Interfaces .....	432
	Adjusting LLDP Advertisement Settings .....	433
	Adjusting SNMP Notification Settings of LLDP Changes .....	434
	Specifying a Management Address for the LLDP Management TLV ..	435
	Configuring LLDP Power Negotiation .....	435
	Disabling LLDP TLVs .....	436
	Configuring LLDP (J-Web Procedure) .....	437
	Understanding LLDP and LLDP-MED on EX Series Switches .....	438
	Benefits of LLDP and LLDP-MED .....	438
	LLDP and LLDP-MED Overview .....	438
	Supported LLDP TLVs .....	439
	Supported LLDP-MED TLVs .....	440
	Disabling TLVs .....	441
	Configuring LLDP-MED (CLI Procedure) .....	441
	Enabling LLDP-MED on Interfaces .....	442
	Configuring Location Information Advertised by the Switch .....	442
	Configuring a Fast Start for LLDP-MED .....	442
	Disabling LLDP-MED TLVs .....	443
	NetBIOS Snooping on EX Series Switches .....	444
	Understanding NetBIOS Snooping .....	444
	What Is a NetBIOS Name? .....	444
	How NetBIOS Snooping Works .....	445
	Configuring NetBIOS Snooping (CLI Procedure) .....	445
	Enabling NetBIOS Snooping .....	445
	Disabling NetBIOS Snooping .....	446

<b>Chapter 8</b>	<b>DHCP on Routers</b>	<b>447</b>
	DHCP for Routing Devices	447
	DHCP Access Service Overview	448
	Network Address Assignments (Allocating a New Address)	448
	Network Address Assignments (Reusing a Previously Assigned Address)	450
	Static and Dynamic Bindings	450
	Compatibility with Autoinstallation	451
	Conflict Detection and Resolution	451
	DHCP Statement Hierarchy and Inheritance	451
	DHCP Local Server	453
	Configuring Address Pools for DHCP Dynamic Bindings	453
	Configuring Manual (Static) DHCP Bindings Between a Fixed IP Address and a Client MAC Address	454
	Specifying DHCP Lease Times for IP Address Assignments	455
	Configuring a DHCP Boot File and DHCP Boot Server	456
	Configuring a Static IP Address as DHCP Server Identifier	457
	Configuring a Domain Name and Domain Search List for a DHCP Server Host	457
	Configuring Routers Available to the DHCP Client	458
	Creating User-Defined DHCP Options Not Included in the Default Junos Implementation of the DHCP Server	459
	Example: Complete DHCP Server Configuration	460
	Verifying and Managing the DHCP Server Configuration	461
	Example: Viewing DHCP Bindings	461
	Example: Viewing DHCP Address Pools	462
	Example: Viewing and Clearing DHCP Conflicts	462
	Configuring Tracing Operations for DHCP Processes	463
	Configuring the DHCP Processes Log Filename	464
	Configuring the Number and Size of DHCP Processes Log Files	464
	Configuring Access to the DHCP Log File	464
	Configuring a Regular Expression for Refining the Output of DHCP Logged Events	464
	Configuring DHCP Trace Operation Events	465
	DHCP Processes Tracing Flags	465
	Extended DHCP Local Server	466
	Extended DHCP Local Server Overview	468
	Interaction Among the DHCP Client, Extended DHCP Local Server, and Address-Assignment Pools	470
	Providing DHCP Client Configuration Information	471
	Minimal Configuration for Clients	472
	DHCP Local Server and Address-Assignment Pools	472
	Configuring the Router as an Extended DHCP Local Server	473
	Interaction Among the DHCP Client, Extended DHCP Local Server, and Address-Assignment Pools	475
	Extended DHCP Local Server and Address-Assignment Pools	475

Methods Used by the Extended DHCP Local Server to Determine Which Address-Assignment Pool to Use . . . . .	476
Matching the Client IP Address to the Address-Assignment Pool . . . .	476
Matching Option 82 Information to Named Address Ranges . . . . .	476
Default Options Provided by the Extended DHCP Server for the DHCP Client . . . . .	477
Using External AAA Authentication Services to Authenticate DHCP Clients . . . . .	477
Configuring Authentication Support for an Extended DHCP Application . . . . .	478
Grouping Interfaces with Common DHCP Configurations . . . . .	479
Configuring Passwords for Usernames the DHCP Application Presents to the External AAA Authentication Service . . . . .	480
Creating Unique Usernames the Extended DHCP Application Passes to the External AAA Authentication Service . . . . .	480
Client Configuration Information Exchanged Between the External Authentication Server, DHCP Application, and DHCP Client . . . . .	482
Example: Configuring the Minimum Extended DHCP Local Server Configuration . . . . .	483
Example: Extended DHCP Local Server Configuration with Optional Pool Matching . . . . .	483
Tracing Extended DHCP Local Server Operations . . . . .	483
Configuring the Filename of the Extended DHCP Local Server Processes Log . . . . .	484
Configuring the Number and Size of Extended DHCP Local Server Processes Log Files . . . . .	485
Configuring Access to the Log File . . . . .	485
Configuring a Regular Expression for Lines to Be Logged . . . . .	485
Configuring Trace Option Flags . . . . .	486
<b>Chapter 9 DHCP for Switches . . . . .</b>	<b>487</b>
DHCP for Switches . . . . .	487
Understanding DHCP Services for Switches . . . . .	488
DHCP Client/Server Model . . . . .	488
Using DHCP . . . . .	489
DHCP Relay Servers and DHCP Servers . . . . .	489
Legacy DHCP and Extended DHCP for Server Versions . . . . .	489
Configuring DHCP on a Switch . . . . .	490
How DHCP Works . . . . .	490
Configuring a Switch as a DHCP Server (CLI Procedure) . . . . .	491
Configuring the Switch as a Local DHCP Server . . . . .	492
Configuring a DHCP Server on Switches (CLI Procedure) . . . . .	494
Configuring an Extended DHCP Server on a Switch . . . . .	495
Configuring a Legacy DHCP Server on a Switch (CLI Procedure) . . . .	496
Configuring a DHCP Client (CLI Procedure) . . . . .	497
Configuring a DHCP SIP Server (CLI Procedure) . . . . .	498
DHCP and BOOTP Relay Overview . . . . .	499

Configuring DHCP and BOOTP .....	499
Configuring DHCP and BOOTP Relay .....	500
Configuring a DHCP and BOOTP Relay Agent .....	501
Configuring DHCP Smart Relay .....	502
Graceful Routing Engine Switchover for DHCP .....	503
Centrally Configured Opaque DHCP Options .....	504
Data Flow for RADIUS-Sourced DHCP Options .....	506
Multiple VSA 26-55 Instances Configuration .....	507
DHCP Options That Cannot Be Centrally Configured .....	507
Extended DHCP Local Server .....	508
Extended DHCP Local Server Overview .....	509
Interaction Among the DHCP Client, Extended DHCP Local Server, and Address-Assignment Pools .....	511
Providing DHCP Client Configuration Information .....	512
Minimal Configuration for Clients .....	513
DHCP Local Server and Address-Assignment Pools .....	513
Example: Minimum Extended DHCP Local Server Configuration .....	514
Disabling Automatic Binding of Stray DHCP Requests .....	514
Configuring a Token for DHCP Local Server Authentication .....	516
Configuring an Extended DHCP Relay Server on EX Series Switches (CLI Procedure) .....	517
Verifying and Managing DHCP Local Server Configuration .....	518
DHCPv6 Local Server .....	519
DHCPv6 Local Server Overview .....	519
Specifying the Delegated Address Pool for IPv6 Prefix Assignment .....	520
Preventing Binding of Clients That Do Not Support Reconfigure Messages .....	521
Configuring DHCPv6 Rapid Commit (MX, EX) .....	521
Verifying and Managing DHCPv6 Local Server Configuration .....	522
Extended DHCP Relay Agent .....	523
Extended DHCP Relay Agent Overview .....	524
Interaction Among the DHCP Relay Agent, DHCP Client, and DHCP Servers .....	525
DHCP Liveness Detection .....	526
Using Layer 2 Unicast Transmission instead of Broadcast for DHCP Packets .....	526
Changing the Gateway IP Address (giaddr) Field to the giaddr of the DHCP Relay Agent .....	526
Replacing the DHCP Relay Request and Release Packet Source Address ..	527
Example: Configuring DHCP Relay Agent Selective Traffic Processing Based on DHCP Option Strings .....	527
Example: Minimum DHCP Relay Agent Configuration .....	531
Verifying and Managing DHCP Relay Configuration .....	532
Overriding the Default DHCP Relay Configuration Settings .....	533
Overriding the Default DHCP Local Server Configuration Settings Overview .....	536
Disabling DHCP Relay Agent for Interfaces, for Groups, or Globally .....	538

DHCP Relay Agent Information Option (Option 82) .....	539
Using DHCP Relay Agent Option 82 Information .....	539
Configuring Option 82 Information .....	540
Overriding Option 82 Information .....	542
Including a Prefix in DHCP Options .....	543
Including a Textual Description in DHCP Options .....	545
How DHCP Relay Agent Uses Option 82 for Auto Logout .....	547
Enable Processing of Untrusted Packets So Option 82 Information Can Be Used .....	548
DHCP Auto Logout Overview .....	549
Auto Logout Overview .....	549
How DHCP Identifies and Releases Clients .....	549
Option 60 and Option 82 Requirements .....	550
Automatically Logging Out DHCP Clients .....	551
DHCP Relay Proxy .....	552
DHCP Relay Proxy Overview .....	552
Interaction Among DHCP Relay Proxy, DHCP Client, and DHCP Servers .....	552
Benefits of Using DHCP Relay Proxy .....	553
Enabling DHCP Relay Proxy Mode .....	553
DHCPv6 Relay Agent .....	554
DHCPv6 Relay Agent Overview .....	554
Inserting DHCPv6 Interface-ID Option (Option 18) In DHCPv6 Packets ..	555
Verifying and Managing DHCPv6 Relay Configuration .....	556
Managing DHCP Services on Switches .....	557
Using External AAA Authentication Services with DHCP .....	557
Creating Unique Usernames for DHCP Clients .....	559
Specifying the Maximum Number of DHCP Clients Per Interface .....	562
DHCP Local Server Handling of Client Information Request Messages ..	563
Enabling Processing of Client Information Requests .....	564
Sending Release Messages When Clients Are Deleted .....	565
Understanding Dynamic Reconfiguration of Extended DHCP Local Server Clients .....	565
Default Client/Server Interaction .....	565
Dynamic Client/Server Interaction for DHCPv4 .....	566
Dynamic Client/Server Interaction for DHCPv6 .....	567
Manually Forcing the Local Server to Initiate the Reconfiguration Process .....	567
Action Taken for Events That Occur During a Reconfiguration .....	567
Benefits of Dynamic Reconfiguration of DHCP Local Server Clients ..	568
Configuring Dynamic Client Reconfiguration of Extended Local Server Clients Overview .....	568
Requesting DHCP Local Server to Initiate Reconfiguration of Client Bindings .....	570
Configuring Dynamic Reconfiguration Attempts for DHCP Clients .....	570
Configuring Deletion of the Client When Dynamic Reconfiguration Fails ..	571
Configuring Reconfiguration of the Client on Receipt of RADIUS-Initiated Disconnect .....	572

Applying a Common DHCP Relay Agent Configuration to Groups of DHCP Servers	572
Configuring Active Server Groups to Apply a Common DHCP Relay Agent Configuration to Named Server Groups	573
Grouping Interfaces and Applying a Common DHCP Configuration to the Group	575
Grouping Interfaces with Common DHCP Configurations	576
Guidelines for Configuring Interface Ranges for Groups of DHCP Interfaces	576
Configuring Group-Specific DHCP Local Server Options	578
Configuring Group-Specific DHCP Relay Options	578
Configuring High Availability in the DHCP Access Network	579
DHCP Liveness Detection Overview	580
Configuring Detection of DHCP Relay or DHCP Relay Proxy Client Connectivity with BFD	581
Configuring Detection of DHCP Local Server Client Connectivity with BFD	583
Example: Configuring Global Liveness Detection with BFD for DHCP Relay Agent Clients	585
Securing DHCP Messages Sent Between DHCP Clients and Servers in Different VRFs	588
DHCP Message Exchange Between DHCP Clients and DHCP Server in Different VRFs	589
Configuring DHCP Message Exchange Between DHCP Server and Clients in Different Virtual Routing Instances	590
Client-Side Support	591
Server-Side Support	592
DHCP Local Server Support	592
Assigning IP Addresses for DHCP	593
Address-Assignment Pools Overview	594
Benefits of Address Assignment Pools	595
Configuring How the Extended DHCP Local Server Determines Which Address-Assignment Pool to Use	595
Example: Extended DHCP Local Server Configuration with Optional Pool Matching	596
Assign a Specific IP Address to a Client Using DHCP Option 50 and DHCPv6 IA_NA Option	597
Multiple Address Assignment for DHCPv6 Clients	598
Suppressing DHCP Access	598
Suppressing DHCP Access, Access-Internal, and Destination Routes	599
Preventing DHCP from Installing Access, Access-Internal, and Destination Routes by Default	600
DHCP Snooping	601
DHCP Snooping Support	601
Example: Configuring DHCP Snooping Support for DHCP Relay Agent	602
Configuring DHCP Snooped Packets Forwarding Support for DHCP Relay Agent	604

<b>Chapter 10</b>	<b>DHCP for Security Devices</b>	<b>607</b>
	DHCP Overview	607
	DHCP Overview	607
	DHCP Local Server	608
	DHCP Client, DHCP Local Server, and Address-Assignment Pool Interaction	608
	DHCP Local Server and Address-Assignment Pools	609
	DHCP Client	609
	DHCP Relay Agent	609
	DHCP Client, DHCP Relay Agent, and DHCP Local Servers	610
	Considerations	610
	DHCP Settings and Restrictions Overview	611
	Propagation of TCP/IP Settings for DHCP	611
	DHCP Conflict Detection and Resolution	612
	DHCP Interface Restrictions	612
	DHCP Server	612
	Understanding DHCP Server Operation	612
	DHCP Options	613
	Compatibility with Autoinstallation	613
	Chassis Cluster Support	613
	DHCP Server Configuration Overview	613
	Minimum DHCP Local Server Configuration	615
	Enabling TCP/IP Propagation on a DHCP Local Server	616
	Example: Configuring the Device as a DHCP Server	616
	Verifying and Managing DHCP Local Server Configuration	622
	DHCP Address-Assignment Pools	623
	Configuring Address-Assignment Pools	624
	Configuring an Address-Assignment Pool Name and Addresses	624
	Configuring a Named Address Range for Dynamic Address Assignment	625
	Configuring Static Address Assignments	625
	Configuring Address-Assignment Pool Linking	626
	DHCP Client	626
	Understanding DHCP Client Operation	627
	Minimum DHCP Client Configuration	627
	Configuring DHCP Client-Specific Attributes for Address-Assignment Pools	628
	Configuring Optional DHCP Client Attributes	629
	Verifying and Managing DHCP Client Configuration	630
	Example: Configuring the Device as a DHCP Client	630
	DHCP Relay Agent	636
	Understanding DHCP Relay Agent Operation	636
	Example: Minimum DHCP Relay Agent Configuration	637
	Example - Configuring JDHCP Relay Configuration	637
	Example: Configuring the Device as a BOOTP or DHCP Relay Agent using Legacy DHCP Deamon Command	648

DHCPv6 Server	652
DHCPv6 Server Overview	653
Creating a Security Policy to Enable DHCPv6 Traffic	654
Example: Configuring DHCPv6 Server Options	654
Understanding Cascaded DHCPv6 Prefix Delegating	658
Example - Configuring DHCPv6 Prefix Delegation (PD) over Point-to-Point Protocol over Ethernet (PPPoE)	660
DHCPv6 Client	681
DHCPv6 Client Overview	682
Minimum DHCPv6 Client Configuration	682
Configuring DHCP Client-Specific Attributes	684
Configuring Optional DHCPv6 Client Attributes	685
Configuring the DHCPv6 Client Rapid Commit Option	686
Configuring a DHCPv6 Client in Autoconfig Mode	687
Configuring TCP/IP Propagation on a DHCPv6 Client	688
Understanding DHCPv6 Client and Server Identification	688
DHCPv6 Address-Assignment Pools	689
Example: Configuring an Address-Assignment Pool for IPv6 Addresses	689
Configuring a Named Address Range and DHCPv6 Attributes for Dynamic Address Assignment	692
Configuring an Address-Assignment Pool for Router Advertisement	693
Configuring Nontemporary Address Assignment	693
Configuring Identity Associations for Nontemporary Addresses and Prefix Delegation	694
Configuring Auto-Prefix Delegation	695
DHCP In Chassis Cluster Mode	696
Example: Configuring the Device as a DHCP Server in Chassis Cluster Mode	696
Example: Configuring the Device as a DHCP Client in Chassis Cluster Mode	702

# About the Documentation

- Documentation and Release Notes on page xli
- Using the Examples in This Manual on page xli
- Documentation Conventions on page xliii
- Documentation Feedback on page xlv
- Requesting Technical Support on page xlv

## Documentation and Release Notes

---

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at <https://www.juniper.net/documentation/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <https://www.juniper.net/books>.

## Using the Examples in This Manual

---

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

## Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xml;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

## Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {
  file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the **load** command, see [CLI Explorer](#).

## Documentation Conventions

Table 1 on page xliii defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.
	Tip	Indicates helpful information.
	Best practice	Alerts you to a recommended use or implementation.

Table 2 on page xliv defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
<b>Bold text like this</b>	Represents text that you type.	To enter configuration mode, type the <b>configure</b> command:  user@host> <b>configure</b>
Fixed-width text like this	Represents output that appears on the terminal screen.	user@host> <b>show chassis alarms</b>  No alarms currently active
<i>Italic text like this</i>	<ul style="list-style-type: none"> <li>Introduces or emphasizes important new terms.</li> <li>Identifies guide names.</li> <li>Identifies RFC and Internet draft titles.</li> </ul>	<ul style="list-style-type: none"> <li>A policy <i>term</i> is a named structure that defines match conditions and actions.</li> <li><i>Junos OS CLI User Guide</i></li> <li>RFC 1997, <i>BGP Communities Attribute</i></li> </ul>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name:  [edit] root@# <b>set system domain-name</b> <i>domain-name</i>
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"> <li>To configure a stub area, include the <b>stub</b> statement at the [edit protocols <b>ospf area area-id</b>] hierarchy level.</li> <li>The console port is labeled <b>CONSOLE</b>.</li> </ul>
< > (angle brackets)	Encloses optional keywords or variables.	<b>stub</b> <default-metric <i>metric</i> >;
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	<b>broadcast</b>   <b>multicast</b>  ( <i>string1</i>   <i>string2</i>   <i>string3</i> )
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	<b>rsvp { # Required for dynamic MPLS only</b>
[ ] (square brackets)	Encloses a variable for which you can substitute one or more values.	<b>community name members</b> [ <b>community-ids</b> ]
Indentation and braces ( { } )	Identifies a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	}

## GUI Conventions

Table 2: Text and Syntax Conventions (continued)

Convention	Description	Examples
<b>Bold text like this</b>	Represents graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"> <li>In the Logical Interfaces box, select <b>All Interfaces</b>.</li> <li>To cancel the configuration, click <b>Cancel</b>.</li> </ul>
<b>&gt;</b> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select <b>Protocols&gt;Ospf</b> .

## Documentation Feedback

We encourage you to provide feedback so that we can improve our documentation. You can use either of the following methods:

- Online feedback system—Click TechLibrary Feedback, on the lower right of any page on the [Juniper Networks TechLibrary](#) site, and do one of the following:

- Click the thumbs-up icon if the information on the page was helpful to you.
- Click the thumbs-down icon if the information on the page was not helpful to you or if you have suggestions for improvement, and use the pop-up form to provide feedback.
- E-mail—Send your comments to [techpubs-comments@juniper.net](mailto:techpubs-comments@juniper.net). Include the document or topic name, URL or page number, and software version (if applicable).

## Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active Juniper Care or Partner Support Services support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <https://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <https://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

## Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <https://www.juniper.net/customers/support/>
- Search for known bugs: <https://prsearch.juniper.net/>
- Find product documentation: <https://www.juniper.net/documentation/>
- Find solutions and answer questions using our Knowledge Base: <https://kb.juniper.net/>
- Download the latest versions of software and review release notes: <https://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications: <https://kb.juniper.net/InfoCenter/>
- Join and participate in the Juniper Networks Community Forum: <https://www.juniper.net/company/communities/>
- Create a service request online: <https://myjuniper.juniper.net>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://entitlementsearch.juniper.net/entitlementsearch/>

## Creating a Service Request with JTAC

You can create a service request with JTAC on the Web or by telephone.

- Visit <https://myjuniper.juniper.net>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <https://support.juniper.net/support/requesting-support/>.

## CHAPTER 1

# Login Classes and Login Settings

- [Junos OS Login Classes Overview on page 47](#)
- [Junos OS Login Settings on page 52](#)

## Junos OS Login Classes Overview

---

Junos OS login class allow you to define access privileges, permission for using CLI commands and statements, and session idle time for each login classes. You can apply login class to an individual user account, there by specifying certain privileges and permissions to the user. Read this topic for more information.

- [Junos OS Login Classes Overview on page 47](#)
- [Defining Junos OS Login Classes on page 51](#)
- [Example: Creating Login Classes with Specific Privileges on page 51](#)

## Junos OS Login Classes Overview

All users who can log in to the router or switch must be in a login class. With login classes, you define the following:

- Access privileges that users have when they are logged in to the router or switch
- Commands and statements that users can and cannot specify
- How long a login session can be idle before it times out and the user is logged out

You can define any number of login classes and then apply one login class to an individual user account.

The Junos operating system (Junos OS) contains a few predefined login classes, which are listed in [Table 3 on page 47](#). The predefined login classes cannot be modified.

**Table 3: Predefined System Login Classes**

Login Class	Permission Flag Set
<b>operator</b>	clear, network, reset, trace, and view
<b>read-only</b>	view

Table 3: Predefined System Login Classes (continued)

Login Class	Permission Flag Set
superuser or super-user	all
unauthorized	None

## NOTE:

- You cannot modify a predefined login class name. If you issue the `set` command on a predefined class name, the Junos OS appends `-local` to the login class name. The following message also appears:

```
warning: '<class-name>' is a predefined class name; changing to
'<class-name>-local'
```

- You cannot issue the `rename` or `copy` command on a predefined login class. Doing so results in the following error message:

```
error: target '<class-name>' is a predefined class
```

### Permission Bits

Each top-level CLI command and each configuration statement has an access privilege level associated with it. Users can execute only those commands and configure and view only those statements for which they have access privileges. The access privileges for each login class are defined by one or more permission bits (see [Table 4 on page 48](#)).

Two forms for the permissions control the individual parts of the configuration:

- "Plain" form—Provides read-only capability for that permission type. An example is `interface`.
- Form that ends in `-control`—Provides read and write capability for that permission type. An example is `interface-control`.

Table 4: Permission Bits for Login Classes

Permission Bit	Access
admin	Can view user account information in configuration mode and with the <code>show configuration</code> command.
admin-control	Can view user accounts and configure them (at the <code>[edit system login]</code> hierarchy level).
access	Can view the access configuration in configuration mode and with the <code>show configuration</code> operational mode command.
access-control	Can view and configure access information (at the <code>[edit access]</code> hierarchy level).

Table 4: Permission Bits for Login Classes (continued)

Permission Bit	Access
<b>all</b>	Has all permissions.
<b>clear</b>	Can clear (delete) information learned from the network that is stored in various network databases (using the <b>clear</b> commands).
<b>configure</b>	Can enter configuration mode (using the <b>configure</b> command) and commit configurations (using the <b>commit</b> command).
<b>control</b>	Can perform all control-level operations (all operations configured with the <b>-control</b> permission bits).
<b>field</b>	Reserved for field (debugging) support.
<b>firewall</b>	Can view the firewall filter configuration in configuration mode.
<b>firewall-control</b>	Can view and configure firewall filter information (at the <b>[edit firewall]</b> hierarchy level).
<b>floppy</b>	Can read from and write to the removable media.
<b>interface</b>	Can view the interface configuration in configuration mode and with the <b>show configuration</b> operational mode command.
<b>interface-control</b>	Can view chassis, class of service, groups, forwarding options, and interfaces configuration information. Can configure chassis, class of service, groups, forwarding options, and interfaces (at the <b>[edit]</b> hierarchy).
<b>maintenance</b>	Can perform system maintenance, including starting a local shell on the device and becoming the superuser in the shell (by issuing the <b>su root</b> command), and can halt and reboot the device (using the <b>request system</b> commands).
<b>network</b>	Can access the network by entering the <b>ping</b> , <b>ssh</b> , <b>telnet</b> , and <b>traceroute</b> commands.
<b>reset</b>	Can restart software processes using the <b>restart</b> command and can configure whether software processes are enabled or disabled (at the <b>[edit system processes]</b> hierarchy level).
<b>rollback</b>	Can use the <b>rollback</b> command to return to a previously committed configuration other than the most recently committed one.
<b>routing</b>	Can view general routing, routing protocol, and routing policy configuration information in configuration and operational modes.
<b>routing-control</b>	Can view general routing, routing protocol, and routing policy configuration information and configure general routing (at the <b>[edit routing-options]</b> hierarchy level), routing protocols (at the <b>[edit protocols]</b> hierarchy level), and routing policy (at the <b>[edit policy-options]</b> hierarchy level).
<b>secret</b>	Can view passwords and other authentication keys in the configuration.

Table 4: Permission Bits for Login Classes (continued)

Permission Bit	Access
<b>secret-control</b>	Can view passwords and other authentication keys in the configuration and can modify them in configuration mode.
<b>security</b>	Can view security configuration in configuration mode and with the <b>show configuration</b> operational mode command.
<b>security-control</b>	Can view and configure security information (at the <b>[edit security]</b> hierarchy level).
<b>shell</b>	Can start a local shell on the device by entering the <b>start shell</b> command.
<b>snmp</b>	Can view SNMP configuration information in configuration and operational modes.
<b>snmp-control</b>	Can view SNMP configuration information and configure SNMP (at the <b>[edit snmp]</b> hierarchy level).
<b>system</b>	Can view system-level information in configuration and operational modes.
<b>system-control</b>	Can view system-level configuration information and configure it (at the <b>[edit system]</b> hierarchy level).
<b>trace</b>	Can view trace file settings in configuration and operational modes.
<b>trace-control</b>	Can view trace file settings and configure trace file properties.
<b>view</b>	Can use various commands to display current system-wide, routing table, and protocol-specific values and statistics.

### Denying or Allowing Individual Commands

By default, all top-level CLI commands have associated access privilege levels. Users can execute only those commands and view only those statements for which they have access privileges. For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that are otherwise permitted or not allowed by a permission bit.

## Defining Junos OS Login Classes

Login classes allow you to define the following:

- Access privileges that users have when they are logged in to the router or switch
- Commands and statements that users can and cannot specify
- How long a login session can be idle before it times out and the user is logged out

All users who can log in to the router or switch must be in a login class. Therefore, you must define a Junos OS login class for each user or class of users. You can define any number of login classes depending on the types of permissions the users need.

To define a login class and its access privileges, include the **class** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
class class-name {
  access-end;
  access-start;
  allow-commands "regular-expression";
  ( allow-configuration | allow-configuration-regexps ) "regular expression 1" "regular
  expression 2";
  allowed-days;
  configuration-breadcrumbs;
  deny-commands "regular-expression";
  ( deny-configuration | deny-configuration-regexps ) "regular expression 1" "regular
  expression 2";
  idle-timeout minutes;
  login-script filename;
  login-tip;
  permissions [ permissions ];
}
```

## Example: Creating Login Classes with Specific Privileges

Login classes are used to assign certain permissions or restrictions to groups of users, ensuring that sensitive commands are only accessible to the appropriate users. By default, Juniper Networks devices have four types of login classes with preset permissions: operator, read-only, superuser or super-user, and unauthorized.

You can create new custom login classes to make different combinations of permissions that are not found in the default login classes. The following example shows how to create three custom login classes, each with specific privileges and timers to disconnect the class members after a period of inactivity. Inactivity timers help protect network security by disconnecting a user from the network if the user is away from his computer for too long, preventing potential security risks created by leaving an unattended account logged in to a switch or router. The permissions and inactivity timers shown here are only examples and should be customized to your organization.

The first class of users is called **observation** and they can only view statistics and configuration. They are not allowed to modify any configuration. The second class of

users is called **operation** and they can view and modify the configuration. The third class of users is called **engineering** and they have unlimited access and control. All three login classes use the same inactivity timer of 5 minutes.

```
[edit]
system {
  login {
    class observation {
      idle-timeout 5;
      permissions [ view ];
    }
    class operation {
      idle-timeout 5;
      permissions [ admin clear configure interface interface-control network
reset routing routing-control snmp snmp-control trace-control
firewall-control rollback ];
    }
    class engineering {
      idle-timeout 5;
      permissions all;
    }
  }
}
```

  - [Junos OS User Access Privileges on page 88](#)

---

## Junos OS Login Settings

Junos OS allows you to specify various settings for the users after they have logged in. You can define what to notify for the users after they have logged in, display system alarms, provide login tips, or specify time-based user access, and limit the number of login attempts. Read this topic for more information.

- [Configuring Junos OS to Display a System Login Announcement on page 53](#)
- [Configuring System Alarms to Appear Automatically Upon Login on page 54](#)
- [Configuring Login Tips on page 55](#)
- [Examples: Configuring Time-Based User Access on page 55](#)
- [Configuring the Timeout Value for Idle Login Sessions on page 56](#)
- [Login Retry Options on page 57](#)
- [Limiting the Number of User Login Attempts for SSH and Telnet Sessions on page 58](#)
- [Example: Configuring Login Retry Options on page 59](#)

## Configuring Junos OS to Display a System Login Announcement

Sometimes you want to make announcements only to authorized users after they have logged in. For example, you might want to announce an upcoming maintenance event.

You can format the announcement using the following special characters:

- \n—New line
- \t—Horizontal tab
- \'—Single quotation mark
- \"—Double quotation mark
- \\—Backslash

If the message text contains any spaces, enclose it in quotation marks.

By default, no login announcement is displayed.

To configure an announcement that can be seen only by authorized users:

1. Include the **announcement** statement in the **[edit system login]** configuration.

```
[edit system login]
user@host# set announcement text
```

For example:

```
system {
  login {
    announcement "\tJuly 27th 1:00 AM to 8:00\n\nPlanned Network
    Maintenance\n\nAFFECTED LOCATIONS: Sunnyvale\n\nPLANNED ACTIVITY:
    Upgrade all 6200 switch firmware to the Enterprise TAC recommended firmware
    version\n\nPURPOSE: This activity will help to minimize the impact of unplanned
    power outages as well as address known issues within our currently installed
    firmware version(s)\n\nWHAT TO EXPECT: During the maintenance window for
    your site, the office network will not be available.\n\n";
    message "\n\n\tTPO - M7i - iX Router Lab\n\n\tUNAUTHORIZED USE OF THIS
    ROUTER\n\tIS STRICTLY PROHIBITED!\n\n\tPlease contact
    \'astatti@juniper.net\' to gain\n\taccess to this equipment if you need
    authorization.\n\n\n"
  }
}
```

2. Commit the configuration.

```
[edit system login]
user@host# commit
```

3. Connect to the device in a new session to verify the presence of the new banner.

The preceding login message configuration example produces a login message similar to the following:

```
server% telnet host
Trying 203.0.113.0
Connected to host.example.net
Escape character is '^['.

      TPO - M7i - iX Router Lab

      UNAUTHORIZED USE OF THIS ROUTER
      IS STRICTLY PROHIBITED!

      Please contact 'astatti@juniper.net' to gain
      access to this equipment if you need authorization

Login: user
Password:

      July 27th 1:00 AM to 8:00

Planned Network Maintenance

AFFECTED LOCATIONS: Sunnyvale

PLANNED ACTIVITY: Upgrade all 6200 switch firmware to the Enterprise TAC
recommended firmware version

PURPOSE: This activity will help to minimize the impact of unplanned power
outages as well as address known issues within our currently installed firmware
version(s)

WHAT TO EXPECT: During the maintenance window for your site, the office network
will not be available.
```

If the announcement text contains any spaces, enclose the text in quotation marks.

A system login *announcement* appears after the user logs in. A system login *message* appears before the user logs in.

**TIP:** You can use the same special characters described to format your system login announcement.

## Configuring System Alarms to Appear Automatically Upon Login

You can configure Juniper Networks routers and switches to run the **show system alarms** command whenever a user with the login class **admin** logs in to the router or switch. To do so, include the **login-alarms** statement at the **[edit system login class admin]** hierarchy level.

```
[edit system login class admin]
login-alarms;
```

For more information on the **show system alarms** command, see the [CLI Explorer](#).

**See Also** • *show system alarms*

## Configuring Login Tips

The Junos OS CLI provides the option of configuring login tips for the user. By default, the **tip** command is not enabled when a user logs in.

- To enable tips, include the **login-tip** statement at the **[edit system login class class-name]** hierarchy level:

```
[edit system login class class-name]
login-tip;
```

Adding this statement enables the **tip** command for the class specified, provided the user logs in using the CLI.

## Examples: Configuring Time-Based User Access

The following example shows how to configure user access for the **operator-round-the-clock-access** login class from Monday through Friday without any restriction on access time or duration of login:

```
[edit system]
login {
  class operator-round-the-clock-access {
    allowed-days [ monday tuesday wednesday thursday friday ];
  }
}
```

The following example shows how to configure user access for the **operator-day-shift** login class on Monday, Wednesday, and Friday from 8:30 AM to 4:30 PM:

```
[edit system]
login {
  class operator-day-shift {
    allowed-days [ monday wednesday friday ];
    access-start 0830;
    access-end 1630;
  }
}
```

Alternatively, you can also specify the login start time and end time for the **operator-day-shift** login class to be from 8:30 AM to 4:30 PM in the following format:

```
[edit system]
login {
  class operator-day-shift {
```

```
    allowed-days [ monday wednesday friday ];
    access-start 08:30am;
    access-end 04:30pm;
  }
}
```

The following example shows how to configure user access for the **operator-day-shift-all-days-of-the-week** login class to be on all days of the week from 8:30 AM to 4:30 PM:

```
[edit system]
login {
  class operator-day-shift-all-days-of-the-week {
    access-start 0830;
    access-end 1630;
  }
}
```

**See Also** • [Configuring Time-Based User Access](#)

## Configuring the Timeout Value for Idle Login Sessions

An idle login session is one in which the CLI operational mode prompt is displayed but there is no input from the keyboard. By default, a login session remains established until a user logs out of the router or switch, even if that session is idle. To close idle sessions automatically, you must configure a time limit for each login class. If a session established by a user in that class remains idle for the configured time limit, the session automatically closes.

To define the timeout value for idle login sessions, include the **idle-timeout** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
idle-timeout minutes;
```

Specify the number of minutes that a session can be idle before it is automatically closed.

If you have configured a timeout value, the CLI displays messages similar to the following when timing out an idle user. It starts displaying these messages 5 minutes before timing out the user.

```
user@host# Session will be closed in 5 minutes if there is no activity.
Warning: session will be closed in 1 minute if there is no activity
Warning: session will be closed in 10 seconds if there is no activity
Idle timeout exceeded: closing session
```

If you configure a timeout value, the session closes after the specified time has elapsed, unless the user is running telnet or monitoring interfaces using the **monitor interface** or **monitor traffic** command.

**See Also** • [idle-timeout \(System-Login\)](#) on page 1030

## Login Retry Options

The security administrator can configure the number of times a user can try to log in to the device with invalid login credentials. The device can be locked after the specified number of unsuccessful authentication attempts. This helps to protect the device from malicious users attempting to access the system by guessing an account's password. The security administrator can unlock the user account or define a time period for the user account to remain locked.

The system **lockout-period** defines the amount of time the device can be locked for a user account after a specified number of unsuccessful login attempts.

The security administrator can configure a period of time after which an inactive session will be locked and require re-authentication to be unlocked. This helps to protect the device from being idle for a long period before the session times out.

The system **idle-timeout** defines length of time the CLI operational mode prompt remains active before the session times out.

The security administrator can configure a banner with an advisory notice to be displayed before the identification and authentication screen.

The system **message** defines the system login message. This message appears before a user logs in.

The number of reattempts the device allows is defined by the **tries-before-disconnect** option. The device allows 3 unsuccessful attempts by default or as configured by the administrator. The device prevents the locked users to perform activities that require authentication, until a security administrator manually clears the lock or the defined time period for the device to remain locked has elapsed. However, the existing locks are ignored when the user attempts to log in from the local console.

**NOTE:** To clear the console during an administrator-initiated logout, the administrator must configure the set system login message “message string” such that, the message-string contains newline (\n) characters and a login banner message at the end of the \n characters.

To ensure that configuration information is cleared completely, the administrator can enter 50 or more \n characters in the *message-string* of the command `set system login message "message string"`.

For example, set system login message

"Welcome to Junos!!!"

## Limiting the Number of User Login Attempts for SSH and Telnet Sessions

You can limit the number of times a user can attempt to enter a password while logging in through SSH or Telnet. The connection is terminated if a user fails to log in after the number of attempts specified. You can also specify a delay, in seconds, before a user can try to enter a password after a failed attempt. In addition, you can specify the threshold for the number of failed attempts before the user experiences a delay in being able to enter a password again.

To specify the number of times a user can attempt to enter a password while logging in, include the **retry-options** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
retry-options {
  tries-before-disconnect number;
  backoff-threshold number;
  backoff-factor seconds;
  maximum-time seconds;
  minimum-time seconds;
}
```

You can configure the following options:

- **tries-before-disconnect**—Number of times a user can attempt to enter a password when logging in. The connection closes if a user fails to log in after the number specified. The range is from 1 through 10, and the default is 10.
- **backoff-threshold**—Threshold for the number of failed login attempts before the user experiences a delay in being able to enter a password again. Use the **backoff-factor** option to specify the length of the delay in seconds. The range is from 1 through 3, and the default is 2.
- **backoff-factor**—Length of time, in seconds, before a user can attempt to log in after a failed attempt. The delay increases by the value specified for each subsequent attempt after the threshold. The range is from 5 through 10, and the default is 5 seconds.
- **maximum-time seconds**—Maximum length of time, in seconds, that the connection remains open for the user to enter a username and password to log in. If the user remains idle and does not enter a username and password within the configured **maximum-time**, the connection is closed. The range is from 20 through 300 seconds, and the default is 120 seconds.
- **minimum-time**—Minimum length of time, in seconds, that a connection remains open while a user is attempting to enter a correct password. The range is from 20 through 60, and the default is 40.

The following example shows how to limit the user to four attempts when the user enters a password while logging in through SSH or Telnet:

Limiting the number of SSH and Telnet login attempts per user is one of the most effective methods of stopping brute force attacks from compromising your network security. Brute force attackers execute a large number of login attempts in a short period of time to

illegitimately gain access to a private network. By configuring the **retry-options** command, you can create an increasing delay after each failed login attempt, eventually disconnecting any user who passes your set threshold of login attempts.

Set the **backoff-threshold** to 2, the **back-off-factor** to 5 seconds, and the **minimum-time** to 40 seconds. The user experiences a delay of 5 seconds after the second attempt to enter a correct password fails. After each subsequent failed attempt, the delay increases by 5 seconds. After the fourth and final failed attempt to enter a correct password, the user experiences an additional 10-second delay, and the connection closes after a total of 40 seconds.

The additional variables **maximum-time** and **lockout-period** are not set in this example.

```
[edit]
system {
  login {
    retry-options {
      backoff-threshold 2;
      backoff-factor 5;
      minimum-time 40;
      tries-before-disconnect 4;
    }
    password {
    }
  }
}
```

**NOTE:** This sample only shows the portion of the [edit system login] hierarchy level being modified.

## Example: Configuring Login Retry Options

This example shows how to configure system retry options to protect the device from malicious users.

- [Requirements on page 59](#)
- [Overview on page 60](#)
- [Configuration on page 62](#)
- [Verification on page 63](#)

### Requirements

Before you begin, you should understand “[Login Retry Options](#)” on page 57.

No special configuration beyond device initialization is required before configuring this feature.

## Overview

---

Malicious users sometimes try to log in to a secure device by guessing an authorized user account's password. Locking out a user account after a number of failed authentication attempts helps protect the device from malicious users.

Device lockout allows you to configure the number of failed attempts before the user account is locked out of the device and configure the amount of time before the user can attempt to log in to the device again. You can configure the amount of time in-between failed login attempts of a user account and can manually lock and unlock user accounts.

**NOTE:**

This example includes the following settings:

- **backoff-factor** — Sets the length of delay in seconds after each failed login attempt. When a user incorrectly logs in to the device, the user must wait the configured amount of time before attempting to log in to the device again. The length of delay increases by this value for each subsequent login attempt after the value specified in the **backoff-threshold** statement. The default value for this statement is five seconds, with a range of five to ten seconds.
- **backoff-threshold** — Sets the threshold for the number of failed login attempts on the device before the user experiences a delay when attempting to reenter a password. When a user incorrectly logs in to the device and hits the threshold of failed login attempts, the user experiences a delay that is set in the **backoff-factor** statement before attempting to log in to the device again. The default value for this statement is two, with a range of one through three.
- **lockout-period** — Sets the amount of time in minutes before the user can attempt to log in to the device after being locked out due to the number of failed login attempts specified in the **tries-before-disconnect** statement. When a user fails to correctly login after the number of allowed attempts specified by the **tries-before-disconnect** statement, the user must wait the configured amount of minutes before attempting to log in to the device again. The lockout-period must be greater than zero. The range at which you can configure the lockout-period is one through 43,200 minutes.
- **tries-before-disconnect** — Sets the maximum number of times the user is allowed to enter a password to attempt to log in to the device through SSH or Telnet. When the user reaches the maximum number of failed login attempts, the user is locked out of the device. The user must wait the configured amount of minutes in the **lockout-period** statement before attempting to log back in to the device. The **tries-before-disconnect** statement must be set when the **lockout-period** statement is set; otherwise, the **lockout-period** statement is meaningless. The default number of attempts is ten, with a range of one through ten attempts.

Once a user is locked out of the device, if you are the security administrator, you can manually remove the user from this state using the `clear system login lockout <username>` command. You can also use the `show system login lockout` command to view which users are currently locked out, when the lockout period began for each user, and when the lockout period ends for each user.

If the security administrator is locked out of the device, he can log in to the device from the console port, which ignores any user locks. This provides a way for the administrator to remove the user lock on their own user account.

In this example the user waits for the **backoff-threshold** multiplied by the **backoff-factor** interval, in seconds, to get the login prompt. In this example, the user must wait 5 seconds after the first failed login attempt and 10 seconds after the second failed login attempt to get the login prompt. The user gets disconnected after 15 seconds after the third failed attempt because the **tries-before-disconnect** option is configured as 3.

The user cannot attempt another login until 120 minutes has elapsed, unless a security administrator manually clears the lock sooner.

### Configuration

---

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set system login retry-options backoff-factor 5
set system login retry-options backoff-threshold 1
set system login retry-options lockout-period 120
set system login retry-options tries-before-disconnect 3
```

**Step-by-Step Procedure** To configure system retry-options:

1. Configure the backoff factor.

```
[edit ]
user@host# set system login retry-options backoff-factor 5
```

2. Configure the backoff threshold.

```
[edit]
user@host# set system login retry-options backoff-threshold 1
```

3. Configure the amount of time the device gets locked after failed attempts.

```
[edit]
user@host# set system login retry-options lockout-period 5
```

4. Configure the number of unsuccessful attempts during which, the device can remain unlocked.

```
[edit]
user@host# set system login retry-options tries-before-disconnect 3
```

**Results** From configuration mode, confirm your configuration by entering the **show system login retry-options** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show system login retry-options
backoff-factor 5;
backoff-threshold 1;
lockout-period 5;
tries-before-disconnect 3;
```

Confirm that the configuration is working properly.

If you are done configuring the device, enter **commit** from configuration mode.

---

## Verification

### *Displaying the Locked User Logins*

<b>Purpose</b>	Verify that the login lockout configuration is enabled.
<b>Action</b>	Attempt three unsuccessful logins for a particular username. The device will be locked for that username; then log in to the device with a different username. From operational mode, enter the <b>show system login lockout</b> command.
<b>Meaning</b>	When you perform three unsuccessful login attempts with a particular username, the device is locked for that user for five minutes, as configured in the example. You can verify that the device is locked for that user by logging in to the device with a different username and entering the <b>show system login lockout</b> command.

## CHAPTER 2

# User Accounts

- [Junos OS User Accounts on page 65](#)
- [Junos OS Administrative Roles on page 77](#)
- [Junos OS User Access Privileges on page 88](#)

## Junos OS User Accounts

---

Junos OS allows you to create accounts for router, switch, and security users. All users also belong one the system login classes.

Junos OS requires that all users have a predefined user account before they can log in to the device. For each user account, you define the login name for the user and, optionally, information that identifies the user. User accounts provide a way for users to access a router or switch or security device. Read this topic for more information.

- [Junos OS User Accounts Overview on page 65](#)
- [Junos-FIPS Crypto Officer and User Accounts Overview on page 67](#)
- [Example: Configuring User Accounts on page 68](#)
- [Example: Configuring New Users on page 68](#)
- [Configuring Junos OS User Accounts by Using a Configuration Group on page 74](#)

## Junos OS User Accounts Overview

User accounts provide one way for users to access the device. (Users can access the device without accounts if you configured RADIUS or TACACS+ servers, as described in [“Junos OS User Authentication Methods” on page 159](#).) For each account, you define the login name for the user and, optionally, information that identifies the user. After you have created an account, the software creates a home directory for the user.

For each user account, you can define the following:

- Username—Name that identifies the user. It must be unique within the device. Do not include spaces, colons, or commas in the username. The username can be up to 64 characters long.
- User's full name—(Optional) If the full name contains spaces, enclose it in quotation marks. Do not include colons or commas.

- User identifier (UID)—(Optional) Numeric identifier that is associated with the user account name. The identifier must be in the range from 100 through 64,000 and must be unique within the device. If you do not assign a UID to a username, the software assigns one when you commit the configuration, preferring the lowest available number.

You must ensure that the UID is unique. However, it is possible to assign the same UID to different users. If you do this, the CLI displays a warning when you commit the configuration and then assigns the duplicate UID.

- User's access privilege—(Required) One of the login classes you defined in the **class** statement at the **[edit system login]** hierarchy level, or one of the default classes listed in ["Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands, Configuration Statements, and Hierarchies"](#) on page 97.
- Authentication method or methods and passwords that the user can use to access the device—(Optional) You can use SSH or a Message Digest 5 (MD5) password, or you can enter a plain-text password that the Junos OS encrypts using MD5-style encryption before entering it in the password database. For each method, you can specify the user's password. If you configure the **plain-text-password** option, you are prompted to enter and confirm the password:

```
[edit system login user username]  
user@host# set authentication plain-text-password  
New password: type password here  
Retype new password: retry password here
```

The default requirements for plain-text passwords are:

- The password must be between 6 and 128 characters long.
- You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
- Valid passwords must contain at least one change of case or character class.

Junos-FIPS and Common Criteria have special password requirements. FIPS and Common Criteria passwords must be between 10 and 20 characters in length. Passwords must use at least three of the five defined character sets (uppercase letters, lowercase letters, digits, punctuation marks, and other special characters). If Junos-FIPS is installed on the device, you cannot configure passwords unless they meet this standard.

For SSH authentication, you can copy the contents of an SSH key file into the configuration or directly configure SSH key information. Use the **load-key-file** *URL filename* command to load an SSH key file that was previously generated, e.g. by using **ssh-keygen**. The *URL filename* is the path to the file's location and name. This command loads RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys. The contents of the SSH key file are copied into the configuration immediately after you enter the **load-key-file** statement. Optionally, you can use the **ssh-dsa public key <from hostname>** and the **ssh-rsa public key <from hostname>** statements to directly configure SSH keys.

Starting in Junos OS Release 18.3R1, the **ssh-dss** and **ssh-dsa** hostkey algorithms are deprecated—rather than immediately removed—to provide backward compatibility and a chance to bring your configuration into compliance with the new configuration.

For each user account and for root logins, you can configure more than one public RSA or DSA key for user authentication. When a user logs in using a user account or as root, the configured public keys are referenced to determine whether the private key matches any of them.

To view the SSH keys entries, use the configuration mode **show** command. For example:

```
[edit system login user boojum]
user@host# set authentication load-key-file my-host::ssh/id_dsa.pub
.file.19692 | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
[edit system]
user@host# show
root-authentication {
  ssh-rsa "$ABC123"; # SECRET-DATA
}
```

An account for the user **root** is always present in the configuration. You configure the password for **root** using the **root-authentication** statement, as described in [“Configuring the Root Password” on page 138](#).

## Junos-FIPS Crypto Officer and User Accounts Overview

Junos-FIPS defines a restricted set of user roles. Unlike the Junos OS, which enables a wide range of capabilities to users, FIPS 140-2 defines specific types of users (Crypto Officer, User, and Maintenance). Crypto Officers and FIPS Users perform all FIPS-related configuration tasks and issue all FIPS-related commands. Crypto Officer and FIPS User configurations must follow FIPS 140-2 guidelines. Typically, no user besides a Crypto Officer can perform FIPS-related tasks.

### Crypto Officer User Configuration

Junos-FIPS offers finer control of user permissions than those mandated by FIPS 140-2. For FIPS 140-2 conformance, any Junos-FIPS user with the **secret**, **security**, and **maintenance** permission bits set is a Crypto Officer. In most cases, the **super-user** class should be reserved for a Crypto Officer. A FIPS User can be defined as any Junos-FIPS user that does not have the **secret**, **security**, and **maintenance** bits set.

### FIPS User Configuration

A Crypto Officer sets up FIPS Users. FIPS Users can be granted permissions normally reserved for a Crypto Officer; for example, permission to zeroize the system and individual AS-II FIPS PICs.

## Example: Configuring User Accounts

The following example shows how to create accounts for four router or switch users, and create an account for the template user **remote**. All users use one of the default system login classes. User **alexander** also has two digital signal algorithm (DSA) public keys configured for SSH authentication.

```
[edit]
system {
  login {
    user philip {
      full-name "Philip of Macedonia";
      uid 1001;
      class super-user;
      authentication {
        encrypted-password "$ABC123";
      }
    }
    user alexander {
      full-name "Alexander the Great";
      uid 1002;
      class view;
      authentication {
        encrypted-password "$ABC123";
        ssh-dsa "8924 37 5678 5678@gaugamela.per";
        ssh-dsa "6273 94 9283@boojum.per";
      }
    }
    user darius {
      full-name "Darius King of Persia";
      uid 1003;
      class operator;
      authentication {
        ssh-rsa "1024 37 12341234@ecbatana.per";
      }
    }
    user anonymous {
      class unauthorized;
    }
    user remote {
      full-name "All remote users";
      uid 9999;
      class read-only;
    }
  }
}
```

## Example: Configuring New Users

This example shows how to configure new users.

- [Requirements on page 69](#)
- [Overview on page 69](#)

- [Configuration on page 69](#)
- [Verification on page 74](#)

## Requirements

No special configuration beyond device initialization is required before configuring this feature.

## Overview

You can add new users to the device's local database. For each account, you define a login name and password for the user and specify a login class for access privileges. The login password must meet the following criteria:

- The password must be at least six characters long.
- You can include most character classes in a password (alphabetic, numeric, and special characters), but not control characters.
- The password must contain at least one change of case or character class.

In this example, you create a login class named `operator-and-boot` and allow it to reboot the device. You can define any number of login classes. You then allow the `operator-and-boot` login class to use commands defined in the `clear`, `network`, `reset`, `trace`, and `view` permission bits.

Then you create user accounts. User accounts enable you to access the device. (You can access the device without accounts if you configured RADIUS or TACACS+ servers.) You set the username as `cmartin` and the login class as `superuser`. Finally, you define the encrypted password for the user.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set system login class operator-and-boot allow-commands "request system reboot"
set class system login operator-and-boot permissions [clear network reset trace view]
set system login user cmartin class superuser authentication encrypted-password
$1$ABC123
```

### GUI Step-by-Step Procedure

To configure new users:

1. In the J-Web user interface, select **Configure>System Properties>User Management**.
2. Click **Edit**. The Edit User Management dialog box appears.
3. Select the **Users** tab.

4. Click **Add** to add a new user. The Add User dialog box appears.
5. In the User name box, type a unique name for the user.  
Do not include spaces, colons, or commas in the username.
6. In the User ID box, type a unique ID for the user.
7. In the Full Name box, type the user's full name.  
If the full name contains spaces, enclose it in quotation marks. Do not include colons or commas.
8. In the Password and Confirm Password boxes, enter a login password for the user and verify your entry.
9. From the Login Class list, select the user's access privilege:
  - **operator**
  - **read-only**
  - **unauthorized**This list also includes any user-defined login classes.
10. Click **OK** in the Add User dialog box and Edit User Management dialog box.
11. Click **OK** to check your configuration and save it as a candidate configuration.
12. If you are done configuring the device, click **Commit Options>Commit**.

**Step-by-Step  
Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the [CLI User Guide](#).

To configure new users:

1. Set the name of the login class and allow the use of the reboot command.

```
[edit system login]
user@host# set class operator-and-boot allow-commands "request system reboot"
```

2. Set the permission bits for the login class.

```
[edit system login]
user@host# set class operator-and-boot permissions [clear network reset trace
view]
```

3. Set the username, login class, and encrypted password for the user.

```
[edit system login]
user@host# set user cmartin class superuser authentication encrypted-password
$1$ABC123
```

**Results** From configuration mode, confirm your configuration by entering the **show system login** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show system login
class operator-and-boot {
  permissions [ clear network reset trace view ];
  allow-commands "request system reboot";
}
user cmartin {
  class superuser;
  authentication {
    encrypted-password "$1$ABC123";
  }
}
```

The following example shows how to create accounts for four router or switch users, and create an account for the template user **remote**. All users use one of the default system login classes. User **alexander** also has two digital signal algorithm (DSA) public keys configured for SSH authentication.

```
[edit]
system {
  login {
    user philip {
      full-name "Philip of Macedonia";
      uid 1001;
      class super-user;
      authentication {
        encrypted-password "$ABC123";
      }
    }
    user alexander {
      full-name "Alexander the Great";
      uid 1002;
      class view;
      authentication {
        encrypted-password "$ABC123";
        ssh-dsa "8924 37 5678 5678@gaugamela.per";
        ssh-dsa "6273 94 9283@boojum.per";
      }
    }
    user darius {
      full-name "Darius King of Persia";
      uid 1003;
```

```
class operator;
authentication {
    ssh-rsa "1024 37 12341234@ecbatana.per";
}
}
user anonymous {
    class unauthorized;
}
user remote {
    full-name "All remote users";
    uid 9999;
    class read-only;
}
}
```

The following example shows how to create accounts for four router or switch users, and create an account for the template user **remote**. All users use one of the default system login classes. User **alexander** also has two digital signal algorithm (DSA) public keys configured for SSH authentication.

```
[edit]
system {
    login {
        user philip {
            full-name "Philip of Macedonia";
            uid 1001;
            class super-user;
            authentication {
                encrypted-password "$ABC123";
            }
        }
        user alexander {
            full-name "Alexander the Great";
            uid 1002;
            class view;
            authentication {
                encrypted-password "$ABC123";
                ssh-dsa "8924 37 5678 5678@gaugamela.per";
                ssh-dsa "6273 94 9283@boojum.per";
            }
        }
        user darius {
            full-name "Darius King of Persia";
            uid 1003;
            class operator;
            authentication {
                ssh-rsa "1024 37 12341234@ecbatana.per";
            }
        }
        user anonymous {
            class unauthorized;
        }
        user remote {
```

```

        full-name "All remote users";
        uid 9999;
        class read-only;
    }
}

```

The following example shows how to create accounts for four router or switch users, and create an account for the template user **remote**. All users use one of the default system login classes. User **alexander** also has two digital signal algorithm (DSA) public keys configured for SSH authentication.

```

[edit]
system {
  login {
    user philip {
      full-name "Philip of Macedonia";
      uid 1001;
      class super-user;
      authentication {
        encrypted-password "$ABC123";
      }
    }
    user alexander {
      full-name "Alexander the Great";
      uid 1002;
      class view;
      authentication {
        encrypted-password "$ABC123";
        ssh-dsa "8924 37 5678 5678@gaugamela.per";
        ssh-dsa "6273 94 9283@boojum.per";
      }
    }
    user darius {
      full-name "Darius King of Persia";
      uid 1003;
      class operator;
      authentication {
        ssh-rsa "1024 37 12341234@ecbatana.per";
      }
    }
    user anonymous {
      class unauthorized;
    }
    user remote {
      full-name "All remote users";
      uid 9999;
      class read-only;
    }
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

**NOTE:** To completely set up RADIUS or TACACS+ authentication, you must configure at least one RADIUS or TACACS+ server and specify a user template account. Do one of the following tasks:

- Configure a RADIUS server. See [“Example: Configuring a RADIUS Server for System Authentication” on page 186](#).
- Configure a TACACS+ server. See [“Example: Configuring a TACACS+ Server for System Authentication” on page 205](#).
- Configure a user. See [“Example: Configuring New Users” on page 68](#).
- Configure template accounts. See [“Example: Creating Template Accounts” on page 163](#).

---

### Verification

Confirm that the configuration is working properly.

#### *Verifying the New Users Configuration*

**Purpose** Verify that the new users have been configured.

**Action** From operational mode, enter the **show system login** command.

## Configuring Junos OS User Accounts by Using a Configuration Group

User accounts provide a way for users to access a router or switch. Junos OS requires that all users have a predefined user account before they can log in to the device. For each user account, you define the login name for the user and, optionally, information that identifies the user. After you have created an account, the software creates a home directory for the user.

It is a common practice to use remote authentication servers to centrally store information about users. Even so, it is also a good practice to configure at least one nonroot user directly on each device, in case access to the remote authentication server is disrupted. This one nonroot user commonly has a generic name, such as **admin**.

Because user accounts are configured on multiple devices, they are commonly configured inside of a configuration group. As such, the examples shown here are in a configuration group called **global**. Using a configuration group for your user accounts is optional.

To create a user account:

1. Add a new user, using the user's assigned account login name.

```
[edit groups global]  
user@host# edit system login user username
```

2. (Optional) Configure a full descriptive name for the account.

If the full name includes spaces, enclose the entire name in quotation marks.

```
[edit groups global system login user user-name]
user@host# set full-name complete-name
```

For example:

```
user@host# show groups
global {
  system {
    login {
      user admin {
        full-name "general administrator";
      }
    }
  }
}
```

3. (Optional) Set the user identifier (UID) for the account.

As with UNIX systems, the UID enforces user permissions and file access. If you do not set the UID, Junos OS assigns one for you. The format of the UID is a number in the range of 100 to 64000.

```
[edit groups global system login user user-name]
user@host# set uid uid-value
```

For example:

```
user@host# show groups
global {
  system {
    login {
      user admin {
        uid 9999;
      }
    }
  }
}
```

4. Assign the user to a login class.

You can define your own login classes or assign one of the predefined Junos OS login classes.

The predefined login classes are as follows:

- super-user—all permissions
- operator—clear, network, reset, trace, and view permissions

- read-only—view permissions
- unauthorized—no permissions

```
[edit groups global system login user user-name]
user@host# set class class-name
```

For example:

```
user@host# show groups
global {
  system {
    login {
      user admin {
        class super-user;
      }
    }
  }
}
```

5. Use one of the following methods to configure the user password.

- To enter a clear-text password that the system encrypts for you, use the following command to set the user password:

```
[edit groups global system login user user-name]
user@host# set authentication plain-text-password password
New Password: type password here
Retype new password: retry password here
```

As you enter the password in plain text, Junos OS encrypts it immediately. You do not have to configure Junos OS to encrypt the password as in some other systems. Plain-text passwords are therefore hidden and marked as ## SECRET-DATA in the configuration.

- To enter a password that is already encrypted, use the following command to set the user password:

**CAUTION:** Do not use the encrypted-password option unless the password is *already* encrypted, and you are entering the encrypted version of the password.

If you accidentally configure the encrypted-password option with a plain-text password or with blank quotation marks (" "), you will not be able to log in to the device as this user.

```
[edit groups global system login user user-name]
user@host# set authentication encrypted-password "password"
New Password: type password here
Retype new password: retry password here
```

- To load previously generated public keys from a named file at a specified URL location, use the following command to set the user password:

```
[edit groups global system login user user-name]
user@host# set authentication load-key-file URL filename
```

- To enter an ssh public string, use the following command to set the user password:

```
[edit groups global system login user user-name]
user@host# set authentication (ssh-dsa | ssh-eccdsa | ssh-rsa) authorized-key
```

6. At the top level of the configuration, apply the configuration group.

If you use a configuration group, you must apply it for it to take effect.

```
[edit]
user@host# set apply-groups global
```

7. Commit the configuration.

```
user@host# commit
```

8. To verify the configuration, log out and log back in as the new user.

Release History Table

Release	Description
18.3R1	Starting in Junos OS Release 18.3R1, the <b>ssh-dss</b> and <b>ssh-dsa</b> hostkey algorithms are deprecated—rather than immediately removed—to provide backward compatibility and a chance to bring your configuration into compliance with the new configuration.

## Junos OS Administrative Roles

Junos OS allows you to define a system user to act as a particular kind of administrator for the system. You can assign an administrative role to a user by configuring a login class to have the administrative role attributes. You can assign one of the role attributes such as audit-officer crypto-officer, security-officer, ids-officer to an administrative user. Read this topic for more information.

- [Understanding Administrative Roles on page 78](#)
- [Example: Configuring Administrative Roles on page 80](#)
- [Configuring a Local Administrator Account on page 87](#)

## Understanding Administrative Roles

A system user can be a member of a class that allows the user to act as a particular kind of administrator for the system. Requiring a specific role to view or modify an item restricts the extent of information a user can obtain from the system. It also limits how much of the system is open to intentional or unintentional modification or observation by a user. We recommend that you use the following guidelines when you are designing administrative roles:

- Do not allow any user to log in to the system as **root**.
- Restrict each user to the smallest set of privileges needed to perform the user's duties.
- Do not allow any user to belong to a login class containing the **shell** permission flag. The **shell** permission flag allows users to run the **start shell** command from the CLI.
- Allow users to have rollback permissions. Rollback permissions allow users to undo an action performed by an administrator but does not allow them to commit the changes.

You can assign an administrative role to a user by configuring a login class to have the privileges required for that role. You can configure each class to allow or deny access to configuration statements and commands by name. These specific restrictions override and take precedence over any permission flags also configured in the class. You can assign one of the following role attributes to an administrative user.

- **Crypto-administrator**—Allows the user to configure and monitor cryptographic data.
- **Security-administrator**—Allows the user to configure and monitor security data.
- **Audit-administrator**—Allows the user to configure and monitor audit data.
- **IDS-administrator**—Allows the user to monitor and clear the intrusion detection service (IDS) security logs.

Each role can perform the following specific management functions:

- **Cryptographic Administrator**
  - Configures the cryptographic self-test.
  - Modifies the cryptographic security data parameters.
- **Audit Administrator**
  - Configures and deletes the audit review search and sort feature.
  - Searches and sorts audit records.
  - Configures search and sort parameters.
  - Manually deletes audit logs.
- **Security Administrator**

- Invokes, determines, and modifies the cryptographic self-test behavior.
  - Enables, disables, determines, and modifies the audit analysis and audit selection functions and configures the device to automatically delete audit logs.
  - Enables or disables security alarms.
  - Specifies limits for quotas on Transport Layer connections.
  - Specifies the limits, network identifiers, and time periods for quotas on controlled connection-oriented resources.
  - Specifies the network addresses permitted to use Internet Control Message Protocol (ICMP) or Address Resolution Protocol (ARP).
  - Configures the time and date used in time stamps.
  - Queries, modifies, deletes, and creates the information flow or access control rules and attributes for the unauthenticated information flow security function policy (SFP), the authenticated information flow SFP, the unauthenticated device services, and the discretionary access control policy.
  - Specifies initial values that override default values when object information is created under unauthenticated information flow SFP, the authenticated information flow SFP, the unauthenticated target of evaluation (TOE) services, and the discretionary access control policy.
  - Creates, deletes, or modifies the rules that control the address from which management sessions can be established.
  - Specifies and revokes security attributes associated with the users, subjects, and objects.
  - Specifies the percentage of audit storage capacity at which the device alerts administrators.
  - Handles authentication failures and modifies the number of failed authentication attempts through SSH or from the CLI that can occur before progressive throttling is enforced for further authentication attempts and before the connection is dropped.
  - Manages basic network configuration of the device.
- **IDS Administrator**—Specifies IDS security alarms, intrusion alarms, audit selections, and audit data.

You need to set the security-role attribute in the classes created for these administrative roles. This attribute restricts which users can show and clear the security logs, actions that cannot be performed through configuration alone.

For example, you need to set the security-role attribute in the **ids-admin** class created for the IDS administrator role if you want to restrict clearing and showing IDS logs to the IDS administrator role. Likewise, you need to set the security-role to one of the other admin values to restrict that class from being able to clear and show non-IDS logs only.

**NOTE:** When a user deletes an existing configuration, the configuration statements under the hierarchy level of the deleted configuration (that is, the child objects that the user does not have permission to modify), now remain in the device.

## Example: Configuring Administrative Roles

This example shows how to configure individual administrative roles for a distinct, unique set of privileges apart from all other administrative roles.

- [Requirements on page 80](#)
- [Overview on page 80](#)
- [Configuration on page 80](#)
- [Verification on page 86](#)

### Requirements

---

No special configuration beyond device initialization is required before configuring this feature.

### Overview

---

This example configures four users:

- **audit-officer** of the class **audit-admin**
- **crypto-officer** of the class **crypto-admin**
- **security-officer** of the class **security-admin**
- **ids-officer** of the class **ids-admin**

When a **security-admin** class is configured, the privileges for creating administrators are revoked from the user who created the **security-admin** class. Creation of new users and logins is at the discretion of the **security-officer**.

In this example, you create audit admin, crypto admin, security admin, and ids admin with permission flags pertaining to this role. Then you allow or deny access to configuration statements and commands by name for each administrative role. These specific restrictions take precedence over the permission flags also configured in the class. For example, only the **crypto-admin** can run the **request system set-encryption-key** command, which requires having the **security** permission flag to access it. Only the **security-admin** can include the **system time-zone** statement in the configuration, which requires having the **system-control** permission flag.

### Configuration

---

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

set system login class audit-admin permissions security
set system login class audit-admin permissions trace
set system login class audit-admin permissions maintenance
set system login class audit-admin allow-commands "^clear (log|security log)"
set system login class audit-admin deny-commands "^clear (security alarms|system
login lockout)|^file (copy|delete|rename)|^request (security|system
set-encryption-key)|^rollback|^set date|^show security
(alarms|dynamic-policies|match-policies|policies)|^start shell";
set system login class audit-admin security-role audit-administrator
set system login class crypto-admin permissions admin-control
set system login class crypto-admin permissions configure
set system login class crypto-admin permissions maintenance
set system login class crypto-admin permissions security-control
set system login class crypto-admin permissions system-control
set system login class crypto-admin permissions trace
set system login class crypto-admin allow-commands "^request system
set-encryption-key"
set system login class crypto-admin deny-commands "^clear (log|security alarms|security
log|system login lockout)|^file (copy|delete|rename)|^rollback|^set date|^show security
(alarms|dynamic-policies|match-policies|policies)|^start shell"
set system login class crypto-admin allow-configuration-regexps "security (ike|ipsec)
(policy|proposal)" "security ipsec ^vpn$ .* manual
(authentication|encryption|protocol|spi)" "system fips self-test after-key-generation"
set system login class crypto-admin security-role crypto-administrator
set system login class security-admin permissions all
set system login class security-admin deny-commands "^clear (log|security
log)|^(clear|show) security alarms alarm-type idp|^request (security|system
set-encryption-key)|^rollback|^start shell"
set system login class security-admin deny-configuration-regexps "security alarms
potential-violation idp" "security (ike|ipsec) (policy|proposal)" "security ipsec ^vpn$
.* manual (authentication| encryption|protocol|spi)" "security log cache" "security log
exclude .* event-id IDP_.*" "system fips self-test after-key- generation"
set system login class security-admin security-role security-administrator
set system login class ids-admin permissions configure
set system login class ids-admin permissions security-control
set system login class ids-admin permissions trace
set system login class ids-admin permissions maintenance
set system login class ids-admin allow-configuration-regexps "security alarms
potential-violation idp" "security log exclude .* event-id IDP_.*"
set system login class ids-admin deny-commands "^clear log|^(clear|show) security
alarms (alarm-id|all|newer-than|older- than|process|severity)|^(clear|show) security
alarms alarm-type
(authentication|cryptographic-self-test|decryption-failures|encryption-failures|
ike-phase1-failures|ike-phase2-failures|key-generation-self-test|
non-cryptographic-self-test|policy|replay-attacks)|^file (copy|delete|rename)|^request

^set date|^show security (dynamic-policies|match-policies|policies)|^start shell"
set system login class ids-admin deny-configuration-regexps "security alarms
potential-violation (authentication|cryptographic-self-test|decryption-
failures|encryption-failures|ike-phase1-failures|ike-phase2-failures|
key-generation-self-test|non-cryptographic-self-test|policy|replay-attacks)"
set system login class ids-admin security-role ids-admin
set system login user audit-officer class audit-admin
set system login user crypto-officer class crypto-admin
set system login user security-officer class security-admin

```

```
set system login user ids-officer class ids-admin
set system login user audit-officer authentication plain-text-password
set system login user crypto-officer authentication plain-text-password
set system login user security-officer authentication plain-text-password
set system login user ids-officer authentication plain-text-password
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure users in administrative roles:

1. Create the **audit-admin** login class.

```
[edit]
user@host# set system login class audit-admin
[edit system login class audit-admin]
user@host# set permissions security
user@host# set permissions trace
user@host# set permissions maintenance
```

2. Configure the **audit-admin** login class restrictions.

```
[edit system login class audit-admin]
user@host# set allow-commands "^clear (log|security log)"
user@host# set deny-commands "^clear (security alarms|system login logout)|^file
(copy|delete|rename)|^request (security|system
set-encryption-key)|^rollback|^set date|^show security
(alarms|dynamic-policies|match-policies|policies)|^start shell"
user@host# set security-role audit-administrator
```

3. Create the **crypto-admin** login class.

```
[edit]
user@host# set system login class crypto-admin

[edit system login class crypto-admin]
user@host# set permissions admin-control
user@host# set permissions configure
user@host# set permissions maintenance
user@host# set permissions security-control
user@host# set permissions system-control
user@host# set permissions trace
```

4. Configure the **crypto-admin** login class restrictions.

```
[edit system login class crypto-admin]
user@host# set allow-commands "^request system set-encryption-key"
```

```

user@host# set deny-commands "^clear (log|security alarms|security log|system
login lockout)|^file (copy|delete|rename)|^rollback|^set date|^show security
(alarms|dynamic-policies|match-policies|policies)|^start shell"
user@host# set allow-configuration-regexps "security (ike|ipsec) (policy|proposal)"
"security ipsec ^vpn$.* manual (authentication|encryption|protocol|spi)" "system
fips self-test after-key-generation"
user@host# set security-role crypto-administrator

```

5. Create the **security-admin** login class.

```

[edit]
user@host# set system login class security-admin

[edit system login class security-admin]
user@host# set permissions all

```

6. Configure the **security-admin** login class restrictions.

```

[edit system login class security-admin]
user@host# set deny-commands "^clear (log|security log)|^(clear|show) security
alarms alarm-type idp|^request (security|system
set-encryption-key)|^rollback|^start shell"
user@host# set deny-configuration-regexps "security alarms potential-violation
idp" "security (ike|ipsec) (policy|proposal)" "security ipsec ^vpn$.* manual
(authentication| encryption|protocol|spi)" "security log cache" "security log
exclude.* event-id IDP_.*" "system fips self-test after-key- generation"
user@host# set security-role security-administrator

```

7. Create the **ids-admin** login class.

```

[edit]
user@host# set system login class ids-admin

[edit system login class ids-admin]
user@host# set permissions configure
user@host# set permissions maintenance
user@host# set permissions security-control
user@host# set permissions trace

```

8. Configure the **ids-admin** login class restrictions.

```

[edit system login class ids-admin]
user@host# set allow-configuration-regexps "security alarms potential-violation
idp" "security log exclude.* event-id IDP_.*"
set system login class ids-admin deny-commands "^clear log|^ (clear|show) security
alarms (alarm-id|all|newer-than|older- than|process|severity)|^ (clear|show)
security alarms alarm-type
(authentication|cryptographic-self-test|decryption-failures|encryption-failures|
ike-phase1-failures|ike-phase2-failures|key-generation-self-test|

```

```

non-cryptographic-self-test|policy|replay-attacks)]^file
(copy|delete|rename)]^request (security|system set-encryption-key)|
^rollback|^set date|^show security (dynamic-policies|match-policies|policies)]^start
shell"
set system login class ids-admin deny-configuration-regexps "security alarms
potential-violation (authentication|cryptographic-self-test|decryption-
failures|encryption-failures|ike-phase1-failures|ike-phase2-failures|
key-generation-self-test|non-cryptographic-self-test|policy|replay-attacks)"
user@host# set security-role ids-administrator

```

9. Assign users to the roles.

```

[edit]
user@host# set system login

[edit system login]
user@host# set user audit-officer class audit-admin
user@host# set user crypto-officer class crypto-admin
user@host# set user security-officer class security-admin
user@host# set user ids-officer class ids-admin

```

10. Configure passwords for the users.

```

[edit system login]
user@host# set user audit-officer authentication plain-text-password
user@host# set user crypto-officer authentication plain-text-password
user@host# set user security-officer authentication plain-text-password
user@host# set user ids-officer authentication plain-text-password

```

## Results

From configuration mode, confirm your configuration by entering the **show system** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

[edit]
user@host# show system
system {
  login {
    class audit-admin {
      permissions [ maintenance security trace ];
      allow-commands "^clear (log|security log)";
      deny-commands "^clear (security alarms|system login lockout)]^file
        (copy|delete|rename)]^request (security|system
        set-encryption-key)]^rollback|^set date|^show security
        (alarms|dynamic-policies|match-policies|policies)]^start shell";
      security-role audit-administrator;
    }
    class crypto-admin {

```

```

permissions [ admin-control configure maintenance security-control system-control
  trace ];
allow-commands "^request (system set-encryption-key)";
deny-commands "^clear (log|security alarms|security log|system login logout)|^file
  (copy|delete|rename)|^rollback|^set date|^show security
  (alarms|dynamic-policies|match-policies|policies)|^start shell";
allow-configuration-regexps "security (ike|ipsec) (policy|proposal)" "security ipsec
  ^vpn$.* manual (authentication|encryption|protocol|spi)" "system fips self-test
  after-key-generation" ;
security-role crypto-administrator;
}
class security-admin {
  permissions [ all];
  deny-commands "^clear (log|security log)|^(clear|show) security alarms alarm-type
  idp|^request (security|system set-encryption-key)|^rollback|^start shell";
  deny-configuration-regexps "security alarms potential-violation idp" "security
  (ike|ipsec) (policy|proposal)" "security ipsec ^vpn$.* manual
  (authentication|encryption|protocol|spi)" "security log exclude.* event-id IDP_.*"
  "system fips self-test after-key-generation";
  security-role security-administrator;
}
class ids-admin {
  permissions [ configure maintenance security-control trace ];
  deny-commands "^clear log|^(clear|show) security alarms
  (alarm-id|all|newer-than|older-than|process|severity)|^(clear|show) security
  alarms alarm-type
  (authentication | cryptographic-self-test | decryption-failures | encryption-failures
  | ike-phase1-failures | ike-phase2-failures|key-generation-self-test |
  non-cryptographic-self-test |policy | replay-attacks) | ^file (copy|delete|rename)
  |^request (security|system set-encryption-key) | ^rollback |
  ^set date | ^show security (dynamic-policies|match-policies|policies) |^start shell";
  allow-configuration-regexps "security alarms potential-violation idp" "security log
  exclude.* event-id IDP_.*";
  deny-configuration-regexps "security alarms potential-violation
  (authentication|cryptographic-self-test|decryption-
  failures|encryption-failures|ike-phase1-failures|ike-phase2-failures|
  key-generation-self-test|non-cryptographic-self-test|policy|replay-attacks)"
  security-role ids-administrator;
}
user audit-officer {
  class audit-admin;
  authentication {
    encrypted-password "$1$ABC123"; ## SECRET-DATA
  }
}
user crypto-officer {
  class crypto-admin;
  authentication {
    encrypted-password "$1$ABC123."; ## SECRET-DATA
  }
}
user security-officer {
  class security-admin;
  authentication {
    encrypted-password "$1$ABC123."; ##SECRET-DATA

```

```

    }
  }
  user ids-officer {
    class ids-admin;
    authentication {
      encrypted-password "$1$ABC123/"; ## SECRET-DATA
    }
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

#### Verifying the Login Permissions

**Purpose** Verify the login permissions for the current user.

**Action** From operational mode, enter the **show cli authorization** command.

```
user@host>show cli authorization
```

```

Current user: 'example' class 'super-user'
Permissions:
  admin      -- Can view user accounts
  admin-control-- Can modify user accounts
  clear      -- Can clear learned network info
  configure  -- Can enter configuration mode
  control    -- Can modify any config
  edit       -- Can edit full files
  field      -- Can use field debug commands
  floppy     -- Can read and write the floppy
  interface  -- Can view interface configuration
  interface-control-- Can modify interface configuration
  network    -- Can access the network
  reset      -- Can reset/restart interfaces and daemons
  routing    -- Can view routing configuration
  routing-control-- Can modify routing configuration
  shell      -- Can start a local shell
  snmp       -- Can view SNMP configuration
  snmp-control-- Can modify SNMP configuration
  system     -- Can view system configuration
  system-control-- Can modify system configuration
  trace      -- Can view trace file settings
  trace-control-- Can modify trace file settings
  view       -- Can view current values and statistics
  maintenance -- Can become the super-user
  firewall   -- Can view firewall configuration
  firewall-control-- Can modify firewall configuration
  secret     -- Can view secret statements
  secret-control-- Can modify secret statements
  rollback   -- Can rollback to previous configurations
  security   -- Can view security configuration
  security-control-- Can modify security configuration

```

```

access      -- Can view access configuration
access-control-- Can modify access configuration
view-configuration-- Can view all configuration (not including secrets)
flow-tap    -- Can view flow-tap configuration
flow-tap-control-- Can modify flow-tap configuration
idp-profiler-operation-- Can Profiler data
pgcp-session-mirroring-- Can view pgcp session mirroring configuration
pgcp-session-mirroring-control-- Can modify pgcp session mirroring configuration
Individual command authorization:
Allow regular expression: none
Deny regular expression: none
Allow configuration regular expression: none
Deny configuration regular expression: none

```

This output summarizes the login permissions.

## Configuring a Local Administrator Account

The following example shows how to configure a password-protected local administration account called **admin** with superuser privileges. Superuser privileges give a user permission to use any command on the router and are generally reserved for a select few users such as system administrators. It is important to protect the local administrator account with a password to prevent unauthorized users from gaining access to superuser commands that can be used to alter the system configuration. Even users with RADIUS authentication should configure a local password. If RADIUS fails or becomes unreachable, the login process will revert to password authentication on the local administrator account.

```

[edit]
system {
  login {
    user admin {
      uid 1000;
      class superuser;
      authentication {
        encrypted-password "<PASSWORD>"; # SECRET-DATA
      }
    }
  }
}

```

## Junos OS User Access Privileges

---

Junos OS allows you to grant the access or permissions to the commands and configuration hierarchy levels and statements. This enables users to execute only those commands and configure and view only those statements for which they have access privileges. You can use extended regular expressions to specify which operational mode commands, configuration statements, and hierarchies are denied or allowed for users. This prevents unauthorized users from executing or configuring sensitive commands and statements that could potentially cause damage to the network. Read this topic for more information.

### Understanding Junos OS Access Privilege Levels

Each top-level CLI command and each configuration statement have an access privilege level associated with them. Users can execute only those commands and configure and view only those statements for which they have access privileges. The access privileges for each login class are defined by one or more permission flags.

For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level specified in the **permissions** statement.

The following sections provide additional information about permissions:

- [Junos OS Login Class Permission Flags on page 88](#)
- [Allowing or Denying Individual Commands for Junos OS Login Classes on page 92](#)

#### Junos OS Login Class Permission Flags

---

Permission flags are used to grant a user access to operational mode commands and configuration hierarchy levels and statements. By specifying a specific permission flag on the user's login class at the **[edit system login class]** hierarchy level, you grant the user access to the corresponding commands and configuration hierarchy levels and statements. To grant access to all commands and configuration statements, use the **all** permissions flag.

**NOTE:** Each command listed represents that command and all subcommands with that command as a prefix. Each configuration statement listed represents the top of the configuration hierarchy to which that flag grants access.

The **permissions** statement specifies one or more of the permission flags listed in [Table 5 on page 89](#). Permission flags are not cumulative, so for each class you must list all the permission flags needed, including **view** to display information and **configure** to enter configuration mode. Two forms of permissions control for individual parts of the configuration are:

- "Plain" form—Provides read-only capability for that permission type. An example is **interface**.
- Form that ends in **-control**—Provides read and write capability for that permission type. An example is **interface-control**.

For permission flags that grant access to configuration hierarchy levels and statements, the flags grant read-only privilege to that configuration. For example, the **interface** permissions flag grants read-only access to the **[edit interfaces]** hierarchy level. The **-control** form of the flag grants read-write access to that configuration. Using the preceding example, **interface-control** grants read-write access to the **[edit interfaces]** hierarchy level.

[Table 5 on page 89](#) lists the Junos OS login class permission flags that you can configure by including the **permissions** statement at the **[edit system login class class-name]** hierarchy level.

The permission flags grant a specific set of access privileges. Each permission flag is listed with the operational mode commands and configuration hierarchy levels and statements for which that flag grants access.

**Table 5: Login Class Permission Flags**

Permission Flag	Description
<i>access</i>	Can view the access configuration in configuration mode and with the <b>show configuration</b> operational mode command.
<i>access-control</i>	Can view and configure access information at the <b>[edit access]</b> hierarchy level.
<i>admin</i>	Can view user account information in configuration mode and with the <b>show configuration</b> operational mode command.
<i>admin-control</i>	Can view user account information and configure it at the <b>[edit system]</b> hierarchy level.
<i>all-control</i>	Can view user accounts and configure them at the <b>[edit system login]</b> hierarchy level.

Table 5: Login Class Permission Flags (continued)

Permission Flag	Description
<b>all</b>	Can access all operational mode commands and configuration mode commands. Can modify configuration in all the configuration hierarchy levels.
<i>clear</i>	Can clear (delete) information learned from the network that is stored in various network databases by using the <b>clear</b> commands.
<i>configure</i>	Can enter configuration mode by using the <b>configure</b> command.
<i>control</i>	Can perform all control-level operations—all operations configured with the <b>-control</b> permission flags.
<i>field</i>	Can view field debug commands. Reserved for debugging support.
<i>firewall</i>	Can view the firewall filter configuration in configuration mode.
<i>firewall-control</i>	Can view and configure firewall filter information at the <b>[edit firewall]</b> hierarchy level.
<i>floppy</i>	Can read from and write to the removable media.
<i>flow-tap</i>	Can view the flow-tap configuration in configuration mode.
<i>flow-tap-control</i>	Can view the flow-tap configuration in configuration mode and can configure flow-tap configuration information at the <b>[edit services flow-tap]</b> hierarchy level.
<i>flow-tap-operation</i>	<p>Can make flow-tap requests to the router or switch. For example, a Dynamic Tasking Control Protocol (DTCP) client must have <b>flow-tap-operation</b> permission to authenticate itself to the Junos OS as an administrative user.</p> <p><b>NOTE:</b> The <b>flow-tap-operation</b> option is not included in the <b>all-control</b> permissions flag.</p>
<i>idp-profiler-operation</i>	Can view profiler data.
<i>interface</i>	Can view the interface configuration in configuration mode and with the <b>show configuration</b> operational mode command.

Table 5: Login Class Permission Flags (continued)

Permission Flag	Description
<i>interface-control</i>	Can view chassis, class of service (CoS), groups, forwarding options, and interfaces configuration information. Can edit configuration at the following hierarchy levels: <ul style="list-style-type: none"> <li>• <b>[edit chassis]</b></li> <li>• <b>[edit class-of-service]</b></li> <li>• <b>[edit groups]</b></li> <li>• <b>[edit forwarding-options]</b></li> <li>• <b>[edit interfaces]</b></li> </ul>
<i>maintenance</i>	Can perform system maintenance, including starting a local shell on the router or switch and becoming the superuser in the shell by using the <b>su root</b> command, and can halt and reboot the router or switch by using the <b>request system</b> commands.
<i>network</i>	Can access the network by using the <b>ping</b> , <b>ssh</b> , <b>telnet</b> , and <b>traceroute</b> commands.
<i>pgcp-session-mirroring</i>	Can view the <b>pgcp</b> session mirroring configuration.
<i>pgcp-session-mirroring-control</i>	Can modify the <b>pgcp</b> session mirroring configuration.
<i>reset</i>	Can restart software processes by using the <b>restart</b> command and can configure whether software processes are enabled or disabled at the <b>[edit system processes]</b> hierarchy level.
<i>rollback</i>	Can use the <b>rollback</b> command to return to a previously committed configuration other than the most recently committed one.
<i>routing</i>	Can view general routing, routing protocol, and routing policy configuration information in configuration and operational modes.
<i>routing-control</i>	Can view general routing, routing protocol, and routing policy configuration information and can configure general routing at the <b>[edit routing-options]</b> hierarchy level, routing protocols at the <b>[edit protocols]</b> hierarchy level, and routing policy at the <b>[edit policy-options]</b> hierarchy level.
<i>secret</i>	Can view passwords and other authentication keys in the configuration.
<i>secret-control</i>	Can view passwords and other authentication keys in the configuration and can modify them in configuration mode.
<i>security</i>	Can view security configuration in configuration mode and with the <b>show configuration</b> operational mode command.

Table 5: Login Class Permission Flags (continued)

Permission Flag	Description
<i>security-control</i>	Can view and configure security information at the <b>[edit security]</b> hierarchy level.
<i>shell</i>	Can start a local shell on the router or switch by using the <b>start shell</b> command.
<i>snmp</i>	Can view Simple Network Management Protocol (SNMP) configuration information in configuration and operational modes.
<i>snmp-control</i>	Can view SNMP configuration information and can modify SNMP configuration at the <b>[edit snmp]</b> hierarchy level.
<i>system</i>	Can view system-level information in configuration and operational modes.
<i>system-control</i>	Can view system-level configuration information and configure it at the <b>[edit system]</b> hierarchy level.
<i>trace</i>	Can view trace file settings and configure trace file properties.
<i>trace-control</i>	Can modify trace file settings and configure trace file properties.
<i>view</i>	Can use various commands to display current system-wide, routing table, and protocol-specific values and statistics. Cannot view the secret configuration.
<a href="#">"view-configuration" on page 1503</a>	<p>Can view all of the configuration excluding secrets, system scripts, and event options.</p> <p><b>NOTE:</b> Only users with the <b>maintenance</b> permission can view commit script, op script, or event script configuration.</p>

### Allowing or Denying Individual Commands for Junos OS Login Classes

By default, all top-level CLI commands have associated access privilege levels. Users can execute only those commands and view only those statements for which they have access privileges. For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level specified in the **permissions** statement.

Permission flags are used to grant a user access to operational mode commands and configuration hierarchy levels and statements. By specifying a specific permission flag on the user's login class at the **[edit system login class]** hierarchy level, you grant the user access to the corresponding commands and configuration hierarchy levels and statements. To grant access to all commands and configuration statements, use the **all** permissions flag. For permission flags that grant access to configuration hierarchy levels and statements, the flags grant read-only privilege to that configuration. For example, the **interface** permissions flag grants read-only access to the **[edit interfaces]** hierarchy

level. The **-control** form of the flag grants read-write access to that configuration. Using the preceding example, **interface-control** grants read-write access to the **[edit interfaces]** hierarchy level.

- The **all** login class permission bits take precedence over extended regular expressions when a user issues **rollback** command with **rollback** permission flag enabled.
- Expressions used to allow and deny commands for users on RADIUS and TACACS+ servers have been simplified. Instead of a single, long expression with multiple commands (**allow-commands=cmd1 cmd2 ... cmdn**), you can specify each command as a separate expression. This new syntax is valid for **allow-configuration**, **deny-configuration**, **allow-commands**, **deny-commands**, and all user permission bits.
- Users cannot issue the **load override** command when specifying an extended regular expression. Users can only issue the **merge**, **replace**, and **patch** configuration commands.
- If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by the **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.
- Regular expressions for **allow-commands** and **deny-commands** can also include the **commit**, **load**, **rollback**, **save**, **status**, and **update** commands.
- If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize** and it is specified for **allow-commands**.

Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize** and it is specified for **deny-commands**.

## Example: Configuring User Permissions with Access Privilege Levels

This example shows how to view permissions for a user account and configure the user permissions with access privileges for a login class. This enables users to execute only those commands and configure and view only those statements for which they have access privileges. This prevents unauthorized users from executing or configuring sensitive commands and statements that could potentially cause damage to the network.

- [Requirements on page 94](#)
- [Overview on page 94](#)

- [Configuration on page 95](#)
- [Verification on page 96](#)

## Requirements

---

This example uses the following hardware and software components:

- One Juniper Networks device
- One TACACS+ (or RADIUS) server
- Junos OS build running on the Juniper Networks device

Before you begin:

- Establish connection between the device and the TACACS+ server.

For information on configuring a TACACS+ server, see [“Configuring TACACS+ Authentication” on page 202](#).

- Configure at least one user assigned to a login class on the Juniper Networks device. There can be more than one login class, each with varying permission configurations, and more than one user on the device.

## Overview

---

Each top-level command-line interface (CLI) command and each configuration statement in Junos OS has an access privilege level associated with it. For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level. Users can execute only those commands and configure and view only those statements for which they have access privileges. To configure access privilege levels, include the **permissions** statement at the **[edit system login class *class-name*]** hierarchy level.

The access privileges for each login class are defined by one or more permission flags specified in the **permissions** statement. Permission flags are used to grant a user access to operational mode commands, statements, and configuration hierarchies. Permission flags are not cumulative, so for each login class you must list all the permission flags needed, including **view** to display information and **configure** to enter configuration mode. By specifying a specific permission flag on the user's login class, you grant the user access to the corresponding commands, statements, and configuration hierarchies. To grant access to all commands and configuration statements, use the **all** permissions flag. The permission flags provide read-only (“plain” form) and read and write (form that ends in -control) capability for a permission type.

**NOTE:** The all login class permission bits take precedence over extended regular expressions when a user issues a rollback command with the rollback permission flag enabled.

---

To configure user access privilege levels:

1. View permissions for a user account.

You can view the permissions for a user account before configuring the access privileges for those permissions.

To view the user permissions, enter `?` at the `[edit]` hierarchy level:

```
[edit]
?
```

2. Configure user permissions with access privileges.

All users who can log in to a device must be in a login class. For each login class, you can configure the access privileges that the associated users can have when they are logged in to the device.

To configure access privilege levels for user permissions, include the **permissions** statement at the `[edit system login class class-name]` hierarchy level, followed by the user permission, the **permissions** option, and the required permission flags.

```
[edit system login]
user@host# set class class-name permissions user-permission permissions [permission
flags];
```

## Configuration

### Configuring User Permissions with Access Privilege Levels

#### Step-by-Step Procedure

To configure access privileges:

1. From the device, view the list of permissions available for the user account. In this example, the username of the user account is `host`.

```
[edit]
user@host> ?
Possible completions:
  clear          Clear information in the system
  configure      Manipulate software configuration information
  file           Perform file operations
  help           Provide help information
  load           Load information from file
  monitor        Show real-time debugging information
  mtrace         Trace multicast path from source to receiver
  op             Invoke an operation script
  ping           Ping remote target
  quit           Exit the management session
  request        Make system-level requests
  restart        Restart software process
  save           Save information to file
  set            Set CLI properties, date/time, craft interface
message
  show           Show system information
  ssh           Start secure shell on another host
```

start	Start shell
telnet	Telnet to another host
test	Perform diagnostic debugging
tracert	Trace route to remote host

The output lists the permissions for the user host. Customized login classes can be created by configuring different access privileges on these user permissions.

2. Configure an access privilege class to enable user host to configure and view SNMP parameters only. In this example, this login class is called `network-management`. To customize the `network-management` login class, include the SNMP permission flags to the **configure** user permission.

```
[edit system login class network-management]
user@host# set permissions configure permissions snmp
user@host# set permissions configure permissions snmp-control
```

Here, the configured permission flags provide both read (snmp) and read-and-write (snmp-control) capability for SNMP, and this is the only allowed access privilege for the `network-management` login class. In other words, all other access privileges other than configuring and viewing SNMP parameters are denied.

### Results

From configuration mode, confirm your configuration by entering the **show system login** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@host# show system login
class network-management {
  permissions [ configure snmp snmp-control ];
}
```

### Verification

Log in as the username assigned with the new login class, and confirm that the configuration is working properly.

- [Verifying SNMP Configuration on page 96](#)
- [Verifying non-SNMP Configuration on page 97](#)

#### Verifying SNMP Configuration

**Purpose** Verify that SNMP configuration can be executed.

**Action** From configuration mode, execute basic SNMP commands at the **[edit snmp]** hierarchy level.

```
[edit snmp]
```

```

user@host# set name device1
user@host# set description switch1
user@host# set location Lab1
user@host# set contact example.com
user@host# commit

```

**Meaning** The user host assigned to the network-management login class is able to configure SNMP parameters, as the permission flags specified for this class include both `snmp` (read capabilities) and `snmp-control` (read and write capabilities) permission bits.

#### *Verifying non-SNMP Configuration*

**Purpose** Verify that non-SNMP configuration is denied for the network-management login class.

**Action** From the configuration mode, execute any non-SNMP configuration, for example, interfaces configuration.

```

[edit]
user@host# edit interfaces
Syntax error, expecting <statement> or <identifier>.

```

## Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands, Configuration Statements, and Hierarchies

This topic contains the following sections:

- [Understanding Regular Expressions on page 97](#)
- [Specifying Regular Expressions on page 99](#)
- [Regular Expressions Operators on page 101](#)
- [Regular Expression Examples on page 104](#)

### Understanding Regular Expressions

You can use extended regular expressions to specify which operational mode commands, configuration statements, and hierarchies are denied or allowed. You specify these regular expressions locally in the `allow/deny-commands`, `allow/deny-configuration`, and `allow/deny-commands-regexps` and `allow/deny-configuration-regexp` statements at the `[edit system login class class-name]` hierarchy level, or remotely by specifying Juniper Networks vendor-specific TACACS+ or RADIUS attributes in your authorization server's configuration.

**NOTE:** Starting in Junos OS Release 18.1, the `allow-commands-regexps` and `deny-commands-regexps` statements are supported for TACACS+ authorization.

The difference between a local and remote authorization configuration is the pattern in which the regular expressions statements are executed. While it is possible to specify multiple regular expressions using strings in the local authorization configuration, in a remote configuration, the regular expressions statements need to be split and specified in individual strings. When the authorization parameters are configured both remotely and locally, the regular expressions received during TACACS+ or RADIUS authorization get merged with any regular expressions available on the local device.

When specifying multiple regular expressions in a local configuration using the **allow-configuration**, **deny-configuration**, **allow-commands**, or **deny-commands** statements, regular expressions are configured within parentheses and separated using the pipe symbol. The complete expression is enclosed in double quotes. For example, you can specify multiple **allow-commands** parameters with the following syntax:

```
allow-commands "(cmd1)|(cmd2)|(cmdn)"
```

The same expression configured remotely on the authorization server uses the following syntax:

```
allow-commands1 = "cmd1"  
allow-commands2 = "cmd2"  
allow-commandsn = "cmdn"
```

When specifying multiple regular expressions in a local configuration using the **allow-configuration-regexps**, **deny-configuration-regexps**, **allow-commands-regexps**, or **deny-commands-regexps** statements, regular expressions are configured within double quotes and separated using the space operator. The complete expression is enclosed in square brackets. For example, you can specify multiple **allow-commands** parameters with the following syntax:

```
allow-commands-regexps [ "cmd1" "cmd2" "cmdn" ]
```

The same expression configured remotely on the authorization server uses the following syntax:

```
allow-commands-regexps1 = "cmd1"  
allow-commands-regexps2 = "cmd2"  
allow-commands-regexpsn = "cmdn"
```

[Table 6 on page 99](#) differentiates the local and remote authorization configuration using regular expressions.

Table 6: Sample Local and Remote Authorization Configuration Using Regular Expressions

Local Configuration	Remote Configuration
<pre> login {   class local {     permissions configure;     allow-commands "(ping.*)(traceroute     .*)(show.*)(configure     .*)(edit)(exit)(commit)(rollback.*)";     deny-commands .*;     allow-configuration "(interfaces.* unit 0     family ethernet-switching vlan mem.*     .*)(interfaces.* native.*.*)(interfaces     .* unit 0 family ethernet-switching     interface-mo.*.*)(interfaces.* unit     .*)(interfaces.* disable)(interfaces.*     description.)(vlangs.* vlan-.*.*)"     deny-configuration .*;   } } </pre>	<pre> user = remote {   login = username   service = junos-exec {     allow-commands1 = "ping ."     allow-commands2 = "traceroute ."     allow-commands3 = "show ."     allow-commands4 = "configure"     allow-commands5 = "edit"     allow-commands6 = "exit"     allow-commands7 = "commit"     allow-commands8 = ".*xml-mode" &lt;&lt;&lt;&lt;&lt;     allow-commands9 = ".*netconf" &lt;&lt;&lt;&lt;&lt;     allow-commands10 = ".*need-trailer" &lt;&lt;&lt;&lt;&lt;     allow-commands11 = "rollback.%"     deny-commands1 = ".*"     allow-configuration1 = "interfaces.* unit 0 family     ethernet-switching vlan mem.*.%"     allow-configuration2 = "interfaces.* native.*.%"     allow-configuration3 = "interfaces.* unit 0 family     ethernet-switching interface-mo.*.%"     allow-configuration4 = "interfaces.* unit.%"     allow-configuration5 = "interfaces.* disable"     allow-configuration6 = "interfaces.* description.%"     allow-configuration7 = "interfaces.%"     allow-configuration8 = "vlangs.* vlan-.*.%"     deny-configuration1 = ".*"     local-user-name = local-username     user-permissions = "configure"   } } </pre>

**NOTE:**

- You need to explicitly allow access to the NETCONF mode, either locally or remotely, by issuing the following three commands: `xml-mode`, `netconf`, and `need-trailer`.
- When the `deny-configuration = ".*"` statement is used, all the other desired configurations should be allowed using the `allow-configuration` statement. This can affect the allowed regular expressions buffer limit for the `allow-configuration` statement. When this limit exceeds, the allowed configuration might not work. This regular expression buffer size limit has been increased in Junos OS Release 14.1x53-D40, 15.1, and 16.1.

### Specifying Regular Expressions

**WARNING:** When you specify regular expression for commands and configuration statements, pay close attention to the following examples, as

regular expression with invalid syntax might not produce the desired results, even if the configuration is committed without any error.

Regular expressions for commands and configuration statements should be specified in the same manner as executing the complete command or statement.

Table 7 on page 100 lists the regular expressions for configuring access privileges for the **[edit interfaces]** and **[edit vlans]** statement hierarchies, and for the **delete interfaces** command.

Table 7: Specifying Regular Expressions

Statement	Regular Expression	Configuration Notes
<p><b>[edit interfaces]</b></p> <p>The <b>set</b> command for interfaces is executed as follows:</p> <pre>[edit] user@host# set interfaces interface-name unit interface-unit-number</pre>	<p>The <b>set interfaces</b> statement is incomplete by itself, and requires the <b>unit</b> option to execute the statement.</p> <p>As a result, the regular expression required for denying the <b>set interfaces</b> configuration must specify the entire executable string with the <b>.*</b> operator in place of statement variables:</p> <pre>[edit system login class class-name] user@host# set permissions configure user@host# set deny-configuration "interfaces .* unit ."</pre>	<ul style="list-style-type: none"> <li>The <b>.*</b> operator denotes everything from the specified point onward for that particular command or statement. In this example, it denotes any interface name with any unit value.</li> <li>Specifying only the <b>deny-configuration "interfaces ."</b> statement is incorrect and does not deny access to the interfaces configuration for the specified login class.</li> <li>Other valid options can be included in the regular expression, for example: <pre>[edit system login class class-name] user@host# set permissions configure user@host# set deny-configuration "interfaces .* description ."</pre> <pre>[edit system login class class-name] user@host# set permissions configure user@host# set allow-configuration-regexps [ "interfaces .* description .*" "interfaces .* unit .* description .*" "interfaces .* unit .* family inet address .*" "interfaces .* disable" ]</pre> <pre>[edit system login class class-name] user@host# set permissions configure user@host# set allow-configuration "interfaces .* unit 0 family ethernet-switching vlan mem .* ."</pre> </li> </ul> <p><b>Note:</b> The <b>mem.*</b> regular expression in this example is used when multiple strings starting with the <b>mem</b> keyword are expected to be included in the specified regular expression. When only one <b>member</b> string is expected to be included, the <b>member .*</b> regular expression is used.</p>

Table 7: Specifying Regular Expressions (continued)

Statement	Regular Expression	Configuration Notes
<b>delete interfaces</b>  The <b>delete</b> command for interfaces is executed as follows:  <pre>[edit] user@host# delete interfaces interface-name</pre>	<p>The <b>delete interfaces</b> statement can be executed by itself and does not require additional statements to be complete.</p> <p>As a result, the regular expression required for denying the <b>delete interfaces</b> statement should specify the following:</p> <pre>[edit system login class class-name] user@host# set permissions configure user@host# set allow-configuration "interfaces.*" user@host# set deny-configuration "interfaces.*"</pre>	<ul style="list-style-type: none"> <li>The <b>.*</b> operator denotes everything from the specified point onward for that particular command or statement. In this example, it denotes any interface name.</li> <li>For the <b>deny-configuration</b> <b>"interfaces.*"</b> regular expression to take effect, the specified login class should allow configuration permissions for the interfaces hierarchy using the <b>allow-configuration</b> <b>"interfaces.*"</b> regular expression.</li> </ul>
<b>[edit vlans]</b>  The <b>set</b> command for VLANs is executed as follows:  <pre>[edit] user@host# set vlans vlan-name vlan-id vlan-id</pre>	<p>Here, the <b>set vlans</b> statement is incomplete by itself, and requires the <b>vlan-id</b> option to execute the statement.</p> <p>As a result, the regular expression required for allowing the <b>set vlans</b> configuration must specify the entire executable string with the <b>.*</b> operator in place of statement variables:</p> <pre>[edit system login class class-name] user@host# set permissions configure user@host# set allow-configuration "vlans.* vlan-id.*"</pre>	<ul style="list-style-type: none"> <li>The <b>.*</b> operator denotes everything from the specified point onward for that particular command or statement. In this example, it denotes any VLAN name with any VLAN ID.</li> <li>Other valid options under the <b>[edit vlans]</b> statement hierarchy can be included in the regular expression, for example:   <pre>[edit system login class class-name] user@host# set permissions configure user@host# set allow-configuration-regexps [ "vlans .* vlan-id.*" "vlans.* vlan-id.* description.*" "vlans.* vlan-id.* filter .*" ]</pre> </li> </ul>

## Regular Expressions Operators

Table 8 on page 102 lists common regular expression operators that you can use for allowing or denying operational and configuration modes.

Command regular expressions implement the extended (modern) regular expressions, as defined in POSIX 1003.2.

Table 8: Common Regular Expression Operators

Operator	Match	Example
	One of two or more terms separated by the pipe. Each term must be a complete standalone expression enclosed in parentheses ( ), with no spaces between the pipe and the adjacent parentheses.	<pre>[edit system login class test] user@host# set permissions configure user@host# set allow-commands "(ping) (traceroute) (show system alarms) (show system software)" user@host# set deny-configuration "(access) (access-profile) (accounting-options) (applications) (apply-groups)  (bridge-domains) (chassis) (class-of-service)"</pre> <p>With the above configuration, the users assigned to the test login class have operational mode access restricted to only the commands specified in the <b>allow-commands</b> statement, and access to the configuration mode, excluding the hierarchy levels specified in the <b>deny-configuration</b> statement.</p>
^	At the beginning of an expression, used to denote where the command begins, where there might be some ambiguity.	<pre>[edit system login class test] user@host# set permissions interface user@host# set permissions interface-control user@host# set allow-commands "(^show) (log interfaces policer)))(^monitor)"</pre> <p>With the above configuration, the users assigned to the test login class have access to configuring and viewing interface configuration from the operational and configuration mode. The <b>allow-commands</b> statement specifies access to commands that begin with <b>show</b> and <b>monitor</b> keywords.</p> <p>For the first filter, the commands specified include the <b>show log</b>, <b>show interfaces</b>, and <b>show policer</b> commands. The second filter specifies all commands starting with the <b>monitor</b> keyword, such as <b>monitor interfaces</b> or <b>monitor traffic</b> commands.</p>
\$	Character at the end of a command. Used to denote a command that must be matched exactly up to that point.	<pre>[edit system login class test] user@host# set permissions interface user@host# set allow-commands "(show interfaces\$)"</pre> <p>With the above configuration, the users assigned to the test login class can view the interface configuration in the configuration mode and with the <b>show configuration</b> operational mode command with the interface user permission. However, the regular expression specified in the <b>allow-commands</b> statement restricts the users to execute only the <b>show interfaces</b> command and denies access to the command extensions, such as <b>show interfaces detail</b> or <b>show interfaces extensive</b>.</p>
[ ]	Range of letters or digits. To separate the start and end of a range, use a hyphen ( - ).	<pre>[edit system login class test] user@host# set permissions clear user@host# set permissions configure user@host# set permissions network user@host# set permissions trace user@host# set permissions view user@host# set allow-configuration-regexps [ "interfaces [gx]e-.* unit [0-9]* description .*" ]</pre> <p>With the above configuration, the users assigned to the test login class have operator-level user permissions, and have access to configure interfaces within the specified range of interface name and unit number (0 through 9).</p>

Table 8: Common Regular Expression Operators (continued)

Operator	Match	Example
( )	A group of commands, indicating a complete, standalone expression to be evaluated. The result is then evaluated as part of the overall expression. Parentheses must be used in conjunction with pipe operators, as explained.	<pre>[edit system login class test] user@host# set permissions all user@host# set allow-commands "(clear) (configure)" user@host# deny-commands "(mtrace) (start) (delete)"</pre> <p>With the above configuration, users assigned to the test login class have superuser-level permissions, and have access to the commands specified in the <b>allow-commands</b> statement.</p>
*	Zero or more terms.	<pre>[edit system login class test] user@host# set permissions configure user@host# set deny-configuration "(system login class m*)"</pre> <p>With the above configuration, users assigned to the test login class whose login username begins with <b>m</b> are denied configuration access.</p>
+	One or more terms.	<pre>[edit system login class test] user@host# set permissions configure user@host# set deny-configuration "(system login class m+)"</pre> <p>With the above configuration, users assigned to the test login class whose login username begins with <b>m</b> are denied configuration access.</p>
.	Any character except for a space " " .	<pre>[edit system login class test] user@host# set permissions configure user@host# set deny-configuration "(system login class m.)"</pre> <p>With the above configuration, users assigned to the test login class whose login username begins with <b>m</b> are denied configuration access.</p>
.*	Everything from the specified point onward.	<pre>[edit system login class test] user@host# set permissions configure user@host# set deny-configuration "(system login class m.*)"</pre> <p>With the above configuration, users assigned to the test login class whose login username begins with <b>m</b> are denied configuration access.</p> <p>Similarly, the <b>deny-configuration "protocols.*"</b> statement denies all configuration access under the <b>[edit protocols]</b> hierarchy level.</p> <p>NOTE:</p> <ul style="list-style-type: none"> <li>• The <b>*</b>, <b>+</b>, and <b>.</b> operations can be achieved by using <b>.*</b>.</li> <li>• The <b>deny-commands.*</b> and <b>deny-configuration.*</b> statements deny access to all operational mode commands and configuration hierarchies, respectively.</li> </ul>

**NOTE:** Junos OS does not support the **!** regular expression operator.

### Regular Expression Examples

Table 9 on page 104 lists the regular expressions used to allow configuration options under two configuration hierarchies—**[edit system ntp server]** and **[edit protocols rip]**—as an example for specifying regular expressions.

**NOTE:** Table 9 on page 104 does not provide a comprehensive list of all regular expressions and keywords for all configuration statements and hierarchies. The regular expressions listed in the table are supported in Junos OS Release 16.1, and are validated only for the **[edit system ntp server]** and **[edit protocols rip]** statement hierarchies.

**Table 9: Regular Expressions Examples**

Statement Hierarchy	Regular Expressions	Allowed Configuration	Denied Configuration
<b>[edit system ntp server]</b>			
key <i>key-number</i>	[edit system login class test] set permissions configure set allow-configuration-regexps [ "system ntp server .*" "system ntp server .* key .*" ] set deny-configuration-regexps [ "system ntp server .* version .*" "system ntp server .* prefer" ]	<ul style="list-style-type: none"> <li>server IP</li> <li>server IP and key</li> </ul>	<ul style="list-style-type: none"> <li>version</li> <li>prefer</li> </ul>
version <i>version-number</i>	[edit system login class test] set permissions configure set allow-configuration-regexps [ "system ntp server .*" "system ntp server .* version .*" ] set deny-configuration-regexps [ "system ntp server .* key .*" "system ntp server .* prefer" ]	<ul style="list-style-type: none"> <li>server IP</li> <li>server IP and version</li> </ul>	<ul style="list-style-type: none"> <li>key</li> <li>prefer</li> </ul>
prefer	[edit system login class test] set permissions configure set allow-configuration-regexps [ "system ntp server .*" "system ntp server .* prefer" ]; set deny-configuration-regexps [ "system ntp server .* key .*" "system ntp server .* version .*" ]	<ul style="list-style-type: none"> <li>server IP</li> <li>server IP and prefer</li> </ul>	<ul style="list-style-type: none"> <li>key</li> <li>version</li> </ul>
<b>[edit protocols rip]</b>			

Table 9: Regular Expressions Examples (continued)

Statement Hierarchy	Regular Expressions	Allowed Configuration	Denied Configuration
message-size <i>message-size</i>	[edit system login class test] set permissions configure set allow-configuration-regexps "protocols rip message-size .*" set deny-configuration-regexps [ "protocols rip metric-in .*" "protocols rip route-timeout .*" "protocols rip update-interval .*" ]	<ul style="list-style-type: none"> <li>message-size</li> </ul>	<ul style="list-style-type: none"> <li>metric-in</li> <li>route-timeout</li> <li>update-interval</li> </ul>
metric-in <i>metric-in</i>	[edit system login class test] set permissions configure set allow-configuration-regexps "protocols rip metric-in .*" set deny-configuration-regexps [ "protocols rip message-size .*" "protocols rip route-timeout .*" "protocols rip update-interval .*" ]	<ul style="list-style-type: none"> <li>metric-in</li> </ul>	<ul style="list-style-type: none"> <li>message-size</li> <li>route-timeout</li> <li>update-interval</li> </ul>
route-timeout <i>route-timeout</i>	[edit system login class test] set permissions configure set allow-configuration-regexps "protocols rip route-timeout .*" set deny-configuration-regexps [ "protocols rip metric-in .*" "protocols rip message-size .*" "protocols rip update-interval .*" ]	<ul style="list-style-type: none"> <li>route-timeout</li> </ul>	<ul style="list-style-type: none"> <li>message-size</li> <li>metric-in</li> <li>update-interval</li> </ul>
update-interval <i>update-interval</i>	[edit system login class test] set permissions configure set allow-configuration-regexps "protocols rip update-interval .*" set deny-configuration-regexps [ "protocols rip metric-in .*" "protocols rip route-timeout .*" "protocols rip message-size .*" ]	<ul style="list-style-type: none"> <li>update-interval</li> </ul>	<ul style="list-style-type: none"> <li>message-size</li> <li>metric-in</li> <li>route-timeout</li> </ul>

## Examples of Defining Access Privileges Using `allow-configuration` and `deny-configuration` Statements

You can define access privileges using a combination of the following types of statements:

- permission flags
- **`allow-configuration`** and **`deny-configuration`** statements

The permission flags define the larger boundaries of what a person or login class can access and control. The **`allow-configuration`** and **`deny-configuration`** statements take precedence over permission flags and give the administrator finer control over exactly what the user has access to.

This topic explains defining access privileges using **`allow-configuration`** and **`deny-configuration`** statements by showing a series of examples of login class configuration using these statements. Examples 1 through 3 use both permission flags and **`deny-configuration`** statements to create login classes that allow users access to all except something. Each **`allow-configuration`** or **`deny-configuration`** statement is configured with one or more regular expressions to be allowed or denied.

Notice that *permission bit* and *permission flag* are used interchangeably.

**Example 1** To create a login class that allows the user to configure everything except telnet parameters:

1. Set the user's login class permission bit to **`all`**.

```
[edit system login]
user@host# set class all-except-telnet permissions all
```

2. Include the following **`deny-configuration`** statement.

```
[edit system login class all-except-telnet]
user@host# set deny-configuration "system services telnet"
```

**Example 2** To create a login class that allows the user to configure everything except anything within any login class whose name begins with "m":

1. Set the user's login class permission bit to **`all`**.

```
[edit system login]
user@host# set class all-except-login-class-m permissions all
```

2. Include the following **`deny-configuration`** statement.

```
[edit system login class all-except-login-class-m]
user@host# set deny-configuration "system login class m.*"
```

**Example 3** This next example shows the creation of a login class with the **all** permission bit that prevents the user from editing a configuration or issuing commands (such as **commit**) at the **[edit system login class]** or **[edit system services]** hierarchy levels:

To create a login class that allows the user to configure everything except at the **[edit system login class]** or **[edit system services]** hierarchy levels:

1. Set the user's login class permission bit to **all**.

```
[edit system login]
user@host# set class all-except-login-class-or-system-services permissions all
```

2. Include the following **deny-configuration** statement.

```
[edit system login class all-except-login-class-or-system-services]
user@host# set deny-configuration "(system login class) | (system services)"
```

The next two examples show how to use the **allow-configuration** and **deny-configuration** statements to determine permissions inverse to each other for the **[edit system services]** hierarchy level.

**Example 4** To create a login class that allows the user to have full configuration privileges at the **[edit system services]** hierarchy level and at only the **[edit system services]** hierarchy level:

1. Set the user's login class permission bit to **configure**.

```
[edit system login]
user@host# set class configure-only-system-services permissions configure
```

2. Include the following **allow-configuration** statement.

```
[edit system login class configure-only-system-services]
user@host# set allow-configuration "system services"
```

**Example 5** To create a login class that allows the user full permissions for all configuration mode hierarchies except the **[edit system services]** hierarchy level:

1. Set the user's login class permission bit to **all**.

```
[edit system login]
user@host# set class all-except-system-services permissions all
```

2. Include the following **deny-configuration** statement.

```
[edit system login class all-except-system-services]
user@host# set deny-configuration "system services"
```

## Example: Using Additive Logic With Regular Expressions to Specify Access Privileges

This example shows how to use additive logic when using regular expressions to set up configuration access privileges.

- [Requirements on page 108](#)
- [Overview on page 108](#)
- [Configuration on page 109](#)
- [Examples on page 109](#)

### Requirements

---

This example uses the following hardware and software components:

- One Juniper Networks J Series, M Series, MX Series, or T Series device
- Junos OS Release 16.1 or later
  - There must be at least one user assigned to a login class.
  - There can be more than one login class, each with varying permission configurations, and more than one user on the device.

### Overview

---

To control who can make configuration changes to the system, and what specifically they can change, you can create regular expressions that indicate specific portions of the configuration hierarchy that users in a named user class are permitted to access. For example, you can create regular expressions that specify a group of routing instances that users are allowed to modify, and prevent the users from making changes to any other routing instances, or to any other configuration level.

You configure regular expressions using the **allow-configuration-regexps** and **deny-configuration-regexps** statements. By default, **deny-configuration-regexps** statements take precedence over **allow-configuration-regexps** statements for users in the named user class to which they are applied.

If a configuration hierarchy appears in a **deny-configuration-regexps** statement for a named user class, it is not visible to the users, regardless of the contents of the **allow-configuration-regexps** statement. If a configuration hierarchy does not appear in a **deny-configuration-regexps** statement, it is visible if it appears in an

**allow-configuration-regexps** statement, or if there is no **allow-configuration-regexps** statement configured for the user class..

You can optionally change this default behavior so additive logic (that is, deny all by default / allow some as specified) is used in regular expressions. When additive logic is enabled, the behavior of existing regular expressions changes so that all configuration hierarchies are denied unless they are included in an **allow-configuration-regexps** statement for the named user class.

## Configuration

To enable additive logic for regular expressions:

1. To explicitly allow one or more individual configuration mode hierarchies, include the **allow-configuration-regexps** statement at the **[edit system login class *class-name*]** hierarchy level, configured with the regular expressions to be allowed.

```
[edit system login class class-name]
user@host# set allow-configuration-regexps "regular expression 1" "regular expression
2" "regular expression 3" "regular expression 4" ...
```

2. Assign the login class to one or more users.

```
[edit system login]
user@host# set user username class class-name
```

3. Enable additive logic for regular expressions.

```
[edit system]
user@host# set regex-additive-logic
```

4. Commit your changes.

Users assigned this login class have access to the configuration hierarchies included in the **allow-configuration-regexps** statement, but no others.

## Examples

### Using Regular Expressions with Additive Logic

<b>Purpose</b>	This section provides examples of regular expressions that use additive logic to give you ideas for creating configurations appropriate for your system.
<b>Allow Specific Routing Instances</b>	The following example login class includes a regular expression that allows configuration of routing instances whose names start with <b>CUST-VRF-</b> ; for example, <b>CUST-VRF-1</b> , <b>CUST-VRF-25</b> , <b>CUST-VRF-100</b> , and so on:

```
[edit system login class class-name]
user@host# set permissions configure view view-configuration
user@host# set allow-configuration-regexps "routing-instances CUST-VRF-.*.*"
```

If the following statement is included in the configuration, it prevents the user from configuring any other routing instances and denies access to any non-routing instance configuration hierarchy:

```
[edit system]
user@host# set regex-additive-logic
```

#### Allow BGP Peer Configuration Only

The following example login class includes a regular expression that allows configuration of BGP peers:

```
[edit system login class class-name]
user@host# set permissions configure view view-configuration
user@host# set allow-configuration-regexps "protocols bgp group *"
```

If the following statement is included in the configuration, it prevents the user from making any other changes, such as deleting or disabling BGP statements:

```
[edit system]
user@host# set regex-additive-logic
```

#### Verification

To verify that you have set the access privileges correctly:

1. Configure a login class and commit the changes.
2. Assign the login class to a *username*.
3. Log in as the *username* assigned with the new login class.
4. Attempt to perform the configurations that have been allowed.
  - You should be able to perform configuration changes to hierarchy levels and regular expressions that have been allowed.
  - All other hierarchies should not be visible.
  - Any allowed or denied expressions should take precedence over any permissions granted with the **permissions** statement.

### Example: Configuring User Permissions with Access Privileges for Operational Mode Commands

This example shows how to configure custom login classes and assign access privileges for operational mode commands. This enables users of the customized login class to execute only those operational commands for which access privileges have been specified. This prevents unauthorized users from executing sensitive commands that could potentially cause damage to the network.

- [Requirements on page 111](#)
- [Overview and Topology on page 111](#)

- [Configuration on page 115](#)
- [Verification on page 120](#)

### Requirements

---

This example uses the following hardware and software components:

- One Juniper Networks device
- One TACACS+ (or RADIUS) server
- Junos OS build running on the Juniper Networks device

Before you begin:

- Establish a TCP connection between the device and the TACACS+ server. In the case of the RADIUS server, establish a UDP connection between the device and the RADIUS server.

For information on configuring a TACACS+ server, see [“Configuring TACACS+ Authentication” on page 202](#).

- Configure at least one user assigned to a login class on the Juniper Networks device. There can be more than one login class, each with varying permission configurations, and more than one user on the device.

### Overview and Topology

---

Each top-level command-line interface (CLI) command and each configuration statement in Junos OS has an access privilege level associated with it. For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level. Users can execute only those commands and configure and view only those statements for which they have access privileges. To configure access privilege levels, include the **permissions** statement at the **[edit system login class class-name]** hierarchy level.

The access privileges for each login class are defined by one or more permission flags specified in the **permissions** statement. In addition to this, you can specify extended regular expressions with the following statements:

- **allow-commands** and **deny-commands**—Allow or deny access to operational mode commands only.
- **allow-configuration** and **deny-configuration**—Allow or deny access to a particular configuration hierarchy only.
- **allow-configuration-regexps** and **deny-configuration-regexps**—Allow or deny access to a particular configuration hierarchy using strings of regular expressions.
- **allow-commands-regexps** and **deny-commands-regexps**—(TACACS+ authorization only) Allow or deny access to a particular command using strings of regular expressions.

The above statements define a user's access privileges to individual operational mode commands, configuration statements, and hierarchies. These statements take precedence over the login class permissions set for a user.

## Configuration Notes

When configuring the **allow-commands**, **deny-commands**, **allow-configuration**, and **deny-configuration** statements with access privileges, take the following into consideration:

- You can include the allow/deny statement only once in each login class.
- If the exact same command is configured under both **allow-commands** and **deny-commands** statements, or both **allow-configuration** and **deny-configuration** statements, then the allow operation takes precedence over the deny statement.

For instance, with the following configuration, a user assigned to login class test is allowed to install software using the **request system software add** command, although the **deny-commands** statement also includes it:

```
[edit system login]
user@host# set class test permissions allow-commands "request system software
add"
user@host# set class test permissions deny-commands "request system software add"
```

For instance, with the following configuration, a user assigned to login class test is allowed to access the **[edit system services]** configuration hierarchy, although the **deny-configuration** statement also includes it:

```
[edit system login]
user@host# set class test permissions allow-configuration "system services"
user@host# set class test permissions deny-configuration "system services"
```

- If you specify a regular expression for **allow-commands** and **deny-commands** statements with two different variants of a command, the longest match is always executed.

For instance, for the following configuration, a user assigned to test login class is allowed to execute the **commit synchronize** command and not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **allow-commands**.

```
[edit system login]
user@host# set class test allow-commands "commit-synchronize"
user@host# set class test deny-commands commit
```

- Regular expressions for **allow-commands** and **deny-commands** statements can also include the **commit**, **load**, **rollback**, **save**, **status**, and **update** commands.
- Explicitly allowing configuration mode hierarchies or regular expressions using the **allow-configuration** statement adds to the regular permissions set using the **permissions** statement. Likewise, explicitly denying configuration mode hierarchies or regular expressions using the **deny-configuration** statement removes permissions for the specified configuration mode hierarchy, from the default permissions provided by the **permissions** statement.

For example, for the following configuration, the login class user can edit the configuration at the **[edit system services]** hierarchy level and issue configuration mode commands (such as **commit**), in addition to just entering the configuration mode using

the **configure** command, which is the permission specified by the configure permission flag:

```
[edit system login]
user@host# set class test permissions configure allow-configuration "system services"
```

Likewise, for the following configuration, the login class user can perform all operations allowed by the *all* permissions flag, except issuing configuration mode commands (such as **commit**) or modifying the configuration at the **[edit system services]** hierarchy level:

```
[edit system login]
user@host# set class test permissions all deny-configuration "system services"
```

- The **allow/deny-configuration** statements are mutually exclusive with the **allow/deny-configuration-regexps** statements, and the **allow-deny-commands** statements are mutually exclusive with the **allow/deny-commands-regexps** statements. For example, you cannot configure both **allow-configuration** and **allow-configuration-regexps** in the same login class.
- If you have existing configurations using the **allow/deny-configuration** or **allow/deny-commands** statements, using the same configuration options with the **allow/deny-configuration-regexps** or **allow/deny-commands-regexps** statements might not produce the same results, as the search and match methods differ in the two forms of these statements.
- To define access privileges to parts of the configuration hierarchy, specify the full paths in the extended regular expressions with the **allow-configuration** and **deny-configuration** statements. Use parentheses around an extended regular expression that connects two or more expressions with the pipe (|) symbol.

For example:

```
[edit system login]
user@host# set class test deny-configuration "(system login class) | (system services)"
```

- If the regular expression contains any spaces, operators, or wildcard characters, enclose the expression in quotation marks. Regular expressions are not case-sensitive; for example, **allow-commands "show interfaces"**.
- Modifiers such as *set*, *log*, and *count* are not supported within the regular expression string to be matched. If a modifier is used, then nothing is matched.

Incorrect configuration:

```
[edit system login]
user@host# set class test permission deny-commands "set protocols"
```

Correct configuration:

```
[edit system login]
user@host# set class test permission deny-commands protocols
```

- Anchors are required when specifying complex regular expressions with the **allow-commands** statement.

For example:

```
[edit system login]
user@host# set class test permissions allow-commands "( ^monitor) | ( ^ping) | ( ^show)
| ( ^exit)"
```

OR

```
set class test permissions allow-commands "allow-commands = "(monitor | ping |
show | exit)"
```

- When specifying extended regular expressions using the **allow/deny-commands** and **allow/deny-configuration** statements, each expression separated by a pipe (|) symbol must be a complete standalone expression, and must be enclosed in parentheses ( ). Do not use spaces between regular expressions separated with parentheses and connected with the pipe (|) symbol.

For example:

```
[edit system login]
user@host# set class test allow-commands "(ping .*)|(traceroute .*)|(show
.*)|(configure .*)|(edit)|(exit)|(commit)|(rollback .*)"
user@host# set class test deny-configuration "(system login class)|(system services)"
```

- When specifying extended regular expressions using the **allow/deny-configuration-regexps** or **allow/deny-commands-regexps** statement, each expression enclosed within quotes (") and separated by a space must be enclosed in angular brackets [ ].

For example:

```
[edit system login]
user@host# set class test allow-configuration-regexps [ "interfaces.* description.*"
"interfaces.* unit.* description.*" "interfaces.* unit.* family inet address.*"
"interfaces.* disable" ]
```

- You can use the \* wildcard character when denoting regular expressions. However, it must be used as a portion of a regular expression. You cannot use [ \* ] or [ .\* ] alone.
- You cannot configure the **allow-configuration** statement with the (interfaces (description (.\*) ) regular expression, as this evaluates to **allow-configuration = .\*** regular expression.
- You can configure as many regular expressions as needed to be allowed or denied. Regular expressions to be denied take precedence over configurations to be allowed.

### Topology

Figure 1: Configuring TACACS+ Server Authentication

Figure 1 on page 115 illustrates a simple topology, where Router R1 is a Juniper Networks device and has a TCP connection established with a TACACS+ server.

In this example, R1 is configured with three customized login classes—Class1, Class2, and Class3—for specifying access privileges with extended regular expressions using the **allow-commands** and **deny-commands** statements differently.

The purpose of each login class is as follows:

- **Class1**—Defines access privileges for the user with the **allow-commands** statement only. This login class provides operator-level user permissions, and should provide authorization for only rebooting the device.
- **Class2**—Defines access privileges for the user with the **deny-commands** statement only. This login class provides operator-level user permissions, and should deny access to **set** commands.
- **Class3**—Defines access privileges for the user with both the **allow-commands** and **deny-commands** statements. This login class provides superuser-level user permissions, and should provide authorization for accessing interfaces and viewing device information. It should also deny access to **edit** and **configure** commands.

Router R1 has three different users, User1, User2, and User3, assigned to Class1, Class2, and Class3 login classes, respectively.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```

R1 set system authentication-order tacplus
   set system authentication-order radius
   set system authentication-order password
   set system radius-server 10.209.1.66 secret "$ABC123"
   set system tacplus-server 10.209.1.66
   set system radius-options enhanced-accounting
   set system tacplus-options enhanced-accounting
   set system accounting events login
   set system accounting events change-log
   set system accounting events interactive-commands
   set system accounting traceoptions file auditlog
  
```

```
set system accounting traceoptions flag all
set system accounting destination tacplus server 10.209.1.66
set system login class Class1 permissions clear
set system login class Class1 permissions network
set system login class Class1 permissions reset
set system login class Class1 permissions trace
set system login class Class1 permissions view
set system login class Class1 allow-commands "request system reboot"
set system login class Class2 permissions clear
set system login class Class2 permissions network
set system login class Class2 permissions reset
set system login class Class2 permissions trace
set system login class Class2 permissions view
set system login class Class2 deny-commands set
set system login class Class3 permissions all
set system login class Class3 allow-commands configure
set system login class Class3 deny-commands .*
set system login user User1 uid 2001
set system login user User1 class Class1
set system login user User1 authentication encrypted-password "$ABC123"
set system login user User2 uid 2002
set system login user User2 class Class2
set system login user User2 authentication encrypted-password "$ABC123"
set system login user User3 uid 2003
set system login user User3 class Class3
set system login user User3 authentication encrypted-password "$ABC123"
set system syslog file messages any any
```

### *Configuring Authentication Parameters for Router R1*

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Router R1 authentication:

1. Configure the order in which authentication should take place for R1. In this example, TACACS+ server authentication is first, followed by RADIUS server authentication, and then the local password.

```
[edit system]
user@R1# set authentication-order tacplus
user@R1# set authentication-order radius
user@R1# set authentication-order password
```

2. Establish R1 connection with the TACACS+ server.

```
[edit system]
user@R1# set tacplus-server 10.209.1.66
user@R1# set tacplus-options enhanced-accounting
user@R1# set accounting destination tacplus server 10.209.1.66
```

3. Configure RADIUS server authentication parameters.

```
[edit system]
user@R1# set radius-server 10.209.1.66 secret "$ABC123"
user@R1# set radius-options enhanced-accounting
```

4. Configure R1 accounting configuration parameters.

```
[edit system]
user@R1# set accounting events login
user@R1# set accounting events change-log
user@R1# set accounting events interactive-commands
user@R1# set accounting traceoptions file auditlog
user@R1# set accounting traceoptions flag all
```

### *Configuring Access Privileges with allow-commands Statement Only (Class1)*

#### Step-by-Step Procedure

To specify regular expressions using the **allow-commands** statement only:

1. Configure Class1 custom login class and assign operator-level user permissions. For information on the predefined system login classes, see the ["Junos OS Login Classes Overview" on page 47](#).

```
[edit system login]
user@R1# set class Class1 permissions clear
user@R1# set class Class1 permissions network
user@R1# set class Class1 permissions reset
user@R1# set class Class1 permissions trace
user@R1# set class Class1 permissions view
```

2. Specify the command to enable rebooting of R1 in the **allow-commands** statement.

```
[edit system login]
user@R1# set class Class1 allow-commands "request system reboot"
```

3. Configure the user account for the Class1 login class.

```
[edit system login]
user@R1# set user User1 uid 2001
user@R1# set user User1 class Class1
user@R1# set user User1 authentication encrypted-password "$ABC123"
```

**Configuring Access Privileges with deny-commands Statement Only (Class2)****Step-by-Step Procedure**

To specify regular expressions using the **deny-commands** statement only:

1. Configure the Class2 custom login class and assign operator-level user permissions. For information on the predefined system login classes, see the [“Junos OS Login Classes Overview”](#) on page 47.

```
[edit system login]
user@R1# set class Class1 permissions clear
user@R1# set class Class1 permissions network
user@R1# set class Class1 permissions reset
user@R1# set class Class1 permissions trace
user@R1# set class Class1 permissions view
```

2. Disable execution of any set commands in the **deny-commands** statement.

```
[edit system login]
user@R1# set class Class1 deny-commands "set"
```

3. Configure the user account for the Class2 login class.

```
user@R1# set login user User2 uid 2002
user@R1# set login user User2 class Class2
user@R1# set login user User2 authentication encrypted-password "$ABC123"
```

**Configuring Access Privileges with Both allow-commands and deny-commands Statements (Class3)****Step-by-Step Procedure**

To specify regular expressions using both the **allow-commands** and **deny-commands** statements:

1. Configure the Class3 custom login class and assign superuser-level user permissions. For information on the predefined system login classes, see the [“Junos OS Login Classes Overview”](#) on page 47.

```
[edit system login]
user@R1# set class Class3 permissions all
```

2. Specify the commands to enable only configure commands in the **allow-commands** statement.

```
[edit system login]
user@R1# set class Class3 allow-commands configure
```

3. Disable execution of all commands in the **deny-commands** statement.

```
[edit system login]
user@R1# set class Class3 deny-commands . *
```

4. Configure the user account for the Class1 login class.

```
[edit system login]
user@R1# set login user User3 uid 2003
user@R1# set login user User3 class Class3
user@R1# set login user User3 authentication encrypted-password "$ABC123"
```

### Results

From configuration mode, confirm your configuration by entering the **show system** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@R1# show system
authentication-order [ tacplus radius password ];
radius-server {
    10.209.1.66 secret "$ABC123";
}
tacplus-server {
    10.209.1.66;
}
radius-options {
    enhanced-accounting;
}
tacplus-options {
    enhanced-accounting;
}
accounting {
    events [ login change-log interactive-commands ];
    traceoptions {
        file auditlog;
        flag all;
    }
    destination {
        tacplus {
            server {
                10.209.1.66;
            }
        }
    }
}
login {
    class Class1 {
        permissions [ clear network reset trace view ];
        allow-commands "request system reboot";
    }
    class Class2 {
        permissions [ clear network reset trace view ];
    }
}
```

```
deny-commands set;
}
class Class3 {
  permissions all;
  allow-commands configure;
  deny-commands .*;
}
user User1 {
  uid 2001;
  class Class1;
  authentication {
    encrypted-password "$ABC123";
  }
}
user User2 {
  uid 2002;
  class Class2;
  authentication {
    encrypted-password "$ABC123";
  }
}
user User3 {
  uid 2003;
  class Class3;
  authentication {
    encrypted-password "$ABC123";
  }
}
}
syslog {
  file messages {
    any any;
  }
}
```

---

## Verification

Log in as the username assigned with the new login class, and confirm that the configuration is working properly.

- [Verifying Class1 Configuration on page 120](#)
- [Verifying Class2 Configuration on page 121](#)
- [Verifying Class3 Configuration on page 122](#)

### *Verifying Class1 Configuration*

**Purpose** Verify that the permissions and commands allowed in the Class1 login class are working.

**Action** From operational mode, run the **show system users** command.

```
User1@R1> show system users
12:39PM up 6 days, 23 mins, 6 users, load averages: 0.00, 0.01, 0.00
USER      TTY      FROM          LOGIN@  IDLE WHAT
User1    p0        abc.example.net 12:34AM 12:04 cli
User2    p1        abc.example.net 12:36AM 12:02 -cli (cli)
User3    p2        abc.example.net 10:41AM 11 -cli (cli)
```

From operational mode, run the **request system reboot** command.

```
User1@R1> request system ?
Possible completions:
  reboot          Reboot the system
```

**Meaning** The Class1 login class to which User1 is assigned has the operator-level user permissions, and is allowed to execute the **request system reboot** command.

The predefined operator login class has the following permission flags specified:

- **clear**—Can clear (delete) information learned from the network that is stored in various network databases by using the **clear** commands.
- **network**—Can access the network by using the **ping**, **ssh**, **telnet**, and **traceroute** commands.
- **reset**—Can restart software processes by using the **restart** command and can configure whether software processes are enabled or disabled at the **[edit system processes]** hierarchy level.
- **trace**—Can view trace file settings and configure trace file properties.
- **view**—Can use various commands to display current system-wide, routing table, and protocol-specific values and statistics. Cannot view the secret configuration.

For the Class1 login class, in addition to the above-mentioned user permissions, User1 can execute the **request system reboot** command. The first output displays the view permissions as an operator, and the second output shows that the only **request** command that User1 can execute as an operator is the **request system reboot** command.

### *Verifying Class2 Configuration*

**Purpose** Verify that the permissions and commands allowed for the Class2 login class are working.

**Action** From the operational mode, run the **ping** command.

```
User2@R1> ping 10.209.1.66

ping 10.209.1.66
PING 10.209.1.66 (10.209.1.66): 56 data bytes
64 bytes from 10.209.1.66: icmp_seq=0 ttl=52 time=212.521 ms
64 bytes from 10.209.1.66: icmp_seq=1 ttl=52 time=212.844 ms
64 bytes from 10.209.1.66: icmp_seq=2 ttl=52 time=211.304 ms
64 bytes from 10.209.1.66: icmp_seq=3 ttl=52 time=210.963 ms
^C
--- 10.209.1.66 ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 210.963/211.908/212.844/0.792 ms
```

From the CLI prompt, check the available permissions.

```
User2@R1> ?

Possible completions:
clear          Clear information in the system
file           Perform file operations
help           Provide help information
load           Load information from file
monitor        Show real-time debugging information
mtrace         Trace multicast path from source to receiver
op             Invoke an operation script
ping           Ping remote target
quit           Exit the management session
request        Make system-level requests
restart        Restart software process
save           Save information to file
show           Show system information
ssh            Start secure shell on another host
start          Start shell
telnet         Telnet to another host
test           Perform diagnostic debugging
traceroute     Trace route to remote host
```

From the CLI prompt, execute any set command.

```
User2@R1> set

^
unknown command.
```

**Meaning** The Class2 login class to which User2 is assigned has the operator-level user permissions, and is denied access to all **set** commands. This is displayed in the command outputs.

The permission flags specified for the predefined operator login class are the same as that of Class1.

### *Verifying Class3 Configuration*

**Purpose** Verify that the permissions and commands allowed for the Class3 login class are working.

**Action** From the CLI prompt, check the available permissions.

```
User3@R1> ?
```

```
Possible completions:
```

```
configure          Manipulate software configuration information
```

From the operational mode, enter configuration mode.

```
User3@R1> configure
```

```
Entering configuration mode
```

```
[edit]
```

```
User3@R1#
```

**Meaning** The Class3 login class to which User3 is assigned has the superuser (all) user permissions, but is allowed to execute the **configure** command only, and is denied access to all other operational mode commands. Because the regular expressions specified in the **allow/deny-commands** statements take precedence over the user permissions, User3 on R1 has access only to configuration mode, and is denied access to all other operational mode commands.

## Example: Configuring User Permissions with Access Privileges for Configuration Statements and Hierarchies

This example shows how to configure custom login classes and assign access privileges to portions of the configuration hierarchy. This enables users of the customized login class to execute only those configuration statements and hierarchies for which access privileges have been specified. This prevents unauthorized users from accessing device configurations that could potentially cause damage to the network.

- [Requirements on page 123](#)
- [Overview and Topology on page 124](#)
- [Configuration on page 130](#)
- [Verification on page 134](#)

### Requirements

This example uses the following hardware and software components:

- One Juniper Networks device
- One TACACS+ (or RADIUS) server
- Junos OS build running on the Juniper Networks device

Before you begin:

- Establish a TCP connection between the device and the TACACS+ server. In the case of the RADIUS server, establish a UDP connection between the device and the RADIUS server.

For information on configuring a TACACS+ server, see [“Configuring TACACS+ Authentication” on page 202](#).

- Configure at least one user assigned to a login class on the Juniper Networks device. There can be more than one login class, each with varying permission configurations, and more than one user on the device.

## Overview and Topology

---

Each top-level command-line interface (CLI) command and each configuration statement in Junos OS has an access privilege level associated with it. For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level. Users can execute only those commands and configure and view only those statements for which they have access privileges. To configure access privilege levels, include the **permissions** statement at the **[edit system login class *class-name*]** hierarchy level.

The access privileges for each login class are defined by one or more permission flags specified in the **permissions** statement. In addition to this, you can specify extended regular expressions with the following statements:

- **allow-commands** and **deny-commands**—Allow or deny access to operational mode commands.
- **allow-configuration** and **deny-configuration**—Allow or deny access to parts of the configuration hierarchy.

These statements perform slower matching, with more flexibility, especially in wildcard matching. However, it can take a very long time to evaluate all of the possible statements if a great number of full-path regular expressions or wildcard expressions are configured, possibly impacting performance.

- **allow-configuration-regexps** and **deny-configuration-regexps**—Allow or deny access to a particular configuration hierarchy using strings of regular expressions. These statements are similar to **allow-configuration** and **deny-configuration** statements, except that in the **allow/deny-configuration-regexps** statements you can configure sets of strings in which the strings include spaces when using the first set of statements.

The above statements define a user’s access privileges to individual operational mode commands, configuration statements, and hierarchies. These statements take precedence over a login class permissions bit set for a user.

### Difference between allow/deny-configuration and allow/deny-configuration-regexps statements

The **allow-configuration** and **deny-configuration** statements were introduced before Junos OS Release 7.4. The **allow-configuration-regexps** and **deny-configuration-regexps**

statements were introduced in Junos OS Release 11.2. In Junos OS Release 11.4, the **allow-configuration** and **deny-configuration** statements were deprecated, but because these statements were useful in executing simple configurations, these statements were undeprecated in Junos OS Release 11.4R6, and starting with the 11.4R6 release, both the **allow/deny-configuration** and the **allow/deny-configuration-regexps** statements are supported.

The **allow/deny-configuration-regexps** statements split up the regular expression into tokens and match each piece against each part of the specified configuration's full path, whereas the **allow/deny-configuration** statements match against the full string. For **allow/deny-configuration-regexps** statements, you configure a set of strings in which each string is a regular expression, with spaces between the terms of the string. This provides very fast matching, but with less flexibility. For specifying wildcard expressions you must set up wildcards for each token of the space-delimited string you want to match, and this makes it more tedious to use wildcard expressions for these statements.

For example:

- This example shows that **options** is the only matched expression against the first token of the statement.

```
[edit system]
login {
  class test {
    permissions configure;
    allow-configuration-regexps .*options;
  }
}
```

The above configuration matches the following statements:

- set policy-**options** condition *condition* dynamic-db
- set routing-**options** static route *static-route* next-hop *next-hop*
- set event-**options** generate-event *event* time-interval *seconds*

The above configuration does not match the following statements:

- system host-name host-**options**
- interfaces *interface-name* description **options**
- This example shows that **ssh** is the only matched expression against the third token of the statement.

```
[edit system]
login {
  class test {
    permissions configure;
    allow-configuration-regexps ".*.*.*ssh";
  }
}
```

In the above example, the three tokens include **.\***, **.\***, and **.\*ssh**, respectively.

The above configuration matches the following statements:

- system host-name hostname-**ssh**
- system services **ssh**
- system services outbound-**ssh**

The above configuration does not match the following statement:

- interfaces *interface-name* description **ssh**

You can restrict configuration access easily using the **deny-configuration** statement as compared to using the **deny-configuration-regexps** statement. [Table 10 on page 126](#) illustrates the use of both the **deny-configuration** and **deny-configuration-regexps** statements in different configurations to achieve the same result of restricting access to a particular configuration.

**Table 10: Restricting Configuration Access Using deny-configuration and deny-configuration-regexps Statements**

Configuration Denied	Using: deny-configuration	Using: deny-configuration-regexps	Result
xnm-ssl	<pre>[edit system] login {   class test {     permissions configure;     allow-configuration .*;     deny-configuration .*xnm-ssl;   } }</pre>	<pre>[edit system] login {   class test {     permissions configure;     allow-configuration .*;     deny-configuration-regexps ".*.* .*-ssl"";   } }</pre>	<p>The following configuration statement is denied:</p> <ul style="list-style-type: none"> <li>• system services xnm-ssl</li> </ul>
ssh	<pre>[edit system] login {   class test {     permissions configure;     allow-configuration .*;     deny-configuration ".*ssh";   } }</pre>	<pre>[edit system] login {   class test {     permissions configure;     allow-configuration .*;     deny-configuration-regexps ".*ssh";     deny-configuration-regexps ".* .*ssh";     deny-configuration-regexps ".*.* .*ssh";   } }</pre>	<p>The following configuration statements are denied:</p> <ul style="list-style-type: none"> <li>• system host-name hostname-ssh</li> <li>• system services ssh</li> <li>• system services outbound-ssh</li> <li>• security ssh-known-host</li> </ul>

Although the **allow/deny-configuration** statements are also useful when simple configuration is desired, the **allow/deny-configuration-regexps** statements provide better performance and overcome the ambiguity that existed when combining expressions set in the **allow/deny-configuration** statements.

**NOTE:** The `allow/deny-configuration` and `allow/deny-configuration-regexps` statements are mutually exclusive and cannot be configured together for a login class. At a given point in time, a login class can include either the `allow/deny-configuration` statement, or the `allow/deny-configuration-regexps` statement. If you have existing configurations using the `allow/deny-configuration` statements, using the same configuration options with the `allow/deny-configuration-regexps` statements might not produce the same results, as the search and match methods differ in the two forms of these statements.

### Configuration Notes

When configuring the `allow-configuration`, `deny-configuration`, `allow-configuration-regexps`, and `deny-configuration-regexps` statements with access privileges, take the following into consideration:

- You can include one `deny-configuration` and one `allow-configuration` statement in each login class.
- The `allow/deny-configuration` and `allow/deny-configuration-regexps` statements are mutually exclusive and cannot be configured together for a login class. At a given point in time, a login class can include either the `allow/deny-configuration` statement, or the `allow/deny-configuration-regexps` statement. If you have existing configurations using the `allow/deny-configuration` statements, using the same configuration options with the `allow/deny-configuration-regexps` statements might not produce the same results, as the search and match methods differ in the two forms of these statements.
- Explicitly allowing configuration mode hierarchies or regular expressions using the `allow-configuration` statement adds to the regular permissions set using the `permissions` statement. Likewise, explicitly denying configuration mode hierarchies or regular expressions using the `deny-configuration` statement removes permissions for the specified configuration mode hierarchy, from the default permissions provided by the `permissions` statement.

For example, for the following configuration, the login class user can edit the configuration at the `[edit system services]` hierarchy level and issue configuration mode commands (such as `commit`), in addition to just entering the configuration mode using the `configure` command, which is the permission specified by the `configure` permission flag:

```
[edit system login]
user@host# set class test permissions configure allow-configuration "system services"
```

Likewise, for the following configuration, the login class user can perform all operations allowed by the `all` permissions flag, except issuing configuration mode commands (such as `commit`) or modifying the configuration at the `[edit system services]` hierarchy level:

```
[edit system login]
user@host# set class test permissions all deny-configuration "system services"
```

- To define access privileges to parts of the configuration hierarchy, specify the full paths in the extended regular expressions with the **allow-configuration** and **deny-configuration** statements. Use parentheses around an extended regular expression that connects two or more expressions with the pipe (|) symbol.

For example:

```
[edit system login]
user@host# set class test deny-configuration "(system login class)|(system services)"
```

- When specifying extended regular expressions using the **allow/deny-commands** and **allow/deny-configuration** statements, each expression separated by a pipe (|) symbol must be a complete standalone expression, and must be enclosed in parentheses ( ). Do not use spaces between regular expressions separated with parentheses and connected with the pipe (|) symbol.

For example:

```
[edit system login]
user@host# set class test allow-commands "(ping .*)|(traceroute .*)|(show
.*)|(configure .*)|(edit)|(exit)|(commit)|(rollback .*)"
user@host# set class test deny-configuration "(system login class)|(system services)"
```

- When specifying extended regular expressions using the **allow-deny-configuration-regexps** statement, each expression enclosed within quotes (") and separated by a space must be enclosed in angular brackets [ ].

For example:

```
[edit system login]
user@host# set class test allow-configuration-regexps [ "interfaces.* description.*"
"interfaces.* unit.* description.*" "interfaces.* unit.* family inet address.*"
"interfaces.* disable" ]
```

- If the exact same command is configured under both **allow-configuration** and **deny-configuration** statements, then the allow operation takes precedence over the deny statement.

For instance, with the following configuration, a user assigned to login class test is allowed to access the **[edit system services]** configuration hierarchy, although the **deny-configuration** statement also includes it:

```
[edit system login]
user@host# set class test permissions allow-configuration "system services"
user@host# set class test permissions deny-configuration "system services"
```

For instance, if a certain command or configuration is allowed, for example, using permission *all*, then we can use the **deny-configuration** command to deny access to a particular hierarchy.

- Modifiers such as *set*, *log*, and *count* are not supported within the regular expression string to be matched. If a modifier is used, then nothing is matched.

Incorrect configuration:

```
[edit system login]
user@host# set class test permission deny-configuration "set protocols"
```

Correct configuration:

```
[edit system login]
user@host# set class test permission deny-configuration protocols
```

- You can use the `*` wildcard character when denoting regular expressions. However, it must be used as a portion of a regular expression. You cannot use `[ * ]` or `[ .* ]` alone.
- You cannot configure the **allow-configuration** statement with the *(interfaces (description (.\*)*) regular expression, as this evaluates to **allow-configuration = .\*** regular expression.
- You can configure as many regular expressions as needed to be allowed or denied. Regular expressions to be denied take precedence over configurations to be allowed.

### Topology

Figure 2: Configuring TACACS+ Server Authentication

Figure 2 on page 129 illustrates a simple topology, where Router R1 is a Juniper Networks device and has a TCP connection established with a TACACS+ server.

In this example, R1 is configured with two customized login classes—Class1 and Class2—for specifying access privileges with extended regular expressions using the **allow-configuration**, **deny-configuration**, **allow-configuration-regexps**, and **deny-configuration-regexps** statements differently.

The purpose of the login classes is as follows:

- **Class1**—Define access privileges for the user with the **allow-configuration** and **deny-configuration** statements. This login class should provide access to configure interfaces hierarchy only, and deny all other access on the device. To do this, the user permissions should include *configure* to provide configuration access. In addition to this, the **allow-configuration** statement should allow interfaces configuration, and the **deny-configuration** statement should deny access to all other configurations. Because the allow statement takes precedence over the deny statement, the users assigned to the Class1 login class can access only the **[edit interfaces]** hierarchy level.
- **Class2**—Define access privileges for the user with the **allow-configuration-regexps** and **deny-configuration-regexps** statements. This login class provides superuser-level user permissions, and in addition, explicitly allows configuration under multiple hierarchy levels for interfaces. It also denies configuration access to the **[edit system]** and **[edit protocols]** hierarchy levels.

Router R1 has two users, User1 and User2, assigned to the Class1 and Class2 login classes, respectively.

### Configuration

---

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
R1 set system authentication-order tacplus
set system authentication-order radius
set system authentication-order password
set system radius-server 10.209.1.66 secret "$ABC123"
set system tacplus-server 10.209.1.66
set system radius-options enhanced-accounting
set system tacplus-options enhanced-accounting
set system accounting events login
set system accounting events change-log
set system accounting events interactive-commands
set system accounting traceoptions file auditlog
set system accounting traceoptions flag all
set system accounting destination tacplus server 10.209.1.66
set system login class Class1 permissions configure
set system login class Class1 allow-configuration "interfaces.* unit.*"
set system login class Class1 deny-configuration.*
set system login class Class2 permissions all
set system login class Class2 allow-configuration-regexps [ "interfaces.* description.*"
    "interfaces.* unit.* description.*" "interfaces.* unit.* family inet address.*"
    "interfaces.* disable" ]
set system login class Class2 deny-configuration-regexps [ "system" "protocols" ]
set system login user User1 uid 2004
set system login user User1 class Class1
set system login user User1 authentication encrypted-password "$ABC123"
set system login user User2 uid 2006
set system login user User2 class Class2
set system login user User2 authentication encrypted-password "$ABC123"
set system syslog file messages any any
```

### Configuring Authentication Parameters for Router R1

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure Router R1 authentication:

1. Configure the order in which authentication should take place for R1. In this example, TACACS+ server authentication is first, followed by RADIUS server authentication, then the local password.

```
[edit system]
user@R1# set authentication-order tacplus
```

```
user@R1# set authentication-order radius
user@R1# set authentication-order password
```

2. Establish R1 connection with the TACACS+ server.

```
[edit system]
user@R1# set tacplus-server 10.209.1.66
user@R1# set tacplus-options enhanced-accounting
user@R1# set accounting destination tacplus server 10.209.1.66
```

3. Configure RADIUS server authentication parameters.

```
[edit system]
user@R1# set radius-server 10.209.1.66 secret "$ABC123"
user@R1# set radius-options enhanced-accounting
```

4. Configure the R1 accounting configuration parameters.

```
[edit system]
user@R1# set accounting events login
user@R1# set accounting events change-log
user@R1# set accounting events interactive-commands
user@R1# set accounting traceoptions file auditlog
user@R1# set accounting traceoptions flag all
```

### *Configuring Access Privileges with allow-configuration and deny-configuration Statements (Class1)*

#### **Step-by-Step Procedure**

To specify regular expressions using the **allow-configuration** and **deny-configuration** statements:

1. Configure the Class1 custom login class and assign configuration user permissions.

```
[edit system login]
user@R1# set class Class1 permissions configure
```

2. Specify the regular expression in the **allow-configuration** statement to allow configuration at the **[edit interfaces]** hierarchy level. To allow **set** commands at the **[edit interfaces]** hierarchy level, the regular expression used is ***interfaces.\*unit.\****.

```
[edit system login]
user@R1# set class Class1 allow-configuration "interfaces.*unit.*"
```

3. Specify the regular expression in the **deny-configuration** statement to disable all configuration access. The regular expression used to deny all configuration access is ***.\****.

```
[edit system login]
user@R1# set class Class1 deny-configuration . *
```

4. Configure the user account for the Class1 login class.

```
[edit system login]
user@R1# set system login user User1 uid 2004
user@R1# set system login user User1 class Class1
user@R1# set system login user User1 authentication encrypted-password "$ABC123"
```

### *Configuring Access Privileges with allow-configuration-regexps and deny-configuration-regexps Statements (Class2)*

**Step-by-Step Procedure** To specify regular expressions using the **allow-configuration-regexps** and **deny-configuration-regexps** statements:

1. Configure the Class2 custom login class and assign superuser (all) user permissions. For information on the predefined system login classes, see [“Junos OS Login Classes Overview” on page 47](#).

```
[edit system login]
user@R1# set class Class2 permissions all
```

2. Specify the regular expression to allow access to multiple hierarchies under the **[edit interfaces]** hierarchy level.

```
[edit system login]
user@R1# set class Class2 allow-configuration-regexps [ "interfaces.*description
.*" "interfaces.*unit.*description.*" "interfaces.*unit.*family inet address.*"
"interfaces.*disable" ]
```

3. Specify the regular expression to deny configuration at the **[edit system]** and **[edit protocols]** hierarchy levels.

```
[edit system login]
user@R1# set class Class2 deny-configuration-regexps [ "system" "protocols" ]
```

4. Configure the user account for the Class2 login class.

```
[edit system login]
user@R1# set system login user User2 uid 2006
user@R1# set system login user User2 class Class2
user@R1# set system login user User2 authentication encrypted-password "$ABC123"
```

## Results

From configuration mode, confirm your configuration by entering the **show system** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

user@R1# show system
authentication-order [ tacplus radius password ];
radius-server {
  10.209.1.66 secret "$ABC123";
}
tacplus-server {
  10.209.1.66;
}
radius-options {
  enhanced-accounting;
}
tacplus-options {
  enhanced-accounting;
}
accounting {
  events [ login change-log interactive-commands ];
  traceoptions {
    file auditlog;
    flag all;
  }
  destination {
    tacplus {
      server {
        10.209.1.66;
      }
    }
  }
}
login {
  class Class1 {
    permissions configure;
    allow-configuration "interfaces.* unit.*";
    deny-configuration.*;
  }
  class Class2 {
    permissions all;
    allow-configuration-regexps [ "interfaces.* description.*" "interfaces.* unit.*
      description.*" "interfaces.* unit.* family inet address.*" "interfaces.* disable" ];
    deny-configuration-regexps [ "system" "protocols" ];
  }
  user User1 {
    uid 2001;
    class Class1;
    authentication {
      encrypted-password "$ABC123";
    }
  }
  user User2 {

```

```
uid 2002;
class Class2;
authentication {
    encrypted-password "$ABC123";
}
}
syslog {
    file messages {
        any any;
    }
}
```

---

### Verification

Log in as the username assigned with the new login class, and confirm that the configuration is working properly.

- [Verifying Class1 Configuration on page 134](#)
- [Verifying Class2 Configuration on page 135](#)

#### ***Verifying Class1 Configuration***

**Purpose** Verify that the permissions allowed in the Class1 login class are working.

**Action** From the CLI prompt, check the available permissions.

```
User1@R1> ?
Possible completions:
clear          Clear information in the system
configure      Manipulate software configuration information
file           Perform file operations
help           Provide help information
load           Load information from file
op             Invoke an operation script
quit           Exit the management session
request        Make system-level requests
save           Save information to file
set            Set CLI properties, date/time, craft interface message
start          Start shell
test           Perform diagnostic debugging
```

From the configuration mode, check the available configuration permissions.

```
User1@R1# edit ?
Possible completions:
> interfaces      Interface configuration
```

**Meaning** User1 has *configure* user permissions seen in the first output, and the only configuration access allowed for User1 is at the interfaces hierarchy level. All other configuration is denied, as seen in the second output.

### ***Verifying Class2 Configuration***

**Purpose** Verify that the Class2 configuration is working.

**Action** From the configuration mode, access the interfaces configuration.

```
[edit interfaces]
User2@R1# set ?
Possible completions:
<interface-name> Interface name
+ apply-groups      Groups from which to inherit configuration data
+ apply-groups-except Don't inherit configuration data from these groups
ge-0/0/3            Interface name
> interface-range   Interface ranges configuration
> interface-set      Logical interface set configuration
> traceoptions       Interface trace options
```

From the configuration mode, access the system and protocols configuration hierarchies.

```
User2@R1# edit system
      ^
Syntax error, expecting <statement> or <identifier>.
```

```
User2@R1# edit protocols
```

```
      ^
```

```
Syntax error, expecting <statement> or <identifier>.
```

**Meaning** User2 has permissions to configure interfaces of R1, but the **[edit system]** and **[edit protocols]** hierarchy levels are denied access, as seen in the output.

## CHAPTER 3

# Passwords for User Access

- [Root Password on page 137](#)
- [Recovering Root Password on page 142](#)
- [Plain-Text Passwords on page 150](#)
- [Master Password for Configuration Encryption on page 153](#)

## Root Password

---

When the router, switch, or security device is powered on first time, it is ready to be configured. Initially, you log in as the user **root** with no password. Later, you must configure a plain-text password for the root-level user (whose username is *root*). Configuring a plain-text password is one way to protect access to the root level by unauthorized users. If you forget the root password for the router, you can use the password recovery procedure to reset the root password. Read this topic for more information.

- [Configuring the Root Password on page 138](#)
- [Example: Configuring a Plain-Text Password for Root Logins on page 139](#)
- [Example: Configuring SSH Authentication for Root Logins on page 142](#)

## Configuring the Root Password

The Junos OS is preinstalled on the router or switch. When the router or switch is powered on, it is ready to be configured. Initially, you log in as the user **root** with no password. The root directory of a UNIX device is the entry point to all other folders and files on that device. As a result, access to the root directory is restricted by default to a predefined user account known as the *root user*. The root user (also referred to as *superuser*) has unrestricted access and full permissions within the system. The expression “log in as root” is commonly used when an action requires the user to log into the device as the root user.

**NOTE:** If you configure a blank password using the **encrypted-password** statement at the **[edit system root-authentication]** hierarchy level for root authentication, you can commit a configuration but you *cannot* log in as the root user and gain root level access to the router or switch.

After you log in, you should configure the root (superuser) password by including the **root-authentication** statement at the **[edit system]** hierarchy level and configuring one of the password options:

```
[edit system]
root-authentication {
  (encrypted-password "password"| plain-text-password);
  load-key-file URL filename;
  ssh-dsa "public-key" <from hostname>;
  ssh-ecdsa "public-key" <from hostname>;
  ssh-rsa "public-key" <from hostname>;
}
```

If you configure the **plain-text-password** option, you are prompted to enter and confirm the password:

```
[edit system]
user@host# set root-authentication plain-text-password
New password: type password here
Retype new password: retype password here
```

The default requirements for plain-text passwords are:

- The password must be between 6 and 128 characters long
  - You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
  - Valid passwords must contain at least one uppercase letter or one lowercase letter, or one character class.

You can use the **load-key-file** *URL filename* statement to load an SSH key file that was previously generated using **ssh-keygen**. The *URL filename* is the path to the file's location

and name. When using this option, the contents of the key file are copied into the configuration immediately after entering the **load-key-file** *URL* statement. This command loads RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys.

Starting in Junos OS Release 18.3R1, the **ssh-dss** and **ssh-dsa** hostkey algorithms are deprecated—rather than immediately removed—to provide backward compatibility and a chance to bring your configuration into compliance with the new configuration.

Optionally, you can use the **ssh-dsa**, **ssh-ecdsa**, or **ssh-rsa** statements to directly configure SSH RSA, DSA, or ECDSA keys to authenticate root logins. You can configure more than one public key for SSH authentication of root logins as well as for user accounts. When a user logs in as root, the public keys are referenced to determine whether the private key matches any of them.

```
[edit system]
user@host# set root-authentication load-key-file my-host:.ssh/id_dsa.pub
.file.19692 | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
[edit system]
```

From configuration mode, you can confirm your SSH key entries by entering the **show** command. It should look something like this:

```
[edit system]
user@hos# show
root-authentication {
  ssh-rsa "$ABC123"; #
  SECRET-DATA
}
```

Junos-FIPS software has special password requirements. FIPS passwords must be between 10 and 20 characters in length. Passwords must use at least three of the five defined character sets (uppercase letters, lowercase letters, digits, punctuation marks, and other special characters). If Junos-FIPS is installed on the router or switch, you cannot configure passwords unless they meet this standard.

If you use the **encrypted-password** option, then a null-password (empty) is not permitted. You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.

  - [Example: Changing the Requirements for Junos OS Plain-Text Passwords on page 151](#)

### Example: Configuring a Plain-Text Password for Root Logins

This example shows how to configure a plain-text password for the root-level user (whose username is *root*). Configuring a plain-text password is one way to protect access to the

root level by unauthorized users. You must prevent unauthorized users from gaining access to superuser commands that can be used to alter your system configuration.

- [Requirements on page 140](#)
- [Overview on page 140](#)
- [Configuration on page 140](#)
- [Verification on page 141](#)

---

## Requirements

No special configuration beyond device initialization is required before configuring this example.

Make sure that you understand the requirements for a valid plain-text password. For Junos OS, the default requirements for a plain-text password are as follows:

- Must be from 6 up to 128 characters long.
- Can include most character classes (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
- Must contain at least one change of case or character class.

---

## Overview

Junos OS is preinstalled on the router. When the router is powered on, it is ready to be configured. Initially, you log in as the root-level user with no password. To set the root password, you have several options. This example shows how to enter a plain-text password that Junos OS then encrypts for you.

---

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following command and paste it into the window. When prompted, type the new password, and then when prompted, retype it.

```
set system root-authentication plain-text-password
```

### *Configuring a Plain-Text Password for User Root*

### Step-by-Step Procedure

To configure a plain-text password for the root-level user:

1. Type the **set** command for the plain-text password and press Enter.

```
[edit]
user@host# set system root-authentication plain-text-password
New password:
```

2. Type the new password next to the **New password** prompt and press Enter.

```
New password: new-password
```

Retype new password:

3. Retype the same password next to the **Retype new password** prompt and press Enter.

### Results

From configuration mode, confirm your configuration by using the **show** command. It should look something like this:

```
[edit ]
user@host# show system
root-authentication {
  encrypted-password "$ABC123"; ## SECRET-DATA
}
```

If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

After you have confirmed that the configuration is correct, enter **commit** from configuration mode.

### Verification

#### *Verifying the Configuration of a Plain-Text Password for User Root*

**Purpose** Verify the configuration of a plain-text password for the root-level user.

**Action** From operational mode, confirm your configuration by entering the **show configuration system** command.

```
user@host> show configuration system
root-authentication {
  encrypted-password "$ABC123"; ## SECRET-DATA
}
```

**Meaning** If you use a clear-text password, Junos OS displays the password as an encrypted string so that users viewing the configuration cannot see the unencrypted password. That is, as you enter the password in plain text, Junos OS encrypts it immediately. You do not have to configure Junos OS to encrypt the password as in some other systems. Plain-text passwords are hidden and marked as **## SECRET-DATA** in the configuration.

**See Also**

- [root-authentication on page 1317](#)
- [Changing the Requirements for Junos OS Plain-Text Passwords on page 150](#)

## Example: Configuring SSH Authentication for Root Logins

The following example shows how to configure two public DSA keys for SSH authentication of root logins:

```
[edit system]
root-authentication {
  encrypted-password "$ABC123";
  ## SECRET-DATA;
  ssh-dsa "2354 95 9304@user.device";
  ssh-dsa "0483 02 8362@user.device";
}
```

### Release History Table

Release	Description
18.3R1	Starting in Junos OS Release 18.3R1, the <b>ssh-dss</b> and <b>ssh-dsa</b> hostkey algorithms are deprecated— rather than immediately removed—to provide backward compatibility and a chance to bring your configuration into compliance with the new configuration.

### Related Documentation

## Recovering Root Password

If you forget the root password for a device running Junos OS, you can use the password recovery procedure to reset the root password. Read this topic to understand how to recover root password.

- [Recovering the Root Password on page 142](#)
- [Recovering the Root Password on Junos OS with Upgraded FreeBSD on page 145](#)
- [Troubleshooting Loss of the Root Password on page 148](#)

## Recovering the Root Password

If you forget the root password for the router, you can use the password recovery procedure to reset the root password.

**NOTE:** You need console access to recover the root password.

**NOTE:** This password recovery procedure does not apply to devices running Junos OS with Upgraded FreeBSD. See [“Root Password” on page 137](#). For MX80 Series routers, try this procedure first, but if it does not work you can manually delete the root-authentication settings from the Junos configuration file and reset the password, as explained here: *Recovering the Root Password for MX80*.

**Video:** [Recovering the Root Password](#)

To recover the root password:

1. Power off the router by pressing the power button on the front panel.
  2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
  3. Plug one end of the Ethernet rollover cable supplied with the router into the RJ-45-to-DB-9 serial port adapter supplied with the router.
  4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
  5. Connect the other end of the Ethernet rollover cable to the console port on the router.
  6. Turn on the power to the management device.
  7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate COM port to use (for example, COM1).
  8. Configure the port settings as follows:
    - Bits per second: 9600
    - Data bits: 8
    - Parity: None
    - Stop bits: 1
    - Flow control: None
  9. Power on the router by pressing the power button on the front panel.
- Verify that the POWER LED on the front panel turns green.

The terminal emulation screen on your management device displays the router's boot sequence.

10. When the following prompt appears, press the Spacebar to access the router's bootstrap loader command prompt:

Depending on your device hardware, the bootstrap loader might proceed quite quickly at this step without pausing for input. Therefore, you might need to press the spacebar multiple times at the beginning of the boot sequence.

```
Hit [Enter] to boot immediately, or space bar for command prompt.  
Booting [kernel] in 9 seconds...
```

11. At the following prompt, type **boot -s** to start the system in single-user mode.

```
ok boot -s
```

12. At the following prompt, type **recovery** to start the root password recovery procedure.

```
Enter full pathname of shell or 'recovery' for root password recovery or RETURN  
for /bin/sh: recovery
```

13. Enter configuration mode in the CLI.

14. Set the root password.

```
[edit]  
user@host# set system root-authentication plain-text-password
```

When you configure a plain-text password, Junos OS encrypts the password for you.

**CAUTION:** Do not use the **encrypted-password** option unless the password is *already* encrypted, and you are entering the encrypted version of the password. If you commit the **encrypted-password** option with a plain-text password or with blank quotation marks (" "), you will not be able to log in to the device as root, and you will need to repeat this password recovery process.

15. At the following prompt, enter the new root password, for example:

```
New password: password
```

```
Retype new password:
```

16. At the second prompt, reenter the new root password.

17. After you have finished configuring the password, commit the configuration.

```
root@host# commit  
commit complete
```

18. Exit configuration mode in the CLI.
  19. Exit operational mode in the CLI.
  20. At the prompt, type **y** to reboot the router.
- ```
Reboot the system? [y/n] y
```

## Recovering the Root Password on Junos OS with Upgraded FreeBSD

If you forget the root password for a device running Junos OS with Upgraded FreeBSD, you can use the password recovery procedure to reset the root password.

**NOTE:** You need console access to recover the root password.

**NOTE:** This password recovery procedure only applies to devices running Junos OS with Upgraded FreeBSD. For password recovery on Junos OS devices, see [“Root Password” on page 137](#).

To recover the root password:

1. Power off the router by pressing the power button on the front panel.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the router into the RJ-45-to-DB-9 serial port adapter supplied with the router.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the router.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate COM port to use (for example, COM1).
8. Configure the port settings as follows:

- Bits per second: 9600
- Data bits: 8
- Parity: None
- Stop bits: 1
- Flow control: None

9. Power on the router by pressing the power button on the front panel.

Verify that the POWER LED on the front panel turns green.

The terminal emulation screen on your management device displays the router's boot sequence.

10. Access the Junos Main Menu.

- Prior to Junos OS Release 17.3, the Junos Main Menu appears for 3 seconds on startup before automatically booting the Junos volume. Press any key within the 3 second window to stop the automatic boot sequence and display the Junos Main Menu.

**NOTE:** The Junos Main Menu will appear every time you reboot the router while connected to the console.

- Starting in Junos OS Release 17.3, press Ctrl+c at the following part in the reboot to bring up the Junos Main Menu:

```
FreeBSD/x86 bootstrap loader, Revision 1.1
(builder@feyrith.juniper.net, Sun Feb  4 13:06:24 PST 2018)
/
Autoboot in 1 seconds... (press Ctrl-C to interrupt)
```

- ```
1.  Boot [J]unos volume
2.  Boot Junos volume in [S]afe mode

3.  [R]eboot

4.  [B]oot menu
5.  [M]ore options
```

11. At the Junos Main Menu, press the **M** or **5** key to activate the **5. [M]ore options** menu:

- ```
1.  Recover [J]unos volume
2.  Recovery mode - [C]LI

3.  Check [F]ile system

4.  Enable [V]erbose boot

5.  [B]oot prompt
```

6. [M]ain menu

12. Press the **C** or **2** key to access the **2. Recovery mode - [C]LI** option. The router will reboot into CLI recovery mode.
13. When prompted, press the **Enter** key to immediately boot the router, or press any other key to bring up the command prompt.
14. Enter configuration mode in the CLI.

```
root># configure
Entering configuration mode
```

15. Set the root password.

When you configure a plain-text password, Junos OS encrypts the password for you.

```
[edit]
root# set system root-authentication plain-text-password
```

**CAUTION:** Do not use the `encrypted-password` option unless the password is *already* encrypted, and you are entering the encrypted version of the password. If you commit the `encrypted-password` option with a plain-text password or with blank quotation marks (""), you will not be able to log in to the router as root, and you will need to repeat this password recovery process.

16. At the following prompt, enter the new root password, for example:

New password: **password**

Retype new password:

17. At the second prompt, reenter the new root password.
18. If you used a configuration group, apply the configuration group, substituting **global** with the appropriate group name.

```
[edit]
root# set apply-groups global
```

19. After you have finished configuring the password, commit the configuration.

```
root@host# commit
```

```
commit complete
```

**See Also** • [Release Information for Junos OS with Upgraded FreeBSD](#)

## Troubleshooting Loss of the Root Password

**Problem Description:** If you forget the root password for a switch, use the password recovery procedure to reset the root password.

**NOTE:** You need physical access to the switch to recover the root password.

**TIP:** For a video on recovering the root password for routers, see [“Root Password” on page 137](#). The procedure is similar for switches.

**Solution** To recover the root password:

1. Power off your switch by unplugging the power cord or turning off the power at the wall switch.
2. Insert one end of the Ethernet cable into the serial port on the management device and connect the other end to the console port on the back of the switch. See [Figure 3 on page 148](#).

**Figure 3: Connecting to the Console Port on the EX Series Switch**

3. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate COM port to use (for example, COM1).

4. Configure the port settings as follows:
  - Bits per second: 9600
  - Data bits: 8
  - Parity: None
  - Stop bits: 1
  - Flow control: None
5. Power on your switch by plugging in the power cord or turning on the power at the wall switch.

**NOTE:** On EX2300 and EX3400 switches after step 5, use the following procedure:

In the main menu that appears, select **[M]ore options > Recovery mode - [C]LI**.

A series of messages describe consistency checks, mounting of filesystems, and initialization and checkout of management services. Then the CLI prompt appears.

Proceed to Step 9 in this procedure.

6. When the following prompt appears, press the Spacebar to access the switch's bootstrap loader command prompt:

```
Hit [Enter] to boot immediately, or space bar for command prompt.
Booting [kernel] in 1 second...
```

**NOTE:** If the switch is in unattended mode for U-Boot, access to the bootstrap loader command prompt is blocked. If the root password is lost, you must reset the switch to the factory default configuration using the LCD panel. For more information, see *Reverting to the Default Factory Configuration for the EX Series Switch*.

7. At the following prompt, type **boot -s** to start up the system in single-user mode:  
**loader> boot -s**
8. At the following prompt, type **recovery** to start the root password recovery procedure:  
**Enter full path name of shell or 'recovery' for root password recovery or RETURN for /bin/sh: recovery**

A series of messages describe consistency checks, mounting of filesystems, and initialization and checkout of management services. Then the CLI prompt appears.

9. Enter configuration mode in the CLI:

```
user@switch> configure
```

10. Set the root password. For example:

```
user@switch# set system root-authentication plain-text-password
```

11. At the following prompt, enter the new root password. For example, juniper1:

```
user@switch# juniper1
```

```
Retype new password:
```

12. At the second prompt, reenter the new root password.

13. If you are finished configuring the network, commit the configuration.

```
root@switch# commit
```

```
commit complete
```

14. Exit configuration mode in the CLI.

```
root@switch# exit
```

15. Exit operational mode in the CLI.

```
root@switch> exit
```

16. At the prompt, enter **y** to reboot the switch.

```
Reboot the system? [y/n] y
```

## Plain-Text Passwords

- [Changing the Requirements for Junos OS Plain-Text Passwords on page 150](#)
- [Example: Changing the Requirements for Junos OS Plain-Text Passwords on page 151](#)

## Changing the Requirements for Junos OS Plain-Text Passwords

For plain-text password requirements, see [Special Requirements for Junos OS Plain-Text Passwords](#).

To change the requirements for plain-text passwords, include the **password** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
password {
  change-type (set-transitions | character-set);
  format (sha1 | sha256 | sha512);
  maximum-length length;
  maximum-lifetime days
  minimum-changes number;
  minimum-character-changes number
  minimum-length length;
  minimum-lifetime days
  minimum-lower-cases number;
  minimum-numeric number;
  minimum-reuse number
  minimum-punctuations number;
  minimum-upper-cases number;
}
```

**NOTE:** These statements apply to plain-text passwords only, not encrypted passwords.

- See Also**
- [Configuring the Root Password on page 138](#)
  - [Example: Changing the Requirements for Junos OS Plain-Text Passwords on page 151](#)

## Example: Changing the Requirements for Junos OS Plain-Text Passwords

This example shows how to set various maximum and minimum requirements for plain-text passwords to increase password strength.

- [Requirements on page 151](#)
- [Overview on page 151](#)
- [Configuration on page 152](#)

### Requirements

This example requires a device running Junos 12.2 or greater. The **minimum-length** and **maximum-length** password requirements statements are available in earlier releases, however, you must have Junos OS Release 12.2 or greater to configure **minimum-lower-cases**, **minimum-numeric**, **minimum-punctuations**, or **minimum-upper-cases**.

### Overview

You can use a variety of requirements to strengthen plain-text passwords for greater security. Junos OS provides a number of possible configurations at the **[edit system login password]** hierarchy level that allow you to require users to create plain-text passwords

that conform to a particular set of requirements that may include such things as length, number of changes, type of characters, numbers, or letter case.

### Configuration

---

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system login password minimum-length 12
set system login password maximum-length 22
set system login password minimum-numeric 1
set system login password minimum-upper-cases 1
set system login password minimum-lower-cases 1
set system login password minimum-punctuations 1
```

#### Configuring Requirements for Plain-Text Passwords

#### Step-by-Step Procedure

This example configures password requirements that require the user to create a password that has a minimum length of 12 characters, a maximum length of 22 characters, and that includes at least one lower-case letter, at least one upper-case letter, at least one punctuation character, and at least one numeric character.

1. Navigate to configuration mode in the `[system login password]` hierarchy level.

```
user@host> edit
[edit]
user@host# edit system login password
```

2. Set a minimum length requirement of 12 characters and a maximum length requirement of 22 characters for user passwords.

```
[edit system login password]
user@host# set minimum-length 12
[edit system login password]
user@host# set maximum-length 22
```

3. Require users to set a password that has at least one lower-case letter and at least one upper-case letter.

```
[edit system login password]
user@host# set minimum-lower-cases 1
[edit system login password]
user@host# set minimum-upper-cases 1
```

4. Require users to set a password that has at least one punctuation-class character and at least one number.

```
[edit system login password]
user@host# set minimum-punctuations 1
[edit system login password]
user@host# set minimum-numeric 1
```

### Results

From configuration mode, confirm your configuration by entering the show command at the edit system login password hierarchy level. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit system login password]
user@host# show
minimum-length 12;
maximum-length 22;
minimum-numeric 1;
minimum-upper-cases 1;
minimum-lower-cases 1;
```

## Master Password for Configuration Encryption

Junos OS supports encryption method for configuration secrets using a master password. The master password derives an encryption key that uses AES256-GCM to protect certain secrets such as private keys, system master passwords, and other sensitive data by storing it in an AES256 encrypted format. For more information, read this topic.

- [Hardening Shared Secrets in Junos OS on page 153](#)
- [Using Trusted Platform Module to Bind Secrets on SRX Series Devices on page 155](#)

## Hardening Shared Secrets in Junos OS

- [Understanding Hardening Shared Secrets on page 153](#)

### Understanding Hardening Shared Secrets

Existing shared secrets (\$9\$ format) in Junos OS currently use an obfuscation algorithm, which is not a very strong encryption for configuration secrets. If you want a strong encryption for your configuration secrets, you can configure a master password. The master password is used to derive an encryption key that is used with AES256-GCM to encrypt configuration secrets. This new encryption method uses the \$8\$ formatted strings.

Starting with Junos OS Release 15.1X49-D50, new CLI commands are introduced to configure a system master password to provide stronger encryption for configuration secrets. The master password encrypts secrets like the RADIUS password, IKE preshared keys, and other shared secrets in the Junos OS management process (mgd) configuration.

The master password itself is not saved as part of the configuration. The password quality is evaluated for strength, and the device gives feedback if weak passwords are used.

The master password is used as input to the password based key derivation function (PBKDF2) to generate an encryption key. the key is used as input to the Advanced Encryption Standard in Galois/Counter Mode (AES256-GCM). The plain text that the user enters is processed by the encryption algorithm (with key) to produce the encrypted text (cipher text). See [Figure 4 on page 154](#)

**Figure 4: Master Password Encryption**

The `$8$` configuration secrets can only be shared between devices using the same master password.

The `$8$`-encrypted passwords have the following format:

`$8$crypt-algo$hash-algo$iterations$salt$iv$tag$encrypted`. See [Table 11 on page 154](#) for the master password format details.

**Table 11: `$8$`-encrypted Password Format**

| Format     | Description                                                                                                                                                                                     |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| crypt-algo | Encryption/decryption algorithm to be used. Currently only AES256-GCM is supported.                                                                                                             |
| hash-algo  | Hash (prf) algorithm to be used for the PBKDF2 key derivation.                                                                                                                                  |
| iterations | The number of iterations to use for the PBKDF2 hash function. Current iteration-count default is 100. The iteration count slows the hashing count, thus slowing attacker guesses.               |
| salt       | Sequence of ASCII64-encoded pseudorandom bytes generated during encryption that are to be used to <i>salt</i> (a random, but known string) the password and input to the PBKDF2 key derivation. |
| iv         | A sequence of ASCII64-encoded pseudorandom bytes generated during encryption that are to be used as initialization vector for the AES256-GCM encryption function.                               |
| tag        | ASCII64-encoded representation of the tag.                                                                                                                                                      |
| encrypted  | ASCII64-encoded representation of the encrypted password.                                                                                                                                       |

The ASCII64 encoding is Base64 (RFC 4648) compatible, except no padding (character “=”) is used to keep the strings short. For example:

`$8$aes256-gcm$sha2-256$100$y/4YMC4YDLU$FzYDI4jjN6YCyQsYLsaf8A$llu4jLcZarD9YnyD/Hejww$okhBlc0cGakSqYxKww`

### Chassis Cluster Considerations

When defining a chassis cluster on SRX Series devices, be aware of the following restrictions:

- For SRX Series devices, first configure the master password on each node, and then build the cluster. The same master password should be configured on each node.
- In chassis cluster mode, the master password cannot be deleted.

**NOTE:** A change in the master password would mean disruption in chassis clustering; therefore you must change the password on both nodes independently.

### Using Trusted Platform Module to Bind Secrets on SRX Series Devices

By enabling the Trusted Platform Module (TPM) on the SRX Series devices, the software layer leverages the use of the underlying TPM chip. TPM is a specialized chip that protects certain secrets at rest such as private keys, system master passwords, and other sensitive data by storing it in an AES256 encrypted format (instead of storing sensitive data in a clear text format). The device also generates a new SHA256 hash of the configuration each time the administrator commits the configuration. This hash is verified each time the system boots up. If the configuration has been tampered with, the verification fails and the device will not continue to boot. Both the encrypted data and the hash of the configuration is protected by the TPM module using the master encryption password.

**NOTE:** Hash validation is performed during any commit operation by performing a validation check of the configuration file against the saved hash from previous commits. In a chassis cluster system, hash is independently generated on the backup system as part of the commit process. A commit from any mode, that is, `batch-config`, `dynamic-config`, `exclusive-config`, or `private config` generates the integrity hash.

**NOTE:** Hash is saved only for the current configuration and not for any rollback configurations. Hash is not generated during reboot or shutdown of the device.

The TPM encrypts the following secrets:

- SHA256 hash of the configuration
- device master-password
- all key-pairs on the device

The TPM chip is available on the SRX300, SRX320, SRX340, and SRX345 devices. TPM is not enabled by default. To enable TPM, see [“Enabling the TPM” on page 156](#).

- [Limitations on page 156](#)
- [Enabling the TPM on page 156](#)
- [Verifying the Status of the TPM on page 157](#)
- [Changing the Master Encryption Password on page 157](#)

---

### Limitations

The following limitations and exceptions apply to the configuration file integrity feature using TPM:

- This feature is supported only on the SRX300, SRX320, SRX340 and SRX345 devices.
- If the master encryption password is not set, data is stored unencrypted.
- If the master encryption password and the multiple index backup files are deleted, data cannot be decrypted.
- If you set up the master encryption password, downgrading to older releases that do not implement TPM is not supported. You must delete the master encryption password and reenter all sensitive data before downgrading.
- If the master encryption password was deleted before the daemons had a chance to re-encrypt the data, then the data becomes unusable.
- The file integrity feature is not supported along with the configuration file encryption feature that uses keys saved in EEPROM. You can enable only one function at a time.

---

### Enabling the TPM

**NOTE:** Before enabling TPM, ensure that you have configured “**set system master-password plain-text-password**” otherwise, certain sensitive data will not be protected by the TPM.

---

You can enable the TPM by setting the master encryption password using the following CLI command:

**request security tpm master-encryption-password set plain-text-password**

You will be prompted to enter the master encryption password twice, to make sure that these passwords match. The master encryption password is validated for required password strength.

After master encryption password is set, the system proceeds to encrypt the sensitive data with the master encryption password which is encrypted by the Master Binding Key that is owned and protected by the TPM chip.

**NOTE:** If there is any issue with setting the master encryption password, a critical ERROR message is logged on the console and the process is aborted.

### Verifying the Status of the TPM

You can use the **show security tpm status** command to verify the status of the TPM. The following information is displayed:

- TPM enabled/disabled
- TPM ownership
- TPM's Master Binding Key status (created or not created)
- master encryption password status (set or not set)

Starting with Junos OS Release 15.1X49-D120 and Junos OS Release 17.4R1, Trusted Platform Module (TPM) firmware has been updated. The upgraded firmware version provides additional secure cryptography and improves security. Updated TPM firmware is available along with the Junos OS package. For updating TPM Firmware, see [Upgrading TPM Firmware on SRX-Devices](#). To confirm the TPM firmware version, use the **show security tpm status** command. **TPM Family** and **TPM Firmware version** output fields are introduced.

### Changing the Master Encryption Password

Changing the master encryption password is done using the CLI.

To change the master encryption password, enter the following command from operational mode:

```
request security tpm master-encryption-password set plain-text-password
```

**NOTE:** It is recommended that no configuration changes are made while you are changing the master encryption password.

The system checks if the master encryption password is already configured. If master encryption password is configured, then you are prompted to enter the current master encryption password.

The entered master encryption password is validated against the current master encryption password to make sure these master encryption passwords match. If the validation succeeds, you will be prompted to enter the new master encryption password as plain text. You will be asked to enter the key twice to validate the password.

The system then proceeds to re-encrypt the sensitive data with the new master encryption password. You must wait for this process of re-encryption to complete before attempting to change the master encryption password again.

If for some reason, the encrypted master encryption password file is lost or corrupted, the system will not be able to decrypt the sensitive data. The system can only be recovered by re-importing the sensitive data in clear text, and re-encrypting them.

If the system is compromised, the administrator can recover the system using of the following method:

- Clear the TPM ownership in u-boot and then install the image in boot loader using TFTP or USB (if USB port is not restricted).

**NOTE:** If the installed software version is older than Junos OS Release 15.1X49-D110 and the master encryption password is enabled, then installation of Junos OS Release 15.1X49-D110 will fail. You must backup the configuration, certificates, key-pairs, and other secrets and use the TFTP/USB installation procedure.

Release History Table

| Release     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 17.4R1      | Starting with Junos OS Release 15.1X49-D120 and Junos OS Release 17.4R1, Trusted Platform Module (TPM) firmware has been updated. The upgraded firmware version provides additional secure cryptography and improves security. Updated TPM firmware is available along with the Junos OS package. For updating TPM Firmware, see <a href="#">Upgrading TPM Firmware on SRX-Devices</a> . To confirm the TPM firmware version, use the <b>show security tpm status</b> command. <b>TPM Family</b> and <b>TPM Firmware version</b> output fields are introduced. |
| 15.1X49-D50 | Starting with Junos OS Release 15.1X49-D50, new CLI commands are introduced to configure a system master password to provide stronger encryption for configuration secrets.                                                                                                                                                                                                                                                                                                                                                                                    |

### Junos OS User Authentication Overview

---

Junos OS supports different methods such as local password authentication, RADIUS and TACACS+ to control access to the network. Authentication methods are used for validating users who attempt to access the router or switch using telnet. Authentication prevents unauthorized devices and users from gaining access to your LAN. For more information, read this topic.

- [Configuring Remote Template Accounts for User Authentication on page 162](#)
- [Example: Creating Template Accounts on page 163](#)
- [Understanding Remote Authentication Servers on page 165](#)

### Junos OS User Authentication Methods

The Junos OS supports three methods of user authentication: local password authentication, Remote Authentication Dial-In User Service (RADIUS), and Terminal Access Controller Access Control System Plus (TACACS+).

With local password authentication, you configure a password for each user allowed to log in to the router or switch.

RADIUS and TACACS+ are authentication methods for validating users who attempt to access the router or switch using telnet. They are both distributed client-server systems—the RADIUS and TACACS+ clients run on the router or switch, and the server runs on a remote network system.

You can configure the router or switch to be both a RADIUS and TACACS+ client, and you can also configure authentication passwords in the Junos OS configuration file. You

can prioritize the methods to configure the order in which the software tries the different authentication methods when verifying user access.

You can control access to your network using several different authentication methods—media access control (MAC) RADIUS, for example. Authentication prevents unauthorized devices and users from gaining access to your LAN. For MAC RADIUS authentication, end devices must be authenticated before they receive an IP address from a DHCP server.

**NOTE:** Note about the MAC RADIUS authentication:

- You can enable end devices to access the network without authenticating on the RADIUS server by configuring the MAC address of the end device in the static MAC bypass list by configuring the MAC address using the `authentication-whitelist` statement.
- You can configure one or more authentication methods on a single interface and thereby enable fallback to the next method if the first or second method is unsuccessful.
- On a single interface you can configure one or a combination of several authentication methods.
- The EAP method supported for MAC RADIUS authentication is EAP-MD5.
- You can configure MAC RADIUS authentication on interfaces that are connected to end devices.
- When you configure the `mac-radius restrict` option, the switch immediately attempts a MAC- RADIUS authentication by sending a request to the RADIUS server for authentication of the MAC address of the end device. If MAC address of the end device is configured for RADIUS authentication, LAN access between the two switches is created.

-

## Configuring Local User Template Accounts for User Authentication

You use local user template accounts when you need different types of templates for authentication. Each template can define a different set of permissions appropriate for the group of users who use that template. These templates are defined locally on the router or switch and referenced by the TACACS+ and RADIUS authentication servers.

When you configure local user templates and a user logs in, Junos OS issues a request to the authentication server to authenticate the user's login name. If a user is authenticated, the server returns the local username to Junos OS, which then determines

whether a local username is specified for that login name (**local-username** for TACACS+, **Juniper-Local-User** for RADIUS). If so, Junos OS selects the appropriate local user template locally configured on the router or switch. If a local user template does not exist for the authenticated user, the router or switch defaults to the **remote** template.

To configure different access privileges for users who share the local user template account, include the **allow-commands** and **deny-commands** commands in the authentication server configuration file.

To configure a local user template, include the **user local-username** statement at the **[edit system login]** hierarchy level and specify the privileges you want to grant to the local users to whom the template applies:

```
[edit system login]
user local-username {
  full-name "Local user account";
  uid uid-value;
  class class-name;
}
```

This example configures the **sales** and **engineering** local user templates:

```
[edit]
system {
  login {
    user sales {
      uid uid-value;
      class class-name;
    }
    user engineering {
      uid uid-value;
      class class-name;
    }
  }
}
```

```
user = simon {
  ...
  service = junos-exec {
    local-user-name = sales
    allow-commands = "configure"
    deny-commands = "shutdown"
  }
}
user = rob {
  ...
  service = junos-exec {
    local-user-name = sales
    allow-commands = "(request system) | (show rip neighbor)"
    deny-commands = "clear"
  }
}
user = harold {
```

```
...
service = junos-exec {
    local-user-name = engineering
    allow-commands = "monitor | help | show | ping | traceroute"
    deny-commands = "configure"
}
}
user = jim {
    ...
    service = junos-exec {
        local-user-name = engineering
        allow-commands = "show bgp neighbor"
        deny-commands = "telnet | ssh"
    }
}
```

When the login users Simon and Rob are authenticated, the router or switch applies the sales local user template. When login users Harold and Jim are authenticated, the router or switch applies the engineering local user template.

  - [user \(Access\) on page 1488](#)

## Configuring Remote Template Accounts for User Authentication

By default, the Junos OS uses remote template accounts for user authentication when:

- The authenticated user does not exist locally on the router or switch.
- The authenticated user's record in the authentication server specifies local user, or the specified local user does not exist locally on the router or switch.

To configure the remote template account, include the **user remote** statement at the **[edit system login]** hierarchy level and specify the privileges you want to grant to remote users:

```
[edit system login]
user remote {
    full-name "All remote users";
    uid uid-value;
    class class-name;
}
```

To configure different access privileges for users who share the remote template account, include the **allow-commands** and **deny-commands** statements in the authentication server configuration file.

- See Also**
- [Example: Configuring Authentication Order on page 175](#)
  - [user \(Access\) on page 1488](#)

## Example: Creating Template Accounts

This example shows how to create template accounts.

- [Requirements on page 163](#)
- [Overview on page 163](#)
- [Configuration on page 163](#)
- [Verification on page 165](#)

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

### Overview

You can create template accounts that are shared by a set of users when you are using RADIUS or TACACS+ authentication. When a user is authenticated by a template account, the CLI username is the login name, and the privileges, file ownership, and effective user ID are inherited from the template account.

By default, Junos OS uses the **remote** template account when:

- The authenticated user does not exist locally on the device.
- The authenticated user's record in the RADIUS or TACACS+ server specifies local user, or the specified local user does not exist locally on the device.

In this example, you create a remote template account and set the username to remote and the login class for the user as operator. You create a remote template that is applied to users authenticated by RADIUS or TACACS+ that do not belong to a local template account.

You then create a local template account and set the username as admin and the login class as superuser. You use local template accounts when you need different types of templates. Each template can define a different set of permissions appropriate for the group of users who use that template.

### Configuration

- [Creating a Remote Template Account on page 163](#)
- [Creating a Local Template Account on page 164](#)

#### *Creating a Remote Template Account*

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set system login user remote class operator
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To create a remote template account:

- Set the username and the login class for the user.

```
[edit system login]
user@host# set user remote class operator
```

**Results** From configuration mode, confirm your configuration by entering the **show system login** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show system login
user remote {
  class operator;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

#### *Creating a Local Template Account*

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set system login user admin class superuser
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To create a local template account:

1. Set the username and the login class for the user.

```
[edit system login]
user@host# set user admin class superuser
```

**Results** From configuration mode, confirm your configuration by entering the **show system login** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show system login
user admin {
class super-user;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

**NOTE:** To completely set up RADIUS or TACACS+ authentication, you must configure at least one RADIUS or TACACS+ server and specify a system authentication order. Do one of the following tasks:

- Configure a RADIUS server. See [“Example: Configuring a RADIUS Server for System Authentication” on page 186](#).
- Configure a TACACS+ server. See [“Example: Configuring a TACACS+ Server for System Authentication” on page 205](#).
- Configure system authentication order. See [“Example: Configuring Authentication Order” on page 175](#).

## Verification

Confirm that the configuration is working properly.

### *Verifying the Template Accounts Creation*

**Purpose** Verify that the template accounts have been created.

**Action** From operational mode, enter the **show system login** command.

**See Also** • [Junos OS User Accounts Overview on page 65](#)

## Understanding Remote Authentication Servers

You probably already use a remote authentication server (or servers) in your network. It is a recommended best practice, because the servers allow you to centrally create a consistent set of user accounts for all devices in your network. There are many good reasons for implementing a authentication, authorization, and accountability (AAA) solution in your network, not the least of which is to make the management of user accounts easier.

There are two basic methods of remote authentication in use by most enterprises today—RADIUS and TACACS+. Junos OS supports both types and can be configured to query multiple remote authentication servers of both types. The idea behind a RADIUS or TACACS+ server is simple, a central authentication server that routers, switches, security devices, and even servers can use to authenticate users as they attempt to gain

access to these systems. Think of the advantages that a central user directory brings for authentication auditing and access control in a client server model, and you have your justification for RADIUS or TACACS+ for your networks infrastructure.

Using a central server has multiple advantages over the alternative of creating local users on each device, a time-consuming and error-prone task. A central authentication system also simplifies the use of one-time password systems such as SecureID, which offer protection against password sniffing and password replay attacks, in which someone uses a captured password to pose as a system administrator.

- **RADIUS**—You should use RADIUS when your priorities are interoperability and performance.
  - **Interoperability**—RADIUS is more interoperable than TACACS+, primarily because of the proprietary nature of TACACS+. While TACACS+ supports more protocols, RADIUS is universally supported.
  - **Performance**—RADIUS is much lighter on your routers and switches and for this reason, network engineers generally prefer RADIUS over TACACS+.
- **TACACS+**—You should use TACACS+ when your priorities are security and flexibility.
  - **Security**—TACACS+ is more secure than RADIUS. Not only is the full session encrypted, but authorization and authentication are done separately to prevent someone from trying to force their way into your network.
  - **Flexibility**—TCP is a more flexible transport protocol than UDP. You can do more with it in more advanced networks. In addition, TACACS+ supports more of the enterprise protocols like NetBios or Appletalk.

## Authentication Order for RADIUS, TACACS+, and Local Password

Junos OS supports different methods such as local password authentication, RADIUS and TACACS+ to control access to the network. Authentication methods are used for validating users who attempt to access the router or switch using telnet. You can prioritize the methods to configure the order in which the Junos OS tries the different authentication methods when verifying user access to a router or switch or security device. For more information, read this topic.

- [Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication on page 167](#)
- [Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and Local Password Authentication on page 173](#)

- [Example: Configuring Authentication Order on page 175](#)
- [Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication on page 178](#)

## Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication

Using the **authentication-order** statement, you can prioritize the order in which the Junos OS tries the different authentication methods when verifying user access to a router or switch.

If RADIUS and/or TACACS+ servers are configured in the authentication order but there is no response from them to a request, the Junos OS always defaults to trying local password authentication as a last resort. If the authentication order is set to **authentication-order password**, that will be the only authentication method attempted.

**NOTE:** It is not possible and would make no sense to try to configure local password authentication ahead of RADIUS or TACACS+ in the order because “no response” cannot happen. A local authentication request will always either be accepted or rejected.

The handling of a rejected authentication request when RADIUS or TACACS+ are present is more complicated.

- If **password** (local password authentication) is *not* in the authentication order, a RADIUS and/or TACACS+ rejection ends with the rejection.
- If **password** is included at the end of the authentication order and RADIUS and/or TACACS+ rejects the authentication, the Junos OS tries for a local authentication check.

In other words, including **password** as a final authentication order option is a means by which you can choose whether a RADIUS and/or TACACS+ rejection ends there or if the request is to be given one last chance for authentication locally.

### Using RADIUS or TACACS+ Authentication

You can configure the Junos OS to be both a RADIUS and TACACS+ authentication client.

If an authentication method included in the **[authentication-order]** statement is not available, or if the authentication is available but returns a reject response, the Junos OS tries the next authentication method included in the **authentication-order** statement.

The RADIUS or TACACS+ server authentication might fail because of the following reasons:

- The authentication method is configured, but the corresponding authentication servers are not configured. For instance, the RADIUS and TACACS+ authentication methods are included in the **authentication-order** statement, but the corresponding RADIUS or TACACS+ servers are not configured at the respective **[edit system radius-server]** and **[edit system tacplus-server]** hierarchy levels.

- The RADIUS or TACACS+ server does not respond within the timeout period configured at the **[edit system radius-server]** or **[edit system tacplus-server]** hierarchy levels.
- The RADIUS or TACACS+ server is not reachable because of a network problem.

The RADIUS or TACACS+ server authentication might return a reject response because of the following reasons:

- The user profiles of users accessing a router or switch might not be configured on the RADIUS or TACACS+ server.
- The user enters incorrect logon credentials.

### Using Local Password Authentication

---

You can explicitly configure the password authentication method or use this method as a fallback mechanism when remote authentication servers fail. The password authentication method consults the local user profiles configured at the **[edit system login]** hierarchy level. Users can log in to a router or switch using their local username and password in the following scenarios:

- The password authentication method (password) is explicitly configured as one of the authentication methods in the **[authentication-order authentication-methods]** statement. In this case, the password authentication method is tried if no previous authentication accepts the logon credentials. This is true whether the previous authentication method fails to respond or returns a reject response because of an incorrect username or password.
- The password authentication method is not explicitly configured as one of the authentication methods in the **authentication-order authentication-methods** statement. In this case, the password authentication method is tried only if all configured authentication methods fail to respond. It is not consulted if any configured authentication method returns a reject response because of an incorrect username or password.

### Order of Authentication Attempts

---

[Table 12 on page 169](#) describes how the **authentication-order** statement at the **[edit system]** hierarchy level determines the procedure that the Junos OS uses to authenticate users for access to a router or switch.

Table 12: Order of Authentication Attempts

| Syntax                                           | Order of Authentication Attempts                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**NOTE:** If SSH public keys are configured, SSH user authentication first tries to perform public key authentication before using the authentication methods configured in the authentication-order statement. If you want SSH logins to use the authentication methods configured in the authentication-order statement without first trying to perform public key authentication, do not configure SSH public keys.

In a routing matrix based on a TX Matrix router, the authentication order must be configured only at the configuration groups `re0` and `re1`. The authentication order must not be configured at the `[edit system]` hierarchy. This is because the authentication order for the routing matrix is controlled on the switch-card chassis (or TX Matrix router) or switch-fabric chassis (for TX Matrix Plus router) only.

In Junos OS Release 10.0 and later, the superuser (belonging to the super-user login class) is also authenticated based on the authentication order that is configured for TACACS+, RADIUS, or password authentication using the authentication-order statement. For example, if the only configured authentication order is TACACS+, the superuser can only be authenticated by the TACACS+ server and password authentication cannot be used as an alternative. However, in Junos OS Release 9.6 and earlier, the superuser can use password authentication to login, even if password authentication is not configured explicitly using the authentication-order statement.

## Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and Local Password Authentication

Using the **authentication-order** statement, you can prioritize the order in which the Junos OS tries the different authentication methods when verifying user access to a router or switch. If you do not set the authentication order, by default users are verified based on their configured passwords.

When configuring a password using plain text and relying on Junos OS to encrypt it, you are still sending the password over the internet in plain text. Using pre-encrypted passwords is more secure because it means that the plain text of the password never has to be sent over the internet. Also, with passwords, only one user can be assigned to a password at a time.

On the other hand, both RADIUS and TACACS+ pre-encrypt passwords. Both let you assign a set of users at a time instead of one by one. But here are how these authentication systems differ:

- RADIUS uses UDP, while TACACS+ uses TCP.
- RADIUS encrypts only the password during transmission whereas TACACS+ encrypts the entire session.
- RADIUS combines authentication (device) and authorization (user) whereas TACACS+ separates authentication, authorization, and accountability.

In short, TACACS+ is the more secure of the two. However, RADIUS has better performance and is more interoperable. RADIUS is widely supported, whereas TACACS+ is a Cisco proprietary product and not widely supported outside of Cisco.

You can configure the authentication order based on your system, its restrictions, and your IT policy and operational preferences.

To configure the authentication order, include the **authentication-order** statement at the **[edit system]** hierarchy level:

```
[edit system]  
authentication-order [ authentication-methods ];
```

For a list of hierarchy levels at which you can include this statement, see the statement summary section for this statement.

Following are the possible authentication order entry options:

- **radius**—Verify the user using RADIUS authentication servers.
- **tacplus**—Verify the user using TACACS+ authentication servers.
- **password**—Verify the user using the username and password configured locally by including the authentication statement at the **[edit system login user]** hierarchy level.

If RADIUS and/or TACACS+ servers are configured in the authentication order but there is no response from them to a request, the Junos OS always defaults to trying local password authentication as a last resort. If the authentication order is set to **authentication-order password**, that will be the only authentication method attempted.

**NOTE:** It is not possible and would make no sense to try to configure local password authentication ahead of RADIUS or TACACS+ in the order because “no response” cannot happen. A local authentication request will always either be accepted or rejected.

The handling of a rejected authentication request when RADIUS or TACACS+ are present is more complicated.

- If **password** (local password authentication) is *not* in the authentication order, a RADIUS and/or TACACS+ rejection ends with the rejection.
- If **password** is included at the end of the authentication order and RADIUS and/or TACACS+ rejects the authentication, the Junos OS tries for a local authentication check.

In other words, including **password** as a final authentication order option is a means by which you can choose whether a RADIUS and/or TACACS+ rejection ends there or if the request is to be given one last chance for authentication locally.

For more details, see [“Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication” on page 167](#).

The CHAP authentication sequence cannot take more than 30 seconds. If it takes longer to authenticate a client, the authentication is abandoned and a new sequence is initiated.

For example, if you configure three RADIUS servers so that the router or switch attempts to contact each server three times, and with each retry the server times out after 3 seconds, then the maximum time given to the RADIUS authentication method before CHAP considers it a failure is 27 seconds. If you add more RADIUS servers to this configuration, they might not be contacted because the authentication process might be abandoned before these servers are tried.

The Junos OS enforces a limit on the number of standing authentication server requests that the CHAP authentication can have at one time. Thus, an authentication server method—RADIUS, for example—might fail to authenticate a client when this limit is exceeded. If it fails, the authentication sequence is reinitiated by the router or switch until authentication succeeds and the link is brought up. However, if the RADIUS servers are

not available and if additional authentication methods such as **tacplus** or **password** are configured along with **radius**, the next authentication method is tried.

The following example shows how to configure **radius** and **password** authentication:

```
[edit system]
user@switch# authentication-order [ radius password ];
```

The following example shows how to delete the **radius** statement from the authentication order:

```
[edit system]
user@switch# delete authentication-order radius
```

The following example shows how to insert the **tacplus** statement after the **radius** statement:

```
[edit system]
user@switch# insert authentication-order tacplus after radius
```

  - [authentication-order on page 788](#)

## Example: Configuring Authentication Order

This example shows how to configure authentication order.

- [Requirements on page 175](#)
- [Overview on page 175](#)
- [Configuration on page 176](#)
- [Verification on page 177](#)

### Requirements

Before you begin, perform the initial device configuration. See the Getting Started Guide for your device.

### Overview

You can configure the authentication methods that the device uses to verify that a user can gain access. For each login attempt, the device tries the authentication methods in order, starting with the first one, until the password matches. If you do not configure system authentication, users are verified based on their configured local passwords.

This example configures the device to attempt user authentication with the local password first, then with the RADIUS server, and finally with the TACACS+ server.

When you use local password authentication, you must create a local user account for every user who wants to access the system. However, when you are using RADIUS or

TACACS+ authentication, you can create single accounts (for authorization purposes) that are shared by a set of users. You create these accounts using the remote and local user template accounts. When a user is using a template account, the command-line interface (CLI) username is the login name; however, the privileges, file ownership, and effective user ID are inherited from the template account.

### Configuration

---

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
insert system authentication-order radius after password
insert system authentication-order tacplus after radius
```

#### GUI Step-by-Step Procedure

To configure authentication order:

1. In the J-Web user interface, select **Configure>System Properties>User Management**.
2. Click **Edit**. The Edit User Management dialog box appears.
3. Select the **Authentication Method and Order** tab.
4. Under Available Methods, select the authentication method the device should use to authenticate users, and use the arrow button to move the item to the Selected Methods list. Available methods include:
  - RADIUS
  - TACACS+
  - Local Password

If you want to use multiple methods to authenticate users, repeat this step to add the additional methods to the Selected Methods list.
5. Under Selected Methods, use the Up Arrow and Down Arrow to specify the order in which the device should execute the authentication methods.
6. Click **OK** to check your configuration and save it as a candidate configuration.
7. If you are done configuring the device, click **Commit Options>Commit**.

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure authentication order:

1. Add RADIUS authentication to the authentication order.

```
[edit]
user@host# insert system authentication-order radius after password
```

2. Add TACACS+ authentication to the authentication order.

```
[edit]
user@host# insert system authentication-order tacplus after radius
```

**Results** From configuration mode, confirm your configuration by entering the **show system authentication-order** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show system authentication-order
authentication-order [password, radius, tacplus];
```

If you are done configuring the device, enter **commit** from configuration mode.

**NOTE:** To completely set up RADIUS or TACACS+ authentication, you must configure at least one RADIUS or TACACS+ server and create user template accounts. Do one of the following tasks:

- Configure a RADIUS server. See [“Example: Configuring a RADIUS Server for System Authentication” on page 186](#).
- Configure a TACACS+ server. See [“Example: Configuring a TACACS+ Server for System Authentication” on page 205](#).
- Configure a user. See [“Example: Configuring New Users” on page 68](#).
- Configure template accounts. See [“Example: Creating Template Accounts” on page 163](#).

## Verification

Confirm that the configuration is working properly.

### Verifying the Authentication Order Configuration

**Purpose** Verify that the authentication order has been configured.

**Action** From operational mode, enter the **show system authentication-order** command.

- See Also**
- [Junos OS User Accounts Overview on page 65](#)
  - [Junos OS User Authentication Methods on page 159](#)

### Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication

The following example shows how to configure system authentication for RADIUS, TACACS+, and password authentication.

In this example, only the user Philip and users authenticated by a remote RADIUS server can log in. If a user logs in and is not authenticated by the RADIUS server, the user is denied access to the router or switch. If the RADIUS server is not available, the user is authenticated using the **password** authentication method and allowed access to the router or switch. For more information about the password authentication method, see [“Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication” on page 167](#).

When Philip tries to log in to the system, if the RADIUS server authenticates him, he is given access and privileges for the **super-user** class. Local accounts are not configured for other users. When they log in to the system and the RADIUS server authenticates them, they are given access using the same user ID (UID) 9999 and the privileges associated with the **operator** class.

```
[edit]
system {
  authentication-order radius;
  login {
    user philip {
      full-name "Philip";
      uid 1001;
      class super-user;
    }
    user remote {
      full-name "All remote users";
      uid 9999;
      class operator;
    }
  }
}
```

**NOTE:** For authorization purposes, you can use a template account to create a single account that can be shared by a set of users at the same time. For example, when you create a remote template account, a set of remote users can concurrently share a single UID. For more information about template accounts, see [“Example: Configuring Authentication Order” on page 175](#).

When a user logs in to a device, the user's login name is used by the RADIUS or TACACS+ server for authentication. If the user is authenticated successfully by the authentication server and the user is not configured at the **[edit system login user]** hierarchy level, the device uses the default remote template user account for the user, provided a remote template account is configured at the **edit system login user remote** hierarchy level. The remote template account serves as a default template user account for all users that are authenticated by the authentication server but not having a locally configured user account on the device. Such users share the same login class and UID.

To configure an alternate template user, specify the **user-name** parameter returned in the RADIUS authentication response packet. Not all RADIUS servers allow you to change this parameter. The following shows a sample Junos OS configuration:

```
[edit]
system {
  authentication-order radius;
  login {
    user philip {
      full-name "Philip";
      uid 1001;
      class super-user;
    }
    user operator {
      full-name "All operators";
      uid 9990;
      class operator;
    }
    user remote {
      full-name "All remote users";
      uid 9999;
      class read-only;
    }
  }
}
```

Assume your RADIUS server is configured with the following information:

- User Philip with password “olympia”
- User Alexander with password “bucephalus” and username “operator”
- User Darius with password “redhead” and username “operator”
- User Roxane with password “athena”

Philip would be given access as a superuser (**super-user**) because he has his own local user account. Alexander and Darius share UID 9990 and have access as operators. Roxane has no template-user override, so she shares access with all the other remote users, getting read-only access.

## RADIUS Authentication

The Junos OS supports RADIUS for central authentication of users on multiple routers or switches or security devices. To use RADIUS authentication on the device, you must configure information about one or more RADIUS servers on the network. You can also configure RADIUS accounting on the device to collect statistical data about the users logging in to or out from a LAN and sending the data to a RADIUS accounting server. For more information, read this topic.

- [Configuring RADIUS Server Authentication on page 180](#)
- [Example: Configuring a RADIUS Server for System Authentication on page 186](#)
- [Example: Configuring RADIUS Authentication on page 188](#)
- [Configuring RADIUS Authentication \(QFX Series or OCX Series\) on page 190](#)
- [Juniper Networks Vendor-Specific RADIUS Attributes on page 192](#)
- [Juniper-Switching-Filter VSA Match Conditions and Actions on page 195](#)
- [Understanding RADIUS Accounting on page 197](#)
- [Configuring RADIUS System Accounting on page 198](#)

### Configuring RADIUS Server Authentication

RADIUS authentication is a method of authenticating users who attempt to access the router or switch.

- [Why Use RADIUS on page 180](#)
- [Configuring RADIUS Server Details on page 181](#)
- [Configuring RADIUS To Use the Management Instance on page 185](#)

---

#### Why Use RADIUS

The Junos OS supports two protocols for central authentication of users on multiple routers: RADIUS and TACACS+. We recommend RADIUS because it is a multivendor IETF standard, and its features are more widely accepted than those of TACACS+ or other proprietary systems. In addition, we recommend using a one-time-password system for increased security, and all vendors of these systems support RADIUS.

You should use RADIUS when your priorities are interoperability and performance:

- **Interoperability**—RADIUS is more interoperable than TACACS+, primarily because of the proprietary nature of TACACS+. While TACACS+ supports more protocols, RADIUS is universally supported.
- **Performance**—RADIUS is much lighter on your routers and switches and for this reason, network engineers generally prefer RADIUS over TACACS+.

### Configuring RADIUS Server Details

---

To use RADIUS authentication on the device, configure information about one or more RADIUS servers on the network by including one **radius-server** statement at the **[edit system]** hierarchy level for each RADIUS server.

Because remote authentication is configured on multiple devices, it is commonly configured inside of a configuration group. As such, the steps shown here are in a configuration group called **global**. Using a configuration group is optional.

.....  
**NOTE:** The **remote** statement must always be lowercase.  
.....  
.....

.....  
**NOTE:** This feature is supported on SRX1500, SRX5400, SRX5600, and SRX5800 devices.  
.....  
.....

To configure authentication by a RADIUS server:

1. Add an IPv4 or IPv6 server address.

- Configure an IPv4 source-address and server-address:

```
[edit groups global]
user@host# set system radius-server server-address source-address source-address
```

For example:

```
[edit groups global]
user@host# set system radius-server 192.168.17.28 source-address 192.168.17.1
```

- Configure an IPv6 source-address and server address:

```
[edit groups global system radius-server server-address]
user@host# set server-address secret "secretkey" source-address-inet6
source-address
```

For example:

```
[edit groups global system radius-server ::17.22.22.162]
user@host# set secret $9$IPOv87ZGiH.5JGn/AtOB7-dVgo source-address-inet6
::17.22.22.1
```

Source address is a valid IPv4 or IPv6 address configured on one of the router or switch interfaces. This sets a fixed address as the source address for locally generated IP packets.

Server address is a unique IPv4 or IPv6 address that is assigned to a particular server and used to route information to the server. If the Junos OS device has several interfaces that can reach the RADIUS server, assign an IP address that Junos OS can use for all its communication with the RADIUS server.

2. Include a shared secret password.

You must specify a password in the **secret password** statement. If the password contains spaces, enclose it in quotation marks. The secret password used by the local router or switch must match that used by the server. The secret password configures the password that the Junos OS device uses to access the RADIUS server.

```
[edit groups global system radius-server server-address]
user@host# set secret password
```

For example:

```
[edit groups global system radius-server 192.168.69.162]
user@host# set secret $9$gQ4UHf5F36CiH.5Tz9CuO1hreM8xw2oIENVwgZG
```

3. If necessary, specify a port on which to contact the RADIUS server.

By default, port number 1812 is used (as specified in RFC 2865).

**NOTE:** You can also specify an accounting port to send accounting packets with the **accounting-port** statement. The default is 1813 (as specified in RFC 2866).

```
[edit groups global system radius-server server-address]
user@host# set port port-number
```

For example:

```
[edit groups global system radius-server 192.168.69.162]
user@host# set port 1845
```

#### 4. Specify the order in which Junos OS attempts authentication.

You must include the **authentication-order** statement in your remote authentication configuration.

The example assumes your network includes both RADIUS and TACACS+ servers. In this example, whenever a user attempts to log in, Junos OS begins by querying the RADIUS server for authentication. If it fails, it next attempts authentication with locally configured user accounts. Finally the TACACS+ server is tried.

```
[edit groups global system]
user@host# set authentication-order [ authentication-methods ]
```

For example:

```
[edit groups global system]
user@host# set authentication-order [ radius password tacplus ]
```

#### 5. Assign a login class to RADIUS-authenticated users.

You can assign different user templates and login classes to RADIUS-authenticated users. This allows RADIUS-authenticated users to be granted different administrative permissions on the Junos OS device. By default, RADIUS-authenticated users use the **remote** user template and are assigned to the associated class, which is specified in the **remote** user template, if the **remote** user template is configured. The username **remote** is a special case in Junos OS. It acts as a template for users who are authenticated by a remote server, but do not have a locally configured user account on the device. In this method, Junos OS applies the permissions of the remote template to those authenticated users without a locally defined account. All users mapped to the remote template are of the same login class.

In the Junos OS configuration, a user template is configured in the same way as a regular local user account, except that no local authentication password is configured because the authentication is remotely performed on the RADIUS server.

- To use the same permissions for all RADIUS-authenticated users:

```
[edit groups global system login]
user@host# set user remote class class
```

For example:

```
[edit groups global system login]
user@host# set user remote class super-user
```

- To have different login classes be used for different RADIUS-authenticated users, granting them different permissions:

- a. Create multiple user templates in the Junos OS configuration.

Every user template can be assigned a different login class.

For example:

```
[edit groups global system login]
set user RO class read-only
set user OP class operator
set user SU class super-user
set user remote full-name "default remote access user template"
set user remote class read-only
```

- b. Have the RADIUS server specify the name of the user template to be applied to the authenticated user.

For a RADIUS server to indicate which user template is to be applied, it needs to include the Juniper-Local-User-Name attribute (Vendor 2636, type 1, string) Juniper VSA (vendor-specific attribute) in the RADIUS Access-Accept message. The string value in the Juniper-Local-User-Name must correspond to the name of a configured user template on the device. For a list of relevant Juniper RADIUS VSAs, see "[Juniper Networks Vendor-Specific RADIUS Attributes](#)" on page 192.

If the Juniper-Local-User-Name is not included in the Access-Accept message or the string contains a user template name that does not exist on the device, the user is assigned to the **remote** user template, if configured. If it is not configured, authentication fails for the user.

After logging in, the remotely authenticated user retains the same username that was used to log in. However, the user inherits the user class from the assigned user template.

In a RADIUS server, users can be assigned a Juniper-Local-User-Name string, which indicates the user template to be used in the Junos OS device. From the previous example, the string would be RO, OP, or SU.

Configuration of the RADIUS server depends on the server being used. For information on using FreeRADIUS, see

<https://kb.juniper.net/InfoCenter/index?page=content&id=KB19446>.

### Configuring RADIUS To Use the Management Instance

By default, Junos OS routes authentication, authorization, and accounting packets for RADIUS through the default routing instance. Starting in Junos OS Release 18.1R1, existing RADIUS behavior is enhanced to support a management interface in a non-default VRF instance.

When the **routing-instance mgmt\_junos** option is configured in both the **radius-server server-address** and the **radius server server-ip-address** statements, provided the **management-instance** statement is also configured, RADIUS packets are routed through the management instance **mgmt\_junos**.

```
[edit system]
radius-server server-address {
  accounting-port port-number;
  port number;
  retry number;
  routing-instance routing-instance-name; #use "mgmt_junos" for RI name
  secret password;
  source-address source-address;
  timeout seconds;
}
```

```
[edit system accounting destination radius]
server {
  server-address {
    accounting-port port-number;
    retry number;
    routing-instance routing-instance; #use "mgmt_junos" for RI name
    secret password;
    source-address address;
    timeout seconds;
  }
}
```

**NOTE:** The **routing-instance mgmt\_junos** option must be configured in both the **radius-server** and the **radius server** statements. If not, even if the **management-instance** statement is set, RADIUS packets will still be sent using the default routing instance only.

For more details on this management instance, see *management-instance*.

- See Also**
- [Juniper Networks Vendor-Specific RADIUS Attributes on page 192](#)
  - [Configuring RADIUS System Accounting on page 198](#)
  - [Example: Configuring RADIUS Authentication on page 188](#)

## Example: Configuring a RADIUS Server for System Authentication

This example shows how to configure a RADIUS server for system authentication.

- [Requirements on page 186](#)
- [Overview on page 186](#)
- [Configuration on page 186](#)
- [Verification on page 188](#)

---

### Requirements

Before you begin:

- Perform the initial device configuration. See the Getting Started Guide for your device.
- Configure at least one RADIUS server. For more details, see [RADIUS Authentication and Accounting Servers Configuration Overview](#).

---

### Overview

In this example, you add a new RADIUS server with an IP address of 172.16.98.1 and specify the shared secret password of the RADIUS server as Radiussecret1. The secret is stored as an encrypted value in the configuration database. Finally, you specify the source address to be included in the RADIUS server requests by the device. In most cases you can use the loopback address of the device, which in this example is 10.0.0.1.

---

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set system radius-server address 172.16.98.1
set system radius-server 172.16.98.1 secret Radiussecret1
set system radius-server 172.16.98.1 source-address 10.0.0.1
```

#### GUI Step-by-Step Procedure

To configure a RADIUS server for system authentication:

1. In the J-Web user interface, select **Configure>System Properties>User Management**.
2. Click **Edit**. The Edit User Management dialog box appears.
3. Select the **Authentication Method and Order** tab.
4. In the RADIUS section, click **Add**. The Add Radius Server dialog box appears.
5. In the IP Address box, type the server's 32-bit IP address.

6. In the Password and Confirm Password boxes, type the secret password for the server and verify your entry.
7. In the Server Port box, type the appropriate port.
8. In the Source Address box, type the source IP address of the server.
9. In the Retry Attempts box, specify the number of times that the server should try to verify the user's credentials.
10. In the Time Out box, specify the amount of time (in seconds) the device should wait for a response from the server.
11. Click **OK** to check your configuration and save it as a candidate configuration.
12. If you are done configuring the device, click **Commit Options>Commit**.

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a RADIUS server for system authentication:

1. Add a new RADIUS server and set its IP address.

```
[edit system]
user@host# set radius-server address 172.16.98.1
```

2. Specify the shared secret (password) of the RADIUS server.

```
[edit system]
user@host# set radius-server 172.16.98.1 secret Radiussecret1
```

3. Specify the device's loopback address source address.

```
[edit system]
user@host# set radius-server 172.16.98.1 source-address 10.0.0.1
```

**Results** From configuration mode, confirm your configuration by entering the **show system radius-server** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show system radius-server
```

```
radius-server 172.16.98.1 {  
    secret Radiussecret1;  
    source-address 10.0.0.1;  
}
```

If you are done configuring the device, enter **commit** from configuration mode.

**NOTE:** To completely set up RADIUS authentication, you must create user template accounts and specify a system authentication order. Do one of the following tasks:

- Configure a system authentication order. See [“Example: Configuring Authentication Order” on page 175](#).
- Configure a user. See [“Example: Configuring New Users” on page 68](#).
- Configure local user template accounts. See [“Example: Creating Template Accounts” on page 163](#).

---

### Verification

Confirm that the configuration is working properly.

#### *Verifying the RADIUS Server System Authentication Configuration*

**Purpose** Verify that the RADIUS server has been configured for system authentication.

**Action** From operational mode, enter the **show system radius-server** command.

**See Also**

- [Junos OS User Authentication Methods on page 159](#)
- [Junos OS User Accounts Overview on page 65](#)
- [Configuring Local User Template Accounts for User Authentication on page 160](#)
- [Example: Configuring a TACACS+ Server for System Authentication on page 205](#)

### Example: Configuring RADIUS Authentication

The Junos OS supports two protocols for central authentication of users on multiple routers: RADIUS and TACACS+. We recommend RADIUS because it is a multivendor IETF standard, and its features are more widely accepted than those of TACACS+ or other proprietary systems. In addition, we recommend using a one-time-password system for increased security, and all vendors of these systems support RADIUS.

The Junos OS uses one or more template accounts to perform user authentication. You create the template account or accounts, and then configure the user access to use that account. If the RADIUS server is unavailable, the fallback is for the login process to use the local account that set up on the router or switch.

The following example shows how to configure RADIUS authentication:

```
[edit]
system {
  authentication-order [ radius password ];
  root-authentication {
    encrypted-password "$ABC123; # SECRET-DATA
  }
  name-server {
    10.1.1.1;
    10.1.1.2;
  }
}
```

The following example shows how to enable RADIUS authentication and define the shared secret between the client and the server. The secret enables the client and server to determine that they are talking to the trusted peer.

Define a timeout value for each server, so that if there is no response within the specified number of seconds, the router can try either the next server or the next authentication mechanism.

```
[edit]
system {
  radius-server {
    10.1.2.1 {
      secret "$ABC123"; # SECRET-DATA
      timeout 5;
    }
    10.1.2.2 {
      secret "$ABC123"; # SECRET-DATA
      timeout 5;
    }
  }
}
```

The following example shows how to configure RADIUS template accounts for different users or groups of users:

```
[edit]
system {
  login {
    user observation {
      uid 1001;
      class observation;
    }
    user operation {
      uid 1002;
      class operation;
    }
    user engineering {
      uid 1003;
      class engineering;
    }
  }
}
```

```

    }
  }
}

```

## Configuring RADIUS Authentication (QFX Series or OCX Series)

RADIUS authentication is a method of authenticating users who attempt to access the router or switch. Tasks to configure RADIUS authentication are:

**NOTE:** The `source-address` statement is not supported at the `[edit system radius-options]` or `[edit system-radius-server name]` hierarchies on the QFabric system.

- [Configuring RADIUS Server Details on page 190](#)
- [Configuring MS-CHAPv2 for Password-Change Support on page 191](#)
- [Specifying a Source Address for the Junos OS to Access External RADIUS Servers on page 192](#)

### Configuring RADIUS Server Details

To use RADIUS authentication on the router or switch, configure information about one or more RADIUS servers on the network by including one **radius-server** statement at the `[edit system]` hierarchy level for each RADIUS server:

```

[edit system]
radius-server server-address {
  accounting-port port-number;
  port number;
  retry number;
  secret password;
  source-address source-address;
  timeout seconds;
}

```

**server-address** is the address of the RADIUS server.

You can specify a port on which to contact the RADIUS server. By default, port number **1812** is used (as specified in RFC 2865). You can also specify an accounting port to send accounting packets. The default is **1813** (as specified in RFC 2866).

You must specify a password in the **secret password** statement. If the password contains spaces, enclose it in quotation marks. The secret used by the local router or switch must match that used by the server.

Optionally, you can specify the amount of time that the local router or switch waits to receive a response from a RADIUS server (in the **timeout** statement) and the number of times that the router or switch attempts to contact a RADIUS authentication server (in the **retry** statement). By default, the router or switch waits 3 seconds. You can configure this to be a value from 1 through 90 seconds. By default, the router or switch retries

connecting to the server three times. You can configure this to be a value from 1 through 10 times.

You can use the **source-address** statement to specify a logical address for individual or multiple RADIUS servers.

To configure multiple RADIUS servers, include multiple **radius-server** statements.

To configure a set of users that share a single account for authorization purposes, you create a template user. To do this, include the **user** statement at the **[edit system login]** hierarchy level, as described in [“Example: Configuring Authentication Order” on page 175](#).

You can also configure RADIUS authentication at the **[edit access]** and **[edit access profile]** hierarchy level. Junos OS uses the following search order to determine which set of servers are used for authentication:

1. **[edit access profile profile-name radius-server server-address]**
2. **[edit access radius-server server-address]**
3. **[edit system radius-server server-address]**

### Configuring MS-CHAPv2 for Password-Change Support

You can configure the Microsoft implementation of the Challenge Handshake Authentication Protocol version 2 (MS-CHAPv2) on the router or switch to support changing of passwords. This feature provides users accessing a router or switch the option of changing the password when the password expires, is reset, or is configured to be changed at the next login.

Before you configure MS-CHAPv2 for password-change support, ensure that you:

- Configure the RADIUS server authentication parameters
- Set the **authentication-order** to use the RADIUS server for the initial password attempt

To configure MS-CHAP-v2, include the following statements at the **[edit system radius-options]** hierarchy level:

```
[edit system radius-options]
password-protocol mschap-v2;
```

The following example shows statements for configuring the MS-CHAPv2 password protocol, password authentication order, and user accounts:

```
[edit]
system {
  authentication-order [ radius password ];
  radius-server {
    192.168.69.149 secret "$ABC123"; ## SECRET-DATA
  }
  radius-options {
    password-protocol mschap-v2;
```

```
    }
    login {
      user bob {
        class operator;
      }
    }
  }
}
```

**Specifying a Source Address for the Junos OS to Access External RADIUS Servers**

You can specify which source address Junos OS uses when accessing your network to contact an external RADIUS server for authentication. You can also specify which source address Junos OS uses when contacting a RADIUS server for sending accounting information.

To specify a source address for a RADIUS server, include the **source-address** statement at the **[edit system radius-server server-address]** hierarchy level:

```
[edit system radius-server server-address]
source-address source-address;
```

**source-address** is a valid IP address configured on one of the router or switch interfaces.

**Juniper Networks Vendor-Specific RADIUS Attributes**

Junos OS supports the configuration of Juniper Networks RADIUS vendor-specific attributes (VSAs). These VSAs are encapsulated in a RADIUS vendor-specific attribute with the vendor ID set to the Juniper Networks ID number, 2636. [Table 13 on page 192](#) lists the Juniper Networks VSAs you can configure.

*Table 13: Juniper Networks Vendor-Specific RADIUS Attributes*

| Name                    | Description                                                                                                                                  | Type | Length | String                                                    |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|------|--------|-----------------------------------------------------------|
| Juniper-Local-User-Name | Indicates the name of the user template used by this user when logging in to a device. This attribute is used only in Access-Accept packets. | 1    | ≥3     | One or more octets containing printable ASCII characters. |

Table 13: Juniper Networks Vendor-Specific RADIUS Attributes (continued)

| Name                        | Description                                                                                                                                                                                                                              | Type | Length | String                                                                                                                                                                                                                                                                |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Juniper-Allow-Commands      | Contains an extended regular expression that enables the user to run operational mode commands in addition to the commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.   | 2    | ≥3     | One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">"Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands, Configuration Statements, and Hierarchies"</a> on page 97. |
| Juniper-Deny-Commands       | Contains an extended regular expression that denies the user permission to run operation mode commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.                       | 3    | ≥3     | One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">"Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands, Configuration Statements, and Hierarchies"</a> on page 97. |
| Juniper-Allow-Configuration | Contains an extended regular expression that enables the user to run configuration mode commands in addition to the commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets. | 4    | ≥3     | One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">"Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands, Configuration Statements, and Hierarchies"</a> on page 97. |
| Juniper-Deny-Configuration  | Contains an extended regular expression that denies the user permission to run configuration commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.                        | 5    | ≥3     | One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">"Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands, Configuration Statements, and Hierarchies"</a> on page 97. |

Table 13: Juniper Networks Vendor-Specific RADIUS Attributes (continued)

| Name                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Type | Length | String                                                                                                                                                                                                                                                               |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Juniper-Interactive-Command  | Indicates the interactive command entered by the user. This attribute is used only in Accounting-Request packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 8    | ≥3     | One or more octets containing printable ASCII characters.                                                                                                                                                                                                            |
| Juniper-Configuration-Change | Indicates the interactive command that results in a configuration (database) change. This attribute is used only in Accounting-Request packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 9    | ≥3     | One or more octets containing printable ASCII characters.                                                                                                                                                                                                            |
| Juniper-User-Permissions     | <p>Contains information the server uses to specify user permissions. This attribute is used only in Access-Accept packets.</p> <p><b>NOTE:</b> When the <b>Juniper-User-Permissions</b> attribute is configured to grant the Junos OS <b>maintenance</b> or <b>all</b> permissions on a RADIUS server, the UNIX wheel group membership is not automatically added to a user's list of group memberships. Some operations such as running the <b>su root</b> command from a local shell require wheel group membership permissions. However, when a user is configured locally with the permissions <b>maintenance</b> or <b>all</b>, the user is automatically granted membership to the UNIX wheel group. Therefore, we recommend that you create a template user account with the required permissions and associate individual user accounts with the template user account.</p> | 10   | ≥3     | <p>One or more octets containing printable ASCII characters.</p> <p>The string is a list of permission flags separated by a space. The exact name of each flag must be specified in its entirety. See <a href="#">"Login Class Permission Flags" on page 89</a>.</p> |
| Juniper-Authentication-Type  | Indicates the authentication method (local database, or RADIUS server) used to authenticate a user. If the user is authenticated using a local database, the attribute value shows 'local'. If the user is authenticated using RADIUS server, the attribute value shows 'remote'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 11   | ≥5     | One or more octets containing printable ASCII characters.                                                                                                                                                                                                            |

Table 13: Juniper Networks Vendor-Specific RADIUS Attributes (continued)

| Name                 | Description                                                  | Type | Length          | String  |
|----------------------|--------------------------------------------------------------|------|-----------------|---------|
| Juniper-Session-Port | Indicates the source port number of the established session. | 12   | size of integer | Integer |

For more information about the VSAs, see RFC 2138, *Remote Authentication Dial In User Service (RADIUS)*.

## Juniper-Switching-Filter VSA Match Conditions and Actions

Devices support the configuration of RADIUS server attributes specific to Juniper Networks. These attributes are known as vendor-specific attributes (VSAs) and are described in RFC 2138, *Remote Authentication Dial In User Service (RADIUS)*.

Through VSAs, you can configure port-filtering attributes on the RADIUS server. VSAs are cleartext fields sent from the RADIUS server to the device as a result of authentication success or failure. Authentication prevents unauthorized user access by blocking a supplicant at the port until the device is authenticated by the RADIUS server. The VSA attributes are interpreted by the device during authentication, and the device takes appropriate actions. Implementing port-filtering attributes with authentication on the RADIUS server provides a central location for controlling LAN access for supplicants.

These port-filtering attributes specific to Juniper Networks are encapsulated in a RADIUS server VSA with the vendor ID set to the Juniper Networks ID number, 2636.

As well as configuring port-filtering attributes through VSAs, you can apply a port firewall filter that has already been configured on the device directly to the RADIUS server. Like port-filtering attributes, the filter is applied during the authentication process, and its actions are applied at the device port. Adding a port firewall filter to a RADIUS server eliminates the need to add the filter to multiple ports and devices.

The Juniper-Switching-Filter VSA works in conjunction with 802.1X authentication to centrally control access of supplicants to the network. You can use this VSA to configure filters on the RADIUS server, which are sent to the switch and applied to users that have been authenticated using 802.1X authentication.

The Juniper-Switching-Filter VSA can contain one or more filter terms. Filter terms are configured using one or more *match conditions* with a resulting *action*. Match conditions are the criteria that a packet must meet for a configured action to be applied on it. The action is the action that the switch takes if a packet meets the criteria in the match conditions. The action that the switch can take is either accept or deny a packet.

The following guidelines apply when you specify match conditions and actions for VSAs:

- Both **match** and **action** statements are mandatory.
- If no match condition is specified, any packet is considered a match by default.
- If no action is specified, the default action is to deny the packet.
- Any or all options can be included in each **match** and **action** statement.

- The AND operation is performed on fields that are of a different type, which are separated by commas. Fields of the same type cannot be repeated.
- For the **forwarding-class** option to be applied, the forwarding class must be configured on the switch. If the forwarding class is not configured on the switch, this option is ignored.

[Table 14 on page 196](#) describes the match conditions that you can specify when you configure a VSA attribute as a firewall filter by using the **match** command on the RADIUS server. The string that defines a match condition is called a *match statement*.

**Table 14: Match Conditions**

| Option                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>destination-ip</b> <i>ip-address</i>   | Address of the final destination node.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>ip-protocol</b> <i>protocol-id</i>     | IPv4 protocol value. In place of the numeric value, you can specify one of the following text synonyms:<br><br><b>ah</b> , <b>egp</b> (8), <b>esp</b> (50), <b>gre</b> (47), <b>icmp</b> (1), <b>igmp</b> (2), <b>ipip</b> (4), <b>ipv6</b> (41), <b>ospf</b> (89), <b>pim</b> (103), <b>rsvp</b> (46), <b>tcp</b> (6), or <b>udp</b> (17)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>source-port</b> <i>port</i>            | TCP or User Datagram Protocol (UDP) source port field. Normally, you specify this match statement in conjunction with the <b>ip-protocol</b> match statement to determine which protocol is being used on the port. In place of the numeric field, you can specify one of the text options listed under <b>destination-port</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>destination-port</b> <i>port</i>       | TCP or UDP destination port field. Normally, you specify this match statement in conjunction with the <b>ip-protocol</b> match statement to determine which protocol is being used on the port. In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed):<br><br><b>afs</b> (1483), <b>bgp</b> (179), <b>biff</b> (512), <b>bootpc</b> (68), <b>bootps</b> (67), <b>cvspserver</b> (2401), <b>cmd</b> (514), <b>dhcp</b> (67), <b>domain</b> (53), <b>eklogin</b> (2105), <b>ekshell</b> (2106), <b>exec</b> (512), <b>finger</b> (79), <b>ftp</b> (21), <b>ftp-data</b> (20), <b>http</b> (80), <b>https</b> (443), <b>ident</b> (113), <b>imap</b> (143), <b>kerberos-sec</b> (88), <b>klogin</b> (543), <b>kpasswd</b> (761), <b>krb-prop</b> (754), <b>krbupdate</b> (760), <b>kshell</b> (544), <b>ldap</b> (389), <b>login</b> (513), <b>mobileip-agent</b> (434), <b>mobilip-mn</b> (435), <b>msdp</b> (639), <b>netbios-dgm</b> (138), <b>netbios-ns</b> (137), <b>netbios-ssn</b> (139), <b>nfsd</b> (2049), <b>nntp</b> (119), <b>ntalk</b> (518), <b>ntp</b> (123), <b>pop3</b> (110), <b>pptp</b> (1723), <b>printer</b> (515), <b>radacct</b> (1813), <b>radius</b> (1812), <b>rip</b> (520), <b>rkinit</b> (2108), <b>smtp</b> (25), <b>snmp</b> (161), <b>snmptrap</b> (162), <b>snpp</b> (444), <b>socks</b> (1080), <b>ssh</b> (22), <b>sunrpc</b> (111), <b>syslog</b> (514), <b>telnet</b> (23), <b>tacacs-ds</b> (65), <b>talk</b> (517), <b>tftp</b> (69), <b>timed</b> (525), <b>who</b> (513), <b>xdmcp</b> (177), <b>zephyr-clt</b> (2103), <b>zephyr-hm</b> (2104) |

When you define one or more terms that specify the filtering criteria, you also define the action to take if the packet matches all criteria. [Table 15 on page 197](#) shows the actions that you can specify in a term.

Table 15: Actions for VSAs

| Option                                   | Description                                                                                                                                                                                                                         |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (allow   deny)                           | Accept a packet or discard a packet silently without sending an Internet Control Message Protocol (ICMP) message.                                                                                                                   |
| forwarding-class <i>class-of-service</i> | (Optional) Classify the packet in one of the following forwarding classes: <ul style="list-style-type: none"> <li>• assured-forwarding</li> <li>• best-effort</li> <li>• expedited-forwarding</li> <li>• network-control</li> </ul> |
| loss-priority (low   medium   high)      | (Optional) Set the packet loss priority (PLP) to <b>low</b> , <b>medium</b> , or <b>high</b> . Specify both the forwarding class and the loss priority.                                                                             |

## Understanding RADIUS Accounting

Devices support IETF RFC 2866, *RADIUS Accounting*. Configuring RADIUS accounting on the device supports collecting statistical data about users logging in to or out from a LAN and sending the data to a RADIUS accounting server. The statistical data gathered can be used for general network monitoring, analyzing and tracking usage patterns, or billing a user based upon the amount of time or type of services accessed.

To configure RADIUS accounting, specify one or more RADIUS accounting servers to receive the statistical data from the device, and select the type of accounting data to be collected.

The RADIUS accounting server you specify can be the same server used for RADIUS authentication, or it can be a separate RADIUS server. You can specify a list of RADIUS accounting servers. If the primary server (the first one configured) is unavailable, each RADIUS server in the list is tried in the order in which they are configured in the Junos OS.

The RADIUS accounting process between the device and a RADIUS server works like this:

1. A RADIUS accounting server listens for User Datagram Protocol (UDP) packets on a specific port. For example, on FreeRADIUS, the default port is 1813.
2. The device forwards an *accounting-request* packet containing an event record to the accounting server. The event record associated with this supplicant contains an *Acct-Status-Type* attribute whose value indicates the beginning of user service for this supplicant. When the supplicant's session ends, the accounting request contains an *Acct-Status-Type* attribute value indicating the end of user service. The RADIUS accounting server records this as a stop-accounting record containing session information and the length of the session.

3. The RADIUS accounting server logs these events in a file as start-accounting or stop-accounting records. On FreeRADIUS, the filename is the server's address; for example, 192.0.2.0.
4. The accounting server sends an *accounting-response* packet back to the device confirming it has received the accounting request.
5. If the device does not receive a response from the server, it continues to send accounting requests until an accounting response is returned from the accounting server.

The statistics collected through this process can be displayed from the RADIUS server; to see those statistics, the user accesses the log file configured to receive them.

## Configuring RADIUS System Accounting

With RADIUS accounting enabled, Juniper Networks routers or switches, acting as RADIUS clients, can notify the RADIUS server about user activities such as software logins, configuration changes, and interactive commands. The framework for RADIUS accounting is described in RFC 2866.

Tasks for configuring RADIUS system accounting are:

1. [Configuring Auditing of User Events on a RADIUS Server on page 198](#)
2. [Specifying RADIUS Server Accounting and Auditing Events on page 199](#)
3. [Configuring RADIUS Server Accounting on page 199](#)

### Configuring Auditing of User Events on a RADIUS Server

---

To audit user events, include the following statements at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
events [ events ];
destination {
  radius {
    server {
      server-address {
        accounting-port port-number;
        retry number;
        routing-instance routing-instance;
        secret password;
        source-address address;
        timeout seconds;
      }
    }
  }
}
```

```
}
```

### Specifying RADIUS Server Accounting and Auditing Events

To specify the events you want to audit when using a RADIUS server for authentication, include the **events** statement at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
events [ events ];
```

**events** is one or more of the following:

- **login**—Audit logins
- **change-log**—Audit configuration changes
- **interactive-commands**—Audit interactive commands (any command-line input)

### Configuring RADIUS Server Accounting

To configure RADIUS server accounting, include the **server** statement at the **[edit system accounting destination radius]** hierarchy level:

```
server {
  server-address {
    accounting-port port-number;
    retry number;
    routing-instance routing-instance;
    secret password;
    source-address address;
    timeout seconds;
  }
}
```

**server-address** specifies the address of the RADIUS server. To configure multiple RADIUS servers, include multiple **server** statements.

**NOTE:** If no RADIUS servers are configured at the **[edit system accounting destination radius]** statement hierarchy level, the Junos OS uses the RADIUS servers configured at the **[edit system radius-server]** hierarchy level.

**accounting-port port-number** specifies the RADIUS server accounting port number.

The default port number is 1813.

**NOTE:** If you enable RADIUS accounting at the **[edit access profile profile-name accounting-order]** hierarchy level, accounting is triggered on the default port of 1813 even if you do not specify a value for the **accounting-port** statement.

**routing-instance** *routing-instance* is the name of the non-default management instance. Use **mgmt\_junos** as the routing-instance name. See *Management Interface in a Nondefault Instance*.

You must specify a secret (password) that the local router or switch passes to the RADIUS client by including the **secret** statement. If the password contains spaces, enclose the entire password in quotation marks (" ").

In the **source-address** statement, specify a source address for the RADIUS server. Each RADIUS request sent to a RADIUS server uses the specified source address. The source address is a valid IPv4 address (in case if radius-server address is IPv4) or IPv6 address (in case if radius-server address is IPv6) configured on one of the router or switch interfaces.

Optionally, you can specify the number of times that the router or switch attempts to contact a RADIUS authentication server by including the **retry** statement. By default, the router or switch retries three times. You can configure the router or switch to retry from 1 through 10 times.

Optionally, you can specify the length of time that the local router or switch waits to receive a response from a RADIUS server by including the **timeout** statement. By default, the router or switch waits 3 seconds. You can configure the timeout to be from 1 through 90 seconds.

Starting with Junos OS Release 14.1 and Junos OS Release 17.3R1, you can configure the **enhanced-accounting** statement to view the attribute values of a logged in user. If you use the **enhanced-accounting** statement at the **[edit system radius-options]** hierarchy level, the RADIUS attributes such as access method, remote port, and access privileges can be audited. You can limit the number of attribute values to be displayed for auditing by using the **enhanced-avs-max <number>** statement at the **[edit system accounting]** hierarchy level.

```
[edit system radius-options]
enhanced-accounting;
```

```
[edit system accounting]
enhanced-avs-max <number>;
```

When a Juniper Networks router or switch is configured with RADIUS accounting, it sends **Accounting-Start** and **Accounting-Stop** messages to the RADIUS server. These messages contain information about user activities such as software logins, configuration changes, and interactive commands. This information is typically used for monitoring a network, collecting usage statistics, and ensuring that users are billed properly.

The following example shows three servers (10.5.5.5, 10.6.6.6, and 10.7.7.7) configured for RADIUS accounting:

```
system {
  accounting {
    events [ login change-log interactive-commands ];
    destination {
```

```

radius {
  server {
    10.5.5.5 {
      accounting-port 3333;
      secret $ABC123;
      source-address 10.1.1.1;
      retry 3;
      timeout 3;
    }
    10.6.6.6 secret $ABC123;
    10.7.7.7 secret $ABC123;
  }
}

```

Release History Table

| Release | Description                                                                                                                                                                   |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 17.4R1  | Starting in Junos OS Release 18.1R1, existing RADIUS behavior is enhanced to support a management interface in a non-default VRF instance.                                    |

## TACACS+ Authentication

The Junos OS supports TACACS+ for central authentication of users on multiple routers or switches or security devices. To use TACACS+ authentication on the device, you must configure information about one or more TACACS+ servers on the network. You can also configure TACACS+ accounting on the device to collect statistical data about the users logging in to or out from a LAN and sending the data to a TACACS+ accounting server. For more information, read this topic.

- [Configuring TACACS+ Authentication on page 202](#)
- [Example: Configuring a TACACS+ Server for System Authentication on page 205](#)
- [Configuring Periodic Refresh of the TACACS+ Authorization Profile on page 208](#)
- [Using Regular Expressions on a RADIUS or TACACS+ Server to Allow or Deny Access to Commands on page 210](#)
- [Juniper Networks Vendor-Specific TACACS+ Attributes on page 212](#)
- [Configuring TACACS+ System Accounting on page 214](#)

## Configuring TACACS+ Authentication

TACACS+ authentication is a method of authenticating users who attempt to access the router or switch.

**NOTE:** Starting with Release 13.3, Junos OS supports IPv6 along with the existing IPv4 support for user authentication using TACACS+ servers.

Tasks to configure TACACS+ configuration are:

- [Configuring TACACS+ Server Details on page 202](#)
- [Configuring TACACS+ to Use the Management Instance on page 203](#)
- [Specifying a Source Address for the Junos OS to Access External TACACS+ Servers on page 204](#)
- [Configuring the Same Authentication Service for Multiple TACACS+ Servers on page 204](#)
- [Configuring Juniper Networks Vendor-Specific TACACS+ Attributes on page 205](#)

---

### Configuring TACACS+ Server Details

To use TACACS+ authentication on the router or switch, configure information about one or more TACACS+ servers on the network by including the **tacplus-server** statement at the **[edit system]** hierarchy level:

```
[edit system]
tacplus-server server-address {
  port port-number;
  routing-instance routing-instance;
  secret password;
  single-connection;
  timeout seconds;
}
```

***server-address*** is the address of the TACACS+ server.

***port-number*** is the TACACS+ server port number.

***routing-instance routing-instance*** is the name of the routing instance used to send and receive TACACS+ packets. By default, Junos OS routes authentication, authorization, and accounting packets for TACACS+ through the default routing instance. Starting in Junos OS Release 17.4R1, existing TACACS+ behavior is enhanced to support routing TACACS+ packets through a management interface in a non-default VRF instance named **mgmt\_junos**. For more information on this VRF management instance, see [“Configuring TACACS+ to Use the Management Instance” on page 203](#). Starting in Junos OS Release 18.2R1, you can route TACACS+ traffic through any routing instance you configure in authentication.

You must specify a secret (password) that the local router or switch passes to the TACACS+ client by including the **secret** statement. If the password included spaces,

enclose the password in quotation marks. The secret used by the local router or switch must match that used by the server.

Optionally, you can specify the length of time that the local router or switch waits to receive a response from a TACACS+ server by including the **timeout** statement. By default, the router or switch waits 3 seconds. You can configure this to be a value in the range from 1 through 90 seconds.

Optionally, you can have the software maintain one open Transmission Control Protocol (TCP) connection to the server for multiple requests, rather than opening a connection for each connection attempt by including the **single-connection** statement.

**NOTE:** Early versions of the TACACS+ server do not support the **single-connection** option. If you specify this option and the server does not support it, the Junos OS will be unable to communicate with that TACACS+ server.

To configure multiple TACACS+ servers, include multiple **tacplus-server** statements.

On a TX Matrix router, TACACS+ accounting should be configured only under the groups **re0** and **re1**.

**NOTE:** Accounting should not be configured at the **[edit system]** hierarchy level; on a TX Matrix router, control is done under the switch-card chassis only.

To configure a set of users that share a single account for authorization purposes, you create a template user. To do this, include the **user** statement at the **[edit system login]** hierarchy level, as described in [“Example: Configuring Authentication Order” on page 175](#).

**See Also** • *routing-instance (Accounting and Authentication)*

### Configuring TACACS+ to Use the Management Instance

By default, Junos OS routes authentication, authorization, and accounting packets for TACACS+ through the default routing instance. Starting in Junos OS Release 17.4R1, existing TACACS+ behavior is enhanced to support a management interface in a non-default VRF instance.

```
[edit system]
tacplus-server server-address {
  routing-instance routing-instance;
}
```

When the **routing-instance mgmt\_junos** option is configured in both the **tacplus-server server-address** and the **tacplus server server-ip** statements (see [tacplus](#)), provided the

**management-instance** statement is also configured, TACACS+ packets are routed through the management instance `mgmt_junos`.

**NOTE:** The `routing-instance mgmt_junos` option must be configured in both the `tacplus-server` and the `tacplus server` statements. If not, even if the `management-instance` statement is set, TACACS+ packets will still be sent using the default routing instance only.

For more details on this management instance, see *management-instance*.

### Specifying a Source Address for the Junos OS to Access External TACACS+ Servers

You can specify which source address the Junos OS uses when accessing your network to contact an external TACACS+ server for authentication. You can also specify which source address the Junos OS uses when contacting a TACACS+ server for sending accounting information.

To specify a source address for a TACACS+ server for authentication, include the **source-address** statement at the `[edit system tacplus-server server-address]` hierarchy level:

```
[edit system tacplus-server server-address]  
source-address source-address;
```

**source-address** is a valid IP address configured on one of the router or switch interfaces.

To specify a source address for a TACACS+ server for system accounting, include the **source-address** statement at the `[edit system accounting destination tacplus server server-address]` hierarchy level:

```
[edit system accounting destination tacplus server server-address]  
source-address source-address;
```

**source-address** is a valid IP address configured on one of the router or switch interfaces.

### Configuring the Same Authentication Service for Multiple TACACS+ Servers

To configure the same authentication service for multiple TACACS+ servers, include statements at the `[edit system tacplus-server]` and `[edit system tacplus-options]` hierarchy levels. For information about how to configure a TACACS+ server at the `[edit system tacplus-server]` hierarchy level, see [“Configuring TACACS+ Authentication” on page 202](#).

To assign the same authentication service to multiple TACACS+ servers, include the **service-name** statement at the `[edit system tacplus-options]` hierarchy level:

```
[edit system tacplus-options]  
service-name service-name;
```

**service-name** is the name of the authentication service. By default, the service name is set to `junos-exec`.

The following example shows how to configure the same authentication service for multiple TACACS+ servers:

```
[edit system]
tacplus-server {
  10.2.2.2 secret "$ABC123"; ## SECRET-DATA
  10.3.3.3 secret "$ABC123"; ## SECRET-DATA
}
tacplus-options {
  service-name bob;
}
```

### Configuring Juniper Networks Vendor-Specific TACACS+ Attributes

The Juniper Networks Vendor-Specific TACACS+ Attributes enable you to configure access privileges for users on a TACACS+ server. They are specified in the TACACS+ server configuration file on a per-user basis. The Junos OS retrieves these attributes through an authorization request of the TACACS+ server after authenticating a user. You do not need to configure these attributes to run the Junos OS with TACACS+.

To specify these attributes, include a **service** statement of the following form in the TACACS+ server configuration file:

```
service = junos-exec {
  local-user-name = <username-local-to-router>
  allow-commands = "<allow-commands-regex>"
  allow-configuration-regexps = "<allow-configuration-regex>"
  deny-commands = "<deny-commands-regex>"
  deny-configuration-regexps = "<deny-configuration-regex>"
}
```

This **service** statement can appear in a **user** or **group** statement.

### Example: Configuring a TACACS+ Server for System Authentication

This example shows how to configure a TACACS+ server for system authentication.

- [Requirements on page 205](#)
- [Overview on page 206](#)
- [Configuration on page 206](#)
- [Verification on page 208](#)

#### Requirements

Before you begin:

- Perform the initial device configuration. See the Getting Started Guide for your device.
- Configure at least one TACACS+ server.

## Overview

---

In this example, you set the IP address to 172.16.98.24 and the shared secret password of the TACACS+ server to Tacacssecret1. The secret password is stored as an encrypted value in the configuration database. You then set the loopback source address as 10.0.0.1

## Configuration

---

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set system tacplus-server address 172.16.98.24
set system tacplus-server 172.16.98.24 secret Tacacssecret1
set system tacplus-server 172.16.98.24 source-address 10.0.0.1
```

### GUI Step-by-Step Procedure

To configure a TACACS+ server for system authentication:

1. In the J-Web user interface, select **Configure>System Properties>User Management**.
2. Click **Edit**. The Edit User Management dialog box appears.
3. Select the **Authentication Method and Order** tab.
4. In the TACACS section, click **Add**. The Add TACACS Server dialog box appears.
5. In the IP Address box, type the server's 32-bit IP address.
6. In the Password and Confirm Password boxes, type the secret password for the server and verify your entry.
7. In the Server Port box, type the appropriate port.
8. In the Source Address box, type the locally configured interface address, which is used as the source address for TACACS+ packets.

**NOTE:** The Source Address box can accept either a hostname or an IP address.

---

9. In the Retry Attempts box, specify the number of times that the server should try to verify the user's credentials.

10. In the Time Out box, specify the amount of time (in seconds) the device should wait for a response from the server.
11. Click **OK** to check your configuration and save it as a candidate configuration.
12. If you are done configuring the device, click **Commit Options>Commit**.

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a TACACS+ server for system authentication:

1. Add a new TACACS+ server and set its IP address.

```
[edit system]
user@host# set tacplus-server address 172.16.98.24
```

2. Specify the shared secret (password) of the TACACS+ server.

```
[edit system]
user@host# set tacplus-server 172.16.98.24 secret Tacacssecret1
```

3. Specify the device's loopback address as the source address.

```
[edit system]
user@host# set tacplus-server 172.16.98.24 source-address 10.0.0.1
```

**Results** From configuration mode, confirm your configuration by entering the **show system tacplus-server** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show system tacplus-server
tacplus-server 172.16.98.24 {
  secret Tacacssecret1;
  source-address 10.0.0.1;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

**NOTE:** To completely set up TACACS+ authentication, you must create user template accounts and specify a system authentication order. Do one of the following tasks:

- Configure a system authentication order. See [“Example: Configuring Authentication Order” on page 175](#).
- Configure a user. See [“Example: Configuring New Users” on page 68](#).
- Configure local user template accounts. See [“Example: Creating Template Accounts” on page 163](#).

---

### Verification

Confirm that the configuration is working properly.

#### *Verifying the TACACS+ Server System Authentication Configuration*

**Purpose** Verify that the TACACS+ server has been configured for system authentication.

**Action** From configuration mode, enter the **show system tacplus-server** command.

**See Also**

- [Junos OS User Authentication Methods on page 159](#)

- [Configuring Local User Template Accounts for User Authentication on page 160](#)

## Configuring Periodic Refresh of the TACACS+ Authorization Profile

When you configure a Junos device to use a TACACS+ server for authentication, the device prompts users for login information, which is verified by the TACACS+ server. After the user is successfully authenticated, the JUNOS device sends an authorization request to the TACACS+ server to obtain the authorization profile for the user. Authorization profiles specify the access permissions for authenticated users or devices.

The TACACS+ server sends the authorization profile as part of an authorization response message. The remote user configured on the TACACS+ server is mapped to a local user configured on the JUNOS device. The JUNOS device combines the remote authorization profile with the locally-configured authorization profile for the user, which is configured at the `[edit system login class]` hierarchy level.

The exchange of authorization request and response messages occurs only once, after successful authentication, by default. You can configure the JUNOS device to periodically fetch the remote authorization profile from the TACACS+ server and refresh the authorization profile stored locally. This ensures that any change in the authorization parameters are reflected on the local device without the user having to restart the authentication process.

To enable periodic refresh of the authorization profile, you must set the time interval at which the JUNOS device checks the authorization profile configured remotely on the TACACS+ server. If there is a change in the remote authorization profile, the device fetches the authorization profile from the TACACS+ server and the authorization profile configured under the login class hierarchy. The device refreshes the authorization profile stored locally by combining the remote and locally-configured authorization profiles.

The time interval can be configured directly on the TACACS+ server or locally on the JUNOS device using the CLI. The time interval is configured in minutes, in the range of 15 to 1440 minutes.

- To configure periodic refresh of the authorization profile on the local device using the CLI, include the **authorization-time-interval** statement at the **[edit system tacplus-options]** hierarchy level:

```
[edit system tacplus-options]
authorization-time-interval [minutes];
```

- To configure the time interval for periodic refresh on the TACACS+ server, add the time interval as a parameter in the authorization profile using the following syntax:

```
refresh-time-interval=minutes
```

Use the following guidelines to determine which time interval configuration takes precedence:

- If there is no refresh time interval configured on the TACACS server for periodic refresh, the JUNOS device does not receive the time interval value in the authorization response. In this case, the value configured locally on the JUNOS device will take effect.
- If the refresh time interval is configured on the TACACS server and there is no refresh time interval configured locally on the JUNOS device, the value configured on the TACACS server will take effect.
- If refresh time interval is configured on the TACACS server and also on the JUNOS device locally, the value configured on the TACACS server will take precedence.
- If there is no refresh time interval configured on the TACACS server and there is no refresh time interval configured on the JUNOS device, there will be no periodic refresh.
- If the refresh time interval configured on the TACACS server is out of range or invalid, the refresh time interval value configured locally will take effect.
- If the refresh time interval configured on the TACACS server is out of range or invalid and there is no refresh time interval configured locally, there will be no periodic refresh.

After the periodic refresh time interval is set, if the user changes the refresh interval before the authorization request is sent from the JUNOS device, the updated refresh interval takes effect after the next immediate periodic refresh.

**See Also** • [Defining Junos OS Login Classes on page 51](#)

- [authorization-time-interval on page 800](#)

## Using Regular Expressions on a RADIUS or TACACS+ Server to Allow or Deny Access to Commands

Use regular expressions to specify which operational or configuration mode commands are allowed or denied when you use a RADIUS or TACACS+ server for user authentication. You can specify the regular expressions using the appropriate Juniper Networks vendor-specific RADIUS or TACACS+ attributes in your authentication server configuration.

The following attributes are supported for configuring authorizations on RADIUS and TACACS+ servers:

- **user-permissions**
- **allow-configuration**
- **deny-configuration**
- **allow-commands**
- **deny-commands**
- **allow-configuration-regex**
- **deny-configuration-regex**
- (TACACS+ only) **allow-commands-regex**
- (TACACS+ only) **deny-commands-regex**

You can specify **allow-configuration**, **deny-configuration**, **allow-commands**, or **deny-commands** in a single extended regular expression, enclosing multiple commands in parentheses and separating them using the pipe symbol. For example, you can specify multiple **allow-commands** parameters using: **allow-commands= (cmd1 | cmd2 | cmdn)**. You can specify **user-permissions** as a list of comma-separated values, and not as a regular expression.

To configure authorizations using the **allow/deny-configuration-regexps** or **allow/deny-commands-regexps** attributes, you configure a set of strings in which each string is a regular expression, enclosed in double quotes and separated with a space operator. For example, you can specify multiple parameters for **allow-commands-regex** using the following syntax: **allow-commands-regexps = ("regex1" "regex2" ...)**.

On a RADIUS or TACACS+ server, you can also use a simplified version for regular expressions where you specify each individual expression on a separate line. The simplified version is valid for **allow-commands**, **deny-commands**, **allow-configuration**, **deny-configuration**, and **permissions** vendor-specific attributes.

For a RADIUS server, specify the individual regular expressions using the following syntax:

```
Juniper-Allow-Commands+= "cmd1"  
Juniper-Allow-Commands+= "cmd2"  
Juniper-Allow-Commands+= "cmdn"
```

```

Juniper-Deny-Commands+= "cmd1"
Juniper-Deny-Commands+= "cmd2"
Juniper-Deny-Commands+= "cmdn"
Juniper-Allow-Configuration+= "regex1"
Juniper-Allow-Configuration+= "regex2"
Juniper-Allow-Configuration+= "regexn"
Juniper-Deny-Configuration+= "regex1"
Juniper-Deny-Configuration+= "regex2"
Juniper-Deny-Configuration+= "regexn"
Juniper-User-Permissions+= "permission-flag1"
Juniper-User-Permissions+= "permission-flag2"
Juniper-User-Permissions+= "permission-flagn"

```

For TACACS+ server, specify the individual regular expressions using the following syntax:

```

allow-commands1="cmd1"
allow-commands2="cmd2"
allow-commandsn="cmdn"
deny-commands1="cmd1"
deny-commands2="cmd2"
deny-commandsn="cmdn"
allow-configuration1="regex1"
allow-configuration2="regex2"
allow-configurationn="regexn"
deny-configuration1="regex1"
deny-configuration2="regex2"
deny-configurationn="regexn"
user-permissions1="permission-flag1"
user-permissions2="permission-flag2"
user-permissionsn="permission-flagn"

```

#### NOTE:

- Numeric values 1 to *n* in the syntax (for TACACS+ server) must be unique but need not be sequential. For example, the following syntax is valid:

```

allow-commands1="cmd1"
allow-commands3="cmd3"
allow-commands2="cmd2"
deny-commands3="cmd3"
deny-commands2="cmd2"
deny-commands1="cmd1"

```

- The limit on the number of lines of individual regular expressions is imposed by the TACACS+ or RADIUS server.
- When you issue the `show cli authorization` command, the command output displays the regular expression in a single line, even if you specify each individual expression on a separate line.

For more information about Juniper Networks vendor-specific RADIUS and TACACS+ attributes, see [“Juniper Networks Vendor-Specific RADIUS Attributes” on page 192](#) and [“Juniper Networks Vendor-Specific TACACS+ Attributes” on page 212](#).

**NOTE:** When RADIUS or TACACS+ authentication is configured for a router, regular expressions configured on the RADIUS or TACACS+ server merge with any regular expressions configured on the local router at the [edit system login class] hierarchy level using the allow-commands, deny-commands, allow-configuration, deny-configuration, or permissions statements. If the final expression has a syntax error, the overall result is an invalid regular expression.

**See Also** • [Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication on page 167](#)

## Juniper Networks Vendor-Specific TACACS+ Attributes

Junos OS supports the configuration of Juniper Networks TACACS+ vendor-specific attributes (VSAs). These VSAs are encapsulated in a TACACS+ vendor-specific attribute with the vendor ID set to the Juniper Networks ID number, 2636. [Table 16 on page 212](#) lists the Juniper Networks VSAs you can configure.

*Table 16: Juniper Networks Vendor-Specific TACACS+ Attributes*

| Name                | Description                                                                                                                                                                          | Length | String                                                                                                                                                                                                                                                                 |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| local-user-name     | Indicates the name of the user template used by this user when logging in to a device.                                                                                               | ≥3     | One or more octets containing printable ASCII characters.                                                                                                                                                                                                              |
| allow-commands      | Contains an extended regular expression that enables the user to run operational mode commands in addition to those commands authorized by the user's login class permission bits.   | ≥3     | One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">“Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands, Configuration Statements, and Hierarchies” on page 97</a> . |
| allow-configuration | Contains an extended regular expression that enables the user to run configuration mode commands in addition to those commands authorized by the user's login class permission bits. | ≥3     | One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">“Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands, Configuration Statements, and Hierarchies” on page 97</a> . |

Table 16: Juniper Networks Vendor-Specific TACACS+ Attributes (continued)

| Name                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Length          | String                                                                                                                                                                                                                                                                |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>deny-commands</b>       | Contains an extended regular expression that denies the user permission to run operational mode commands authorized by the user's login class permission bits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | ≥3              | One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">“Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands, Configuration Statements, and Hierarchies”</a> on page 97. |
| <b>deny-configuration</b>  | Contains an extended regular expression that denies the user permission to run configuration mode commands authorized by the user's login class permission bits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | ≥3              | One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">“Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands, Configuration Statements, and Hierarchies”</a> on page 97. |
| <b>user-permissions</b>    | <p>Contains information the server uses to specify user permissions.</p> <p><b>NOTE:</b> When the <b>user-permissions</b> attribute is configured to grant the Junos OS <b>maintenance</b> or <b>all</b> permissions on an IPv4 or IPv6 TACACS+ server, the UNIX wheel group membership is not automatically added to a user's list of group memberships. Some operations such as running the <b>su root</b> command from a local shell require wheel group membership permissions. However, when a user is configured locally with the permissions <b>maintenance</b> or <b>all</b>, the user is automatically granted membership to the UNIX wheel group. Therefore, we recommend that you create a template user account with the required permissions and associate individual user accounts with the template user account.</p> | ≥3              | One or more octets containing printable ASCII characters. See <a href="#">“Understanding Junos OS Access Privilege Levels”</a> on page 88.                                                                                                                            |
| <b>authentication-type</b> | Indicates the authentication method (local database, or TACACS+ server) used to authenticate a user. If the user is authenticated using a local database, the attribute value shows 'local'. If the user is authenticated using TACACS+ server, the attribute value shows 'remote'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | ≥5              | One or more octets containing printable ASCII characters.                                                                                                                                                                                                             |
| <b>session-port</b>        | Indicates the source port number of the established session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | size of integer | Integer                                                                                                                                                                                                                                                               |

## Configuring TACACS+ System Accounting

You can use TACACS+ to track and log software logins, configuration changes, and interactive commands. To audit these events, include the following statements at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
events [ events ];
destination {
  tacplus {
    server {
      server-address {
        port port-number;
        routing-instance routing-instance;
        secret password;
        single-connection;
        timeout seconds;
      }
    }
  }
}
```

Tasks for configuring TACACS+ system accounting are:

1. [Specifying TACACS+ Auditing and Accounting Events on page 214](#)
2. [Configuring TACACS+ Server Accounting on page 214](#)
3. [Configuring TACACS+ To Use the Management Instance on page 216](#)
4. [Configuring TACACS+ Accounting on a TX Matrix Router on page 216](#)

---

### Specifying TACACS+ Auditing and Accounting Events

To specify the events you want to audit when using a TACACS+ server for authentication, include the **events** statement at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
events [ events ];
```

**events** is one or more of the following:

- **login**—Audit logins
- **change-log**—Audit configuration changes
- **interactive-commands**—Audit interactive commands (any command-line input)

---

### Configuring TACACS+ Server Accounting

To configure TACACS+ server accounting, include the **server** statement at the **[edit system accounting destination tacplus]** hierarchy level:

```
[edit system accounting destination tacplus]
server {
```

```

server-address {
  port port-number;
  routing-instance routing-instance;
  secret password;
  single-connection;
  timeout seconds;
}

```

**server-address** specifies the address of the TACACS+ server. To configure multiple TACACS+ servers, include multiple **server** statements.

**NOTE:** If no TACACS+ servers are configured at the [edit system accounting destination tacplus] statement hierarchy level, the Junos OS uses the TACACS+ servers configured at the [edit system tacplus-server] hierarchy level.

We recommend that you add the following configuration at the [edit system accounting destination tacplus] statement hierarchy level to identify a destination and help avoid generating an error condition:

```

accounting {
  events [ login change-log interactive-commands ];
  destination {
    tacplus;
  }
}

```

**port-number** specifies the TACACS+ server port number.

**routing-instance routing-instance** is the name of the routing instance used to send and receive TACACS+ packets. By default, Junos OS routes authentication, authorization, and accounting packets for TACACS+ through the default routing instance. Starting in Junos OS Release 17.4R1, existing TACACS+ behavior is enhanced to support routing TACACS+ packets through a management interface in a non-default VRF instance named `mgmt_junos`. For more information on this VRF management instance, see [“Configuring TACACS+ To Use the Management Instance” on page 216](#). Starting in Junos OS Release 18.2R1, you can route TACACS+ traffic through any routing instance you configure in accounting.

You must specify a secret (password) that the local router or switch passes to the TACACS+ client by including the **secret** statement. If the password contains spaces, enclose the entire password in quotation marks (“ ”). The password used by the local router or switch must match that used by the server.

Optionally, you can specify the length of time that the local router or switch waits to receive a response from a TACACS+ server by including the **timeout** statement. By default, the router or switch waits 3 seconds. You can configure this to be a value in the range from 1 through 90 seconds.

Optionally, you can maintain one open TCP connection to the server for multiple requests, rather than opening a connection for each connection attempt, by including the **single-connection** statement.

To ensure that start and stop requests for accounting of login events are correctly logged in the Accounting file instead of the Administration log file on a TACACS+ server, include either the **no-cmd-attribute-value** statement or the **exclude-cmd-attribute** at the **[edit system tacplus-options]** hierarchy level.

If you use the **no-cmd-attribute-value** statement, the value of the **cmd** attribute is set to a null string in the start and stop requests. If you use the **exclude-cmd-attribute** statement, the **cmd** attribute is totally excluded from the start and stop requests. Both statements support the correct logging of accounting requests in the Accounting file, instead of the Administration file.

```
[edit system tacplus-options]
(no-cmd-attribute-value | exclude-cmd-attribute);
```

---

### Configuring TACACS+ To Use the Management Instance

---

By default, Junos OS routes authentication, authorization, and accounting packets for TACACS+ through the default routing instance. Starting in Junos OS Release 17.4R1, existing TACACS+ behavior is enhanced to support a management interface in a non-default VRF instance.

```
[edit system accounting destination tacplus]
server {
  server-address {
    routing-instance routing-instance;
  }
}
```

When the **routing-instance mgmt\_junos** option is configured in both the **tacplus-server server-address** and the **tacplus server server-ip** statements, provided the **management-instance** statement is also configured, TACACS+ packets are routed through the management instance **mgmt\_junos**.

**NOTE:** The **routing-instance mgmt\_junos** option must be configured in both the **tacplus-server** and the **tacplus server** statements. If not, even if the **management-instance** statement is set, TACACS+ packets will still be sent using the default routing instance only.

---

For more details on this management instance, see *management-instance*.

---

### Configuring TACACS+ Accounting on a TX Matrix Router

---

On a TX Matrix router, TACACS+ accounting should be configured only under the groups **re0** and **re1**.

**NOTE:** Accounting should *not* be configured at the [edit system] hierarchy; on a TX Matrix router, control is done under the switch-card chassis only.

Release History Table

| Release | Description                                                                                                                                                                                  |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 18.2R1  | Starting in Junos OS Release 18.2R1, you can route TACACS+ traffic through any routing instance you configure in authentication.                                                             |

## Authentication for Routing Protocols

You can configure an authentication method and password for routing protocol messages for IGPs, IS-IS, OSPF, and RIP, and RSVP. To prevent exchange of unauthenticated or forged packets, routers must ensure that they form routing protocol relationships (peering or neighboring relationships) to trusted peers. One way of doing this is by authenticating routing protocol messages. Neighboring routers use the password to verify the authenticity of packets sent by the protocol from the router or from a router interface. Read this topic for more information.

- [Junos OS Authentication Methods for Routing Protocols on page 218](#)
- [Example: Configuring the Authentication Key for BGP and IS-IS Routing Protocols on page 218](#)
- [Configuring the Authentication Key Update Mechanism for BGP and LDP Routing Protocols on page 220](#)

## Junos OS Authentication Methods for Routing Protocols

Some interior gateway protocols (IGPs)—Intermediate System-to-Intermediate System (IS-IS), Open Shortest Path First (OSPF), and Routing Information Protocol (RIP)—and Resource Reservation Protocol (RSVP) allow you to configure an authentication method and password. Neighboring routers use the password to verify the authenticity of packets sent by the protocol from the router or from a router interface. The following authentication methods are supported:

- Simple authentication (IS-IS, OSPF, and RIP)—Uses a simple text password. The receiving router uses an authentication key (password) to verify the packet. Because the password is included in the transmitted packet, this method of authentication is relatively insecure. We recommend that you not use this authentication method.
- MD5 and HMAC-MD5 (IS-IS, OSPF, RIP, and RSVP)—Message Digest 5 (MD5) creates an encoded checksum that is included in the transmitted packet. HMAC-MD5, which combines HMAC authentication with MD5, adds the use of an iterated cryptographic hash function. With both types of authentication, the receiving router uses an authentication key (password) to verify the packet. HMAC-MD5 authentication is defined in RFC 2104, *HMAC: Keyed-Hashing for Message Authentication*.

In general, authentication passwords are text strings consisting of a maximum of 16 or 255 letters and digits. Characters can include any ASCII strings. If you include spaces in a password, enclose all characters in quotation marks (“ ”).

Junos-FIPS has special password requirements. FIPS passwords must be between 10 and 20 characters in length. Passwords must use at least three of the five defined character sets (uppercase letters, lowercase letters, digits, punctuation marks, and other special characters). If Junos-FIPS is installed on the router, you cannot configure passwords unless they meet this standard.

### Example: Configuring the Authentication Key for BGP and IS-IS Routing Protocols

The main task of a router is to use its routing and forwarding tables to forward user traffic to its intended destination. Attackers can send forged routing protocol packets to a router with the intent of changing or corrupting the contents of its routing table or other databases, which in turn can degrade the functionality of the router and the network. To prevent such attacks, routers must ensure that they form routing protocol relationships (peering or neighboring relationships) to trusted peers. One way of doing this is by authenticating routing protocol messages. We strongly recommend using authentication when configuring routing protocols. The Junos OS supports HMAC-MD5 authentication for BGP, Intermediate System-to-Intermediate System (IS-IS), Open Shortest Path First (OSPF), Routing Information Protocol (RIP), and Resource Reservation Protocol (RSVP). HMAC-MD5 uses a secret key that is combined with the data being transmitted to compute a hash. The computed hash is transmitted along with the data. The receiver uses the matching key to recompute and validate the message hash. If an attacker has forged or modified the message, the hash will not match and the data will be discarded.

In the following examples, we configure BGP as the exterior gateway protocol (EGP) and IS-IS as the interior gateway protocol (IGP). If you use OSPF, configure it similarly to the IS-IS configuration shown.

## Configuring BGP

The following example shows the configuration of a single authentication key for the BGP peer group internal peers. You can also configure BGP authentication at the neighbor or routing instance levels, or for all BGP sessions. As with any security configuration, there is a trade-off between the degree of granularity (and to some extent the degree of security) and the amount of management necessary to maintain the system. This example also configures a number of tracing options for routing protocol events and errors, which can be good indicators of attacks against routing protocols. These events include protocol authentication failures, which might point to an attacker that is sending spoofed or otherwise malformed routing packets to the router in an attempt to elicit a particular behavior.

```
[edit]
protocols {
  bgp {
    group ibgp {
      type internal;
      traceoptions {
        file bgp-trace size 1m files 10;
        flag state;
        flag general;
      }
      local-address 10.10.5.1;
      log-updown;
      neighbor 10.2.1.1;
      authentication-key "$9$aH1j8gqQ1gjyjjhgjgiiii";
    }
    group ebgp {
      type external;
      traceoptions {
        file ebgp-trace size 10m files 10;
        flag state;
        flag general;
      }
      local-address 10.10.5.1;
      log-updown;
      peer-as 2;
      neighbor 10.2.1.2;
      authentication-key "$9$aH1j8gqQ1gjyjjhgjgiiii";
    }
  }
}
```

## Configuring IS-IS

Although all IGPs supported by the Junos OS support authentication, some are inherently more secure than others. Most service providers use OSPF or IS-IS to allow fast internal convergence and scalability and to use traffic engineering capabilities with Multiprotocol Label Switching (MPLS). Because IS-IS does not operate at the network layer, it is more difficult to spoof than OSPF, which is encapsulated in IP and is therefore subject to remote spoofing and DoS attacks.

The following example also shows how to configure a number of tracing options for routing protocol events and errors, which can be good indicators of attacks against routing protocols. These events include protocol authentication failures, which might point to an attacker that is sending spoofed or otherwise malformed routing packets to the router in an attempt to elicit a particular behavior.

```
[edit]
protocols {
  isis {
    authentication-key "$9$aHlj8gqQ1gjiyghgijgiiii"; # SECRET-DATA
    authentication-type md5;
    traceoptions {
      file isis-trace size 10m files 10;
      flag normal;
      flag error;
    }
    interface at-0/0/0.131 {
      lsp-interval 50;
      level 2 disable;
      level 1 {
        metric 3;
        hello-interval 5;
        hold-time 60;
      }
    }
    interface lo0.0 {
      passive;
    }
  }
}
```

## Configuring the Authentication Key Update Mechanism for BGP and LDP Routing Protocols

You can configure an authentication key update mechanism for the Border Gateway Protocol (BGP) and Label Distribution Protocol (LDP) routing protocols. This mechanism allows you to update authentication keys without interrupting associated routing and signaling protocols such as Open Shortest Path First (OSPF) and Resource Reservation Setup Protocol (RSVP).

To configure this feature, include the **authentication-key-chains** statement at the **[edit security]** level, and include the **authentication-algorithm *algorithm*** and **authentication-key-chain** statements for the BGP or LDP routing protocols at the **[edit protocols]** level .

The following topics provide more details about configuring authentication key updates for BGP and LDP Routing Protocols:

- [Configuring Authentication Key Updates on page 221](#)

- [Configuring BGP and LDP for Authentication Key Updates on page 221](#)

### Configuring Authentication Key Updates

To configure the authentication key update mechanism, include the **key-chain** statement at the **[edit security authentication-key-chains]** hierarchy level, and specify the **key** option to create a keychain consisting of several authentication keys.

```
[edit security authentication-key-chains]
key-chain key-chain-name {
  key key {
    secret secret-data;
    start-time yyyy-mm-dd.hh:mm:ss;
  }
}
```

**key-chain**—Assigns a name to the keychain mechanism. This name is also configured at the **[edit protocols bgp]** or the **[edit protocols ldp]** hierarchy levels to associate unique **authentication key-chain** attributes as specified using the following options:

- **key**—Each key within a keychain is identified by a unique integer value. The range is from 0 through 63.
- **secret**—Each key must specify a secret in encrypted text or plain text format. Even if you enter the secret data in plain-text format, the secret always appears in encrypted format.
- **start-time**—Start times for authentication key updates are specified in UTC (Coordinated Universal Time), and must be unique within the keychain.

### Configuring BGP and LDP for Authentication Key Updates

To configure the authentication key update mechanism for the BGP and LDP routing protocols, include the **authentication-key-chain** statement at the **[edit protocols (bgp | ldp)]** hierarchy level to associate each routing protocol with the **[edit security authentication-key-chains]** authentication keys. You must also configure the **authentication-algorithm** *algorithm* statement at the **[edit protocols (bgp | ldp)]** hierarchy level.

```
[edit protocols (bgp | ldp)]
group group-name {
  neighbor address {
    authentication-algorithm algorithm;
    authentication-key-chain key-chain-name;
  }
}
```

.....

**NOTE:** When configuring the authentication key update mechanism for BGP, you cannot commit the 0.0.0.0/allow statement with authentication keys or key chains. The CLI issues a warning and fails to commit such configurations.

For information about the BGP protocol, see the *Junos OS Routing Protocols Library*.

## CHAPTER 5

# Remote Access Management

- [Remote Access Overview on page 223](#)
- [Secure Web Access for Remote Management on page 246](#)

### Remote Access Overview

---

You can access a router, switch, or security device remotely using DHCP, Finger, FTP, rlogin, SSH, and Telnet services and so on. This topic shows you how to configure remote access using Telnet, SSH, FTP, and Finger services. Read this topic for more information.

- [System Services Overview on page 223](#)

- [Configuring Password Retry Limits for Telnet and SSH Access on page 239](#)
- [Example: Configuring a Filter to Block Telnet and SSH Access on page 240](#)

### System Services Overview

For security reasons, remote access to the router is disabled by default. You must configure the router explicitly so that users on remote systems can access it. The router can be accessed from a remote system by means of the DHCP, finger, FTP, rlogin, SSH, and Telnet services. In addition, Junos XML protocol client applications can use Secure Sockets Layer (SSL) or the Junos XML protocol-specific clear-text service, among other services.

**NOTE:** To protect system resources, you can limit the number of simultaneous connections that a service accepts and the number of processes owned by a single user. If either limit is exceeded, connection attempts fail.

## Configuring Telnet Service for Remote Access to a Router or Switch

To configure the router or switch to accept Telnet as an access service, include the **telnet** statement at the **[edit system services]** hierarchy level:

```
[edit system services]
telnet {
  connection-limit limit;
  rate-limit limit;
}
```

By default, the router or switch supports a limited number of simultaneous Telnet sessions and connection attempts per minute.

Optionally, you can include either or both of the following statements to change the defaults:

- **connection-limit limit**—Maximum number of simultaneous connections per protocol (IPv4 and IPv6). The range is from 1 through 250. The default is 75. When you configure a connection limit, the limit is applicable to the number of telnet sessions per protocol (IPv4 and IPv6). For example, a connection limit of 10 allows 10 IPv6 telnet sessions and 10 IPv4 telnet sessions.
- **rate-limit limit**—Maximum number of connection attempts accepted per minute (from 1 through 250). The default is 150. When you configure a rate limit, the limit is applicable to the number of connection attempts per protocol (IPv4 and IPv6). For example, a rate limit of 10 allows 10 IPv6 telnet session connection attempts per minute and 10 IPv4 telnet session connection attempts per minute.

You cannot include the **telnet** statement on devices that run the Junos-FIPS software. We recommend that you do not use Telnet in a Common Criteria environment.

- See Also**
- [telnet on page 1420](#)

## Configuring FTP Service for Remote Access to the Router or Switch

To configure the router or switch to accept FTP as an access service, include the **ftp** statement at the **[edit system services]** hierarchy level:

```
[edit system services]
ftp {
  connection-limit limit;
  rate-limit limit;
}
```

By default, the router or switch supports a limited number of simultaneous FTP sessions and connection attempts per minute. You can include either or both of the following statements to change the defaults:

- **connection-limit *limit***—Maximum number of simultaneous connections per protocol (IPv4 and IPv6). The range is a value from 1 through 250. The default is 75. When you configure a connection limit, the limit is applicable to the number of sessions per protocol (IPv4 and IPv6). For example, a connection limit of 10 allows 10 IPv6 FTP sessions and 10 IPv4 FTP sessions.
- **rate-limit *limit***—Maximum number of connection attempts accepted per minute (a value from 1 through 250). The default is 150. When you configure a rate limit, the limit is applicable to the number of connection attempts per protocol (IPv4 and IPv6). For example, a rate limit of 10 allows 10 IPv6 FTP session connection attempts and 10 IPv4 FTP session connection attempts.

You can use passive FTP to access devices that accept only passive FTP services. All commands and statements that use FTP also accept passive FTP. Include the **ftp** statement at the **[edit system services]** hierarchy level to use either active FTP or passive FTP.

To start a passive FTP session, use **pasvftp** (instead of **ftp**) in the standard FTP format (**ftp://*destination***). For example:

```
request system software add pasvftp://name.com/jinstall.tgz
```

You cannot include the **ftp** statement on routers or switches that run the Junos-FIPS software. We recommend that you do not use the finger service in a Common Criteria environment.

## Configuring Finger Service for Remote Access to the Router

To configure the router to accept finger as an access service, include the **finger** statement at the **[edit system services]** hierarchy level:

```
[edit system services]
finger {
  connection-limit limit;
  rate-limit limit;
}
```

By default, the router supports a limited number of simultaneous finger sessions and connection attempts per minute. Optionally, you can include either or both of the following statements to change the defaults:

- **connection-limit *limit***—Maximum number of simultaneous connections per protocol (IPv4 and IPv6). The range is a value from 1 through 250. The default is 75. When you configure a connection limit, the limit is applicable to the number of sessions per protocol (IPv4 and IPv6). For example, a connection limit of 10 allows 10 IPv6 clear-text service sessions and 10 IPv4 clear-text service sessions
- **rate-limit *limit***—Maximum number of connection attempts accepted per minute (a value from 1 through 250). The default is 150. When you configure a rate limit, the limit is applicable to the number of connection attempts per protocol (IPv4 and IPv6). For example, a rate limit of 10 allows 10 IPv6 session connection attempts per minute and 10 IPv4 session connection attempts per minute.

You cannot include the **finger** statement on routers that run the Junos-FIPS software. We recommend that you do not use the finger service in a Common Criteria environment.

## Configuring SSH Service for Remote Access to the Router or Switch

To configure the router or switch to accept SSH as an access service, include the **ssh** statement at the **[edit system services]** hierarchy level:

```
[edit system services]
ssh {
  authentication-order [method 1 method2...];
  ciphers [ cipher-1 cipher-2 cipher-3 ...];
  client-alive-count-max seconds;
  client-alive-interval seconds;
  connection-limit limit;
  fingerprint-hash (md5 | sha2-256);
  hostkey-algorithm (algorithm | no-algorithm);
  key-exchange [algorithm1 algorithm2...];
  macs [algorithm1 algorithm2...];
  max-sessions-per-connection <number>;
  no-passwords;
  no-public-keys;
  no-tcp-forwarding;
  protocol-version [v2];
  rate-limit limit;
  root-login (allow | deny | deny-password);
}
```

By default, the router or switch supports a limited number of simultaneous SSH sessions and connection attempts per minute. Use the following statements to change the defaults:

- **connection-limit *limit***—Maximum number of simultaneous connections per protocol (IPv4 and IPv6). The range is a value from 1 through 250. The default is 75. When you configure a connection limit, the limit is applicable to the number of SSH sessions per protocol (IPv4 and IPv6). For example, a connection limit of 10 allows 10 IPv6 SSH sessions and 10 IPv4 SSH sessions.
- **max-sessions-per-connection *number***—Include this statement to specify the maximum number of SSH sessions allowed per single SSH connection. This allows you to limit the number of cloned sessions tunneled within a single SSH connection. The default value is 10.
- **rate-limit *limit***—Maximum number of connection attempts accepted per minute (a value from 1 through 250). The default is 150. When you configure a rate limit, the limit is applicable to the number of connection attempts per protocol (IPv4 and IPv6). For example, a rate limit of 10 allows 10 IPv6 SSH session connection attempts per minute and 10 IPv4 SSH session connection attempts per minute.
- **data-limit**—Data limit before renegotiating session keys (bytes)
- **time-limit**—Time limit before renegotiating session keys (minutes)

By default, a user can create an SSH tunnel over a CLI session to a router running Junos OS via SSH. This type of tunnel could be used to forward TCP traffic, bypassing any firewall filters or access control lists allowing access to resources beyond the router. Use the **no-tcp-forwarding** option to prevent a user from creating an SSH tunnel to a router via SSH.

For information about other configuration settings, see the following topics:

- [Configuring the Root Login Through SSH on page 227](#)
- [Configuring the SSH Protocol Version on page 228](#)
- [Configuring the Client Alive Mechanism on page 228](#)
- [Configuring the SSH Fingerprint Hash Algorithm on page 228](#)

### Configuring the Root Login Through SSH

By default, users are allowed to log in to the router or switch as **root** through SSH when the authentication method does not require a password. To control user access through SSH, include the **root-login** statement at the **[edit systems services ssh]** hierarchy level:

```
[edit system services ssh]
root-login (allow | deny | deny-password);
```

**allow**—Allows users to log in to the router or switch as root through SSH.

**deny**—Disables users from logging in to the router or switch as root through SSH.

**deny-password**—Allows users to log in to the router or switch as root through SSH when the authentication method (for example, RSA) does not require a password.

The default is **deny-password**.

### Configuring the SSH Protocol Version

---

By default, only version 2 of the SSH protocol is enabled.

To configure the router or switch to use version 2 of the SSH protocol, include the **protocol-version** statement and specify **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v2 ];
```

Systems in FIPS mode always use SSH protocol version **v2**.

### Configuring the Client Alive Mechanism

---

The client alive mechanism is valuable when the client or server depends on knowing when a connection has become inactive. It differs from the standard keepalive mechanism because the client alive messages are sent through the encrypted channel. The client alive mechanism is not enabled at default. To enable it, configure the **client-alive-count-max** and **client-alive-interval** statements. This option applies to SSH protocol version 2 only.

In the following example, unresponsive SSH clients will be disconnected after approximately 100 seconds (20 x 5).

```
[edit system services ssh]
client-alive-count-max 5;
client-alive-interval 20;
```

See Also • [ssh on page 1384](#)

### Configuring the SSH Fingerprint Hash Algorithm

---

To configure the hash algorithm used by the SSH server when it displays key fingerprints, include the **fingerprint-hash** statement and specify **md5** or **sha2-256** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
fingerprint-hash (md5 | sha2-256);
```

The **md5** hash algorithm is unavailable on systems in FIPS mode.

See Also • [ssh on page 1384](#)

## The telnet Command

You can use the CLI **telnet** command to open a Telnet session to a remote device:

```
user@host> telnet host <8bit> <bypass-routing> <inet> <interface interface-name>
<no-resolve> <port port> <routing-instance routing-instance-name> <source address>
```

**NOTE:** On SRX100, SRX210, SRX220, SRX240, SRX300, SRX320, SRX340, SRX345, and SRX1500 devices, the maximum number of concurrent Telnet sessions is indicated in the following table. Platform support depends on the Junos OS release in your installation.

| SRX100 | SRX210<br>SRX220 | SRX240 | SRX300<br>SRX320<br>SRX340 | SRX345 | SRX1500 |
|--------|------------------|--------|----------------------------|--------|---------|
| 3      | 3                | 5      | 3                          | 5      | 5       |

To exit the Telnet session and return to the Telnet command prompt, press Ctrl-].

To exit the Telnet session and return to the CLI command prompt, enter **quit**.

[Table 17 on page 229](#) describes the **telnet** command options.

**Table 17: CLI telnet Command Options**

| Option                                        | Description                                                                                                                                                                           |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>8bit</b>                                   | Use an 8-bit data path.                                                                                                                                                               |
| <b>bypass-routing</b>                         | Bypass the routing tables and open a Telnet session only to hosts on directly attached interfaces. If the host is not on a directly attached interface, an error message is returned. |
| <b>host</b>                                   | Open a Telnet session to the specified hostname or IP address.                                                                                                                        |
| <b>inet</b>                                   | Force the Telnet session to an IPv4 destination.                                                                                                                                      |
| <b>interface source-interface</b>             | Open a Telnet session to a host on the specified interface. If you do not include this option, all interfaces are used.                                                               |
| <b>no-resolve</b>                             | Suppress the display of symbolic names.                                                                                                                                               |
| <b>port port</b>                              | Specify the port number or service name on the host.                                                                                                                                  |
| <b>routing-instance routing-instance-name</b> | Use the specified routing instance for the Telnet session.                                                                                                                            |
| <b>source address</b>                         | Use the specified source address for the Telnet session.                                                                                                                              |

**See Also** • *Configuring Reverse Telnet and Reverse SSH*

## The ssh Command

You can use the CLI **ssh** command to use the secure shell (SSH) program to open a connection to a remote device:

```
user@host> ssh host <bypass-routing> <inet> <interface interface-name>
<routing-instance routing-instance-name> <source address> <v1> <v2>
```

**NOTE:** On SRX100, SRX210, SRX220, SRX240, SRX300, SRX320, SRX340, SRX345, and SRX1500 devices, the maximum number of concurrent SSH sessions is indicated in the following table. Platform support depends on the Junos OS release in your installation.

| SRX100 | SRX210<br>SRX220 | SRX240 | SRX300<br>SRX320<br>SRX340 | SRX345 | SRX1500 |
|--------|------------------|--------|----------------------------|--------|---------|
| 3      | 3                | 5      | 3                          | 5      | 5       |

Table 18 on page 230 describes the **ssh** command options.

**Table 18: CLI ssh Command Options**

| Option                                        | Description                                                                                                                                                                            |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bypass-routing</b>                         | Bypass the routing tables and open an SSH connection only to hosts on directly attached interfaces. If the host is not on a directly attached interface, an error message is returned. |
| <b>host</b>                                   | Open an SSH connection to the specified hostname or IP address.                                                                                                                        |
| <b>inet</b>                                   | Force the SSH connection to an IPv4 destination.                                                                                                                                       |
| <b>interface source-interface</b>             | Open an SSH connection to a host on the specified interface. If you do not include this option, all interfaces are used.                                                               |
| <b>routing-instance routing-instance-name</b> | Use the specified routing instance for the SSH connection.                                                                                                                             |
| <b>source address</b>                         | Use the specified source address for the SSH connection.                                                                                                                               |
| <b>v1</b>                                     | Force SSH to use version 1 for the connection.                                                                                                                                         |
| <b>v2</b>                                     | Force SSH to use version 2 for the connection.                                                                                                                                         |

## Configuring SSH Host Keys for Secure Copying of Data

Secure Shell (SSH) uses encryption algorithms to generate a host, server, and session key system that ensures secure data transfer. You can configure SSH host keys to support secure copy (SCP) as an alternative to FTP for the background transfer of data such as configuration archives and event logs. To configure SSH support for SCP, you must complete the following tasks:

- Specify SSH known hosts by including hostnames and host key information in the Routing Engine configuration hierarchy.
- Set an SCP URL to specify the host from which to receive data. Setting this attribute automatically retrieves SSH host key information from the SCP server.
- Verify that the host key is authentic.
- Accept the secure connection. Accepting this connection automatically stores host key information in the local host key database. Storing host key information in the configuration hierarchy automates the secure handshake and allows background data transfer using SCP.

Tasks to configure SSH host keys for secure copying of data are:

1. [Configuring SSH Known Hosts on page 231](#)
2. [Configuring Support for SCP File Transfer on page 232](#)
3. [Updating SSH Host Key Information on page 232](#)

### Configuring SSH Known Hosts

To configure SSH known hosts, include the **host** statement, and specify hostname and host key options for trusted servers at the **[edit security ssh-known-hosts]** hierarchy level:

```
[edit security ssh-known-hosts]
host corporate-archive-server, ip-address {
  dsa-key key;
}
host archive-server-url {
  rsa-key key;
}
host server-with-ssh-version-1, ip-address {
  rsa1-key key;
}
```

Host keys are one of the following:

- **dsa-key key**—Base64 encoded Digital Signature Algorithm (DSA) key for SSH version 2.
- **ecdsa-sha2-nistp256-key key**—Base64 encoded ECDSA-SHA2-NIST256 key.
- **ecdsa-sha2-nistp384-key key**—Base64 encoded ECDSA-SHA2-NIST384 key.
- **ecdsa-sha2-nistp521-key key**—Base64 encoded ECDSA-SHA2-NIST521 key.

- **ed25519-key key**—Base64 encoded ED25519 key.
- **rsa-key key**—Base64 encoded public key algorithm that supports encryption and digital signatures for SSH version 1 and SSH version 2.
- **rsa1-key key**—Base64 encoded RSA public key algorithm, which supports encryption and digital signatures for SSH version 1.

Starting in Junos OS Release 18.3R1, the **ssh-dss** and **ssh-dsa** hostkey algorithms are deprecated—rather than immediately removed—to provide backward compatibility and a chance to bring your configuration into compliance with the new configuration.

### Configuring Support for SCP File Transfer

To configure a known host to support background SCP file transfers, include the **archive-sites** statement at the **[edit system archival configuration]** hierarchy level.

```
[edit system archival configuration]
archive-sites {
  scp://username<:password>@host<:port>/url-path;
}
```

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks ( " ") and enclose the IPv6 host address in brackets ( [ ] ). For example, "scp://username<:password>@[host]<:port>/url-path";

Setting the **archive-sites** statement to point to an SCP URL triggers automatic host key retrieval. At this point, Junos OS connects to the SCP host to fetch the SSH public key, displays the host key message digest or fingerprint as output to the console, and terminates the connection to the server.

```
user@host# set system archival configuration archive-sites "<scp-url-path>"
The authenticity of host <my-archive-server (<server-ip-address>)> can't be established.
RSA key fingerprint is <ascii-text key>. Are you sure you want to continue connecting
(yes/no)?
```

To verify that the host key is authentic, compare this fingerprint with a fingerprint that you obtain from the same host using a trusted source. If the fingerprints are identical, accept the host key by entering **yes** at the prompt. The host key information is then stored in the Routing Engine configuration and supports background data transfers using SCP.

### Updating SSH Host Key Information

Typically, SSH host key information is automatically retrieved when you set a URL attribute for SCP using the **archival configuration archive-sites** statement at the **[edit system]** hierarchy level. However, if you need to manually update the host key database, use one of the following methods.

1. [Retrieving Host Key Information Manually on page 233](#)
2. [Importing Host Key Information from a File on page 233](#)

### Retrieving Host Key Information Manually

To manually retrieve SSH public host key information, use the **fetch-from-server** option with the **set security ssh-known-hosts** command. You must include a hostname attribute with the **set security ssh-known-hosts fetch-from-server** command to specify the host from which to retrieve the SSH public key.

```
user@host# set security ssh-known-hosts fetch-from-server <hostname>
```

### Importing Host Key Information from a File

To manually import SSH host key information from the known-hosts file located at **/var/tmp/known-hosts** on the server, include the **load-key-file** option with the **set security ssh-known-hosts** command. You must include the path to the **known-hosts** file with the **set security ssh-known-hosts load-key-file** command to specify the location from which to import host key information.

```
user@host# set security ssh-known-hosts load-key-file /var/tmp/known-hosts
```

## Configuring the SSH Service to Support Legacy Cryptography

Starting in Junos OS Release 16.1, the SSH server in Junos OS is based on OpenSSH 7 and defaults to a more secure set of ciphers and key-exchange algorithms. OpenSSH 7 omits some legacy cryptography.

**NOTE:** Lack of support for legacy cryptography in devices causes Junos Space device discovery to fail. To work around this issue, configure the device to support the 3des-cbc or blowfish-cbc cipher, or both, and the dh-group1-sha1 key-exchange method. This issue does not affect devices running Junos OS with upgraded FreeBSD.

**NOTE:** See the OpenSSH 7 documentation at <https://www.openssh.com/> for more information about these extensions.

Junos OS Release 16.1 supports the following set of ciphers by default:

- chacha20-poly1305@openssh.com
- aes128-ctr
- aes192-ctr
- aes256-ctr
- aes128-gcm@openssh.com
- aes256-gcm@openssh.com

In Junos OS Release 16.1, the following ciphers are not supported by default, but you can configure your device to support them. They are listed from the most secure to the least secure:

- **aes256-cbc**
- **aes192-cbc**
- **aes128-cbc**
- **3des-cbc**
- **blowfish-cbc**
- **cast128-cbc**
- **arcfour256**
- **arcfour128**
- **arcfour**

Junos OS Release 16.1 supports the following set of key-exchange methods by default:

- **curve25519-sha256**
- **ecdh-sha2-nistp256**
- **ecdh-sha2-nistp384**
- **ecdh-sha2-nistp521**
- **group-exchange-sha2**
- **dh-group14-sha1**

In Junos OS Release 16.1, the following key-exchange methods are not supported by default, but you can configure your device to support them:

- **group-exchange-sha1**
- **dh-group1-sha1**

To configure the SSH service to support legacy cryptography:

**NOTE:** By configuring an ordered set of ciphers, key-exchange methods, or message authentication codes (MACs), the newly defined set is applied to both server and client commands. Changes to the defaults affect the file copy command when you use Secure Copy Protocol (SCP).

1. Add support for ciphers by using the **set system services ssh ciphers [ cipher 1 cipher 2 ... ]** command. We recommend that you add the ciphers to the end of the configuration list so that they are among the last options used. In the following example, the **3des-cbc** and **blowfish-cbc** ciphers are added to the default set:

```
[edit system services ssh]
```

```
user@device# set ciphers [ chacha20-poly1305@openssh.com aes128-ctr aes192-ctr
aes256-ctr aes128-gcm@openssh.com aes256-gcm@openssh.com 3des-cbc
blowfish-cbc ]
```

2. Add support for key-exchange methods by using the **set system services ssh key-exchange [ method 1 method 2 ... ]** command. We recommend that you add the key-exchange methods to the end of the configuration list so that they are among the last options used. In the following example, the **dh-group1-sha1** key-exchange method is added to the default set:

```
[edit system services ssh]
user@device# set key-exchange [ curve25519-sha256 ecdh-sha2-nistp256
ecdh-sha2-nistp384 ecdh-sha2-nistp521 group-exchange-sha2 dh-group14-sha1
dh-group1-sha1 ]
```

3. Commit the configuration:

```
[edit]
user@device# commit
```

- See Also
- [ciphers on page 824](#)
  - [key-exchange on page 1083](#)
  - [macs on page 1112](#)

## Configuring Outbound SSH Service

You can configure a device running the Junos OS to initiate a TCP/IP connection with a client management application that would be blocked if the client attempted to initiate the connection (for example, if the device is behind a firewall). The **outbound-ssh** command instructs the device to create a TCP/IP connection with the client management application and to forward the identity of the device. Once the connection is established, the management application acts as the client and initiates the SSH sequence, and the device acts as the server and authenticates the client.

**NOTE:** There is no initiation command with outbound SSH. Once outbound SSH is configured and committed, the device begins to initiate an outbound SSH connection based on the committed configuration. The device repeatedly attempts to create this connection until successful. If the connection between the device and the client management application is dropped, the device again attempts to create a new outbound SSH connection until successful. This connection is maintained until the outbound SSH stanza is removed from the configuration.

To configure the device for outbound SSH connections, include the **outbound-ssh** statement at the **[edit system services]** hierarchy level:

**[edit system services outbound-ssh]**

The following topics describe the tasks for configuring the outbound SSH service:

- [Configuring the Device Identifier for Outbound SSH Connections on page 236](#)
- [Sending the Public SSH Host Key to the Outbound SSH Client on page 236](#)
- [Configuring Keepalive Messages for Outbound SSH Connections on page 237](#)
- [Configuring a New Outbound SSH Connection on page 238](#)
- [Configuring the Outbound SSH Client to Accept NETCONF as an Available Service on page 238](#)
- [Configuring Outbound SSH Clients on page 238](#)

### **Configuring the Device Identifier for Outbound SSH Connections**

---

Each time the device establishes an outbound SSH connection, it first sends an initiation sequence to the management client. This sequence identifies the device to the management client. Within this transmission is the value of **device-id**.

To configure the device identifier of the device, include the **device-id** statement at the **[edit system services outbound-ssh client *client-id*]** hierarchy level:

```
[edit system services outbound-ssh client client-id]  
device-id device-id;
```

The initiation sequence when **secret** is not configured:

```
MSG-ID: DEVICE-CONN-INFO\r\n  
MSG-VER: V1\r\n  
DEVICE-ID: <device-id>\r\n
```

### **Sending the Public SSH Host Key to the Outbound SSH Client**

---

Each time the router or switch establishes an outbound SSH connection, it first sends an initiation sequence to the management client. This sequence identifies the router or switch to the management client. Within this transmission is the value of **device-id**.

To configure the device identifier of the router or switch, include the **device-id** statement at the **[edit system services outbound-ssh client *client-id*]** hierarchy level:

```
[edit system services outbound-ssh client client-id]  
device-id device-id;
```

The initiation sequence when **secret** is not configured:

```
MSG-ID: DEVICE-CONN-INFO\r\n  
MSG-VER: V1\r\n  
DEVICE-ID: <device-id>\r\n
```

During the initialization of an SSH connection, the client authenticates the identity of the device using the public SSH host key of the device. Therefore, before the client can initiate the SSH sequence, it needs the public SSH key of the device. When you configure the

**secret** statement, the device passes its public SSH key as part of the outbound SSH connection initiation sequence.

When the **secret** statement is set and the device establishes an outbound SSH connection, the device communicates its device ID, its public SSH key, and an SHA1 hash derived in part from the **secret** statement. The value of the **secret** statement is shared between the device and the management client. The client uses the shared secret to authenticate the public SSH host key it is receiving to determine whether the public key is from the device identified by the **device-id** statement.

Using the **secret** statement to transport the public SSH host key is optional. You can manually transport and install the public key onto the client system.

**NOTE:** Including the **secret** statement means that the device sends its public SSH host key every time it establishes a connection to the client. It is then up to the client to decide what to do with the SSH host key if it already has one for that device. We recommend that you replace the client's copy with the new key. Host keys can change for various reasons and by replacing the key each time a connection is established, you ensure that the client has the latest key.

To send the router's or switch's public SSH host key when the device connects to the client, include the **secret** statement at the **[edit system services outbound-ssh client *client-id*]** hierarchy level:

```
[edit system services outbound-ssh client client-id]
secret password;
```

The following message is sent by the device when the **secret** attribute is configured:

```
MSG-ID: DEVICE-CONN-INFO\r\n
MSG-VER: V1\r\n
DEVICE-ID: <device-id>\r\n
HOST-KEY: <public-host-key>\r\n
HMAC:<HMAC(pub-SSH-host-key, <secret>>)>\r\n
```

### Configuring Keepalive Messages for Outbound SSH Connections

Once the client application has the router's or switch's public SSH host key, it can then initiate the SSH sequence as if it had created the TCP/IP connection and can authenticate the device using its copy of the router's or switch's public host SSH key as part of that sequence. The device authenticates the client user through the mechanisms supported in the Junos OS (RSA/DSA public string or password authentication).

To enable the device to send SSH protocol keepalive messages to the client application, configure the **keep-alive** statement at the **[edit system services outbound-ssh client *client-id*]** hierarchy level:

```
[edit system services outbound-ssh client client-id]
```

```
keep-alive {
    retry number;
    timeout seconds;
}
```

### Configuring a New Outbound SSH Connection

When disconnected, the device begins to initiate a new outbound SSH connection. To specify how the device reconnects to the server after a connection is dropped, include the **reconnect-strategy** statement at the **[edit system services outbound-ssh client *client-id*]** hierarchy level:

```
[edit system services outbound-ssh client-id]
reconnect-strategy (sticky | in-order);
```

You can also specify the number of retry attempts and set the amount of time before the reconnection attempts stop. See “[Configuring Keepalive Messages for Outbound SSH Connections](#)” on page 237.

### Configuring the Outbound SSH Client to Accept NETCONF as an Available Service

To configure the application to accept NETCONF as an available service, include the **services netconf** statement at the **[edit system services outbound-ssh client *client-id*]** hierarchy level:

```
[edit system services outbound-ssh client client-id]
services {
    netconf;
}
```

### Configuring Outbound SSH Clients

To configure the clients available for this outbound SSH connection, list each client with a separate address statement at the **[edit system services outbound-ssh client *client-id*]** hierarchy level:

```
[edit system services outbound-ssh client client-id]
address address {
    retry number;
    timeout seconds;
    port port-number;
}
```

**NOTE:** Outbound SSH connections support IPv4 and IPv6 address formats.

### Configuring NETCONF-Over-SSH Connections on a Specified TCP Port

The Junos OS enables you to restrict incoming NETCONF connections to a specified TCP port without configuring a firewall. To configure the TCP port used for NETCONF-over-SSH connections, include the **port** statement at the **[edit system services netconf ssh]** hierarchy

level. The configured port accepts only NETCONF-over-SSH sessions. Regular SSH session requests for this port are rejected.

You can either configure the default port 830 for NETCONF connections over SSH, as specified in RFC 4742, *Using the NETCONF Configuration Protocol over Secure Shell (SSH)*, or configure any port from 1 through 65535.

NOTE:

- The default SSH port (22) continues to accept NETCONF sessions even with a configured NETCONF server port. To disable the SSH port from accepting NETCONF sessions, specify this in the login event script.
- We do not recommend configuring the default ports for FTP (21) and Telnet (23) services for configuring NETCONF-over-SSH connections.

See Also • [port \(NETCONF\) on page 1224](#)

## Configuring Password Retry Limits for Telnet and SSH Access

To prevent brute force and dictionary attacks, the device performs the following actions for Telnet or SSH sessions by default:

- Disconnects a session after a maximum of 10 consecutive password retries.
- After the second password retry, introduces a delay in multiples of 5 seconds between subsequent password retries.

For example, the device introduces a delay of 5 seconds between the third and fourth password retry, a delay of 10 seconds between the fourth and fifth password retry, and so on.

- Enforces a minimum session time of 20 seconds during which a session cannot be disconnected. Configuring the minimum session time prevents malicious users from disconnecting sessions before the password retry delay goes into effect, and attempting brute force and dictionary attacks with multiple logins.

You can configure the password retry limits for Telnet and SSH access. In this example, you configure the device to take the following actions for Telnet and SSH sessions:

- Allow a maximum of four consecutive password retries before disconnecting a session.
- Introduce a delay in multiples of 5 seconds between password retries that occur after the second password retry.
- Enforce a minimum session time of 40 seconds during which a session cannot be disconnected.

To configure password retry limits for Telnet and SSH access:

1. Set the maximum number of consecutive password retries before a Telnet or SSH or telnet session is disconnected. The default number is **10**, but you can set a number from 1 through 10.

```
[edit system login retry-options]
user@host# set tries-before-disconnect 4
```

2. Set the threshold number of password retries after which a delay is introduced between two consecutive password retries. The default number is **2**, but you can specify a value from 1 through 3.

```
[edit system login retry-options]
user@host# set backoff-threshold 2
```

3. Set the delay (in seconds) between consecutive password retries after the threshold number of password retries. The default delay is in multiples of **5** seconds, but you can specify a value from 5 through 10 seconds.

```
[edit system login retry-options]
user@host# set backoff-factor 5
```

4. Set the minimum length of time (in seconds) during which a Telnet or SSH session cannot be disconnected. The default is **20** seconds, but you can specify an interval from 20 through 60 seconds.

```
[edit system login retry-options]
user@host# set minimum-time 40
```

5. If you are done configuring the device, enter **commit** from configuration mode.

**See Also** • [Configuring Reverse Telnet and Reverse SSH](#)

## Example: Configuring a Filter to Block Telnet and SSH Access

- [Requirements on page 240](#)
- [Overview on page 241](#)
- [Configuration on page 241](#)
- [Verification on page 243](#)

---

### Requirements

You must have access to a remote host that has network connectivity with this device.

## Overview

In this example, you create an IPv4 stateless firewall filter that logs and rejects Telnet or SSH access packets unless the packet is destined for or originates from the 192.168.1.0/24 subnet.

- To match packets destined for or originating from the **address 192.168.1.0/24** subnet, you use the **source-address 192.168.1.0/24** IPv4 match condition.
- To match packets destined for or originating from a TCP port, Telnet port, or SSH port, you use the **protocol tcp**, **port telnet**, and **telnet ssh** IPv4 match conditions.

## Configuration

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode*.

To configure this example, perform the following tasks:

- [Configure the Stateless Firewall Filter on page 241](#)
- [Apply the Firewall Filter to the Loopback Interface on page 242](#)
- [Confirm and Commit Your Candidate Configuration on page 242](#)

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set firewall family inet filter local_acl term terminal_access from source-address
  192.168.1.0/24
set firewall family inet filter local_acl term terminal_access from protocol tcp
set firewall family inet filter local_acl term terminal_access from port ssh
set firewall family inet filter local_acl term terminal_access from port telnet
set firewall family inet filter local_acl term terminal_access then accept
set firewall family inet filter local_acl term terminal_access_denied from protocol tcp
set firewall family inet filter local_acl term terminal_access_denied from port ssh
set firewall family inet filter local_acl term terminal_access_denied from port telnet
set firewall family inet filter local_acl term terminal_access_denied then log
set firewall family inet filter local_acl term terminal_access_denied then reject
set firewall family inet filter local_acl term default-term then accept
set interfaces lo0 unit 0 family inet filter input local_acl
set interfaces lo0 unit 0 family inet address 127.0.0.1/32
```

### Configure the Stateless Firewall Filter

### Step-by-Step Procedure

To configure the stateless firewall filter that selectively blocks Telnet and SSH access:

1. Create the stateless firewall filter **local\_acl**.

[edit]

```
user@myhost# edit firewall family inet filter local_acl
```

2. Define the filter term **terminal\_access**.

```
[edit firewall family inet filter local_acl]
user@myhost# set term terminal_access from source-address 192.168.1.0/24
user@myhost# set term terminal_access from protocol tcp
user@myhost# set term terminal_access from port ssh
user@myhost# set term terminal_access from port telnet
user@myhost# set term terminal_access then accept
```

3. Define the filter term **terminal\_access\_denied**.

```
[edit firewall family inet filter local_acl]
user@myhost# set term terminal_access_denied from protocol tcp
user@myhost# set term terminal_access_denied from port ssh
user@myhost# set term terminal_access_denied from port telnet
user@myhost# set term terminal_access_denied then log
user@myhost# set term terminal_access_denied then reject
user@myhost# set term default-term then accept
```

### *Apply the Firewall Filter to the Loopback Interface*

#### **Step-by-Step Procedure**

- To apply the firewall filter to the loopback interface:

```
[edit]
user@myhost# set interfaces lo0 unit 0 family inet filter input local_acl
user@myhost# set interfaces lo0 unit 0 family inet address 127.0.0.1/32
```

### *Confirm and Commit Your Candidate Configuration*

#### **Step-by-Step Procedure**

To confirm and then commit your candidate configuration:

1. Confirm the configuration of the stateless firewall filter by entering the **show firewall** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@myhost# show firewall
family inet {
  filter local_acl {
    term terminal_access {
      from {
        source-address {
          192.168.1.0/24;
        }
        protocol tcp;
        port [ssh telnet];
      }
    }
  }
}
```

```

    }
    then accept;
  }
  term terminal_access_denied {
    from {
      protocol tcp;
      port [ssh telnet];
    }
    then {
      log;
      reject;
    }
  }
  term default-term {
    then accept;
  }
}
}

```

2. Confirm the configuration of the interface by entering the **show interfaces** configuration mode command. If the command output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```

[edit]
user@myhost# show interfaces
lo0 {
  unit 0 {
    family inet {
      filter {
        input local_acl;
      }
      source-address 127.0.0.1/32;
    }
  }
}
}

```

3. If you are done configuring the device, commit your candidate configuration.

```

[edit]
user@myhost# commit

```

## Verification

Confirm that the configuration is working properly.

- [Verifying Accepted Packets on page 244](#)
- [Verifying Logged and Rejected Packets on page 244](#)

### Verifying Accepted Packets

**Purpose** Verify that the actions of the firewall filter terms are taken.

**Action** 1. Clear the firewall log on your router or switch.

```
user@myhost> clear firewall log
```

2. From a host at an IP address *within* the 192.168.1.0/24 subnet, use the **ssh *hostname*** command to verify that you can log in to the device using only SSH. This packet should be accepted, and the packet header information for this packet should not be logged in the firewall filter log buffer in the Packet Forwarding Engine.

```
user@host-A> ssh myhost
```

```
user@myhosts's password:
```

```
--- JUNOS 11.1-20101102.0 built 2010-11-02 04:48:46 UTC
```

```
% cli
```

```
user@myhost>
```

3. From a host at an IP address *within* the 192.168.1.0/24 subnet, use the **telnet *hostname*** command to verify that you can log in to your router or switch using only Telnet. This packet should be accepted, and the packet header information for this packet should not be logged in the firewall filter log buffer in the Packet Forwarding Engine.

```
user@host-A> telnet myhost
```

```
Trying 192.168.249.71...
Connected to myhost-fxp0.example.net.
Escape character is '^J'.
```

```
host (ttyp0)
```

```
login: user
```

```
Password:
```

```
--- JUNOS 11.1-20101102.0 built 2010-11-02 04:48:46 UTC
```

```
% cli
```

```
user@myhost>
```

4. Use the **show firewall log** command to verify that the routing table on the device does not contain any entries with a source address in the 192.168.1.0/24 subnet.

```
user@myhost> show firewall log
```

### Verifying Logged and Rejected Packets

**Purpose** Verify that the actions of the firewall filter terms are taken.

- Action** 1. Clear the firewall log on your router or switch.

```
user@myhost> clear firewall log
```

2. From a host at an IP address *outside of* the 192.168.1.0/24 subnet, use the **ssh hostname** command to verify that you cannot log in to the device using only SSH. This packet should be rejected, and the packet header information for this packet should be logged in the firewall filter log buffer in the Packet Forwarding Engine.

```
user@host-B ssh myhost
```

```
ssh: connect to host sugar port 22: Connection refused
--- JUNOS 11.1-20101102.0 built 2010-11-02 04:48:46 UTC
%
```

3. From a host at an IP address *outside of* the 192.168.1.0/24 subnet, use the **telnet hostname** command to verify that you can log in to the device using only Telnet. This packet should be rejected, and the packet header information for this packet should be logged in the firewall filter log buffer in the PFE.

```
user@host-B> telnet myhost
```

```
Trying 192.168.249.71...
telnet: connect to address 192.168.187.3: Connection refused
telnet: Unable to connect to remote host
%
```

4. Use the **show firewall log** command to verify that the routing table on the device does not contain any entries with a source address in the 192.168.1.0/24 subnet.

```
user@myhost> show firewall log
```

| Time     | Filter    | Action | Interface | Protocol | Src Addr      | Dest Addr     |
|----------|-----------|--------|-----------|----------|---------------|---------------|
| 18:41:25 | local_acl | R      | fxp0.0    | TCP      | 192.168.187.5 | 192.168.187.1 |
| 18:41:25 | local_acl | R      | fxp0.0    | TCP      | 192.168.187.5 | 192.168.187.1 |
| 18:41:25 | local_acl | R      | fxp0.0    | TCP      | 192.168.187.5 | 192.168.187.1 |
| ...      |           |        |           |          |               |               |
| 18:43:06 | local_acl | R      | fxp0.0    | TCP      | 192.168.187.5 | 192.168.187.1 |
| 18:43:06 | local_acl | R      | fxp0.0    | TCP      | 192.168.187.5 | 192.168.187.1 |
| 18:43:06 | local_acl | R      | fxp0.0    | TCP      | 192.168.187.5 | 192.168.187.1 |
| ...      |           |        |           |          |               |               |

## Release History Table

| Release | Description                                                                                                                                                                                                                                                          |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 18.3R1  | Starting in Junos OS Release 18.3R1, the <b>ssh-dss</b> and <b>ssh-dsa</b> hostkey algorithms are deprecated— rather than immediately removed—to provide backward compatibility and a chance to bring your configuration into compliance with the new configuration. |

## Secure Web Access Overview

You can manage a Juniper Networks device remotely through the J-Web interface. To communicate with the device, the J-Web interface uses the Hypertext Transfer Protocol (HTTP). HTTP allows easy Web access but no encryption. The data that is transmitted between the Web browser and the device by means of HTTP is vulnerable to interception and attack. To enable secure Web access, the Juniper Networks devices support HTTP over Secure Sockets Layer (HTTPS). You can enable HTTP or HTTPS access on specific interfaces and ports as needed.

The Juniper Networks device uses the Secure Sockets Layer (SSL) protocol to provide secure device management through the Web interface. SSL uses public-private key technology that requires a paired private key and an authentication certificate for providing the SSL service. SSL encrypts communication between your device and the Web browser with a session key negotiated by the SSL server certificate.

An SSL certificate includes identifying information such as a public key and a signature made by a certificate authority (CA). When you access the device through HTTPS, an SSL handshake authenticates the server and the client and begins a secure session. If the information does not match or the certificate has expired, you cannot access the device through HTTPS.

Without SSL encryption, communication between your device and the browser is sent in the open and can be intercepted. We recommend that you enable HTTPS access on your WAN interfaces.

HTTP access is enabled by default on the built-in management interfaces. By default, HTTPS access is supported on any interface with an SSL server certificate.

**See Also** • *Configuring Device Addresses (IPv4 and Loopback Addresses)*

## Generating SSL Certificates for Secure Web Access (SRX Series Devices)

To generate an SSL certificate using the **openssl** command:

1. Enter **openssl** in the CLI. The **openssl** command generates a self-signed SSL certificate in privacy-enhanced mail (PEM) format. It writes the certificate and an unencrypted 1024-bit RSA private key to the specified file.

**NOTE:** Run this command on a LINUX or UNIX device because Juniper Networks Services Gateways do not support the **openssl** command.

```
% openssl req -x509 -nodes -newkey rsa:1024 -keyout filename.pem -out
filename.pem
```

Replace **filename** with the name of a file in which you want the SSL certificate to be written—for example, **new.pem**.

2. When prompted, type the appropriate information in the identification form. For example, type **US** for the country name.
3. Display the contents of the file **new.pem**.

```
cat new.pem
```

Copy the contents of this file for installing the SSL certificate.

## Generating SSL Certificates to Be Used for Secure Web Access (EX Series Switch)

You can set up secure Web access for an EX Series switch. To enable secure Web access, you must generate a digital Secure Sockets Layer (SSL) certificate and then enable HTTPS access on the switch.

To generate an SSL certificate:

1. Enter the following **openssl** command in your SSH command-line interface on a BSD or Linux system on which **openssl** is installed. The **openssl** command generates a self-signed SSL certificate in the privacy-enhanced mail (PEM) format. It writes the certificate and an unencrypted 1024-bit RSA private key to the specified file.

```
% openssl req -x509 -nodes -newkey rsa:1024 -keyout filename.pem -out filename.pem
```

where **filename** is the name of a file in which you want the SSL certificate to be written—for example, **my-certificate**.

2. When prompted, type the appropriate information in the identification form. For example, type **US** for the country name.
3. Display the contents of the file that you created.

```
cat my-certificate.pem
```

You can use the J-Web Configuration page to install the SSL certificate on the switch. To do this, copy the file containing the certificate from the BSD or Linux system to the switch. Then open the file, copy its contents, and paste them into the Certificate box on the J-Web Secure Access Configuration page.

You can also use the following CLI statement to install the SSL certificate on the switch:

```
[edit]
user@switch# set security certificates local my-signed-cert load-key-file my-certificate.pem
```

- See Also**
- *Configuring Management Access for the EX Series Switch (J-Web Procedure)*
  - *Port Security Features*

## Generating a Self-Signed SSL Certificate Automatically

To generate a self-signed SSL certificate on Juniper Networks devices:

1. Establish basic connectivity.
2. Reboot the system. The self-signed certificate is automatically generated at startup time.

```
user@host> request system reboot
Reboot the system ? [yes,no] yes
```

3. Specify **system-generated-certificate** under HTTPS Web management.

```
[edit]
user@host# show system services web-management https
system-generated-certificate
```

## Manually Generating Self-Signed SSL Certificates

To manually generate a self-signed SSL certificate on Juniper Networks devices:

1. Establish basic connectivity.
2. If you have root login access, you can manually generate the self-signed certificate by using the following commands:

```
root@host> request security pki generate-key-pair size 512 certificate-id certname
```

Generated key pair sslcert, key size 512 bits

```
root@host> request security pki local-certificate generate-self-signed certificate-id
cert-name email email domain-name domain name ip-address IP address subject
"DC= Domain name, CN= Common-Name, OU= Organizational-Unit-name, O=
Organization-Name, ST= state, C= Country"
```

Self-signed certificate generated and loaded successfully

**NOTE:** When generating the certificate, you must specify the subject, e-mail address, and either domain-name or ip-address.

3. To verify that the certificate was generated and loaded properly, enter the **show security pki local-certificate** operational command and specify **local-certificate** under HTTPS Web management.

```
[edit]
root@host# show system services web-management https local-certificate certname
```

## Deleting Self-Signed Certificates (CLI Procedure)

You can delete a self-signed certificate that is automatically or manually generated from the EX Series switch. When you delete the automatically generated self-signed certificate, the switch generates a new self-signed certificate and stores it in the file system.

- To delete the automatically generated certificate and its associated key pair from the switch:

```
user@switch> clear security pki local-certificate system-generated
```

- To delete a manually generated certificate and its associated key pair from the switch:

```
user@switch> clear security pki local-certificate certificate-id certificate-id-name
```

- To delete all manually generated certificates and their associated key pairs from the switch:

```
user@switch> clear security pki local-certificate all
```

## Understanding Self-Signed Certificates on EX Series Switches

When you initialize a Juniper Networks EX Series Ethernet Switch with the factory default configuration, the switch generates a self-signed certificate, allowing secure access to the switch through the Secure Sockets Layer (SSL) protocol. Hypertext Transfer Protocol

over Secure Sockets Layer (HTTPS) and XML Network Management over Secure Sockets Layer (XNM-SSL) are the two services that can make use of the self-signed certificates.

**NOTE:** Self-signed certificates do not provide additional security as do those generated by Certificate Authorities (CAs). This is because a client cannot verify that the server he or she has connected to is the one advertised in the certificate.

The switches provide two methods for generating a self-signed certificate:

- Automatic generation

In this case, the creator of the certificate is the switch. An automatically generated (also called “system-generated”) self-signed certificate is configured on the switch by default.

After the switch is initialized, it checks for the presence of an automatically generated self-signed certificate. If it does not find one, the switch generates one and saves it in the file system.

A self-signed certificate that is automatically generated by the switch is similar to an SSH host key. It is stored in the file system, not as part of the configuration. It persists when the switch is rebooted, and it is preserved when a **request system snapshot** command is issued.

The switch uses the following distinguished name for the automatically generated certificate:

**“CN=<device serial number>, CN=system generated, CN=self-signed”**

If you delete the system-generated self-signed certificate on the switch, the switch generates a self-signed certificate automatically.

- Manual generation

In this case, you create the self-signed certificate for the switch. At any time, you can use the CLI to generate a self-signed certificate. Manually generated self-signed certificates are stored in the file system, not as part of the configuration.

Self-signed certificates are valid for five years from the time they are generated. When the validity of an automatically generated self-signed certificate expires, you can delete it from the switch so that the switch generates a new self-signed certificate.

System-generated self-signed certificates and manually generated self-signed certificates can coexist on the switch.

## Manually Generating Self-Signed Certificates on Switches (CLI Procedure)

EX Series switches allow you to generate custom self-signed certificates and store them in the file system. The certificate you generate manually can coexist with the automatically generated self-signed certificate on the switch. To enable secure access to the switch

over SSL, you can use either the system-generated self-signed certificate or a certificate you have generated manually.

To generate self-signed certificates manually, you must complete the following tasks:

- [Generating a Public-Private Key Pair on Switches on page 251](#)
- [Generating Self-Signed Certificates on Switches on page 251](#)

### Generating a Public-Private Key Pair on Switches

A digital certificate has an associated cryptographic key pair that is used to sign the certificate digitally. The cryptographic key pair comprises a public key and a private key. When you generate a self-signed certificate, you must provide a public-private key pair that can be used to sign the self-signed certificate. Therefore, you must generate a public-private key pair before you can generate a self-signed certificate.

To generate a public-private key pair:

```
user@switch> request security pki generate-key-pair certificate-id certificate-id-name
```

**NOTE:** Optionally, you can specify the encryption algorithm and the size of the encryption key. If you do not specify the encryption algorithm and encryption key size, default values are used. The default encryption algorithm is RSA, and the default encryption key size is 1024 bits.

After the public-private key pair is generated, the switch displays the following:

```
generated key pair certificate-id-name, key size 1024 bits
```

### Generating Self-Signed Certificates on Switches

To generate the self-signed certificate manually, include the certificate ID name, the subject of the distinguished name (DN), the domain name, the IP address of the switch, and the e-mail address of the certificate holder:

```
user@switch> request security pki local-certificate generate-self-signed certificate-id  
certificate-id-name domain-name domain-name email email-address ip-address switch-ip-address  
subject subject-of-distinguished-name
```

The certificate you have generated is stored in the switch's file system. The certificate ID you have specified while generating the certificate is a unique identifier that you can use to enable the HTTPS or XNM-SSL services.

To verify that the certificate was generated and loaded properly, enter the **show security pki local-certificate** operational command.

- See Also**
- [Enabling HTTPS and XNM-SSL Services on Switches Using Self-Signed Certificates \(CLI Procedure\)](#)

## Example: Configuring Secure Web Access

This example shows how to configure secure Web access on your device.

- [Requirements on page 252](#)
- [Overview on page 252](#)
- [Configuration on page 252](#)
- [Verification on page 253](#)

---

### Requirements

No special configuration beyond device initialization is required before configuring this feature.

**NOTE:** You can enable HTTPS access on specified interfaces. If you enable HTTPS without specifying an interface, HTTPS is enabled on all interfaces.

---

---

### Overview

In this example, you import the SSL certificate that you have generated as a new and private key in PEM format. You then enable HTTPS access and specify the SSL certificate to be used for authentication. Finally, you specify the port as 8443 on which HTTPS access is to be enabled.

---

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set security certificates local new load-key-file /var/tmp/new.pem
set system services web-management https local-certificate new port 8443
```

#### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure secure Web access on your device:

1. Import the SSL certificate and private key.

```
[edit security]
user@host# set certificates local new load-key-file /var/tmp/new.pem
```

2. Enable HTTPS access and specify the SSL certificate and port.

```
[edit system]
user@host# set services web-management https local-certificate new port 8443
```

**Results** From configuration mode, confirm your configuration by entering the **show security** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show security
certificates {
  local {
    new {
      "-----BEGIN RSA PRIVATE KEY-----\nMIICXQIBAAKBgQC/C5UI4frNqbi
      qPwbTiOkJvqoDw2YgYse0Z5zzVJyErgSg954T\nEuHM67Ck8hAOrCnb0YO+SY
      Y5rCXLf4+2s8k9EypLtYRw/Ts66DZoXI4viqE7HSsK\n5sQw/UDBlw7/MJ+OpA
      ... KYiFf4CbBBbjlMQJOHFudW6ISVBslONkzX+FT\ni95ddka6ilRnArEb4VFCRh+
      eIQBdp1UjziYf7NuzDx4Z\n -----END RSA PRIVATE KEY-----\n-----BEGIN
      CERTIFICATE----- \nMIIDjDCCAvWgAwIBAgIBADANBgkqhkiG9w0BAQQQ ...
      FADCBkTElMAkGAIUEBhMCdXMx\nCzAJBgNVBAGTAhNhMRlWEAYDVQQHEWlzdW5ue
      HB1YnMxDTALBgNVBAMTBGpucHlxdAIBgkqhkiG9w0BCQEFW5iaGFyZ2F2YUB
      fLUYAnBYmsYWOH\n -----END CERTIFICATE-----\n"; ## SECRET-DATA
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Verifying an SSL Certificate Configuration on page 253](#)
- [Verifying a Secure Access Configuration on page 253](#)

#### *Verifying an SSL Certificate Configuration*

**Purpose** Verify the SSL certificate configuration.

**Action** From operational mode, enter the **show security** command.

#### *Verifying a Secure Access Configuration*

**Purpose** Verify the secure access configuration.

**Action** From operational mode, enter the **show system services** command. The following sample output displays the sample values for secure Web access:

```
[edit]
user@host# show system services
web-management {
  http;
  https {
    port 8443;
    local-certificate new;
  }
}
```

## Access Control and Authentication on Switching Devices

---

You can control access to your network through a switch by using several different authentication. Junos OS switches support 802.1X, MAC RADIUS, and captive portal as an authentication methods to devices requiring to connect to a network. Read this topic for more information.

- [Understanding Authentication on Switches on page 256](#)
- [Understanding Access Control on Switches on page 262](#)
- [Understanding Authentication Session Timeout on page 264](#)
- [Controlling Authentication Session Timeouts \(CLI Procedure\) on page 265](#)

## Understanding Authentication on Switches

You can control access to your network through a Juniper Networks EX Series Ethernet Switch by using authentication methods such as 802.1X, MAC RADIUS, or captive portal. Authentication prevents unauthenticated devices and users from gaining access to your LAN. For 802.1X and MAC RADIUS authentication, end devices must be authenticated before they receive an IP address from a Dynamic Host Configuration Protocol (DHCP) server. For captive portal authentication, the switch allows the end devices to acquire an IP address in order to redirect them to a login page for authentication.

This topic covers:

- [Sample Authentication Topology on page 256](#)
- [802.1X Authentication on page 257](#)
- [MAC RADIUS Authentication on page 259](#)
- [Captive Portal Authentication on page 259](#)
- [Static MAC Bypass of Authentication on page 260](#)
- [Fallback of Authentication Methods on page 261](#)

### Sample Authentication Topology

---

[Figure 5 on page 257](#) illustrates a basic deployment topology for authentication on an EX Series switch:

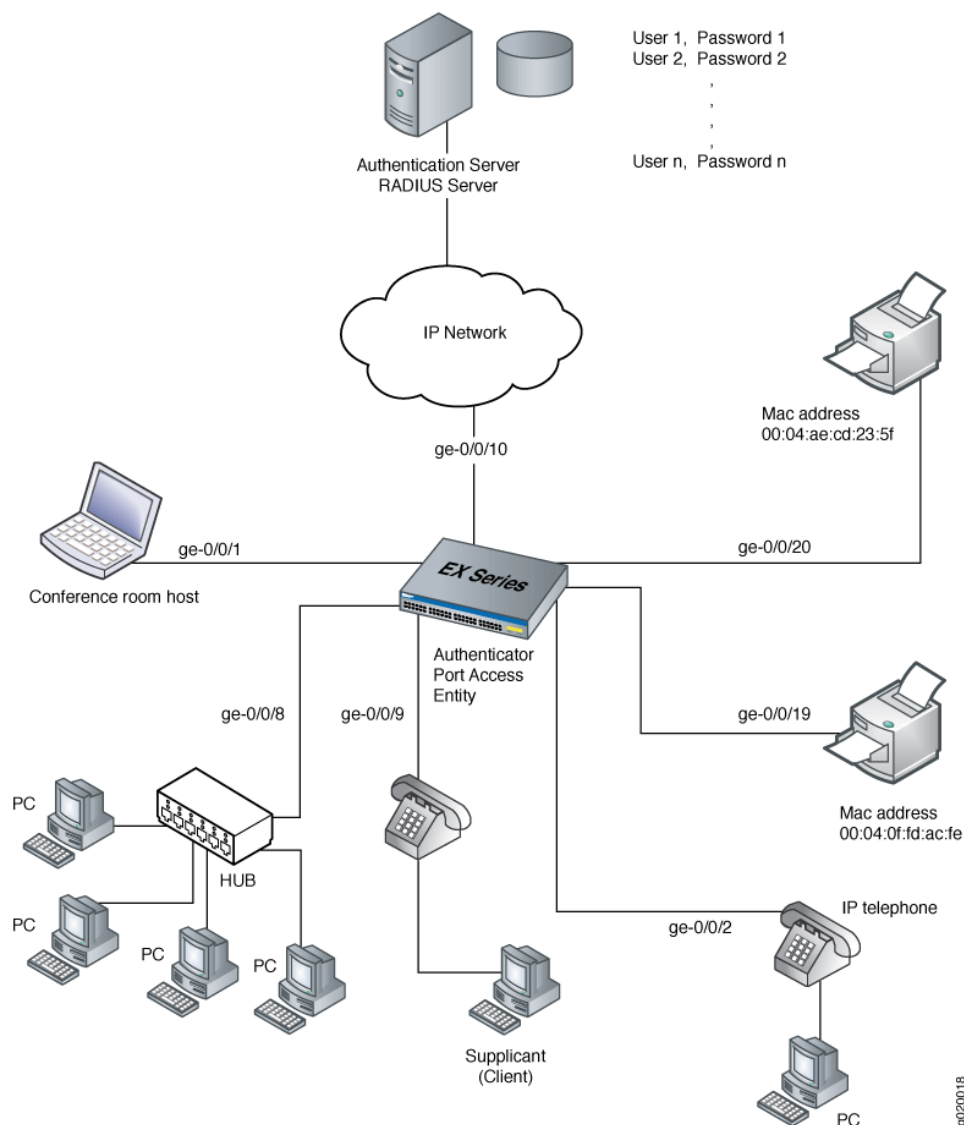

**NOTE:** For illustration purposes, we have used an EX Series switch, but a QFX5100 switch can be used in the same way.

---

Figure 5: Example Authentication Topology

The topology contains an EX Series access switch connected to the authentication server on port ge-0/0/10. Interface ge-0/0/1 connects to the conference room host. Interface ge-0/0/8 is connected to four desktop PCs through a hub. Interfaces ge-0/0/9 and ge-0/0/2 are connected to IP phones with an integrated hub to connect the phone and desktop PC to a single port. Interfaces ge-0/0/19 and ge-0/0/20 are connected to printers.

### 802.1X Authentication

802.1X is an IEEE standard for port-based network access control (PNAC). It provides an authentication mechanism for devices seeking to access a LAN. The 802.1X authentication feature on an EX Series switch is based upon the IEEE 802.1X standard *Port-Based Network Access Control*.

The communication protocol between the end device and the switch is Extensible Authentication Protocol over LAN (EAPoL). EAPoL is a version of EAP designed to work with Ethernet networks. The communication protocol between the authentication server and the switch is RADIUS.

During the authentication process, the switch completes multiple message exchanges between the end device and the authentication server. While 802.1X authentication is in process, only 802.1X traffic and control traffic can transit the network. Other traffic, such as DHCP traffic and HTTP traffic, is blocked at the data link layer.

**NOTE:** You can configure both the maximum number of times an EAPoL request packet is retransmitted and the timeout period between attempts. For information, see [“Configuring 802.1X Interface Settings \(CLI Procedure\)” on page 280](#).

An 802.1X authentication configuration for a LAN contains three basic components:

- *Supplicant* (also called end device)—Supplicant is the IEEE term for an end device that requests to join the network. The end device can be responsive or nonresponsive. A responsive end device is 802.1X-enabled and provides authentication credentials using EAP. The credentials required depend on the version of EAP being used—specifically, a username and password for EAP MD5 or a username and client certificates for Extensible Authentication Protocol-Transport Layer Security (EAP-TLS), EAP-Tunneled Transport Layer Security (EAP-TTLS), and Protected EAP (PEAP).

You can configure a server-reject VLAN to provide limited LAN access for responsive 802.1X-enabled end devices that sent incorrect credentials. A server-reject VLAN can provide a remedial connection, typically only to the Internet, for these devices. See [“Example: Configuring Fallback Options on EX Series Switches for EAP-TTLS Authentication and Odyssey Access Clients” on page 303](#) for additional information.

**NOTE:** If the end device that is authenticated using the server-reject VLAN is an IP phone, voice traffic is dropped.

A nonresponsive end device is one that is not 802.1X-enabled. It can be authenticated through MAC RADIUS authentication.

- *Authenticator port access entity*—The IEEE term for the authenticator. The switch is the authenticator, and it controls access by blocking all traffic to and from end devices until they are authenticated.
- *Authentication server*—The authentication server contains the backend database that makes authentication decisions. It contains credential information for each end device that is authenticated to connect to the network. The authenticator forwards credentials supplied by the end device to the authentication server. If the credentials forwarded by the authenticator match the credentials in the authentication server database, access is granted. If the credentials forwarded do not match, access is denied. The EX Series switches support RADIUS authentication servers.

**NOTE:** You cannot configure 802.1X authentication on redundant trunk groups (RTGs). For more information about RTGs, see *Understanding Redundant Trunk Links (Legacy RTG Configuration)*.

### MAC RADIUS Authentication

The 802.1X authentication method only works if the end device is 802.1X-enabled, but many single-purpose network devices such as printers and IP phones do not support the 802.1X protocol. You can configure MAC RADIUS authentication on interfaces that are connected to network devices that do not support 802.1X and for which you want to allow to access the LAN. When an end device that is not 802.1X-enabled is detected on the interface, the switch transmits the MAC address of the device to the authentication server. The server then tries to match the MAC address with a list of MAC addresses in its database. If the MAC address matches an address in the list, the end device is authenticated.

You can configure both 802.1X and MAC RADIUS authentication methods on the interface. In this case, the switch first attempts to authenticate the end device by using 802.1X, and if that method fails, it attempts to authenticate the end device by using MAC RADIUS authentication. If you know that only non-responsive supplicants connect on that interface, you can eliminate the delay that occurs for the switch to determine that the end device is not 802.1X-enabled by configuring the **mac-radius restrict** option. When this option is configured, the switch does not attempt to authenticate the end device through 802.1X authentication but instead immediately sends a request to the RADIUS server for authentication of the MAC address of the end device. If the MAC address of that end device is configured as a valid MAC address on the RADIUS server, the switch opens LAN access to the end device on the interface to which it is connected.

The **mac-radius-restrict** option is useful when no other 802.1X authentication methods, such as guest VLAN, are needed on the interface. If you configure **mac-radius-restrict** on an interface, the switch drops all 802.1X packets.

The authentication protocols supported for MAC RADIUS authentication are EAP-MD5, which is the default, Protected EAP (EAP-PEAP), and Password Authentication Protocol (PAP). You can specify the authentication protocol to be used for MAC RADIUS authentication using the **authentication-protocol** statement.

### Captive Portal Authentication

Captive portal authentication (hereafter referred to as captive portal) enables you to authenticate users on EX Series switches by redirecting Web browser requests to a login page that requires users to input a valid username and password before they can access the network. Captive portal controls network access by requiring users to provide information that is authenticated against a RADIUS server database by using EAP-MD5. You can also use captive portal to display an acceptable-use policy to users before they access your network.

Juniper Networks Junos operating system (Junos OS) for EX Series switches provides a template that enables you to easily design and modify the look of the captive portal login

page. You enable specific interfaces for captive portal. The first time an end device connected to a captive portal interface attempts to access a webpage, the switch presents the captive portal login page. After the device is successfully authenticated, it is allowed access to the network and to continue to the original page requested.

**NOTE:** If HTTPS is enabled, HTTP requests are redirected to an HTTPS connection for the captive portal authentication process. After authentication, the end device is returned to the HTTP connection.

If there are end devices that are not HTTP-enabled connected to the captive portal interface, you can allow them to bypass captive portal authentication by adding their MAC addresses to an authentication whitelist.

When a user is authenticated by the RADIUS server, any per-user policies (attributes) associated with that user are also sent to the switch.

Captive portal on switches has the following limitations:

- Captive portal does not support dynamic assignment of VLANs downloaded from the RADIUS server.
- If the user remains idle for more than about 5 minutes and there is no traffic passed, the user must log back in to the captive portal.

### Static MAC Bypass of Authentication

---

You can allow end devices to access the LAN without authentication on a RADIUS server by including their MAC addresses in the static MAC bypass list (also known as the exclusion list).

You might choose to include a device in the bypass list to:

- Allow non-802.1X-enabled devices access to the LAN.
- Eliminate the delay that occurs for the switch to determine that a connected device is a non-802.1X-enabled host.

When you configure static MAC on the switch, the MAC address of the end device is first checked in a local database (a user-configured list of MAC addresses). If a match is found, the end device is successfully authenticated and the interface is opened up for it. No further authentication is done for that end device. If a match is not found and 802.1X authentication is enabled on the switch, the switch attempts to authenticate the end device through the RADIUS server.

For each MAC address, you can also configure the VLAN to which the end device is moved or the interfaces on which the host connects.

**CAUTION:** When you clear the learned MAC addresses from an interface, using the `clear dot1x interface` command, all MAC addresses are cleared, including those in the static MAC bypass list.

### Fallback of Authentication Methods

You can configure 802.1X, MAC RADIUS, and captive portal authentication on a single interface to enable fallback to another method if authentication by one method fails. The authentication methods can be configured in any combination, except that you cannot configure both MAC RADIUS and captive portal on an interface without also configuring 802.1X. By default, an EX Series switch uses the following order of authentication methods:

1. 802.1X authentication—If 802.1X is configured on the interface, the switch sends EAPoL requests to the end device and attempts to authenticate the end device through 802.1X authentication. If the end device does not respond to the EAP requests, the switch checks whether MAC RADIUS authentication is configured on the interface.
2. MAC RADIUS authentication—If MAC RADIUS authentication is configured on the interface, the switch sends the MAC RADIUS address of the end device to the authentication server. If MAC RADIUS authentication is not configured, the switch checks whether captive portal is configured on the interface.
3. Captive portal authentication—If captive portal is configured on the interface, the switch attempts to authenticate the end device by using this method after the other authentication methods configured on the interface have failed.

For an illustration of the default process flow when multiple authentication methods are configured on an interface, see [“Understanding Access Control on Switches” on page 262](#).

You can override the default order for fallback of authentication methods by configuring the **authentication-order** statement to specify that the switch use either 802.1X authentication or MAC RADIUS authentication first. Captive portal must always be last in the order of authentication methods. For more information, see [“Configuring Flexible Authentication Order” on page 377](#).

**NOTE:** Starting with Junos OS Release 15.1R3, if an interface is configured in multiple-suplicant mode, end devices connecting through the interface can be authenticated using different methods in parallel. Therefore, if an end device on the interface was authenticated after fall back to captive portal, then additional end devices can still be authenticated using 802.1X or MAC RADIUS authentication.

## Understanding Access Control on Switches

You can control access to your network through a switch by using several different authentication methods—including 802.1X, MAC RADIUS, or captive portal.

[Figure 6 on page 263](#) illustrates the authentication process:

*Figure 6: Authentication Process Flow for Switches*

- [Example: Setting Up Captive Portal Authentication on an EX Series Switch on page 361](#)

## Understanding Authentication Session Timeout

Information about authentication sessions—including the associated interfaces and VLANs for each MAC address that is authenticated—is stored in the authentication session table. The authentication session table is tied to the Ethernet switching table (also called the MAC table). Each time the switch detects traffic from a MAC address, it updates the timestamp for that network node in the Ethernet switching table. A timer on the switch periodically checks the timestamp and if its value exceeds the user-configured **mac-table-aging-time** value, the MAC address is removed from the Ethernet switching table. When a MAC address ages out of the Ethernet switching table, the entry for that MAC address is also removed from the authentication session table, with the result that the session ends.

When the authentication session ends due to MAC address aging, the host must re-attempt authentication. To limit the downtime resulting from re-authentication, you can control the timeout of authentication sessions in the following ways:

- For 802.1X and MAC RADIUS authentication sessions, disassociate the authentication session table from the Ethernet switching table by using the **no-mac-table-binding** statement. This setting prevents the termination of the authentication session when the associated MAC address ages out of the Ethernet switching table.
- For captive portal authentication sessions, configure a keep-alive timer using the **user-keepalive** statement. With this option configured, when the associated MAC address ages out of the Ethernet switching table, the keep-alive timer is started. If traffic is received within the keep-alive timeout period, the timer is deleted. If there is no traffic within the keep-alive timeout period, the session is deleted.

You can also specify timeout values for authentication sessions to end the session before the MAC aging timer expires. After the session times out, the host must re-attempt authentication.

- For 802.1X and MAC RADIUS authentication sessions, the duration of the session before timeout depends on the value of the **reauthentication** statement. If the MAC aging timer expires before the session times out, and the **no-mac-table-binding** statement is not configured, the session is ended, and the host must re-authenticate.
- For captive portal authentication sessions, the duration of the session depends on the value configured for the **session-expiry** statement. If the MAC aging timer expires before the session times out, and the **user-keepalive** statement is not configured, the session is ended, and the host must re-authenticate.

**NOTE:** If the authentication server sends an authentication session timeout to the client, this takes priority over the value configured locally using either the reauthentication statement of the session-expiry statement. The session timeout value is sent from the server to the client as an attribute of the RADIUS Access-Accept message. For information about configuring the authentication server to send an authentication session timeout, see the documentation for your server.

  - [Configuring MAC Table Aging on Switches](#)

## Controlling Authentication Session Timeouts (CLI Procedure)

The expiration of an authentication session can result in downtime because the host must re-attempt authentication. You can limit this downtime by controlling the timeout period for authentication sessions.

An authentication session can end when the MAC address associated with the authenticated host ages out of the Ethernet switching table. When the MAC address is cleared from the Ethernet switching table, the authenticated session for that host ends, and the host must re-attempt authentication.

To prevent the authentication session from ending when the MAC address ages out of the Ethernet switching table:

- For sessions authenticated using 802.1X or MAC RADIUS authentication, you can prevent authentication session timeouts due to MAC address aging by disassociating the authentication session table from the Ethernet switching table using the [no-mac-table-binding](#) statement:

```
[edit]
user@switch# set protocols dot1x authenticator no-mac-table-binding;
```

- For sessions authenticated using captive portal authentication, you can prevent authentication session timeouts due to MAC address aging by extending the timeout period using the [user-keepalive](#) statement:

```
[edit]
user@switch# set services captive-portal interface interface-name user-keepalive minutes;
```

You can also configure timeout values for authentication sessions to end an authenticated session before the MAC aging timer expires.

**NOTE:** Configuring the session timeout for an authentication session does not extend the session after the MAC aging timer expires. You must configure either the `no-mac-table-binding` statement for 802.1X and MAC RADIUS authentication, or the `user-keepalive` statement for captive portal authentication, to prevent session timeout due to MAC aging.

For 802.1X and MAC RADIUS authentication sessions, configure the timeout value using the `reauthentication` statement.

- To configure the timeout value on a single interface:

```
[edit]
user@switch# set protocols dot1x authenticator interface interface-name reauthentication
seconds;
```

- To configure the timeout value on all interfaces:

```
[edit]
user@switch# set protocols dot1x authenticator interface all reauthentication seconds;
```

For captive portal authentication sessions, configure the timeout value using the `session-expiry` statement.

- To configure the timeout value on a single interface:

```
[edit]
user@switch# set services captive-portal interface interface-name session-expiry minutes;
```

- To configure the timeout value on all interfaces:

```
[edit]
user@switch# set services captive-portal interface all session-expiry minutes;
```

**NOTE:** If the authentication server sends an authentication session timeout to the client, this takes priority over the value configured using the `reauthentication` statement or the `session-expiry` statement. The session timeout value is sent from the server to the client as an attribute of the RADIUS Access-Accept message.

## Preventing Unauthorized Access to EX Series Switches Using Unattended Mode for U-Boot

Junos OS allows you to configure anattended mode for U-Boot to prevent unauthorized access to the switch during the boot process. When you configure unattended mode, an user can access the CLI during the boot process by supplying the boot-loader password. This prevents unauthorized access during boot process. Read this topic for more information.

- [Understanding Unattended Mode for U-Boot on EX Series Switches on page 267](#)
- [Using Unattended Mode for U-Boot to Prevent Unauthorized Access on page 268](#)

### Understanding Unattended Mode for U-Boot on EX Series Switches

Unattended mode for U-Boot can be configured to prevent unauthorized access to the switch that can occur during the boot process. After the CPU has been reset, there are several known methods of accessing the system before the JUNOS OS login prompt appears that do not require the user to enter authorization credentials. By gaining unauthorized access, the user can view, modify, or corrupt the switch configuration, or make the switch unavailable on the network.

When unattended mode is configured, the user can access the CLI during the boot process only by pressing <Ctrl+c> and entering the correct password, which is known as the boot-loader password. The boot-loader password must have been previously configured on the switch. Entering the correct boot-loader password will place the user in the U-Boot CLI. If the password is incorrect, or if no password is entered within one minute, access to the U-Boot CLI is blocked and the boot process continues automatically.

Access to the bootstrap loader command prompt (**loader>**) is blocked in unattended mode, which prevents the use of the following recovery mechanisms: root password recovery by using single-user mode, and booting the switch by using a software package stored on a USB flash drive.

**NOTE:** If the root password is lost while the switch is in unattended mode, the switch must be reset to the factory default configuration using the LCD panel. For more information see *Reverting to the Default Factory Configuration for the EX Series Switch*.

If unattended mode is not configured, but a boot-loader password has been configured, the user must enter the correct password to access the U-Boot CLI. If a boot-loader password has not been configured, the user can access the U-Boot CLI without entering a password. In either case, the user can access the bootstrap loader command prompt, which enables root password recovery by using single-user mode as well as booting from a USB flash drive.

Unattended mode is not enabled by default. When configured, unattended mode is turned on and will block unauthorized access to the switch. [Table 19 on page 268](#) summarizes the behaviors for U-Boot mode.

**Table 19: Unattended Mode Behavior**

| Unattended Mode | Boot-loader password | Behavior                                                                                                                                                                                                                                                                                 |
|-----------------|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| On              | Set                  | <ul style="list-style-type: none"> <li>Access to U-Boot CLI is allowed only after entering correct password.</li> <li>Access to loader command prompt is blocked.</li> <li>Booting from USB is blocked.</li> <li>Root password recovery by using single-user mode is blocked.</li> </ul> |
| On              | Not Set              | <ul style="list-style-type: none"> <li>Access to U-Boot CLI is blocked.</li> <li>Access to loader command prompt is blocked.</li> <li>Booting from USB is blocked.</li> <li>Root password recovery by using single-user mode is blocked.</li> </ul>                                      |
| Off             | Set                  | <ul style="list-style-type: none"> <li>Access to U-Boot CLI is allowed only after entering correct password.</li> <li>Access to loader command prompt is allowed.</li> <li>Booting from USB is allowed.</li> <li>Root password recovery by using single-user mode is allowed.</li> </ul> |
| Off             | Not Set              | <ul style="list-style-type: none"> <li>Access to U-Boot CLI is allowed.</li> <li>Access to loader command prompt is allowed.</li> <li>Booting from USB is allowed.</li> <li>Root password recovery by using single-user mode is allowed.</li> </ul>                                      |

## Using Unattended Mode for U-Boot to Prevent Unauthorized Access

Unattended mode for U-Boot can be used to prevent unauthorized access to the switch that can occur during the boot process. When unattended mode is configured, the user can access the CLI during the boot process only by entering the correct password, which is known as the boot-loader password. The boot-loader password must have been previously configured on the switch.

When unattended mode is configured, access to the bootstrap loader command prompt (**loader>**) is blocked, which prevents the use of the following recovery mechanisms: root password recovery by using single-user mode, and booting the switch by using a software package stored on a USB flash drive.

**WARNING:** On EX2200 switches, if both the root and unattended mode password are lost while the switch is in unattended mode, there is no alternative recovery method available. The switch must be returned to Juniper

Networks. For more information, see *Returning an EX2200 Switch or Component for Repair or Replacement*.

To use unattended mode, follow the following procedures:

- [Configuring the Boot Loader Password on page 269](#)
- [Configuring Unattended Mode for U-Boot on page 270](#)
- [Accessing the U-Boot CLI on page 270](#)

### Configuring the Boot Loader Password

To configure the boot loader password, you can use either a plain-text password that the system encrypts for you, or a password that has already been encrypted. If you use a plain-text password, Junos OS displays the password as an encrypted string so that users viewing the configuration cannot see it. As you enter the password in plain text, Junos OS encrypts it immediately. You do not have to configure Junos OS to encrypt the password. Plain-text passwords are hidden and marked as `## SECRET-DATA` in the configuration.

To configure the boot-loader password:

1. Enter either a plain-text password or an encrypted password by using the **set system boot-loader authentication** command.

- To enter a plain-text password, use the **plain-text-password** option, and re-enter the password when prompted:

```
[edit]
root@# set system boot-loader-authentication plain-text-password
New Password: type password here
Retype new password: retype password here
```

- To enter a password that is already encrypted, use the **encrypted-password** option:

```
[edit]
root@# set system boot-loader-authentication encrypted-password password
```

2. Commit the changes.

```
[edit]
root@# commit
```

3. To view the encrypted password entries, use the configuration mode **show** command. For example:

```
[edit]
root@# show system boot-loader-authentication
encrypted-password "$ABC123"; ## SECRET-DATA
```

### Configuring Unattended Mode for U-Boot

---

Before enabling unattended mode for U-Boot, you must download and install the jloader firmware package

`/volume/build/junos/13.2/service/13.2X51-D20.2/ship/jloader-ex-2200-13.2X51-D20.2-signed.tgz`, as described in [TSB16425](#).

Unattended mode for U-Boot is not enabled by default. Use the following procedure to configure unattended mode:

1. Configure unattended mode.

```
[edit]
root@# set system unattended-boot
```

2. Commit the changes.

```
[edit]
root@# commit
```

### Accessing the U-Boot CLI

---

When unattended mode for U-Boot is configured and the boot-loader password has been set, you can access the U-Boot CLI during the boot process by pressing <Ctrl+c> and entering the password at the prompt:

```
Press Ctrl-C in next 1 seconds to enter u-boot prompt...
Enter password:
password correct...
=>
```

The correct password must be entered within one minute after the prompt appears. If the password is not entered within one minute, or if the password is incorrect or has not been configured, access to the U-Boot CLI will be blocked, and the boot process will continue. For more information about unattended mode behavior, see [“Understanding Unattended Mode for U-Boot on EX Series Switches” on page 267](#).

- [Access Control and Authentication on Switching Devices on page 255](#)

## RADIUS Server Configuration for Authentication

---

Juniper Networks Ethernet Switches use 802.1X, MAC RADIUS, or captive portal authentication to provide access control to the devices or users. When 802.1X, MAC

RADIUS, or captive portal authentications are configured on the switch, end devices are evaluated at the initial connection by an authentication (RADIUS) server. To use 802.1X or MAC RADIUS authentication, you must specify the connections on the switch for each RADIUS server to which you want to connect. Read this topic for more information.

- [Specifying RADIUS Server Connections on Switches \(CLI Procedure\) on page 271](#)
- [Configuring MS-CHAPv2 to Provide Password-Change Support \(CLI Procedure\) on page 272](#)
- [Configuring MS-CHAPv2 for Password-Change Support on page 273](#)
- [Understanding Server Fail Fallback and Authentication on Switches on page 274](#)
- [Configuring RADIUS Server Fail Fallback \(CLI Procedure\) on page 275](#)

## Specifying RADIUS Server Connections on Switches (CLI Procedure)

IEEE 802.1X and MAC RADIUS authentication both provide network edge security, protecting Ethernet LANs from unauthorized user access by blocking all traffic to and from devices at the interface until the supplicant's credentials or MAC address are presented and matched on the *authentication server* (a RADIUS server). When the supplicant is authenticated, the switch stops blocking access and opens the interface to the supplicant.

To use 802.1X or MAC RADIUS authentication, you must specify the connections on the switch for each RADIUS server to which you will connect.

To configure a RADIUS server on the switch:

1. Define the IP address of the RADIUS server, the RADIUS server authentication port number, and the secret password. You can define more than one RADIUS server. The secret password on the switch must match the secret password on the server:

```
[edit access]
user@switch# set radius-server server-address port 1812 secret password
```

**NOTE:** Specifying the authentication port is optional, and port 1812 is the default. However, we recommend that you configure it in order to avoid confusion as some RADIUS servers might refer to an older default.

2. (Optional) Specify the IP address by which the switch is identified by the RADIUS server. If you do not specify the IP address, the RADIUS server uses the address of the interface that sends the RADIUS request. We recommend that you specify this IP address because if the request gets diverted on an alternate route to the RADIUS server, the interface relaying the request might not be an interface on the switch.

```
[edit access]
user@switch# set access radius-server source-address source-address
```

3. Configure the authentication order, making **radius** the first method of authentication:

```
[edit access]
user@switch# set profile profile-name authentication-order (Access Profile) radius
```

4. Create a profile and specify the list of RADIUS servers to be associated with the profile. For example, you might choose to group your RADIUS servers geographically by city. This feature enables easy modification whenever you want to change to a different set of authentication servers.

```
[edit access profile profile-name]
user@switch# set radius authentication-server server-address server-address
```

5. Specify the group of servers to be used for 802.1X or MAC RADIUS authentication by identifying the profile name:

```
[edit]
user@switch# set protocols dot1x authenticator authentication-profile-name
access-profile-name
```

6. Configure the IP address of the switch in the list of clients on the RADIUS server. For information about configuring the RADIUS server, consult the documentation for your server.

- See Also**
- [Configuring 802.1X Interface Settings \(CLI Procedure\) on page 280](#)
  - [Configuring 802.1X Authentication \(J-Web Procedure\)](#)
  - [Configuring MAC RADIUS Authentication \(CLI Procedure\) on page 313](#)
  - [Configuring 802.1X RADIUS Accounting \(CLI Procedure\) on page 323](#)

## Configuring MS-CHAPv2 to Provide Password-Change Support (CLI Procedure)

Junos OS for EX Series switches enables you to configure the Microsoft Corporation implementation of the Challenge Handshake Authentication Protocol version 2 (MS-CHAPv2) on the switch to provide password-change support. Configuring MS-CHAPv2 on the switch provides users accessing a switch the option of changing the password when the password expires, is reset, or is configured to be changed at next login.

See RFC 2433, *Microsoft PPP CHAP Extensions*, for information about MS-CHAP.

Before you configure MS-CHAPv2 to provide password-change support, ensure that you have:

- Configured RADIUS server authentication. Configure users on the authentication server and set the first-try option in the authentication order to radius. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch”](#) on page 290.

To configure MS-CHAPv2, specify the following:

```
[edit system radius-options]
user@switch# set password-protocol mschap-v2
```

You must have the required access permission on the switch in order to change your password.

- See Also**
- *Managing Users (J-Web Procedure)*
  - For more about configuring user access, see the [Junos OS Access Privilege Configuration Guide](#).

## Configuring MS-CHAPv2 for Password-Change Support

You can configure the Microsoft implementation of the Challenge Handshake Authentication Protocol version 2 (MS-CHAPv2) on the router or switch to support changing of passwords. This feature provides users accessing a router or switch the option of changing the password when the password expires, is reset, or is configured to be changed at next logon.

Before you configure MS-CHAPv2 for password-change support, ensure that you have done the following:

- Configured RADIUS server authentication parameters.
- Set the first tried option in the authentication order to RADIUS server.

To configure MS-CHAP-v2, include the following statements at the **[edit system radius-options]** hierarchy level:

```
[edit system radius-options]
password-protocol mschap-v2;
```

The following example shows statements for configuring the MS-CHAPv2 password protocol, password authentication order, and user accounts:

```
[edit]
system {
  authentication-order [ radius password ];
  radius-server {
    192.168.69.149 secret "$9$G-j.5Qz6tpBk.1hrlXxUjiq5Qn/C"; ## SECRET-DATA
  }
  radius-options {
    password-protocol mschap-v2;
  }
  login {
    user bob {
```

```
class operator;  
}  
}  
}
```

**See Also** • [Configuring Access Profiles for L2TP or PPP Parameters](#)

## Understanding Server Fail Fallback and Authentication on Switches

Juniper Networks Ethernet Switches use authentication to implement access control in an enterprise network. If 802.1X, MAC RADIUS, or captive portal authentication is configured on the switch, end devices are evaluated at the initial connection by an authentication (RADIUS) server. If the end device is configured on the authentication server, the device is granted access to the LAN and the EX Series switch opens the interface to permit access.

Server fail fallback enables you to specify how end devices connected to the switch are supported if the RADIUS authentication server becomes unavailable or sends a RADIUS access-reject message. Server fail fallback is triggered most often during reauthentication when the already configured and in-use RADIUS server becomes inaccessible. However, server fail fallback can also be triggered by an end device's first attempt at authentication through the RADIUS server.

Server fail fallback enables you to specify one of four actions to be taken for end devices awaiting authentication when the server is timed out. The switch can accept or deny access to supplicants or maintain the access already granted to supplicants before the RADIUS timeout occurred. You can also configure the switch to move the supplicants to a specific VLAN. The VLAN must already be configured on the switch. The configured VLAN name overrides any attributes sent by the server.

- *Permit* authentication, allowing traffic to flow from the end device through the interface as if the end device were successfully authenticated by the RADIUS server.
- *Deny* authentication, preventing traffic from flowing from the end device through the interface. This is the default.
- *Move* the end device to a specified VLAN if the switch receives a RADIUS access-reject message. The configured VLAN name overrides any attributes sent by the server. (The VLAN must already exist on the switch.)
- *Sustain* authenticated end devices that already have LAN access and *deny* unauthenticated end devices. If the RADIUS servers time out during reauthentication, previously authenticated end devices are reauthenticated and new users are denied LAN access.

## Configuring RADIUS Server Fail Fallback (CLI Procedure)

You can configure authentication fallback options to specify how end devices connected to a switch are supported if the RADIUS authentication server becomes unavailable or sends a RADIUS access-reject message.

When you set up 802.1X or MAC RADIUS authentication on the switch, you specify a primary authentication server and one or more backup authentication servers. If the primary authentication server cannot be reached by the switch and the secondary authentication servers are also unreachable, a RADIUS server timeout occurs. If this happens, because it is the authentication server that grants or denies access to the end devices awaiting authentication, the switch does not receive access instructions for end devices attempting access to the LAN, and normal authentication cannot be completed.

You can configure the server fail fallback feature to specify an action that the switch applies to end devices when the authentication servers are unavailable. The switch can accept or deny access to supplicants or maintain the access already granted to supplicants before the RADIUS timeout occurred. You can also configure the switch to move the supplicants to a specific VLAN.

You can also configure the server reject fallback feature for end devices that receive a RADIUS access-reject message from the authentication server. The server reject fallback feature provides limited access to a LAN, typically only to the Internet, for responsive end devices that are 802.1X-enabled but that have sent the wrong credentials.

Server fail fallback is supported for voice traffic starting in Release 14.1X53-D40 and Release 15.1R4. To configure server fail fallback actions for VoIP clients sending voice traffic, use the **server-fail-voip** statement. For all data traffic, use the **server-fail** statement. The switch determines the fallback method to use based on the type of traffic sent by the client. Untagged data frames are subject to the action configured with **server-fail**, even if they are sent by a VoIP client. Tagged VoIP VLAN frames are subject to the action configured with **server-fail-voip**. If **server-fail-voip** is not configured, the voice traffic is dropped.

**NOTE:** Server reject fallback is not supported for VoIP VLAN tagged traffic. If a VoIP client starts authentication by sending untagged data traffic to a VLAN while server reject fallback is in effect, the VoIP client is allowed to access the fallback VLAN. If the same client subsequently sends tagged voice traffic, the voice traffic is dropped.

If a VoIP client starts authentication by sending tagged voice traffic while server reject fallback is in effect, the VoIP client is denied access to the fallback VLAN.

You can use the following procedure to configure server fail actions for data clients. To configure server fail fallback for VoIP clients sending voice traffic, use the **server-fail-voip** statement in place of the **server-fail** statement.

To configure server fail fallback actions:

- Configure an interface to allow traffic to flow from a supplicant to the LAN if a RADIUS server timeout occurs (as if the end device had been successfully authenticated by a RADIUS server):

```
[edit protocols dot1x authenticator]
user@switch# set interface interface-name server-fail permit
```

- Configure an interface to prevent traffic flow from an end device to the LAN (as if the end device had failed authentication and had been denied access by the RADIUS server):

```
[edit protocols dot1x authenticator]
user@switch# set interface interface-name server-fail deny
```

- Configure an interface to move an end device to a specified VLAN if a RADIUS server timeout occurs:

```
[edit protocols dot1x authenticator]
user@switch# set interface interface-name server-fail vlan-name
```

- Configure an interface to recognize already connected end devices as reauthenticated if there is a RADIUS timeout during reauthentication (new end devices are denied access):

```
[edit protocols dot1x authenticator]
user@switch# set interface interface-name server-fail use-cache
```

You can configure an interface that receives a RADIUS access-reject message from the authentication server to move end devices attempting LAN access on the interface to a server-reject VLAN, a specified VLAN already configured on the switch.

To configure a server reject fallback VLAN:

- [edit protocols dot1x authenticator]  
user@switch# set interface *interface-name* server-reject-vlan *vlan-sf*

## 802.1X Authentication

IEEE 802.1X standard for port-based network access control and protects Ethernet LANs from unauthorized user access. It blocks all traffic to and from a supplicant (client) at the interface until the supplicant's credentials are presented and matched on the authentication server (a RADIUS server). When the supplicant is authenticated, the switch stops blocking access and opens the interface to the supplicant. Read this topic for more information.

## 802.1X for Switches Overview

### How 802.1X Authentication Works

802.1X authentication works by using an authenticator port access entity (the switch) to block ingress traffic from a supplicant (end device) at the port until the supplicant's

credentials are presented and match on the authentication server (a RADIUS server). When authenticated, the switch stops blocking traffic and opens the port to the supplicant.

The end device is authenticated in *single supplicant mode*, *single-secure supplicant mode*, or *multiple supplicant mode*:

- **single supplicant**—Authenticates only the first end device. All other end devices that connect later to the port are allowed full access without any further authentication. They effectively *piggyback* on the first end device's authentication.
- **single-secure supplicant**—Allows only one end device to connect to the port. No other end device is allowed to connect until the first device logs out.
- **multiple supplicant**—Allows multiple end devices to connect to the port. Each end device is authenticated individually.

Network access can be further defined by using VLANs and firewall filters, both of which act as filters to separate and match groups of end devices to the areas of the LAN they require. For example, you can configure VLANs to handle different categories of authentication failures depending upon:

- Whether or not the end device is 802.1X-enabled.
- Whether or not MAC RADIUS authentication is configured on the switch interfaces to which the hosts are connected.
- Whether the RADIUS authentication server becomes unavailable or sends a RADIUS access-reject message. See [“Configuring RADIUS Server Fail Fallback \(CLI Procedure\)” on page 275](#).

---

## 802.1X Features Overview

The following 802.1X features are supported on Juniper Networks Ethernet Switches:

- **Guest VLAN**—Provides limited access to a LAN, typically only to the Internet, for nonresponsive end devices that are not 802.1X-enabled when MAC RADIUS authentication is not configured on the switch interfaces to which the hosts are connected. Also, a guest VLAN can be used to provide limited access to a LAN for guest users. Typically, the guest VLAN provides access only to the Internet and to other guests' end devices.
- **Server-reject VLAN**—Provides limited access to a LAN, typically only to the Internet, for responsive end devices that are 802.1X-enabled but that have sent the wrong credentials. If the end device that is authenticated using the server-reject VLAN is an IP phone, voice traffic is not allowed.
- **Server-fail VLAN**—Provides limited access to a LAN, typically only to the Internet, for 802.1X end devices during a RADIUS server timeout.
- **Dynamic VLAN**—Enables an end device, after authentication, to be a member of a VLAN dynamically.
- **Private VLAN**—Enables configuration of 802.1X authentication on interfaces that are members of private VLANs (PVLANS).

- **Dynamic changes to a user session**—Enables the switch administrator to terminate an already authenticated session. This feature is based on support of the RADIUS Disconnect Message defined in RFC 3576.
- **VoIP VLAN**—Supports IP telephones. The implementation of a voice VLAN on an IP telephone is vendor-specific. If the phone is 802.1X-enabled, it is authenticated as any other supplicant is. If the phone is not 802.1X-enabled, but has another 802.1X-compatible device connected to its data port, that device is authenticated, and then VoIP traffic can flow to and from the phone (provided that the interface is configured in single supplicant mode and not in single-secure supplicant mode).

**NOTE:** Configuring a VoIP VLAN on private VLAN (PVLAN) interfaces is not supported.

- **RADIUS accounting**—Sends accounting information to the RADIUS accounting server. Accounting information is sent to the server whenever a subscriber logs in or logs out and whenever a subscriber activates or deactivates a subscription.
- **RADIUS server attributes for 802.1X**—The **Juniper-Switching-Filter** is a vendor-specific attribute (VSA) that can be configured on the RADIUS server to further define a supplicant's access during the 802.1X authentication process. Centrally configuring attributes on the authentication server obviates the need to configure these same attributes in the form of firewall filters on every switch in the LAN to which the supplicant might connect to the LAN. This feature is based on RFI 4583, AAA RADIUS BRAS VSA Support.

The following features are supported to authenticate devices that are not 802.1X-enabled:

- **Static MAC bypass**—Provides a bypass mechanism to authenticate devices that are not 802.1X-enabled (such as printers). Static MAC bypass connects these devices to 802.1X-enabled ports, bypassing 802.1X authentication.
- **MAC RADIUS authentication**—Provides a means to permit hosts that are not 802.1X-enabled to access the LAN. MAC-RADIUS simulates the supplicant functionality of the client device, using the MAC address of the client as username and password.

### 802.1X Authentication on Trunk Ports

Starting in Junos OS Release 18.4R1, you can configure 802.1X authentication on trunk interfaces, which allows the network access device (NAS) to authenticate an access point (AP) or another connected Layer 2 device. An AP or switch connected to the NAS will support multiple VLANs, so must connect to a trunk port. Enabling 802.1X authentication on the trunk interface protects the NAS from a security breach in which an attacker might disconnect the AP and connect a laptop to get free access to network for all the configured VLANs.

Please note the following caveats when configuring 802.1X authentication on trunk interfaces.

- Only single and single-secure supplicant modes are supported on trunk interfaces.
- You must configure 802.1X authentication locally on the trunk interface. If you configure 802.1X authentication globally using the **set protocol dot1x interface all** command, the configuration is not applied to the trunk interface.
- Dynamic VLANs are not supported on trunk interfaces.
- Guest VLAN and server-reject VLAN are not supported on trunk interfaces.
- Server fail fallback for VoIP clients is not supported on trunk interfaces (**server-fail-voip**).
- Authentication on trunk port is not supported using captive portal.
- Authentication on trunk port is not supported on aggregated interfaces.
- Configuration of 802.1X authentication on interfaces that are members of private VLANs (PVLANS) is not supported on trunk ports.

## Configuring 802.1X Interface Settings (CLI Procedure)

IEEE 802.1X authentication provides network edge security, protecting Ethernet LANs from unauthorized user access by blocking all traffic to and from a supplicant (client) at the interface until the supplicant's credentials are presented and matched on the *authentication server* (a RADIUS server). When the supplicant is authenticated, the switch stops blocking access and opens the interface to the supplicant.

### NOTE:

- You can also specify an 802.1X exclusion list to specify supplicants that can bypass authentication and be automatically connected to the LAN. See [“Configuring Static MAC Bypass of 802.1X and MAC RADIUS Authentication \(CLI Procedure\)” on page 356](#).
- You cannot configure 802.1X user authentication on interfaces that have been enabled for Q-in-Q tunneling.

---

Before you begin, specify the RADIUS server or servers to be used as the authentication server. See [“Specifying RADIUS Server Connections on Switches \(CLI Procedure\)” on page 271](#).

To configure 802.1X on an interface:

1. Configure the supplicant mode as **single** (authenticates the first supplicant), **single-secure** (authenticates only one supplicant), or **multiple** (authenticates multiple supplicants):

```
[edit protocols dot1x]
user@switch# set authenticator interface interface-name supplicant multiple
```

**NOTE:** Multiple supplicant mode is not supported on trunk interfaces.

2. Enable reauthentication and specify the reauthentication interval:

```
[edit protocols dot1x]
user@switch# set authenticator interface interface-name reauthentication interval seconds
```

3. Configure the interface timeout value for the response from the supplicant:

```
[edit protocols dot1x]
user@switch# set authenticator interface interface-name supplicant-timeout seconds
```

4. Configure the timeout for the interface before it resends an authentication request to the RADIUS server:

```
[edit protocols dot1x]
user@switch# set authenticator interface interface-name server-timeout seconds
```

5. Configure how long, in seconds, the interface waits before retransmitting the initial EAPOL PDUs to the supplicant:

```
[edit protocols dot1x]
user@switch# set authenticator interface interface-name transmit-period seconds
```

6. Configure the maximum number of times an EAPOL request packet is retransmitted to the supplicant before the authentication session times out:

```
[edit protocols dot1x]
user@switch# set authenticator interface interface-name maximum-requests number
```

7. Configure the number of times the switch attempts to authenticate the port after an initial failure. The port remains in a wait state during the quiet period after the authentication attempt.

```
[edit protocols dot1x]
user@switch# set authenticator interface interface-name retries number
```

**NOTE:** This setting specifies the number of attempts before the switch puts the interface in a *HELD* state.

## Understanding RADIUS-Initiated Changes to an Authorized User Session

When using an authentication service that is based on a client/server RADIUS model, requests are typically initiated by the client and sent to the RADIUS server. There are instances in which a request might be initiated by the server and sent to the client in order to dynamically modify an authenticated user session already in progress. The client that receives and processes the messages is the switch, which acts as the network access server, or NAS. The server can send the switch a Disconnect message requesting to terminate a session, or a Change of Authorization (CoA) message requesting to modify the session authorization attributes.

The switch listens for unsolicited RADIUS requests on UDP port 3799, and accepts requests only from a trusted source. Authorization to send a Disconnect or CoA request is determined based on the source address and the corresponding shared secret, which must be configured on the switch as well as on the RADIUS server. For more information about configuring the source address and shared secret on the switch, see [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 290](#).

- [Disconnect Messages on page 282](#)
- [Change of Authorization Messages on page 283](#)
- [CoA Request Port Bounce on page 283](#)
- [Error-Cause Codes on page 284](#)

---

### Disconnect Messages

The RADIUS server sends a Disconnect-Request message to the switch in order to terminate a user session and discard all associated session context. The switch responds to a Disconnect-Request packet with a Disconnect-ACK message if the request is successful, that is, all associated session context is discarded and the user session is no longer connected, or with a Disconnect-NAK packet if the request fails, that is, the authenticator is unable to disconnect the session and discard all associated session context.

In Disconnect-Request messages, RADIUS attributes are used to uniquely identify the switch (NAS) and the user session. The combination of NAS identification attributes and session identification attributes included in the message must match at least one session for the request to be successful; otherwise, the switch responds with a Disconnect-NAK message. A Disconnect-Request message can contain only NAS and session identification attributes; if any other attributes are included, the switch responds with a Disconnect-NAK message.

### Change of Authorization Messages

---

Change of Authorization (CoA) messages contain information for dynamically modifying the authorization attributes for a user session to change the authorization level. This occurs as part of a two-step authentication process, in which the endpoint is first authenticated using MAC RADIUS authentication, and is then profiled based on the type of device. The CoA message is used to apply an enforcement policy that is appropriate for the device, typically by changing the data filters or the VLAN.

The switch responds to a CoA message with a CoA-ACK message if the authorization change is successful, or a with CoA-NAK message if the change is unsuccessful. If one or more authorization changes specified in a CoA-Request message cannot be carried out, the switch responds with a CoA-NAK message.

In CoA-Request messages, RADIUS attributes are used to uniquely identify the switch (acting as the NAS) and the user session. The combination of NAS identification attributes and session identification attributes included in the message must match the identification attributes of at least one session for the request to be successful; otherwise, the switch responds with a CoA-NAK message.

CoA-Request packets also include the session authorization attributes that will be modified if the request is accepted. The supported session authorization attributes are listed below. The CoA message can contain any or all of these attributes. If any attribute is not included as part of the CoA-Request message, the NAS assumes that the value for that attribute is to remain unchanged.

- Filter-ID
- Tunnel-Private-Group-ID
- Juniper-Switching-Filter
- Juniper-VoIP-VLAN
- Session-Timeout

### CoA Request Port Bounce

---

When a CoA message is used to change the VLAN for an authenticated host, end devices such as printers do not have a mechanism to detect the VLAN change, so they do not renew the lease for their DHCP address in the new VLAN. Starting in Junos OS Release 17.3, the port bounce feature can be used to force the end device to initiate DHCP re-negotiation by causing a link flap on the authenticated port.

The command to bounce the port is sent from the RADIUS server using a Juniper Networks vendor-specific attribute (VSA). The port is bounced if the following VSA attribute-value pair is received in the CoA message from the RADIUS server:

- Juniper-AV-Pair = "Port-Bounce"

To enable the port bounce feature, you must update the Junos dictionary file (**juniper.dct**) on the RADIUS server with the Juniper-AV-Pair VSA. Locate the dictionary file and add the following text to the file:

```
ATTRIBUTE Juniper-AV-Pair Juniper-VSA(52, string) r
```

For more information about adding the VSA, consult the FreeRADIUS documentation.

You can disable the feature by configuring the **ignore-port-bounce** statement at the **[edit protocols dot1x authenticator interface interface-name mac-radius]** hierarchy level.

### Error-Cause Codes

When a disconnect or CoA operation is unsuccessful, an Error-Cause attribute (RADIUS attribute 101) can be included in the response message sent by the NAS to the server to provide detail about the cause of the problem. If the detected error does not map to one of the supported Error-Cause attribute values, the router sends the message without an error-cause attribute. See [Table 20 on page 284](#) for descriptions of error-cause codes that can be included in response messages sent from the NAS.

*Table 20: Error-Cause Codes (RADIUS Attribute 101)*

| Code | Value                            | Description                                                                                                                                                                                                                  |
|------|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 201  | Residual session context removed | Sent in response to a Disconnect-Request message if one or more user sessions are no longer active, but residual session context was found and successfully removed. This code is sent only within a Disconnect-ACK message. |
| 401  | Unsupported attribute            | The request contains an attribute that is not supported (for example, a third-party attribute).                                                                                                                              |
| 402  | Missing attribute                | A critical attribute (for example, the session identification attribute) is missing from a request.                                                                                                                          |
| 403  | NAS identification mismatch      | Request contains one or more NAS identification attributes that do not match the identity of the NAS receiving the request.                                                                                                  |
| 404  | Invalid request                  | Some other aspect of the request is invalid—for example, if one or more attributes are not formatted properly.                                                                                                               |
| 405  | Unsupported service              | The Service-Type attribute included with the request contains an invalid or unsupported value.                                                                                                                               |
| 406  | Unsupported extension            | The entity receiving the request (either an NAS or a RADIUS proxy) does not support RADIUS-initiated requests.                                                                                                               |
| 407  | Invalid attribute value          | The request contains an attribute with an unsupported value.                                                                                                                                                                 |

Table 20: Error-Cause Codes (RADIUS Attribute 101) (continued)

| Code | Value                                  | Description                                                                                                                                                   |
|------|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 501  | Administratively prohibited            | The NAS is configured to prohibit honoring of Disconnect-Request or CoA-Request messages for the specified session.                                           |
| 503  | Session context not found              | The session context identified in the request does not exist on the NAS.                                                                                      |
| 504  | Session context not removable          | The subscriber identified by attributes in the request is owned by a component that is not supported. This code is sent only within a Disconnect-NAK message. |
| 506  | Resources unavailable                  | A request could not be honored because of lack of available NAS resources (such as memory).                                                                   |
| 507  | Request initiated                      | The CoA-Request message includes a Service-Type attribute with a value of Authorize Only.                                                                     |
| 508  | Multiple session selection unsupported | The session identification attributes included in the request match multiple sessions, but the NAS does not support requests that apply to multiple sessions. |

## Filtering 802.1X Suplicants by Using RADIUS Server Attributes

There are two ways to configure the a RADIUS server with port firewall filters (Layer 2 firewall filters):

- Include one or more filter terms in the Juniper-Switching-Filter attribute. The Juniper-Switching-Filter attribute is a vendor-specific attribute (VSA) listed under attribute ID number 48 in the Juniper dictionary on the RADIUS server. Use this VSA to configure simple filter conditions for 802.1X authenticated users. Nothing needs to be configured on the switch; all of the configuration is on the RADIUS server.
- Configure a local firewall filter on each switch and apply that firewall filter to users authenticated through the RADIUS server. Use this method for more complex filters. The firewall filter must be configured on each switch.

**NOTE:** If the firewall filter configuration is modified after users are authenticated using the 802.1X authentication, then the established 802.1X authentication session must be terminated and re-established for the firewall filter configuration changes to take effect.

This topic includes the following tasks:

1. [Configuring Firewall Filters on the RADIUS Server on page 286](#)
2. [Applying a Locally Configured Firewall Filter from the RADIUS Server on page 289](#)

## Configuring Firewall Filters on the RADIUS Server

You can configure simple filter conditions by using the `Juniper-Switching-Filter` attribute in the Juniper dictionary on the RADIUS server. These filters are sent to a switch whenever a new user is authenticated successfully. The filters are created and applied on all EX Series switches that authenticate users through that RADIUS server without the need for you to configure anything on each individual switch.

**NOTE:** This procedure describes using FreeRADIUS software to configure the `Juniper-Switching-Filter` VSA. For specific information about configuring your server, consult the AAA documentation included with your server.

To configure the `Juniper-Switching-Filter` attribute, enter one or more filter terms by using the CLI for the RADIUS server. Each filter term consists of match conditions with a corresponding action. Enter the filter terms enclosed within quotation marks ( " ") by using the following syntax:

```
Juniper-Switching-Filter = "match <destination-mac mac-address> <source-vlan
vlan-name> <source-dot1q-tag tag> <destination-ip ip-address> <ip-protocol
protocol-id> <source-port port> <destination-port port> action (allow | deny)
<forwarding-class class-of-service> <loss-priority (low | medium | high)>"
```

More than one match condition can be included in a filter term. When multiple conditions are specified in a filter term, they must all be fulfilled for the packet to match the filter term. For example, the following filter term requires a packet to match *both* the destination IP address and the destination MAC address to meet the term criteria:

```
Juniper-Switching-Filter = "match destination-ip 10.10.10.8 destination-mac
00:00:00:01:02:03 action allow"
```

Multiple filter terms should be separated with commas—for example:

```
Juniper-Switching-Filter = "match destination-mac 00:00:00:01:02:03 action allow,
match destination-port 80 destination-mac 00:aa:bb:cc:dd:ee action allow"
```

See ["Juniper-Switching-Filter VSA Match Conditions and Actions"](#) on page 195 for definitions of match conditions and actions.

**NOTE:** On EX9200 switches, and in a Junos Fusion Enterprise with EX9200 as the aggregate device, the dynamic firewall filter is strictly applied for all IP packets. If the filter is configured to allow only a specific destination IP address, packets with other IP addresses as the destination IP will be dropped per the filter rules. This includes any IP protocol packets, such as DHCP, IGMP and ARP packets.

To configure match conditions on the RADIUS server:

1. Verify that the Juniper dictionary is loaded on your RADIUS server and includes the filtering attribute **Juniper-Switching-Filter** (attribute ID 48):

```
[root@freeradius]# cat /usr/local/share/freeradius/dictionary.juniper
```

```
# dictionary.juniper
#
# Version:      $Id: dictionary.juniper,v 1.2.6.1 2005/11/30 22:17:25 aland
Exp
$
#  VENDOR      Juniper      2636
BEGIN-VENDOR   Juniper
ATTRIBUTE      Juniper-Local-User-Name      1      string
ATTRIBUTE      Juniper-Allow-Commands       2      string
ATTRIBUTE      Juniper-Deny-Commands        3      string
ATTRIBUTE      Juniper-Allow-Configuration  4      string
ATTRIBUTE      Juniper-Deny-Configuration   5      string
ATTRIBUTE      Juniper-Switching-Filter      48     string
<-
```

2. Enter the match conditions and actions. For example:

- To deny authentication based on the 802.1Q tag (here, the 802.1Q tag is 10):

```
[root@freeradius]#
cd /usr/local/etc/raddb
vi users
```

For each relevant user, add the **Juniper-Switching-Filter** attribute:

**Juniper-Switching-Filter = "Match Source-dot1q-tag 10 Action deny"**

- To deny access based on a destination IP address:

```
[root@freeradius]# cd /usr/local/etc/raddb
vi users
```

For each relevant user, add the **Juniper-Switching-Filter** attribute:

**Juniper-Switching-Filter = "Match Destination-ip 192.168.1.0/31 Action deny"**

- To set the packet loss priority (PLP) to **high** based on a destination MAC address and the IP protocol:

```
[root@freeradius]# cd /usr/local/etc/raddb
vi users
```

For each relevant user, add the **Juniper-Switching-Filter** attribute:

**Juniper-Switching-Filter = "Match Destination-mac 00:04:0f:fd:ac:fe, Ip-protocol 2, forwarding-class high, Action loss-priority high"**

.....

**NOTE:** For the `forwarding-class` option to be applied, the forwarding class must be configured on the switch and the packet loss priority specified. If it is not configured on the switch, this option is ignored. You must specify both the forwarding class and the packet loss priority.

.....

3. Stop and restart the RADIUS process to activate the configuration.

### Applying a Locally Configured Firewall Filter from the RADIUS Server

You can apply a port firewall filter (Layer 2 firewall filter) to user policies centrally from the RADIUS server. The RADIUS server can then specify the firewall filters that are to be applied to each user that requests authentication, reducing the need to configure the same firewall filter on multiple switches. Use this method when the firewall filter contains a large number of conditions or you want to use different conditions for the same filter on different switches. The firewall filters must be configured on each switch.

For more information about firewall filters, see *Firewall Filters for EX Series Switches Overview*.

To apply a port firewall filter centrally from the RADIUS server:

**NOTE:** If port firewall filters are also configured locally for the interface, then the firewall filters configured by using VSAs take precedence if they conflict with the locally configured port firewall filters. If there is no conflict, they are merged.

1. Create the firewall filter on the local switch. See *Configuring Firewall Filters (CLI Procedure)* for more information on configuring a port firewall filter.
2. On the RADIUS server, open the **users** file to display the local user profiles of the end devices to which you want to apply the filter:

```
[root@freeradius]#  
cat /usr/local/etc/raddb/usersvi users
```

3. Apply the filter to each user profile by adding the Filter-ID attribute with the filter name as the attribute value:

**Filter-Id =filter-name**

For example, the user profile below for **supplicant1** includes the Filter-ID attribute with the filter name **filter1**:

```
[root@freeradius]# cat /usr/local/etc/raddb/users  
  
supplicant1 Auth-Type := EAP, User-Password == "supplicant1"  
    Tunnel-Type = VLAN,  
    Tunnel-Medium-Type = IEEE-802,  
    Tunnel-Private-Group-Id = "1005",  
    Filter-Id = "filter1"
```

**NOTE:** Multiple filters are not supported on a single interface. However, you can support multiple filters for multiple users that are connected to

the switch on the same interface by configuring a single filter with policies for each of those users.

.....

4. Stop and restart the RADIUS process to activate the configuration.

- See Also**
- [Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants by Using RADIUS Server Attributes on an EX Series Switch on page 337](#)
  - *Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches*

### Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch

802.1X is the IEEE standard for port-based network access control (PNAC). You use 802.1X to control network access. Only users and devices providing credentials that have been verified against a user database are allowed access to the network. You can use a RADIUS server as the user database for 802.1X authentication, as well as for MAC RADIUS authentication.

This example describes how to connect a RADIUS server to an EX Series switch, and configure it for 802.1X:

- [Requirements on page 290](#)
- [Overview and Topology on page 291](#)
- [Configuration on page 293](#)
- [Verification on page 294](#)

#### Requirements

---

This example uses the following software and hardware components:

- Junos OS Release 9.0 or later for EX Series switches
- One EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you connect the server to the switch, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See the documentation that describes setting up basic bridging and a VLAN for your switch. If you are using a switch that supports the Enhanced Layer 2 Software (ELS) configuration style, see *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch with ELS Support*

. For all other switches, see *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch*.

**NOTE:** For more about ELS, see *Using the Enhanced Layer 2 Software CLI*.

- Configured users on the RADIUS authentication server.

---

### Overview and Topology

The EX Series switch acts as an authenticator PAE. It blocks all traffic and acts as a control gate until the supplicant (client) is authenticated by the server. All other users and devices are denied access.

Figure 7 on page 292 shows one EX4200 switch that is connected to the devices listed in Table 21 on page 292.

Figure 7: Topology for Configuration

Table 21: Components of the Topology

| Property          | Settings                                                                                                                                                                                           |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Switch hardware   | EX4200 access switch, 24 Gigabit Ethernet ports: 8 PoE ports ( <code>ge-0/0/0</code> through <code>ge-0/0/7</code> ) and 16 non-PoE ports ( <code>ge-0/0/8</code> through <code>ge-0/0/23</code> ) |
| VLAN name         | default                                                                                                                                                                                            |
| One RADIUS server | Backend database with an address <b>10.0.0.100</b> connected to the switch at port <b>ge-0/0/10</b>                                                                                                |

In this example, connect the RADIUS server to access port ge-0/0/10 on the EX4200 switch. The switch acts as the authenticator and forwards credentials from the supplicant to the user database on the RADIUS server. You must configure connectivity between the EX4200 and the RADIUS server by specifying the address of the server and configuring the secret password. This information is configured in an access profile on the switch.

**NOTE:** For more information about authentication, authorization, and accounting (AAA) services, see the [Junos OS System Basics Configuration Guide](#).

### Configuration

**CLI Quick Configuration** To quickly connect the RADIUS server to the switch, copy the following commands and paste them into the switch terminal window:

```
[edit]
set access radius-server 10.0.0.100 secret juniper
set access radius-server 10.0.0.200 secret juniper
set access profile profile1 authentication-order radius
set access profile profile1 radius authentication-server [10.0.0.100 10.0.0.200]
```

**Step-by-Step Procedure** To connect the RADIUS server to the switch:

1. Define the address of the servers, and configure the secret password. The secret password on the switch must match the secret password on the server:

```
[edit]
user@switch# set access radius-server 10.0.0.100 secret juniper
user@switch# set access radius-server 10.0.0.200 secret juniper
```

2. Configure the authentication order, making **radius** the first method of authentication:

```
[edit]
user@switch# set access profile profile1 authentication-order radius
```

3. Configure a list of server IP addresses to be tried in sequential order to authenticate the supplicant:

```
[edit]
user@switch# set access profile profile1 radius authentication-server [10.0.0.100
10.0.0.200]
```

**Results** Display the results of the configuration:

```
user@switch> show configuration access
radius-server {
  10.0.0.100
  port 1812;
  secret "$ABC123"; ## SECRET-DATA
}
```

```
}
profile profile1{
  authentication-order radius;
  radius {
    authentication-server 10.0.0.100 10.0.0.200;
  }
}
```

---

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verify That the Switch and RADIUS Server Are Properly Connected on page 294](#)

#### *Verify That the Switch and RADIUS Server Are Properly Connected*

**Purpose** Verify that the RADIUS server is connected to the switch on the specified port.

**Action** Ping the RADIUS server to verify the connection between the switch and the server:

```
user@switch> ping 10.0.0.100

PING 10.0.0.100 (10.0.0.100): 56 data bytes
64 bytes from 10.93.15.218: icmp_seq=0 ttl=64 time=9.734 ms
64 bytes from 10.93.15.218: icmp_seq=1 ttl=64 time=0.228 ms
```

**Meaning** ICMP echo request packets are sent from the switch to the target server at 10.0.0.100 to test whether the server is reachable across the IP network. ICMP echo responses are being returned from the server, verifying that the switch and the server are connected.

## Understanding Dynamic Filters Based on RADIUS Attributes

You can use RADIUS server attributes to implement port firewall filters on a RADIUS authentication server. These filters can be dynamically applied to supplicants that request authentication through that server. RADIUS server attributes are clear-text fields encapsulated in Access-Accept messages sent from the authentication server to the switch when a supplicant connected to the switch is successfully authenticated. The

switch, acting as the authenticator, uses the information in the RADIUS attributes to apply the related filters to the supplicant. Dynamic filters can be applied to multiple ports on the same switch, or to multiple switches that use the same authentication server, providing centralized access control for the network.

You can define firewall filters directly on the RADIUS server by using the Juniper-Switching-Filter attribute, which is a RADIUS attribute specific to Juniper Networks, also known as a vendor-specific attribute (VSA). VSAs are described in RFC 2138, *Remote Authentication Dial In User Service* (RADIUS). The Juniper-Switching-Filter VSA is listed under attribute ID number 48 in the Juniper dictionary on the RADIUS server, with the vendor ID set to the Juniper Networks ID number 2636. Using this attribute, you define filters on the authentication server, which are applied on all switches that authenticate supplicants through that server. This method eliminates the need to configure the same filters on multiple switches.

Alternatively, you can apply a port firewall filter to multiple ports on the same switch by using the Filter-ID attribute, which is RADIUS attribute ID number 11. To use the Filter-ID attribute, you must first configure a filter on the switch, and then add the filter name to user policies on the RADIUS server as the value of the Filter-ID attribute. When a supplicant defined in one of those policies is authenticated by the RADIUS server, the filter is applied to the switch port that has been authenticated for the supplicant. Use this method when the firewall filter has complex conditions, or if you want to use different conditions for the same filter on different switches. The filter named in the Filter-ID attribute must be configured locally on the switch at the `[edit firewall family ethernet-switching filter]` hierarchy level.

VSAs are supported only for 802.1X single supplicant configurations and multiple supplicant configurations.

  - [Configuring Firewall Filters \(CLI Procedure\)](#)
  - [Juniper-Switching-Filter VSA Match Conditions and Actions on page 195](#)

## Understanding Dynamic VLAN Assignment Using RADIUS Attributes

VLANs can be dynamically assigned by a RADIUS server to supplicants requesting 802.1X authentication through that server. You configure the VLAN on the RADIUS server using RADIUS server attributes, which are clear-text fields encapsulated in messages sent from the authentication server to the switch when a supplicant connected to the switch requests authentication. The switch, acting as the authenticator, uses the information in the RADIUS attributes to assign the VLAN to the supplicant. Based on the results of the authentication, a supplicant that began authentication in one VLAN might be assigned to another VLAN.

Successful authentication requires that the VLAN ID or VLAN name is configured on the switch acting as 802.1X authenticator, and that it matches the VLAN ID or VLAN name

sent by the RADIUS server during authentication. If neither exists, the end device is not authenticated. If a guest VLAN is established, the unauthenticated end device is automatically moved to the guest VLAN.

The RADIUS server attributes used for dynamic VLAN assignment described in RFC 2868, *RADIUS Attributes for Tunnel Protocol Support*.

- Tunnel-Type—Defined as RADIUS attribute type 64. The value should be set to **VLAN**.
- Tunnel-Medium-Type—Defined as RADIUS attribute type 65. The value should be set to **IEEE-802**.
- Tunnel-Private-Group-ID—Defined as RADIUS attribute type 81. The value should be set to the VLAN ID or the VLAN name.

For more information about configuring dynamic VLANs on your RADIUS server, see the documentation for your RADIUS server.

- See Also**
- [Example: Configuring MAC RADIUS Authentication on an EX Series Switch on page 314](#)
  - [Example: Setting Up 802.1X in Conference Rooms to Provide Internet Access to Corporate Visitors on an EX Series Switch on page 331](#)

## Understanding Guest VLANs for 802.1X on Switches

Guest VLANs can be configured on switches that are using 802.1X authentication to provide limited access—typically only to the Internet—for:

- Corporate guests
- End devices that are not 802.1X-enabled
- Nonresponsive end devices when MAC RADIUS authentication has not been configured on the switch interfaces to which the hosts are connected

A guest VLAN is not used for supplicants that send incorrect credentials. Those supplicants are directed to the server-reject VLAN instead.

For end devices that are not 802.1X-enabled, a guest VLAN can allow limited access to a server from which the non-802.1X-enabled end device can download the supplicant software and attempt authentication again.

A guest VLAN is not used when MAC RADIUS authentication has been configured on the switch interfaces to which the hosts are connected.

- See Also**
- [Example: Setting Up 802.1X in Conference Rooms to Provide Internet Access to Corporate Visitors on an EX Series Switch on page 331](#)
  - [Understanding Authentication on Switches on page 256](#)

## Example: Configuring 802.1X Authentication Options When the RADIUS Server Is Unavailable to an EX Series Switch

Server fail fallback enables you to specify how 802.1X supplicants connected to the switch are supported if the RADIUS authentication server becomes unavailable or sends a RADIUS access-reject message.

You use 802.1X to control network access. Only users and devices (supplicants) providing credentials that have been verified against a user database are allowed access to the network. You use a RADIUS server as the user database.

This example describes how to configure an interface to move a supplicant to a VLAN in the event of a RADIUS server timeout:

- [Requirements on page 297](#)
- [Overview and Topology on page 298](#)
- [Configuration on page 300](#)
- [Verification on page 301](#)

### Requirements

This example uses the following software and hardware components:

**NOTE:** This example also applies to QFX5100 switches.

- Junos OS Release 9.3 or later for EX Series switches
- One EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you connect the server to the switch, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See the documentation that describes setting up basic bridging and a VLAN for your switch. If you are using a switch that supports the Enhanced Layer 2 Software (ELS) configuration style, see *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch with ELS Support* or *Example: Setting Up Basic Bridging and a VLAN on Switches*. For all other switches, see *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch*.

**NOTE:** For more about ELS, see *Using the Enhanced Layer 2 Software CLI*.

- Set up a connection between the switch and the RADIUS server. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 290](#).

- Configured users on the authentication server.

---

### Overview and Topology

A RADIUS server timeout occurs if no authentication RADIUS servers are reachable when a supplicant logs in and attempts to access the LAN. Using server fail fallback, you configure alternative options for supplicants attempting LAN access. You can configure the switch to accept or deny access to supplicants or to maintain the access already granted to supplicants before the RADIUS server timeout. Additionally, you can configure the switch to move supplicants to a specific VLAN if a RADIUS timeout occurs or if the RADIUS server sends an EAP Access-Reject message.

Figure 8 on page 299 shows the topology used for this example. The RADIUS server is connected to the EX4200 switch on access port **ge-0/0/10**. The switch acts as the authenticator port access entity (PAE) and forwards credentials from the supplicant to the user database on the RADIUS server. The switch blocks all traffic and acts as a control gate until the supplicant is authenticated by the authentication server. A supplicant is connected to the switch through interface **ge-0/0/1**.

**NOTE:** This figure also applies to QFX5100 switches.

---

Figure 8: Topology for Configuring 802.1X Options

Table 22 on page 299 describes the components in this topology.

Table 22: Components of the Topology

| Property          | Settings                                                                                               |
|-------------------|--------------------------------------------------------------------------------------------------------|
| Switch hardware   | EX4200 access switch, 24 Gigabit Ethernet ports: 16 non-PoE ports and 8 PoE ports.                     |
| VLAN names        | <b>default</b> VLAN<br><b>vlan-sf</b> VLAN                                                             |
| Supplicant        | Supplicant attempting access on interface <b>ge-0/0/1</b>                                              |
| One RADIUS server | Backend database with an address of <b>10.0.0.100</b> connected to the switch at port <b>ge-0/0/10</b> |

In this example, configure interface ge-0/0/1 to move a supplicant attempting access to the LAN during a RADIUS timeout to another VLAN. A RADIUS timeout prevents the normal exchange of EAP messages that carry information from the RADIUS server to the

switch and permit the authentication of a supplicant. The default VLAN is configured on interface ge-0/0/1. When a RADIUS timeout occurs, supplicants on the interface will be moved from the default VLAN to the VLAN named vlan-sf.

### Configuration

---

**CLI Quick Configuration** To quickly configure server fail fallback on the switch, copy the following commands and paste them into the switch terminal window:

```
[edit protocols dot1x authenticator]
set interface ge-0/0/1 server-fail vlan-name vlan-sf
```

**Step-by-Step Procedure** To configure an interface to divert supplicants to a specific VLAN when a RADIUS timeout occurs (here, the VLAN is **vlan-sf**):

1. Define the VLAN to which supplicants are diverted:

```
[edit protocols dot1x authenticator]
user@switch# set interface ge-0/0/1 server-fail vlan-name vlan-sf
```

**Results** Display the results of the configuration:

```
user@switch> show configuration
interfaces {
  ge-0/0/1 {
    unit 0 {
      family ethernet-switching {
        vlan {
          members default;
        }
      }
    }
  }
}
protocols {
  dot1x {
    authenticator {
      interface {
        ge-0/0/1.0 {
          server-fail vlan-name vlan-sf;
        }
      }
    }
  }
}
```

### Verification

---

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That the Supplicants Are Moved to an Alternative VLAN During a RADIUS Timeout on page 301](#)

#### ***Verifying That the Supplicants Are Moved to an Alternative VLAN During a RADIUS Timeout***

**Purpose** Verify that the interface moves supplicants to an alternative VLAN during a RADIUS timeout.

**NOTE:** On switches running Junos OS for EX Series with support for ELS, the output for the `show vlans` command will contain additional information. If your switch runs software that supports ELS, see *show vlans*. For ELS details, see *Using the Enhanced Layer 2 Software CLI*

---

**Action** Display the VLANs configured on the switch; the interface **ge-0/0/1.0** is a member of the **default** VLAN:

```
user@switch> show vlans
```

| Name    | Tag | Interfaces                                                                                              |
|---------|-----|---------------------------------------------------------------------------------------------------------|
| default |     | ge-0/0/0.0, ge-0/0/1.0*, ge-0/0/5.0*, ge-0/0/10.0, ge-0/0/12.0*, ge-0/0/14.0*, ge-0/0/15.0, ge-0/0/20.0 |
| v2      | 77  | None                                                                                                    |
| vlan-sf | 50  | None                                                                                                    |
| mgmt    |     | me0.0*                                                                                                  |

Display 802.1X protocol information on the switch to view supplicants that are authenticated on interface **ge-0/0/1.0**:

```
user@switch> show dot1x interface brief
```

802.1X Information:

| Interface   | Role          | State         | MAC address       | User |
|-------------|---------------|---------------|-------------------|------|
| ge-0/0/1.0  | Authenticator | Authenticated | 00:00:00:00:00:01 | abc  |
| ge-0/0/10.0 | Authenticator | Initialize    |                   |      |
| ge-0/0/14.0 | Authenticator | Connecting    |                   |      |
| ge-0/0/15.0 | Authenticator | Initialize    |                   |      |
| ge-0/0/20.0 | Authenticator | Initialize    |                   |      |

A RADIUS server timeout occurs. Display the Ethernet switching table to show that the supplicant with the MAC address **00:00:00:00:00:01** previously accessing the LAN through the **default** VLAN is now being learned on the VLAN named **vlan-sf**:

```
user@switch> show ethernet-switching table
```

Ethernet-switching table: 3 entries, 1 learned

| VLAN    | MAC address       | Type  | Age  | Interfaces    |
|---------|-------------------|-------|------|---------------|
| v1      | *                 | Flood |      | - All-members |
| vlan-sf | 00:00:00:00:00:01 | Learn | 1:07 | ge-0/0/1.0    |
| default | *                 | Flood |      | - All-members |

Display 802.1X protocol information to show that interface **ge-0/0/1.0** is connecting and will open LAN access to supplicants:

```
user@switch> show dot1x interface brief
```

802.1X Information:

| Interface   | Role          | State      | MAC address | User |
|-------------|---------------|------------|-------------|------|
| ge-0/0/1.0  | Authenticator | Connecting |             |      |
| ge-0/0/10.0 | Authenticator | Initialize |             |      |
| ge-0/0/14.0 | Authenticator | Connecting |             |      |
| ge-0/0/15.0 | Authenticator | Initialize |             |      |
| ge-0/0/20.0 | Authenticator | Initialize |             |      |

**Meaning** The `show vlans` command displays interface `ge-0/0/1.0` as a member of the **default** VLAN. The `show dot1x interface brief` command shows that a supplicant (`abc`) is authenticated on interface `ge-0/0/1.0` and has the MAC address `00:00:00:00:00:01`. A RADIUS server timeout occurs, and the authentication server cannot be reached by the switch. The `show-ethernet-switching table` command shows that MAC address `00:00:00:00:00:01` is learned on VLAN `vlan-sf`. The supplicant has been moved from the **default** VLAN to the `vlan-sf` VLAN. The supplicant is then connected to the LAN through the VLAN named `vlan-sf`.

- [Example: Setting Up 802.1X for Single-Supplicant or Multiple-Supplicant Configurations on an EX Series Switch on page 325](#)
  - [Configuring RADIUS Server Fail Fallback \(CLI Procedure\) on page 275](#)
  - [Configuring 802.1X RADIUS Accounting \(CLI Procedure\) on page 323](#)
  - [Understanding Server Fail Fallback and Authentication on Switches on page 274](#)

### Example: Configuring Fallback Options on EX Series Switches for EAP-TTLS Authentication and Odyssey Access Clients

For 802.1X user authentication, EX Series switches support RADIUS authentication servers that are using Extensible Authentication Protocol–Tunneled TLS (EAP-TTLS) to authenticate Odyssey Access Client (OAC) supplicants. OAC networking software runs on endpoint computers (desktop, laptop, or notepad computers and supported wireless devices) and provides secure access to both wired and wireless networks.

This example describes how to configure an 802.1X-enabled interface on the switch to provide fallback support for OAC users who have entered incorrect login credentials:

- [Requirements on page 303](#)
- [Overview and Topology on page 304](#)
- [Configuration on page 306](#)
- [Verification on page 307](#)

#### Requirements

This example uses the following software and hardware components:

**NOTE:** This example also applies to QFX5100 switches.

- Junos OS Release 11.2 or later for EX Series switches
- One EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.

- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.
- One OAC end device acting as a supplicant.

Before you begin configuring the fallback option, ensure that you have:

- Set up a connection between the switch and the RADIUS server. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch”](#) on page 290.
- Configured EAP-TTLS on the server. See your RADIUS server documentation.
- Configured users on the RADIUS server. See your RADIUS server documentation.

---

### Overview and Topology

OAC is networking software that runs on endpoint computers (desktop, laptop, or notepad) and supported wireless devices. OAC provides full support for EAP, which is required for secure wireless LAN access.

In this topology, OAC is deployed with an 802.1X-enabled switch and a RADIUS server. The switch functions as an enforcement point in the network security architecture. This topology:

- Ensures that only authorized users can connect.
- Maintains privacy of login credentials.
- Maintains data privacy over the wireless link.

This example includes the configuration of a server-reject VLAN on the switch, which can be used to prevent accidental lockout for users who have entered incorrect login credentials. These users can be given limited LAN access.

However, this fallback configuration is complicated by the fact that the OAC supplicant and RADIUS server are using EAP-TTLS. EAP-TTLS creates a secure encrypted tunnel between the server and the end device to complete the authentication process. When the user enters incorrect login credentials, the RADIUS server sends EAP failure messages directly to the client through this tunnel. The EAP failure message causes the client to restart the authentication procedure, so that the switch's 802.1X authentication process tears down the session that was established with the switch using the server-reject VLAN. You can enable the remedial connection to continue by configuring:

- **eapol-block**—Enable the EAPoL block timer on the 802.1X interface that is configured to belong to the server-reject VLAN. The block timer causes the authentication port access entity to ignore EAP start messages from the client, attempting to restart the authentication procedure.

**NOTE:** The EAPoL block timer is triggered only after the configured number of allowed reattempts (using the `retries` option) on the 802.1X interface have been exhausted. You can configure `retries` to specify the number of times the switch attempts to authenticate the port after an initial failure. The default is three retries.

- **block-interval**—Configure the amount of time that you want the EAPoL block timer to continue to ignore EAP start messages. If you do not configure the block interval, the EAPoL block timer defaults to 120 seconds.

When the 802.1X interface ignores the EAP start messages from the client, the switch allows the existing remedial session that was established through the `server-reject-vlan` to remain open.

These configuration options apply to single, single-secure, and multiple supplicant authentication modes. In this example, the 802.1X interface is configured in single supplicant mode.

Figure 9 on page 305 shows an EX Series switch connecting an OAC end device to a RADIUS server, and indicates the protocols being used to connect the network entities.

**NOTE:** This figure also applies to QFX5100 switches.

Figure 9: EX Series Switch Connecting OAC to RADIUS Server Using EAP-TTLS Authentication

Table 23 on page 305 describes the components in this OAC deployment:

Table 23: Components of the OAC Deployment

| Property         | Settings                                                                                            |
|------------------|-----------------------------------------------------------------------------------------------------|
| Switch hardware  | EX Series switch                                                                                    |
| VLANs            | <b>default</b><br><b>server-reject-vlan:</b> VLAN name is <b>remedial</b> and VLAN ID is <b>700</b> |
| 802.1X interface | <b>ge-0/0/8</b>                                                                                     |

Table 23: Components of the OAC Deployment (continued)

| Property                         | Settings |
|----------------------------------|----------|
| OAC supplicant                   | EAP-TTLS |
| One RADIUS authentication server | EAP-TTLS |

### Configuration

**CLI Quick Configuration** To quickly configure the fallback options for EAP-TTLS and OAC supplicants, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans remedial vlan-id 700
set protocols dot1x authenticator interface ge-0/0/8 retries 4
set protocols dot1x authenticator interface ge-0/0/8 server-reject-vlan remedial
set protocols dot1x authenticator interface ge-0/0/8 server-reject-vlan eapol-block
set protocols dot1x authenticator interface ge-0/0/8 server-reject-vlan block-interval 130
```

**Step-by-Step Procedure** To configure the fallback options for EAP-TTLS and OAC supplicants:

**TIP:** In this example, the switch has only one server-reject VLAN. Therefore, the configuration specifies `eapol-block` and `block-interval` directly after `server-reject-vlan`. However, if you have configured multiple VLANs on the switch, you must include the VLAN name or VLAN ID directly after `server-reject-vlan` to indicate which VLAN is being modified.

1. Configure a VLAN that will function as the server-reject VLAN to provide limited LAN access for users who have entered incorrect login credentials:

```
[edit]
user@switch# set vlans remedial vlan-id 700
```

2. Configure the number of times for the client to be prompted for username and password before an incorrect login is directed to the server-reject VLAN:

```
[edit protocols dot1x authenticator interface ge-0/0/8]
user@switch# set retries 4
```

3. Configure the 802.1X authenticator interface to use the server-reject VLAN as a fallback for incorrect logins:

```
[edit protocols dot1x authenticator interface ge-0/0/8]
user@switch# set server-reject-vlan remedial
```

4. Enable the EAPoL block timer on the 802.1X interface that is configured to belong to the server-reject VLAN.

```
[edit protocols dot1x authenticator interface ge-0/0/8]
```

```
user@switch# set server-reject-vlan eapol-block
```

5. Configure the amount of time for the EAPoL block to remain in effect:

```
[edit protocols dot1x authenticator interface ge-0/0/8]  
user@switch# set server-reject-vlan block-interval 130
```

### Results

Check the results of the configuration:

```
user@switch> show configuration  
protocols {  
  dot1x {  
    authenticator {  
      interface {  
        ge-0/0/8.0 {  
          supplicant single;  
          retries 4;  
          server-reject-vlan remedial block-interval 130 eapol-block;  
        }  
      }  
    }  
  }  
}
```

### Verification

To confirm that the configuration and the fallback options are working correctly, perform this task:

- [Verifying the Configuration of the 802.1X Interface on page 307](#)

#### *Verifying the Configuration of the 802.1X Interface*

**Purpose** Verify that the 802.1X interface is configured with the desired options.

**Action** user@switch> **show dot1x** interface ge-0/0/8.0 detail

```

ge-0/0/8.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 4
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 120 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPoL requests: 2
  Guest VLAN member: guest
  Number of connected supplicants: 1
    Supplicant: tem, 2A:92:E6:F2:00:00
      Operational state: Authenticated
      Backend Authentication state: Idle
      Authentication method: Radius
      Authenticated VLAN: remedial
      Session Reauth interval: 120 seconds
      Reauthentication due in 68 seconds

```

**Meaning** The **show dot1x ge-0/0/8 detail** command output shows that the **ge-0/0/8** interface is in the **Authenticated** state and that it is using the **remedial** VLAN.

**See Also** • [Understanding Authentication on Switches on page 256](#)

## Monitoring 802.1X Authentication

**Purpose**

**NOTE:** This topic applies only to the J-Web Application package.

J-Web Application package Release 14.1X53-A2 does not support 802.1X authentication on EX4600 switches.

Use the monitoring feature to display details of authenticated users and users that failed authentication.

**Action** To display authentication details in the J-Web interface, select **Monitoring > Security > 802.1X**.

To display authentication details in the CLI, enter the following commands:

- **show dot1x interface detail | display xml**
- **show dot1x interface detail <interface> | display xml**

- **show dot1x auth-failed-users**

**Meaning** The details displayed include:

- A list of authenticated users.
- The number of connected users.
- A list of users that failed authentication.

You can also specify an interface for which the details must be displayed.

**See Also**

- *Configuring 802.1X Authentication (J-Web Procedure)*
- [Example: Setting Up 802.1X for Single-Suppliant or Multiple-Suppliant Configurations on an EX Series Switch on page 325](#)

## Verifying 802.1X Authentication

**Purpose** Verify that supplicants are being authenticated on an interface on a switch with the interface configured for 802.1X authentication, and display the method of authentication being used.

**Action** Display detailed information about an interface configured for 802.1X (here, the interface is ge-0/0/16):

```
user@switch> show dot1x interface ge-0/0/16.0 detail
```

```
ge-0/0/16.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Enabled
  Mac Radius Strict: Disabled
  Reauthentication: Enabled Reauthentication interval: 40 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 1
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user5, 00:30:48:8C:66:BD
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: v200
      Reauthentication due in 17 seconds
```

**Meaning** The sample output from the **show dot1x interface detail** command shows that the **Number of connected supplicants** is 1. The supplicant that was authenticated and is now connected

to the LAN is known as **user5** on the RADIUS server and has the MAC address **00:30:48:8C:66:BD**. The supplicant was authenticated by means of the 802.1X authentication method called RADIUS authentication, as indicated by **Radius** in the output. When RADIUS authentication is used, the supplicant is configured on the RADIUS server, the RADIUS server communicates this to the switch, and the switch opens LAN access on the interface to which the supplicant is connected. The sample output also shows that the supplicant is connected to VLAN **v200**.

Other 802.1X authentication methods supported on EX Series switches in addition to RADIUS authentication are:

- Guest VLAN—A nonresponsive host is granted Guest-VLAN access.
- MAC Radius—A nonresponsive host is authenticated based on its MAC address. The MAC address is configured as permitted on the RADIUS server, the RADIUS server notifies the switch that the MAC address is a permitted address, and the switch grants LAN access to the nonresponsive host on the interface to which it is connected.
- Server-fail deny—If the RADIUS servers time out, all supplicants are denied access to the LAN, preventing traffic from the supplicant from traversing through the interface. This is the default.
- Server-fail permit—When the RADIUS server is unavailable, a supplicant is still permitted access to the LAN as if the supplicant were successfully authenticated by the RADIUS server.
- Server-fail use-cache—If the RADIUS servers time out during reauthentication, previously authenticated supplicants are granted LAN access, but new supplicants are denied LAN access.
- Server-fail VLAN—A supplicant is configured to be moved to a specified VLAN if the RADIUS server is unavailable to reauthenticate the supplicant. (The VLAN must already exist on the switch.)

## Troubleshooting Authentication of End Devices on EX Series Switches

**Problem**    **Description:** End devices configured using static MAC addresses lose connection to the switch after the `clear dot1x interface` command is run to clear all learned MAC addresses. Before clearing MAC addresses:

```
user@switch# run show ethernet-switching table
Ethernet-switching table: 3 entries, 1 learned, 0 persistent entries
VLAN      MAC address      Type      Age Interfaces
vlan100    *                Flood     - A11-members
default    *                Flood     - A11-members
default    00:a0:d4:00:03:00 Learn     0 ge-3/0/16.0
```

```

user@switch> show dot1x authentication-bypassed-users
MAC address      Interface      VLAN
00:a0:d4:00:03:00 ge-3/0/16.0    configured/default

```

To clear MAC addresses:

```

user@switch> clear dot1x interface

```

After clearing MAC addresses:

```

user@switch> show ethernet-switching table
Ethernet-switching table: 2 entries, 0 learned, 0 persistent entries
  VLAN      MAC address  Type      Age Interfaces
  ----      -
vlan100     *            Flood     - All-members
default     *            Flood     - All-members

user@switch> show dot1x authentication-bypassed-users

```

Note that there are no end devices on the authentication bypass list.

**Cause** Static MAC addresses are treated the same as other learned MAC addresses on an interface. When the `clear dot1x interface` command is run, it clears all learned MAC addresses from the interface, including the static MAC bypass list (also known as the exclusion list).

**Solution** If you run the `clear dot1x interfaces` command for an interface that has static MAC addresses configured for authentication bypass, re-add the static MAC addresses to the static MAC bypass list.

---

## MAC RADIUS Authentication

You can control access to your network through a switch by using several different authentication. Junos OS switches support 802.1X, MAC RADIUS, and captive portal as an authentication methods to devices requiring to connect to a network.

You can configure MAC RADIUS authentication on the switch interfaces to which the hosts are connected to provide LAN access. For more information, read this topic.

- [Configuring MAC RADIUS Authentication \(CLI Procedure\) on page 313](#)
- [Example: Configuring MAC RADIUS Authentication on an EX Series Switch on page 314](#)

## Configuring MAC RADIUS Authentication (CLI Procedure)

You can permit devices that are not 802.1X-enabled LAN access by configuring MAC RADIUS authentication on the switch interfaces to which the hosts are connected.

**NOTE:** You can also allow non-802.1X-enabled devices to access the LAN by configuring their MAC address for static MAC bypass of authentication.

You can configure MAC RADIUS authentication on an interface that also allows 802.1X authentication, or you can configure either authentication method alone.

If both MAC RADIUS and 802.1X authentication are enabled on the interface, the switch first sends the host three EAPoL requests to the host. If there is no response from the host, the switch sends the host's MAC address to the RADIUS server to check whether it is a permitted MAC address. If the MAC address is configured as permitted on the RADIUS server, the RADIUS server sends a message to the switch that the MAC address is a permitted address, and the switch opens LAN access to the nonresponsive host on the interface to which it is connected.

If MAC RADIUS authentication is configured on the interface but 802.1X authentication is not (by using the **mac-radius restrict** option), the switch attempts to authenticate the MAC address with the RADIUS server without delaying by attempting 802.1X authentication first.

Before you configure MAC RADIUS authentication, be sure you have:

- Configured basic access between the switch and the RADIUS server. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch”](#) on page 290.

To configure MAC RADIUS authentication by using the CLI:

- On the switch, configure the interfaces to which the nonresponsive hosts are attached for MAC RADIUS authentication, and add the **restrict** qualifier for interface **ge-0/0/20** to have it use only MAC RADIUS authentication:

```
[edit]
user@switch# set protocols dot1x authenticator interface ge-0/0/19 mac-radius
user@switch# set protocols dot1x authenticator interface ge-0/0/20 mac-radius restrict
```

- On a RADIUS authentication server, create user profiles for each nonresponsive host using the MAC address (without colons) of the nonresponsive host as the username and password (here, the MAC addresses are **00:04:0f:fd:ac:fe** and **00:04:ae:cd:23:5f**):

```
[root@freeradius]#
edit /etc/raddb
vi users
00040ffdacfe Auth-type:=Local, User-Password = "00040ffdacfe"
0004aecd235f Auth-type:=Local, User-Password = "0004aecd235f"
```

**See Also** • [Understanding Authentication on Switches on page 256](#)

## Example: Configuring MAC RADIUS Authentication on an EX Series Switch

To permit hosts that are not 802.1X-enabled to access a LAN, you can configure MAC RADIUS authentication on the switch interfaces to which the non-802.1X-enabled hosts are connected. When MAC RADIUS authentication is configured, the switch will attempt to authenticate the host with the RADIUS server by using the host's MAC address.

This example describes how to configure MAC RADIUS authentication for two non-802.1X-enabled hosts:

- [Requirements on page 314](#)
- [Overview and Topology on page 315](#)
- [Configuration on page 317](#)
- [Verification on page 318](#)

### Requirements

---

This example uses the following software and hardware components:

**NOTE:** This example also applies to QFX5100 switches.

---

- Junos OS Release 9.3 or later for EX Series switches.
- An EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- A RADIUS authentication server. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you configure MAC RADIUS authentication, be sure you have:

- Configured basic access between the EX Series switch and the RADIUS server. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 290](#).
- Performed basic bridging and VLAN configuration on the switch. See the documentation that describes setting up basic bridging and a VLAN for your switch. If you are using a switch that supports the Enhanced Layer 2 Software (ELS) configuration style, see *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch with ELS Support* or *Example: Setting Up Basic Bridging and a VLAN on Switches*. For all other switches, see *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch*.

**NOTE:** For more about ELS, see: *Using the Enhanced Layer 2 Software CLI*

---

- Performed basic 802.1X configuration. See “[Configuring 802.1X Interface Settings \(CLI Procedure\)](#)” on page 280.

### Overview and Topology

IEEE 802.1X port-based network access control (PNAC) authenticates and permits devices access to a LAN if the devices can communicate with the switch by using the 802.1X protocol (that is, the devices are 802.1X-enabled). To permit non-802.1X-enabled end devices to access the LAN, you can configure MAC RADIUS authentication on the interfaces to which the end devices are connected. When the MAC address of the end device appears on the interface, the switch consults the RADIUS server to check whether it is a permitted MAC address. If the MAC address of the end device is configured as permitted on the RADIUS server, the switch opens LAN access to the end device.

You can configure both MAC RADIUS authentication and 802.1X authentication methods on an interface configured for multiple supplicants. Additionally, if an interface is connected only to a non-802.1X-enabled host, you can enable MAC RADIUS and not enable 802.1X authentication by using the **mac-radius restrict** option, and thus avoid the delay that occurs while the switch determines that the device does not respond to EAP messages.

[Figure 10 on page 316](#) shows the two printers connected to the switch.

**NOTE:** This figure also applies to QFX5100 switches.

Figure 10: Topology for MAC RADIUS Authentication Configuration

Table 24 on page 316 shows the components in the example for MAC RADIUS authentication.

Table 24: Components of the MAC RADIUS Authentication Configuration Topology

| Property                                  | Settings                                                                  |
|-------------------------------------------|---------------------------------------------------------------------------|
| Switch hardware                           | EX4200 ports (ge-0/0/0 through ge-0/0/23)                                 |
| VLAN name                                 | sales                                                                     |
| Connections to printers (no PoE required) | ge-0/0/19, MAC address 00040ffdacfe<br>ge-0/0/20, MAC address 0004aec235f |
| RADIUS server                             | Connected to the switch on interface <b>ge-0/0/10</b>                     |

The printer with the MAC address 00040ffdacfe is connected to access interface ge-0/0/19. A second printer with the MAC address 0004aecd235f is connected to access interface ge-0/0/20. In this example, both interfaces are configured for MAC RADIUS authentication on the switch, and the MAC addresses (without colons) of both printers are configured on the RADIUS server. Interface ge-0/0/20 is configured to eliminate the normal delay while the switch attempts 802.1X authentication; MAC RADIUS authentication is enabled and 802.1X authentication is disabled using the **mac radius restrict** option.

### Configuration

#### CLI Quick Configuration

To quickly configure MAC RADIUS authentication, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols dot1x authenticator interface ge-0/0/19 mac-radius
set protocols dot1x authenticator interface ge-0/0/20 mac-radius restrict
```

**NOTE:** You must also configure the two MAC addresses as usernames and passwords on the RADIUS server, as is done in step 2 of the Step-by-Step Procedure.

#### Step-by-Step Procedure

Configure MAC RADIUS authentication on the switch and on the RADIUS server:

1. On the switch, configure the interfaces to which the printers are attached for MAC RADIUS authentication, and configure the restrict option on interface ge-0/0/20, so that only MAC RADIUS authentication is used:

```
[edit]
user@switch# set protocols dot1x authenticator interface ge-0/0/19 mac-radius
user@switch# set protocols dot1x authenticator interface ge-0/0/20 mac-radius restrict
```

2. On the RADIUS server, configure the MAC addresses 00040ffdacfe and 0004aecd235f as usernames and passwords:

```
[root@freeradius]#
edit /etc/raddb
vi users
00040ffdacfe Auth-type:=EAP, User-Password = "00040ffdacfe"
0004aecd235f Auth-type:=EAP, User-Password = "0004aecd235f"
```

**Results** Display the results of the configuration on the switch:

```
user@switch> show configuration
protocols {
  dot1x {
    authenticator {
      authentication-profile-name profile52;
```

```
interface {  
  ge-0/0/19.0 {  
    mac-radius;  
  }  
  ge-0/0/20.0 {  
    mac-radius {  
      restrict;  
    }  
  }  
}  
}  
}
```

---

### Verification

Verify that the supplicants are authenticated:

- [Verifying That the Supplicants Are Authenticated on page 318](#)

#### *Verifying That the Supplicants Are Authenticated*

**Purpose** After supplicants are configured for MAC RADIUS authentication on the switch and on the RADIUS server, verify that they are authenticated and display the method of authentication.

**Action** Display information about the 802.1X-configured interfaces ge-0/0/19 and ge-0/0/20:

```
user@switch> show dot1x interface ge-0/0/19.0 detail
```

```
ge-0/0/19.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Enabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user101, 00:04:0f:fd:ac:fe
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: vo11
      Dynamic Filter: match source-dot1q-tag 10 action deny
      Session Reauth interval: 60 seconds
      Reauthentication due in 50 seconds
```

```
user@switch> show dot1x interface ge-0/0/20.0 detail
```

```
ge-0/0/20.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Enabled
  Mac Radius Restrict: Enabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user102, 00:04:ae:cd:23:5f
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: vo11
      Dynamic Filter: match source-dot1q-tag 10 action deny
      Session Reauth interval: 60 seconds
      Reauthentication due in 50 seconds
```

**Meaning** The sample output from the `show dot1x interface detail` command displays the MAC address of the connected end device in the **Supplicant** field. On interface ge-0/0/19, the MAC address is **00:04:0f:fd:ac:fe**, which is the MAC address of the first printer configured for MAC RADIUS authentication. The **Authentication method** field displays the

authentication method as **Radius**. On interface **ge-0/0/20**, the MAC address is **00:04:ae:cd:23:5f**, which is the MAC address of the second printer configured for MAC RADIUS authentication. The **Authentication method** field displays the authentication method as **Radius**.

## 802.1X and RADIUS Accounting

EX Series Switches support RADIUS accounting. You can configure RADIUS accounting on an EX Series switch to collect statistical data about users logging in to or out of a LAN and send that data to a RADIUS accounting server. The data gathered is used for network monitoring purpose.

- [Understanding 802.1X and RADIUS Accounting on Switches on page 320](#)
- [Configuring 802.1X RADIUS Accounting \(CLI Procedure\) on page 323](#)

### Understanding 802.1X and RADIUS Accounting on Switches

Juniper Networks EX Series Ethernet Switches support IETF RFC 2866, *RADIUS Accounting*. By configuring RADIUS accounting on an EX Series switch, you can collect statistical data about users logging in to or out of a LAN and send that data to a RADIUS accounting server. The statistical data gathered can be used to perform general network monitoring, to analyze and track usage patterns, or to bill a user based on the amount of time or type of services accessed.

- [RADIUS Accounting Process on page 320](#)
- [Supported RADIUS Attributes on page 321](#)

---

#### RADIUS Accounting Process

RADIUS accounting is based on a client/server model in which the switch, operating as the network access server (NAS), is the client. The client forwards user accounting statistics to a designated RADIUS accounting server. The RADIUS accounting server must send a response to the client when it has successfully received and recorded the accounting statistics.

The RADIUS accounting process between a switch and a RADIUS server is based on the exchange of two types of RADIUS messages—Accounting-Request and Accounting-Response. Accounting-Request messages are sent from the switch to the server and convey information used to account for a service provided to a user. Accounting-Response messages are sent from the server to acknowledge receipt of the Accounting-Request packets. The exchange of messages between the switch and the server proceeds as follows:

1. A RADIUS accounting server listens for User Datagram Protocol (UDP) packets on a specific port. For example, on FreeRADIUS, the default port is 1813.
2. When a supplicant is authenticated through 802.1X authentication and then connected to the LAN, the switch forwards an Accounting-Request message with a record of the event to the accounting server. The Accounting-Request message sent by the switch includes the RADIUS attribute Acct-Status-Type with a value of Start, which indicates the beginning of user service for this supplicant. The accounting server records this event in the accounting log file as a start record.
3. The accounting server sends an Accounting-Response message back to the switch confirming that it received the accounting request. If the switch does not receive a response from the server, it continues to send accounting requests until an accounting response is returned from the accounting server.
4. The switch might send an interim message to the accounting server to periodically update the server with information pertaining to a specific session. Interim messages are sent as Accounting-Request messages with the Acct-Status-Type attribute value of Interim-Update. The accounting server sends an Accounting-Response message back to the switch to confirm receipt of an interim update.
5. When the supplicant's session ends, the switch forwards an Accounting-Request message with the Acct-Status-Type attribute value set to Stop, indicating the end of user service. The accounting server records this event in the accounting log file as a stop record that contains session information and the length of the session.

The statistics collected through this process can be displayed from the RADIUS server. To view those statistics, the user needs to access the accounting log file configured to receive them. On FreeRADIUS, the filename is the server's address—for example, 122.69.1.250.

### Supported RADIUS Attributes

RADIUS accounting statistics are conveyed through the attributes included in each Accounting-Request message sent from the NAS to the server. [Table 25 on page 321](#) list the RADIUS attributes supported for Accounting-Request messages.

**Table 25: RADIUS Accounting Request Attributes**

| Type | Attribute | Description                                                                                                                      |
|------|-----------|----------------------------------------------------------------------------------------------------------------------------------|
| 1    | User-Name | The name of the authenticated user.                                                                                              |
| 5    | NAS-Port  | The physical port number of the NAS that authenticates the user. Either NAS-Port or NAS-Port-ID must be contained in the packet. |

**Table 25: RADIUS Accounting Request Attributes (continued)**

| Type | Attribute          | Description                                                                                                                                                                        |
|------|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8    | Framed-IP-Address  | The IP address of the authenticated user.<br><br><b>NOTE:</b> The Framed-IP-Address attribute is sent only if a valid DHCP binding exists for the host in the DHCP snooping table. |
| 11   | Filter-ID          | The name of the filter list for the user.                                                                                                                                          |
| 12   | Framed-MTU         | The maximum transmission unit that can be configured for the user.                                                                                                                 |
| 26   | Client-System-Name | Vendor-specific attribute (VSA) used to indicate the client's hostname. Supported for LLDP-capable devices only.                                                                   |
| 27   | Session-Timeout    | Sets the maximum time (in seconds) that a session stays active before it terminates or a prompt is issued notifying its termination.                                               |
| 28   | Idle-Timeout       | The maximum number of consecutive seconds of idle connection allowed to the user before termination of the session or prompt.                                                      |
| 30   | Called-Station-ID  | Enables the NAS to identify the phone number that the user called, using Dialed Number Identification (DNIS) or a similar technology.                                              |
| 31   | Calling-Station-ID | Enables the NAS to identify the phone number that the call came from, using Automatic Number Identification (ANI) or a similar technology.                                         |
| 32   | NAS-Identifier     | Contains a string identifying the NAS originating the Accounting-Request message.                                                                                                  |
| 40   | Acct-Status-Type   | Indicates whether this Accounting-Request message marks the beginning (Start) or the end (Stop) of the user session. Can also be used for an interim update (Interim-Update).      |
| 44   | Acct-Session-ID    | A unique ID for a specific accounting session that can be used to match start and stop records for a session in the log file.                                                      |
| 45   | Acct-Authentic     | Indicates whether the user was authenticated locally, by the RADIUS server, or by another remote authentication protocol.                                                          |
| 55   | Event-Timestamp    | Records the time an event occurred.                                                                                                                                                |
| 87   | NAS-Port-ID        | Text string that identifies the port that authenticates the user. Either NAS-Port or NAS-Port-ID must be present in the packet.                                                    |

  - [Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch on page 290](#)

- [Configuring 802.1X RADIUS Accounting \(CLI Procedure\) on page 323](#)

## Configuring 802.1X RADIUS Accounting (CLI Procedure)

RADIUS accounting enables statistical data about users logging in to or out of a LAN to be collected and sent to a RADIUS accounting server. The statistical data gathered can be used to perform general network monitoring, to analyze and track usage patterns, or to bill a user based upon the amount of time or type of services accessed.

RADIUS accounting is based on a client/server model in which the switch, operating as the network access server (NAS), is the client. The client is responsible for forwarding user accounting statistics to a designated RADIUS accounting server. To configure RADIUS accounting, specify one or more RADIUS accounting servers to receive the statistical data from the switch, and select the type of accounting data to be collected.

The RADIUS accounting server you specify can be the same server used for RADIUS authentication, or it can be a separate RADIUS server. You can specify a list of RADIUS accounting servers. If the primary server (the first one configured) is unavailable, then each RADIUS server in the list is tried in the order in which the servers are configured in Junos OS.

To configure RADIUS accounting by using the CLI:

1. Configure an access profile and specify the accounting servers to which the switch forwards accounting statistics:

```
[edit access]
user@switch# set profile profile-name radius accounting-server [server-addresses]
```

2. Define the address of RADIUS accounting servers and configure the secret password (the secret password on the switch must match the secret password on the server):

```
[edit access]
user@switch# set radius-server server-address secret password
```

3. Enable accounting for the access profile:

```
[edit access]
user@switch# set profile profile-name accounting
```

4. Configure the accounting order, making RADIUS the first method for sending accounting messages and updates:

```
[edit access]
user@switch# set profile profile-name accounting order radius
```

5. Configure the statistics to be collected on the switch and forwarded to the accounting server:

```
[edit access]
user@switch# set profile profile-name accounting accounting-stop-on-access-deny
user@switch# set profile profile-name accounting accounting-stop-on-failure
```

6. (Optional) Configure the switch to send periodic updates for a user session at a specified interval to the accounting server:

```
[edit access]
```

```
user@switch# set profile profile-name accounting update-interval minutes
```

7. Display accounting statistics collected on the switch using the **show network-access aaa statistics accounting** command, for example:

```
user@switch> show network-access aaa statistics accounting
```

```
Accounting module statistics
Requests received: 1
Accounting Response failures: 0
Accounting Response Success: 1
Requests timedout: 0
```

8. Open an accounting log on the RADIUS accounting server by using the server's address, and view accounting statistics, for example:

```
[root@freeradius]# cd /usr/local/var/log/radius/radacct/192.168.0.1
```

```
[root@freeradius 192.168.0.1]# ls
```

```
detail-20071214
```

```
[root@freeradius 192.168.0.1]# vi detail-20071214
```

```

## Example: Setting Up 802.1X for Single-Supplicant or Multiple-Supplicant Configurations on an EX Series Switch

802.1x port-based network access control (PNAC) authentication on EX Series switches provides three types of authentication to meet the access needs of your enterprise LAN:

- Authenticate the first end device (supplicant) on an authenticator port, and allow all other end devices also connecting to have access to the LAN.
- Authenticate only one end device on an authenticator port at one time.
- Authenticate multiple end devices on an authenticator port. Multiple supplicant mode is used in VoIP configurations.

This example configures an EX Series switch to use IEEE 802.1X to authenticate end devices that use three different administrative modes.

- [Requirements on page 325](#)
- [Overview and Topology on page 326](#)
- [Configuration of 802.1X to Support Multiple Supplicant Modes on page 328](#)
- [Verification on page 329](#)

### Requirements

This example uses the following software and hardware components:

**NOTE:** This example also applies to QFX5100 switches.

- Junos OS Release 9.0 or later for EX Series switches
- One EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from end devices until they are authenticated.
- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for end devices (supplicants) that have permission to connect to the network.

Before you configure the ports for 802.1X authentication, be sure you have:

- Performed the initial switch configuration. See *Connecting and Configuring an EX Series Switch (CLI Procedure)*.
- Performed basic bridging and VLAN configuration on the switch. See the documentation that describes setting up basic bridging and a VLAN for your switch. If you are using a

switch that supports the Enhanced Layer 2 Software (ELS) configuration style, see *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch with ELS Support* or *Example: Setting Up Basic Bridging and a VLAN on Switches*. For all other switches, see *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch*.

**NOTE:** For more about ELS, see *Using the Enhanced Layer 2 Software CLI*.

- Configured users on the authentication server.

## Overview and Topology

As shown in [Figure 11 on page 327](#), the topology contains an EX4200 access switch connected to the authentication server on port ge-0/0/10. Interfaces ge-0/0/8, ge-0/0/9, and ge-0/0/11 will be configured for three different administrative modes.

**NOTE:** This figure also applies to QFX5100 switches.

Figure 11: Topology for Configuring Supplicant Modes

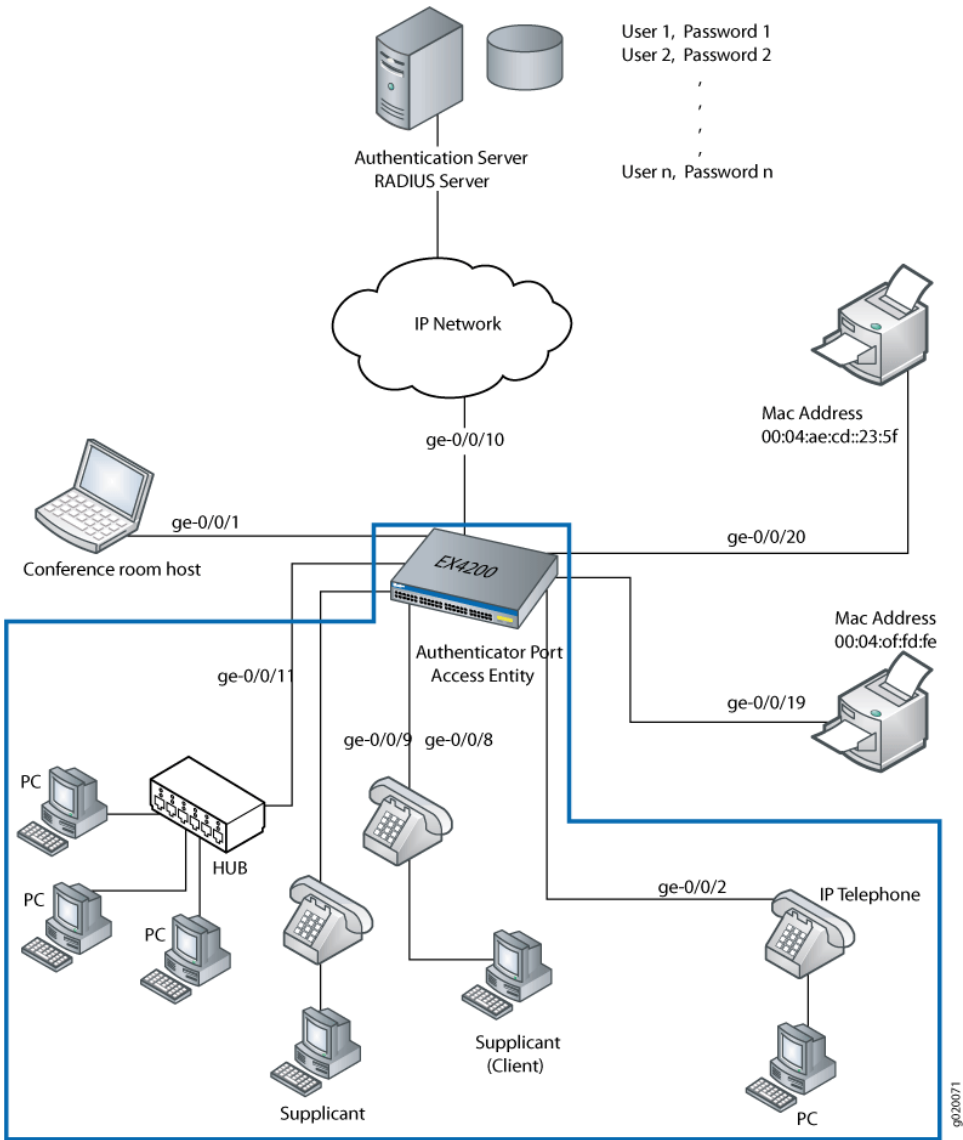

Table 26: Components of the Supplicant Mode Configuration Topology

| Property                                                                                                          | Settings                                                                                                                            |
|-------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Switch hardware                                                                                                   | EX4200 switch, 24 Gigabit Ethernet ports: 8 PoE ports (ge-0/0/0 through ge-0/0/7) and 16 non-PoE ports (ge-0/0/8 through ge-0/0/23) |
| Connections to Avaya phones—with integrated hub, to connect phone and desktop PC to a single port; (requires PoE) | ge-0/0/8, ge-0/0/9, and ge-0/0/11                                                                                                   |

To configure the administrative modes to support supplicants in different areas of the Enterprise network:

- Configure access port ge-0/0/8 for single supplicant mode authentication.
- Configure access port ge-0/0/9 for single secure supplicant mode authentication.
- Configure access port ge-0/0/11 for multiple supplicant mode authentication.

*Single supplicant mode* authenticates only the first end device that connects to an authenticator port. All other end devices connecting to the authenticator port after the first has connected successfully, whether they are 802.1X-enabled or not, are permitted access to the port without further authentication. If the first authenticated end device logs out, all other end devices are locked out until an end device authenticates.

*Single-secure supplicant mode* authenticates only one end device to connect to an authenticator port. No other end device can connect to the authenticator port until the first logs out.

*Multiple supplicant mode* authenticates multiple end devices individually on one authenticator port. If you configure a maximum number of devices that can be connected to a port through port security, the lesser of the configured values is used to determine the maximum number of end devices allowed per port.

## Configuration of 802.1X to Support Multiple Supplicant Modes

**CLI Quick Configuration** To quickly configure the ports with different 802.1X authentication modes, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols dot1x authenticator interface ge-0/0/8 supplicant single
set protocols dot1x authenticator interface ge-0/0/9 supplicant single-secure
set protocols dot1x authenticator interface ge-0/0/11 supplicant multiple
```

**Step-by-Step Procedure** Configure the administrative mode on the interfaces:

1. Configure the supplicant mode as single on interface ge-0/0/8:

```
[edit protocols]
user@switch# set dot1x authenticator interface ge-0/0/8 supplicant single
```

2. Configure the supplicant mode as single secure on interface ge-0/0/9:

```
[edit protocols]
user@switch# set dot1x authenticator interface ge-0/0/9 supplicant single-secure
```

3. Configure multiple supplicant mode on interface ge-0/0/11:

```
[edit protocols]
user@switch# set dot1x authenticator interface ge-0/0/11 supplicant multiple
```

---

## Results

Check the results of the configuration:

```
[edit]
user@access-switch> show configuration
protocols {
  dot1x {
    authenticator {
      interface {
        ge-0/0/8.0 {
          supplicant single;
        }
        ge-0/0/9.0 {
          supplicant single-secure;
        }
        ge-0/0/11.0 {
          supplicant multiple;
        }
      }
    }
  }
}
```

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying the 802.1X Configuration on page 329](#)

### Verifying the 802.1X Configuration

**Purpose** Verify the 802.1X configuration on interfaces ge-0/0/8, ge-0/0/9, and ge-0/0/5.

**Action** Verify the 802.1X configuration by issuing the operational mode command **show dot1x interface**:

```
user@switch> show dot1x interface ge-0/0/8.0 detail
```

```
ge-0/0/8.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
```

```
user@switch> show dot1x interface ge-0/0/9.0 detail
```

```
ge-0/0/9.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single-Secure
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 0
```

```
user@switch> show dot1x interface ge-0/0/11.0 detail
```

```
ge-0/0/11.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Multiple
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 0
```

**Meaning** The **Supplicant mode** output field displays the configured administrative mode for each interface. Interface **ge-0/0/8.0** displays **Single** supplicant mode. Interface **ge-0/0/9.0** displays **Single-Secure** supplicant mode. Interface **ge-0/0/11.0** displays **Multiple** supplicant mode.

## Example: Setting Up 802.1X in Conference Rooms to Provide Internet Access to Corporate Visitors on an EX Series Switch

802.1X on EX Series switches provides LAN access to users who do not have credentials in the RADIUS database. These users, referred to as *guests*, are authenticated and typically provided with access to the Internet.

This example describes how to create a guest VLAN and configure 802.1X authentication for it.

- [Requirements on page 331](#)
- [Overview and Topology on page 332](#)
- [Configuration of a Guest VLAN That Includes 802.1X Authentication on page 334](#)
- [Verification on page 334](#)

### Requirements

This example uses the following software and hardware components:

**NOTE:** This example also applies to QFX5100 switches.

- Junos OS Release 9.0 or later for EX Series switches
- One EX Series switch acting as a port access entity (PAE). The interfaces on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.

- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you configure guest VLAN authentication, be sure you have:

- Performed the initial switch configuration. See *Connecting and Configuring an EX Series Switch (CLI Procedure)*.
- Performed basic bridging and VLAN configuration on the switch. See the documentation that describes setting up basic bridging and a VLAN for your switch. If you are using a switch that supports the Enhanced Layer 2 Software (ELS) configuration style, see *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch with ELS Support* or *Example: Setting Up Basic Bridging and a VLAN on Switches*. For all other switches, see *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch*.

**NOTE:** For more about ELS, see: *Using the Enhanced Layer 2 Software CLI*

---

## Overview and Topology

As part of IEEE 802.1X port-based network access control (PNAC), you can provide limited network access to supplicants who do not belong to a VLAN authentication group by configuring authentication for a guest VLAN. Typically, guest VLAN access is used to provide Internet access to visitors to a corporate site. However, you can also use the guest VLAN feature to provide access to a VLAN with limited resources to supplicants that fail 802.1X authentication on a corporate LAN.

**NOTE:** This figure also applies to QFX5100 switches.

---

Figure 12 on page 333 shows the conference room connected to the switch at interface ge-0/0/1.

Figure 12: Topology for Guest VLAN Example

Table 27: Components of the Guest VLAN Topology

| Property               | Settings                                                                                                                                                                           |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Switch hardware        | EX4200 switch, 24 Gigabit Ethernet interfaces: 8 PoE interfaces ( <b>ge-0/0/0</b> through <b>ge-0/0/7</b> ) and 16 non-PoE interfaces ( <b>ge-0/0/8</b> through <b>ge-0/0/23</b> ) |
| VLAN names and tag IDs | <b>sales</b> , tag 100<br><b>support</b> , tag 200<br><br><b>guest-vlan</b> , tag 300                                                                                              |
| One RADIUS server      | Backend database connected to the switch through interface <b>ge-0/0/10</b>                                                                                                        |

In this example, access interface **ge-0/0/1** provides LAN connectivity in the conference room. Configure this access interface to provide LAN connectivity to visitors in the conference room who are not authenticated by the corporate VLAN.

## Configuration of a Guest VLAN That Includes 802.1X Authentication

**CLI Quick Configuration** To quickly configure a guest VLAN, with 802.1X authentication, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans guest-vlan vlan-id 300
set protocols dot1x authenticator interface all guest-vlan guest-vlan
```

**Step-by-Step Procedure** To configure a guest VLAN that includes 802.1X authentication on an EX Series switch:

1. Configure the VLAN ID for the guest VLAN:

```
[edit]
user@switch# set vlans guest-vlan vlan-id 300
```

2. Configure the guest VLAN under **dot1x** protocol:

```
[edit]
user@switch# set protocols dot1x authenticator interface all guest-vlan guest-vlan
```

**Results** Check the results of the configuration:

```
user@switch> show configuration
protocols {
  dot1x {
    authenticator {
      interface {
        all {
          guest-vlan {
            guest-vlan;
          }
        }
      }
    }
  }
}
vlans {
  guest-vlan {
    vlan-id 300;
  }
}
```

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That the Guest VLAN Is Configured on page 335](#)

### Verifying That the Guest VLAN Is Configured

---

**Purpose** Verify that the guest VLAN is created and that an interface has failed authentication and been moved to the guest VLAN.

.....

**NOTE:** On switches running Junos OS for EX Series with support for ELS, the output for the `show vlans` command will contain additional information. If your switch runs software that supports ELS, see `show vlans`. For ELS details, see *Using the Enhanced Layer 2 Software CLI*.

.....

**Action** Issue the operational mode commands:

```
user@switch> show vlans
```

| Name       | Tag | Interfaces  |
|------------|-----|-------------|
| default    |     | ge-0/0/3.0* |
| dynamic    | 40  | None        |
| guest      | 30  | None        |
| guest-vlan | 300 | ge-0/0/1.0* |
| vlan_dyn   |     | None        |

```
user@switch> show dot1x interface ge-0/0/1.0 detail
```

```
ge-0/0/1.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Enabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: guest-vlan
  Number of connected supplicants: 1
    Supplicant: user1, 00:00:00:00:13:23
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: vo11
      Dynamic Filter: match source-dot1q-tag 10 action deny
      Session Reauth interval: 60 seconds
      Reauthentication due in 50 seconds
```

**Meaning** The output of the **show vlans** command shows **guest-vlan** as the the name of the VLAN and the VLAN ID as **300**.

The output of the **show dot1x interface ge-0/0/1.0 detail** command displays the **Guest VLAN membership** field, indicating that a supplicant at this interface failed 802.1X authentication and was passed through to the **guest-vlan**.

## Interfaces Enabled for 802.1X or MAC RADIUS Authentication

EX Series switches support port firewall filters. Port firewall filters are configured on a single EX Series switch, but in order for them to operate throughout an enterprise, they must be configured on multiple switches. To reduce the need to configure the same port firewall filter on multiple switches, you can instead apply the filter centrally on the RADIUS server by using RADIUS server attributes. Terms are applied after a device is successfully authenticated through 802.1X. For more information, read this topic.

- [Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants by Using RADIUS Server Attributes on an EX Series Switch on page 337](#)
- [Example: Applying Firewall Filters to Multiple Supplicants on Interfaces Enabled for 802.1X or MAC RADIUS Authentication on page 344](#)
- [Example: Applying Firewall Filters to Multiple Supplicants on Interfaces Enabled for 802.1X or MAC RADIUS Authentication on EX Series Switches with ELS Support on page 350](#)

### Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants by Using RADIUS Server Attributes on an EX Series Switch

You can use RADIUS server attributes and a port firewall filter to centrally apply terms to multiple supplicants (end devices) connected to an EX Series switch in your enterprise. Terms are applied after a device is successfully authenticated through 802.1X. If the firewall filter configuration is modified after end devices are authenticated using the 802.1X authentication, then the established 802.1X authentication session must be terminated and re-established for the firewall filter changes to take effect.

EX Series switches support port firewall filters. Port firewall filters are configured on a single EX Series switch, but in order for them to operate throughout an enterprise, they must be configured on multiple switches. To reduce the need to configure the same port firewall filter on multiple switches, you can instead apply the filter centrally on the RADIUS server by using RADIUS server attributes.

The following example uses FreeRADIUS to apply a port firewall filter on a RADIUS server. For information about configuring your server, consult the documentation that was included with your RADIUS server.

This example describes how to configure a port firewall filter with terms, create counters to count packets for the supplicants, apply the filter to user profiles on the RADIUS server, and display the counters to verify the configuration:

- [Requirements on page 338](#)
- [Overview and Topology on page 338](#)
- [Configuring the Port Firewall Filter and Counters on page 341](#)

- [Applying the Port Firewall Filter to the Supplicant User Profiles on the RADIUS Server on page 343](#)
- [Verification on page 344](#)

---

## Requirements

This example uses the following software and hardware components:

**NOTE:** This example also applies to QFX5100 switches.

- Junos OS Release 9.3 or later for EX Series switches
- One EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- One RADIUS authentication server. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you connect the server to the switch, be sure you have:

- Set up a connection between the switch and the RADIUS server. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 290](#).
- Configured 802.1X authentication on the switch, with the supplicant mode for interface ge-0/0/2 set to **multiple**. See [“Configuring 802.1X Interface Settings \(CLI Procedure\)” on page 280](#) and [“Example: Setting Up 802.1X for Single-Supplicant or Multiple-Supplicant Configurations on an EX Series Switch” on page 325](#).
- Configured users on the RADIUS authentication server (in this example, the user profiles for Supplicant 1 and Supplicant 2 in the topology are modified on the RADIUS server).

---

## Overview and Topology

When the 802.1X configuration on an interface is set to **multiple** supplicant mode, you can apply a single port firewall filter configured through the Junos OS CLI on the EX Series switch to any number of end devices (supplicants) by adding the filter centrally to the RADIUS server. Only a single filter can be applied to an interface; however, the filter can contain multiple terms for separate end devices.

For more information about firewall filters, see *Firewall Filters for EX Series Switches Overview* or *Overview of Firewall Filters*.

RADIUS server attributes are applied to the port where the end device is connected after the device is successfully authenticated using 802.1X. To authenticate an end device, the switch forwards the end device's credentials to the RADIUS server. The RADIUS server matches the credentials against preconfigured information about the supplicant located in the supplicant's user profile on the RADIUS server. If a match is found, the RADIUS server instructs the switch to open an interface to the end device. Traffic then flows from and to the end device on the LAN. Further instructions configured in the port firewall filter

and added to the end device's user profile using a RADIUS server attribute further define the access that the end device is granted. Filtering terms configured in the port firewall filter are applied to the port where the end device is connected after 802.1X authentication is complete.

**NOTE:** If you modify the port firewall filter after an end device is successfully authenticated using 802.1X, you must terminate and re-establish the 802.1X authentication session for the firewall filter configuration changes to be effective.

Figure 13 on page 340 shows the topology used for this example. The RADIUS server is connected to an EX4200 switch on access port ge-0/0/10. Two end devices (supplicants) are accessing the LAN on interface ge-0/0/2. Supplicant 1 has the MAC address 00:50:8b:6f:60:3a. Supplicant 2 has the MAC address 00:50:8b:6f:60:3b.

**NOTE:** This figure also applies to QFX5100 switches.

Figure 13: Topology for Firewall Filter and RADIUS Server Attributes Configuration

Table 28 on page 340 describes the components in this topology.

Table 28: Components of the Firewall Filter and RADIUS Server Attributes Topology

| Property                                                         | Settings                                                                                                                                                   |
|------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Switch hardware                                                  | EX4200 access switch, 24 Gigabit Ethernet ports: 16 non-PoE ports and 8 PoE ports.                                                                         |
| One RADIUS server                                                | Backend database with the address 10.0.0.100 connected to the switch at port ge-0/0/10.                                                                    |
| 802.1X supplicants connected to the switch on interface ge-0/0/2 | <ul style="list-style-type: none"> <li>Supplicant 1 has MAC address 00:50:8b:6f:60:3a.</li> <li>Supplicant 2 has MAC address 00:50:8b:6f:60:3b.</li> </ul> |

Table 28: Components of the Firewall Filter and RADIUS Server Attributes Topology (continued)

| Property                                                | Settings                                                                                                                                                               |
|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port firewall filter to be applied on the RADIUS server | <b>filter1</b>                                                                                                                                                         |
| Counters                                                | <b>counter1</b> counts packets from Supplicant 1, and <b>counter2</b> counts packets from Supplicant 2.                                                                |
| Policer                                                 | <b>policer p1</b>                                                                                                                                                      |
| User profiles on the RADIUS server                      | <ul style="list-style-type: none"> <li>Supplicant 1 has the user profile <b>supplicant1</b>.</li> <li>Supplicant 2 has the user profile <b>supplicant2</b>.</li> </ul> |

In this example, you configure a port firewall filter named **filter1**. The filter contains terms that will be applied to the end devices based on the MAC addresses of the end devices. When you configure the filter, you also configure the counters **counter1** and **counter2**. Packets from each end device are counted, which helps you verify that the configuration is working. Policer **p1** limits the traffic rate based on the values for **exceeding** and **discard** parameters. Then, you check to see that the RADIUS server attribute is available on the RADIUS server and apply the filter to the user profiles of each end device on the RADIUS server. Finally, you verify the configuration by displaying output for the two counters.

### Configuring the Port Firewall Filter and Counters

#### CLI Quick Configuration

To quickly configure a port firewall filter with terms for Supplicant 1 and Supplicant 2 and create parallel counters for each supplicant, copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall family ethernet-switching filter filter1 term supplicant1 from source-mac-address 00:50:8b:6f:60:3a
set firewall family ethernet-switching filter filter1 term supplicant2 from source-mac-address 00:50:8b:6f:60:3b
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1k
set firewall policer p1 then discard
set firewall family ethernet-switching filter filter1 term supplicant1 then count counter1
set firewall family ethernet-switching filter filter1 term supplicant1 then policer p1
set firewall family ethernet-switching filter filter1 term supplicant2 then count counter2
```

#### Step-by-Step Procedure

To configure a port firewall filter and counters on the switch:

1. Configure a port firewall filter (here, **filter1**) with terms for each end device based on the MAC address of each end device:

```
[edit firewall family ethernet-switching]
user@switch# set filter filter1 term supplicant1 from source-mac-address 00:50:8b:6f:60:3a
user@switch# set filter filter1 term supplicant2 from source-mac-address 00:50:8b:6f:60:3b
```

2. Set policer definition:

```
[edit]
user@switch# set firewall policer p1 if-exceeding bandwidth-limit 1m
user@switch# set firewall policer p1 if-exceeding burst-size-limit 1k
user@switch# set firewall policer p1 then discard
```

3. Create two counters that will count packets for each end device and a policer that limits the traffic rate:

```
[edit firewall family ethernet-switching]
user@switch# set filter filter1 term supplicant1 then count counter1
user@switch# set filter filter1 term supplicant1 then policer p1
user@switch# set filter filter1 term supplicant2 then count counter2
```

**Results** Display the results of the configuration:

```
user@switch> show configuration
firewall {
  family ethernet-switching {
    filter filter1 {
      term supplicant1 {
        from {
          source-mac-address {
            00:50:8b:6f:60:3a;
          }
        }
        then count counter1;
        then policer p1;
      }
      term supplicant2 {
        from {
          source-mac-address {
            00:50:8b:6f:60:3b;
          }
        }
        then count counter2;
      }
    }
  }
}
policer p1 {
  if-exceeding {
    bandwidth-limit 1m;
    burst-size-limit 1k;
  }
  then discard;
}
```

## Applying the Port Firewall Filter to the Supplicant User Profiles on the RADIUS Server

**Step-by-Step Procedure** To verify that the RADIUS server attribute **Filter-ID** is on the RADIUS server and to apply the filter to the user profiles:

1. Display the dictionary **dictionary.rfc2865** on the RADIUS server, and verify that the attribute **Filter-ID** is in the dictionary:

```
[root@freeradius]# cd usr/share/freeradius/dictionary.rfc2865
```

2. Close the dictionary file.

3. Display the local user profiles of the end devices to which you want to apply the filter (here, the user profiles are called **supplicant1** and **supplicant2**):

```
[root@freeradius]# cat /usr/local/etc/raddb/users
```

The output shows:

```
supplicant1 Auth-Type := EAP, User-Password == "supplicant1"
    Tunnel-Type = VLAN,
    Tunnel-Medium-Type = IEEE-802,
    Tunnel-Private-Group-Id = "1005"

supplicant2 Auth-Type := EAP, User-Password == "supplicant2"
    Tunnel-Type = VLAN,
    Tunnel-Medium-Type = IEEE-802,
    Tunnel-Private-Group-Id = "1005"
```

4. Apply the filter to both user profiles by adding the line **Filter-Id = "filter1"** to each profile, and then close the file:

```
[root@freeradius]# cat /usr/local/etc/raddb/users
```

After you paste the line into the files, the files look like this:

```
supplicant1 Auth-Type := EAP, User-Password == "supplicant1"
    Tunnel-Type = VLAN,
    Tunnel-Medium-Type = IEEE-802,
    Tunnel-Private-Group-Id = "1005",
    Filter-Id = "filter1"

supplicant2 Auth-Type := EAP, User-Password == "supplicant2"
    Tunnel-Type = VLAN,
    Tunnel-Medium-Type = IEEE-802,
    Tunnel-Private-Group-Id = "1005",
    Filter-Id = "filter1"
```

## Verification

---

### *Verifying That the Filter Has Been Applied to the Supplicants*

**Purpose** After the end devices are authenticated on interface ge-0/0/2, verify that the filter has been configured on the switch and includes the results for both supplicants:

**Action** user@switch> `show dot1x firewall`

```
Filter: dot1x-filter-ge-0/0/2
Counters
counter1_dot1x_ge-0/0/2_user1 100
counter2_dot1x_ge-0/0/2_user2 400
```

**Meaning** The output of the `show dot1x firewall` command displays **counter1** and **counter2**. Packets from User\_1 are counted using **counter1**, and packets from User 2 are counted using **counter2**. The output displays packets incrementing for both counters. The filter has been applied to both end devices.

  - [Understanding Dynamic Filters Based on RADIUS Attributes on page 294](#)

## Example: Applying Firewall Filters to Multiple Supplicants on Interfaces Enabled for 802.1X or MAC RADIUS Authentication

On EX Series switches, firewall filters that you apply to interfaces enabled for 802.1X or MAC RADIUS authentication are dynamically combined with the per-user policies sent to the switch from the RADIUS server. The switch uses internal logic to dynamically combine the interface firewall filter with the user policies from the RADIUS server and create an individualized policy for each of the multiple users or nonresponsive hosts that are authenticated on the interface.

This example describes how dynamic firewall filters are created for multiple supplicants on an 802.1X-enabled interface (the same principles shown in this example apply to interfaces enabled for MAC RADIUS authentication):

- [Requirements on page 345](#)
- [Overview and Topology on page 345](#)

- [Configuration on page 347](#)
- [Verification on page 349](#)

---

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.5 or later for EX Series switches
- One EX Series switch
- One RADIUS authentication server. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you apply firewall filters to an interface for use with multiple supplicants, be sure you have:

- Set up a connection between the switch and the RADIUS server. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 290](#).
- Configured 802.1X authentication on the switch, with the authentication mode for interface **ge-0/0/2** set to **multiple**. See [“Configuring 802.1X Interface Settings \(CLI Procedure\)” on page 280](#) and [“Example: Setting Up 802.1X for Single-Supplicant or Multiple-Supplicant Configurations on an EX Series Switch” on page 325](#).
- Configured users on the RADIUS authentication server.

---

### Overview and Topology

When the 802.1X configuration on an interface is set to multiple supplicant mode, the system dynamically combines interface firewall filter with the user policies sent to the switch from the RADIUS server during authentication and creates separate terms for each user. Because there are separate terms for each user authenticated on the interface, you can, as shown in this example, use counters to view the activities of individual users that are authenticated on the same interface.

When a new user (or a nonresponsive host) is authenticated on an interface, the system adds a term to the firewall filter associated with the interface, and the term (policy) for each user is associated with the MAC address of the user. The term for each user is based on the user-specific filters set on the RADIUS server and the filters configured on the interface. For example, as shown in [Figure 14 on page 346](#), when User1 is authenticated by the EX Series switch, the system creates the firewall filter **dynamic-filter-example**. When User2 is authenticated, another term is added to the firewall filter, and so on.

Figure 14: Conceptual Model: Dynamic Filter Updated for Each New User

This is a conceptual model of the internal process—you cannot access or view the dynamic filter.

**NOTE:** If the firewall filter on the interface is modified after the user (or nonresponsive host) is authenticated, the modifications are not reflected in the dynamic filter unless the user is reauthenticated.

In this example, you configure a firewall filter to count the requests made by each endpoint authenticated on interface **ge-0/0/2** to the file server, which is located on subnet **192.0.2.16/28**, and set policer definitions to rate limit the traffic. [Figure 15 on page 347](#) shows the network topology for this example.

Figure 15: Multiple Supplicants on an 802.1X-Enabled Interface Connecting to a File Server

### Configuration

To configure firewall filters for multiple supplicants on 802.1X-enabled interfaces:

- [Configuring Firewall Filters on Interfaces with Multiple Supplicants on page 347](#)

#### Configuring Firewall Filters on Interfaces with Multiple Supplicants

#### CLI Quick Configuration

To quickly configure firewall filters for multiple supplicants on an 802.1X-enabled interface copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols dot1x authenticator interface ge-0/0/2 supplicant multiple
set firewall family ethernet-switching filter filter1 term term1 from destination-address 192.0.2.16/28
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1k
set firewall family ethernet-switching filter filter1 term term1 then count counter1
set firewall family ethernet-switching filter filter1 term term2 then policer p1
```

#### Step-by-Step Procedure

To configure firewall filters on an interface enabled for multiple supplicants:

1. Configure interface **ge-0/0/2** for multiple supplicant mode authentication:

```
[edit protocols dot1x]
```

```
user@switch# set authenticator interface ge-0/0/2 supplicant multiple
```

2. Set policer definition:

```
user@switch# show policer p1 |display set
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1k
set firewall policer p1 then discard
```

3. Configure a firewall filter to count packets from each user and a policer that limits the traffic rate. As each new user is authenticated on the multiple supplicant interface, this filter term will be included in the dynamically created term for the user:

```
[edit firewall family ethernet-switching]
user@switch# set filter filter1 term term1 from destination-address 192.0.2.16/28
user@switch# set filter filter1 term term1 then count counter1
user@switch# set filter filter1 term term2 then policer p1
```

**Results** Check the results of the configuration:

```
user@switch> show configuration
```

```
firewall {
  family ethernet-switching {
    filter filter1 {
      term term1 {
        from {
          destination-address {
            192.0.2.16/28;
          }
        }
        then count counter1;
      }
      term term2 {
        from {
          destination-address {
            192.0.2.16/28;
          }
        }
        then policer p1;
      }
    }
  }
}
policer p1 {
  if-exceeding {
    bandwidth-limit 1m;
    burst-size-limit 1k;
  }
  then discard;
}
protocols {
  dot1x {
```

```

authenticator
  interface ge-0/0/2 {
    suppliant multiple;
  }
}

```

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying Firewall Filters on Interfaces with Multiple Supplicants on page 349](#)

#### *Verifying Firewall Filters on Interfaces with Multiple Supplicants*

**Purpose** Verify that firewall filters are functioning on the interface with multiple supplicants.

**Action** 1. Check the results with one user authenticated on the interface. In this case, the user is authenticated on **ge-0/0/2**:

```

user@switch> show dot1x firewall

Filter: dot1x_ge-0/0/2
Counters
counter1_dot1x_ge-0/0/2_user1 100

```

2. When a second user, User2, is authenticated on the same interface, **ge-0/0/2**, you can verify that the filter includes the results for both of the users authenticated on the interface:

```

user@switch> show dot1x firewall

Filter: dot1x-filter-ge-0/0/0
Counters
counter1_dot1x_ge-0/0/2_user1 100
counter1_dot1x_ge-0/0/2_user2 400

```

**Meaning** The results displayed by the **show dot1x firewall** command output reflect the dynamic filter created with the authentication of each new user. User1 accessed the file server located at the specified destination address 100 times, while User2 accessed the same file server 400 times.

**See Also**

- [Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches](#)
- [Filtering 802.1X Supplicants by Using RADIUS Server Attributes on page 285](#)

## Example: Applying Firewall Filters to Multiple Supplicants on Interfaces Enabled for 802.1X or MAC RADIUS Authentication on EX Series Switches with ELS Support

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [“Example: Applying Firewall Filters to Multiple Supplicants on Interfaces Enabled for 802.1X or MAC RADIUS Authentication” on page 344](#). For ELS details, see *Using the Enhanced Layer 2 Software CLI*.

On EX Series switches, firewall filters that you apply to interfaces enabled for 802.1X or MAC RADIUS authentication are dynamically combined with the per-user policies sent to the switch from the RADIUS server. The switch uses internal logic to dynamically combine the interface firewall filter with the user policies from the RADIUS server and create an individualized policy for each of the multiple users or nonresponsive hosts that are authenticated on the interface.

This example describes how dynamic firewall filters are created for multiple supplicants on an 802.1X-enabled interface (the same principles shown in this example apply to interfaces enabled for MAC RADIUS authentication):

- [Requirements on page 350](#)
- [Overview and Topology on page 351](#)
- [Configuration on page 353](#)
- [Verification on page 355](#)

---

### Requirements

This example uses the following software and hardware components:

**NOTE:** This example also applies to QFX5100 switches.

- Junos OS Release 13.2 or later for EX Series switches
- One EX Series switch with support for ELS
- One RADIUS authentication server. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you apply firewall filters to an interface for use with multiple supplicants, be sure you have:

- Set up a connection between the switch and the RADIUS server. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 290](#).
- Configured 802.1X authentication on the switch, with the authentication mode for the interface ge-0/0/2 set to **multiple**. See [“Configuring 802.1X Interface Settings \(CLI](#)

Procedure)” on page 280 and “Example: Setting Up 802.1X for Single-Suppliant or Multiple-Suppliant Configurations on an EX Series Switch” on page 325.

- Configured users on the RADIUS authentication server.

### Overview and Topology

---

When the 802.1X configuration on an interface is set to multiple supplicant mode, the system dynamically combines the interface firewall filter with the user policies sent to the switch from the RADIUS server during authentication and creates separate terms for each user. Because there are separate terms for each user authenticated on the interface, you can, as shown in this example, use counters to view the activities of individual users that are authenticated on the same interface.

When a new user (or a nonresponsive host) is authenticated on an interface, the system adds a term to the firewall filter associated with the interface, and the term (policy) for each user is associated with the MAC address of the user. The term for each user is based on the user-specific filters set on the RADIUS server and the filters configured on the interface. For example, as shown in [Figure 16 on page 352](#), when User 1 is authenticated by the EX Series switch, the system adds a term to the firewall filter **dynamic-filter-example**. When User 2 is authenticated, another term is added to the firewall filter, and so on.

**NOTE:** This figure also applies to QFX5100 switches.

Figure 16: Conceptual Model: Dynamic Filter Updated for Each New User

This is a conceptual model of the internal process—you cannot access or view the dynamic filter.

**NOTE:** If the firewall filter on the interface is modified after the user (or nonresponsive host) is authenticated, the modifications are not reflected in the dynamic filter unless the user is reauthenticated.

In this example, you configure a firewall filter to count the requests made by each endpoint authenticated on interface ge-0/0/2 to the file server, which is located on subnet 192.0.2.16/28, and set policer definitions to rate-limit the traffic. [Figure 17 on page 353](#) shows the network topology for this example.

Figure 17: Multiple Supplicants on an 802.1X-Enabled Interface Connecting to a File Server

## Configuration

### Configuring Firewall Filters on Interfaces with Multiple Supplicants

**CLI Quick Configuration** To quickly configure firewall filters for multiple supplicants on an 802.1X-enabled interface copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall family ethernet-switching filter filter1 term term1 from ip-destination-address 192.0.2.16/28
set firewall family ethernet-switching filter filter1 term term2 from ip-destination-address 192.0.2.16/28
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1500
set firewall policer p1 then discard
set firewall family ethernet-switching filter filter1 term term1 then count counter1
set firewall family ethernet-switching filter filter1 term term2 then policer p1
```

**Step-by-Step Procedure** To configure firewall filters on an interface enabled for multiple supplicants:

1. Set the policer definition:

```
user@switch# show policer p1 |display set
set firewall policer p1 if-exceeding bandwidth-limit 1m
```

```
set firewall policer p1 if-exceeding burst-size-limit 1500
set firewall policer p1 then discard
```

2. Configure a firewall filter to count packets from each user and a policer that limits the traffic rate. As each new user is authenticated on the multiple supplicant interface, this filter term will be included in the dynamically created term for the user:

```
[edit firewall family ethernet-switching]
user@switch# set filter filter1 term term1 from ip-destination-address 192.0.2.16/28
user@switch# set filter filter1 term term2 from ip-destination-address 192.0.2.16/28
user@switch# set filter filter1 term term1 then count counter1
user@switch# set filter filter1 term term2 then policer p1
```

**Results** Check the results of the configuration:

```
user@switch> show configuration
```

```
firewall {
  family ethernet-switching {
    filter filter1 {
      term term1 {
        from {
          ip-destination-address {
            192.0.2.16/28;
          }
        }
        then count counter1;
      }
      term term2 {
        from {
          ip-destination-address {
            192.0.2.16/28;
          }
        }
        then policer p1;
      }
    }
  }
  policer p1 {
    if-exceeding {
      bandwidth-limit 1m;
      burst-size-limit 1500;
    }
    then discard;
  }
}
protocols {
  dot1x {
    authenticator
    interface ge-0/0/2 {
      supplicant multiple;
    }
  }
}
```

```
}
```

## Verification

### Verifying Firewall Filters on Interfaces with Multiple Supplicants

**Purpose** Verify that firewall filters are functioning on the interface with multiple supplicants.

- Action**
1. Check the results with one user authenticated on the interface. In this case, User 1 is authenticated on ge-0/0/2:

```
user@switch> show dot1x firewall
Filter: dot1x_ge-0/0/2
Counters
counter1_dot1x_ge-0/0/2_user1 100
```

2. When a second user, User 2, is authenticated on the same interface, ge-0/0/2, you can verify that the filter includes the results for both of the users authenticated on the interface:

```
user@switch> show dot1x firewall
Filter: dot1x-filter-ge-0/0/0
Counters
counter1_dot1x_ge-0/0/2_user1 100
counter1_dot1x_ge-0/0/2_user2 400
```

**Meaning** The results displayed by the **show dot1x firewall** command output reflect the dynamic filter created with the authentication of each new user. User 1 accessed the file server located at the specified destination address **100** times, while User 2 accessed the same file server **400** times.

  - [Filtering 802.1X Supplicants by Using RADIUS Server Attributes on page 285](#)

- Related Documentation**
- [Example: Setting Up 802.1X for Single-Supplicant or Multiple-Supplicant Configurations on an EX Series Switch on page 325](#)

## Static MAC Bypass of 802.1X and MAC RADIUS Authentication

Junos OS allows you to configure access to your LAN through 802.1X-configured interfaces without authentication, by configuring a static MAC bypass list on the EX Series switch. The static MAC bypass list, also known as the *exclusion list*, specifies MAC addresses

that are allowed on the switch without sending a request to an authentication server. For more information, read this topic.

- [Configuring Static MAC Bypass of 802.1X and MAC RADIUS Authentication \(CLI Procedure\) on page 356](#)
- [Example: Configuring Static MAC Bypass of 802.1X and MAC RADIUS Authentication on an EX Series Switch on page 356](#)

## Configuring Static MAC Bypass of 802.1X and MAC RADIUS Authentication (CLI Procedure)

You can configure a static MAC bypass list (sometimes called the exclusion list) on the switch to specify MAC addresses of devices allowed access to the LAN without 802.1X or MAC RADIUS authentication requests to the RADIUS server.

To configure the static MAC bypass list:

- Specify a MAC address to bypass authentication:

```
[edit protocols dot1x]  
user@switch# set authenticator static 00:04:0f:fd:ac:fe
```

- Configure a supplicant to bypass authentication if it is connected through a particular interface:

```
[edit protocols dot1x]  
user@switch# set authenticator static 00:04:0f:fd:ac:fe interface ge-0/0/5
```

- Configure a supplicant to be moved to a specific VLAN after it is authenticated:

```
[edit protocols dot1x]  
user@switch# set authenticator static 00:04:0f:fd:ac:fe interface ge-0/0/5 vlan-assignment  
default-vlan
```

- See Also**
- [Configuring 802.1X Interface Settings \(CLI Procedure\) on page 280](#)
  - [Configuring 802.1X Authentication \(J-Web Procedure\)](#)

## Example: Configuring Static MAC Bypass of 802.1X and MAC RADIUS Authentication on an EX Series Switch

To allow devices to access your LAN through 802.1X-configured interfaces without authentication, you can configure a static MAC bypass list on the EX Series switch. The static MAC bypass list, also known as the *exclusion list*, specifies MAC addresses that are allowed on the switch without sending a request to an authentication server.

You can use static MAC bypass of authentication to allow connection for devices that are not 802.1X-enabled, such as printers. If a host's MAC address is compared and matched against the static MAC address list, the nonresponsive host is authenticated and an interface opened for it.

This example describes how to configure static MAC bypass of authentication for two printers:

- [Requirements on page 357](#)
- [Overview and Topology on page 357](#)
- [Configuration on page 359](#)
- [Verification on page 360](#)

### Requirements

---

This example uses the following software and hardware components:

**NOTE:** This example also applies to QFX5100 switches.

- Junos OS Release 9.0 or later for EX Series switches
- One EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.

Before you configure static MAC bypass of authentication, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See the documentation that describes setting up basic bridging and a VLAN for your switch. If you are using a switch that supports the Enhanced Layer 2 Software (ELS) configuration style, see *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch with ELS Support* or *Example: Setting Up Basic Bridging and a VLAN on Switches*. For all other switches, see *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch*.

For more about ELS, see: *Using the Enhanced Layer 2 Software CLI*.

- Specified the RADIUS server connections and configured an access profile on the switch. See "[Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch](#)" on page 290.

### Overview and Topology

---

To permit printers access to the LAN, add them to the static MAC bypass list. The MAC addresses on this list are permitted access without authentication from the RADIUS server.

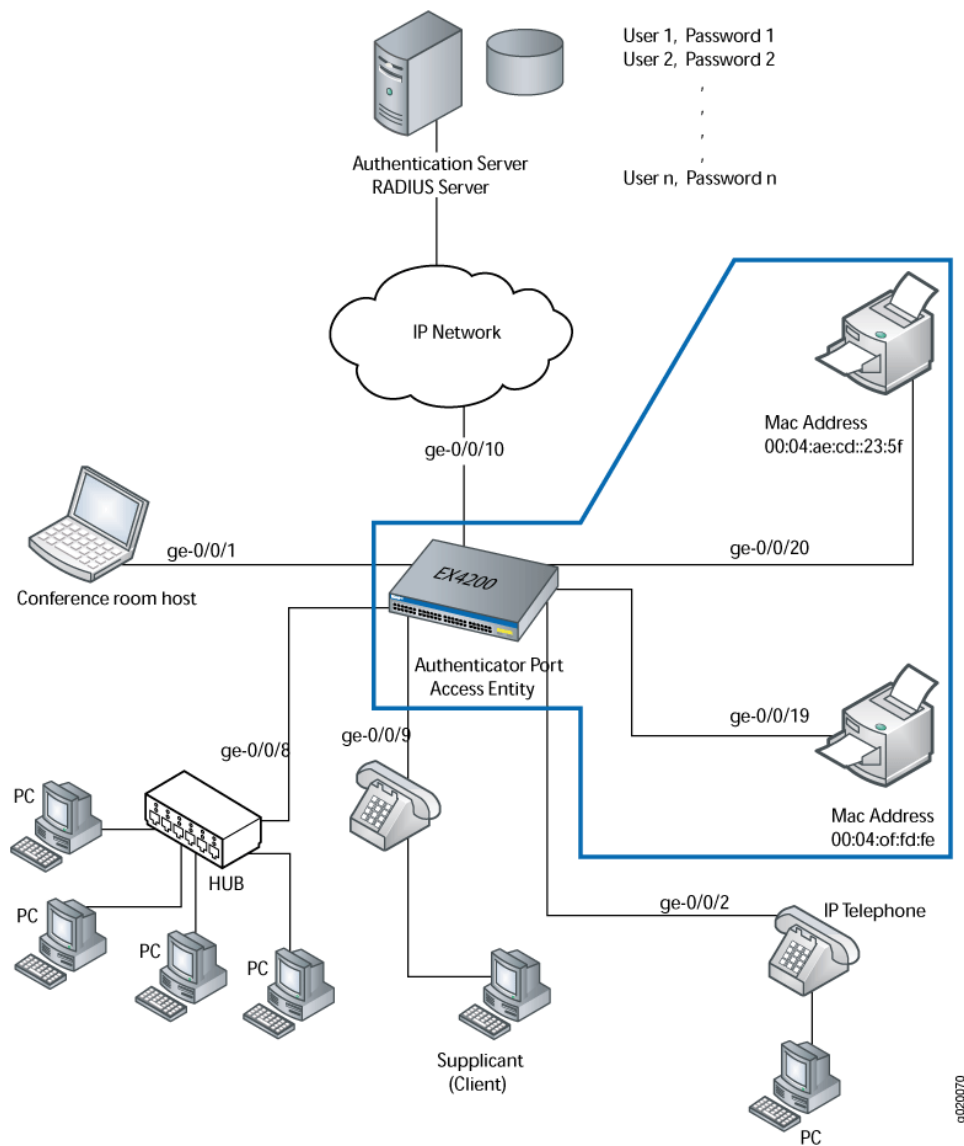

[Figure 18 on page 358](#) shows the two printers connected to the EX4200.

**NOTE:** This figure also applies to QFX5100 switches.

Figure 18: Topology for Static MAC Bypass of Authentication Configuration

The interfaces shown in [Table 29](#) on page 358 will be configured for static MAC bypass of authentication.

Table 29: Components of the Static MAC Bypass of Authentication Configuration Topology

| Property                                                                | Settings                                                                                         |
|-------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| Switch hardware                                                         | EX4200, 24 Gigabit Ethernet ports: 16 non-PoE ports and 8 PoE ports (ge-0/0/0 through ge-0/0/23) |
| VLAN name                                                               | default                                                                                          |
| Connections to integrated printer/fax/copier machines (no PoE required) | ge-0/0/19, MAC address 00:04:0f:fd:ac:fe<br>ge-0/0/20, MAC address 00:04:ae:cd:23:5f             |

The printer with the MAC address 00:04:0f:fd:ac:fe is connected to access interface **ge-0/0/19**. A second printer with the MAC address 00:04:ae:cd:23:5f is connected to access interface **ge-0/0/20**. Both printers will be added to the static list and bypass 802.1X authentication.

### Configuration

**CLI Quick Configuration** To quickly configure the static MAC bypass list, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols dot1x authenticator static [00:04:0f:fd:ac:fe 00:04:ae:cd:23:5f]
set protocols dot1x authenticator interface all supplicant multiple
set protocols dot1x authenticator authentication-profile-name profile1
```

**Step-by-Step Procedure** Configure the static MAC bypass list:

1. Configure MAC addresses **00:04:0f:fd:ac:fe** and **00:04:ae:cd:23:5f** as static MAC addresses:

```
[edit protocols]
user@switch# set dot1x authenticator static [00:04:0f:fd:ac:fe 00:04:ae:cd:23:5f]
```

2. Configure the 802.1X authentication method:

```
[edit protocols]
user@switch# set dot1x authenticator interface all supplicant multiple
```

3. Configure the authentication profile name (access profile name) to use for authentication:

```
[edit protocols]
user@switch# set dot1x authenticator authentication-profile-name profile1
```

**NOTE:** Access profile configuration is required only for 802.1X clients, not for static MAC clients.

**Results** Display the results of the configuration:

```
user@switch> show
interfaces {
  ge-0/0/19 {
    unit 0 {
      family ethernet-switching {
        vlan members default;
      }
    }
  }
}
```

```

ge-0/0/20 {
  unit 0 {
    family ethernet-switching {
      vlan members default;
    }
  }
}
protocols {
  dot1x {
    authenticator {
      authentication-profile-name profile1
      static [00:04:0f:fd:ac:fe 00:04:ae:cd:23:5f];
      interface {
        all {
          supplicant multiple;
        }
      }
    }
  }
}

```

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying Static MAC Bypass of Authentication on page 360](#)

#### *Verifying Static MAC Bypass of Authentication*

**Purpose** Verify that the MAC addresses of both printers are configured and associated with the correct interfaces.

**Action** Issue the operational mode command:

```
user@switch> show dot1x static-mac-address
```

| MAC address       | VLAN-Assignment | Interface   |
|-------------------|-----------------|-------------|
| 00:04:0f:fd:ac:fe | default         | ge-0/0/19.0 |
| 00:04:ae:cd:23:5f | default         | ge-0/0/20.0 |

**Meaning** The output field **MAC address** shows the MAC addresses of the two printers.

The output field **Interface** shows that the MAC address **00:04:0f:fd:ac:fe** can connect to the LAN through interface **ge-0/0/19.0** and that the MAC address **00:04:ae:cd:23:5f** can connect to the LAN through interface **ge-0/0/20.0**.

## Captive Portal Authentication

---

You can control access to your network through a switch by using several different authentication. Junos OS switches support 802.1X, MAC RADIUS, and captive portal as an authentication methods to devices requiring to connect to a network. You can set up captive portal authentication on a switch to redirect Web browser requests to a login page that requires the user to input a username and password. For more information, read this topic.

- [Example: Setting Up Captive Portal Authentication on an EX Series Switch on page 361](#)
- [Configuring Captive Portal Authentication \(CLI Procedure\) on page 366](#)
- [Designing a Captive Portal Authentication Login Page on Switches on page 368](#)
- [Configuring Captive Portal Authentication \(CLI Procedure\) on an EX Series Switch with ELS Support on page 371](#)
- [Example: Setting Up Captive Portal Authentication on an EX Series Switch with ELS Support on page 372](#)

### Example: Setting Up Captive Portal Authentication on an EX Series Switch

You can set up captive portal authentication (hereafter referred to as captive portal) on a switch to redirect Web browser requests to a login page that requires the user to input a username and password. Upon successful authentication, the user is allowed to continue with the original page request and subsequent access to the network.

This example describes how to set up captive portal on an EX Series switch:

- [Requirements on page 361](#)
- [Overview and Topology on page 362](#)
- [Configuration on page 362](#)
- [Verification on page 365](#)
- [Troubleshooting on page 366](#)

#### Requirements

---

This example uses the following hardware and software components:

- An EX Series switch that supports captive portal
- Junos OS Release 10.1 or later for EX Series switches

Before you begin, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch*.
- Generated an SSL certificate and installed it on the switch. See [“Generating SSL Certificates to Be Used for Secure Web Access \(EX Series Switch\)”](#) on page 247.
- Designed your captive portal login page. See [“Designing a Captive Portal Authentication Login Page on Switches”](#) on page 368.

---

## Overview and Topology

This example shows the configuration required on the switch to enable captive portal on an interface. To permit a printer connected to the captive portal interface to access the LAN without going through captive portal, add its MAC address to the authentication whitelist. The MAC addresses in this list are permitted access on the interface without captive portal.

The topology for this example consists of one EX Series switch connected to a RADIUS authentication server. One interface on the switch is configured for captive portal. In this example, the interface is configured in multiple supplicant mode.

---

## Configuration

To configure captive portal on your switch:

### CLI Quick Configuration

To quickly configure captive portal on the switch after completing the tasks in the Requirements section, copy the following commands and paste them into the switch terminal window:

```
[edit]
set access radius-server 10.204.96.165 port 1812
set access radius-server 10.204.96.165 secret "ABC123"
set access profile profile1 authentication-order radius
set access profile profile1 radius authentication-server 10.204.96.165
set system services web-management http
set system services web-management https local-certificate my-signed-cert
set services captive-portal secure-authentication https
set services captive-portal interface ge-0/0/10.0 supplicant multiple
set services captive-portal authentication-profile-name profile1
set ethernet-switching-options authentication-whitelist 00:10:12:e0:28:22
set services captive-portal custom-options post-authentication-url
http://www.my-home-page.com
```

**Step-by-Step  
Procedure**

To configure captive portal on the switch:

1. Define the server IP address, the server authentication port number, and configure the secret password. The secret password on the switch must match the secret password on the server:

```
[edit]
user@switch# set access radius-server 10.204.96.165 port 1812
[edit]
user@switch# set access radius-server 10.204.96.165 secret "ABC123"
```

2. Configure the authentication order, making **radius** the first method of authentication:

```
[edit]
user@switch# set access profile profile1 authentication-order radius
```

3. Configure the server IP address to be tried in order to authenticate the supplicant:

```
[edit]
user@switch# set access profile profile1 radius authentication-server 10.204.96.165
```

4. Enable HTTP access on the switch:

```
[edit]
user@switch# set system services web-management http
```

5. To create a secure channel for Web access to the switch, configure captive portal for HTTPS:

**NOTE:** You can enable HTTP without enabling HTTPS, but we recommend HTTPS for security purposes.

- a. Associate the security certificate with the Web server and enable HTTPS access on the switch:

```
[edit]
user@switch# set system services web-management https local-certificate
my-signed-cert
```

- b. Configure captive portal to use HTTPS:

```
[edit]
user@switch# set services captive-portal secure-authentication https
```

6. Enable an interface for captive portal:

```
[edit]
user@switch# set services captive-portal interface ge-0/0/10 supplicant multiple
```

7. Specify the name of the access profile to be used for captive portal authentication:

```
[edit]
user@switch# set services captive-portal authentication-profile-name profile1
```

8. (Optional) Allow specific clients to bypass captive portal:

**NOTE:** If the client is already attached to the switch, you must clear its MAC address from the captive portal authentication by using the `clear captive-portal mac-address mac-address` command after adding its MAC address to the whitelist. Otherwise the new entry for the MAC address will not be added to the Ethernet switching table and authentication bypass will not be allowed.

[edit]

```
user@switch# set ethernet-switching-options authentication-whitelist 00:10:12:e0:28:22
```

**NOTE:** Optionally, you can use `set ethernet-switching-options authentication-whitelist 00:10:12:e0:28:22 interface ge-0/0/10.0` to limit the scope to the interface.

9. (Optional) To redirect clients to a specified page rather than the page they originally requested, configure the post-authentication URL:

[edit]

```
user@switch# set services captive-portal custom-options post-authentication-url http://www.my-home-page.com
```

**Results** Display the results of the configuration:

```
[edit]
user@switch> show
system {
  services {
    web-management {
      http;
      https {
        local-certificate my-signed-cert;
      }
    }
  }
}
security {
  certificates {
    local {
      my-signed-cert {
        "-----BEGIN RSA PRIVATE KEY-----ABC123
        ...
        ABC123-----END CERTIFICATE-----\n"; ## SECRET-DATA
      }
    }
  }
}
```

```

    }
  }
}
services {
  captive-portal {
    interface {
      ge-0/0/10.0 {
        supplicant multiple;
      }
    }
    secure-authentication https;
  }
}
ethernet-switching-options {
  authentication-whitelist {
    00:10:12:e0:28:22/48;
  }
}
}

```

### Verification

To confirm that captive portal is configured and working properly, perform these tasks:

- [Verifying That Captive Portal Is Enabled on the Interface on page 365](#)
- [Verify That Captive Portal Is Working Correctly on page 365](#)

#### *Verifying That Captive Portal Is Enabled on the Interface*

**Purpose** Verify that captive portal is configured on interface ge-0/0/10.

**Action** Use the operational mode command `show captive-portal interface interface-name detail`:

```

user@switch> show captive-portal interface ge-0/0/10.0 detail
ge-0/0/10.0
  Supplicant mode: Multiple
  Number of retries: 3
  Quiet period: 60 seconds
  Configured CP session timeout: 3600 seconds
  Server timeout: 15 seconds

```

**Meaning** The output confirms that captive portal is configured on interface ge-0/0/10 with the default settings for number of retries, quiet period, CP session timeout, and server timeout.

#### *Verify That Captive Portal Is Working Correctly*

**Purpose** Verify that captive portal is working on the switch.

**Action** Connect a client to interface ge-0/0/10. From the client, open a Web browser and request a webpage. The captive portal login page that you designed should be displayed. After

you enter your login information and are authenticated against the RADIUS server, the Web browser should display either the page you requested or the post-authentication URL that you configured.

## Troubleshooting

To troubleshoot captive portal, perform these tasks:

- [Troubleshooting Captive Portal on page 366](#)

### *Troubleshooting Captive Portal*

**Problem** The switch does not return the captive portal login page when a user connected to a captive portal interface on the switch requests a Web page.

**Solution** You can examine the ARP, DHCP, HTTPS, and DNS counters—if one or more of these counters are not incrementing, this provides an indication of where the problem lies. For example, if the client cannot get an IP address, check the switch interface to determine whether the DHCP counter is incrementing—if the counter increments, the DHCP packet was received by the switch.

```
user@switch> show captive-portal firewall ge-0/0/10.0
```

```
ge-0/0/10.0
  Filter name: dot1x_ge-0/0/10
  Counters:
  Name                               Bytes          Packets
  dot1x_ge-0/0/10_CP_arp             7616           119
  dot1x_ge-0/0/10_CP_dhcp             0              0
  dot1x_ge-0/0/10_CP_http             0              0
  dot1x_ge-0/0/10_CP_https            0              0
  dot1x_ge-0/0/10_CP_t_dns            0              0
  dot1x_ge-0/0/10_CP_u_dns            0              0
```

## Configuring Captive Portal Authentication (CLI Procedure)

Configure captive portal authentication (hereafter referred to as captive portal) on an EX Series switch so that users connected to the switch are authenticated before being allowed to access the network. When the user requests a web page, a login page is displayed that requires the user to input a username and password. Upon successful authentication, the user is allowed to continue with the original page request and subsequent access to the network.

Before you begin, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch*.
- Generated an SSL certificate and installed it on the switch. See “[Generating SSL Certificates to Be Used for Secure Web Access \(EX Series Switch\)](#)” on page 247.

- Configured basic access between the EX Series switch and the RADIUS server. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 290](#).
- Designed your captive portal login page. See [“Designing a Captive Portal Authentication Login Page on Switches” on page 368](#).

This topic includes the following tasks:

- [Configuring Secure Access for Captive Portal on page 367](#)
- [Enabling an Interface for Captive Portal on page 367](#)
- [Configuring Bypass of Captive Portal Authentication on page 368](#)

### Configuring Secure Access for Captive Portal

To configure secure access for captive portal:

1. Enable HTTP access on the switch:

```
[edit]
user@switch# set system services web-management http
```

2. Associate the security certificate with the Web server and enable HTTPS access on the switch:

```
[edit]
user@switch# set system services web-management https local-certificate my-signed-cert
```

**NOTE:** You can enable HTTP without HTTPS, but we recommend HTTPS for security purposes.

3. Configure captive portal to use HTTPS:

```
[edit]
user@switch# set services captive-portal secure-authentication https
```

### Enabling an Interface for Captive Portal

To enable an interface for captive portal:

```
[edit]
user@switch# set services captive-portal interface interface-name
```

For example, to enable captive portal on the interface ge-0/0/10:

```
[edit]
user@switch# set services captive-portal interface ge-0/0/10
```

## Configuring Bypass of Captive Portal Authentication

---

To allow specific clients to bypass captive portal:

```
[edit]
user@switch# set ethernet-switching-options authentication-whitelist mac-address
```

For example, to allow specific clients to bypass captive portal:

```
[edit]
user@switch# set ethernet-switching-options authentication-whitelist 00:10:12:e0:28:22
```

**NOTE:** Optionally, you can use `set ethernet-switching-options authentication-whitelist 00:10:12:e0:28:22 interface ge-0/0/10.0` to limit the scope to the interface.

**NOTE:** If the client is already attached to the switch, you must clear its MAC address from the captive portal authentication by using the `clear captive-portal mac-address mac-address` command after adding its MAC address to the whitelist. Otherwise the new entry for the MAC address will not be added to the Ethernet switching table and authentication bypass will not be allowed.

## Designing a Captive Portal Authentication Login Page on Switches

You can set up captive portal authentication on your switch to redirect all Web browser requests to a login page that requires users to input a username and password before they are allowed access. Upon successful authentication, users are allowed access to the network and redirected to the original page requested.

Junos OS provides a customizable template for the captive portal window that allows you to easily design and modify the look of the captive portal login page. You can modify the design elements of the template to change the look of your captive portal login page and to add instructions or information to the page. You can also modify any of the design elements of a captive portal login page.

The first screen displayed before the captive login page requires the user to read the terms and conditions of use. By clicking the Agree button, the user can access the captive portal login page.

Figure 19 on page 369 shows an example of a captive portal login page:

Figure 19: Example of a Captive Portal Login Page

Table 30 on page 369 summarizes the configurable elements of a captive portal login page.

Table 30: Configurable Elements of a Captive Portal Login Page

| Element                      | CLI Statement                                 | Description                                                                                                                                                                                                                                                                                        |
|------------------------------|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Footer background color      | <b>footer-bgcolor</b> <i>hex-color</i>        | The HTML hexadecimal code for the background color of the captive portal login page footer.                                                                                                                                                                                                        |
| Footer message               | <b>footer-message</b> <i>text-string</i>      | Text displayed in the footer of the captive portal login page. You can include copyright information, links, and additional information such as help instructions, legal notices, or a privacy policy<br><br>The default text shown in the footer is <b>Copyright @2010, Juniper Networks Inc.</b> |
| Footer text color            | <b>footer- text-color</b> <i>color</i>        | Color of the text in the footer. The default color is white.                                                                                                                                                                                                                                       |
| Form header background color | <b>form-header-bgcolor</b> <i>hex-color</i>   | The HTML hexadecimal code for the background color of the header bar across the top of the form area of the captive portal login page.                                                                                                                                                             |
| Form header message          | <b>form-header-message</b> <i>text-string</i> | Text displayed in the header of the captive portal login page. The default text is <b>Captive Portal User Authentication</b> .                                                                                                                                                                     |
| Form header text color       | <b>form-header- text- color</b> <i>color</i>  | Color of the text in the form header. The default color is black.                                                                                                                                                                                                                                  |
| Form reset button label      | <b>form-reset-label</b> <i>label-name</i>     | Using the <b>Reset</b> button, the user can clear the username and password fields on the form.                                                                                                                                                                                                    |

Table 30: Configurable Elements of a Captive Portal Login Page (continued)

| Element                  | CLI Statement                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Form submit button label | <b>form-submit-label</b><br><i>label-name</i> | Using the <b>Login</b> button, the user can submit the login information.                                                                                                                                                                                                                                                                                                                                                                             |
| Header background color  | <b>header-bgcolor</b> <i>hex-color</i>        | The HTML hexadecimal code for the background color of the captive portal login page header.                                                                                                                                                                                                                                                                                                                                                           |
| Header logo              | <b>header-logo</b> <i>filename</i>            | <p>Filename of the file containing the image of the logo that you want to appear in the header of the captive portal login page. The image file can be in GIF, JPEG, or PNG format.</p> <p>You can upload a logo image file to the switch. Copy the logo to the /var/tmp directory on the switch (during commit, the files are saved to persistent locations).</p> <p>If you do not specify a logo image, the Juniper Networks logo is displayed.</p> |
| Header message           | <b>header-message</b><br><i>text-string</i>   | Text displayed in the page header. The default text is <b>User Authentication</b> .                                                                                                                                                                                                                                                                                                                                                                   |
| Header text color        | <b>header-text- color</b> <i>color</i>        | Color of the text in the header. The default color is white.                                                                                                                                                                                                                                                                                                                                                                                          |
| Post-authentication URL  | <b>post-authentication-url</b><br><i>url</i>  | URL to which the users are directed on successful authentication. By default, users are directed to the page they had originally requested.                                                                                                                                                                                                                                                                                                           |

To design the captive portal login page:

1. (Optional) Upload your logo image file to the switch:

```
user@switch> file copy ftp://username:prompt@ftp.hostname.net/var/tmp/my-logo.jpeg
```

2. Configure the custom options to specify the background colors and text displayed in the captive portal page:

```
[edit system services captive-portal]
user@switch# set custom-options header-bgcolor #006600
set custom-options header-message "Welcome to Our Network"
set custom-options banner-message "Please enter your username and password".The banner
displays the message "XXXXXXX" by default. The user can modify this message.
set custom-options footer-message "Copyright ©2010, Our Network"
```

Now you can commit the configuration.

**NOTE:** For the custom options that you do not specify, the default value is used.

## Configuring Captive Portal Authentication (CLI Procedure) on an EX Series Switch with ELS Support

**NOTE:** This task uses Junos OS for switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [“Configuring Captive Portal Authentication \(CLI Procedure\)” on page 366](#). For ELS details, see *Using the Enhanced Layer 2 Software CLI*.

Configure captive portal authentication (hereafter referred to as captive portal) on a switch so that users connected to the switch are authenticated before being allowed to access the network. When the user requests a webpage, a login page is displayed that requires the user to input a username and password. Upon successful authentication, the user is allowed to continue with the original page request and subsequent access to the network.

Before you begin, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch with ELS Support*.
- Generated an SSL certificate and installed it on the switch. See [“Generating SSL Certificates to Be Used for Secure Web Access \(EX Series Switch\)” on page 247](#).
- Configured basic access between the switch and the RADIUS server. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 290](#).
- Designed your captive portal login page. See [“Designing a Captive Portal Authentication Login Page on Switches” on page 368](#).

This topic includes the following tasks:

- [Configuring Secure Access for Captive Portal on page 371](#)
- [Enabling an Interface for Captive Portal on page 372](#)
- [Configuring Bypass of Captive Portal Authentication on page 372](#)

### Configuring Secure Access for Captive Portal

To configure secure access for captive portal:

1. Associate the security certificate with the Web server and enable HTTPS on the switch:

[edit]

```
user@switch# set system services web-management https local-certificate certificate-name
```

**NOTE:** You can enable HTTP instead of HTTPS, but we recommend HTTPS for security purposes.

2. Configure captive portal to use HTTPS:

```
[edit]
user@switch# set services captive-portal secure-authentication https
```

---

### Enabling an Interface for Captive Portal

To enable an interface for use with captive portal authentication:

```
[edit]
user@switch# set services captive-portal interface interface-name
```

---

### Configuring Bypass of Captive Portal Authentication

You can allow specific clients to bypass captive portal authentication:

```
[edit]
user@switch# set switch-options authentication-whitelist mac-address
```

**NOTE:** Optionally, you can use `set switch-options authentication-whitelist mac-address interface interface-name` to limit the scope to the interface.

**NOTE:** If the client is already attached to the switch, you must clear its MAC address from the captive portal authentication by using the `clear captive-portal mac-address session-mac-addr` command after adding its MAC address to the whitelist. Otherwise, the new entry for the MAC address is not added to the Ethernet switching table and the authentication bypass is not allowed.

---

## Example: Setting Up Captive Portal Authentication on an EX Series Switch with ELS Support

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [“Example: Setting Up Captive Portal Authentication on an EX Series Switch” on page 361](#). For ELS details, see *Using the Enhanced Layer 2 Software CLI*.

You can set up captive portal authentication (hereafter referred to as captive portal) on a switch to redirect Web browser requests to a login page that requires the user to input a username and password. Upon successful authentication, the user is allowed to continue with the original page request and subsequent access to the network.

This example describes how to set up captive portal on an EX Series switch:

- [Requirements on page 373](#)
- [Overview and Topology on page 373](#)
- [Configuration on page 373](#)

- [Verification on page 376](#)
- [Troubleshooting on page 376](#)

### Requirements

This example uses the following software and hardware components:

- Junos OS Release 13.2X50 or later for EX Series switches
- An EX Series switch with support for ELS

Before you begin, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch with ELS Support*.
- Generated an SSL certificate and installed it on the switch. See [“Generating SSL Certificates to Be Used for Secure Web Access \(EX Series Switch\)” on page 247](#).
- Configured basic access between the EX Series switch and the RADIUS server. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 290](#).
- Designed your captive portal login page. See [“Designing a Captive Portal Authentication Login Page on Switches” on page 368](#).

### Overview and Topology

This example shows the configuration required on the switch to enable captive portal on an interface. To permit a printer connected to the captive portal interface to access the LAN, add its MAC address to the authentication whitelist and assign it to a VLAN, vlan1. The MAC addresses on this list are permitted access on the interface without captive portal authentication.

The topology for this example consists of one EX Series switch connected to a RADIUS authentication server. One interface on the switch is configured for captive portal. In this example, the interface is configured in multiple supplicant mode.

### Configuration

To configure captive portal on your switch:

#### CLI Quick Configuration

To quickly configure captive portal on the switch after completing the tasks in the Requirements section, copy the following commands and paste them into the switch terminal window:

```
[edit]
set system services web-management https local-certificate my-signed-cert
set services captive-portal secure-authentication https
set services captive-portal interface ge-0/0/10.0 supplicant multiple
set switch-options authentication-whitelist 00:10:12:e0:28:22 vlan-assignment vlan1
set custom-options post-authentication-url http://www.my-home-page.com
```

**Step-by-Step  
Procedure**

1. To create a secure channel for Web access to the switch, configure captive portal for HTTPS:
  - a. Associate the security certificate with the Web server and enable HTTPS on the switch:

```
[edit]
user@switch# set system services web-management https local-certificate
my-signed-cert
```

**NOTE:** You can enable HTTP instead of HTTPS, but we recommend that you enable HTTPS for security purposes.

- b. Configure captive portal to use HTTPS:

```
[edit]
user@switch# set services captive-portal secure-authentication https
```

2. Enable an interface for captive portal:

```
[edit]
user@switch# set services captive-portal interface ge-0/0/10 supplicant multiple
```

3. (Optional) Allow specific clients to bypass captive portal authentication:

**NOTE:** If the client is already attached to the switch, you must clear its MAC address from the captive portal authentication by using the `clear captive-portal mac-address mac-address` command after adding its MAC address to the whitelist. Otherwise, the new entry for the MAC address will not be added to the Ethernet switching table and the authentication bypass will not be allowed.

```
[edit]
user@switch# set switch-options authentication-whitelist 00:10:12:e0:28:22
vlan-assignment vlan1
```

**NOTE:** Optionally, you can use `set switch-options authentication-whitelist 00:10:12:e0:28:22 vlan-assignment vlan1 interface ge-0/0/10.0` to limit the scope to the interface.

4. (Optional) To redirect clients to a specified page rather than the page they originally requested, configure the post-authentication URL:

```
[edit services captive-portal]
user@switch# set custom-options post-authentication-url http://www.my-home-page.com
```

**Results** Display the results of the configuration:

```
[edit]
user@switch# show
system {
  services {
    web-management {
      https {
        local-certificate my-signed-cert;
      }
    }
  }
}
security {
  certificates {
    local {
      my-signed-cert {
        "-----BEGIN RSA PRIVATE KEY-----\ABC123
        ABC123ABC123ABC123 ... ABC123
        ----END CERTIFICATE-----\n"; ## SECRET-DATA
      }
    }
  }
}
services {
  captive-portal {
    interface {
      ge-0/0/10.0 {
        supplicant multiple;
      }
    }
    secure-authentication https;
    custom-options {
      post-authentication-url http://www.my-home-page.com;
    }
  }
}
switch-options {
  authentication-whitelist {
    00:10:12:e0:28:22/48 {
      vlan-assignment vlan1;
    }
  }
}
```

### Verification

---

To confirm that captive portal authentication is configured and working properly, perform these tasks:

- [Verifying That Captive Portal Is Enabled on the Interface on page 376](#)
- [Verify That Captive Portal Is Working Correctly on page 376](#)

#### *Verifying That Captive Portal Is Enabled on the Interface*

**Purpose** Verify that captive portal is configured on the interface ge-0/0/10.

**Action** Use the operational mode command **show captive-portal interface *interface-name* detail**:

```
user@switch> show captive-portal interface ge-0/0/10.0 detail
ge-0/0/10.0
  Supplicant mode: Multiple
  Number of retries: 3
  Quiet period: 60 seconds
  Configured CP session timeout: 3600 seconds
  Server timeout: 15 seconds
```

**Meaning** The output confirms that captive portal is configured on the interface **ge-0/0/10**, with the default settings for number of retries, quiet period, CP session timeout, and server timeout.

#### *Verify That Captive Portal Is Working Correctly*

**Purpose** Verify that captive portal is working on the switch.

**Action** Connect a client to the interface ge-0/0/10. From the client, open a Web browser and request a webpage. The captive portal login page that you designed should be displayed. After you enter your login information and are authenticated against the RADIUS server, the Web browser should display either the page you requested or the post-authentication URL that you configured.

### Troubleshooting

---

To troubleshoot captive portal, perform this task:

- [Troubleshooting Captive Portal on page 376](#)

#### *Troubleshooting Captive Portal*

**Problem** The switch does not return the captive portal login page when a user connected to a captive portal interface on the switch requests a webpage.

**Solution** You can examine the ARP, DHCP, HTTPS, and DNS counters—if one or more of these counters are not incrementing, this provides an indication of where the problem lies. For example, if the client cannot get an IP address, you might check the switch interface to determine whether the DHCP counter is incrementing—if the counter increments, the DHCP packet was received by the switch.

```
user@switch> show captive-portal firewall ge-0/0/10.0
```

```
ge-0/0/10.0
```

```
Filter name: dot1x_ge-0/0/10
```

```
Counters:
```

| Name                     | Bytes | Packets |
|--------------------------|-------|---------|
| dot1x_ge-0/0/10_CP_arp   | 7616  | 119     |
| dot1x_ge-0/0/10_CP_dhcp  | 0     | 0       |
| dot1x_ge-0/0/10_CP_http  | 0     | 0       |
| dot1x_ge-0/0/10_CP_https | 0     | 0       |
| dot1x_ge-0/0/10_CP_t_dns | 0     | 0       |
| dot1x_ge-0/0/10_CP_u_dns | 0     | 0       |

## Flexible Authentication Order on EX Series Switches

Junos OS switches support 802.1X, MAC RADIUS, and captive portal as an authentication methods to devices requiring to connect to a network. You can use the flexible authentication order feature to specify the order of authentication methods that the switch uses when attempting to authenticate a client. If multiple authentication methods are configured on a single interface, when one authentication method fails, the switch falls back to another method. For more information, read this topic.

- [Configuring Flexible Authentication Order on page 377](#)
- [Configuring EAPoL Block to Maintain an Existing Authentication Session on page 380](#)

### Configuring Flexible Authentication Order

You can use the flexible authentication order feature to specify the order of authentication methods that the switch uses when attempting to authenticate a client. If multiple authentication methods are configured on a single interface, when one authentication method fails, the switch falls back to another method.

By default, the switch attempts to authenticate a client by using 802.1X authentication first. If 802.1X authentication fails because there is no response from the client, and MAC RADIUS authentication is configured on the interface, the switch will attempt authentication using MAC RADIUS. If MAC RADIUS fails, and captive portal is configured on the interface, the switch attempts authentication using captive portal.

With a flexible authentication order, the sequence of authentication method used can be changed based on the type of clients connected to the interface. You can configure the **authentication-order** statement to specify whether 802.1X authentication or MAC RADIUS authentication must be the first authentication method tried. Captive portal is always the last authentication method tried.

If MAC RADIUS authentication is configured as the first authentication method in the order, then on receiving data from any client, the switch attempts to authenticate the client by using MAC RADIUS authentication. If MAC RADIUS authentication fails, then the switch uses 802.1X authentication to authenticate the client. If 802.1X authentication fails, and captive portal is configured on the interface, the switch attempts authentication using captive portal.

**NOTE:** If 802.1X authentication and MAC RADIUS authentication fail, and captive portal is not configured on the interface, the client is denied access to the LAN unless a server fail fallback method is configured. See [“Configuring RADIUS Server Fail Fallback \(CLI Procedure\)” on page 275](#) for more information.

Different authentication methods can be used in parallel on an interface that is configured in multiple-suplicant mode. Therefore, if an end device is authenticated on the interface by using captive portal, another end device connected to that interface can still be authenticated using 802.1X or MAC RADIUS authentication.

Before you configure the flexible authentication order on an interface, make sure that the authentication methods are configured on that interface. The switch does not attempt authentication using a method that is not configured on the interface, even if that method is included in the authentication order; the switch ignores that method and attempts the next method in the authentication order that is enabled on that interface.

Use the following guidelines when configuring the **authentication-order** statement:

- The authentication order must include at least two methods of authentication.
- 802.1X authentication must be one of the methods included in the authentication order.
- If captive portal is included in the authentication order, it must be the last method in the order.
- If **mac-radius-restrict** is configured on an interface then the authentication order cannot be configured on that interface.

To configure a flexible authentication order, use one of the following valid combinations:

**NOTE:** The authentication order can be configured globally using the `interface all` option as well as locally using the individual interface name. If the authentication order is configured both for an individual interface and for all interfaces, the local configuration for that interface overrides the global configuration.

- To configure 802.1X authentication as the first authentication method, followed by MAC RADIUS authentication, and then captive portal:

```
[edit]
user@switch# set protocols dot1x authenticator interface interface-name authentication-order
[dot1x mac-radius captive-portal]
```

- To configure 802.1X authentication as the first authentication method, followed by captive portal:

```
[edit]
user@switch# set protocols dot1x authenticator interface interface-name authentication-order
[dot1x captive-portal]
```

- To configure 802.1X authentication as the first authentication method, followed by MAC RADIUS authentication:

```
[edit]
user@switch# set protocols dot1x authenticator interface interface-name authentication-order
[dot1x mac-radius]
```

- To configure MAC RADIUS authentication as the first authentication method, followed by 802.1X, followed by captive portal:

```
[edit]
user@switch# set protocols dot1x authenticator interface interface-name authentication-order
[mac-radius dot1x captive-portal]
```

After you configure the authentication order, you must use the `insert` command to make any modifications to the authentication order. Using the `set` command does not change the configured order.

To change the authentication order after initial configuration:

```
[edit]
user@switch# insert protocols dot1x authenticator interface interface-name authentication-order
authentication-method before authentication-method
```

For example, to change the order from `[mac-radius dot1x captive portal]` to `[dot1x mac-radius captive portal]`:

```
[edit]
user@switch# insert protocols dot1x authenticator interface interface-name authentication-order
dot1x before mac-radius
```

- See Also**
- [Understanding Authentication on Switches on page 256](#)
  - [Example: Configuring MAC RADIUS Authentication on an EX Series Switch on page 314](#)

## Configuring EAPoL Block to Maintain an Existing Authentication Session

When a switch acting as an 802.1X authenticator receives an EAP-Start message from an authenticated client, the switch tries to re-authenticate the client using the 802.1X method and typically returns an EAP-Request message, and waits for a response. If the client fails to respond, the switch attempts to re-authenticate the client using MAC RADIUS or captive portal method if these methods were configured. Clients that have been authenticated using MAC RADIUS or captive portal authentication are non-responsive, and traffic is dropped on the interface as the switch attempts re-authentication.

If you have configured flexible authentication order on the interface so that MAC RADIUS is the first method used to authenticate a client, the switch still reverts to using 802.1X for re-authentication if the client sends an EAP-Start message, even if the client was successfully authenticated using MAC RADIUS authentication. You can configure an EAPoL block with either a fixed or flexible authentication order. If you do not configure the **authentication-order** statement, the order is fixed by default. The **eapol-block** statement can be configured with or without configuring the **authentication-order** statement.

You can configure a switch to ignore EAP-Start messages sent from a client that has been authenticated using MAC RADIUS authentication or captive portal authentication using the **eapol-block** statement. With a block of EAPoL messages in effect, if the switch receives an EAP-Start message from the client, it does not return an EAP-Request message, and the existing authentication session is maintained.

**NOTE:** If the endpoint has not been authenticated with MAC RADIUS authentication or captive portal authentication, the EAPoL block does not take effect. The endpoint can authenticate using 802.1X authentication.

---

If **eapol-block** is configured with the **mac-radius** option, then once the client is authenticated with MAC RADIUS authentication or CWA (Central Web Authentication), the client remains in authenticated state even if it sends an EAP-Start message. If **eapol-block** is configured with the **captive-portal** option, then once the client is authenticated with captive portal, the client remains in authenticated state even if it sends an EAP-Start message.

**NOTE:** This feature is supported on EX4300 and EX9200 switches.

---

To configure a block of EAPoL messages to maintain an existing authentication session:

- To configure EAPoL block for a client authenticated using MAC RADIUS authentication:

```
[edit]
user@switch# set protocols dot1x authenticator interface interface-name eapol-block
mac-radius
```

- To configure EAPoL block for a client authenticated using captive portal authentication:

```
[edit]
user@switch# set protocols dot1x authenticator interface interface-name eapol-block
captive-portal
```

## Central Web Authentication

Web authentication provides access to network for users by redirecting the client's Web browser to a central Web authentication server (CWA server), which handles the complete login process. Web authentication can also be used as a fallback authentication method for regular network users who have 802.1X-enabled devices, but fail authentication because of other issues, such as expired network credentials.

- [Understanding Central Web Authentication on page 381](#)
- [Configuring Central Web Authentication on page 384](#)

## Understanding Central Web Authentication

Web authentication redirects Web browser requests to a login page that requires the user to input a username and password. Upon successful authentication, the user is allowed access to the network. Web authentication is useful for providing network access to temporary users, such as visitors to a corporate site, who try to access the network using devices that are not 802.1X-enabled. Web authentication can also be used as a fallback authentication method for regular network users who have 802.1X-enabled devices, but fail authentication because of other issues, such as expired network credentials.

Web authentication can be done locally on the switch using captive portal, but this requires that the Web portal pages be configured on each switch used as a network access device. Central Web authentication (CWA) provides efficiency and scaling benefits

by redirecting the client's Web browser to a central Web authentication server (CWA server), which handles the complete login process.

- [Central Web Authentication Process on page 382](#)
- [Dynamic Firewall Filters for Central Web Authentication on page 383](#)
- [Redirect URL for Central Web Authentication on page 383](#)

### Central Web Authentication Process

---

Central Web authentication is invoked after a host has failed MAC RADIUS authentication. The host can attempt authentication using 802.1X authentication first, but must then attempt MAC RADIUS authentication before attempting central Web authentication. The switch, operating as the authenticator, exchanges RADIUS messages with the authentication, authorization, and accounting (AAA) server. After MAC RADIUS authentication fails, the switch receives an Access-Accept message from the AAA server. This message includes a dynamic firewall filter and a redirect URL for central Web authentication. The switch applies the filter, which allows the host to receive an IP address, and uses the URL to redirect the host to the Web authentication page.

The host is prompted for login credentials and might also be asked to agree to an acceptable use policy. If Web authentication is successful, the AAA server sends a Change of Authorization (CoA) message, which updates the terms of the authorized session in progress. This enables the authenticator to update the filter or VLAN assignment applied to the controlled port, to allow the host to access the LAN.

The sequence of events in central Web authentication is as follows (see [Figure 20 on page 383](#)):

1. A host connected to the switch (authenticator) initiates MAC RADIUS authentication.
2. MAC RADIUS authentication fails. Instead of sending an Access-Reject message to the switch, the AAA server sends an Access-Accept message that includes a dynamic firewall filter and a CWA redirect URL.
3. The host is allowed by the terms of the filter to send DHCP requests.
4. The host receives an IP address and DNS information from the DHCP server. The AAA server initiates a new session that has a unique session ID.
5. The host opens a Web browser.
6. The authenticator sends the CWA redirect URL to the host.
7. The host is redirected to the CWA server and is prompted for login credentials.
8. The host provides the username and password.

- Figure 20: Central Web Authentication Process**

To use the Juniper-Switching-Filter VSA for central Web authentication, you must configure the filter with the correct terms that allow the destination IP address of the CWA server. This configuration is done directly on the AAA server. To use the Filter-ID attribute for central web authentication, enter the value as JNPR\_RSVD\_FILTER\_CWA on the AAA server. The filter terms for this attribute are internally defined for central Web authentication, because of which no additional configuration is required. For more information about configuring dynamic firewall filters for central web authentication, see [“Configuring Central Web Authentication” on page 384](#).

383

the login process. The redirect URL for central web authentication can be configured on the AAA server or on the authenticator. The redirect URL, along with the dynamic firewall filter, must be present to trigger the central web authentication process after the failure of MAC RADIUS authentication.

The redirect URL can be centrally defined on the AAA server by using the Juniper-CWA-Redirect VSA, which is attribute number 50 in the Juniper RADIUS dictionary. The URL is forwarded from the AAA server to the switch in the same RADIUS Access-Accept message that contains the dynamic firewall filter. You can also configure the redirect URL locally on the host interface by using the CLI statement **redirect-url** at the **[edit protocols dot1x authenticator interface *interface-name*]** hierarchy level. For more information about configuring the redirect URL, see [“Configuring Central Web Authentication” on page 384](#).

- See Also**
- [Understanding Dynamic Filters Based on RADIUS Attributes on page 294](#)

  - [Filtering 802.1X Supplicants by Using RADIUS Server Attributes on page 285](#)

## Configuring Central Web Authentication

Central Web authentication is a fallback method of authentication in which the host's Web browser is redirected to a central Web authentication (CWA) server. The CWA server provides a web portal where the user can enter a username and password. If these credentials are validated by the CWA server, the user is authenticated and is allowed access to the network.

Central Web authentication is invoked after a host has failed MAC RADIUS authentication. The switch, operating as the authenticator, receives a RADIUS Access-Accept message from the AAA server that includes a dynamic firewall filter and a redirect URL for central Web authentication. The dynamic firewall filter and the redirect URL must both be present for the central Web authentication process to be triggered.

- [Configuring Dynamic Firewall Filters for Central Web Authentication on page 384](#)
- [Configuring the Redirect URL for Central Web Authentication on page 385](#)
- [Guidelines for Configuring Central Web Authentication on page 386](#)

### Configuring Dynamic Firewall Filters for Central Web Authentication

---

Dynamic firewall filters are used in central Web authentication to enable the host to get an IP address from a DHCP server, which allows the host to access the network. The filters are defined on the AAA server using RADIUS attributes, which are sent to the authenticator in an Access-Accept message. You can define the filter using either the Juniper-Switching-Filter attribute, which is a vendor-specific attribute (VSA), or the Filter-ID attribute, which is an IETF RADIUS attribute.

- To use the Juniper-Switching-Filter VSA for central Web authentication, you must configure the filter terms directly on the AAA server. The filter must include a term to match the destination IP address of the CWA server with the action **allow**.

For example:

```
001122334455 Auth-Type := EAP, Cleartext-Password := "001122334455"
    Session-Timeout = "300",
    Juniper-CWA-Redirect-URL = "https://10.10.10.10",
    Juniper-Switching-Filter = "Match Destination-ip 10.10.10.10 Action
allow, Match ip-protocol 17 Action allow, Match Destination-mac 00:01:02:33:44:55
Action deny"
```

**NOTE:** The switch does not resolve the DNS queries for the redirect URL. You must configure the Juniper-Switching-Filter attribute to allow the destination IP address of the CWA server.

- To use the Filter-ID attribute for central Web authentication, enter JNPR\_RSVD\_FILTER\_CWA as the value for the attribute on the AAA server. The filter terms for this attribute are internally defined for central Web authentication, because of which no additional configuration is required.

For example:

```
001122334455 Auth-Type := EAP, Cleartext-Password := "001122334455"
    Session-Timeout = "300",
    Juniper-CWA-Redirect-URL = "https://10.10.10.10",
    Filter-Id = "JNPR_RSVD_FILTER_CWA",
```

For more information about configuring dynamic firewall filters on the AAA server, see the documentation for your AAA server.

### Configuring the Redirect URL for Central Web Authentication

In central Web authentication, the authenticator redirects the host's Web browser request to the CWA server by using a redirect URL. The redirect URL for central Web authentication can be configured on the AAA server or locally on the host interface.

- To configure the redirect URL on the AAA server, use the Juniper-CWA-Redirect VSA, which is attribute number 50 in the Juniper RADIUS dictionary. The URL is forwarded from the AAA server to the switch in the same RADIUS Access-Accept message that contains the dynamic firewall filter.

For example:

```
001122334455 Auth-Type := EAP, Cleartext-Password := "001122334455"
    Session-Timeout = "300",
    Juniper-CWA-Redirect-URL = "https://10.10.10.10",
    Filter-Id = "JNPR_RSVD_FILTER_CWA",
```

**NOTE:** When the special Filter-ID attribute JNPR\_RSVD\_FILTER\_CWA is used for the dynamic firewall filter, the redirect URL must include the IP address of the AAA server, for example, https://10.10.10.10.

- To configure the redirect URL locally on the host interface, use the following CLI statement:

[edit]

```
user@switch# set protocols dot1x authenticator interface interface-name redirect-url
```

For example:

```
user@switch# show protocols dot1x
authenticator {
  authentication-name-profile auth1;
  interface {
    ge-0/0/1.0 {
      supplicant single;
      mac-radius;
      redirect-url https://10.10.10.10;
    }
  }
}
```

---

### Guidelines for Configuring Central Web Authentication

Central Web authentication is triggered after the failure of MAC RADIUS authentication when the redirect URL and dynamic firewall filter are both present. The redirect URL and dynamic firewall filter can be configured in any of the following combinations:

1. The AAA server sends both the CWA redirect URL and dynamic firewall filter to the authenticator. The redirect URL is configured on the AAA server by using the Juniper-CWA-Redirect VSA and the dynamic firewall filter is configured on the AAA server by using the Juniper-Switching-Filter VSA. The filter must be configured to allow the destination IP address of the CWA server in this case.
2. The AAA server sends the dynamic firewall filter to the authenticator and the redirect URL is configured locally on the host port. The redirect URL is configured on the authenticator by using the **redirect-url** CLI statement and the dynamic firewall filter is configured on the AAA server by using the Juniper-Switching-Filter VSA. The filter must be configured to allow the destination IP address of the CWA server in this case.
3. The AAA server sends both the CWA redirect URL and dynamic firewall filter to the authenticator. The redirect URL is configured on the AAA server by using the Juniper-CWA-Redirect VSA and the dynamic firewall filter is configured on the AAA server by using the Filter-ID attribute with the value JNPR\_RSVD\_FILTER\_CWA. The redirect URL must contain the IP address of the CWA server in this case.
4. The AAA server sends the dynamic firewall filter to the authenticator and the redirect URL is configured locally on the host port. The redirect URL is configured on the authenticator by using the **redirect-url** CLI statement and the dynamic firewall filter is configured on the AAA server by using the Filter-ID attribute with the value JNPR\_RSVD\_FILTER\_CWA. The redirect URL must contain the IP address of the CWA server in this case.

## Centralized Access Control to Network Resources on EX Series Switches

---

Network access control (NAC) allows you to control access to network resources such as servers, applications, and stored data.

You can use Junos Pulse Access Control Service and the switches for a centralized end-to-end NAC system. The Access Control Service eliminates the need to configure firewall filters on each switch. Instead, you define resource access policies centrally on the NAC device. For more information, read this topic.

- [Understanding Centralized Network Access Control and EX Series Switches on page 387](#)
- [Configuring an EX Series Switch to Use Junos Pulse Access Control Service for Network Access Control \(CLI Procedure\) on page 389](#)
- [Configuring the EX Series Switch for Captive Portal Authentication with Junos Pulse Access Control Service \(CLI Procedure\) on page 392](#)

## Understanding Centralized Network Access Control and EX Series Switches

Network access control (NAC) allows you to control who is admitted to the network and what resources—servers, applications, and stored data—those users are allowed to access. These controls include:

- Authentication—Pre-admission controls
- Authorization—Post-admission controls

You can use different methods to implement NAC on Juniper Networks EX Series Ethernet Switches.

This topic describes:

- [NAC Using Any RADIUS Server and Access Policies Defined on the Local Switch on page 387](#)
- [Centralized NAC Using Junos Pulse Access Control Service on page 388](#)
- [Captive Portal Authentication on page 389](#)

### NAC Using Any RADIUS Server and Access Policies Defined on the Local Switch

For pre-admission controls, you can use the switch in combination with any RADIUS server as the *authentication server*. For additional information, see [“Understanding Authentication on Switches” on page 256](#).

For post-admission controls, you can configure firewall filters to limit access to specific resources. For additional information, see *Firewall Filters for EX Series Switches Overview*.

### Centralized NAC Using Junos Pulse Access Control Service

---

You can use Junos Pulse Access Control Service and the switches for a centralized end-to-end NAC system, including both pre-admission *authentication* and post-admission *authorization*.

When you configure such a system, the Juniper Networks MAG Series Junos Pulse Gateways or the Juniper Networks IC Series Unified Access Control Appliances NAC device functions as the authentication server. For messages relating to IEEE 802.1X and MAC RADIUS authentication, the NAC device communicates with the switch using the RADIUS protocol.

The Access Control Service also performs additional functions. It eliminates the need to configure firewall filters on each switch. Instead, you define resource access policies centrally on the NAC device. This centralized method is particularly helpful when you have multiple switches in your network.

The resource access policy on the Access Control Service defines which network resources are allowed and denied for a user, based upon the user's role. The NAC device distributes these policies to all connected switches. The NAC device thus functions as a centralized policy management server. For messages relating to access policies, the NAC device communicates with the switch using the Junos UAC Enforcer Protocol (JUEP). The switch converts the resource access policies into filter definitions and applies these to the appropriate port.

**NOTE:** With this solution, the EX Series switch serves as an *Infranet Enforcer*, that is, a policy enforcement point for the Access Control Service. The Access Control Service sends auth table entries and resource access policies when an endpoint successfully completes 802.1X authentication or MAC authentication (unmanaged devices). Access for any endpoint is governed by the resource access policies that you configure on the Access Control Service. Because resource access policies are employed, firewall filters are not required for the switch configuration.

---

This integrated solution of Access Control Service and EX Series switches is easier to implement and much more efficient than previous versions of Access Control Service and the switches. As soon the switch connects to the MAG Series or IC Series NAC device, the Access Control Service pushes the role-based policies to the switch via JUEP. This enables the user to access the network more quickly than previous implementations, because the policy is already available on the switch and does not need to be pushed from the centralized device at the time of user authentication. Moreover, the policy push happens only once, which utilizes network bandwidth efficiently and makes this implementation suitable for scaled environments.

If you change policies, the Access Control Service automatically pushes the updated policies to the connected switch. The switch applies the policies dynamically without taking users through another authentication transaction.

**NOTE:** Do not configure firewall filters on the switch and do not use RADIUS server attributes for firewall filters if you are configuring the switch to use the Access Control Service. Instead, specify or deny access to resources by using the Access Control Service resource access policies.

You create policies on the NAC device's administrative interface to control access to resources and services. Access is based on successful authentication, the user's assigned role, and the security compliance of the endpoint device. For example, you can provide full access to protected resources employee role and limited access for a contractor role.

### Captive Portal Authentication

Captive portal authentication allows you to authenticate users on the switches by redirecting Web browser requests to a login page that requires users to input a username and password before they are allowed access to the network. The details of configuring captive portal authentication differ depending on whether you are using the Access Control Service:

- If you have connected the switch to the Access Control Service, use the Access Control Service NAC device as an external captive portal server for redirecting Web browser requests. When users try to access a protected network resource that is connected to the switch, the user must first sign in to the Access Control Service for authentication and endpoint security checking. The captive portal redirects the user to a login page located on the Access Control Service. When the sign-in page for the Access Control Service is displayed, the user signs in and the Access Control Service examines the endpoint for compliance with security policies. If the endpoint passes the security check, access is granted to the protected resource.

See [“Configuring the EX Series Switch for Captive Portal Authentication with Junos Pulse Access Control Service \(CLI Procedure\)” on page 392](#). You can use the same Access Control Service as the external captive portal server for more than one switch.

- If you are not using the Access Control Service, you can use captive portal to redirect users to a login page that you configure on the local switch. See [“Designing a Captive Portal Authentication Login Page on Switches” on page 368](#) for information about designing a login page on your switch.

### Configuring an EX Series Switch to Use Junos Pulse Access Control Service for Network Access Control (CLI Procedure)

You can connect the switch to Junos Pulse Access Control Service to set up a centralized, end-to-end network access control (NAC) system, which allows you to control who is admitted to the network and what resources those users are allowed to access.

The Access Control Service functions both as an *authentication server* (RADIUS server) and as a *centralized policy management server*.

Before you begin configuring the switch to connect to the Access Control Service:

- Configure a resource access policy.

- Obtain the password of the Access Control Service.
- Obtain the IP address of the Access Control Service.

**NOTE:** Specify the same IP address for the authentication server, the RADIUS server, and the infranet controller (NAC device). These components refer to the same Access Control Service.

To configure the switch to work with the Access Control Service:

1. Configure the switch to use the Access Control Service for authentication and authorization:

```
[edit ethernet-switching-options]
user@switch# set uac-policy
```

2. Configure the access profile to specify the Access Control Service. The access profile contains the authentication and authorization configuration that aids in handling authentication and authorization requests, including the authentication method and sequence, and the Access Control Service address:

- a. Configure **radius** as the authentication method to be used when attempting to authenticate a user. For each login attempt, the software tries the authentication methods in order, starting with the first one, until the password matches:

```
[edit access profile]
user@switch# set profile-name authentication-order radius
```

- b. Specify the IP address of the authentication server:

**NOTE:** Specify the same IP address that you use for the RADIUS server and the NAC device.

```
[edit access profile]
user@switch# set profile-name radius authentication-server ip-address
```

3. Configure the RADIUS server to use the same IP address that you specified for the authentication server:

```
[edit access]
user@switch# set radius-server ip-address
```

4. Configure the password to use for connecting the switch with the RADIUS server:

**NOTE:** The password specified here is used for RADIUS communications between the switch and the Access Control Service. It does not need to match the password that is specified on the Access Control Service through the administrative interface on the Access Control Service.

```
[edit access]
user@switch# set radius-server secret password
```

5. Configure the address of the Access Control Service MAG Series or the IC Series NAC device:

**NOTE:** Specify the hostname and IP address of the NAC device. This is the same IP address that you used for specifying the authentication server.

```
[edit services united-access-control infranet-controller hostname]
user@switch# set address ip-address
```

6. Configure the switch's management Ethernet interface for the NAC device:

```
[edit services united-access-control infranet-controller hostname]
user@switch# set interface me0.0
```

7. Configure the password for connecting the switch to the Access Control Service NAC device:

**NOTE:** This password must match the password specified on the Access Control Service through its administrative interface. It is used for Junos UAC Enforcer Protocol (JUEP) communications between the switch and the Access Control Service.

```
[edit services united-access-control infranet-controller hostname]
user@switch# set password password
```

8. Configure the amount of time that switch waits to receive a response from the Access Control Service:

```
[edit services united-access-control]
user@switch# set timeout seconds
```

9. Specify the time between continuity-check messages for the switch's connection with the Access Control Service:

```
[edit services united-access-control]
user@switch# set interval seconds
```

10. Specify an action for the switch to take if a timeout occurs for the connection between the switch and the Access Control Service:

```
[edit services united-access-control]
user@switch# set timeout-action action
```

11. Specify the name of the access profile to use for 802.1X, MAC RADIUS, or captive portal authentication:

**NOTE:** Use the same access profile that you configured previously (step 2).

```
[edit protocols dot1x]
user@switch# set authenticator authentication-profile-name profile-name
```

12. Configure the 802.1X interface that the switch will use for communicating with the Access Control Service:

```
[edit protocols dot1x]
user@switch# set authenticator interface interface-name
```

## Configuring the EX Series Switch for Captive Portal Authentication with Junos Pulse Access Control Service (CLI Procedure)

If you have connected the EX Series switch to the Junos Pulse Access Control Service and you want to use the captive portal user authentication feature, configure the Access Control Service network access control (NAC) device as an external captive portal server. The captive portal feature is required only for user authentication. Unmanaged devices, such as printers or phones, can be authenticated through 802.1X and MAC address authentication.

When users try to access a protected network resource that is connected to the switch, the user must first sign in to the Access Control Service for authentication and endpoint security checking. The captive portal redirects the user to a login page located on the Access Control Service.

When the sign-in page for the Access Control Service is displayed, the user signs in and the Access Control Service examines the endpoint for compliance with security policies. If the endpoint passes the security check, access is granted to the protected resource.

Before you begin, be sure you have:

- Configured access between the switch and the Access Control Service. See [“Configuring an EX Series Switch to Use Junos Pulse Access Control Service for Network Access Control \(CLI Procedure\)”](#) on page 389.
- Designed your captive portal login page on the Access Control Service.

To configure the switch to use the Access Control Service for captive portal:

1. Configure captive portal to authenticate clients connected to the switch for access to use the authentication profile that directs the client to the Access Control Service:

**NOTE:** The access profile name specified here must match the access profile name that you specified for the Access Control Service in [“Configuring an EX Series Switch to Use Junos Pulse Access Control Service for Network Access Control \(CLI Procedure\)”](#) on page 389.

```
[edit]
user@switch# set services captive-portal authentication-profile-name access-profile-name
```

2. Enable an interface for use with captive portal authentication:

```
[edit]
user@switch# set services captive-portal interface interface-name supplicant multiple
```

3. (Optional) Specify which clients are to bypass captive portal authentication:

```
[edit]
user@switch# set ethernet-switching-options authentication-whitelist mac-address
```

**NOTE:** You can use `set ethernet-switching-options authentication-whitelist mac-address interface interface-name` to limit the scope to the interface.

**NOTE:** If the client is already attached to the switch, you must clear its MAC address from captive portal authentication by using the `clear captive-portal mac-address mac-address` command after adding its MAC address to the authentication whitelist. Otherwise the new entry for the MAC address will not be added to the Ethernet switching table and the authentication bypass will not be allowed.

## VoIP on EX Series Switches

You can configure voice over IP (VoIP) on an EX Series switch to support IP telephones. When you use VoIP, you can connect IP telephones to the switch and configure IEEE 802.1X authentication for 802.1X-compatible IP telephones. For more information, read this topic.

- [Understanding 802.1X and VoIP on EX Series Switches on page 394](#)
- [Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch on page 396](#)
- [Example: Configuring VoIP on an EX Series Switch Without Including LLDP-MED Support on page 404](#)
- [Example: Configuring VoIP on an EX Series Switch Without Including LLDP-MED Support on page 409](#)
- [Example: Configuring VoIP on an EX Series Switch Without Including 802.1X Authentication on page 414](#)
- [Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch with ELS Support on page 421](#)

## Understanding 802.1X and VoIP on EX Series Switches

When you use VoIP, you can connect IP telephones to the switch and configure IEEE 802.1X authentication for 802.1X-compatible IP telephones. The 802.1X authentication provides network edge security, protecting Ethernet LANs from unauthorized user access.

VoIP is a protocol used for the transmission of voice through packet-switched networks. VoIP transmits voice calls by using a network connection instead of an analog phone line.

When VoIP is used with 802.1X, the RADIUS server authenticates the phone, and Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) provides the class-of-service (CoS) parameters to the phone.

You can configure 802.1X authentication to work with VoIP in multiple supplicant or single supplicant mode. In *multiple supplicant* mode, the 802.1X process allows multiple supplicants to connect to the interface. Each supplicant is authenticated individually. For an example of a VoIP multiple supplicant topology, see [Figure 21 on page 394](#).

**Figure 21: VoIP Multiple Supplicant Topology**

If an 802.1X-compatible IP telephone does not have an 802.1X host but has another 802.1X-compatible device connected to its data port, you can connect the phone to an interface in single supplicant mode. In *single supplicant* mode, the 802.1X process authenticates only the first supplicant. All other supplicants who connect later to the interface are allowed full access without any further authentication. They effectively “piggyback” on the first supplicant’s authentication. For an example of a VoIP single supplicant topology, see [Figure 22 on page 395](#).

*Figure 22: VoIP Single Supplicant Topology*

If an IP telephone does not support 802.1X, you can configure VoIP to bypass 802.1X and LLDP-MED and have the packets forwarded to a VoIP VLAN.

### Multi Domain 802.1X Authentication

Multi-domain 802.1X authentication is an extension of multiple supplicant mode that allows one default VoIP device and multiple data devices to authenticate on a single port. Multi-domain 802.1X authentication provides enhanced security over multiple supplicant mode by restricting the number of authenticated data and VoIP sessions on the port. In multiple supplicant mode, any number of VoIP or data sessions can be authenticated; the number of sessions can be restricted using MAC limiting, but there is no way to apply the limit specifically to either data or VoIP sessions.

With multi-domain 802.1X authentication, the single port is divided into two domains; one is the data domain and the other is the voice domain. Multi-domain 802.1X authentication maintains separate session counts based on the domain. You can configure the maximum number of authenticated data sessions allowed on the port. The number of VoIP sessions is not configurable; only one authenticated VoIP session is allowed on the port.

If a new client attempts to authenticate on the interface after the maximum session count has been reached, the default action is to drop the packet and generate an error log message. You can also configure the action to shut down the interface. The port can be manually recovered from the down state by issuing the **clear dot1x recovery-timeout** command, or by can recover automatically after a configured recovery timeout period.

Multi-domain authentication does not enforce the order of device authentication. However, for the best results, the VoIP device should be authenticated before a data device on a multi domain 802.1X-enabled port. Multi-domain authentication is supported only in multiple supplicant mode.

**See Also** • [Understanding LLDP and LLDP-MED on EX Series Switches on page 438](#)

### Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch

You can configure voice over IP (VoIP) on an EX Series switch to support IP telephones. The Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) protocol forwards VoIP parameters from the switch to the phone. You also configure 802.1X authentication to allow the telephone access to the LAN. Authentication is done through a backend RADIUS server.

This example describes how to configure VoIP on an EX Series switch to support an Avaya IP phone, as well as the LLDP-MED protocol and 802.1X authentication:

**NOTE:** If your switch runs Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style, see [“Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch with ELS Support” on page 421](#). For ELS details, see *Using the Enhanced Layer 2 Software CLI*.

- 
- [Requirements on page 396](#)
  - [Overview and Topology on page 397](#)
  - [Configuration on page 399](#)
  - [Verification on page 401](#)

#### Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 9.1 or later for EX Series switches
- One EX Series switch acting as an authenticator port access entity (PAE). The interfaces on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- An Avaya 9620 IP telephone that supports LLDP-MED and 802.1X

Before you configure VoIP, be sure you have:

- Installed your EX Series switch. See *Installing and Connecting an EX3200 Switch*.
- Performed the initial switch configuration. See *Connecting and Configuring an EX Series Switch (J-Web Procedure)*.
- Performed basic bridging and VLAN configuration on the switch. See *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch*.

- Configured the RADIUS server for 802.1X authentication and set up the access profile. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 290](#).
- (Optional) Configured interface **ge-0/0/2** for Power over Ethernet (PoE). The PoE configuration is not necessary if the VoIP supplicant is using a power adapter. For information about configuring PoE, see *Configuring PoE on EX Series Switches (CLI Procedure)*.

**NOTE:** If the IP address isn't configured on the Avaya IP phone, the phone exchanges LLDP-MED information to get the VLAN ID for the voice VLAN. You must configure the `voip` statement on the interface to designate the interface as a VoIP interface and allow the switch to forward the VLAN name and VLAN ID for the voice VLAN to the IP telephone. The IP telephone then uses the voice VLAN (that is, it references the voice VLAN's ID) to send a DHCP discover request and exchange information with the DHCP server (voice gateway).

### Overview and Topology

Instead of using a regular telephone, you connect an IP telephone directly to the switch. An IP phone has all the hardware and software needed to handle VoIP. You also can power an IP telephone by connecting it to one of the Power over Ethernet (PoE) interfaces on the switch.

In this example, the access interface **ge-0/0/2** on the EX4200 switch is connected to an Avaya 9620 IP telephone. Avaya phones have a built-in bridge that allows you to connect a desktop PC to the phone, so the desktop and phone in a single office require only one interface on the switch. The EX Series switch is connected to a RADIUS server on interface **ge-0/0/10** (see [Figure 23 on page 398](#)).

Figure 23: VoIP Topology

In this example, you configure VoIP parameters and specify the forwarding class **assured-forward** for voice traffic to provide the highest quality of service.

[Table 31 on page 398](#) describes the components used in this VoIP configuration example.

Table 31: Components of the VoIP Configuration Topology

| Property        | Settings      |
|-----------------|---------------|
| Switch hardware | EX4200 switch |

Table 31: Components of the VoIP Configuration Topology (continued)

| Property                                                                                                            | Settings                                                                               |
|---------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| VLAN names                                                                                                          | <b>data-vlan</b><br><b>voice-vlan</b>                                                  |
| Connection to Avaya phone—with integrated hub, to connect phone and desktop PC to a single interface (requires PoE) | <b>ge-0/0/2</b>                                                                        |
| One RADIUS server                                                                                                   | Provides backend database connected to the switch through interface <b>ge-0/0/10</b> . |

As well as configuring a VoIP for interface **ge-0/0/2**, you configure:

- 802.1X authentication. Authentication is set to **multiple** supplicant to support more than one supplicant's access to the LAN through interface **ge-0/0/2**.
- LLDP-MED protocol information. The switch uses LLDP-MED to forward VoIP parameters to the phone. Using LLDP-MED ensures that voice traffic gets tagged and prioritized with the correct values at the source itself. For example, 802.1p class of service and 802.1Q tag information can be sent to the IP telephone.

**NOTE:** A PoE configuration is not necessary if an IP telephone is using a power adapter.

Configuration

To configure VoIP, LLDP-MED, and 802.1X authentication:

CLI Quick Configuration

To quickly configure VoIP, LLDP-MED, and 802.1X, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans data-vlan vlan-id 77
set vlans voice-vlan vlan-id 99
set vlans data-vlan interface ge-0/0/2.0
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
set interfaces ge-0/0/2 unit 0 family ethernet-switching port-mode access
set ethernet-switching-options voip interface ge-0/0/2.0 vlan voice-vlan
set ethernet-switching-options voip interface ge-0/0/2.0 forwarding-class assured-forwarding
set protocols lldp-med interface ge-0/0/2.0
set protocols dot1x authenticator interface ge-0/0/2.0 supplicant multiple
```

**Step-by-Step  
Procedure**

To configure VoIP with LLDP-MED and 802.1X:

1. Configure the VLANs for voice and data:

```
[edit vlans]
user@switch# set data-vlan vlan-id 77
user@switch# set voice-vlan vlan-id 99
```

2. Associate the VLAN **data-vlan** with the interface:

```
[edit vlans]
user@switch# set data-vlan interface ge-0/0/2.0
```

3. Configure the interface as an access interface, configure support for Ethernet switching, and add the **data-vlan** VLAN:

```
[edit interfaces]
user@switch# set ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
user@switch# set ge-0/0/2 unit 0 family ethernet-switching port-mode access
```

4. Configure VoIP on the interface and specify the **assured-forwarding** forwarding class to provide the most dependable class of service:

```
[edit ethernet-switching-options]
user@switch# set voip interface ge-0/0/2.0 vlan voice-vlan
user@switch# set voip interface ge-0/0/2.0 forwarding-class assured-forwarding
```

5. Configure LLDP-MED protocol support:

```
[edit protocols]
user@switch# set lldp-med interface ge-0/0/2.0
```

6. To authenticate an IP phone and a PC connected to the IP phone on the interface, configure 802.1X authentication support and specify **multiple** supplicant mode:

**NOTE:** If you do not want to authenticate any device, skip the 802.1X configuration on this interface.

```
[edit protocols]
user@switch# set dot1x authenticator interface ge-0/0/2.0 supplicant multiple
```

**Results** Display the results of the configuration:

```
[edit]
user@switch# show configuration
interfaces {
  ge-0/0/2 {
    unit 0 {
      family ethernet-switching {
        port-mode access;
```

```

        vlan {
            members data-vlan;
        }
    }
}
protocols {
    lldp-med {
        interface ge-0/0/2.0;
    }
    dot1x {
        authenticator {
            interface {
                ge-0/0/2.0 {
                    supplicant multiple;
                }
            }
        }
    }
}
vllans {
    data-vlan {
        vlan-id 77;
        interface {
            ge-0/0/2.0;
        }
    }
    voice-vlan {
        vlan-id 99;
    }
}
ethernet-switching options {
    voip {
        interface ge-0/0/2.0 {
            vlan voice-vlan;
            forwarding-class assured-forwarding;
        }
    }
}
}

```

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying LLDP-MED Configuration on page 401](#)
- [Verifying 802.1X Authentication for IP Phone and Desktop PC on page 402](#)
- [Verifying the VLAN Association with the Interface on page 403](#)

#### *Verifying LLDP-MED Configuration*

**Purpose** Verify that LLDP-MED is enabled on the interface.

**Action** user@switch> `show lldp detail`

```
LLDP : Enabled
Advertisement interval : 30 Second(s)
Transmit delay : 2 Second(s)
Hold timer : 2 Second(s)
Config Trap Interval : 300 Second(s)
Connection Hold timer : 60 Second(s)

LLDP MED : Enabled
MED fast start count : 3 Packet(s)
```

| Interface  | LLDP    | LLDP-MED | Neighbor count |
|------------|---------|----------|----------------|
| all        | Enabled | -        | 0              |
| ge-0/0/2.0 | -       | Enabled  | 0              |

| Interface   | VLAN-id | VLAN-name     |
|-------------|---------|---------------|
| ge-0/0/0.0  | 0       | default       |
| ge-0/0/1.0  | 0       | employee-vlan |
| ge-0/0/2.0  | 0       | data-vlan     |
| ge-0/0/2.0  | 99      | voice-vlan    |
| ge-0/0/3.0  | 0       | employee-vlan |
| ge-0/0/8.0  | 0       | employee-vlan |
| ge-0/0/10.0 | 0       | default       |
| ge-0/0/11.0 | 20      | employee-vlan |
| ge-0/0/23.0 | 0       | default       |

LLDP basic TLVs supported:

Chassis identifier, Port identifier, Port description, System name, System description, System capabilities, Management address.

LLDP 802 TLVs supported:

Power via MDI, Link aggregation, Maximum frame size, Port VLAN tag, Port VLAN name.

LLDP MED TLVs supported:

LLDP MED capabilities, Network policy, Endpoint location, Extended power Via MDI.

**Meaning** The `show lldp detail` output shows that both LLDP and LLDP-MED are configured on the `ge-0/0/2.0` interface. The end of the output shows the list of supported LLDP basic TLVs, 802.3 TLVs, and LLDP-MED TLVs that are supported.

#### *Verifying 802.1X Authentication for IP Phone and Desktop PC*

**Purpose** Display the 802.1X configuration to confirm that the VoIP interface has access to the LAN.

**Action** user@switch> `show dot1x interface ge/0/0/2.0 detail`

```

ge-0/0/2.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Multiple
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user101, 00:04:0f:fd:ac:fe
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: vo11
      Dynamic Filter: match source-dot1q-tag 10 action deny
      Session Reauth interval: 60 seconds
      Reauthentication due in 50 seconds

```

**Meaning** The field **Role** shows that the **ge-0/0/2.0** interface is in the authenticator state. The **Supplicant** field shows that the interface is configured in multiple supplicant mode, permitting multiple supplicants to be authenticated on this interface. The MAC addresses of the supplicants currently connected are displayed at the bottom of the output.

#### *Verifying the VLAN Association with the Interface*

**Purpose** Display the interface state and VLAN membership.

**Action** user@switch> [show ethernet-switching interfaces](#)

Ethernet-switching table: 0 entries, 0 learned

```
user@switch> show ethernet-switching interfaces
Interface  State  VLAN members  Blocking
ge-0/0/0.0 down  default       unblocked
ge-0/0/1.0 down  employee-vlan unblocked
ge-0/0/5.0 down  employee-vlan unblocked
ge-0/0/3.0 down  employee-vlan unblocked
ge-0/0/8.0 down  employee-vlan unblocked
ge-0/0/10.0 down default       unblocked
ge-0/0/11.0 down employee-vlan unblocked
ge-0/0/23.0 down default       unblocked
ge-0/0/2.0 up    voice-vlan    unblocked
                data-vlan     unblocked
```

**Meaning** The field **VLAN members** shows that the **ge-0/0/2.0** interface supports both the **data-vlan** VLAN and **voice-vlan** VLAN. The **State** field shows that the interface is up.

### Example: Configuring VoIP on an EX Series Switch Without Including LLDP-MED Support

You can configure voice over IP (VoIP) on an EX Series switch to support IP telephones. The Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) protocol is sometimes used with IP phones to forward VoIP parameters from the switch to the phone. However, not all IP phones support LLDP-MED.

This example describes how to configure VoIP on an EX Series switch without using LLDP-MED:

- [Requirements on page 405](#)
- [Overview on page 405](#)
- [Configuring VoIP Without LLDP-MED by Using a Voice VLAN on an Access Port on page 406](#)
- [Configuring VoIP Without LLDP-MED by Using a Trunk Port with Native VLAN Option on page 407](#)
- [Verification on page 409](#)

---

## Requirements

---

This example uses the following hardware and software components:

- One EX Series switch with support for ELS acting as an authenticator port access entity (PAE). The interfaces on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- An IP phone that does not support LLDP-MED.
- Junos OS Release 13.2X50 or later for EX Series switches.

Before you configure VoIP, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch with ELS Support*.
- Configured the IP phone as a member of the voice VLAN.
- (Optional) Configured interface ge-0/0/2 for Power over Ethernet (PoE). The PoE configuration is not necessary if the VoIP supplicant is using a power adapter. See *Configuring PoE on EX Series Switches (CLI Procedure)*.

---

## Overview

---

Instead of using a regular telephone, you connect an IP telephone directly to the switch. An IP phone has all the hardware and software needed to handle VoIP. You can also power an IP telephone by connecting it to one of the Power over Ethernet (PoE) interfaces on the switch.

EX Series switches can accommodate an IP telephone and end host connected to a single switch port. In such a scenario, voice and data traffic must be separated into different broadcast domains, or VLANs. One method for accomplishing this is by configuring a voice VLAN, which enables access ports to accept untagged data traffic as well as tagged voice traffic from IP phones, and associate each type of traffic with separate and distinct VLANs. Voice traffic (tagged) can then be treated differently, generally with a higher priority than data traffic (untagged).

The voice VLAN delivers the greatest benefit when used with IP phones that support LLDP-MED, but it is flexible enough that IP phones that do not support LLDP-MED can also use it effectively. However, in the absence of LLDP-MED, the voice VLAN ID must be set manually on the IP phone because LLDP-MED is not available to accomplish this dynamically. For information about setting up a voice VLAN for IP phones that support LLDP-MED, see [“Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch with ELS Support” on page 421](#).

Another method to separate voice (tagged) and data (untagged) traffic into different VLANs is to use a trunk port with the native VLAN ID option. The trunk port is added as a member of the voice VLAN, and processes only tagged voice traffic from that VLAN. The trunk port must also be configured with the native VLAN ID for the data VLAN so that it can process untagged data traffic from the data VLAN. This configuration also requires that the voice VLAN ID be set manually on the IP phone.

This example illustrates both methods. In this example, the interface ge-0/0/2 on the switch is connected to a non-LLDP-MED IP phone.

**NOTE:** The implementation of a voice VLAN on an IP telephone is vendor-specific. Consult the documentation that came with your IP telephone for instructions on configuring a voice VLAN. For example, on an Avaya phone, you can ensure that the phone gets the correct VoIP VLAN ID even in the absence of LLDP-MED by enabling DHCP option 176.

### Configuring VoIP Without LLDP-MED by Using a Voice VLAN on an Access Port

#### CLI Quick Configuration

To quickly configure VoIP, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans data-vlan vlan-id 77
set vlans voice-vlan vlan-id 99
set vlans data-vlan switch-options interface ge-0/0/2.0
set interfaces ge-0/0/2 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
set switch-options voip interface ge-0/0/2.0 vlan voice-vlan
set switch-options voip interface ge-0/0/2.0 forwarding-class assured-forwarding
```

#### Step-by-Step Procedure

1. Configure two VLANs: one for data traffic and one for voice traffic:

```
[edit vlans]
user@switch# set data-vlan vlan-id 77
user@switch# set voice-vlan vlan-id 99
```

**NOTE:** The voice VLAN ID must be set manually on the IP phone.

2. Associate the VLAN **data-vlan** with the interface ge-0/0/2:

```
[edit vlans]
user@switch# set data-vlan switch-options interface ge-0/0/2.0
```

3. Configure the interface ge-0/0/2 as an access port belonging to the data VLAN:

```
[edit interfaces]
user@switch# set ge-0/0/2 unit 0 family ethernet-switching port-mode access
user@switch# set ge-0/0/2 unit 0 family ethernet-switching vlan member data-vlan
```

4. Configure VoIP on the interface ge-0/0/2 and add this interface to the voice VLAN:

```
[edit switch-options]
```

```
user@switch# set voip interface ge-0/0/2.0 vlan voice-vlan
```

5. Specify the assured-forwarding forwarding class to provide the most dependable class of service:

```
[edit switch-options]
user@switch# set voip interface ge-0/0/2.0 forwarding-class assured-forwarding
```

**Results** Display the results of the configuration:

```
[edit]
user@switch> show configuration
interfaces {
  ge-0/0/2 {
    unit 0 {
      family ethernet-switching {
        port-mode access;
        vlan {
          members data-vlan;
        }
      }
    }
  }
}
vlands {
  data-vlan {
    vlan-id 77;
    interface {
      ge-0/0/2.0;
    }
  }
  voice-vlan {
    vlan-id 99;
  }
}
ethernet-switching options {
  voip {
    interface ge-0/0/2.0 {
      vlan voice-vlan;
      forwarding-class assured-forwarding;
    }
  }
}
```

### Configuring VoIP Without LLDP-MED by Using a Trunk Port with Native VLAN Option

**CLI Quick Configuration** To quickly configure VoIP, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlands data-vlan vlan-id 77
```

```

set vlans voice-vlan vlan-id 99
set interfaces ge-0/0/2 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members voice-vlan
set interfaces ge-0/0/2 unit 0 family ethernet-switching native-vlan-id data-vlan

```

### Step-by-Step Procedure

1. Configure two VLANs: one for data traffic and one for voice traffic:

```

[edit vlans]
user@switch# set data-vlan vlan-id 77
user@switch# set voice-vlan vlan-id 99

```

**NOTE:** The voice VLAN ID must be set manually on the IP phone.

2. Configure interface ge-0/0/2 as a trunk port that includes only the voice VLAN:

```

[edit interfaces]
user@switch# set ge-0/0/2 unit 0 family ethernet-switching port-mode trunk
user@switch# set ge-0/0/2 unit 0 family ethernet-switching vlan member voice-vlan

```

3. Configure the native VLAN ID for the data VLAN on the trunk port:

```

[edit interfaces]
user@switch# set ge-0/0/2 unit 0 family ethernet-switching native-vlan-id data-vlan

```

**Results** Display the results of the configuration:

```

[edit]
user@switch> show configuration
interfaces {
  ge-0/0/2 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members voice-vlan;
        }
        native-vlan-id data-vlan;
      }
    }
  }
}
vlans {
  data-vlan {
    vlan-id 77;
  }
  voice-vlan {
    vlan-id 99;
  }
}

```

## Verification

To confirm that the configuration is working properly, perform the following task:

- [Verifying the VLAN Association With the Interface on page 409](#)

### *Verifying the VLAN Association With the Interface*

**Purpose** Display the interface state and VLAN membership.

**Action** user@switch> [show ethernet-switching interfaces](#)

```
Ethernet-switching table: 0 entries, 0 learned
```

```
user@switch> show ethernet-switching interfaces
Interface  State  VLAN members  Blocking
ge-0/0/0.0  down  default        unblocked
ge-0/0/1.0  down  employee-vlan  unblocked
ge-0/0/5.0  down  employee-vlan  unblocked
ge-0/0/3.0  down  employee-vlan  unblocked
ge-0/0/8.0  down  employee-vlan  unblocked
ge-0/0/10.0 down  default        unblocked
ge-0/0/11.0 down  employee-vlan  unblocked
ge-0/0/23.0 down  default        unblocked
ge-0/0/2.0  up    voice-vlan     unblocked
           data-vlan     unblocked
```

**Meaning** The field **VLAN members** shows that the ge-0/0/2.0 interface supports both the data VLAN, data-vlan, and the voice VLAN, voice-vlan. The **State** field shows that the interface is up.

## Overview

Instead of using a regular telephone, you connect an IP telephone directly to the switch. An IP phone has all the hardware and software needed to handle VoIP. You can also power an IP telephone by connecting it to one of the Power over Ethernet (PoE) interfaces on the switch.

EX Series switches can accommodate an IP telephone and end host connected to a single switch port. In such a scenario, voice and data traffic must be separated into different broadcast domains, or VLANs. One method for accomplishing this is by configuring a voice VLAN, which enables access ports to accept untagged data traffic as well as tagged voice traffic from IP phones, and associate each type of traffic with separate and distinct VLANs. Voice traffic (tagged) can then be treated differently, generally with a higher priority than data traffic (untagged).

The voice VLAN delivers the greatest benefit when used with IP phones that support LLDP-MED, but it is flexible enough that IP phones that do not support LLDP-MED can also use it effectively. However, in the absence of LLDP-MED, the voice VLAN ID must be set manually on the IP phone because LLDP-MED is not available to accomplish this dynamically. For information about setting up a voice VLAN for IP phones that support LLDP-MED, see [“Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch” on page 396](#).

Another method to separate voice (tagged) and data (untagged) traffic into different VLANs is to use a trunk port with the native VLAN ID option. The trunk port is added as a member of the voice VLAN, and processes only tagged voice traffic from that VLAN.

The trunk port must also be configured with the native VLAN ID for the data VLAN so that it can process untagged data traffic from the data VLAN. This configuration also requires that the voice VLAN ID be set manually on the IP phone.

This example illustrates both methods. In this example, the interface ge-0/0/2 on the EX4200 switch is connected to a non-LLDP-MED IP phone.

**NOTE:** The implementation of a voice VLAN on an IP telephone is vendor-specific. Consult the documentation that came with your IP telephone for instructions on configuring a voice VLAN. For example, on an Avaya phone, you can ensure that the phone gets the correct VoIP VLAN ID even in the absence of LLDP-MED by enabling DHCP option 176.

### Configuring VoIP Without LLDP-MED by Using a Voice VLAN on an Access Port

#### CLI Quick Configuration

To quickly configure VoIP, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans data-vlan vlan-id 77
set vlans voice-vlan vlan-id 99
set vlans data-vlan interface ge-0/0/2.0
set interfaces ge-0/0/2 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
set ethernet-switching-options voip interface ge-0/0/2.0 vlan voice-vlan
```

#### Step-by-Step Procedure

1. Configure two VLANs: one for data traffic and one for voice traffic:

```
[edit vlans]
user@switch# set data-vlan vlan-id 77
user@switch# set voice-vlan vlan-id 99
```

**NOTE:** The voice VLAN ID must be set manually on the IP phone.

2. Configure the VLAN **data-vlan** on the interface ge-0/0/2:

```
[edit vlans]
user@switch# set data-vlan interface ge-0/0/2.0
```

3. Configure the interface ge-0/0/2 as an access port belonging to the data VLAN:

```
[edit interfaces]
user@switch# set ge-0/0/2 unit 0 family ethernet-switching port-mode access
user@switch# set ge-0/0/2 unit 0 family ethernet-switching vlan member data-vlan
```

4. Configure VoIP on the interface ge-0/0/2 and add this interface to the voice VLAN:

```
[edit ethernet-switching-options]
user@switch# set voip interface ge-0/0/2.0 vlan voice-vlan
```

**Results** Display the results of the configuration:

```
[edit]
user@switch> show configuration
interfaces {
  ge-0/0/2 {
    unit 0 {
      family ethernet-switching {
        port-mode access;
        vlan {
          members data-vlan;
        }
      }
    }
  }
}
vlangs {
  data-vlan {
    vlan-id 77;
    interface {
      ge-0/0/2.0;
    }
  }
  voice-vlan {
    vlan-id 99;
  }
}
ethernet-switching options {
  voip {
    interface ge-0/0/2.0 {
      vlan voice-vlan;
    }
  }
}
```

---

### Configuring VoIP Without LLDP-MED by Using a Trunk Port with Native VLAN Option

---

**CLI Quick Configuration** To quickly configure VoIP, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans data-vlan vlan-id 77
set vlans voice-vlan vlan-id 99
set interfaces ge-0/0/2 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members voice-vlan
set interfaces ge-0/0/2 unit 0 family ethernet-switching native-vlan-id data-vlan
```

**Step-by-Step  
Procedure**

1. Configure two VLANs: one for data traffic and one for voice traffic:

```
[edit vlans]
user@switch# set data-vlan vlan-id 77
user@switch# set voice-vlan vlan-id 99
```

**NOTE:** The voice VLAN ID must be set manually on the IP phone.

2. Configure interface ge-0/0/2 as a trunk port that includes only the voice VLAN:

```
[edit interfaces]
user@switch# set ge-0/0/2 unit 0 family ethernet-switching port-mode trunk
user@switch# set ge-0/0/2 unit 0 family ethernet-switching vlan member voice-vlan
```

3. Configure the native VLAN ID for the data VLAN on the trunk port:

```
[edit interfaces]
user@switch# set ge-0/0/2 unit 0 family ethernet-switching native-vlan-id data-vlan
```

**Results** Display the results of the configuration:

```
[edit]
user@switch> show configuration
interfaces {
  ge-0/0/2 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members voice-vlan;
        }
        native-vlan-id data-vlan;
      }
    }
  }
}
vlands {
  data-vlan {
    vlan-id 77;
  }
  voice-vlan {
    vlan-id 99;
  }
}
```

## Verification

To confirm that the configuration is working properly, perform the following task:

- [Verifying the VLAN Association With the Interface on page 414](#)

### *Verifying the VLAN Association With the Interface*

**Purpose** Display the interface state and VLAN membership.

**Action** user@switch> [show ethernet-switching interfaces](#)

```
Ethernet-switching table: 0 entries, 0 learned
```

```
user@switch> show ethernet-switching interfaces
Interface  State  VLAN members  Blocking
ge-0/0/0.0 down  default       unblocked
ge-0/0/1.0 down  employee-vlan unblocked
ge-0/0/5.0 down  employee-vlan unblocked
ge-0/0/3.0 down  employee-vlan unblocked
ge-0/0/8.0 down  employee-vlan unblocked
ge-0/0/10.0 down default       unblocked
ge-0/0/11.0 down employee-vlan unblocked
ge-0/0/23.0 down default       unblocked
ge-0/0/2.0 up    voice-vlan    unblocked
              data-vlan     unblocked
```

**Meaning** The field **VLAN members** shows that the ge-0/0/2.0 interface supports both the data VLAN, data-vlan, and the voice VLAN, voice-vlan. The **State** field shows that the interface is up.

**See Also** • [Understanding LLDP and LLDP-MED on EX Series Switches on page 438](#)

## Example: Configuring VoIP on an EX Series Switch Without Including 802.1X Authentication

You can configure voice over IP (VoIP) on an EX Series switch to support IP telephones.

To configure VoIP on an EX Series switch to support an IP phone that does not support 802.1X authentication, you must either add the MAC address of the phone to the static MAC bypass list or enable MAC RADIUS authentication on the switch.

This example describes how to configure VoIP on an EX Series switch without 802.1X authentication using static MAC bypass of authentication:

- [Requirements on page 415](#)
- [Overview on page 415](#)
- [Configuration on page 416](#)
- [Verification on page 418](#)

## Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.1 or later for EX Series switches
- An IP telephone

Before you configure VoIP, be sure you have:

- Installed your EX Series switch. See the installation information for your switch.
- Performed the initial switch configuration. See *Connecting and Configuring an EX Series Switch (CLI Procedure)*.
- Performed basic bridging and VLAN configuration on the switch. See *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch*.
- Configured the RADIUS server for 802.1X authentication and set up the access profile. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 290](#).
- (Optional) Configured interface **ge-0/0/2** for Power over Ethernet (PoE). The PoE configuration is not necessary if the VoIP supplicant is using a power adapter. For information about configuring PoE, see *Configuring PoE on EX Series Switches (CLI Procedure)*.

**NOTE:** If the IP address isn't configured on the Avaya IP phone, the phone exchanges LLDP-MED information to get the VLAN ID for the voice VLAN. You must configure the **voip** statement on the interface to designate the interface as a VoIP interface and allow the switch to forward the VLAN name and VLAN ID for the voice VLAN to the IP telephone. The IP telephone then uses the voice VLAN (that is, it references the voice VLAN's ID) to send a DHCP discover request and exchange information with the DHCP server (voice gateway).

## Overview

Instead of using a regular telephone, you connect an IP telephone directly to the switch. An IP phone has all the hardware and software needed to handle VoIP. You also can power an IP telephone by connecting it to one of the Power over Ethernet (PoE) interfaces on the switch.

In this example, the access interface **ge-0/0/2** on the EX4200 switch is connected to a non-802.1X IP phone.

To configure VoIP on an EX Series switch to support an IP phone that does not support 802.1X authentication, add the MAC address of the phone as a static entry in the authenticator database and set the supplicant mode to multiple.

## Configuration

---

To configure VoIP without 802.1X authentication:

**CLI Quick Configuration** To quickly configure VoIP, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans data-vlan vlan-id 77
set vlans voice-vlan vlan-id 99
set vlans data-vlan interface ge-0/0/2.0
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
set interfaces ge-0/0/2 unit 0 family ethernet-switching port-mode access
set ethernet-switching-options voip interface ge-0/0/2.0 vlan voice-vlan
set ethernet-switching-options voip interface ge-0/0/2.0 forwarding-class assured-forwarding
set protocols lldp-med interface ge-0/0/2.0
set protocols dot1x authenticator authentication-profile-name auth-profile
set protocols dot1x authenticator static 00:04:f2:11:aa:a7
set protocols dot1x authenticator interface ge-0/0/2.0 supplicant multiple
```

**Step-by-Step Procedure** To configure VoIP without 802.1X:

1. Configure the VLANs for voice and data:

```
[edit vlans]
user@switch# set data-vlan vlan-id 77
user@switch# set voice-vlan vlan-id 99
```

2. Associate the VLAN **data-vlan** with the interface:

```
[edit vlans]
user@switch# set data-vlan interface ge-0/0/2.0
```

3. Configure the interface as an access interface, configure support for Ethernet switching, and add the **data-vlan** VLAN:

```
[edit interfaces]
user@switch# set ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
user@switch# set ge-0/0/2 unit 0 family ethernet-switching port-mode access
```

4. Configure VoIP on the interface and specify the **assured-forwarding** forwarding class to provide the most dependable class of service:

```
[edit ethernet-switching-options]
user@switch# set voip interface ge-0/0/2.0 vlan voice-vlan
user@switch# set voip interface ge-0/0/2.0 forwarding-class assured-forwarding
```

5. Configure LLDP-MED protocol support:

```
[edit protocols]
user@switch# set lldp-med interface ge-0/0/2.0
```

6. Set the authentication profile (see [“Configuring 802.1X Interface Settings \(CLI Procedure\)” on page 280](#) and [“Configuring 802.1X RADIUS Accounting \(CLI Procedure\)” on page 323](#)):

```
[edit protocols]
set dot1x authenticator authentication-profile-name auth-profile
```

7. Add the MAC address of the phone to the static MAC bypass list:

```
[edit protocols]
set dot1x authenticator static 00:04:f2:11:aa:a7
```

8. Set the supplicant mode to multiple:

```
[edit protocols]
set dot1x authenticator interface ge-0/0/2.0 supplicant multiple
```

**Results** Display the results of the configuration:

```
[edit]
user@switch# show configuration
interfaces {
  ge-0/0/2 {
    unit 0 {
      family ethernet-switching {
        port-mode access;
        vlan {
          members data-vlan;
        }
      }
    }
  }
}
protocols {
  lldp-med {
    interface ge-0/0/2.0;
  }
  dot1x {
    authenticator {
      authentication-profile-name auth-profile;
      static {
        00:04:f2:11:aa:a7;
      }
    }
    interface {
      ge-0/0/2.0 {
        supplicant multiple;
      }
    }
  }
}
vllans {
  data-vlan {
```

```
vlan-id 77;
interface {
  ge-0/0/2.0;
}
}
voice-vlan {
  vlan-id 99;
}
}
ethernet-switching options {
  voip {
    interface ge-0/0/2.0 {
      vlan voice-vlan;
      forwarding-class assured-forwarding;
    }
  }
}
}
```

---

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying LLDP-MED Configuration on page 418](#)
- [Verifying Authentication for the Desktop PC on page 419](#)
- [Verifying the VLAN Association with the Interface on page 420](#)

### *Verifying LLDP-MED Configuration*

**Purpose** Verify that LLDP-MED is enabled on the interface.

**Action** user@switch> `show lldp detail`

```
LLDP : Enabled
Advertisement interval : 30 Second(s)
Transmit delay : 2 Second(s)
Hold timer : 2 Second(s)
Config Trap Interval : 300 Second(s)
Connection Hold timer : 60 Second(s)

LLDP MED : Enabled
MED fast start count : 3 Packet(s)

Interface      LLDP      LLDP-MED      Neighbor count
all            Enabled    -              0
ge-0/0/2.0     -          Enabled        0

Interface      VLAN-id    VLAN-name
ge-0/0/0.0     0          default
ge-0/0/1.0     0          employee-vlan
ge-0/0/2.0     0          data-vlan
ge-0/0/2.0     99         voice-vlan
ge-0/0/3.0     0          employee-vlan
ge-0/0/8.0     0          employee-vlan
ge-0/0/10.0    0          default
ge-0/0/11.0    20         employee-vlan
ge-0/0/23.0    0          default

LLDP basic TLVs supported:
Chassis identifier, Port identifier, Port description, System name, System
description, System capabilities, Management address.

LLDP 802 TLVs supported:
Power via MDI, Link aggregation, Maximum frame size, Port VLAN tag, Port
VLAN name.

LLDP MED TLVs supported:
LLDP MED capabilities, Network policy, Endpoint location, Extended power
Via MDI.
```

**Meaning** The `show lldp detail` output shows that both LLDP and LLDP-MED are configured on the `ge-0/0/2.0` interface. The end of the output shows the list of supported LLDP basic TLVs, 802.3 TLVs, and LLDP-MED TLVs that are supported.

### *Verifying Authentication for the Desktop PC*

**Purpose** Display the 802.1X configuration for the desktop PC connected to the VoIP interface through the IP phone.

**Action** user@switch> `show dot1x interface ge-0/0/2.0 detail`

```
ge-0/0/2.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Multiple
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user101, 00:04:0f:fd:ac:fe
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: vo11
      Dynamic Filter: match source-dot1q-tag 10 action deny
      Session Reauth interval: 60 seconds
      Reauthentication due in 50 seconds
```

**Meaning** The field **Role** shows that the **ge-0/0/2.0** interface is in the authenticator state. The **Supplicant** field shows that the interface is configured in multiple supplicant mode, permitting multiple supplicants to be authenticated on this interface. The MAC addresses of the supplicants currently connected are displayed at the bottom of the output.

#### *Verifying the VLAN Association with the Interface*

**Purpose** Display the interface state and VLAN membership.

**Action** user@switch> [show ethernet-switching interfaces](#)

Ethernet-switching table: 0 entries, 0 learned

```
user@switch> show ethernet-switching interfaces
Interface  State  VLAN members  Blocking
ge-0/0/0.0 down  default        unblocked
ge-0/0/1.0 down  employee-vlan  unblocked
ge-0/0/5.0 down  employee-vlan  unblocked
ge-0/0/3.0 down  employee-vlan  unblocked
ge-0/0/8.0 down  employee-vlan  unblocked
ge-0/0/10.0 down default        unblocked
ge-0/0/11.0 down employee-vlan  unblocked
ge-0/0/23.0 down default        unblocked
ge-0/0/2.0 up    voice-vlan     unblocked
                data-vlan      unblocked
```

**Meaning** The field **VLAN members** shows that the **ge-0/0/2.0** interface supports both the **data-vlan** VLAN and **voice-vlan** VLAN. The **State** field shows that the interface is up.

**See Also** • [Understanding LLDP and LLDP-MED on EX Series Switches on page 438](#)

## Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch with ELS Support

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [“Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch” on page 396](#). For ELS details, see *Using the Enhanced Layer 2 Software CLI*.

You can configure VoIP on an EX Series switch to support IP telephones. The Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) protocol forwards VoIP parameters from the switch to the phone. You also configure 802.1X authentication to allow the telephone access to the LAN. Authentication is done through a backend RADIUS server.

This example describes how to configure VoIP on an EX Series switch to support an Avaya IP phone, as well as how to configure the LLDP-MED protocol and 802.1X authentication:

- [Requirements on page 422](#)
- [Overview and Topology on page 422](#)
- [Configuration on page 424](#)
- [Verification on page 426](#)

## Requirements

---

This example uses the following software and hardware components:

**NOTE:** This example also applies to QFX5100 switches.

- Junos OS Release 13.2X50 or later for EX Series switches
- One EX Series switch with support for ELS acting as an authenticator port access entity (PAE). The interfaces on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- An Avaya IP telephone that supports LLDP-MED and 802.1X

Before you configure VoIP, be sure you have:

- Installed your EX Series switch. See the installation information for your switch.
- Performed the initial switch configuration. See *Connecting and Configuring an EX Series Switch (CLI Procedure)*.
- Performed basic bridging and VLAN configuration on the switch. See *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch with ELS Support* or *Example: Setting Up Basic Bridging and a VLAN on Switches*.
- Configured the RADIUS server for 802.1X authentication and set up the access profile. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 290](#).
- (Optional) Configured the interface ge-0/0/2 for Power over Ethernet (PoE). The PoE configuration is not necessary if the VoIP supplicant uses a power adapter. For information about configuring PoE, see *Configuring PoE on EX Series Switches (CLI Procedure)*.

**NOTE:** If the IP address is not configured on the Avaya IP phone, the phone exchanges LLDP-MED information to get the VLAN ID for the voice VLAN. You must configure the `voip` statement on the interface to designate the interface as a VoIP interface and allow the switch to forward the VLAN name and VLAN ID for the voice VLAN to the IP telephone. The IP telephone then uses the voice VLAN (that is, it references the voice VLAN's ID) to send a DHCP discover request and exchange information with the DHCP server (voice gateway).

## Overview and Topology

---

Instead of using a regular telephone, you connect an IP telephone directly to the switch. An IP phone has all the hardware and software needed to handle VoIP. You also can power an IP telephone by connecting it to one of the Power over Ethernet (PoE) interfaces on the switch.

In this example, the access interface ge-0/0/2 on the EX Series switch is connected to an Avaya IP telephone. Avaya phones have a built-in bridge that enables you to connect a desktop PC to the phone, so the desktop and phone in a single office require only one interface on the switch. The EX Series switch is connected to a RADIUS server on the ge-0/0/10 interface (see [Figure 24 on page 423](#)).

**NOTE:** This figure also applies to QFX5100 switches.

*Figure 24: VoIP Topology*

In this example, you configure VoIP parameters and specify the forwarding class **assured-forward** for voice traffic to provide the highest quality of service.

Table 32 on page 424 describes the components used in this VoIP configuration example.

**Table 32: Components of the VoIP Configuration Topology**

| Property                                                                                                            | Settings                                                                       |
|---------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
| Switch hardware                                                                                                     | EX Series switch with support for ELS.                                         |
| VLAN names and IDs                                                                                                  | data-vlan, 77<br>voice-vlan, 99                                                |
| Connection to Avaya phone—with integrated hub, to connect phone and desktop PC to a single interface (requires PoE) | ge-0/0/2                                                                       |
| One RADIUS server                                                                                                   | Provides backend database connected to the switch through interface ge-0/0/10. |

Besides configuring a VoIP for interface ge-0/0/2, you configure:

- 802.1X authentication. Authentication is set to **multiple** supplicant mode to support more than one supplicant's access to the LAN through interface ge-0/0/2.
- LLDP-MED protocol information. The switch uses LLDP-MED to forward VoIP parameters to the phone. Using LLDP-MED ensures that voice traffic gets tagged and prioritized with the correct values at the source itself. For example, 802.1p class of service and 802.1Q tag information can be sent to the IP telephone.

**NOTE:** A PoE configuration is not necessary if an IP telephone uses a power adapter.

## Configuration

### CLI Quick Configuration

To quickly configure VoIP, LLDP-MED, and 802.1X, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans data-vlan vlan-id 77
set vlans voice-vlan vlan-id 99
set vlans data-vlan switch-options interface ge-0/0/2.0
set interfaces ge-0/0/2 unit 0 family ethernet-switching interface-mode access
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
set switch-options voip interface ge-0/0/2.0 vlan voice-vlan
set switch-options voip interface ge-0/0/2.0 forwarding-class assured-forwarding
set protocols lldp-med interface ge-0/0/2
set protocols dot1x authenticator interface ge-0/0/2.0 supplicant multiple
```

**Step-by-Step Procedure**

To configure VoIP with LLDP-MED and 802.1X:

1. Configure the VLANs for voice and data:

```
[edit vlans]
user@switch# set data-vlan vlan-id 77
user@switch# set voice-vlan vlan-id 99
```

2. Associate the VLAN **data-vlan** with the interface:

```
[edit vlans]
user@switch# set data-vlan switch-options interface ge-0/0/2.0
```

3. Configure the interface as an access interface, configure support for Ethernet switching, and add the interface as a member of the **data-vlan** VLAN:

```
[edit interfaces]
user@switch# set ge-0/0/2 unit 0 family ethernet-switching interface-mode access
user@switch# set ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
```

4. Configure VoIP on the interface and specify the **assured-forwarding** forwarding class to provide the most dependable class of service:

```
[edit switch-options]
user@switch# set voip interface ge-0/0/2.0 vlan voice-vlan
user@switch# set voip interface ge-0/0/2.0 forwarding-class assured-forwarding
```

5. Configure LLDP-MED protocol support:

```
[edit protocols]
user@switch# set lldp-med interface ge-0/0/2
```

6. To authenticate an IP phone and a PC connected to the IP phone on the interface, configure 802.1X authentication support and specify **multiple** supplicant mode:

**NOTE:** If you do not want to authenticate any device, skip the 802.1X configuration on this interface.

```
[edit protocols]
user@switch# set dot1x authenticator interface ge-0/0/2.0 supplicant multiple
```

**Results** Display the results of the configuration:

```
[edit]
user@switch# show configuration
interfaces {
  ge-0/0/2 {
    unit 0 {
      family ethernet-switching {
        interface-mode access;
```

        }
    }
}
```

---

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying LLDP-MED Configuration on page 426](#)
- [Verifying 802.1X Authentication for IP Phone and Desktop PC on page 427](#)
- [Verifying the VLAN Association with the Interface on page 428](#)

#### ***Verifying LLDP-MED Configuration***

**Purpose** Verify that LLDP-MED is enabled on the interface.

**Action** user@switch> `show lldp detail`

```

LLDP : Enabled
Advertisement interval : 30 seconds
Transmit delay : 2 seconds
Hold timer : 120 seconds
Notification interval : 0 Second(s)
Config Trap Interval : 0 seconds
Connection Hold timer : 300 seconds

LLDP MED : Enabled
MED fast start count : 3 Packets

Port ID TLV subtype : locally-assigned

Interface      Parent Interface  LLDP      LLDP-MED    Power Negotiation
Neighbor count
all            -                Enabled    Enabled      Enabled
0
ge-0/0/2       -                -          Enabled      -
0

Interface      Parent Interface  Vlan-id    Vlan-name
ge-0/0/0       -                1          vlan-1
ge-0/0/1       -                1          vlan-1
ge-0/0/2       -                77         vlan-77
ge-0/0/2       -                99         vlan-99
ge-0/0/3       -                1          vlan-1
ge-0/0/4       -                1          vlan-1
ge-0/0/5       -                1          vlan-1
ge-0/0/6       -                1          vlan-1
ge-0/0/7       -                1          vlan-1
ge-0/0/8       -                1          vlan-1
ge-0/0/9       -                1          vlan-1
ge-0/0/10      -                1          vlan-1

Basic Management TLVs supported:
End Of LLDPDU, Chassis ID, Port ID, Time To Live, Port Description, System Name,
System Description, System Capabilities, Management Address

Organizationally Specific TLVs supported:
MAC/PHY configuration/status, Power via MDI, Link aggregation, Maximum Frame Size,
Port VLAN tag, Port VLAN name.

```

**Meaning** The `show lldp detail` output shows that both **LLDP** and **LLDP-MED** are configured on the **ge-0/0/2** interface. The end of the output shows the list of supported LLDP basic management TLVs and organizationally specific TLVs that are supported.

### *Verifying 802.1X Authentication for IP Phone and Desktop PC*

**Purpose** Display the 802.1X configuration to confirm that the VoIP interface has access to the LAN.

**Action** user@switch> **show dot1x** interface ge-0/0/2.0 detail

```

ge-0/0/2.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Multiple
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user101, 00:04:0f:fd:ac:fe
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: vo11
      Dynamic Filter: match source-dot1q-tag 10 action deny
      Session Reauth interval: 60 seconds
      Reauthentication due in 50 seconds

```

**Meaning** The field **Role** shows that the **ge-0/0/2.0** interface is in the authenticator state. The **Supplicant mode** field shows that the interface is configured in **multiple** supplicant mode, permitting multiple supplicants to be authenticated on this interface. The MAC addresses of the supplicants currently connected are displayed at the bottom of the output.

#### *Verifying the VLAN Association with the Interface*

**Purpose** Display the interface's VLAN membership.

**Action** user@switch> **show ethernet-switching** interface ge-0/0/2.0

```

Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop,
                        LH - MAC limit hit, DN - interface down )

```

| Logical interface | Vlan members  | TAG | MAC limit | STP state  | Logical interface flags | Tagging  |
|-------------------|---------------|-----|-----------|------------|-------------------------|----------|
| ge-0/0/2.0        | voice-vlan 99 |     | 65535     |            |                         | untagged |
|                   |               |     | 65535     | Discarding |                         |          |
|                   | data-vlan 77  |     | 65535     | Discarding |                         |          |

**Meaning** The field **VLAN members** shows that the **ge-0/0/2.0** interface supports both the **data-vlan** VLAN and **voice-vlan** VLAN.

## CHAPTER 7

# Device Discovery

- [Device Discovery Using LLDP and LLDP-MED on Switches on page 431](#)
- [NetBIOS Snooping on EX Series Switches on page 444](#)

### Device Discovery Using LLDP and LLDP-MED on Switches

---

The Link Layer Discovery Protocol (LLDP) is an industry-standard, vendor-neutral method to allow networked devices to advertise capabilities, identity, and other information onto a LAN. It also provides additional TLVs for capabilities discovery, network policy, Power over Ethernet (PoE), and inventory management. For more information, read this topic.

- [Understanding LLDP on page 431](#)
- [Configuring LLDP \(CLI Procedure\) on page 432](#)
- [Configuring LLDP \(J-Web Procedure\) on page 437](#)
- [Understanding LLDP and LLDP-MED on EX Series Switches on page 438](#)
- [Configuring LLDP-MED \(CLI Procedure\) on page 441](#)

### Understanding LLDP

The device uses Link Layer Discovery Protocol (LLDP) to learn and distribute device information on network links. The information enables the switch to identify a variety of devices quickly. This quick identification results in a LAN that interoperates smoothly and efficiently.

LLDP-capable devices transmit information in type, length, and value (TLV) messages to neighbor devices. Device information can include specifics, such as chassis and port identification and system name and system capabilities. The TLVs leverage this information from parameters that have already been configured in Junos OS.

The device supports the following basic TLVs:

- **Chassis Identifier**—The MAC address associated with the local system.
- **Port Identifier**—The port identification for the specified port in the local system.
- **Port Description**—The user-configured port description. The port description can be a maximum of 256 characters.

- **System Name**—The user-configured name of the local system. The system name can be a maximum of 256 characters.
- **System Description**—The system description containing information about the software and current image running on the system. This information cannot be configured, but is taken from the software.
- **System Capabilities**—The primary function performed by the system. The capabilities that system supports are defined; for example, bridge or router. This information cannot be configured, but is based on the model of the product.
- **Management Address**—The IP management address of the local system.

The device supports the following 802.3 TLVs:

- **Power via MDI**—A TLV that advertises media dependent interface (MDI) power support, power source equipment (PSE) power pair, and power class information.
- **MAC/PHY Configuration Status**—A TLV that advertises information about the physical interface, such as autonegotiation status and support and MAU type. The information cannot be configured, but is based on the physical interface structure.
- **Link Aggregation**—A TLV that advertises whether the port is aggregated and its aggregated port ID.
- **Maximum Frame Size**—A TLV that advertises the Maximum Transmission Unit (MTU) of the interface sending LLDP frames.
- **Port Vlan**—A TLV that advertises the VLAN name configured on the interface.

## Configuring LLDP (CLI Procedure)

Devices use Link Layer Discovery Protocol (LLDP) and Link Layer Discovery Protocol—Media Endpoint Discovery (LLDP-MED) to learn and distribute device information on network links. The information enables the device to quickly identify a variety of other devices, resulting in a LAN that interoperates smoothly and efficiently.

This topic describes:

- [Enabling LLDP on Interfaces on page 432](#)
- [Adjusting LLDP Advertisement Settings on page 433](#)
- [Adjusting SNMP Notification Settings of LLDP Changes on page 434](#)
- [Specifying a Management Address for the LLDP Management TLV on page 435](#)
- [Configuring LLDP Power Negotiation on page 435](#)
- [Disabling LLDP TLVs on page 436](#)

---

### Enabling LLDP on Interfaces

LLDP is enabled on all interfaces by default. If it is disabled, you can enable LLDP by configuring it on all interfaces or on specific interfaces.

- To configure LLDP on all interfaces:

```
[edit protocols lldp]
user@switch# set interface all
```

- To configure LLDP on a specific interface:

```
[edit protocols lldp]
user@switch# set interface interface-name
```

**NOTE:** On EX4300 and QFX5100 switches, LLDP cannot be configured on the me0 or vme interface. Issuing the `set protocols lldp interface me0` command generates the following error message:

```
error: name: 'me0': Invalid interface
error: statement creation failed: interface
```

Issuing the `set protocols lldp interface vme` command generates the following error message:

```
error: name: 'vme': Invalid interface
error: statement creation failed: interface
```

### Adjusting LLDP Advertisement Settings

You can adjust the following settings for LLDP advertisements for troubleshooting or verification purposes. The default values are applied when LLDP is enabled. For normal operations, we recommend that you do not change the default values.

- To specify the frequency at which LLDP advertisements are sent (in seconds):

```
[edit protocols lldp]
user@switch# set advertisement-interval seconds
```

For example, using the default value:

```
[edit protocols lldp]
user@switch# set advertisement-interval 45
```

- To specify the number of seconds that LLDP information is held before it is discarded (the multiplier value is used in combination with the `advertisement-interval` value):

```
[edit protocols lldp]
user@switch# set hold-multiplier seconds
```

For example, using the default value:

```
[edit protocols lldp]
user@switch# set hold-multiplier 5
```

- To specify the number of seconds the device waits before sending advertisements to neighbors after a change is made in a TLV (type, length, or value) element in LLDP or

in the state of the local system, such as a change in hostname or management address, set the transmit delay. The transmit delay is enabled by default on switches to reduce the delay in notifying neighbors of a change in the local system. The default value is 2 seconds (if the **advertisement-interval** value is set to 8 seconds or more) or 1 second (if the **advertisement-interval** value is set to less than 8 seconds).

```
[edit protocols lldp]
user@switch# set transmit-delay seconds
```

For example:

```
[edit protocols lldp]
user@switch# set transmit-delay 2
```

**NOTE:** The advertisement-interval value must be greater than or equal to four times the transmit-delay value; otherwise, an error is returned when you attempt to commit the configuration.

---

### Adjusting SNMP Notification Settings of LLDP Changes

---

You can adjust the following settings for SNMP notifications of LLDP changes. If the values are not specified or if the interval values are set to 0, the notifications are disabled.

- To specify the frequency at which LLDP database changes are sent (in seconds):

```
[edit protocols lldp]
user@switch# set lldp-configuration-notification-interval seconds
```

For example:

```
[edit protocols lldp]
user@switch# set lldp-configuration-notification-interval 600
```

- To configure the time interval for SNMP trap notifications to wait for topology changes (in seconds):

```
[edit protocols lldp]
user@switch# set ptopo-configuration-trap-interval seconds
```

For example:

```
[edit protocols lldp]
user@switch# set ptopo-configuration-trap-interval 600
```

- To specify the holding time (used in combination with the **ptopo-configuration-trap-interval** value) to maintain dynamic topology entries (in seconds):

```
[edit protocols lldp]
user@switch# set ptopo-configuration-maximum-hold-time seconds
```

For example:

```
[edit protocols lldp]
user@switch# set ptopo-configuration-maximum-hold-time 2147483647
```

### Specifying a Management Address for the LLDP Management TLV

You can configure an IPv4 or IPv6 management address to be used in the LLDP Management Address type, length, and value (TLV) messages. Only an out-of-band management address must be used as the value for the **management-address** statement.

To configure the management address:

```
[edit protocols lldp]
user@switch# set management-address ip-address
```

**NOTE:** Ensure that the interface with the configured management address has LLDP enabled using the `set protocols lldp interface` command. If you configure a customized management address for LLDP on an interface that has LLDP disabled, the `show lldp local-information` command output does not display the correct interface information.

### Configuring LLDP Power Negotiation

LLDP power negotiation enables the switch's Power over Ethernet (PoE) controller to dynamically allocate PoE power to PoE interfaces, based on the needs of the powered device, by negotiating with LLDP-enabled powered devices.

**NOTE:** LLDP power negotiation is not supported on EX3200 or EX4200 switches (except for the EX4200-PX models).

LLDP power negotiation is supported on switches running PoE controller software version 4.04 or later. For information about upgrading the PoE controller software, see *Upgrading the PoE Controller Software*.

LLDP power negotiation is automatically enabled when the PoE management mode is set to **class**:

```
• [edit poe]
user@switch# set management class
```

To disable LLDP power negotiation:

- On switch interfaces:

```
[edit protocols lldp interface all power-negotiation]
user@switch# disable
```

- On a specific switch interface:

```
[edit protocols lldp interface interface-name power-negotiation]
```

```
user@switch# disable
```

### Disabling LLDP TLVs

---

LLDP sends TLV messages by default. You can configure LLDP to disable non-mandatory TLVs. Mandatory TLVs are: chassis-id, port-id, and time-to-live. In this procedure, any reference to disabling all TLVs means disabling all non-mandatory TLVs.

There are two options for disabling TLVs:

- **tlv-select**—Select which TLVs are allowed to be advertised by LLDP. This approach is useful if you want to allow only a few TLVs and nothing else.
- **tlv-filter**—Filter the TLVs that should not be advertised by LLDP. This approach is useful if you want to filter only few TLVs, and allow everything else.

**NOTE:** The **tlv-select** and **tlv-filter** are mutually exclusive and cannot be used on the same configuration stanza at the same time.

---

You can disable TLVs on a specific interfaces or on all interfaces. The configuration under the interface configuration stanza takes precedence over global the global configuration.

To select which TLVs are allowed to be advertised by LLDP:

- On all interfaces:

```
[edit protocols lldp]
user@switch# set tlv-select tlv-name
```

- On a specific interface:

```
[edit protocols lldp]
user@switch# set interface interface-name tlv-select tlv-name
```

To filter TLVs that should not be advertised by LLDP:

- On all interfaces:

```
[edit protocols lldp]
user@switch# set tlv-filter tlv-name
```

- On a specific interface:

```
[edit protocols lldp]
user@switch# set interface interface-name tlv-filter tlv-name
```

The following example disables all TLVs except port-description:

```
[edit protocols lldp]
user@switch# set tlv-select port-description
```

The following example disables the system-description TLV on ge-2/1/1 interface:

```
[edit protocols lldp]
user@switch# set interface ge-2/1/1 tlv-filter system-description
```

The following example disables all TLVs except port-description and system-description on all interfaces except on the ge-0/0/1 interface, where it disables only the system-name TLV:

```
[edit protocols lldp]
user@switch# set tlv-select [port-description system-description]
user@switch# set interface ge-0/0/1 tlv-filter system-name
```

You can also disable TLVs for the LLDP Media Endpoint Discovery (LLDP-MED) protocol. See [“Configuring LLDP-MED \(CLI Procedure\)” on page 441](#) for more information.

## Configuring LLDP (J-Web Procedure)

**NOTE:** This topic applies only to the J-Web Application package.

Use the LLDP Configuration page to configure LLDP global and port settings for an EX Series switch on the J-Web interface.

To configure LLDP:

1. Select **Configure > Switching > LLDP**.

The LLDP Configuration page displays LLDP Global Settings and Port Settings.

The second half of the screen displays operational details for the selected port.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

2. For an EX8200 Virtual Chassis configuration, select the member and the slot (FPC) from the list.
3. To modify LLDP Global Settings, click **Global Settings**.  
Enter information as described in [Table 33 on page 438](#).
4. To modify Port Settings, click **Edit** in the Port Settings section.  
Enter information as described in [Table 34 on page 438](#).

**Table 33: Global Settings**

| Field                | Function                                                                                                                                                                                                                         | Your Action                            |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------|
| Advertising interval | Specifies the frequency of outbound LLDP advertisements. You can increase or decrease this interval.                                                                                                                             | Type the number of seconds.            |
| Hold multiplier      | Specifies the multiplier factor to be used by an LLDP-enabled switch to calculate the time-to-live (TTL) value for the LLDP advertisements it generates and transmits to LLDP neighbors.                                         | Type the required number in the field. |
| Fast start count     | Specifies the number of LLDP advertisements sent in the first second after the device connects. The default is 3. Increasing this number results in the port initially advertising LLDP-MED at a faster rate for a limited time. | Type the Fast start count.             |

**Table 34: Edit Port Settings**

| Field           | Function                                                 | Your Action                                                     |
|-----------------|----------------------------------------------------------|-----------------------------------------------------------------|
| LLDP Status     | Specifies whether LLDP has been enabled on the port.     | Select one: <b>Enabled</b> , <b>Disabled</b> , or <b>None</b> . |
| LLDP-MED Status | Specifies whether LLDP-MED has been enabled on the port. | Select <b>Enable</b> from the list.                             |

## Understanding LLDP and LLDP-MED on EX Series Switches

EX Series Ethernet Switches use Link Layer Discovery Protocol (LLDP) and Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) to learn and distribute device information on network links. The information enables the switch to quickly identify a variety of devices, resulting in a LAN that interoperates smoothly and efficiently.

- [Benefits of LLDP and LLDP-MED on page 438](#)
- [LLDP and LLDP-MED Overview on page 438](#)
- [Supported LLDP TLVs on page 439](#)
- [Supported LLDP-MED TLVs on page 440](#)
- [Disabling TLVs on page 441](#)

### Benefits of LLDP and LLDP-MED

- Enables the switch to quickly identify a variety of devices.
- Provides PoE power management capabilities.
- Ensures that voice traffic gets tagged and prioritized with the correct values at the source itself.

### LLDP and LLDP-MED Overview

LLDP-capable devices transmit information in type, length, and value (TLV) messages to neighbor devices. Device information can include information such as chassis and port identification and system name and system capabilities. The TLVs leverage this

information from parameters that have already been configured in the Junos operating system (Junos OS).

LLDP-MED goes one step further than LLDP, exchanging IP-telephony messages between the switch and the IP telephone.

**NOTE:** If your IP telephone is configured for VoIP (VoIP), the switch automatically detects the configuration and assigns the telephone to the voice VLAN. The implementation of a voice VLAN on an IP telephone is vendor-specific. Consult the documentation that came with your IP telephone for instructions on configuring a voice VLAN. For example, on an Avaya phone, you can ensure that the phone gets the correct VoIP VLAN ID even in the absence of LLDP-MED by enabling DHCP option 176.

LLDP and LLDP-MED also provide PoE power management capabilities. LLDP power negotiation allows the switch to manage PoE power by negotiating with LLDP-enabled powered devices to dynamically allocate PoE power as needed. LLDP power priority allows an LLDP-enabled powered device to set the PoE power priority on the switch interface to which it connects.

The switch also uses these protocols to ensure that voice traffic gets tagged and prioritized with the correct values at the source itself. For example, 802.1p CoS and 802.1Q tag information can be sent to the IP telephone.

### Supported LLDP TLVs

EX Series switches and QFX5100 switches support the following basic management TLVs:

- Chassis ID—The MAC address associated with the local system.

**NOTE:** The Chassis ID TLV has a subtype for the network address family. LLDP frames are validated only if this subtype has a value of 1 (IPv4) or 2 (IPv6). For any other value, the transmitting device is detected by LLDP as a neighbor and displayed in the output of the `show lldp neighbors` command, but is not assigned to the VLAN.

- Port ID—The port identification for the specified port in the local system.
- Time to Live—The length of time that the received information should remain valid.
- Port Description—Textual description of the interface or the logical unit. The description for the logical unit is used, if available; otherwise, the Port Description TLV contains the description configured on the physical interface. For example, LAG member interfaces do not contain a logical unit; therefore, only the description configured on the physical interface can be used.
- System Name—The user-configured name of the local system. The system name can be a maximum of 256 characters. The system name field contains the host name and the domain name in the following format: *host-name.domain-name*.

- **System Description**—The system description that contains information about the software and current image running on the system. This information is not configurable, but taken from the software.
- **System Capabilities**—The primary function performed by the system. The capabilities that the system supports—for example, bridge or router. This information is not configurable, but based on the model of the product.
- **Management Address**—The IPv4 or IPv6 management address of the local system.

EX Series switches and QFX5100 switches support the following organizationally defined TLVs:

- **Power via MDI**—A TLV that advertises MDI (media dependent interface) power support, PSE (power sourcing equipment) power pair, and power class information.
- **MAC/PHY Configuration Status**—A TLV that advertises information about the physical interface, such as autonegotiation status and support and MAU (medium attachment unit) type. The information is not configurable, but based on the physical interface structure.

**NOTE:** The MAC/PHY Configuration Status TLV has a subtype for the PMD Auto-Negotiation Advertised Capability field. This field contains a value of **other** or **unknown** if the LLDP packet is transmitted from a 10-gigabit SFP+ port.

- **Link Aggregation**—A TLV that advertises whether the port is aggregated and its aggregated port ID.
- **Maximum Frame Size**—A TLV that advertises the maximum transmission unit (MTU) of the interface sending LLDP frames.
- **Port Vlan**—A TLV that advertises the VLAN name configured on the interface.

---

### Supported LLDP-MED TLVs

---

EX Series switches and QFX5100 switches support the following LLDP-MED TLVs:

- **LLDP MED Capabilities**—A TLV that advertises the primary function of the port. The values of capabilities range from 0 through 15:
  - 0—Capabilities
  - 1—Network Policy
  - 2—Location Identification
  - 3—Extended Power via MDI-PSE
  - 4—Inventory
  - 5-15—Reserved
- **LLDP-MED Device Class Values**—Categorizes media endpoint devices into classes:

- 0—Class not defined
- 1—Class 1 (generic endpoints). This class definition is applicable to all endpoints that require the base LLDP discovery services.
- 2—Class 2 (media endpoints). This class includes endpoints that have IP media capabilities.
- 3—Class 3 (communication endpoints). Devices acting as end user communication appliances
- 4—Network Connectivity Device
- 5-255—Reserved
- Network Policy—A TLV that advertises the port VLAN configuration and associated Layer 2 and Layer 3 attributes. Attributes include the policy identifier, application types, such as voice or streaming video, 802.1Q VLAN tagging, and 802.1p priority bits and Diffserv code points.
- Endpoint Location— A TLV that advertises the physical location of the endpoint.
- Extended Power via MDI— A TLV that advertises the power type, power source, power priority, and power value of the port. It is the responsibility of the PSE device (network connectivity device) to advertise the power priority on a port.

### Disabling TLVs

In multi-vendor networks, it might not be desirable to send TLV messages because they can contain sensitive information about a network device. You can configure LLDP or LLDP-MED to disable any non-mandatory TLV message. Mandatory TLVs are: chassis-id, port-id, and time-to-live. All other TLVs can be disabled, either on specific interfaces or on a global basis. See [“Configuring LLDP \(CLI Procedure\)” on page 432](#) and [“Configuring LLDP-MED \(CLI Procedure\)” on page 441](#) for more information.

**See Also** • [Understanding PoE on EX Series Switches](#)

## Configuring LLDP-MED (CLI Procedure)

Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) is an extension of LLDP. The EX Series switch uses LLDP-MED to support device discovery of VoIP telephones and to create location databases for these telephone locations.

LLDP-MED is enabled by default on EX Series switches.

This topic describes:

- [Enabling LLDP-MED on Interfaces on page 442](#)
- [Configuring Location Information Advertised by the Switch on page 442](#)
- [Configuring a Fast Start for LLDP-MED on page 442](#)
- [Disabling LLDP-MED TLVs on page 443](#)

## Enabling LLDP-MED on Interfaces

---

LLDP-MED is enabled on all interfaces by default. If it is disabled, you can enable LLDP-MED by configuring it on all interfaces or on specific interfaces.

**NOTE:** On switches running Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style, configure LLDP-MED on the physical interface—for example, on ge-0/0/2. For more about ELS, see *Using the Enhanced Layer 2 Software CLI*.

To configure LLDP-MED on all interfaces or on a specific interface:

```
[edit protocols lldp-med]
user@switch# set interface interface-name
```

## Configuring Location Information Advertised by the Switch

---

You can configure the location information that is advertised from the switch to the LLDP-MED device. You can specify a civic-based location (geographic location) or a location based on an ELIN (Emergency Location Identification Number):

- To specify a location by geography:

```
[edit protocols lldp-med]
user@switch# set interface ge-0/0/2.0 location civic-based country-code country-code
user@switch# set interface ge-0/0/2.0 location civic-based ca-type ca-type ca-value ca-value
```

- To specify a location by using an elin string:

```
[edit protocols lldp-med]
user@switch# set interface ge-0/0/2.0 location elin 4085551212
```

## Configuring a Fast Start for LLDP-MED

---

When the switch detects an LLDP-MED capable device, it begins to send LLDP advertisements from the port connected to the device. The fast start count indicates how many advertisements will be sent in the first second after the switch detects the LLDP-MED device. The default is 3; to set it to another value:

```
[edit protocols lldp-med]
user@switch# set fast-start seconds
```

For example:

```
[edit protocols lldp-med]
user@switch# set fast-start 6
```

**NOTE:** If an interface is configured as a VoIP interface, then the switch does not wait for an attached phone to identify itself as an LLDP-MED device before it performs an LLDP-MED fast start after a graceful Routing Engine switchover (GRES) or a reboot. Instead, it immediately performs an LLDP-MED fast start after a GRES or reboot. This behavior prevents certain models of IP phones from resetting after a GRES.

### Disabling LLDP-MED TLVs

LLDP-MED sends TLV messages by default. You can configure LLDP-MED to disable non-mandatory TLVs. Mandatory TLVs are: chassis-id, port-id, and time-to-live. In this procedure, any reference to disabling all TLVs means disabling all non-mandatory TLVs.

There are two options for disabling TLVs:

- **tlv-select**—Select which TLVs are allowed to be advertised by LLDP. This approach is useful if you want to allow only a few TLVs and nothing else.
- **tlv-filter**—Filter the TLVs that should not be advertised by LLDP. This approach is useful if you want to filter only few TLVs, and allow everything else.

**NOTE:** The **tlv-select** and **tlv-filter** are mutually exclusive and cannot be used on the same configuration stanza at the same time.

You can disable TLVs on a specific interfaces or on all interfaces. The configuration under the interface configuration stanza takes precedence over global the global configuration.

To select which TLVs are allowed to be advertised by LLDP-MED:

- On all interfaces:

```
[edit protocols lldp-med]
user@switch# set tlv-select tlv-name
```

- On a specific interface:

```
[edit protocols lldp-med]
user@switch# set interface interface-name tlv-select tlv-name
```

To filter TLVs that should not be advertised by LLDP-MED:

- On all interfaces:

```
[edit protocols lldp-med]
user@switch# set tlv-filter tlv-name
```

- On a specific interface:

```
[edit protocols lldp-med]
user@switch# set interface interface-name tlv-filter tlv-name
```

The following example disables all TLVs except location-id:

```
[edit protocols lldp-med]
user@switch# set tlv-select location-id
```

The following example disables the ext-power-via-mdi TLV on ge-2/1/1 interface:

```
[edit protocols lldp-med]
user@switch# set interface ge-2/1/1 tlv-filter ext-power-via-mdi
```

The following example disables all TLVs except location-id and ext-power-via-mdi on all interfaces except on the ge-0/0/1 interface, where it disables only the network-policy TLV:

```
[edit protocols lldp-med]
user@switch# set tlv-select [location-id ext-power-via-mdi]
user@switch# set interface ge-0/0/1 tlv-filter network-policy
```

You can also disable TLVs for the LLDP protocol. See [“Configuring LLDP \(CLI Procedure\)” on page 432](#) for more information.

## NetBIOS Snooping on EX Series Switches

---

NetBIOS snooping enables an EX Series switch to learn information about NetBIOS hosts that are connected to the switch. The NetBIOS snooping-enabled switch extracts the host details from the NetBIOS name registration packet and stores the details in the LLDP neighbor database. For more information, read this topic.

- [Understanding NetBIOS Snooping on page 444](#)
- [Configuring NetBIOS Snooping \(CLI Procedure\) on page 445](#)

### Understanding NetBIOS Snooping

NetBIOS snooping allows Juniper Networks EX Series Ethernet Switches to discover NetBIOS hosts that are connected to the switch.

- [What Is a NetBIOS Name? on page 444](#)
- [How NetBIOS Snooping Works on page 445](#)

---

#### What Is a NetBIOS Name?

---

A NetBIOS name is a key element in communications between NetBIOS resources. A NetBIOS name identifies a NetBIOS resource on the network. A NetBIOS name is either

a unique (exclusive) name or a group (nonexclusive) name. When a NetBIOS resource communicates with one other NetBIOS resource, a unique name is used in that communication. When a NetBIOS resource communicates with multiple resources, a group name is used.

The NetBIOS name of each NetBIOS resource is stored on the NetBIOS Name Server (NBNS). The NetBIOS name of a NetBIOS resource is mapped to its IP address.

A NetBIOS name is a 16-byte address. The first 15 bytes contain the name and the last byte contains the name type.

The NetBIOS name service is supported over UDP port 137.

### How NetBIOS Snooping Works

You can enable NetBIOS snooping on the switch so that the switch can identify NetBIOS resources that are connected to it.

When a host connected to the switch initializes itself, it attempts to register its NetBIOS name by sending a NetBIOS name registration request message. The host can opt for either a unique or a group NetBIOS name. For a unique NetBIOS name, the host either broadcasts a NetBIOS name query message on the local network or unicasts it to the NBNS to check whether the requested name is already being used by another host. If so, the host that previously registered the name or the NBNS responds with a negative name registration response. If the host receives no negative response, it broadcasts the NetBIOS name registration packet to confirm the name. For a NetBIOS group name, the host sends a NetBIOS name registration packet, which generates no responses from other hosts because multiple hosts can use the same group name at the same time.

The NetBIOS snooping-enabled switch extracts the host details from the NetBIOS name registration packet and stores the details in the LLDP neighbor database.

## CHAPTER 8

# DHCP on Routers

- [DHCP for Routing Devices on page 447](#)
- [DHCP Local Server on page 453](#)
- [Extended DHCP Local Server on page 466](#)

### DHCP for Routing Devices

---

A Dynamic Host Configuration Protocol (DHCP) server provides a framework to pass configuration information to client hosts on a TCP/IP network. A Junos OS device acting as a DHCP server can dynamically allocate IP addresses and other configuration parameters, minimizing the overhead that is required to add clients to the network. For more information, read this topic.

- [DHCP Access Service Overview on page 448](#)
- [DHCP Statement Hierarchy and Inheritance on page 451](#)

## DHCP Access Service Overview

DHCP access service consists of two components: a protocol for delivering host-specific configuration information from a server to a client host and a method for allocating network addresses to a client host. The client sends a message to request configuration information. A DHCP server sends the configuration information back to the client.

With DHCP, clients can be assigned a network address for a fixed *lease*, enabling serial reassignment of network addresses to different clients. A DHCP server leases IP addresses for specific times to various clients. If a client does not use its assigned address for some period of time, the DHCP server can assign that IP address to another host. When assignments are made or changed, the DHCP server updates information in the DNS server. The DHCP server provides clients with their previous lease assignments whenever possible.

A DHCP server provides persistent storage of network parameters for clients. Because DHCP is an extension of BOOTP, DHCP servers can handle BOOTP requests.

The DHCP server includes IPv4 address assignment and commonly used DHCP options. The server is compatible with DHCP servers from other vendors on the network. The server does not support IPv6 address assignment, user class-specific configuration, DHCP failover protocol, dynamic DNS updates, or VPN connections. The Junos-FIPS software does not support the DHCP server.

**NOTE:** You cannot configure a router as a DHCP server and a BOOTP relay agent at the same time.

---

The following topics describe these concepts in detail:

- [Network Address Assignments \(Allocating a New Address\) on page 448](#)
- [Network Address Assignments \(Reusing a Previously Assigned Address\) on page 450](#)
- [Static and Dynamic Bindings on page 450](#)
- [Compatibility with Autoinstallation on page 451](#)
- [Conflict Detection and Resolution on page 451](#)

---

### Network Address Assignments (Allocating a New Address)

---

To receive configuration information and a network address assignment, a DHCP client negotiates with DHCP servers in a series of messages. The following steps show the messages exchanged between a DHCP client and servers to allocate a new network address. When allocating a new network address, the DHCP process can involve more than one server, but only one server is selected by the client.

1. When a client computer is started, it broadcasts a **DHCPDISCOVER** message on the local subnet, requesting a DHCP server. This request includes the hardware address of the requesting client.

Figure 25: DHCP Discover

**NOTE:** For improved operation with DHCP clients that do not strictly conform to RFC 2131, the DHCP server accepts and processes **DHCPDISCOVER** messages even if the overload options in the messages are not properly terminated with an end statement.

2. Each DHCP server receiving the broadcast sends a **DHCPOFFER** message to the client, offering an IP address for a set period of time, known as the lease period.

Figure 26: DHCP Offer

3. The client receives one or more **DHCPOFFER** messages from one or more servers and selects one of the offers received. Normally, a client looks for the longest lease period.
4. The client broadcasts a **DHCPREQUEST** message indicating the client has selected an offered leased IP address and identifies the selected server.

Figure 27: DHCP Request

5. Those servers not selected by the **DHCPREQUEST** message return the unselected IP addresses to the pool of available addresses.
6. The selected DHCP server sends a **DHCPACK** acknowledgment that includes configuration information such as the IP address, subnet mask, default gateway, and the lease period.

**Figure 28: DHCP ACK**

The information offered by the server is configurable.

7. The client receives the **DHCPACK** message with configuration information. The process is complete. The client is configured and has access to the network.
  - If the client receives a **DHCPNAK** message (for example, if the client has moved to a new subnet), the client restarts the negotiation process.
  - The client can relinquish its lease on a network address by sending a **DHCPRELEASE** message to the server (for example, when the client is restarted). When the server receives the **DHCPRELEASE** message, it marks the lease as free and the IP address becomes available again.

**Figure 29: DHCP Release**

### Network Address Assignments (Reusing a Previously Assigned Address)

To enable reuse of a previously allocated network address, the following events occur:

1. A client that previously had a lease broadcasts a **DHCPREQUEST** message on the local subnet.
2. The server with knowledge of the client's configuration responds with a **DHCPACK** message.
3. The client verifies the DHCP configuration information sent by the server and uses this information to reestablish the lease.

### Static and Dynamic Bindings

DHCP supports both dynamic and static bindings. For dynamic bindings, IP addresses are assigned to clients from a pool of addresses. Static bindings provide configuration information for a specific client and can include one or more fixed IP addresses for the client. You can configure a DHCP server to include both address pools and static bindings. For any individual client, static bindings take priority over address pools.

### Compatibility with Autoinstallation

The DHCP server is compatible with the autoinstallation feature on J Series Services Routers. The server automatically checks autoinstallation settings for conflicts and gives autoinstallation settings priority over corresponding DHCP settings. For example, an IP address set by autoinstallation takes priority over an IP address set by the DHCP server.

**NOTE:** The autoinstallation feature includes a fixed address pool and a fixed lease time. With DHCP, you can create address pools and modify lease times.

### Conflict Detection and Resolution

When a client receives an IP address from the DHCP server, the client performs a series of ARP tests to verify that the IP address is available and no conflicts exist. If the client detects an address conflict, the client notifies the DHCP server about the conflict and may request another IP address from the DHCP server.

The DHCP server keeps a log of all conflicts and removes addresses with conflicts from the pool. These addresses remain excluded until you manually clear the conflicts list with the **clear system services dhcp conflict** command.

### DHCP Statement Hierarchy and Inheritance

DHCP configuration statements are organized hierarchically. Statements at the top of the hierarchy apply to the DHCP server and network, branches contain statements that apply to address pools in a subnetwork, and leaves contain statements that apply to static bindings for individual clients. See [Table 35 on page 451](#).

The **pool** and **static-binding** statements appear at the **[edit system services dhcp]** hierarchy level. You can include the remaining statements at the following hierarchy levels:

```
[edit system services dhcp]
[edit system services dhcp pool]
[edit system services dhcp static-binding]
```

**Table 35: Pool and Binding Statements**

| Statement             | Description                                                                                                                                                         | Hierarchy Level                    |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|
| <b>pool</b>           | Configure a pool of IP addresses for DHCP clients on a subnet. When a client joins the network, the DHCP server dynamically allocates an IP address from this pool. | <b>[edit system services dhcp]</b> |
| <b>static-binding</b> | Set static bindings for DHCP clients. A static binding is a mapping between a fixed IP address and the client's MAC address.                                        |                                    |

To minimize configuration changes, include common configuration statements shown in [Table 36 on page 452](#) (for example, the **domain-name** statement) at the highest

applicable level of the hierarchy (network or subnetwork). Configuration statements at lower levels of the hierarchy override statements inherited from a higher level. For example, if a statement appears at both the **[edit system services dhcp]** and **[edit system services dhcp pool]** hierarchy levels, the value assigned to the statement at the **[edit system services dhcp pool]** level takes priority.

*Table 36: Common Configuration Statements*

| Statement                 | Description                                                                                                                                                                       | Hierarchy Level                                                                                                                            |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>boot-file</b>          | Set the boot filename advertised to clients. The client uses the boot image stored in the boot file to complete configuration.                                                    | <b>[edit system services dhcp]</b><br><br><b>[edit system services dhcp pool]</b><br><br><b>[edit system services dhcp static-binding]</b> |
| <b>boot-server</b>        | Set the server that contains the boot file.                                                                                                                                       |                                                                                                                                            |
| <b>default-lease-time</b> | Set the default lease time assigned to any client that does not request a specific lease time.                                                                                    |                                                                                                                                            |
| <b>domain-name</b>        | Configure the name of the domain in which clients will search for a DHCP server host. This is the default domain name that is appended to hostnames that are not fully qualified. |                                                                                                                                            |
| <b>domain-search</b>      | Define a domain search list.                                                                                                                                                      |                                                                                                                                            |
| <b>maximum-lease-time</b> | Set the maximum lease time allowed by the server.                                                                                                                                 |                                                                                                                                            |
| <b>name-server</b>        | Specify the DNS server that maintains the database of client name to IP address mappings.                                                                                         |                                                                                                                                            |
| <b>option</b>             | Configure user-defined DHCP options.                                                                                                                                              |                                                                                                                                            |
| <b>router</b>             | Specify IP address for routers on the client's subnetwork. Routers are listed in order of preference.                                                                             |                                                                                                                                            |
| <b>server-identifier</b>  | Set the IP address of the DHCP server.                                                                                                                                            |                                                                                                                                            |

## DHCP Local Server

DHCP local server receives DHCP request and reply packets from DHCP clients and then responds with an IP address and other optional configuration information to the client. For more information, read this topic.

### Configuring Address Pools for DHCP Dynamic Bindings

For dynamic bindings, set aside a pool of IP addresses that can be assigned to clients. Addresses in a pool must be available to clients on the same subnet.

To configure an address pool, include the following statements at the **[edit system services dhcp]** hierarchy level:

```
[edit system services dhcp]
pool address</prefix-length> {
  address-range {
    low address;
    high address;
  }
  exclude-address {
    address;
  }
}
```

The pool definition must include the client subnet number and prefix length (in bits). Optionally, the definition can include an address range and a list of excluded addresses.

The **address-range** statement defines the lowest and highest IP addresses in the pool that are available for dynamic address assignment. This statement is optional. If no range is specified, the pool will use all available addresses within the subnet specified. (Broadcast addresses, interface addresses, and excluded addresses are not available.)

The **exclude-address** statement specifies addresses within the range that are not used for dynamic address assignment. You can exclude one or more addresses within the range. This statement is optional.

The following is an example of a pool configuration.

```
[edit system services dhcp]
pool 10.3.3.0/24 {
  address-range low 10.3.3.2 high 10.3.3.254;
  exclude-address {
    10.3.3.33;
  }
}
```

For dynamic address assignment, configure an address pool for each client subnet the DHCP server supports. You can configure multiple address pools for a DHCP server, but only one address range per pool is supported.

DHCP maintains the state information for all pools configured. Clients are assigned addresses from pools with subnets that match the interface on which the **DHCPDISCOVER** packet is received. When more than one pool exists on the same interface, addresses are assigned on a rotating basis from all available pools.

**See Also** • [DHCP Access Service Overview on page 448](#)

## Configuring Manual (Static) DHCP Bindings Between a Fixed IP Address and a Client MAC Address

Static bindings provide configuration information for specific clients. This information can include one or more fixed Internet addresses, the client hostname, and a client identifier.

To configure static bindings, include the following statements at the **[edit system services dhcp]** hierarchy level:

```
[edit system services dhcp]
static-binding mac-address {
  fixed-address {
    address;
  }
  host client-hostname;
  client-identifier (ascii client-id | hexadecimal client-id);
}
```

A static binding defines a mapping between a fixed IP address and the client's MAC address.

The *mac-address* variable specifies the MAC address of the client. This is a hardware address that uniquely identifies each client on the network.

The **fixed-address** statement specifies the fixed IP address assigned to the client. Typically a client has one address assigned, but you can assign more.

The **host** statement specifies the hostname of the client requesting the DHCP server. The name can include the local domain name. Otherwise, the name is resolved based on the **domain-name** statement.

The **client-identifier** statement is used by the DHCP server to index the database of address bindings. The client identifier is either an ASCII string or hexadecimal digits. It can include a type-value pair as specified in RFC 1700, *Assigned Numbers*. Either a client identifier or the client's MAC address must be configured to uniquely identify the client on the network.

**NOTE:** For each unique client-identifier *client-id* value, the DHCP server issues a unique lease and IP address from the pool. Previously, when the client provided an incorrect client-identifier *client-id* value, the DHCP server did not issue a lease.

The following is an example of a static binding configuration:

```
[edit system services dhcp]
static-binding 00:0d:56:f4:01:ab {
  fixed-address {
    10.5.5.5;
    10.6.6.6;
  }
  host-name "another-host.domain.tld";
  client-identifier hexadecimal 01001122aabbcc;
}
```

## Specifying DHCP Lease Times for IP Address Assignments

For clients that do not request a specific lease time, the default lease time is one day. You can configure a maximum lease time for IP address assignments or change the default lease time.

To configure lease times, include the **maximum-lease-time** and **default-lease-time** statements:

```
maximum-lease-time;
default-lease-time;
```

You can include these statements at the following hierarchy levels:

```
[edit system services dhcp]
[edit system services dhcp pool]
[edit system services dhcp static-binding]
```

Lease times defined for static bindings and address pools take priority over lease times defined at the **[edit system services dhcp]** hierarchy level.

The **maximum-lease-time** statement configures the maximum length of time in seconds for which a client can request and hold a lease. If a client requests a lease longer than the maximum specified, the lease is granted only for the maximum time configured on the server. After a lease expires, the client must request a new lease.

**NOTE:** Maximum lease times do not apply to dynamic BOOTP leases. These leases are not specified by the client and can exceed the maximum lease time configured.

The following example shows a configuration for maximum and default lease times:

```
[edit system services dhcp]
maximum-lease-time 7200;
default-lease-time 3600;
```

## Configuring a DHCP Boot File and DHCP Boot Server

When a DHCP client starts, it contacts a boot server to download the boot file.

To configure a boot file and boot server, include the **boot-file** and **boot-server** statements:

```
boot-file filename;
boot-server (address | hostname);
```

You can include these statements at the following hierarchy levels:

```
[edit system services dhcp]
[edit system services dhcp pool]
[edit system services dhcp static-binding]
```

After a client receives a **DHCP OFFER** response from a DHCP server, the client can communicate directly with the boot server (instead of the DHCP server) to download the boot file. This minimizes network traffic and enables you to specify separate boot server/file pairs for each client pool or subnetwork.

The **boot-file** statement configures the name and location of the initial boot file that the DHCP client loads and executes. This file stores the boot image for the client. In most cases, the boot image is the operating system the client uses to load.

The **boot-server** statement configures the IP address of the TFTP server that contains the client's initial boot file. You must configure an IP address or a hostname for the server.

You must configure at least one boot file and boot server. Optionally, you can configure multiple boot files and boot servers. For example, you might configure two separate boot servers and files: one for static binding and one for address pools. Boot file configurations for pools or static bindings take precedence over boot file configurations at the **[edit system services dhcp]** hierarchy level.

The following example specifies a boot file and server for an address pool:

```
[edit system services dhcp]
pool 10.4.4.0/24 {
  boot-file "boot.client";
  boot-server 10.4.4.1;
}
```

## Configuring a Static IP Address as DHCP Server Identifier

The host running the DHCP server must itself use a manually assigned, static IP address. It cannot send a request and receive an IP address from itself or another DHCP server.

To configure a DHCP server identifier, include the **server-identifier** statement:

```
server-identifier address;
```

You can include this statement at the following hierarchy levels:

```
[edit system services dhcp]
[edit system services dhcp pool]
[edit system services dhcp static-binding]
```

The **server-identifier** statement specifies the IP address of the DHCP server. The host must be a TFTP server that is accessible by all clients served within a range of IP addresses (based on either an address pool or static binding).

The following example shows a DHCP server identifier configured for an address pool:

```
[edit system services dhcp]
pool 10.3.3.0/24 {
  address-range low 10.3.3.2 high 10.3.3.254;
  exclude-address {
    10.3.3.33;
  }
  router {
    10.3.3.1;
  }
  server-identifier 10.3.3.1;
}
```

## Configuring a Domain Name and Domain Search List for a DHCP Server Host

To configure the name of the domain in which clients search for a DHCP server host, include the **domain-name** statement:

```
domain-name domain;
```

You can include this statement at the following hierarchy levels:

```
[edit system services dhcp]
[edit system services dhcp pool]
```

```
[edit system services dhcp static-binding]
```

The **domain-name** statement sets the domain name that is appended to hostnames that are not fully qualified. This statement is optional. If you do not configure a domain name, the default is the client's current domain.

To configure a domain search list, include the **domain-search** statement:

```
domain-search [ domain-list ];
```

You can include this statement at the following hierarchy levels:

```
[edit system services dhcp]  
[edit system services dhcp pool]  
[edit system services dhcp static-binding]
```

The **domain-search** statement sets the order in which clients append domain names when searching for the IP address of a host. You can include one or more domain names in the list. For more information, see RFC 3397, *Dynamic Host Configuration Protocol (DHCP) Domain Search Option*.

The **domain-search** statement is optional, if you do not configure a domain search list, the default is the client's current domain.

## Configuring Routers Available to the DHCP Client

After a DHCP client loads the boot image and has booted, the client sends packets to a router.

To configure routers available to the DHCP client, include the **router** statement:

```
router {  
    address;  
}
```

You can include this statement at the following hierarchy levels:

```
[edit system services dhcp]  
[edit system services dhcp pool]  
[edit system services dhcp static-binding]
```

The **router** statement specifies a list of IP addresses for routers on the client's subnet. List routers in order of preference. You must configure at least one router for each client subnet.

The following example shows routers configured at the **[edit system services dhcp]** hierarchy level:

```
[edit system services dhcp]  
router {  
    10.6.6.1;  
    10.7.7.1;
```

```
}
```

## Creating User-Defined DHCP Options Not Included in the Default Junos Implementation of the DHCP Server

You can configure one or more user-defined options that are not included in the Junos default implementation of the DHCP server. For example, if a client requests a DHCP option that is not included in the DHCP server, you can create a user-defined option that enables the server to respond to the client's request.

To configure a user-defined DHCP option, include the **option** statement:

```
option {
  [ (id-number option-type option-value) | (id-number array option-type option-value) ];
}
```

The **option** statement specifies the following values:

- *id-number*—Any whole number. The ID number is used to index the option and must be unique across a DHCP server.
- *option-type*—Any of the following types: **byte**, **byte-stream**, **flag**, **integer**, **ip-address**, **short**, **string**, **unsigned-integer**, **unsigned-short**.
- *array*—An option can include an array of values.
- *option-value*—Value associated with an option. The option value must be compatible with the option type (for example, an **On** or **Off** value for a **flag** type).

You can include this statement at the following hierarchy levels:

```
[edit system services dhcp]
[edit system services dhcp pool]
[edit system services dhcp static-binding]
```

The following example shows user-defined DHCP options:

```
[edit system services dhcp]
option 19 flag off; # 19: "IP Forwarding" option
option 40 string "domain.tld"; # 40: "NIS Domain" option
option 16 ip-address 10.3.3.33; # 16: "Swap Server" option
```

User-defined options that conflict with DHCP configuration statements are ignored by the server. For example, in the following configuration, the DHCP server ignores the user-defined **option 3 router** statement and uses the **router** statement instead:

```
[edit system services dhcp]
option 3 router 10.7.7.2; # 3: "Default Router" option
router {
  10.7.7.1;
}
```

## Example: Complete DHCP Server Configuration

This topic shows a complete DHCP server configuration with address pools, static bindings, and user-defined options.

The following example shows statements at the **[edit interfaces]** hierarchy level. The interface's primary address (10.3.3.1/24) has a corresponding address pool (10.3.3.0/24) defined at the **[edit system services]** hierarchy level.

```
[edit interfaces]
fe-0/0/1 {
  unit 0 {
    family inet {
      address 10.3.3.1/24;
    }
  }
}
```

**NOTE:** You can configure a DHCP server only on an interface's primary IP address. The primary address on an interface is the address that is used by default as the local address for broadcast and multicast packets sourced locally and sent out the interface.

Statements at the **[edit system services]** hierarchy level include the following:

```
[edit system services]
dhcp {
  domain-name "domain.tld";
  maximum-lease-time 7200;
  default-lease-time 3600;
  name-server {
    10.6.6.6;
    10.6.6.7;
  }
  domain-search [ subnet1.domain.tld subnet2.domain.tld ];
  wins-server {
    10.7.7.7;
    10.7.7.9;
  }
  router {
    10.6.6.1;
    10.7.7.1;
  }
  option 19 flag off; # 19: "IP Forwarding" option
  option 40 string "domain.tld"; # 40: "NIS Domain" option
  option 16 ip-address 10.3.3.33; # 16: "Swap Server" option
  pool 10.3.3.0/24 {
    address-range low 10.3.3.2 high 10.3.3.254;
    exclude-address {
      10.3.3.33;
    }
  }
}
```

```

router {
  10.3.3.1;
}
server-identifier 10.3.3.1;
}
pool 10.4.4.0/24 {
  boot-file "boot.client";
  boot-server 10.4.4.1;
}
static-binding 00:0d:56:f4:20:01 {
  fixed-address 10.4.4.4;
  host-name "host.domain.tld";
}
static-binding 00:0d:56:f4:01:ab {
  fixed-address {
    10.5.5.5;
    10.6.6.6;
  }
  host-name "another-host.domain.tld";
  client-identifier "01aa.001a.bc65.3e";
}
}

```

## Verifying and Managing the DHCP Server Configuration

To display the client address bindings for the extended DHCP local server, use the following operational commands:

- **show dhcp server binding**
- **show dhcp server statistics**

To clear client address bindings and DHCP local server statistics, use the following operational commands:

- **clear dhcp server binding**
- **clear dhcp server statistics**

For information about using these operations commands, see the *Junos System Basics and Services Reference*.

## Example: Viewing DHCP Bindings

Use the CLI command **show system services dhcp binding** to view information about DHCP address bindings, lease times, and address conflicts.

The following example shows the binding type and lease expiration times for IP addresses configured on a router that supports a DHCP server:

```
user@host> show system services dhcp binding
```

| IP Address  | Hardware Address  | Type    | Lease expires at        |
|-------------|-------------------|---------|-------------------------|
| 192.168.1.2 | 00:a0:12:00:12:ab | static  | never                   |
| 192.168.1.3 | 00:a0:12:00:13:02 | dynamic | 2004-05-03 13:01:42 PDT |

Enter an IP address to show binding for a specific IP address:

```
user@host> show system services dhcp binding 192.168.1.3

DHCP binding information:
IP address      192.168.1.3
Hardware address 00:a0:12:00:12:ab
Client identifier
61 63 65 64 2d 30 30 3a 61 30 3a 31 32 3a 30 30 aced-00:a0:12:00
3a 31 33 3a 30 32
Lease information:
Type            dynamic
Obtained at      2004-05-02 13:01:42 PDT
Expires at       2004-05-03 13:01:42 PDT
```

Use the **detail** option to show detailed binding information:

```
user@host> show system services dhcp binding detail

DHCP binding information:
IP address      192.168.1.3
Hardware address 00:a0:12:00:12:ab
Pool            192.168.1.0/24
Interface       fe-0/0/0, relayed by 192.168.4.254
Lease information:
Type            dynamic
Obtained at      2004-05-02 13:01:42 PDT
Expires at       2004-05-03 13:01:42 PDT
DHCP options:
name-server foo.mydomain.tld
domain-name mydomain.tld
option 19 flag off
```

### Example: Viewing DHCP Address Pools

Use the CLI **show system services dhcp pool** command to view information about DHCP address pools.

The following example show address pools configured on a DHCP server:

```
user@ host> show system services dhcp pool
```

| Pool name    | Low address | High address | Excluded addresses |
|--------------|-------------|--------------|--------------------|
| 10.40.1.0/24 | 10.40.1.1   | 10.40.1.254  | 10.40.1.254        |

### Example: Viewing and Clearing DHCP Conflicts

When the DHCP server provides an IP address, the client performs an ARP check to make sure the address is not being used by another client and reports any conflicts back to the server. The server keeps track of addresses with conflicts and removes them from the address pool. Use the CLI command **show system services dhcp conflict** to show conflicts.

```
user@host> show system services dhcp conflict
```

| Detection time          | Detection method | Address     |
|-------------------------|------------------|-------------|
| 2004-08-03 19:04:00 PDT | client           | 192.168.1.5 |
| 2004-08-04 04:23:12 PDT | ping             | 192.168.1.8 |

Use the **clear system services dhcp conflicts** command to clear the conflicts list and return IP addresses to the pool. The following command shows how to clear an address on the server that has a conflict:

```
user@host> clear system services dhcp conflict 192.168.1.5
```

For more information about CLI commands you can use with the DHCP server, see the [CLI Explorer](#).

## Configuring Tracing Operations for DHCP Processes

DHCP tracing operations track all DHCP operations and record them to a log file. By default, no DHCP processes are traced. If you include the **traceoptions** statement at the **[edit system services dhcp]** hierarchy level, the default tracing behavior is the following:

- Important events are logged in a file called **dhcpcd** located in the **/var/log** directory.
- When the file **dhcpcd** reaches 128 kilobytes (KB), it is renamed **dhcpcd.0**, then **dhcpcd.1**, and so on, until there are three trace files. Then the oldest trace file (**dhcpcd.2** is overwritten). For more information about how log files are created, see the [System Log Explorer](#).
- Log files can be accessed only by the user who configures the tracing operation.

You cannot change the directory in which trace files are located. However, you can customize the other trace file settings by including the following statements at the **[edit system services dhcp traceoptions]** hierarchy level:

```
[edit system services dhcp traceoptions]
file filename <files number> <match regex> <size size> <world-readable |
no-world-readable>;
flag {
  all;
}
```

Tasks for configuring DHCP tracing operations are:

1. [Configuring the DHCP Processes Log Filename on page 464](#)
2. [Configuring the Number and Size of DHCP Processes Log Files on page 464](#)
3. [Configuring Access to the DHCP Log File on page 464](#)
4. [Configuring a Regular Expression for Refining the Output of DHCP Logged Events on page 464](#)
5. [Configuring DHCP Trace Operation Events on page 465](#)

### Configuring the DHCP Processes Log Filename

---

By default, the name of the file that records trace output is **dhcpcd**. You can specify a different name by including the file statement at the **[edit system services dhcp traceoptions]** hierarchy level:

```
[edit system services dhcp traceoptions]
file filename;
```

### Configuring the Number and Size of DHCP Processes Log Files

---

By default, when the trace file reaches 128 kilobytes (KB) in size, it is renamed **filename.0**, then **filename.1**, and so on, until there are three trace files. Then the oldest trace file (**filename.2**) is overwritten.

You can configure the limits on the number and size of trace files by including the following statements at the **[edit system services dhcp traceoptions]** hierarchy level:

```
[edit system services dhcp traceoptions]
file files number size size;
```

For example, set the maximum file size to 2 MB, and the maximum number of files to 20. When the file that receives the output of the tracking operation (**filename**) reaches 2 MB, **filename** is renamed **filename.0**, and a new file called **filename** is created. When the new **filename** reaches 2 MB, **filename.0** is renamed **filename.1** and **filename** is renamed **filename.0**. This process repeats until there are 20 trace files. Then the oldest file (**filename.19**) is overwritten by the newest file (**filename.0**).

The number of files can be from 2 through 1000 files. The file size of each file can be from 10KB through 1 gigabyte (GB).

### Configuring Access to the DHCP Log File

---

By default, log files can be accessed only by the user who configures the tracing operation.

To specify that any user can read all log files, include the **file world-readable** statement at the **[edit system services dhcp traceoptions]** hierarchy level:

```
[edit system services dhcp traceoptions]
file world-readable;
```

To set the default behavior explicitly, include the **file no-world-readable** statement at the **[edit system services dhcp traceoptions]** hierarchy level:

```
[edit system services dhcp traceoptions]
file no-world readable;
```

### Configuring a Regular Expression for Refining the Output of DHCP Logged Events

---

By default, the trace operations output includes all lines relevant to the logged events.

You can refine the output by including the match statement at the **[edit system services dhcp traceoptions file *filename*]** hierarchy level and specifying a regular expression (regex) to be matched:

```
[edit system services dhcp traceoptions]
file filename match regex;
```

### Configuring DHCP Trace Operation Events

By default, only important events are logged. You can configure the trace operations to be logged by including the following options at the **[edit system services dhcp traceoptions]** hierarchy level:

```
[edit dhcp system services dhcp traceoptions]
flag {
  all;
  binding;
  config;
  conflict;
  event;
  ifdb;
  io;
  lease;
  main;
  misc;
  packet;
  options;
  pool;
  protocol;
  rtsock;
  scope;
  signal;
  trace;
  ui;
}
```

### DHCP Processes Tracing Flags

[Table 37 on page 465](#) describes which operation or event is recorded by each DHCP tracing flag. By default, all flags are disabled.

*Table 37: DHCP Processes Tracing Flags*

| Flag            | Operation or Event                          |
|-----------------|---------------------------------------------|

## Extended DHCP Local Server Overview

Junos OS includes an extended DHCP local server that enhances traditional DHCP server operation by providing additional address assignment and client configuration functionality and flexibility in a subscriber-aware environment. The extended DHCP local server enables service providers to take advantage of external address-assignment pools and integrated RADIUS-based configuration capabilities in addition to the continued support of traditional local address pools. The address-assignment pools are considered external because they are external to the DHCP local server. The pools are managed independently of the DHCP local server, and can be shared by different client applications, such as DHCP or PPPoE access. [Table 38 on page 469](#) provides a comparison of the extended DHCP local server and a traditional DHCP local server.

The extended DHCP local server provides an IP address and other configuration information in response to a client request. The server supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide DHCP client authentication. You can configure the dynamic profile and authentication support on a global basis or for a specific group of interfaces.

**Table 38: Comparing the Extended DHCP Local Server to the Traditional DHCP Local Server**

| Feature                                                                                                     | Extended DHCP Local Server | Traditional DHCP Local Server |
|-------------------------------------------------------------------------------------------------------------|----------------------------|-------------------------------|
| Local address pools                                                                                         | X                          | X                             |
| External, centrally-managed address pools                                                                   | X                          | —                             |
| Local configuration                                                                                         | X                          | X                             |
| External configuration using information from address-assignment pools or RADIUS servers                    | X                          | —                             |
| Dynamic-profile attachment                                                                                  | X                          | —                             |
| RADIUS-based subscriber authentication, and configuration using RADIUS attributes and Juniper Networks VSAs | X                          | —                             |
| IPv6 client support                                                                                         | X                          | —                             |
| Default minimum client configuration                                                                        | X                          | X                             |

You can also configure the extended DHCP local server to support IPv6 clients. Both DHCP local server and DHCPv6 local server support the specific address request feature, which enables you to assign a particular address to a client.

**NOTE:** If you delete the DHCP server configuration, DHCP server bindings might still remain. To ensure that DHCP bindings are removed, issue the `clear dhcp server binding` command before you delete the DHCP server configuration.

This overview covers:

- [Providing DHCP Client Configuration Information on page 471](#)
- [Minimal Configuration for Clients on page 472](#)
- [DHCP Local Server and Address-Assignment Pools on page 472](#)

### **Interaction Among the DHCP Client, Extended DHCP Local Server, and Address-Assignment Pools**

---

The pattern of interaction between the DHCP local server, the DHCP client, and address-assignment pools is the same regardless of whether you are using a router or a switch. However, there are some differences in the details of usage.

- On routers—In a typical carrier edge network configuration, the DHCP client is on the subscriber's computer or customer premises equipment (CPE), and the DHCP local server is configured on the router.
- On switches—In a typical network configuration, the DHCP client is on an access device, such as a personal computer, and the DHCP local server is configured on the switch.

The following steps provide a high-level description of the interaction among the DHCP local server, DHCP client, and address-assignment pools:

1. The DHCP client sends a discover packet to one or more DHCP local servers in the network to obtain configuration parameters and an IP address for the subscriber (or DHCP client).
2. Each DHCP local server that receives the discover packet then searches its address-assignment pool for the client address and configuration options. Each local server creates an entry in its internal client table to keep track of the client state, then sends a DHCP offer packet to the client.
3. On receipt of the offer packet, the DHCP client selects the DHCP local server from which to obtain configuration information and sends a request packet indicating the DHCP local server selected to grant the address and configuration information.
4. The selected DHCP local server sends an acknowledgement packet to the client that contains the client address lease and configuration parameters. The server also installs the host route and ARP entry, and then monitors the lease state.

### Providing DHCP Client Configuration Information

When the extended DHCP application receives a response from an external authentication server, the response might include information in addition to the IP address and subnet mask. The extended DHCP application uses the information from the authentication grant for the response the DHCP application sends to the DHCP client. The DHCP application can either send the information in its original form or the application might merge the information with local configuration specifications. For example, if the authentication grant includes an address pool name and a local configuration specifies DHCP attributes for that pool (such as, DNS server address), the extended DHCP application merges the authentication results and the attributes in the reply that the server sends to the client.

A local configuration is optional — a client can be fully configured by the external authentication service. However, if the external authentication service does not provide client configuration, you might need to configure the local address-assignment pool to provide the configuration information, such as DNS server, for the client. When a local configuration specifies options, the extended DHCP application adds the local configuration options to the offer PDU the server sends to the client. If the two sets of options overlap, the options in the authentication response from the external service take precedence.

When you use RADIUS to provide the authentication, the additional information might be in the form of RADIUS attributes and Juniper Networks VSAs. [Table 39 on page 471](#) lists the information that RADIUS might include in the authentication grant. See *RADIUS Attributes and Juniper Networks VSAs Supported by the AAA Service Framework* for a complete list of RADIUS attributes and Juniper Networks VSAs that the extended DHCP applications supports for subscriber access management or DHCP management.

**Table 39: Information in Authentication Grant**

| Attribute Number          | Attribute Name    | Description                                       |
|---------------------------|-------------------|---------------------------------------------------|
| RADIUS attribute 8        | Framed-IP-Address | Client IP address                                 |
| RADIUS attribute 9        | Framed-IP-Netmask | Subnet mask for client IP address (DHCP option 1) |
| Juniper Networks VSA 26-4 | Primary-DNS       | Primary domain server (DHCP option 6)             |
| Juniper Networks VSA 26-5 | Secondary-DNS     | Secondary domain server (DHCP option 6)           |
| Juniper Networks VSA 26-6 | Primary-WINS      | Primary WINS server (DHCP option 44)              |
| Juniper Networks VSA 26-7 | Secondary-WINS    | Secondary WINS server (DHCP option 44)            |
| RADIUS attribute 27       | Session-Timeout   | Lease time                                        |

*Table 39: Information in Authentication Grant (continued)*

| Attribute Number            | Attribute Name           | Description                  |
|-----------------------------|--------------------------|------------------------------|
| RADIUS attribute 88         | Framed-Pool              | Address assignment pool name |
| Juniper Networks VSA 26-109 | DHCP-Guided-Relay-Server | DHCP relay server            |

### Minimal Configuration for Clients

The extended DHCP local server provides a minimal configuration to the DHCP client if the client does not have DHCP option 55 configured. The server provides the subnet mask of the address-assignment pool that is selected for the client. In addition to the subnet mask, the server provides the following values to the client if the information is configured in the selected address-assignment pool:

- **router**—A router located on the client's subnet. This statement is the equivalent of DHCP option 3.
- **domain name**—The name of the domain in which the client searches for a DHCP server host. This is the default domain name that is appended to hostnames that are not fully qualified. This is equivalent to DHCP option 15.
- **domain name server**—A Domain Name System (DNS) name server that is available to the client to resolve hostname-to-client mappings. This is equivalent to DHCP option 6.

### DHCP Local Server and Address-Assignment Pools

In the traditional DHCP server operation, the client address pool and client configuration information reside on the DHCP server. With the extended DHCP local server, the client address and configuration information reside in external address-assignment pools (external to the DHCP local server). The external address-assignment pools are managed by the **authd** process, independently of the DHCP local server, and can be shared by different client applications.

The extended DHCP local server also supports advanced pool matching and the use of named address ranges. You can also configure the local server to use DHCP option 82 information in the client PDU to determine which named address range to use for a particular client. The client configuration information, which is configured in the address-assignment pool, includes user-defined options, such as boot server, grace period, and lease time.

Configuring the DHCP environment that includes the extended DHCP local server requires two independent configuration operations, which you can complete in any order. In one operation, you configure the extended DHCP local server on the router and specify how the DHCP local server determines which address-assignment pool to use. In the other operation, you configure the address-assignment pools used by the DHCP local server. The address-assignment pools contain the IP addresses, named address ranges, and configuration information for DHCP clients.

**NOTE:** The extended DHCP local server and the address-assignment pools used by the server must be configured in the same logical system and routing instance.

## Configuring the Router as an Extended DHCP Local Server

You can enable the router to function as an extended DHCP local server and configure the extended DHCP local server options on the router. The extended DHCP local server provides an IP address and other configuration information in response to a client request.

The extended DHCP local server enhances traditional DHCP server operation in which the client address pool and client configuration information reside on the DHCP server. With the extended DHCP local server, the client address and configuration information reside in centralized address-assignment pools, which are managed independently of the DHCP local server and which can be shared by different client applications.

The extended DHCP local server also supports advanced pool matching and the use of named address ranges. You can also configure the local server to use DHCP option 82 information in the client PDU to determine which named address range to use for a particular client. The client configuration information, which is configured in the address-assignment pool, includes user-defined options, such as boot server, grace period, and lease time.

Configuring the DHCP environment that includes the extended DHCP local server requires two independent configuration operations, which you can complete in any order. In one operation, you configure the extended DHCP local server on the router and specify how the DHCP local server determines which address-assignment pool to use. In the other operation, you configure the address-assignment pools used by the DHCP local server. The address-assignment pools contain the IP addresses, named address ranges, and configuration information for DHCP clients. See *Address-Assignment Pool Configuration Overview* for details about creating and using address-assignment pools.

**NOTE:** The extended DHCP local server and the address-assignment pools used by the server must be configured in the same logical system and routing instance.

You cannot configure the extended DHCP local server and extended DHCP relay on the same interface.

To configure the extended DHCP local server on the router, include the **dhcp-local-server** statement at the **[edit system services]** hierarchy level:

```
[edit system services]
dhcp-local-server {
  authentication {
    password password-string;
    username-include {
```

```

circuit-type;
delimiter delimiter-character;
domain-name domain-name-string;
logical-system-name;
mac-address;
option-60;
option-82 <circuit-id> <remote-id>;
routing-instance-name;
user-prefix user-prefix-string;
}
}
group group-name {
  authentication {
    password password-string;
    username-include {
      circuit-type;
      delimiter delimiter-character;
      domain-name domain-name-string;
      logical-system-name;
      mac-address;
      option-60;
      option-82 <circuit-id> <remote-id>;
      routing-instance-name;
      user-prefix user-prefix-string;
    }
  }
  interface interface-name <upto upto-interface-name> <exclude>;
}
pool-match-order {
  ip-address-first;
  option-82;
}
}
}

```

You can also include these statements at the following hierarchy levels:

- [edit logical-systems *logical-system-name* system services]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* system services]
- [edit routing-instances *routing-instance-name* system services]

In addition, you can configure tracing for DHCP local server operations by including the **traceoptions** statement at the [edit system processes dhcp-service] hierarchy level:

```

[edit system processes]
traceoptions {
  file filename <files number> <match regular-expression> <size maximum-file-size>
    <world-readable | no-world-readable>;
  flag flag;
  level (all | error | info | notice | verbose | warning);
  no-remote-trace;
}

```

## Interaction Among the DHCP Client, Extended DHCP Local Server, and Address-Assignment Pools

In a typical carrier edge network configuration, the DHCP client is on the subscriber's computer, and the DHCP local server is configured on the router. The following steps provide a high-level description of the interaction among the DHCP local server, DHCP client, and address-assignment pools:

1. The DHCP client sends a discover packet to one or more DHCP local servers in the network to obtain configuration parameters and an IP address for the subscriber.
2. Each DHCP local server that receives the discover packet then searches its address-assignment pool for the client address and configuration options. Each local server creates an entry in its internal client table to keep track of the client state, then sends a DHCP offer packet to the client.
3. On receipt of the offer packet, the DHCP client selects the DHCP local server from which to obtain configuration information and sends a request packet indicating the DHCP local server that will grant the address and configuration information.
4. The selected DHCP local server sends an acknowledgement packet to the client that contains the client address lease and configuration parameters. The server also installs the host route and ARP entry, and then monitors the lease state.

## Extended DHCP Local Server and Address-Assignment Pools

The extended DHCP local server enhances traditional DHCP server operation in which the client address pool and client configuration information reside on the DHCP server. With the extended DHCP local server, the client address and configuration information reside in centralized address-assignment pools, which are managed independently of the DHCP local server and which can be shared by different client applications.

The extended DHCP local server also supports advanced pool matching and the use of named address ranges. You can also configure the local server to use DHCP option 82 information in the client PDU to determine which named address range to use for a particular client. The client configuration information, which is configured in the address-assignment pool, includes user-defined options, such as boot server, grace period, and lease time.

Configuring the DHCP environment that includes the extended DHCP local server requires two independent configuration operations, which you can complete in any order. In one operation, you configure the extended DHCP local server on the router and specify how the DHCP local server determines which address-assignment pool to use. In the other operation, you configure the address-assignment pools used by the DHCP local server. The address-assignment pools contain the IP addresses, named address ranges, and configuration information for DHCP clients. See *Address-Assignment Pool Configuration Overview* for details about creating and using address-assignment pools.

**NOTE:** The extended DHCP local server and the address-assignment pools used by the server must be configured in the same logical system and routing instance.

## Methods Used by the Extended DHCP Local Server to Determine Which Address-Assignment Pool to Use

You can specify the method that the extended DHCP local server uses to determine which address-assignment pool provides the IP address and configuration for a DHCP client. By default, the server matches the IP address in the client DHCP request to the address of the address-assignment pool.

The following sections describe the methods used by the DHCP local server to determine which address-assignment pool to use:

- [Matching the Client IP Address to the Address-Assignment Pool on page 476](#)
- [Matching Option 82 Information to Named Address Ranges on page 476](#)

### Matching the Client IP Address to the Address-Assignment Pool

---

In the default configuration, the server selects the address-assignment pool to use by matching the IP address in the client DHCP request with the network address of the address-assignment pool. If the client request contains the gateway IP address (giaddr), the local server matches the giaddr to the address-assignment pool's address. If there is no giaddr in the request, the DHCP local server matches the IP address of the receiving interface to the address of the address-assignment pool.

### Matching Option 82 Information to Named Address Ranges

---

You can also configure the extended DHCP local server to match the DHCP relay agent information option (option 82) in the client DHCP packets to a named range in the address-assignment pool used for the client. Named ranges are subsets within the overall address-assignment pool address range, and are configured when you create the address-assignment pool. To use the DHCP local server option 82 matching feature, you must ensure that the **option-82** statement is included in the **dhcp-attributes** statement for the address-assignment pool.

**NOTE:** To enable the option 82 matching method, you must first specify the **ip-address-first** statement in the **pool-match-order** statement, and then specify the **option-82** statement.

## Default Options Provided by the Extended DHCP Server for the DHCP Client

The extended DHCP local server provides a minimal configuration to the DHCP client if the client does not have DHCP option 55 configured. The server provides the subnet mask of the address-assignment pool that is selected for the client. In addition to the subnet mask, the server provides the following values to the client if the information is configured in the selected address-assignment pool:

- **router**—A router located on the client's subnet. This statement is the equivalent of DHCP option 3.
- **domain name**—The name of the domain in which the client searches for a DHCP server host. This is the default domain name that is appended to hostnames that are not fully qualified. This is equivalent to DHCP option 15.
- **domain name server**—A Domain Name System (DNS) name server that is available to the client to resolve hostname-to-client mappings. This is equivalent to DHCP option 6.

## Using External AAA Authentication Services to Authenticate DHCP Clients

Both the extended DHCP local server and the extended DHCP relay agent support the use of external AAA authentication services, such as RADIUS, to authenticate DHCP clients. When the extended DHCP local server or relay agent receives a discover PDU from a client, the extended DHCP application contacts the AAA server to authenticate the DHCP client. The extended DHCP application can obtain client addresses and DHCP configuration options from the external AAA authentication server.

**NOTE:** This topic uses the term extended DHCP application to refer to both the extended DHCP local server and the extended DHCP relay agent.

The external authentication feature also supports AAA directed logout. If the external AAA service supports a user logout directive, the extended DHCP application honors the logout and views it as if it was requested by a CLI management command. All of the client state information and allocated resources are deleted at logout. The extended DHCP application supports directed logout using the list of configured authentication servers you specify with the **authentication-server** statement at the **[edit access profile profile-name]** hierarchy level.

Tasks for configuring External AAA authentication services are:

1. [Configuring Authentication Support for an Extended DHCP Application on page 478](#)
2. [Grouping Interfaces with Common DHCP Configurations on page 479](#)
3. [Configuring Passwords for Usernames the DHCP Application Presents to the External AAA Authentication Service on page 480](#)
4. [Creating Unique Usernames the Extended DHCP Application Passes to the External AAA Authentication Service on page 480](#)

### Configuring Authentication Support for an Extended DHCP Application

---

To configure authentication support for an extended DHCP application, include the **authentication** statement at these hierarchy levels. You can configure either global authentication support or group-specific support.

You must configure the **username-include** statement to enable the use of authentication. The **password** statement is not required and does not cause DHCP to use authentication if the **username-include** statement is not included.

Extended DHCP local server hierarchies:

- [edit system services dhcp-local-server]
- [edit system services dhcp-local-server group *group-name*]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* system services dhcp-local-server]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* system services dhcp-local-server group *group-name*]
- [edit logical-systems *logical-system-name* system services dhcp-local-server]
- [edit logical-systems *logical-system-name* system services dhcp-local-server group *group-name*]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* system services dhcp-local-server]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* system services dhcp-local-server group *group-name*]
- [edit routing-instances *routing-instance-name* system services dhcp-local-server]
- [edit routing-instances *routing-instance-name* system services dhcp-local-server group *group-name*]

Extended DHCP relay agent hierarchies:

- [edit forwarding-options dhcp-relay]
- [edit forwarding-options dhcp-relay group *group-name*]
- [edit logical-systems *logical-system-name* forwarding-options dhcp-relay]
- [edit logical-systems *logical-system-name* forwarding-options dhcp-relay group *group-name*]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* forwarding-options dhcp-relay]
- [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* forwarding-options dhcp-relay group *group-name*]

- [edit routing-instances *routing-instance-name* forwarding-options dhcp-relay]
- [edit routing-instances *routing-instance-name* forwarding-options dhcp-relay group *group-name*]

```
authentication {
  password password-string;
  username-include {
    circuit-type;
    delimiter delimiter-character;
    domain-name domain-name-string;
    logical-system-name;
    mac-address;
    option-60;
    option-82 <circuit-id> <remote-id>;
    routing-instance-name;
    user-prefix user-prefix-string;
  }
}
```

### Grouping Interfaces with Common DHCP Configurations

The extended DHCP applications enable you to group together a set of interfaces and apply a common DHCP configuration to the named interface group.

To configure an interface group, use the **group** statement.

```
group group-name {
  authentication {
    password password-string;
    username-include {
      circuit-type;
      delimiter delimiter-character;
      domain-name domain-name-string;
      logical-system-name;
      mac-address;
      option-60;
      option-82 <circuit-id> <remote-id>;
      routing-instance-name;
      user-prefix user-prefix-string;
    }
  }
  interface interface-name <upto upto-interface-name> <exclude>;
}
```

You can specify the names of one or more interfaces on which the extended DHCP application is enabled. You can repeat the **interface interface-name** statement to specify multiple interfaces within a group, but you cannot specify the same interface in more than one group. For example:

```
group boston {
  interface 192.168.10.1;
  interface 192.168.15.5;
```

```
}
```

You can use the *upto* option to specify a range of interfaces on which the extended DHCP application is enabled. For example:

```
group quebec {  
  interface 192.168.10.1 upto 192.168.10.255;  
}
```

You can use the **exclude** option to exclude a specific interface or a specified range of interfaces from the group. For example:

```
group paris {  
  interface 192.168.100.1 exclude;  
  interface 192.168.100.100 upto 192.168.100.125 exclude;  
}
```

### Configuring Passwords for Usernames the DHCP Application Presents to the External AAA Authentication Service

---

You can configure an optional password that the extended DHCP application presents to the external AAA authentication service to authenticate the specified username.

To configure a password that authenticates the username, use the **password** statement. For example:

```
authentication {  
  password myPassword1234;  
}
```

### Creating Unique Usernames the Extended DHCP Application Passes to the External AAA Authentication Service

---

You can configure the extended DHCP application to include additional fields in the username passed to the external AAA authentication service when the DHCP client logs in. This additional information enables you to construct usernames that uniquely identify subscribers.

**NOTE:** No authentication is performed if you do not include a username in the authentication configuration; however, the IP address is provided by the local pool if it is configured.

To configure unique usernames, use the **username-include** statement. You can include any or all of the additional statements.

```
authentication {  
  username-include {  
    circuit-type;  
    delimiter delimiter-character;
```

```

domain-name domain-name-string;
logical-system-name;
mac-address;
option-60;
option-82 <circuit-id> <remote-id>;
routing-instance-name;
user-prefix user-prefix-string;
}

```

The following list describes the attributes that can be included as part of the username:

- **circuit-type**—The circuit type used by the DHCP client, for example **enet**.
- **delimiter**—The delimiter character that separates components that make up the concatenated username. The semicolon (;) is not supported as a delimiter character.
- **domain-name**—The client domain name as string. The router adds the @ delimiter to the username.
- **logical-system-name**—The name of the logical system, if the receiving interface is in a logical system.
- **mac-address**—The client MAC address, in a string of format *xxxx.xxxx.xxxx*.
- **option-60**—The portion of the option 60 payload that follows the length field.
- **option-82 <circuit-id> <remote-id>**—The specified contents of the option 82 payload.
  - **circuit-id**—The payload of the agent circuit ID suboption.
  - **remote-id**—The payload of the Agent Remote ID suboption.
  - Both **circuit-id** and **remote-id**—The payloads of both suboptions, in the format: **circuit-id[delimiter]remote-id**.
  - Neither **circuit-id** or **remote-id**—The raw payload of the option 82 from the PDU is concatenated to the username.
- **routing-instance-name**—The name of the routing instance, if the receiving interface is in a routing instance.
- **user-prefix**—A string indicating the user prefix.

The router creates the unique username by including the specified additional information in the following order, with the fields separated by a delimiter. The default delimiter is a period (.). You can specify a different delimiter; however, the semicolon character (;) is not allowed.

```

user-prefix[delimiter]mac-address[delimiter]logical-system-name[delimiter]
routing-instance-name[delimiter]circuit-type[delimiter]option-82[delimiter]
option-60@domain-name

```

The following example shows a sample configuration that creates a unique username. The username is shown after the configuration.

```
authentication {
  username-include {
    circuit-type;
    domain-name isp55.com;
    mac-address;
    user-prefix wallybrown;
  }
}
```

The resulting unique username is:

```
wallybrown.0090.1a01.1234.enet@isp55.com
```

## Client Configuration Information Exchanged Between the External Authentication Server, DHCP Application, and DHCP Client

When the extended DHCP application receives a response from an external authentication server, the response might include information in addition to the IP address and subnet mask. The extended DHCP application uses the information from the authentication grant for the response the DHCP application sends to the DHCP client. The DHCP application can either send the information in its original form or the application might merge the information with local configuration specifications. For example, if the authentication grant includes an address pool name and a local configuration specifies DHCP attributes for that pool, the extended DHCP application merges the authentication results and the attributes in the reply that the server sends to the client.

A local configuration is optional—a client can be fully configured by the external authentication service. However, if the external authentication service does not provide client configuration, you must configure the local address assignment pool to provide the configuration for the client. When a local configuration specifies options, the extended DHCP application adds the local configuration options to the offer PDU the server sends to the client. If the two sets of options overlap, the options in the authentication response from the external service take precedence.

When you use RADIUS to provide the authentication, the additional information might be in the form of RADIUS attributes and Juniper Networks VSAs. The following list shows the information that RADIUS might include in the authentication grant. See *RADIUS Attributes and Juniper Networks VSAs Supported by the AAA Service Framework* for a complete list of RADIUS attributes and Juniper Networks VSAs that the extended DHCP applications supports for subscriber access management.

- Client IP address—RADIUS attribute 8, Framed-IP-Address
- Subnet mask for client IP address (DHCP option 1)—RADIUS attribute 9, Framed-IP-Netmask
- Primary domain server (DHCP option 6)—VSA 26-4, Primary-DNS
- Secondary domain server (DHCP option 6)—VSA 26-5 Secondary-DNS

- Primary WINS server (DHCP option 44)—VSA 26-6, Primary-WINS
- Secondary WINS server (DHCP option 44)—VSA 26-7, Secondary-WINS
- Address assignment pool name—RADIUS attribute 88, Framed-Pool
- Lease time—RADIUS attribute 27, Session-Timeout
- DHCP relay server—VSA 26-109, DHCP-Guided-Relay-Server

### Example: Configuring the Minimum Extended DHCP Local Server Configuration

The following example shows the minimum configuration you need to use the extended DHCP local server on the router:

This example creates the server group named **group\_one**, and specifies that the DHCP local server is enabled on interface **fe-0/0/2.0** within the group. The DHCP local server uses the default pool match configuration of **ip-address-first**.

```
[edit system services]
dhcp-local-server {
  group group_one {
    interface fe-0/0/2.0;
  }
}
```

### Example: Extended DHCP Local Server Configuration with Optional Pool Matching

The following example shows an extended DHCP local server configuration that includes optional pool matching and interface groups. This configuration specifies that the DHCP local server uses option 82 information to match the named address range for client IP address assignment. The option 82 matching must also be included in the address-assignment pool configuration.

```
[edit system services]
dhcp-local-server {
  group group_one {
    interface fe-0/0/2.0;
    interface fe-0/0/2.1;
  }
  group group_two {
    interface fe-0/0/3.0;
    interface fe-0/0/3.1;
  }
  pool-match-order {
    ip-address-first;
    option-82;
  }
}
```

### Tracing Extended DHCP Local Server Operations

The extended DHCP tracing operations track the extended DHCP local server operations and record them in a log file. By default, no extended DHCP local server processes are

traced. If you include the **traceoptions** statement at the **[edit system processes dhcp-service]** hierarchy level, the default tracing behavior is the following:

- Important extended DHCP local server events are logged in a file called **jdhcpd** located in the **/var/log** directory.
- When the file **jdhcpd** reaches 128 kilobytes (KB), it is renamed **jdhcpd.0**, then **jdhcpd.1**, and so on, until there are three trace files. Then the oldest trace file (**jdhcpd.2**) is overwritten. For more information about how log files are created, see the *Junos System Log Messages Reference*.
- Log files can be accessed only by the user who configures the tracing operation.

**NOTE:** In software releases earlier than Junos OS 11.4, you configured tracing statements at the **[edit system services dhcp-local-server]** and **[edit forwarding-options dhcp-relay]** hierarchy levels. Starting in Junos OS Release 11.4, these statements have been deprecated and hidden in favor of a new statement at the **[edit system processes dhcp-service]** hierarchy level. The deprecated statements may be removed from a future release; we recommend that you transition to the new statement.

To trace DHCP local server operations, include the **traceoptions** statement at the **[edit system processes dhcp-service]** hierarchy level:

```
traceoptions {
  file filename <files number> <match regular-expression > <size maximum-file-size>
    <world-readable | no-world-readable>;
  flag flag;
  level (all | error | info | notice | verbose | warning);
  no-remote-trace;
}
```

The following topics describe the tracing operation configuration statements:

1. [Configuring the Filename of the Extended DHCP Local Server Processes Log on page 484](#)
2. [Configuring the Number and Size of Extended DHCP Local Server Processes Log Files on page 485](#)
3. [Configuring Access to the Log File on page 485](#)
4. [Configuring a Regular Expression for Lines to Be Logged on page 485](#)
5. [Configuring Trace Option Flags on page 486](#)

### Configuring the Filename of the Extended DHCP Local Server Processes Log

By default, the name of the file that records trace output is **jdhcpd**. You can specify a different name by including the **file** statement at the **[edit system processes dhcp-service traceoptions]** hierarchy level:

```
[edit system processes dhcp-service traceoptions]
file filename;
```

### Configuring the Number and Size of Extended DHCP Local Server Processes Log Files

By default, when the trace file reaches 128 kilobytes (KB) in size, it is renamed **jdhcpd.0**, then **jdhcpd.1**, and so on, until there are three trace files. Then the oldest trace file (**jdhcpd.2**) is overwritten.

You can configure the limits on the number and size of trace files by including the following statements at the **[edit system processes dhcp-service traceoptions]** hierarchy level:

```
[edit system processes dhcp-service traceoptions]
file filename files number size size;
```

For example, set the maximum file size to 2 MB, and the maximum number of files to 20. When the file that receives the output of the tracking operation (**jdhcpd**) reaches 2 MB, **jdhcpd** is renamed **jdhcpd.0**, and a new file called **jdhcpd** is created. When the new **jdhcpd** reaches 2 MB, **jdhcpd.0** is renamed **jdhcpd.1** and **filename** is renamed **jdhcpd.0**. This process repeats until there are 20 trace files. Then the oldest file (**jdhcpd.19**) is overwritten by the newest file (**jdhcpd.0**).

The number of files can be from 2 through 1000 files. The file size of each file can be from 10KB through 1 gigabyte (GB).

### Configuring Access to the Log File

By default, log files can be accessed only by the user who configures the tracing operation.

To specify that any user can read all log files, include the **file world-readable** statement at the **[edit system processes dhcp-service traceoptions]** hierarchy level:

```
[edit system processes dhcp-service traceoptions]
file filename world-readable;
```

To set the default behavior explicitly, include the **file no-world-readable** statement at the **[edit system processes dhcp-service traceoptions]** hierarchy level:

```
[edit system processes dhcp-service traceoptions]
file filename no-world readable;
```

### Configuring a Regular Expression for Lines to Be Logged

By default, the trace operations output includes all lines relevant to the logged events.

You can refine the output by including the **match** statement at the **[edit system processes dhcp-service traceoptions]** hierarchy level and specifying a regular expression (regex) to be matched:

```
[edit system processes dhcp-service traceoptions]
file filename match regex;
```

### Configuring Trace Option Flags

---

By default, only important events are logged. You can configure the trace operations to be logged by including extended DHCP local server tracing flags at the **[edit system processes dhcp-service traceoptions]** hierarchy level:

```
[edit system processes dhcp-service traceoptions]  
flag flag;
```

You can configure the following tracing flags:

- **all**—Trace all operations.
- **auth**—Trace authentication operations.
- **database**—Trace database events.
- **fwd**—Trace firewall process events.
- **general**—Trace miscellaneous events.
- **ha**—Trace high availability-related events.
- **interface**—Trace interface operations.
- **io**—Trace I/O operations.
- **packet**—Trace packet decoding operations.
- **performance**—Trace performance measurement operations.
- **profile**—Trace profile operations.
- **rpd**—Trace routing protocol process events.
- **rtsock**—Trace routing socket operations.
- **session-db**—Trace session database operations.
- **state**—Trace changes in state.
- **statistics**—Trace baseline statistics.
- **ui**—Trace user interface operations.

## DHCP for Switches

---

A Dynamic Host Configuration Protocol (DHCP) server provides a framework to pass configuration information to client hosts on a TCP/IP network. A switch acting as a DHCP server can dynamically allocate IP addresses and other configuration parameters, minimizing the overhead that is required to add clients to the network. You can configure a switch either as a DHCP server or as a DHCP relay server, but not both. For more information, read this topic.

## Understanding DHCP Services for Switches

A Dynamic Host Configuration Protocol (DHCP) server on a switch can provide many valuable TCP/IP network services. For example, DHCP can dynamically allocate the four required IP parameters to each computer on the LAN: IP address, network mask, switch address, and name server address. Additionally, DHCP on the switch can automatically upgrade software on client systems.

This topic describes:

- [DHCP Client/Server Model on page 488](#)
- [Using DHCP on page 489](#)
- [DHCP Relay Servers and DHCP Servers on page 489](#)
- [Legacy DHCP and Extended DHCP for Server Versions on page 489](#)
- [Configuring DHCP on a Switch on page 490](#)
- [How DHCP Works on page 490](#)

### DHCP Client/Server Model

DHCP IP address allocation works on a client/server model in which the server, in this case a switch, assigns the client reusable IP information from an address pool. A DHCP client might receive offer messages from multiple DHCP servers and can accept any one of the offers; however, the client usually accepts the first offer it receives. See [Figure 30 on page 488](#).

*Figure 30: DHCP Client/Server Model*

g041177

---

## Using DHCP

DHCP automates network-parameter assignment to network devices. Even in small networks, DHCP is useful because it makes it easy to add new machines to the network.

DHCP access service minimizes the overhead required to add clients to the network by providing a centralized, server-based setup, which means that you do not have to manually create and maintain IP address assignments for clients. In addition, when you use DHCP to manage a pool of IP addresses among hosts, you reduce the number of IP addresses needed on the network. DHCP does this by leasing an IP address to a host for a limited period of time, allowing the DHCP server to share a limited number of IP addresses. DHCP also provides a central database of devices that are connected to the network and eliminates duplicate resource assignments. In addition to IP addresses for clients, DHCP provides other configuration information, particularly the IP addresses of local caching Domain Name System (DNS) resolvers, network boot servers, or other service hosts.

Another valuable DHCP feature is automatic software download for installation of software packages on switches. DHCP clients configured for automatic software download receive messages as part of the DHCP message exchange process—when the software package name in the DHCP server message is different from that of the software package that booted the DHCP client switch, the new software is downloaded and installed. See *Upgrading Software by Using Automatic Software Download for Switches*.

---

## DHCP Relay Servers and DHCP Servers

You can configure a switch either as a DHCP server or as a DHCP relay server, but not both. Whereas a DHCP server replies to a client with an IP address, a DHCP relay server relays DHCP messages to and from the configured DHCP server, even if the client and server are on different IP networks.

Configure a switch to be a DHCP relay agent if you have locally attached hosts and a remote DHCP server.

---

## Legacy DHCP and Extended DHCP for Server Versions

Two versions of both DHCP server and DHCP relay agent are available on EX Series, QFX Series, and OCX Series switches. The original legacy DHCP server and legacy DHCP relay agent can be used in the same network as the extended DHCP servers and extended DHCP relay agent—extended DHCP is also referred to as virtual router (VR) aware DHCP.

You cannot configure legacy DHCP and extended DHCP versions on the same switch. Because the newer extended DHCP server version has more features, we recommend that you configure the extended DHCP server if it is supported by the switch.

The extended DHCP server version has the following added features:

- Graceful Routing Engine switchover (GRES), which provides mirroring support for clients.
- Virtual routing and forwarding (VRF), which allows multiple instances of a routing table to simultaneously coexist on the same switch. For details, see *Understanding Virtual Routing Instances on EX Series Switches*.

**NOTE:** Legacy DHCP supports the circuit ID and the remote ID fields for the relay agent option (option 82). Extended DHCP for the relay agent option supports only circuit ID. See *EX Series Switch Software Features Overview* for a list of switches that support extended DHCP (VR-aware DHCP).

Legacy DHCP and extended DHCP servers can be configured at the hierarchy levels shown in [Table 40 on page 490](#):

**Table 40: Legacy DHCP and Extended DHCP Server Hierarchy Levels**

| DHCP Service               | Hierarchy                                           |
|----------------------------|-----------------------------------------------------|
| Extended DHCP server       | <code>edit system services dhcp-local-server</code> |
| Extended DHCP address pool | <code>edit access address-assignment pool</code>    |
| Legacy DHCP server         | <code>edit system services dhcp</code>              |
| Legacy DHCP relay          | <code>edit forwarding-options helpers bootp</code>  |
| Extended DHCP relay        | <code>edit forwarding-options dhcp-relay</code>     |
| Legacy DHCP address pool   | <code>edit system services dhcp pool</code>         |

DHCP clients on a switch are always configured at the hierarchy level `[edit interfaces interface-name family dhcp]`.

### Configuring DHCP on a Switch

A DHCP configuration consists of two parts: the configuration for a DHCP server and the configuration for DHCP clients. The DHCP server configuration is simple if you accept the default configurations.

When you configure a legacy DHCP server, you only need to define the DHCP server name and the interface on the switch. You can use the default configuration for the rest of the settings. When you configure an extended DHCP server, you need to only define a DHCP pool, indicate IP addresses for the pool, and create a server group. You can use the default configuration for the rest of the settings.

For directions for configuring either a legacy DHCP server or an extended DHCP server, see [“Configuring a DHCP Server on Switches \(CLI Procedure\)” on page 494](#).

To configure a DHCP client, set the client’s DHCP interface address in the `[edit interfaces interface-name unit 0 family inet dhcp]` hierarchy. For directions for configuring a DHCP client on a switch, see [“Configuring a DHCP Client \(CLI Procedure\)” on page 497](#).

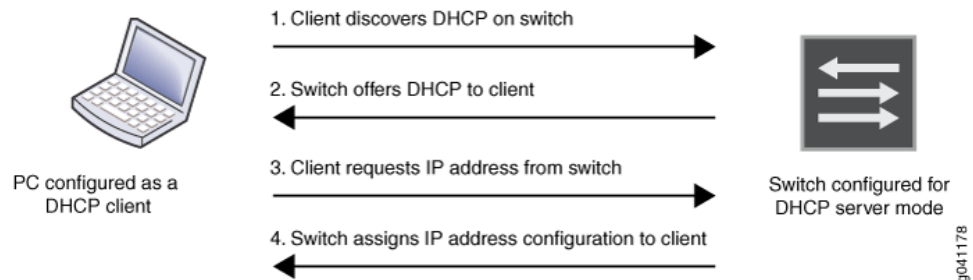

### How DHCP Works

DHCP consists of a four-step transfer process beginning with a broadcast DHCP discovery message from the client. As the second step, the client receives a DHCP offer message

from the server. This message includes the IP address and mask, and some other specific parameters. The client then sends a DHCP request message to accept the IP address and other parameters that it received from the server in the previous step. The DHCP server sends a DHCP response message and removes the now-allocated address from the DHCP address pool. See [Figure 31 on page 491](#).

*Figure 31: DHCP Four-Step Transfer*

**NOTE:** Because the DHCP discovery message from the client is a broadcast message and because broadcast messages cross other segments only when they are explicitly routed, you might have to configure a DHCP relay agent on the switch interface so that all DHCP discovery messages from the clients are forwarded to one DHCP server.

**See Also** • [Upgrading Software by Using Automatic Software Download for Switches](#)

## Configuring a Switch as a DHCP Server (CLI Procedure)

**NOTE:** This topic applies to Junos OS for EX Series switches and QFX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [“Configuring a DHCP Server on Switches \(CLI Procedure\)” on page 494](#). For ELS details, see [Using the Enhanced Layer 2 Software CLI](#).

A Dynamic Host Configuration Protocol (DHCP) server provides a framework to pass configuration information to client hosts on a TCP/IP network. A switch acting as a DHCP server can dynamically allocate IP addresses and other configuration parameters, minimizing the overhead that is required to add clients to the network.

A DHCP configuration consists of two components—an optional reconfiguration of default settings on DHCP clients and the configuration of a DHCP server. This topic covers configuration of the switch as a local DHCP server using DHCP for IPv4 (DHCPv4). For information about DHCPv6 local server, see [“DHCPv6 Local Server Overview” on page 519](#).

This topic describes the following task:

1. [Configuring the Switch as a Local DHCP Server on page 492](#)

## Configuring the Switch as a Local DHCP Server

To configure a switch as a local DHCP server, you must configure a DHCP address pool and indicate IP addresses for the pool. The switch, operating as the DHCP server, dynamically distributes the IP addresses from this pool. The switch can dynamically assign additional configuration parameters, such as default gateway, to provide the client with information about the network.

Multiple address pools can be configured for a DHCP server. DHCP maintains the state information about all configured pools. Clients are assigned addresses from pools with subnets that match the interface on which the DHCPDISCOVER packet sent by the client is received on the server. When more than one pool exists on the same interface, addresses are assigned on a rotating basis from all available pools.

You must ensure that you do not assign addresses that are already in use in the network to the address pools. The DHCP server does not check whether the addresses are already in use in the network before it assigns them to clients.

1. Configure a Layer 3 interface with an IP address on which the DHCP server will be reachable:

```
[edit]
user@switch# set interfaces interface-name unit unit-number family family address
address/prefix-length
user@switch# set vlans vlan-name vlan-id vlan-id
user@switch# set vlans vlan-name l3-interface l3-interface
user@switch# set interfaces l3-interface family family address address/prefix-length
```

For example:

```
[edit]
user@switch# set interfaces ge-0/0/1 unit 0 family inet address 192.0.2.1/24
user@switch# set vlans server vlan-id 301
user@switch# set vlans server l3-interface irb.301
user@switch# set interfaces irb.301 family inet address 192.0.2.2/24
```

2. Configure the DHCP server for the Layer 3 interface:

```
[edit]
user@switch# set system services dhcp-local-server group-name interface
interface-name
```

For example:

```
[edit]
user@switch# set system services dhcp-local-server group server1 interface ge-0/0/1
user@switch# set system services dhcp-local-server group server1 interface irb.301
```

3. Create an address pool for IPv4 addresses that can be assigned to clients. The addresses in the pool must be on the subnet in which the DHCP clients reside. Do not include addresses that are already in use on the network.

```
[edit]
user@switch# set access address-assignment pool pool-name family family network
address/prefix-length
```

For example:

```
[edit]
user@switch# set access address-assignment pool pool1 family inet network
198.51.100.0/24
```

4. (Optional) Define a range of addresses in the address-assignment pool. The range is a subset of addresses within the pool that can be assigned to clients. If no range is specified, then all addresses within the pool are available for assignment. Configure the name of the range and the lower and upper boundaries of the addresses in the range:

```
[edit]
user@switch# set access address-assignment pool pool-name family family range
range-name low low-IP-address
user@switch# set access address-assignment pool pool-name family family range
range-name high high-IP-address
```

For example:

```
[edit]
user@switch# set access address-assignment pool pool1 family inet range range1 low
198.51.100.1
user@switch# set access address-assignment pool pool1 family inet range range1 high
198.51.100.2
```

5. (Optional) Configure one or more routers as the default gateway on the client's subnet:

```
[edit]
user@switch# set access address-assignment pool pool-name family family
dhcp-attributes router gateway-ip-address
```

For example:

```
[edit]
user@switch# set access address-assignment pool pool1 family inet dhcp-attributes
router 198.1.1.254
```

6. (Optional) Configure the IP address that is used as the source address for the DHCP server in messages exchanged with the client. Clients use this information to distinguish between lease offers.

```
[edit]
user@switch# set access address-assignment pool pool-name family family
dhcp-attributes server-identifier ip-address
```

For example:

```
[edit]
user@switch# set access address-assignment pool pool1 family inet dhcp-attributes
server-identifier 198.51.100.254
```

7. (Optional) Specify the maximum time period, in seconds, that a client holds the lease for an assigned IP address if the client does not renew the lease:

```
[edit]
user@switch# set access address-assignment pool pool-name family family
dhcp-attributes maximum-lease-time seconds
```

For example:

```
[edit]
user@switch# set access address-assignment pool pool1 family inet dhcp-attributes
maximum-lease-time 43,200
```

8. (Optional) Specify user-defined options to be included in DHCP packets:

```
[edit]
user@switch# set access address-assignment pool pool-name family family
dhcp-attributes option option-id-number option-type option-value
```

For example:

```
[edit]
user@switch# set access address-assignment pool pool1 family inet dhcp-attributes
option 98 string test98
```

## Configuring a DHCP Server on Switches (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches that does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see [“Configuring a Switch as a DHCP Server \(CLI Procedure\)” on page 491](#). For ELS details, see *Using the Enhanced Layer 2 Software CLI*.

A Dynamic Host Configuration Protocol (DHCP) server can provide two valuable TCP/IP network services. DHCP can dynamically allocate IP parameters, such as an IP address, to clients and it can also deliver software upgrades to clients.

A DHCP configuration consists of two components—an optional reconfiguration of default settings on DHCP clients and the configuration of a DHCP server. This topic covers configuration of the DHCP server. For information about reconfiguring a DHCP client, see [“Configuring a DHCP Client \(CLI Procedure\)” on page 497](#).

You can configure either of two versions of a DHCP server on a switch— the extended server version or the legacy server version. We recommend that you configure the extended server unless you need to keep your DHCP server configuration backward-compatible with the legacy server version.

This topic includes the following tasks:

1. [Configuring an Extended DHCP Server on a Switch on page 495](#)
2. [Configuring a Legacy DHCP Server on a Switch \(CLI Procedure\) on page 496](#)

### Configuring an Extended DHCP Server on a Switch

To configure an extended DHCP server, you must configure a DHCP pool, indicate IP addresses for the pool, and create a server group. Additional configurations are optional.

Do not assign addresses that are already in use in the network to address pools. The extended DHCP server does not check whether addresses are already in use before it assigns them to clients.

1. Create an address pool for DHCP IP addresses:

```
[edit]
user@switch# set access address-pool address-pool
```

2. Configure an address-assignment pool that can be used by different client applications for DHCP dynamic assignment:

```
[edit access address-assignment]
user@switch# set pool address-pool-name
```

3. Create a server group on the switch, providing a group name and an interface name for DHCP:

```
[edit system services dhcp-local-server]
user@switch# set group group-name interface interface-name
```

4. (Optional) Process the information protocol data units (PDUs):

```
[edit system services dhcp-local-server]
user@switch# set overrides process-inform
```

5. (Optional) Redefine the order of attribute matching for pool selection:

```
[edit system services dhcp-local-server]
user@switch# set pool-match-order ip-address-first
```

6. (Optional) Enable dynamic reconfiguration triggered by the DHCP extended server for all DHCP clients or only for the DHCP clients serviced by the specified group of interfaces:

```
[edit system services dhcp-local-server]
user@switch# set reconfigure
```

```
[edit system services dhcp-local-server group group-name]
user@switch# set reconfigure
```

### Configuring a Legacy DHCP Server on a Switch (CLI Procedure)

---

To configure a legacy DHCP server, you must configure a pool of IP addresses for dynamic assignment. You only need to supply a series of network addresses. Additional configurations are optional.

1. Configure a pool of IP addresses for dynamic assignment:

```
[edit system services dhcp]
user@switch# set pool network-range
```

**NOTE:** Step 2 through Step 15 are for assigning global values at the [edit system services dhcp] hierarchy level. You can also assign the same values to a specific pool by using those same commands at the [edit system services dhcp pool *network-range*] hierarchy level.

2. (Optional) Change the domain search list used to resolve hostnames:

```
[edit system services dhcp]
user@switch# set domain-search [ domain-list ]
```

3. (Optional) Change the domain name server (DNS) name that the DHCP server advertises to clients:

```
[edit system services dhcp]
user@switch# set name-server address
```

4. (Optional) Change the DHCP options:

```
[edit system services dhcp]
user@switch# set option id-number
```

5. (Optional) Change the devices advertised to clients:

```
[edit system services dhcp]
user@switch# set router address
```

6. (Optional) Configure the name of the boot server advertised to DHCP clients. The client uses a boot file located on the boot server to complete the DHCP setup. This configuration step is equivalent to DHCP Option 66:

```
[edit system services dhcp]
user@switch# set boot-server (address | hostname)
```

7. (Optional) Set the boot file advertised to DHCP clients. After the client receives an IP address and the boot file location from the DHCP server, the client uses the boot image stored in the boot file to complete DHCP setup. This configuration step is equivalent to DHCP Option 67:

```
[edit system services dhcp]
user@switch# set boot-file filename
```

8. (Optional) Change the SIP server:

```
[edit system services dhcp]
user@switch# set sip-server addresses-or-names
```

For more information, see [“Configuring a DHCP SIP Server \(CLI Procedure\)” on page 498](#).

9. (Optional) Change the DHCP client's hardware address:

```
[edit system services dhcp]
user@switch# set static-binding mac-address
```

10. (Optional) Change the NetBIOS name server:

```
[edit system services dhcp]
user@switch# set wins-server address
```

## Configuring a DHCP Client (CLI Procedure)

A Dynamic Host Configuration Protocol (DHCP) server can provide many valuable TCP/IP network services. DHCP can dynamically allocate IP parameters, such as an IP address, to clients, and it can also deliver software upgrades to clients.

DHCP configuration consists of two components, configuration of DHCP clients and configuration of a DHCP server. Client configuration determines how clients send a message requesting an IP address, whereas a DHCP server configuration enables the server to send an IP address configuration back to the client. This topic describes configuring a DHCP client. For directions for configuring a DHCP server, see [“Configuring a DHCP Server on Switches \(CLI Procedure\)” on page 494](#) or [“Configuring a Switch as a DHCP Server \(CLI Procedure\)” on page 491](#).

You can change DHCP client configurations from the switch, using client identifiers to indicate which clients you want to configure.

To configure a DHCP client, you configure an interface to belong to the DHCP family and specify additional attributes, as desired:

```
[edit]
user@switch# set interfaces interface-name unit number family inet dhcp
configuration-statement
```

**NOTE:** Starting in Junos OS Release 18.1R1, DHCPv4 and DHCPv6 clients are supported on management interfaces (fxp0 and em0) configured in the non-default management routing instance, `mgmt_junos`.

The options that you can configure are listed in [Table 41 on page 498](#). Replace the variable *configuration-statement* with one or more of the statements listed in this table. If you do not explicitly configure these options, the switch uses default values for them.

**Table 41: DHCP Client Settings**

| Configuration Statement              | Description                                                                                                                                                                                                                                             |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>client-identifier</code>       | Unique client ID—By default this consists of the hardware type (01 for Ethernet) and the MAC address (a.b.c.d). For this example, the value would be 01abcd.                                                                                            |
| <code>lease-time</code>              | Time in seconds that a client holds the lease for an IP address assigned by a DHCP server. If a client does not request a specific lease time, then the server sends the default lease time. The default lease time on a Junos OS DHCP server is 1 day. |
| <code>retransmission-attempt</code>  | Number of times the client attempts to retransmit a DHCP packet.                                                                                                                                                                                        |
| <code>retransmission-interval</code> | Time between transmission attempts.                                                                                                                                                                                                                     |
| <code>server-address</code>          | IP address of the server that the client queries for an IP address.                                                                                                                                                                                     |
| <code>update-server</code>           | TCP/IP settings learned from an external DHCP server to the DHCP server running on the switch are propagated.                                                                                                                                           |
| <code>vendor-option</code>           | Vendor class ID (CPU's manufacturer ID string) for the DHCP client.                                                                                                                                                                                     |

## Configuring a DHCP SIP Server (CLI Procedure)

You can use the `sip-server` statement on the EX Series switch to configure option 120 on a DHCP server. The DHCP server sends configured option values—Session Initiation Protocol (SIP) server addresses or names—to DHCP clients when they request them. Previously, you were only allowed to specify a SIP server by address using `[edit system services dhcp option 120]`. You specify either an IPv4 address or a fully qualified domain name to be used by SIP clients to locate a SIP server. You cannot specify both an address and name in the same statement.

To configure a SIP server using the `address` option:

```
[edit system services dhcp]
```

```
user@switch# set sip-server address
```

For example, to configure one address:

```
[edit system services dhcp]
user@switch set sip-server 192.168.0.11
```

To configure a SIP server using the *name* option:

```
[edit system services dhcp]
user@switch# set sip-server name
```

For example, to configure a name:

```
[edit system services dhcp]
user@switch set sip-server abc.example.com
```

## DHCP and BOOTP Relay Overview

You can configure a Juniper Networks switch to act as a Dynamic Host Configuration Protocol (DHCP) or Bootstrap Protocol (BOOTP) relay agent. This means that if the switch receives a broadcast DHCP or BOOTP request from a locally attached host (client), it relays the message to a specified DHCP or BOOTP server. You should configure the switch to be a DHCP/BOOTP relay agent if you have locally attached hosts and a distant DHCP or BOOTP server.

You can configure the switch to use the gateway IP address (*giaddr*) as the source IP address of the switch for relayed DHCP packets when the switch is used as the DHCP relay agent. For information on configuring this option, see the [source-address-giaddr](#) configuration statement.

You can also use smart DHCP relay, which enables you to configure alternative IP addresses for the gateway interface so that if the server fails to reply to the requests sent from the primary gateway address, the switch can resend the requests using the alternative gateway addresses. To use this feature, you must configure a Layer 3 interface, Layer 3 subinterface, or IRB interface with multiple IP addresses and configure that interface to be a relay agent.

**NOTE:** Because DHCP and BOOTP messages are broadcast and are not directed to a specific server, switch, or router, Juniper switches cannot function as both a DHCP server and a DHCP/BOOTP relay agent at the same time. The Junos operating system (Junos OS) generates a commit error if both options are configured at the same time, and the commit operation does not succeed until one of the options is removed.

## Configuring DHCP and BOOTP

You can configure a switch to act as a Dynamic Host Configuration Protocol (DHCP) and Bootstrap Protocol (BOOTP) server or DHCP relay agent. When a switch is a relay agent,

if a locally attached host issues a DHCP or BOOTP request as a broadcast message, the switch relays the message to a specified DHCP or BOOTP server. You should configure a switch to be a DHCP and BOOTP relay agent if you have locally attached hosts and a remote DHCP or BOOTP server.

**NOTE:** This task uses the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [“Configuring DHCP and BOOTP Relay” on page 500](#). For ELS details, see *Using the Enhanced Layer 2 Software CLI*.

To configure a switch to be a server, use the `dhcp-local-server` statement. To configure a switch to be a relay agent, use the `dhcp-relay` statement.

If you want to enable BOOTP support when the switch is configured to be a DHCP server, enter the following statement:

```
[edit system services dhcp-local-server]
user@switch# set overrides bootp-support
```

If you want to enable BOOTP support when the switch is configured to be a DHCP relay agent, enter the following statement:

```
[edit forwarding-options dhcp-relay]
user@switch# set overrides bootp-support
```

## Configuring DHCP and BOOTP Relay

You can configure the QFX Series to act as a Dynamic Host Configuration Protocol (DHCP) and Bootstrap Protocol (BOOTP) relay agent. This means that if a locally attached host can issue a DHCP or BOOTP request as a broadcast message and the switch relays the message to a specified DHCP or BOOTP server. You should configure a switch to be a DHCP and BOOTP relay agent if you have locally attached hosts and a remote DHCP or BOOTP server.

**NOTE:** This task uses a release of Junos OS that does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see [“Configuring DHCP and BOOTP” on page 499](#). For ELS details, see *Using the Enhanced Layer 2 Software CLI*.

If you configure a switch to be a DHCP relay agent, you can also enable smart DHCP relay, which allows you to configure alternative gateway addresses for a DHCP server so that if the server fails to reply to the requests sent using the primary gateway address, the switch can resend the requests via the alternative gateway addresses. To use this feature, you must configure a routed VLAN interface or Layer 3 logical interface with multiple IP addresses and configure that interface to be a relay agent.

- [Configuring a DHCP and BOOTP Relay Agent on page 501](#)
- [Configuring DHCP Smart Relay on page 502](#)

### Configuring a DHCP and BOOTP Relay Agent

To configure a switch to act as a DHCP and BOOTP relay agent, include the **bootp** statement at the **[edit forwarding-options helpers]** hierarchy level:

```
[edit forwarding-options helpers]
bootp {
  apply-secondary-as-giaddr text-description;
  client-response-ttl number;
  description text-description;
  interface (interface-name | interface-group) {
    client-response-ttl number;
    description text-description;
    maximum-hop-count number;
    minimum-wait-time seconds;
    no-listen;
    server address
    apply-secondary-as-giaddr
  }
  maximum-hop-count number;
  minimum-wait-time seconds;
  relay-agent-option;
  server server-identifier
}
```

To include a description of the BOOTP service, DHCP service, or interface, use the **description** statement.

To configure a logical interface or a group of logical interfaces with a specific DHCP relay or BOOTP configuration, include the **interface** statement.

To stop packets from being forwarded, include the **no-listen** statement.

To set the maximum allowed number in the hops field of the BOOTP message, include the **maximum-hop-count** statement. BOOTP messages that have a larger number in the hops field than the maximum allowed are not forwarded. If you omit the **maximum-hop-count** statement, the default maximum number of hops is four.

To set the minimum allowed number of seconds in the **secs** field of the BOOTP message, include the **minimum-wait-time** statement. This setting configures a minimum number of seconds since the client sent its first BOOTP request. BOOTP messages that have a smaller number in the **secs** field than the allowed minimum are not forwarded. The default value for the minimum wait time is zero (0).

To set the IP address that specify the DHCP or BOOTP server for the router, switch, or interface, include the **server** statement. You can include multiple **server** statements.

To set an IP time-to-live (TTL) value for DHCP response packets sent to a DHCP client, include the **client-response-ttl** statement.

The following example demonstrates a BOOTP relay agent configuration.

```
user@host# show forwarding-options
helpers {
  bootp {
    description "dhcp relay agent global parameters";
    server 192.168.55.44;
    server 172.16.0.3 routing-instance c3;
    maximum-hop-count 10;
    minimum-wait-time 8;
    interface {
      xe-0/0/1 {
        description "use this info for this interface";
        server 10.10.10.10;
        server 192.168.14.14;
        maximum-hop-count 11;
        minimum-wait-time 3;
      }
      xe-0/0/2 {
        no-listen; ###ignore DHCPDISCOVER messages on this interface
      }
      all {
        description "globals apply to all other interfaces";
      }
    }
  }
}
```

### Configuring DHCP Smart Relay

You can use DHCP smart relay to provide redundancy and resiliency to your DHCP relay configuration. Smart relay provides additional relay functionality and requires all of the configuration settings required by DHCP relay. To use DHCP smart relay, you also need an interface with multiple IP addresses assigned to it. You can achieve this by doing either of the following tasks:

- Create a routed VLAN interface and assign at least two IP addresses to it. See *Configuring IRB Interfaces on Switches* and *Example: Configuring Routing Between VLANs on One Switch Using an IRB Interface* for information about this approach.
- Create a Layer 3 logical interface (by using VLAN tagging) and assign at least two IP addresses to it. See *Understanding Layer 3 Logical Interfaces* and *Configuring a Layer 3 Logical Interface* for information about this approach.

Once you have created an interface with multiple IP addresses, complete the smart relay configuration by entering one of the following statements:

- **set forwarding-options helpers bootp smart-relay-global:** Use this statement to enable smart relay on all the interfaces that are configured as relay agents.
- **set forwarding-options helpers bootp interface *interface-name* smart-relay-agent:** Use this statement to enable smart relay on a specific interface.

When smart relay is configured for an interface, the switch initially sends DHCP request (discover) messages out of that interface using the primary address of the interface as the gateway IP address (in the giaddr field) for the DHCP message. If no DHCP offer message is received from a server in reply, the switch allows the client to send as many as three more discover messages using the same gateway IP address. If no DHCP offer message is received after three retries, the switch resends the discover message using the alternate IP address as the gateway IP address. If you configure more than two IP addresses on the relay agent interface, the switch repeats this process until a DHCP offer message is received or all of the IP addresses have been used without success.

## Graceful Routing Engine Switchover for DHCP

For EX Series switches, only extended DHCP local server maintains the state of active DHCP client leases. The DHCP local server supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide subscriber authentication. You can configure dynamic profile and authentication support on a global basis or for a specific group of interfaces. The extended DHCP local server also supports the use of Junos address-assignment pools or external authorities, such as RADIUS, to provide the client address and configuration information.

For MX Series routers, the extended DHCP local server and the DHCP relay agent applications both maintain the state of active DHCP client leases in the session database. The extended DHCP application can recover this state if the DHCP process fails or is manually restarted, thus preventing the loss of active DHCP clients in either of these circumstances. However, the state of active DHCP client leases is lost if a power failure occurs or if the kernel stops operating (for example, when the router is reloaded) on a single Routing Engine.

You can enable graceful switchover support on both EX Series switches and MX Series routers. To enable graceful switchover support for the extended DHCP local server or extended DHCP relay agent on a switch, include the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level. To enable graceful Routing Engine switchover support on MX Series routers, include the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level. You cannot disable graceful Routing Engine switchover support for the extended DHCP application when the router is configured to support graceful Routing Engine switchover.

For more information about using graceful Routing Engine switchover, see *Understanding Graceful Routing Engine Switchover*.

## Centrally Configured Opaque DHCP Options

Subscriber management (on the routers) or DHCP management (on the switches) enables you to centrally configure DHCP options on a RADIUS server and then distribute the options on a per-subscriber or per DHCP-client basis. This method results in RADIUS-sourced DHCP options—the DHCP options originate at the RADIUS server and are sent to the subscriber (or DHCP client). This differs from the traditional client-sourced method (also called DHCP-sourced) of configuring DHCP options, in which the options originate at the client and are sent to the RADIUS server. The subscriber management (DHCP management) RADIUS-sourced DHCP options are also considered to be *opaque*, because DHCP local server performs minimal processing and error checking for the DHCP options string before passing the options to the subscriber (DHCP client).

Subscriber management (or DHCP management) uses Juniper Networks VSA 26-55 (DHCP-Options) to distribute the RADIUS-sourced DHCP options. The RADIUS server includes VSA 26-55 in the Access-Accept message that the server returns during subscriber authentication or DHCP client authentication. The RADIUS server sends the Access-Accept message to the RADIUS client, and then on to DHCP local server for return to the DHCP subscriber. The RADIUS server can include multiple instances of VSA 26-55 in a single Access-Accept message. The RADIUS client concatenates the multiple instances and uses the result as a single instance.

There is no CLI configuration required to enable subscriber management (DHCP management) to use the centrally configured DHCP options—the procedure is triggered by the presence of VSA 26-55 in the RADIUS Access-Accept message.

When building the offer packet for the DHCP client, DHCP local server uses the following sequence:

1. Processes any RADIUS-configured parameters that are passed as separate RADIUS attributes; for example, RADIUS attribute 27 (Session Timeout).
2. Processes any client-sourced parameters; for example, RADIUS attributes 53 (DHCP Message Type) and 54 (Server Identifier).
3. Appends (without performing any processing) the opaque DHCP options string contained in the VSA 26-55 received from the RADIUS server.

In addition to supporting central configuration of DHCP options directly on the RADIUS server (RADIUS-sourced options), subscriber management (DHCP management) also supports the traditional client-sourced options configuration, in which the router's (switch's) DHCP component sends the options to the RADIUS server. The client-sourced DHCP options method is supported for both DHCP local server and DHCP relay agent; however, the RADIUS-sourced central configuration method is supported on DHCP local server only. Both the RADIUS-sourced and client-sourced methods support DHCPv4 and DHCPv6 subscribers (clients).

**NOTE:** You can use the RADIUS-sourced and client-sourced methods simultaneously on DHCP local server. However, you must ensure that the central configuration method does not include options that override client-sourced DHCP options, because this can create unpredictable results.

- [Data Flow for RADIUS-Sourced DHCP Options on page 506](#)
- [Multiple VSA 26-55 Instances Configuration on page 507](#)
- [DHCP Options That Cannot Be Centrally Configured on page 507](#)

### Data Flow for RADIUS-Sourced DHCP Options

Figure 32 on page 506 shows the procedure subscriber management (DHCP management) uses when configuring DHCP options for subscribers (DHCP clients).

Figure 32: DHCP Options Data Flow

The following general sequence describes the data flow when subscriber management (DHCP management) uses RADIUS-sourced DHCP options and VSA 26-55 to configure a DHCP subscriber (client):

1. The subscriber (DHCP client) sends a DHCP discover message (or DHCPv6 solicit message) to the DHCP local server. The message includes client-sourced DHCP options.
2. The DHCP local server initiates authentication with the Junos OS RADIUS client.
3. The RADIUS client sends an Access-Request message on behalf of the subscriber (DHCP client) to the external RADIUS server. The message includes the subscriber's (DHCP client's) client-sourced DHCP options.
4. The external RADIUS server responds by sending an Access-Accept message to the RADIUS client. The Access-Accept message includes the RADIUS-sourced opaque DHCP options in VSA 26-55.
5. The RADIUS client sends the DHCP options string to DHCP local server. If there are multiple VSA 26-55 instances, the RADIUS client first assembles them into a single options string.
6. DHCP local server processes all options into the DHCP offer (or DHCPv6 reply) message, except for the RADIUS-sourced VSA 26-55 DHCP options. After processing

all other options, DHCP local server then appends the unmodified VSA 26-55 DHCP options to the message and sends the message to the subscriber (DHCP client).

7. The subscriber (DHCP client) is configured with the DHCP options.
8. The following operations occur after the subscriber (DHCP client) receives the DHCP options:
  - Accounting—The RADIUS client sends Acct-Start and Interim-Accounting requests to the RADIUS server, including the RADIUS-sourced DHCP options in VSA 26-55. By default, the DHCP options are included in accounting requests.
  - Renewal—When the subscriber (DHCP client) renews, the cached DHCP options value is returned in the DHCP renew (or DHCPv6 ACK) message. The originally assigned DHCP options cannot be modified during a renew cycle.
  - Logout—When the subscriber (DHCP client) logs out, the RADIUS client sends an Acct-Stop message to the RADIUS server, including the RADIUS-sourced VSA 26-55.

### Multiple VSA 26-55 Instances Configuration

VSA 26-55 supports a maximum size of 247 bytes. If your RADIUS-sourced DHCP options field is greater than 247 bytes, you must break the field up and manually configure multiple instances of VSA 26-55 for the RADIUS server to return. When using multiple instances for an options field, you must place the instances in the packet in the order in which the fragments are to be reassembled by the RADIUS client. The fragments can be of any size of 247 bytes or less.

**BEST PRACTICE:** For ease of configuration and management of your DHCP options, you might want to have one DHCP option per VSA 26-55 instance, regardless of the size of the option field.

When the RADIUS client returns a reassembled opaque options field in an accounting request to the RADIUS server, the client uses 247-byte fragments. If you had originally created instances of fewer than 247 bytes, the returned fragments might not be the same as you originally configured on the RADIUS server.

**NOTE:** If you are configuring Steel-Belted Radius (SBR) to support multiple VSA 26-55 instances, ensure that you specify VSA 26-55 with the RO flags in the Subscriber Management RADIUS dictionary file. The R value indicates a multivalued reply attribute and the O value indicates an ordered attribute.

### DHCP Options That Cannot Be Centrally Configured

Table 42 on page 508 shows the DHCP options that you must not centrally configure on the RADIUS server.

*Table 42: Unsupported Opaque DHCP Options*

| DHCP Option | Option Name            | Comments                                                    |
|-------------|------------------------|-------------------------------------------------------------|
| Option 0    | Pad Option             | Not supported.                                              |
| Option 51   | IP Address Lease Time  | Value is provided by RADIUS attribute 27 (Session-Timeout). |
| Option 52   | Option Overload        | Not supported.                                              |
| Option 53   | DHCP Message Type      | Value is provided by DHCP local server.                     |
| Option 54   | Server Identifier      | Value is provided by DHCP local server.                     |
| Option 55   | Parameter Request List | Value is provided by DHCP local server.                     |
| Option 255  | End                    | Value is provided by DHCP local server.                     |
| –           | DHCP magic cookie      | Not supported.                                              |

## Extended DHCP Local Server

The extended DHCP local server provides an IP address and other configuration information in response to a client request. Extended DHCP local server enhances traditional DHCP server operation by providing additional address assignment and client configuration functionality and flexibility in a subscriber-aware environment. For information, read this topic.

- [Extended DHCP Local Server Overview on page 509](#)
- [Example: Minimum Extended DHCP Local Server Configuration on page 514](#)
- [Disabling Automatic Binding of Stray DHCP Requests on page 514](#)
- [Configuring a Token for DHCP Local Server Authentication on page 516](#)
- [Configuring an Extended DHCP Relay Server on EX Series Switches \(CLI Procedure\) on page 517](#)
- [Verifying and Managing DHCP Local Server Configuration on page 518](#)

## Extended DHCP Local Server Overview

Junos OS includes an extended DHCP local server that enhances traditional DHCP server operation by providing additional address assignment and client configuration functionality and flexibility in a subscriber-aware environment. The extended DHCP local server enables service providers to take advantage of external address-assignment pools and integrated RADIUS-based configuration capabilities in addition to the continued support of traditional local address pools. The address-assignment pools are considered external because they are external to the DHCP local server. The pools are managed independently of the DHCP local server, and can be shared by different client applications, such as DHCP or PPPoE access. [Table 38 on page 469](#) provides a comparison of the extended DHCP local server and a traditional DHCP local server.

The extended DHCP local server provides an IP address and other configuration information in response to a client request. The server supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide DHCP client authentication. You can configure the dynamic profile and authentication support on a global basis or for a specific group of interfaces.

**Table 43: Comparing the Extended DHCP Local Server to the Traditional DHCP Local Server**

| Feature                                                                                                     | Extended DHCP Local Server | Traditional DHCP Local Server |
|-------------------------------------------------------------------------------------------------------------|----------------------------|-------------------------------|
| Local address pools                                                                                         | X                          | X                             |
| External, centrally-managed address pools                                                                   | X                          | —                             |
| Local configuration                                                                                         | X                          | X                             |
| External configuration using information from address-assignment pools or RADIUS servers                    | X                          | —                             |
| Dynamic-profile attachment                                                                                  | X                          | —                             |
| RADIUS-based subscriber authentication, and configuration using RADIUS attributes and Juniper Networks VSAs | X                          | —                             |
| IPv6 client support                                                                                         | X                          | —                             |
| Default minimum client configuration                                                                        | X                          | X                             |

You can also configure the extended DHCP local server to support IPv6 clients. Both DHCP local server and DHCPv6 local server support the specific address request feature, which enables you to assign a particular address to a client.

**NOTE:** If you delete the DHCP server configuration, DHCP server bindings might still remain. To ensure that DHCP bindings are removed, issue the `clear dhcp server binding` command before you delete the DHCP server configuration.

This overview covers:

- [Interaction Among the DHCP Client, Extended DHCP Local Server, and Address-Assignment Pools on page 511](#)
- [Providing DHCP Client Configuration Information on page 512](#)
- [Minimal Configuration for Clients on page 513](#)
- [DHCP Local Server and Address-Assignment Pools on page 513](#)

### **Interaction Among the DHCP Client, Extended DHCP Local Server, and Address-Assignment Pools**

The pattern of interaction between the DHCP local server, the DHCP client, and address-assignment pools is the same regardless of whether you are using a router or a switch. However, there are some differences in the details of usage.

- On routers—In a typical carrier edge network configuration, the DHCP client is on the subscriber's computer or customer premises equipment (CPE), and the DHCP local server is configured on the router.
- On switches—In a typical network configuration, the DHCP client is on an access device, such as a personal computer, and the DHCP local server is configured on the switch.

The following steps provide a high-level description of the interaction among the DHCP local server, DHCP client, and address-assignment pools:

1. The DHCP client sends a discover packet to one or more DHCP local servers in the network to obtain configuration parameters and an IP address for the subscriber (or DHCP client).
2. Each DHCP local server that receives the discover packet then searches its address-assignment pool for the client address and configuration options. Each local server creates an entry in its internal client table to keep track of the client state, then sends a DHCP offer packet to the client.
3. On receipt of the offer packet, the DHCP client selects the DHCP local server from which to obtain configuration information and sends a request packet indicating the DHCP local server selected to grant the address and configuration information.
4. The selected DHCP local server sends an acknowledgement packet to the client that contains the client address lease and configuration parameters. The server also installs the host route and ARP entry, and then monitors the lease state.

### Providing DHCP Client Configuration Information

When the extended DHCP application receives a response from an external authentication server, the response might include information in addition to the IP address and subnet mask. The extended DHCP application uses the information from the authentication grant for the response the DHCP application sends to the DHCP client. The DHCP application can either send the information in its original form or the application might merge the information with local configuration specifications. For example, if the authentication grant includes an address pool name and a local configuration specifies DHCP attributes for that pool (such as, DNS server address), the extended DHCP application merges the authentication results and the attributes in the reply that the server sends to the client.

A local configuration is optional — a client can be fully configured by the external authentication service. However, if the external authentication service does not provide client configuration, you might need to configure the local address-assignment pool to provide the configuration information, such as DNS server, for the client. When a local configuration specifies options, the extended DHCP application adds the local configuration options to the offer PDU the server sends to the client. If the two sets of options overlap, the options in the authentication response from the external service take precedence.

When you use RADIUS to provide the authentication, the additional information might be in the form of RADIUS attributes and Juniper Networks VSAs. [Table 39 on page 471](#) lists the information that RADIUS might include in the authentication grant. See *RADIUS Attributes and Juniper Networks VSAs Supported by the AAA Service Framework* for a complete list of RADIUS attributes and Juniper Networks VSAs that the extended DHCP applications supports for subscriber access management or DHCP management.

**Table 44: Information in Authentication Grant**

| Attribute Number          | Attribute Name    | Description                                       |
|---------------------------|-------------------|---------------------------------------------------|
| RADIUS attribute 8        | Framed-IP-Address | Client IP address                                 |
| RADIUS attribute 9        | Framed-IP-Netmask | Subnet mask for client IP address (DHCP option 1) |
| Juniper Networks VSA 26-4 | Primary-DNS       | Primary domain server (DHCP option 6)             |
| Juniper Networks VSA 26-5 | Secondary-DNS     | Secondary domain server (DHCP option 6)           |
| Juniper Networks VSA 26-6 | Primary-WINS      | Primary WINS server (DHCP option 44)              |
| Juniper Networks VSA 26-7 | Secondary-WINS    | Secondary WINS server (DHCP option 44)            |
| RADIUS attribute 27       | Session-Timeout   | Lease time                                        |

*Table 44: Information in Authentication Grant (continued)*

| Attribute Number            | Attribute Name           | Description                  |
|-----------------------------|--------------------------|------------------------------|
| RADIUS attribute 88         | Framed-Pool              | Address assignment pool name |
| Juniper Networks VSA 26-109 | DHCP-Guided-Relay-Server | DHCP relay server            |

### Minimal Configuration for Clients

The extended DHCP local server provides a minimal configuration to the DHCP client if the client does not have DHCP option 55 configured. The server provides the subnet mask of the address-assignment pool that is selected for the client. In addition to the subnet mask, the server provides the following values to the client if the information is configured in the selected address-assignment pool:

- **router**—A router located on the client's subnet. This statement is the equivalent of DHCP option 3.
- **domain name**—The name of the domain in which the client searches for a DHCP server host. This is the default domain name that is appended to hostnames that are not fully qualified. This is equivalent to DHCP option 15.
- **domain name server**—A Domain Name System (DNS) name server that is available to the client to resolve hostname-to-client mappings. This is equivalent to DHCP option 6.

### DHCP Local Server and Address-Assignment Pools

In the traditional DHCP server operation, the client address pool and client configuration information reside on the DHCP server. With the extended DHCP local server, the client address and configuration information reside in external address-assignment pools (external to the DHCP local server). The external address-assignment pools are managed by the **authd** process, independently of the DHCP local server, and can be shared by different client applications.

The extended DHCP local server also supports advanced pool matching and the use of named address ranges. You can also configure the local server to use DHCP option 82 information in the client PDU to determine which named address range to use for a particular client. The client configuration information, which is configured in the address-assignment pool, includes user-defined options, such as boot server, grace period, and lease time.

Configuring the DHCP environment that includes the extended DHCP local server requires two independent configuration operations, which you can complete in any order. In one operation, you configure the extended DHCP local server on the router and specify how the DHCP local server determines which address-assignment pool to use. In the other operation, you configure the address-assignment pools used by the DHCP local server. The address-assignment pools contain the IP addresses, named address ranges, and configuration information for DHCP clients.

**NOTE:** The extended DHCP local server and the address-assignment pools used by the server must be configured in the same logical system and routing instance.

---

### Example: Minimum Extended DHCP Local Server Configuration

This example shows the minimum configuration you need to use for the extended DHCP local server on the router or switch:

```
[edit system services]
dhcp-local-server {
  group group_one {
    interface fe-0/0/2.0;
  }
}
```

**NOTE:** The interface type in this topic is just an example. The **fe-** interface type is not supported by EX Series switches.

This example creates the server group named **group\_one**, and specifies that the DHCP local server is enabled on interface **fe-0/0/2.0** within the group. The DHCP local server uses the default pool match configuration of **ip-address-first**.

**NOTE:** If you delete the DHCP server configuration, DHCP server bindings might still remain. To ensure that DHCP bindings are removed, issue the **clear dhcp server binding** command before you delete the DHCP server configuration.

---

### Disabling Automatic Binding of Stray DHCP Requests

DHCP requests that are received but have no entry in the database are known as stray requests. By default, DHCP relay, DHCP relay proxy, and DHCPv6 relay agent attempt to bind the requesting client by creating a database entry and forwarding the request to the DHCP server. If the server responds with an ACK, the client is bound and the ACK is forwarded to the client. If the server responds with a NAK, the database entry is deleted and the NAK is forwarded to the client. This behavior occurs regardless of whether authentication is configured.

You can override the default configuration at the global level, for a named group of interfaces, or for a specific interface within a named group. Overriding the default causes DHCP relay, DHCP relay proxy, and DHCPv6 relay agent to drop all stray requests instead of attempting to bind the clients.

**NOTE:** Automatic binding of stray requests is enabled by default.

- To disable automatic binding behavior, include the **no-bind-on-request** statement when you configure DHCP overrides at the global, group, or interface level.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set no-bind-on-request
```

- To override the default behavior for DHCPv6 relay agent, configure the override at the **[edit forwarding-options dhcp-relay dhcpv6]** hierarchy level.

```
[edit forwarding-options dhcp-relay dhcpv6 overrides]
user@host# set no-bind-on-request
```

The following two examples show a configuration that disables automatic binding of stray requests for a group of interfaces and a configuration that disables automatic binding on a specific interface.

To disable automatic binding of stray requests on a group of interfaces:

1. Specify the named group.

```
[edit forwarding-options dhcp-relay]
user@host# edit group boston
```

2. Specify that you want to configure overrides.

```
[edit forwarding-options dhcp-relay group boston]
user@host# edit overrides
```

3. Disable automatic binding for the group.

```
[edit forwarding-options dhcp-relay group boston overrides]
user@host# set no-bind-on-request
```

To disable automatic binding of stray requests on a specific interface:

1. Specify the named group of which the interface is a member.

```
[edit forwarding-options dhcp-relay]
user@host# edit group boston
```

2. Specify the interface on which you want to disable automatic binding.

```
[edit forwarding-options dhcp-relay group boston]
user@host# edit interface fe-1/0/1.2
```

3. Specify that you want to configure overrides.

```
[edit forwarding-options dhcp-relay group boston interface fe-1/0/1.2]
```

```
user@host# edit overrides
```

4. Disable automatic binding on the interface.

```
[edit forwarding-options dhcp-relay group boston interface fe-1/0/1.2 overrides]  
user@host# set no-bind-on-request
```

## Configuring a Token for DHCP Local Server Authentication

You can configure an authentication token to provide rudimentary protection against inadvertently instantiated DHCP servers. You can configure the local server to include a constant, unencoded token in the DHCP forcerenew message as part of the authentication option it sends to clients. If the service provider has previously configured the DHCP client with a token, then the client can compare that token against the newly received token. If the tokens do not match, the DHCP client discards the forcerenew message. This functionality corresponds to RFC 3118, *Authentication for DHCP Messages*, section 4.

(Optional) To configure the DHCP local server to include a token in the forcerenew message sent to the client, for all clients:

- Specify the token.

For DHCPv4:

```
[edit system services dhcp-local-server reconfigure]  
user@host# set token token-value
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 reconfigure]  
user@host# set token token-value
```

(Optional) For only a particular group of clients:

- Specify the token.

For DHCPv4:

```
[edit system services dhcp-local-server group group-name reconfigure]  
user@host# set token token-value
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 group group-name reconfigure]  
user@host# set token token-value
```

## Configuring an Extended DHCP Relay Server on EX Series Switches (CLI Procedure)

You can configure an EX Series switch to act as an extended DHCP relay agent. This means that a locally attached host can issue a DHCP request as a broadcast message and the switch configured for DHCP relay relays the message to a specified DHCP server. Configure a switch to be a DHCP relay agent if you have locally attached hosts and a remote DHCP server.

Before you begin:

- Ensure that the switch can connect to the DHCP server.

To configure a switch to act as an extended DHCP relay agent server:

1. Create at least one DHCP server group, which is a group of 1 through 5 DHCP server IP addresses:

```
[edit forwarding-options dhcp-relay]
user@switch# set server-group server-group-name ip-address
```

2. Set the global active DHCP server group. The DHCP relay server relays DHCP client requests to the DHCP servers defined in the active server group:

```
[edit forwarding-options dhcp-relay]
user@switch# set active-server-group server-group-name
```

3. Create a DHCP relay group that includes at least one interface. DHCP relay runs on the interfaces defined in DHCP groups:

```
[edit forwarding-options dhcp-relay]
user@switch# set group group-name interface interface-name
```

4. (Optional) Configure overrides of default DHCP relay behaviors, at the global level. See the override options in the **overrides** statement.

```
[edit forwarding-options dhcp-relay]
user@switch# set overrides
```

5. (Optional) Configure DHCP relay to use the DHCP vendor class identifier option (option 60) in DHCP client packets, at the global level:

```
[edit forwarding-options dhcp-relay]
user@switch# set relay-option option-number 60
```

6. (Optional) Configure settings for a DHCP relay group that override the settings at the global level, using these statements:

```
[edit forwarding-options dhcp-relay group group-name]
user@switch# set active-server-group server-group-name
user@switch# set overrides
user@switch# set relay-option option-number 60
```

7. (Optional) Configure settings for a DHCP relay group interface that override the settings at the global and **group** levels, using these statements:

```
[edit forwarding-options dhcp-relay group group-name interface interface-name]
user@switch# exclude
user@switch# set overrides
user@switch# set trace
user@switch# set upto upto-interface-name
```

**See Also** • [Understanding the Extended DHCP Relay Agent for EX Series Switches](#)

## Verifying and Managing DHCP Local Server Configuration

**Purpose** View or clear information about client address bindings and statistics for the extended DHCP local server.

**NOTE:** If you delete the DHCP server configuration, DHCP server bindings might still remain. To ensure that DHCP bindings are removed, issue the `clear dhcp server binding` command before you delete the DHCP server configuration.

**Action** • To display the address bindings in the client table on the extended DHCP local server:

```
user@host> show dhcp server binding routing-instance customer routing instance
```

- To display extended DHCP local server statistics:

```
user@host> show dhcp server statistics routing-instance customer routing instance
```

- To clear the binding state of a DHCP client from the client table on the extended DHCP local server:

```
user@host> clear dhcp server binding routing-instance customer routing instance
```

- To clear all extended DHCP local server statistics:

```
user@host> clear dhcp server statistics routing-instance customer routing instance
```

## DHCPv6 Local Server

---

Junos OS device can act as a DHCPv6 server and allocates IP addresses to IPv6 clients. DHCPv6 server also delivers configuration settings to client hosts on a subnet or to the requesting devices that need an IPv6 prefix. The DHCPv6 local server sends and receives packets using the IPv6 protocol and informs IPv6 of the routing requirements of router clients. For more information, read this topic.

- [DHCPv6 Local Server Overview on page 519](#)
- [Specifying the Delegated Address Pool for IPv6 Prefix Assignment on page 520](#)
- [Preventing Binding of Clients That Do Not Support Reconfigure Messages on page 521](#)
- [Configuring DHCPv6 Rapid Commit \(MX, EX\) on page 521](#)
- [Verifying and Managing DHCPv6 Local Server Configuration on page 522](#)

### DHCPv6 Local Server Overview

The DHCPv6 local server is compatible with the DHCP local server and the DHCP relay agent, and can be enabled on the same interface as either the extended DHCP local server or DHCP relay agent.

The DHCPv6 local server provides many of the same features as the DHCP local server, including:

- Configuration for a specific interface or for a group of interfaces
- Site-specific usernames and passwords
- Numbered Ethernet interfaces
- Statically configured CoS and filters
- AAA directed login
- Use of the IA\_NA option to assign a specific address to a client

When a DHCPv6 client logs in, the DHCPv6 local server can optionally use the AAA service framework to interact with the RADIUS server. The RADIUS server, which is configured independently of DHCP, authenticates the client and supplies the IPv6 prefix and client configuration parameters.

The client username, which uniquely identifies a subscriber or a DHCP client, must be present in the configuration in order for DHCPv6 local server to use RADIUS authentication.

You can configure DHCPv6 local server to communicate the following attributes to the AAA service framework and RADIUS at login time:

- Client username
- Client password

Based on the attributes that the DHCPv6 local server provides, RADIUS returns the information listed in [Table 45 on page 520](#) to configure the client:

Table 45: RADIUS Attributes and VSAs for DHCPv6 Local Server

| Attribute Number | Attribute Name            | Description                                                        |
|------------------|---------------------------|--------------------------------------------------------------------|
| 27               | Session-Timeout           | Lease time, in seconds. If not supplied, the lease does not expire |
| 123              | Delegated-IPv6-Prefix     | Prefix that is delegated to the client                             |
| 26-143           | Max-Clients-Per-Interface | Maximum number of clients allowed per interface                    |

To configure the extended DHCPv6 local server on the router (or switch), you include the **dhcpv6** statement at the **[edit system services dhcp-local-server]** hierarchy level.

You can also include the **dhcpv6** statement at the following hierarchy levels:

- **[edit logical-systems *logical-system-name* system services dhcp-local-server]**
- **[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* system services dhcp-local-server]**
- **[edit routing-instances *routing-instance-name* system services dhcp-local-server]**

## Specifying the Delegated Address Pool for IPv6 Prefix Assignment

You can explicitly specify a delegated address pool:

- On routers—Subscriber management uses the pool to assign IPv6 prefixes for subscribers. You can specify the delegated address pool globally, for a specific group of interfaces, or for a particular interface.
- On switches—DHCP management uses the pool to assign IPv6 prefixes for DHCP clients. You can specify the delegated address pool globally, for a specific group of interfaces, or for a particular interface.

**NOTE:** You can also use by Juniper Networks VSA 26-161 to specify the delegated address pool. The VSA-specified value always takes precedence over the **delegated-address** statement.

To configure the delegated address pool for DHCPv6 local server:

1. Specify that you want to configure override options.

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit overrides
```

2. Configure the delegated address pool.

```
[edit system services dhcp-local-server dhcpv6 overrides]
user@host# set delegated-pool paris-cable-12
```

  - [Extended DHCP Local Server Overview on page 468](#)
  - [Extended DHCP Relay Agent Overview on page 524](#)

## Preventing Binding of Clients That Do Not Support Reconfigure Messages

The DHCPv6 client and server negotiate the use of reconfigure messages. When the client can accept reconfigure messages from the server, then the client includes the Reconfigure Accept option in both solicit and request messages sent to the server.

By default, the DHCPv6 server accepts solicit messages from clients regardless of whether they support reconfiguration. You can specify that the server require clients to accept reconfigure messages. In this case, the DHCPv6 server includes the Reconfigure Accept option in both advertise and reply messages when reconfiguration is configured for the client interface. Solicit messages from nonsupporting clients are discarded and the clients are not allowed to bind.

To configure the DHCPv6 local server to bind only clients that support client-initiated reconfiguration:

- Specify strict reconfiguration.

For all DHCPv6 clients:

```
[edit system services dhcp-local-server dhcpv6 reconfigure]
user@host# set strict
```

For only a particular group of DHCPv6 clients:

```
[edit system services dhcp-local-server dhcpv6 group group-name reconfigure]
user@host# set strict
```

The **show dhcpv6 server statistics** command displays a count of solicit messages that the server has discarded.

- See Also**
- [Configuring Dynamic Client Reconfiguration of Extended Local Server Clients Overview on page 568](#)
  - [Understanding Dynamic Reconfiguration of Extended DHCP Local Server Clients on page 565](#)

## Configuring DHCPv6 Rapid Commit (MX, EX)

You can configure the DHCPv6 local server to support the DHCPv6 Rapid Commit option (DHCPv6 option 14). When rapid commit is enabled, the server recognizes the Rapid

Commit option in Solicit messages sent from the DHCPv6 client. (DHCPv6 clients are configured separately to include the DHCPv6 Rapid Commit option in the Solicit messages.) The server and client then use a two-message exchange (Solicit and Reply) to configure clients, rather than the default four-message exchange (Solicit, Advertise, Request, and Reply). The two-message exchange provides faster client configuration, and is beneficial in environments in which networks are under a heavy load.

You can configure the DHCPv6 local server to support the Rapid Commit option globally, for a specific group, or for a specific interface. By default, rapid commit support is disabled on the DHCPv6 local server.

To configure the DHCPv6 local server to support the DHCPv6 Rapid Commit option:

1. Specify that you want to configure the **overrides** options:

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit overrides
```

2. Enable rapid commit support:

```
[edit system services dhcp-local-server dhcpv6 overrides]
user@host# set rapid-commit
```

## Verifying and Managing DHCPv6 Local Server Configuration

**Purpose** View or clear information about client address bindings and statistics for the DHCPv6 local server.

- Action** • To display the address bindings in the client table on the DHCPv6 local server:

```
user@host> show dhcpv6 server binding
```

- To display DHCPv6 local server statistics:

```
user@host> show dhcpv6 server statistics
```

- To clear all DHCPv6 local server statistics:

```
user@host> clear dhcpv6 server binding
```

- To clear all DHCPv6 local server statistics:

```
user@host> clear dhcpv6 server statistics
```

## Extended DHCP Relay Agent

A DHCP relay agent forwards DHCP request and reply packets between a DHCP client and a DHCP server. Extended DHCP local server enhances traditional DHCP relay agent operation.

## Extended DHCP Relay Agent Overview

You can configure extended DHCP relay options on the router or on the switch and enable the router (or switch) to function as a DHCP relay agent. A DHCP relay agent forwards DHCP request and reply packets between a DHCP client and a DHCP server.

DHCP relay supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide subscriber authentication or DHCP client authentication. You can attach dynamic profiles and configure authentication support on a global basis or for a specific group of interfaces.

**NOTE:** The PTX Series Packet Transport Routers do not support authentication for DHCP relay agents.

---

On the routers, you can use DHCP relay in carrier edge applications such as video/IPTV to obtain configuration parameters, including an IP address, for your subscribers.

On the switches, you can use DHCP relay to obtain configuration parameters including an IP address for DHCP clients.

**NOTE:** The extended DHCP relay agent options configured with the `dhcp-relay` statement are incompatible with the DHCP/BOOTP relay agent options configured with the `bootp` statement. As a result, you cannot enable both the extended DHCP relay agent and the DHCP/BOOTP relay agent on the router at the same time.

For information about the DHCP/BOOTP relay agent, see *Configuring Routers, Switches, and Interfaces as DHCP and BOOTP Relay Agents*.

---

You can also configure the extended DHCP relay agent to support IPv6 clients. See “[DHCPv6 Relay Agent Overview](#)” on [page 554](#) for information about the DHCPv6 relay agent feature.

To configure the extended DHCP relay agent on the router (or switch), include the `dhcp-relay` statement at the `[edit forwarding-options]` hierarchy level.

You can also include the `dhcp-relay` statement at the following hierarchy levels:

- `[edit logical-systems logical-system-name forwarding-options]`
- `[edit logical-systems logical-system-name routing-instances routing-instance-name forwarding-options]`
- `[edit routing-instances routing-instance-name forwarding-options]`
- [Interaction Among the DHCP Relay Agent, DHCP Client, and DHCP Servers on page 525](#)
- [DHCP Liveness Detection on page 526](#)

### Interaction Among the DHCP Relay Agent, DHCP Client, and DHCP Servers

The pattern of interaction among the DHCP Relay agent, DHCP client, and DHCP servers is the same regardless of whether the software installation is on a router or a switch. However, there are some difference in the details of usage.

On routers—In a typical carrier edge network configuration, the DHCP client is on the subscriber's computer, and the DHCP relay agent is configured on the router between the DHCP client and one or more DHCP servers.

On switches—In a typical network configuration, the DHCP client is on an access device such as a personal computer and the DHCP relay agent is configured on the switch between the DHCP client and one or more DHCP servers.

The following steps describe, at a high level, how the DHCP client, DHCP relay agent, and DHCP server interact in a configuration that includes two DHCP servers.

1. The DHCP client sends a discover packet to find a DHCP server in the network from which to obtain configuration parameters for the subscriber (or DHCP client), including an IP address.
2. The DHCP relay agent receives the discover packet and forwards copies to each of the two DHCP servers. The DHCP relay agent then creates an entry in its internal client table to keep track of the client's state.
3. In response to receiving the discover packet, each DHCP server sends an offer packet to the client. The DHCP relay agent receives the offer packets and forwards them to the DHCP client.
4. On receipt of the offer packets, the DHCP client selects the DHCP server from which to obtain configuration information. Typically, the client selects the server that offers the longest lease time on the IP address.
5. The DHCP client sends a request packet that specifies the DHCP server from which to obtain configuration information.
6. The DHCP relay agent receives the request packet and forwards copies to each of the two DHCP servers.
7. The DHCP server requested by the client sends an acknowledgement (ACK) packet that contains the client's configuration parameters.
8. The DHCP relay agent receives the ACK packet and forwards it to the client.
9. The DHCP client receives the ACK packet and stores the configuration information.
10. If configured to do so, the DHCP relay agent installs a host route and Address Resolution Protocol (ARP) entry for this client.
11. After establishing the initial lease on the IP address, the DHCP client and the DHCP server use unicast transmission to negotiate lease renewal or release. The DHCP relay agent "snoops" on all of the packets unicast between the client and the server that pass through the router (or switch) to determine when the lease for this client has expired or been released. This process is referred to as *lease shadowing* or *passive snooping*.

### DHCP Liveness Detection

Liveness detection for DHCP subscriber or DHCP client IP sessions utilizes an active liveness detection protocol to institute liveness detection checks for relevant clients. Clients are expected to respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, then the liveness detection check fails and a failure action is implemented.

**NOTE:** DHCP liveness detection either globally or per DHCP group.

### Using Layer 2 Unicast Transmission instead of Broadcast for DHCP Packets

You can configure the DHCP relay agent to override the setting of the broadcast bit in DHCP request packets. DHCP relay agent then instead uses the Layer 2 unicast transmission method to send DHCP Offer reply packets and DHCP ACK reply packets from the DHCP server to DHCP clients during the discovery process.

To override the default setting of the broadcast bit in DHCP request packets:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Specify that the DHCP relay agent uses the Layer 2 unicast transmission method.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set layer2-unicast-replies
```

### Changing the Gateway IP Address (giaddr) Field to the giaddr of the DHCP Relay Agent

You can configure the DHCP relay agent to change the gateway IP address (giaddr) field in packets that it forwards between a DHCP client and a DHCP server.

To overwrite the giaddr of every DHCP packet with the giaddr of the DHCP relay agent before forwarding the packet to the DHCP server:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Specify that the giaddr of DHCP packets is overwritten.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set always-write-giaddr
```

## Replacing the DHCP Relay Request and Release Packet Source Address

You can configure the DHCP relay agent to replace request and release packets with the gateway IP address (giaddr) before forwarding the packet to the DHCP server.

To replace the source address with giaddr:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]  
user@host# edit overrides
```

2. Specify that you want to replace the IP source address in DHCP relay request and release packets with the gateway IP address (giaddr).

```
[edit forwarding-options dhcp-relay overrides]  
user@host# set replace-ip-source-with giaddr
```

## Example: Configuring DHCP Relay Agent Selective Traffic Processing Based on DHCP Option Strings

This example shows how to configure DHCP relay agent to use DHCP option strings to selectively identify, filter, and process client traffic.

- [Requirements on page 527](#)
- [Overview on page 527](#)
- [Configuration on page 528](#)
- [Verification on page 530](#)

### Requirements

This example uses the following hardware and software components:

- MX Series 5G Universal Routing Platforms or EX Series Switches

Before you configure DHCP relay agent selective processing support, be sure you:

- Configure DHCP relay agent.

See [“Extended DHCP Relay Agent Overview” on page 524](#).

- (Optional) Configure a named DHCP local server group if you want to forward client traffic to a server group.

See [“Grouping Interfaces with Common DHCP Configurations” on page 576](#).

### Overview

In this example, you configure DHCP relay agent to use DHCP option strings in client packets to selectively identify, filter, and process client traffic. To configure selective processing, you perform the following procedures:

1. Identify the client traffic—Specify the DHCP option that DHCP relay agent uses to identify the client traffic you want to process. The option you specify matches the option in the client traffic.
2. Configure a default action—Specify the default processing action, which DHCP relay uses for identified client traffic that does not satisfy any configured match criteria.
3. Create match filters and associate an action with each filter—Specify match criteria that filter the client traffic. The criteria can be an exact match or a partial match with the option string in the client traffic. Associate a processing action with each match criterion.

### Configuration

To configure DHCP relay agent selective processing based on DHCP option information, perform these tasks:

- [Configuring DHCP Relay Agent To Selectively Process Client Traffic Based on DHCP Option Strings on page 528](#)
- [Results on page 529](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the command into the CLI at the **[edit]** hierarchy level.

```
set forwarding-options dhcp-relay relay-option option-number 60
set forwarding-options dhcp-relay relay-option equals ascii video-gold forward-only
set forwarding-options dhcp-relay relay-option equals ascii video-bronze local-server-group
  servergroup-15
set forwarding-options dhcp-relay relay-option starts-with hexadecimal ffff
  local-server-group servergroup-east
set forwarding-options dhcp-relay relay-option default-action drop
```

#### *Configuring DHCP Relay Agent To Selectively Process Client Traffic Based on DHCP Option Strings*

#### Step-by-Step Procedure

To configure DHCP relay selective processing:

1. Specify that you want to configure DHCP relay agent support.

```
[edit forwarding-options]
user@host# edit dhcp-relay
```

2. Specify the DHCP option that DHCP relay agent uses to identify incoming client traffic.

```
[edit forwarding-options dhcp-relay]
user@host# set relay-option option-number 60
```

3. Configure a default action, which DHCP relay agent uses when the incoming client traffic does not satisfy any configured match criteria.

```
[edit forwarding-options dhcp-relay]
user@host# set relay-option default-action drop
```

4. Configure an exact match condition and associated action that DHCP relay uses to process the identified client traffic.

```
[edit forwarding-options dhcp-relay]
user@host# set relay-option equals ascii video-gold forward-only
```

5. Configure a second exact match condition and associated action that DHCP relay uses to process client traffic.

```
[edit forwarding-options dhcp-relay]
user@host# set relay-option equals ascii video-bronze local-server-group
servergroup-15
```

6. Configure a partial match criteria and associated action that DHCP relay uses to process client traffic.

```
[edit forwarding-options dhcp-relay]
user@host# set relay-option starts-with hexadecimal ffff local-server-group
servergroup-east
```

## Results

From configuration mode, confirm the results of your configuration by issuing the **show** statement at the **[edit forwarding-options]** hierarchy level. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit forwarding-options]
user@host# show
dhcp-relay {
  relay-option {
    option-number 60;
    equals {
      ascii video-gold {
        forward-only;
      }
    }
    equals {
      ascii video-bronze {
        local-server-group servergroup-15;
      }
    }
    default-action {
```

```
        drop;
    }
    starts-with {
        hexadecimal ffff {
            local-server-group servergroup-east;
        }
    }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

---

### Verification

To verify the status of DHCP relay agent selective traffic processing, perform this task:

- [Verifying the Status of DHCP Relay Agent Selective Traffic Processing on page 530](#)

#### *Verifying the Status of DHCP Relay Agent Selective Traffic Processing*

**Purpose** Verify the DHCP relay agent selective traffic processing status.

**Action** Display statistics for DHCP relay agent.

```
user@host> show dhcp relay statistics
```

```
Packets dropped:
  Total                  30
  Bad hardware address   1
  Bad opcode             1
  Bad options            3
  Invalid server address 5
  No available addresses 1
  No interface match     2
  No routing instance match 9
  No valid local address 4
  Packet too short       2
  Read error             1
  Send error             1
  Option 60              1
  Option 82              2

Messages received:
  BOOTREQUEST            116
  DHCPDECLINE            0
  DHCPDISCOVER           11
  DHCPINFORM             0
  DHCPRELEASE            0
  DHCPREQUEST            105

Messages sent:
  BOOTREPLY              0
  DHCPPOFFER             2
  DHCPACK                1
  DHCPNAK                0
  DHCPFORCERENEW         0

Packets forwarded:
  Total                  4
  BOOTREQUEST            2
  BOOTREPLY              2
```

**Meaning** The **Packets forwarded** field in the **show dhcp relay statistics** command output displays the number of client packets that have been forwarded as a result of the selective traffic processing configuration. In this example, the output indicates the total number of packets that DHCP relay agent has forwarded, as well as a breakdown for the number of **BOOTREQUEST** and **BOOTREPLY** packets forwarded.

### Example: Minimum DHCP Relay Agent Configuration

This example shows the minimum configuration you need to use the extended DHCP relay agent on the router or switch:

```
[edit forwarding-options]
dhcp-relay {
  server-group {
```

```

test 203.0.113.21;
}
active-server-group test;
group all {
    interface fe-0/0/2.0;
}
}

```

**NOTE:** The interface type in this topic is just an example. The **fe-** interface type is not supported by EX Series switches.

This example creates a server group and an active server group named **test** with IP address 203.0.113.21. The DHCP relay agent configuration is applied to a group named **all**. Within this group, the DHCP relay agent is enabled on interface fe-0/0/2.0.

## Verifying and Managing DHCP Relay Configuration

**Purpose** View or clear address bindings or statistics for DHCP relay agent clients.

**Action** • To display the address bindings for DHCP relay agent clients:

```
user@host> show dhcp relay binding
```

• To display DHCP relay agent statistics:

```
user@host> show dhcp relay statistics
```

• To clear the binding state of DHCP relay agent clients:

```
user@host> clear dhcp relay binding
```

• To clear all DHCP relay agent statistics:

```
user@host> clear dhcp relay statistics
```

To clear or view information about client bindings and statistics in a routing instance, run the following commands:

- **show dhcp relay binding routing instance <routing-instance name>**
- **show dhcp relay statistics routing instance <routing-instance name>**
- **clear dhcp relay binding routing instance <routing-instance name>**
- **clear dhcp relay statistics routing instance <routing-instance name>**

**NOTE:** On all SRX Series devices, DHCP relay is unable to update the binding status based on DHCP\_RENEW and DHCP\_RELEASE messages.

**See Also** • *Minimum DHCP Relay Agent Configuration*

## Overriding the Default DHCP Relay Configuration Settings

You can override the default DHCP relay configuration settings at the global level, for a named group of interfaces, or for a specific interface within a named group.

- To override global default DHCP relay agent configuration options, include the **overrides** statement and its subordinate statements at the **[edit forwarding-options dhcp-relay]** hierarchy level.
- To override DHCP relay configuration options for a named group of interfaces, include the statements at the **[edit forwarding-options dhcp-relay group *group-name*]** hierarchy level.
- To override DHCP relay configuration options for a specific interface within a named group of interfaces, include the statements at the **[edit forwarding-options dhcp-relay group *group-name* interface *interface-name*]** hierarchy level.
- To configure overrides for DHCPv6 relay at the global level, group level, or per-interface, use the corresponding statements at the **[edit forwarding-options dhcp-relay dhcpv6]** hierarchy level.

To override default DHCP relay agent configuration settings:

1. (DHCPv4 and DHCPv6) Specify that you want to configure override options.

- DHCPv4 overrides.

Global override:

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

Group-level override:

```
[edit forwarding-options dhcp-relay]
user@host# edit group group-name overrides
```

Per-interface override:

```
[edit forwarding-options dhcp-relay]
user@host# edit group group-name interface interface-name overrides
```

- DHCPv6 overrides.

Global override:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit overrides
```

Group-level override:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit group group-name overrides
```

Per-interface override:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit group group-name interface interface-name overrides
```

2. (DHCPv4 only) Enable DHCP relay proxy mode.

See [“Enabling DHCP Relay Proxy Mode”](#) on page 553.

3. (DHCPv4 only) Overwrite the giaddr in DHCP packets that the DHCP relay agent forwards.

See [“Changing the Gateway IP Address \(giaddr\) Field to the giaddr of the DHCP Relay Agent”](#) on page 526.

4. (DHCPv4 only) Replace the IP source address in DHCP relay request and release packets with the gateway IP address (giaddr).

See [“Replacing the DHCP Relay Request and Release Packet Source Address”](#) on page 527.

5. (DHCPv4 only) Override the DHCP relay agent information option (option 82) in DHCP packets.

See [“Overriding Option 82 Information” on page 542](#).

6. (DHCPv4 only) Override the setting of the broadcast bit in DHCP request packets and use the Layer 2 unicast transmission method.

See [“Using Layer 2 Unicast Transmission instead of Broadcast for DHCP Packets” on page 526](#).

7. (DHCPv4 only) Trust DHCP client packets that have a giaddr of 0 and that contain option 82 information.

See [“Enable Processing of Untrusted Packets So Option 82 Information Can Be Used” on page 548](#).

8. (DHCPv4 and DHCPv6) Override the maximum number of DHCP clients allowed per interface.

See [“Specifying the Maximum Number of DHCP Clients Per Interface” on page 562](#).

9. (DHCPv4 only) Configure client auto logout.

See [“DHCP Auto Logout Overview” on page 549](#).

10. (DHCPv4 and DHCPv6) Enable or disable support for DHCP snooped clients on interfaces.

See *Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent*.

11. (DHCPv4 and DHCPv6) Delay authentication of subscribers until the DHCP client sends a Request packet.

See the *delay-authentication*.

12. (DHCPv4 and DHCPv6) Send release messages to the DHCP server when clients are deleted.

See [“Sending Release Messages When Clients Are Deleted” on page 565](#).

13. (Optional) Specify that when the DHCP or DHCPv6 relay agent receives a Discover or Solicit message that has a client ID that matches the existing client entry, the relay agent deletes the existing client entry.

See *DHCP Behavior When Renegotiating While in Bound State*.

14. (DHCPv6 only) Automatically log out existing client when new client solicits on same interface.

See *Automatically Logging Out DHCPv6 Clients*.

15. (DHCPv4 only) Disable the DHCP relay agent on specific interfaces.  
See [“Disabling DHCP Relay Agent for Interfaces, for Groups, or Globally” on page 538](#).
16. (DHCPv4 and DHCPv6) Disable automatic binding of stray DHCP requests.  
See [“Disabling Automatic Binding of Stray DHCP Requests” on page 514](#).
17. (DHCPv4 and DHCPv6) Assign a single-session DHCP dual-stack group to a specified group of subscribers. You must assign the group to both legs of the DHCP dual stack.  
See *Configuring Single-Session DHCP Dual-Stack Support*.
18. (Optional, DHCPv4 and DHCPv6) Specify that a short lease be sent to the client.  
See *Configuring DHCP Asymmetric Leasing*.

## Overriding the Default DHCP Local Server Configuration Settings Overview

Subscriber management enables you to override certain default DHCP local server configuration settings. You can override the configuration settings at the global level, for a named group of interfaces, or for a specific interface within a named group.

- To override global default DHCP local server configuration options, include the **overrides** statement and its subordinate statements at the **[edit system services dhcp-local-server]** hierarchy level.
- To override DHCP local server configuration options for a named group of interfaces, include the statements at the **[edit system services dhcp-local-server group group-name]** hierarchy level.
- To override DHCP local server configuration options for a specific interface within a named group of interfaces, include the statements at the **[edit system services dhcp-local-server group group-name interface interface-name]** hierarchy level.
- To configure overrides for DHCPv6 local server at the global level, group level, or per-interface, use the corresponding statements at the **[edit system services dhcp-local-server dhcpv6]** hierarchy level.

To override default DHCP local server configuration settings:

1. (DHCPv4 and DHCPv6) Specify that you want to configure override options.

- DHCPv4 overrides.

Global override:

```
[edit system services dhcp-local-server]
user@host# edit overrides
```

Group-level override:

```
[edit system services dhcp-local-server]
user@host# edit group group-name overrides
```

Per-interface override:

```
[edit system services dhcp-local-server]
user@host# edit group group-name overrides interface interface-name
```

DHCPv6 overrides.

Global override:

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit overrides
```

Group level override:

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit group group-name overrides
```

Per-interface override:

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit group group-name overrides interface interface-name
```

2. (Optional) Override the maximum number of DHCP clients allowed per interface.

See [“Specifying the Maximum Number of DHCP Clients Per Interface” on page 562](#).

3. (Optional) Configure DHCP client auto logout.

See [“Automatically Logging Out DHCP Clients” on page 551](#).

4. (Optional) Enable processing of information requests from clients.

See [“Enabling Processing of Client Information Requests” on page 564](#).

5. (Optional) Specify that DHCP NAK and FORCERENEW messages support option 82 information.

*See [Configuring DHCP Message Exchange Between DHCP Server and Clients in Different Virtual Routing Instances](#).*

6. (Optional, DHCPv6 only) Specify a delegated pool name to use for DHCPv6 multiple address assignment.

*See [Specifying the Delegated Address-Assignment Pool to Be Used for DHCPv6 Prefix Delegation](#).*

7. (Optional, DHCPv6 only) Enable DHCPv6 rapid commit support.

*See [“Configuring DHCPv6 Rapid Commit \(MX, EX\)” on page 521](#).*

8. (Optional, DHCPv6 only) Specify that DHCPv6 local server return DNS server addresses as IA\_NA or IA\_PD suboptions rather than as a global DHCPv6 option.

*See [Overriding How the DNS Server Address Is Returned in a DHCPv6 Multiple Address Environment](#).*

9. (Optional, DHCPv6 only) Automatically log out existing client when new client solicits on same interface.

*See [Automatically Logging Out DHCPv6 Clients](#).*

10. (Optional) Specify that when the DHCP or DHCPv6 local server receives a Discover or Solicit message that has a client ID that matches the existing client entry, the local server deletes the existing client entry.

*See [DHCP Behavior When Renegotiating While in Bound State](#).*

11. (Optional, DHCPv4 and DHCPv6) Specify that a short lease be sent to the client.

*See [Configuring DHCP Asymmetric Leasing](#).*

12. (Optional, DHCPv4 and DHCPv6) Specify DHCP attributes globally or for groups.

*See [Configuring DHCP Attributes for All Clients or a Group of Clients](#).*

13. Load balance traffic by allowing some local servers to respond to specific clients while preventing other local servers from responding immediately to these clients.

*See [Delaying DHCP Offer and Advertise Responses to Load Balance DHCP Servers](#).*

## Disabling DHCP Relay Agent for Interfaces, for Groups, or Globally

You can disable DHCP relay on all interfaces or a group of interfaces.

To disable DHCP relay agent:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Disable the DHCP relay agent.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set disable-relay
```

## DHCP Relay Agent Information Option (Option 82)

The DHCP relay agent information option (option 82) enables you to include additional useful information in the client-originated DHCP packets that the DHCP relay forwards to a DHCP server. You can configure the option 82 support globally or for a named group of interfaces. For more information, read this topic.

- [Using DHCP Relay Agent Option 82 Information on page 539](#)
- [How DHCP Relay Agent Uses Option 82 for Auto Logout on page 547](#)
- [Enable Processing of Untrusted Packets So Option 82 Information Can Be Used on page 548](#)
- [DHCP Auto Logout Overview on page 549](#)
- [Automatically Logging Out DHCP Clients on page 551](#)

### Using DHCP Relay Agent Option 82 Information

Subscriber management enables you to configure the DHCP relay agent to include additional option 82 information in the DHCP packets that the relay agent receives from clients and forwards to a DHCP server. The DHCP server uses the additional information to determine the IP address to assign to the client. The server might also use the information for other purposes—for example, to determine which services to grant the client, or to provide additional security against threats such as address spoofing. The DHCP server sends its reply back to the DHCP relay agent, and the agent removes the option 82 information from the message and forwards the packet to the client.

To configure support for the DHCP relay agent information option 82, you use the **relay-option-82** statement. You can configure the DHCP relay agent to include the following suboptions in the packet the relay agent sends to the DHCP server:

- Agent Circuit ID (suboption 1)—An ASCII string that identifies the interface on which the client DHCP packet is received.
- Agent Remote ID (suboption 2)—An ASCII string assigned by the DHCP relay agent that securely identifies the client.

You can configure the option 82 support globally or for a named group of interfaces.

To restore the default behavior, in which option 82 information is not inserted into DHCP packets, you use the **delete relay-option-82** statement.

**NOTE:** The DHCPv6 relay agent provides similar Agent Circuit ID and Agent Remote ID support for DHCPv6 clients. For DHCPv6, subscriber management uses DHCPv6 option 18 to include the circuit ID in the packets that the relay agent sends to a DHCPv6 server, and option 37 to include the remote ID in the packets. See *DHCPv6 Relay Agent Options*.

The following sections describe the option 82 operations you can configure:

- [Configuring Option 82 Information on page 540](#)
- [Overriding Option 82 Information on page 542](#)
- [Including a Prefix in DHCP Options on page 543](#)
- [Including a Textual Description in DHCP Options on page 545](#)

### Configuring Option 82 Information

---

You use the **relay-option-82** statement to configure the DHCP relay agent to insert option 82 information in DHCP packets that the relay agent receives from clients and forwards to a DHCP server. When you configure option 82, you can include one of the suboption statements to specify the type of information you want to include in the DHCP packets. If you configure option 82 without including one of the suboption statements, the Agent Circuit ID option is included by default. Use the **circuit-id** statement to include the Agent Circuit ID (suboption 1) in the packets, or the **remote-id** statement to include the Agent Remote ID (suboption 2).

You can optionally configure DHCP relay agent to include a prefix or the interface description as part of the suboption information. If you specify the **circuit-id** or **remote-id** statement without including any of the optional **prefix**, **use-interface-description**, **use-vlan-id**, **include-irb-and-l2**, or **no-vlan-interface-name** statements, the format of the Agent Circuit ID or Agent Remote ID information for Fast Ethernet (fe), Gigabit Ethernet (ge), and integrated routing and bridging (irb) interfaces is one of the following, depending on your network configuration:

- For Fast Ethernet or Gigabit Ethernet interfaces that do not use VLANs, stacked VLANs (S-VLANs), or bridge domains:

```
(fe | ge)-fpc/pic/port.subunit
```

**NOTE:** For remote systems, the *subunit* is required and is used to differentiate an interface.

- For Fast Ethernet or Gigabit Ethernet interfaces that use VLANs:

```
(fe | ge)-fpc/pic/port:vlan-id
```

- For Fast Ethernet or Gigabit Ethernet interfaces that use S-VLANs:

```
(fe | ge)-fpc/pic/port:svlan-id-vlan-id
```

**NOTE:** Integrated routing and bridging (IRB) provides simultaneous support for Layer 2 bridging and Layer 3 IP routing on the same interface. IRB enables you to route local packets to another routed interface or to another bridging domain that has a Layer 3 protocol configured.

The interface to bridge domain relationship might be implicit (the interface is mapped to the bridge domain by the system based on the VLAN tag) or explicit (the interface is mapped to the bridge domain by configuring it in the bridge domain definition). For the explicit case, tagging might not be relevant for the mapping.

In the case of an IRB interface, the format displays the Layer 2 interface instead of the IRB interface along with the bridge domain name. For IRB interfaces (or other pseudo devices) the default format is as follows:

- IRB interfaces that use bridge domains but do not use VLANs or S-VLANs:

```
(fe | ge)-fpc/pic/port.subunit:bridge-domain-name
```

- IRB interfaces that use VLANs:

```
(fe | ge)-fpc/pic/port.subunit:vlan-name
```

To include the IRB interface name with the Layer 2 interface name, configure the **include-irb-and-l2** statement. The format is as follows:

- IRB interfaces that use bridge domains but do not use VLANs or S-VLANs:

```
(fe | ge)-fpc/pic/port:bridge-domain-name+irb.subunit
```

- IRB interfaces that use VLANs:

```
(fe | ge)-fpc/pic/port:vlan-name+irb.subunit
```

To include only the IRB interface name without the Layer 2 interface and bridge domain or VLAN, configure the **no-vlan-interface-name** statement. The format is as follows:

```
irb.subunit
```

To enable insertion of option 82 information:

1. Specify that you want to configure option 82 support.

```
[edit forwarding-options dhcp-relay]  
user@host# edit relay-option-82
```

2. Configure the DHCP relay agent to insert the Agent Circuit ID suboption, the Agent Remote ID suboption, or both.

- To insert the Agent Circuit ID:

```
[edit forwarding-options dhcp-relay relay-option-82]  
user@host# set circuit-id
```

- To insert the Agent Remote ID:

```
[edit forwarding-options dhcp-relay relay-option-82]  
user@host# set remote-id
```

- To insert both, configure both set commands.

3. (Optional) Configure a prefix that is used in the option 82 information in the DHCP packets.

*See Including a Prefix in DHCP Options.*

4. (Optional) Configure the DHCP relay agent to include the interface's textual description instead of the interface identifier in the option 82 information.

*See Including a Textual Description in DHCP Options.*

---

### Overriding Option 82 Information

You can configure the DHCP relay agent to add or remove the DHCP relay agent information option (option 82) in DHCP packets.

This feature causes the DHCP relay agent to perform one of the following actions, depending on the configuration:

- If the DHCP relay agent is configured to add option 82 information to DHCP packets, it clears the existing option 82 values from the DHCP packets and inserts the new values before forwarding the packets to the DHCP server.
- If the DHCP relay agent is not configured to add option 82 information to DHCP packets, it clears the existing option 82 values from the packets, but does not add any new values before forwarding the packets to the DHCP server.

To override the default option 82 information in DHCP packets destined for a DHCP server:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]  
user@host# edit overrides
```

2. Specify that the option 82 information in DHCP packets is overwritten.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set always-write-option-82
```

### Including a Prefix in DHCP Options

When you configure the DHCP relay agent to include DHCP options in the packets that the relay agent sends to a DHCP server, you can specify that the relay agent add a prefix to the DHCP option. You can add a prefix to the following DHCP options:

- DHCPv4 option 82 Agent Circuit ID (suboption 1)
- DHCPv4 option 82 Agent Remote ID (suboption 2)
- DHCPv6 option 18 Relay Agent Interface-ID
- DHCPv6 option 37 Relay Agent Remote-ID

The prefix is separated from the DHCP option information by a colon (:), and it can include any combination of the **host-name**, **logical-system-name**, and **routing-instance-name** options. The DHCP relay agent obtains the values for the **host-name**, **logical-system-name**, and **routing-instance-name** as follows:

- If you include the **host-name** option, the DHCP relay agent uses the hostname of the device configured with the **host-name** statement at the **[edit system]** hierarchy level.
- If you include the **logical-system-name** option, the DHCP relay agent uses the logical system name configured with the **logical-system** statement at the **[edit logical-system]** hierarchy level.
- If you include the **routing-instance-name** option, the DHCP relay agent uses the routing instance name configured with the **routing-instance** statement at the **[edit routing-instances]** hierarchy level or at the **[edit logical-system logical-system-name routing-instances]** hierarchy level.

If you include the hostname and either or both of the logical system name and the routing instance name in the prefix, the hostname is followed by a forward slash (/). If you include both the logical system name and the routing instance name in the prefix, these values are separated by a semicolon (;).

The following examples show several possible formats for the DHCP option information when you specify the **prefix** statement for Fast Ethernet (fe) or Gigabit Ethernet (ge) interfaces with S-VLANs.

- If you include only the hostname in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:

```
hostname:(fe | ge)-fpc/pic/port:svlan-id-vlan-id
```

- If you include only the logical system name in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:

```
logical-system-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id
```

- If you include only the routing instance name in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:

```
routing-instance-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id
```

- If you include both the hostname and the logical system name in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:

```
host-name/logical-system-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id
```

- If you include both the logical system name and the routing instance name in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:

```
logical-system-name;routing-instance-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id
```

- If you include the hostname, logical system name, and routing instance name in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:

```
host-name/logical-system-name;routing-instance-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id
```

For Fast Ethernet or Gigabit Ethernet interfaces that use VLANs but not S-VLANs, only the **vlan-id** value appears in the DHCP option format.

(DHCPv4) To configure a prefix with the option 82 information:

1. Specify that you want to configure option 82 support.

```
[edit forwarding-options dhcp-relay]
user@host# edit relay-option-82
```

2. Configure DHCP relay agent to insert the Agent Circuit ID, the Agent Remote ID, or both.

- To configure the Agent Circuit ID:

```
[edit forwarding-options dhcp-relay relay-option-82]
user@host# edit circuit-id
```

- To configure the Agent Remote ID:

```
[edit forwarding-options dhcp-relay relay-option-82]
user@host# edit remote-id
```

3. Specify that the prefix be included in the option 82 information. In this example, the prefix includes the hostname and logical system name.

- To include the prefix with the Agent Circuit ID:

```
[edit forwarding-options dhcp-relay relay-option-82 circuit-id]
```

```
user@host# set prefix host-name logical-system-name
```

- To include the prefix with the Agent Remote ID:

```
[edit forwarding-options dhcp-relay relay-option-82 remote-id]
user@host# set prefix host-name logical-system-name
```

(DHCPv6) To use a prefix with the DHCPv6 option 18 or option 37 information:

1. Specify that you want to configure DHCPv6 relay agent support.

```
[edit forwarding-options dhcp-relay]
user@host# edit dhcpv6
```

2. Configure DHCPv6 relay agent to insert option 18 (Relay Agent Interface-ID), option 37 (Relay Agent Remote-ID), or both.

- To configure option 18:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit relay-agent-interface-id
```

- To configure option 37:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit relay-agent-remote-id
```

3. Specify that the prefix is included in the option information. In this example, the prefix includes the hostname and logical system name

- To include the prefix with option 18:

```
[edit forwarding-options dhcp-relay dhcpv6 relay-agent-interface-id]
user@host# set prefix host-name logical-system-name
```

- To include the prefix with option 37:

```
[edit forwarding-options dhcp-relay dhcpv6 relay-agent-remote-id]
user@host# set prefix host-name logical-system-name
```

### Including a Textual Description in DHCP Options

By default, when DHCP relay agent inserts option information in the packets sent to a DHCP server, the options include the interface identifier. However, you can configure the DHCP relay agent to include the textual description that is configured for the interface instead of the interface identifier. You can use the textual description for either the logical interface or the device interface.

You can include the textual interface description in the following DHCP options:

- DHCPv4 option 82 Agent Circuit ID (suboption 1)
- DHCPv4 option 82 Agent Remote ID (suboption 2)

- DHCPv6 option 18 Relay Agent Interface-ID
- DHCPv6 option 37 Relay Agent Remote-ID

The textual description is configured separately, using the **description** statement at the **[edit interfaces *interface-name*]** hierarchy level. If you specify that the textual description is used and no description is configured for the interface, DHCP relay defaults to using the Layer 2 interface name.

In the case of integrated routing and bridging (IRB) interfaces, the textual description of the Layer 2 interface is used instead of the textual description of the IRB interface. If there is no description configured, the Layer 2 logical interface name is used.

**NOTE:** For IRB interfaces, the option 82 field must be able to uniquely identify the incoming interface based on either the Agent Circuit ID or Agent Remote ID . You can modify the information in the textual interface description to match the raw IFD (physical interface without a subunit) name and configure the option 82 field to use the interface description.

You can use the textual description with the following DHCP options:

- DHCPv4 Option 82 Agent Circuit ID (suboption 1)
- DHCPv4 Option 82 Agent Remote ID (suboption 2)
- DHCPv6 Relay Agent Interface-ID (option 18)
- DHCPv6 Relay Agent Remote-ID (option 37)

(DHCPv4) To configure the DHCP relay option 82 suboption to include the textual interface description:

1. Specify that you want to configure option 82 support.

```
[edit forwarding-options dhcp-relay]
user@host# edit relay-option-82
```

2. Configure DHCP relay agent to insert the Agent Circuit ID, Agent Remote ID, or both.

```
[edit forwarding-options dhcp-relay relay-option-82]
user@host# edit circuit-id
```

3. Specify that the textual description is included in the option 82 information. In this example, the option 82 information includes the description used for the device interface.

```
[edit forwarding-options dhcp-relay relay-option-82 circuit-id]
user@host# set use-interface-description device
```

(DHCPv6) To configure the DHCPv6 option 18 or option 37 to include the textual interface description:

1. Specify that you want to configure DHCPv6 relay agent support.

```
[edit forwarding-options dhcp-relay]
user@host# edit dhcpv6
```

2. Configure DHCPv6 relay agent to insert option 18 (Relay Agent Interface-ID), option 37 (Relay Agent Remote-ID), or both.

- To configure option 18:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit relay-agent-interface-id
```

- To configure option 37:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit relay-agent-remote-id
```

3. Specify that the textual description is included in the option information. In the following example, the option information includes the description used for the device interface.

- To include the textual description in option 18:

```
[edit forwarding-options dhcp-relay dhcpv6 relay-agent-interface-id]
user@host# set use-interface-description device
```

- To include the textual description in option 37:

```
[edit forwarding-options dhcp-relay dhcpv6 relay-agent-remote-id]
user@host# set use-interface-description device
```

## How DHCP Relay Agent Uses Option 82 for Auto Logout

Table 46 on page 548 indicates how the DHCP relay agent determines the option 82 value used for the client auto logout feature. Depending on the configuration settings, DHCP relay agent takes the action indicated in the right column.

**Table 46: DHCP Relay Agent Option 82 Value for Auto Logout**

| DHCP Relay Agent Configuration Settings |                                    |                            |                                   | giaddr in non-snooped packet | Action Taken                       |
|-----------------------------------------|------------------------------------|----------------------------|-----------------------------------|------------------------------|------------------------------------|
| DHCP Relay Configured with Option 82    | Discover Packet Contains Option 82 | Override "trust-option-82" | Override "always-write-option-82" |                              |                                    |
| No                                      | No                                 | —                          | —                                 | —                            | No secondary search performed      |
| No                                      | Yes                                | Yes                        | —                                 | —                            | Use option 82 from packet          |
| No                                      | Yes                                | No                         | —                                 | Zero                         | Drop packet                        |
| No                                      | Yes                                | No                         | —                                 | Non-zero                     | Use option 82 from packet          |
| Yes                                     | No                                 | —                          | —                                 | —                            | Use configured option 82           |
| Yes                                     | Yes                                | No                         | —                                 | Zero                         | Drop packet                        |
| Yes                                     | Yes                                | No                         | No                                | Non-zero                     | Use option 82 from packet          |
| Yes                                     | Yes                                | No                         | Yes                               | Non-zero                     | Overwrite the configured option 82 |
| Yes                                     | Yes                                | Yes                        | No                                | —                            | Use option 82 from packet          |
| Yes                                     | Yes                                | Yes                        | Yes                               | —                            | Overwrite the configured option 82 |

### Enable Processing of Untrusted Packets So Option 82 Information Can Be Used

By default, the DHCP relay agent treats client packets with a giaddr of 0 (zero) and option 82 information as if the packets originated at an untrusted source, and drops them without further processing. You can override this behavior and specify that the DHCP relay agent process DHCP client packets that have a giaddr of 0 (zero) and contain option 82 information.

To configure DHCP relay agent to trust option 82 information:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]  
user@host# edit overrides
```

2. Specify that the DHCP relay agent process DHCP client packets with a giaddr of 0 and that contain option 82 information.

```
[edit forwarding-options dhcp-relay overrides]  
user@host# set trust-option-82
```

## DHCP Auto Logout Overview

This topic provides an introduction to the DHCP auto logout feature and includes the following sections:

- [Auto Logout Overview on page 549](#)
- [How DHCP Identifies and Releases Clients on page 549](#)
- [Option 60 and Option 82 Requirements on page 550](#)

### Auto Logout Overview

Auto logout is supported for DHCP local server and DHCP relay agent. It improves the efficiency of DHCP IP address assignment by allowing IP addresses to be immediately released and returned to the address pool when DHCP clients are no longer using the addresses. DHCP can then assign the addresses to other clients. Without auto logout, an IP address is blocked for the entire lease period, and DHCP must wait until the address lease time expires before reusing the address.

Auto logout is particularly useful when DHCP uses long lease times for IP address assignments and to help avoid allocating duplicate IP addresses for a single client.

For example, you might have an environment that includes set-top boxes (STB) that are often upgraded or replaced. Each time a STB is changed, the new STB repeats the DHCP discover process to obtain client configuration information and an IP address. DHCP views the new STB as a completely new client and assigns a new IP address—the previous IP address assigned to the client (the old STB) remains blocked and unavailable until the lease expires. If auto logout is configured in this situation, DHCP recognizes that the new STB is actually the same client and then immediately releases the original IP address. DHCP relay agent acts as a proxy client for auto logout and sends a DHCP release message to the DHCP server.

### How DHCP Identifies and Releases Clients

The auto logout feature requires that DHCP explicitly identify clients. By default, DHCP local server and DHCP relay agent identify clients based on MAC address or Client Identifier, and subnet. However, in some cases this type of identification might not be sufficient. For example, in the previous STB example, each STB has a different MAC address, so DHCP incorrectly assumes that an upgraded or replacement STB is a new client.

In order to explicitly identify clients, auto logout uses a secondary identification method when the primary identification method is unsuccessful— the primary method is considered unsuccessful if the MAC address or Client Identifier does not match that of an existing client. Subscriber management supports two secondary identification methods that you can configure.

- Incoming interface method— DHCP views a new client connection on the interface as if it comes from the same client. DHCP deletes the existing client binding before creating a binding for the newly connected device. This method allows only one client device to connect on the interface.

**NOTE:** The incoming interface method differs from the **overrides interface-client-limit 1** statement, which retains the existing binding and rejects the newly connected client.

- Option 60 and option 82 method— DHCP considers two clients as different if they have the same option 60 and option 82 information, but different subnets.

DHCP local server and DHCP relay agent perform the following operations when auto logout is enabled and the secondary identification method identifies a duplicate client (that is, the Discover packet is from an existing client).

- DHCP local server immediately releases the existing address.
- DHCP relay agent immediately releases the existing client and then sends a DHCP release packet to the DHCP server. Sending the release packet ensures that DHCP relay and the DHCP server are synchronized.

If the DHCP relay receives a Discover message from an existing client, the DHCP relay forwards the Discover message to the DHCP server. The DHCP relay preserves the binding if the client's existing IP address is returned by the DHCP server. This behavior is not applicable if the proxy-mode override or client-discover-match functionality are enabled.

**NOTE:** If the DHCP relay agent is in snoop mode, DHCP relay releases the client but does not send a release packet to the DHCP server if the discover packet is for a passive client (a client added as a result of snooped packets) or if the discover packet is a snooped packet.

---

### Option 60 and Option 82 Requirements

DHCP local server requires that the received discover packet include both DHCP option 60 and option 82. If either option is missing, DHCP local server cannot perform the secondary identification method and auto logout is not used.

DHCP relay agent requires that the received discover packet contain DHCP option 60. DHCP relay determines the option 82 value based on the guidelines provided in [“DHCP Relay Agent Option 82 Value for Auto Logout”](#) on page 548.

## Automatically Logging Out DHCP Clients

You can configure the extended DHCP local server and extended DHCP relay to automatically log out DHCP clients. Auto logout immediately releases an existing client when DHCP receives a discover packet from a client whose identity matches an existing client. DHCP then releases the existing client IP address without waiting for the normal lease expiration.

**NOTE:** When the existing client is released, the new client undergoes the normal authentication process. The new client might not receive the same IP address as the original client.

To configure DHCP client auto logout:

1. Specify that you want to configure override options.

- For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# edit overrides
```

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Enable auto logout and specify the secondary identification method you want to use when the primary identification method is unsuccessful.

- For example, to configure DHCP local server to use the incoming interface method:

```
[edit system services dhcp-local-server overrides]
user@host# set client-discover-match incoming-interface
```

- For example, to configure DHCP relay agent to use the option 60 and option 82 method:

```
[edit forwarding-options dhcp-relay overrides]
user@host# set client-discover-match option60-and-option82
```

**NOTE:** If you change the auto logout configuration, existing clients continue to use the auto logout setting that was configured when they logged in. New clients use the new setting.

## DHCP Relay Proxy

---

A DHCP relay is transparent to DHCP clients and DHCP servers, and simply forwards messages between DHCP clients and servers. The DHCP relay agent is configured on the router or switch, which operates between the DHCP client and one or more DHCP servers. For more information, read this topic.

- [DHCP Relay Proxy Overview on page 552](#)
- [Enabling DHCP Relay Proxy Mode on page 553](#)

### DHCP Relay Proxy Overview

DHCP relay proxy mode is an enhancement to extended DHCP relay. DHCP relay proxy supports all DHCP relay features while providing additional features and benefits.

Normally, extended DHCP relay operates as a helper application for DHCP operations. Except for the ability to add DHCP relay agent options and the gateway address (giaddr) to DHCP packets, DHCP relay is transparent to DHCP clients and DHCP servers, and simply forwards messages between DHCP clients and servers.

When you configure DHCP relay to operate in proxy mode, the relay is no longer transparent. In proxy mode, DHCP relay conceals DHCP server details from DHCP clients, which interact with a DHCP relay in proxy mode as though it is the DHCP server. For DHCP servers there is no change, because proxy mode has no effect on how the DHCP server interacts with the DHCP relay.

**NOTE:** You cannot configure both DHCP relay proxy and extended DHCP local server on the same interface.

---

### Interaction Among DHCP Relay Proxy, DHCP Client, and DHCP Servers

---

The DHCP relay agent is configured on the router (or switch), which operates between the DHCP client and one or more DHCP servers.

The following steps provide a high-level description of how DHCP relay proxy interacts with DHCP clients and DHCP servers.

1. The DHCP client sends a discover packet to locate a DHCP server in the network from which to obtain configuration parameters for the subscriber.
2. The DHCP relay proxy receives the discover packet from the DHCP client and forwards copies of the packet to each supporting DHCP server. The DHCP relay proxy then creates a client table entry to keep track of the client state.
3. In response to the discover packet, each DHCP server sends an offer packet to the client, which the DHCP relay proxy receives. The DHCP relay proxy does the following:
  - a. Selects the first offer received as the offer to sent to the client
  - b. Replaces the DHCP server address with the address of the DHCP relay proxy

- c. Forwards the offer to the DHCP client.
4. The DHCP client receives the offer from the DHCP relay proxy.
5. The DHCP client sends a request packet that indicates the DHCP server from which to obtain configuration information—the request packet specifies the address of the DHCP relay proxy.
6. The DHCP relay proxy receives the request packet and forwards copies, which include the address of selected server, to all supporting DHCP servers.
7. The DHCP server requested by the client sends an acknowledgement (ACK) packet that contains the client configuration parameters.
8. The DHCP relay proxy receives the ACK packet, replaces the DHCP server address with its own address, and forwards the packet to the client.
9. The DHCP client receives the ACK packet and stores the configuration information.
10. If configured to do so, the DHCP relay proxy installs a host route and Address Resolution Protocol (ARP) entry for the DHCP client.
11. After the initial DHCP lease is established, the DHCP relay proxy receives all lease renewals and lease releases from the DHCP client and forwards them to the DHCP server.

### Benefits of Using DHCP Relay Proxy

DHCP relay proxy provides the following benefits:

- DHCP server isolation and DoS protection—DHCP clients are unable to detect the DHCP servers, learn DHCP server addresses, or determine the number of servers that are providing DHCP support. Server isolation also provides denial-of-service (DoS) protection for the DHCP servers.
- Multiple lease offer selection—DHCP relay proxy receives lease offers from multiple DHCP servers and selects a single offer to send to the DHCP client, thereby reducing traffic in the network. Currently, the DHCP relay proxy selects the first offer received.
- Support for both numbered and unnumbered Ethernet interfaces—For DHCP clients connected through Ethernet interfaces, when the DHCP client obtains an address, the DHCP relay proxy adds an access internal host route specifying that interface as the outbound interface. The route is automatically removed when the lease time expires or when the client releases the address.
- Logical system support—DHCP relay proxy can be configured in a logical system, whereas a non-proxy mode DHCP relay cannot.

### Enabling DHCP Relay Proxy Mode

You can enable DHCP relay proxy mode on all interfaces or a group of interfaces.

To enable DHCP relay proxy mode:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Enable DHCP relay proxy mode.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set proxy-mode
```

## DHCPv6 Relay Agent

The DHCP relay agent operates as the interface between DHCP clients and the server. The DHCPv6 Relay Agent relays DHCP messages between DHCPv6 clients and DHCPv6 servers in an IPv6 network. For more information, read this topic.

- [DHCPv6 Relay Agent Overview on page 554](#)
- [Inserting DHCPv6 Interface-ID Option \(Option 18\) In DHCPv6 Packets on page 555](#)
- [Verifying and Managing DHCPv6 Relay Configuration on page 556](#)

### DHCPv6 Relay Agent Overview

The DHCPv6 relay agent enhances the DHCP relay agent by providing support in an IPv6 network. The DHCPv6 relay agent passes messages between the DHCPv6 client and the DHCPv6 server, similar to the way DHCP relay agent supports an IPv4 network. DHCPv6 relay agents eliminate the necessity of having a DHCPv6 server on each physical network.

When a DHCPv6 client logs in, the DHCPv6 relay agent uses the AAA service framework to interact with the RADIUS server to provide authentication and accounting. The RADIUS server, which is configured independently of DHCP, authenticates the client and supplies the IPv6 prefix and client configuration parameters, such as session timeout and the maximum number of clients allowed per interface.

**NOTE:** The PTX Series Packet Transport Routers do not support authentication for DHCPv6 relay agents.

---

**NOTE:**

The following DHCPv6 functionalities are not supported on ACX Series routers:

- Subscriber authentication for DHCPv6 relay agents
- DHCP snooping
- DHCPv6 client
- Liveness detection
- Dynamic profiles
- Option 37 support for remote ID insertion
- Bidirectional Forwarding Detection (BFD) for DHCPv6 relay
- DHCPv6 relay persistence on router reboot, crash, or power failure

The DHCPv6 relay agent is compatible with the DHCP local server and the DHCP relay agent, and can be enabled on the same interface as either the DHCP local server or DHCP relay agent.

To configure the DHCPv6 relay agent on the router (or switch), you include the **dhcpv6** statement at the **[edit forwarding-options dhcp-relay]** hierarchy level.

You can also include the **dhcpv6** statement at the following hierarchy levels:

- **[edit logical-systems *logical-system-name* forwarding-options dhcp-relay]**
- **[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* forwarding-options dhcp-relay]**
- **[edit routing-instances *routing-instance-name* forwarding-options dhcp-relay]**

See *DHCPv6 Monitoring and Management* for commands specific to viewing and clearing DHCPv6 bindings and statistics.

## Inserting DHCPv6 Interface-ID Option (Option 18) In DHCPv6 Packets

You can configure DHCPv6 relay agent to insert the DHCPv6 Interface-ID (option 18) in the packets that the relay sends to a DHCPv6 server. You can configure the option 18 support at either the DHCPv6 global or group level.

When you configure option 18 support, you can optionally include the following additional information:

- Prefix—Specify the **prefix** option to add a prefix to the interface identifier. The prefix can be any combination of hostname, logical system name, and routing instance name.
- Interface description—Specify the **use-interface-description** option to include the textual interface description instead of the interface identifier. You can include either the device interface description or the logical interface description.

- Option 82 Agent Circuit ID suboption (suboption 1)—Specify the **use-option-82** option to include the DHCPv4 Option 82 Agent Circuit ID suboption (suboption 1). This configuration is useful in a dual-stack environment, which has both DHCPv4 and DHCPv6 subscribers that reside over the same underlying logical interface. The router checks for the option 82 suboption 1 value and inserts it into the outgoing packets. If no DHCPv4 binding exists or if the binding does not have an option 82 suboption 1 value, the router sends the packets without adding an option 18.

**NOTE:** If you specify one of the optional configurations, and the specified information does not exist (for example, there is no interface description), DHCPv6 relay ignores the optional configuration and inserts the default interface identifier in the packets.

To insert the DHCPv6 Interface-ID option (option 18) in DHCPv6 packets:

1. Configure the DHCPv6 relay to include option 18.

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit relay-agent-interface-id
```

2. (Optional) Specify the prefix to include in option 18.

```
[edit forwarding-options dhcp-relay dhcpv6 relay-agent-interface-id]
user@host# set prefix prefix
```

3. (Optional) Specify that option 18 include the textual description of the interface. You can specify either the **logical** interface description or the **device** interface description.

```
[edit forwarding-options dhcp-relay dhcpv6 relay-agent-interface-id]
user@host# set use-interface-description (logical | device)
```

4. (Optional) Specify that option 18 use the DHCPv4 Option 82 Agent Circuit ID suboption (suboption 1) value.

```
[edit forwarding-options dhcp-relay dhcpv6 relay-agent-interface-id]
user@host# set use-option-82
```

## Verifying and Managing DHCPv6 Relay Configuration

**Purpose** View or clear address bindings or statistics for extended DHCPv6 relay agent clients:

- Action**
- To display the address bindings for extended DHCPv6 relay agent clients:

```
user@host> show dhcpv6 relay binding
```

- To display extended DHCPv6 relay agent statistics:

```
user@host> show dhcpv6 relay statistics
```

- To clear the binding state of DHCPv6 relay agent clients:

```
user@host> clear dhcpv6 relay binding
```

- To clear all extended DHCPv6 relay agent statistics:

```
user@host> clear dhcpv6 relay statistics
```

## Using External AAA Authentication Services with DHCP

The extended DHCP local server, including DHCPv6 local server, and the extended DHCP relay agent, including DHCPv6 relay agent, support the use of external AAA authentication

services, such as RADIUS, to authenticate DHCP clients. When the extended DHCP local server or relay agent receives a discover PDU from a client, the extended DHCP application contacts the AAA server to authenticate the DHCP client. The extended DHCP application can obtain client addresses and DHCP configuration options from the external AAA authentication server.

**NOTE:** This section uses the term *extended DHCP application* to refer to both the extended DHCP local server and the extended DHCP relay agent.

The external authentication feature also supports AAA directed logout. If the external AAA service supports a user logout directive, the extended DHCP application honors the logout and responds as though it were requested by a CLI management command. All of the client state information and allocated resources are deleted at logout. The extended DHCP application supports directed logout using the list of configured authentication servers you specify with the **authentication-server** statement at the **[edit access profile profile-name]** hierarchy level.

You can configure either global authentication support or group-specific support.

You must configure the **username-include** statement to enable the use of authentication. The **password** statement is not required and does not cause DHCP to use authentication if the **username-include** statement is not included.

To configure DHCP local server and DHCP relay agent authentication support:

1. Specify that you want to configure authentication options.

- For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# edit authentication
```

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit authentication
```

- For DHCPv6 local server:

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit authentication
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit authentication
```

2. (Optional) Configure a password that authenticates the username to the external authentication service.

See *Configuring Passwords for Usernames*.

3. (Optional) Configure optional features to create a unique username.

See [“Creating Unique Usernames for DHCP Clients” on page 559](#).

## Creating Unique Usernames for DHCP Clients

You can configure the extended DHCP application to include additional information in the username that is passed to the external AAA authentication service when the DHCP client logs in. This additional information enables you to construct usernames that uniquely identify subscribers (DHCP clients).

**NOTE:** If you do not include a username in the authentication configuration, the router (or switch) does not perform authentication; however, the IP address is provided by the local pool if it is configured.

When you use the DHCPv6 local server, you must configure authentication and the client username; otherwise client login fails.

The following list describes the optional information that you can include as part of the username:

- **circuit-type**—The circuit type used by the DHCP client, for example **enet**.
- **client-id**—The client identifier option (option 1). (DHCPv6 local server DHCPv6 relay agent only)
- **delimiter**—The delimiter character that separates components that make up the concatenated username. The default delimiter is a period (.). The semicolon (;) is not supported as a delimiter character.
- **domain-name**—The client domain name as a string. The router adds the @ delimiter to the username.
- **interface-description**—The description of the device (physical) interface or the logical interface.
- **interface-name**—The interface name, including the interface device and associated VLAN IDs.
- **logical-system-name**—The name of the logical system, if the receiving interface is in a logical system.
- **mac-address**—The client MAC address, in a string of the format **xxxx.xxxx.xxxx**.

For DHCPv6 clients, because the DHCPv6 packet format has no specific field for the client MAC address, the MAC address is derived from among several sources with the following priority:

- Client DUID Type 1 or Type 3.
- Option 79 (client link-layer address), if present.
- The packet source address if the client is directly connected.
- The link local address.

- **option-60**—The portion of the option 60 payload that follows the length field. (Not supported for DHCPv6 local server)
- **option-82 <circuit-id> <remote-id>**—The specified contents of the option 82 payload. (Not supported for DHCPv6 local server)
  - **circuit-id**—The payload of the Agent Circuit ID suboption.
  - **remote-id**—The payload of the Agent Remote ID suboption.
  - Both **circuit-id** and **remote-id**—The payloads of both suboptions, in the format: **circuit-id[delimiter]remote-id**.
  - Neither **circuit-id** or **remote-id**—The raw payload of the option 82 from the PDU is concatenated to the username.

**NOTE:** For DHCP relay agent, the option 82 value used in creating the username is based on the option 82 value that is encoded in the outgoing (relayed) PDU.

- **relay-agent-interface-id**—The Interface-ID option (option 18). (DHCPv6 local server or DHCPv6 relay agent only)
- **relay-agent-remote-id**—The DHCPv6 Relay Agent Remote-ID option (option 37). (DHCPv6 local server or DHCPv6 relay agent only)
- **relay-agent-subscriber-id**—(On routers only) The DHCPv6 Relay Agent Subscriber-ID option (option 38). (DHCPv6 local server or DHCPv6 relay agent only)
- **routing-instance-name**—The name of the routing instance, if the receiving interface is in a routing instance.
- **user-prefix**—A string indicating the user prefix.
- **vlan-tags**—The subscriber VLAN tags. Includes the outer VLAN tag and, if present, the inner VLAN tag. You can use this option instead of the **interface-name** option when the outer VLAN tag is unique across the system and you do not need the underlying physical interface name to be part of the format.

The router (switch) creates the unique username by including the specified additional information in the following order, with the fields separated by a delimiter.

For DHCP local server and DHCP relay agent:

```
user-prefix[delimiter]mac-address[delimiter]logical-system-name[delimiter]
routing-instance-name[delimiter]circuit-type[delimiter]interface-name[delimiter]option-82[delimiter]
option-60@domain-name
```

For DHCPv6 local server:

```
user-prefix[delimiter]mac-address[delimiter]logical-system-name[delimiter]routing-instance-name[delimiter]
circuit-type[delimiter]interface-name[delimiter]relay-agent-remote-id[delimiter]
relay-agent-subscriber-id[delimiter]relay-agent-interface-id[delimiter]client-id@domain-name
```

To configure a unique username:

1. Specify that you want to configure authentication.

- For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# edit authentication
```

- For DHCPv6 local server:

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit authentication
```

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit authentication
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit authentication
```

**NOTE:** You can also configure authentication and usernames for groups at additional hierarchy levels. See [authentication \(DHCP Local Server\)](#) and [authentication \(DHCP Relay Agent\)](#).

2. Specify that you want to include optional information in the username. (DHCP local server, DHCPv6 local server, DHCP relay agent, and DHCPv6 relay agent all support the **username-include** statement.)

```
[edit system services dhcp-local-server authentication]
user@host# set username-include
```

3. (Optional) Specify the optional information you want to include in the username. DHCP local server, DHCPv6 local server, DHCP relay agent, and DHCPv6 relay agent all support the **username-include** statement.

The following sample configuration produces this unique username:

**wallybrown.00:00:5e:00:53:ff.enet@example.com**

```
[edit system services dhcp-local-server authentication username-include]
user@host# set username-include circuit-type
user@host# set username-include domain-name example.com
user@host# set username-include mac-address
user@host# set username-include user-prefix wallybrown
```

## Specifying the Maximum Number of DHCP Clients Per Interface

By default, there is no limit to the number of DHCP local server or DHCP relay clients allowed on an interface. However, you can override the default setting and specify the maximum number of clients allowed per interface, in the range 1 through 500,000. When the number of clients on the interface reaches the specified limit, no additional DHCP Discover PDUs or DHCPv6 Solicit PDUs are accepted. When the number of clients subsequently drops below the limit, new clients are again accepted.

**NOTE:** The maximum number of DHCP (and DHCPv6) local server clients or DHCP (and DHCPv6) relay clients can also be specified by Juniper Networks VSA 26-143 during client login. The VSA-specified value always takes precedence if the `interface-client-limit` statement specifies a different number.

If the VSA-specified value differs with each client login, DHCP uses the largest limit set by the VSA until there are no clients on the interface.

To configure the maximum number of DHCP clients allowed per interface:

1. Specify that you want to configure override options.

- For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# edit overrides
```

- For DHCPv6 local server:

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit overrides
```

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit overrides
```

2. Configure the maximum number of clients allowed per interface. (DHCP local server, DHCPv6 local server, DHCP relay agent and DHCPv6 relay agent all support the `interface-client-limit` statement.)

```
[edit system services dhcp-local-server overrides]
user@host# set interface-client-limit number
```

**NOTE:** For DHCP local server and DHCP relay agent, you can use either the `interface-client-limit` statement or the `client-discover-match incoming-interface` statement to set a limit of one client per interface. The `interface-client-limit` statement with a value of 1 retains the existing client and rejects any new client connections. The `client-discover-match incoming-interface` statement deletes the existing client and allows a new client to connect.

## DHCP Local Server Handling of Client Information Request Messages

DHCP clients that already have externally provided addresses may solicit further configuration information from a DHCP server by sending a DHCP inform or DHCPv6 information-request message that indicates what information is desired. These message types can be collectively referred to as information request messages. By default, DHCP local server and DHCPv6 local server ignore any DHCP information requests that they receive. You can override this default behavior to enable processing of these messages.

If you enable processing of information requests, DHCP local server responds to the client with a DHCP acknowledgment message that includes the requested information—if it is available. DHCPv6 local server responds in the same manner but uses a DHCP reply message. No subscriber management or DHCP-management is applied as a result of the DHCP information request message.

By default, DHCP relay and DHCP relay proxy automatically forward DHCP information request messages without modification if the messages are received on an interface configured for a DHCP server group. DHCP relay and relay proxy drop information request messages received on any other interfaces. You cannot disable this default DHCP relay and relay proxy behavior.

The information requested by these clients is typically configured with the `dhcp-attributes` statement for an address pool defined by the `address-assignment pool pool-name` statement at the `[edit access]` hierarchy level.

When you enable processing of DHCP information requests, you can optionally specify the name of the pool from which the local server retrieves the requested configuration information for the client. If you do not specify a local pool, then the local server requests that AAA selects and returns only the name of the relevant pool.

**NOTE:** PPP interfaces are not supported on EX Series switches.

When DHCPv6 is configured over PPP interfaces, the PPP RADIUS authentication data can be used to select the pool from which the response information is taken. Additionally other RADIUS attributes can also be inserted into the DHCPv6 reply message. If an overlap exists between RADIUS attributes and local pool attributes, the RADIUS values are used instead of the local configuration data. If no RADIUS information is received from the underlying PPP interface, then the behavior is the same as described previously for non-PPP interfaces.

## Enabling Processing of Client Information Requests

By default, DHCP local server and DHCPv6 local server do not respond to information request (DHCP inform and DHCPv6 information-request) messages from the client. You can enable DHCP local server and DHCPv6 local server to process these messages and respond to them with an acknowledgment (ack or reply message, respectively) and the requested information.

DHCP relay agent automatically forwards the information request messages without modification to the configured server group by means of the interfaces configured for the respective server group. The messages are dropped if they are received on an unconfigured interface. DHCP relay proxy also supports forwarding these messages. You cannot disable forwarding of the information request messages.

Configure one or more local address pools if you want to use a local pool rather than one provided by AAA. See *Configuring an Address-Assignment Pool Name and Addresses*. For processing information request messages, the address configuration is not necessary. For DHCP local server, you must specify the IPv4 family; for DHCPv6 local server, you must specify the IPv6 family.

See *Configuring DHCP Client-Specific Attributes Applied When Clients Obtain an Address* for details about how to configure the information sought by clients that send information request messages.

To enable processing of DHCP client information request messages:

1. Specify that you want to configure override options.

- For DHCP local server:

```
[edit system services dhcp-local-server overrides]
user@host# set process-inform
```

- For DHCPv6 local server:

```
[edit system services dhcp-local-server dhcpv6 overrides]
user@host# set process-inform
```

2. (Optional) Specify a pool name from which DHCP information is returned to the client.

- For DHCP local server:

```
[edit system services dhcp-local-server overrides process-inform]
user@host# set pool pool-name
```

- For DHCPv6 local server:

```
[edit system services dhcp-local-server dhcpv6 overrides process-inform]
user@host# set pool pool-name
```

## Sending Release Messages When Clients Are Deleted

By default, when DHCP relay and relay proxy delete a client, they do not send a release message to the DHCP server. You can override the default behavior and configure DHCP relay and relay proxy to send a release message whenever they delete a client. The release message sent by DHCP relay and relay proxy includes option 82 information.

**NOTE:** You must include the `send-release-on-delete` statement to configure DHCP relay and relay proxy to send the release message when the `client-discover-match` statement is included.

You can use the `[edit forwarding-options dhcp-relay dhcpv6]` hierarchy level to override the default behavior for DHCPv6 relay agent.

To send a release message:

1. Specify that you want to configure override options.

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit overrides
```

2. Specify that you want DHCP relay and relay proxy (or DHCPv6 relay agent) to send a release message when clients are deleted.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set send-release-on-delete
```

## Understanding Dynamic Reconfiguration of Extended DHCP Local Server Clients

Dynamic reconfiguration of clients enables the extended DHCP local server to initiate a client update without waiting for the client to initiate a request.

### Default Client/Server Interaction

Typically the DHCP client initiates all of the basic DHCP client/server interactions. The DHCP server sends information to a client only in response to a request from that client. This behavior does not enable a client to be quickly updated with its network address and configuration in the event of server changes:

**NOTE:** Technically, the DHCP client/server interactions are the same on routers and switches. However, the primary usage of this technology on the routers is for subscriber management. The switches are not used for subscriber management. Therefore, this topic provides two sample scenarios. The actions are the same, but the implementation details are different.

- On routers—Suppose a service provider restructures its addressing scheme or changes the server IP addresses that it provided to clients. Without dynamic reconfiguration, the service provider typically clears the DHCP server binding table, but cannot inform the DHCP clients that their bindings have been cleared. Consequently, the DHCP client operates as though its IP address is still valid, but it is now unable to communicate over the access network, resulting in an outage. The DHCP local server needs to wait for the client to send a message to renew its lease or rebind to the server. In response, the server sends a NAK message to the client to force it to begin the DHCP connection process again. Alternatively, the provider can wait for customers to make a service call about the network failures and then instruct them to power cycle their customer premises equipment to reinitiate the connection. Neither of these actions is timely or convenient for customers.
- On switches—Suppose you restructure the addressing scheme or change the server IP addresses that the DHCP server provides to clients. Without dynamic reconfiguration, the network typically clears the DHCP server binding table, but cannot inform the DHCP clients that their bindings have been cleared. Consequently, the DHCP client operates as though its IP address is still valid, but it is now unable to communicate over the access network, resulting in an outage. The DHCP local server needs to wait for the client to send a message to renew its lease or rebind to the server. In response, the server sends a NAK message to the client to force it to begin the DHCP connection process again. Alternatively, you can wait for users to notify you of the network failures and then instruct them to power cycle their equipment to reinitiate the connection. Neither of these actions is timely or convenient for users.

---

### Dynamic Client/Server Interaction for DHCPv4

Dynamic reconfiguration for DHCPv4 is available through a partial implementation of RFC 3203, *DHCP Reconfigure Extension* for DHCPv4. It enables the DHCPv4 local server to send a message to the client to force reconfiguration.

The server sends a `forcerenew` message to a DHCPv4 client, initiating a message exchange. In response, DHCPv4 clients that support the `forcerenew` message then send a lease renewal message to the server. The server rejects the lease renewal request and sends a NAK to the client, causing the client to reinitiate the DHCP connection. A successful reconnection results in the reconfiguration of the DHCP client. Only the exchange of `forcerenew`, `renew`, and NAK messages is supported from RFC 3202. DHCP relay and DHCP relay proxy do not participate in the client reconfiguration or react to `forcerenew` messages other than to forward them to the client.

When the local server state machine starts the reconfiguration process on a bound client, the client transitions to the reconfiguring state and the local server sends a `forcerenew` message to the client. Because the client was in the bound state before entering the

reconfiguring state, all subscriber services or DHCP-managed services, such as forwarding and statistics, continue to work. Client statistics are not maintained in the interval between a successful reconfiguration and the subsequent client binding. When the server responds to the client renewal request with a NAK, the client entry is removed from the binding table and final statistics are reported. New statistics are collected when the client sends a discover message to establish a new session.

### Dynamic Client/Server Interaction for DHCPv6

Dynamic reconfiguration for DHCPv6 is available through a partial implementation of RFC 3315, *Dynamic Host Configuration Protocol for IPv6 (DHCPv6)*. It enables the DHCPv6 local server to send a message to the client to force reconfiguration.

DHCPv6 servers send reconfigure messages to DHCPv6 clients, initiating a message exchange. In response, DHCPv6 clients that support the reconfigure message transition to the renewing state and send a renew message to the server. The server returns a reply message with a lifetime of zero (0). The client transitions to the init state and sends a solicit message. The server sends an advertise message to indicate that it is available for service. The client sends a request for configuration parameters, which the server then includes in its reply. DHCP relay and DHCP relay proxy do not participate in the client reconfiguration or react to reconfigure messages other than to forward them to the client.

When a DHCPv6 server is triggered to initiate reconfiguration on a bound DHCPv6 client, the client transitions to the reconfigure state. All subscriber services, such as forwarding and statistics, continue to work. The server then sends the reconfigure message to the client. If the DHCPv6 client is already in the reconfigure state, the DHCPv6 server ignores the reconfiguration trigger. For clients in any state other than bound or reconfigure, the server clears the binding state of the client, as if the **clear dhcpv6 server binding** command had been issued.

### Manually Forcing the Local Server to Initiate the Reconfiguration Process

You can force the local server to initiate the reconfiguration process for clients by issuing the **request dhcp server reconfigure** command for DHCPv4 clients, and the **request dhcpv6 server reconfigure** command for DHCPv6 clients. Command options determine whether reconfiguration is then attempted for all clients or specified clients.

### Action Taken for Events That Occur During a Reconfiguration

Events that take place while a reconfiguration is in process take precedence over the reconfiguration. [Table 47 on page 567](#) lists the actions taken in response to several different events.

**Table 47: Action Taken for Events That Occur During a Reconfiguration**

| Event                                                                            | Action                                  |
|----------------------------------------------------------------------------------|-----------------------------------------|
| Server receives a discover (DHCPv4) or solicit (DHCPv6) message from the client. | Server drops packet and deletes client. |

*Table 47: Action Taken for Events That Occur During a Reconfiguration (continued)*

| Event                                                                                                                       | Action                                                                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Server receives a request, renew, rebind, or init-reboot message from the client.                                           | DHCPv4—Server sends NAK message and deletes client.<br><br>DHCPv6—Server drops packet and deletes client. Server replies to renew message with lease time of zero (0). |
| Server receives a release or decline message from the client.                                                               | Server deletes client.                                                                                                                                                 |
| The client lease times out.                                                                                                 | Server deletes client.                                                                                                                                                 |
| The <b>clear dhcp server binding</b> command is issued.                                                                     | Server deletes client.                                                                                                                                                 |
| The <b>request dhcp server reconfigure</b> (DHCPv4) or <b>request dhcpv6 server reconfigure</b> (DHCPv6) command is issued. | Command is ignored.                                                                                                                                                    |
| GRES or DHCP restart occurs.                                                                                                | Reconfiguration process is halted.                                                                                                                                     |

#### Benefits of Dynamic Reconfiguration of DHCP Local Server Clients

- Enable the DHCP local server to dynamically reconfigure DHCP clients, avoiding extended outages because of server configuration changes that otherwise require the server to wait for the client to renew its lease or rebind to the server.

### Configuring Dynamic Client Reconfiguration of Extended Local Server Clients Overview

The DHCP local server can initiate reconfiguration of its clients to avoid extended outages because of server configuration changes. You can enable dynamic reconfiguration for all DHCP clients or only the DHCP clients serviced by a specified group of interfaces, and you can modify the behavior accordingly.

Starting in Junos OS Release 14.1, you can modify the behavior of the process in which the DHCP local server initiates reconfiguration of its clients by including the appropriate configuration statements. You can provide the statements at the **[edit system services dhcp-local-server reconfigure]** hierarchy level for all DHCPv4 clients, and at the **[edit system services dhcp-local-server dhcpv6 reconfigure]** hierarchy level for all DHCPv6 clients. To override this global configuration for only the DHCP clients serviced by a specified group of interfaces, you can include the statements with different values at the **[edit system services dhcp-local-server group group-name reconfigure]** hierarchy level for DHCPv4 clients, and at the **[edit system services dhcp-local-server dhcpv6 group group-name reconfigure]** hierarchy level for DHCPv6 clients.

To configure dynamic reconfiguration of DHCP clients:

1. Enable dynamic reconfiguration with default values for all clients.

For DHCPv4:

```
[edit system services dhcp-local-server]
user@host# set reconfigure
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6]
user@host# set reconfigure
```

2. (Optional) Enable dynamic reconfiguration for only the clients serviced by a group of interfaces.

For DHCPv4:

```
[edit system services dhcp-local-server group-name]
user@host# set reconfigure
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 group group-name]
user@host# set reconfigure
```

3. (Optional) Configure how the server attempts reconfiguration.  
See [“Configuring Dynamic Reconfiguration Attempts for DHCP Clients” on page 570](#).
4. (Optional) Configure the response to a failed reconfiguration.  
See [“Configuring Deletion of the Client When Dynamic Reconfiguration Fails” on page 571](#).
5. (Optional) Configure the behavior in response to a RADIUS-initiated disconnect.  
See [“Configuring Reconfiguration of the Client on Receipt of RADIUS-Initiated Disconnect” on page 572](#).
6. (Optional) Configure a token for rudimentary server authentication.  
See [“Configuring a Token for DHCP Local Server Authentication” on page 516](#).
7. (Optional) Prevent DHCPv6 clients from binding if they do not support reconfigure messages.  
See [“Preventing Binding of Clients That Do Not Support Reconfigure Messages” on page 521](#).

## Requesting DHCP Local Server to Initiate Reconfiguration of Client Bindings

You can request that the DHCP local server initiate reconfiguration of all of clients or only specified clients.

To request reconfiguration of all clients:

- Specify the **all** option.

```
user@host> request dhcp server reconfigure all
```

You can use any of the following methods to request reconfiguration of specific clients:

- Specify the IP address of the DHCPv4 client.

```
user@host> request dhcp server reconfigure 192.168.27.3
```

- Specify the MAC address of a DHCPv4 client.

```
user@host> request dhcp server reconfigure 00:00:5E:00:53:67
```

- Specify an interface; reconfiguration is attempted for all clients on this interface.

```
user@host> request dhcp server reconfigure interface fe-0/0/0.100
```

- Specify a logical system; reconfiguration is attempted for all clients or the specified clients in this logical system.

```
user@host> request dhcp server reconfigure all logical-system ls-bldg5
```

- Specify a routing instance; reconfiguration is attempted for all clients or the specified clients in this routing instance.

```
user@host> request dhcp server reconfigure all routing-instance ri-boston
```

## Configuring Dynamic Reconfiguration Attempts for DHCP Clients

You can configure how many attempts the local server makes to initiate reconfiguration of the DHCP client by sending `forcerenew` or `reconfigure` messages. You can also specify how long the server waits between attempts. By default, eight attempts are made and the initial interval is two seconds.

Each successive attempt doubles the interval between attempts. For example, if the first value is 2, the first retry is attempted 2 seconds after the first attempt fails. The second retry is attempted 4 seconds after the first retry fails. The third retry is attempted 8 seconds after the second retry fails, and so on. A group configuration takes precedence over a DHCP local server configuration.

(Optional) To configure DHCP local server reconfiguration behavior for all DHCP clients:

1. Specify the number of reconfiguration attempts.

For DHCPv4:

```
[edit system services dhcp-local-server reconfigure]
user@host# set attempts 5
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 reconfigure]
user@host# set attempts 5
```

2. Specify the interval between reconfiguration attempts.

For DHCPv4:

```
[edit system services dhcp-local-server reconfigure]
user@host# set timeout 8
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 reconfigure]
user@host# set timeout 8
```

To override the global configuration for a particular group of clients, include the statements at the `[edit system services dhcp-local-server group group-name reconfigure]` hierarchy level or the `[edit system services dhcpv6 dhcp-local-server group group-name reconfigure]` hierarchy level.

## Configuring Deletion of the Client When Dynamic Reconfiguration Fails

You can configure the local server to delete the client when the maximum number of reconfiguration attempts has been made without success. By default, the client's original configuration is restored.

(Optional) To configure the DHCP local server to delete the client when reconfiguration is not successful, for all clients:

- Specify the client deletion.

For DHCPv4:

```
[edit system services dhcp-local-server reconfigure]
user@host# set clear-on-abort
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 reconfigure]
user@host# set clear-on-abort
```

To override the global configuration for a particular group of clients, include the statement at the `[edit system services dhcp-local-server group group-name reconfigure]` hierarchy

level or the `[edit system services dhcpv6 dhcp-local-server group group-name reconfigure]` hierarchy level.

## Configuring Reconfiguration of the Client on Receipt of RADIUS-Initiated Disconnect

You can configure the local server to reconfigure the client when the client receives a RADIUS-initiated disconnect. By default, the client is deleted when a RADIUS-initiated disconnect is received.

(Optional) To configure the DHCP local server to reconfigure the client instead of deleting the client when a RADIUS-initiated disconnect is received, for all clients:

- Specify the RADIUS-initiated disconnect trigger.

For DHCPv4:

```
[edit system services dhcp-local-server reconfigure trigger]
user@host# set radius-disconnect
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 reconfigure trigger]
user@host# set radius-disconnect
```

To override the global configuration for a particular group of clients, include the statement at the `[edit system services dhcp-local-server group group-name reconfigure trigger]` hierarchy level or the `[edit system services dhcpv6 dhcp-local-server group group-name reconfigure trigger]` hierarchy level.

### Release History Table

## Applying a Common DHCP Relay Agent Configuration to Groups of DHCP Servers

You can apply a common DHCP or DHCPv6 relay configuration to a set of DHCP server IP addresses configured as a server group. For this, you must configure a group of DHCP server addresses, and apply them as an active server group. For more information, read this topic.

- [Configuring Active Server Groups to Apply a Common DHCP Relay Agent Configuration to Named Server Groups on page 573](#)

## Configuring Active Server Groups to Apply a Common DHCP Relay Agent Configuration to Named Server Groups

You can apply a common DHCP or DHCPv6 relay configuration to a set of DHCP server IP addresses configured as a server group, by specifying that group with the **active-server-group** statement globally or at the group level (configured with the **group** statement). When you apply the active server group at the group level, it overrides a global active server group configuration. An active server group is sometimes referred to as a trusted group of servers.

For example, you might want to direct certain DHCP clients to a different DHCP server than other clients, and you have different relay configurations for the clients. You can configure an interface group for each set of clients, specifying the DHCP relay interfaces for the group and any other relay configuration. In each of these groups, you specify an active server group to which each client groups traffic is forwarded.

To configure a group of DHCP server addresses and apply them as an active server group:

1. Specify the name of the server group.

- For DHCPv4 servers:

```
[edit forwarding-options dhcp-relay]
user@host# set server-group server-group-name
```

- For DHCPv6 servers:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# set server-group server-group-name
```

2. Add the IP addresses of the DHCP servers belonging to the group.

```
[edit forwarding-options dhcp-relay server-group server-group-name]
user@host# set ip-address1
user@host# set ip-address2
```

**NOTE:** Starting in Junos OS Release 18.4R1, up to 32 server IP addresses are supported per DHCPv4 server group. In earlier releases, a maximum of 5 server IP addresses are supported for DHCPv4 servers. Configuring more than the maximum number of server addresses results in a commit check failure.

3. Apply the server group as an active server group.

- For all DHCP clients, unless overridden:

```
[edit forwarding-options dhcp-relay]
user@host# set active-server-group server-group-name
```

- For a group of DHCP relay interfaces, overriding the global active server group:

```
[edit forwarding-options dhcp-relay group interface-group-name]
user@host# set active-server-group server-group-name
```

- For all DHCPv6 clients, unless overridden for a group:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# set active-server-group server-group-name
```

- For a group of DHCPv6 relay interfaces, overriding the global active server group:

```
[edit forwarding-options dhcp-relay dhcpv6 group interface-group-name]
user@host# set active-server-group server-group-name
```

Consider the following example. Three groups of DHCP server addresses are configured, Default, Campus-A, and Campus-B. The Default group is applied as the global active server group for the overall DHCP relay configuration.

The Campus-A server group is assigned as the active server group for interface group Campus-A-v10-DHCP-RELAY. DHCP traffic received on the interfaces in Campus-A-v10-DHCP-RELAY is forwarded to DHCP servers 198.51.100.100 and 198.51.100.101.

The Campus-B server group is assigned as the active server group for interface group Campus-B-v200-DHCP-RELAY. DHCP traffic received on the interfaces in Campus-B-v200-DHCP-RELAY is forwarded to DHCP servers 198.51.100.55 and 198.51.100.56.

All other DHCP traffic is forwarded to DHCP server 203.0.113.1.

```
[edit forwarding-options dhcp-relay]
#
# Server groups
user@host# set server-group Default 203.0.113.1
user@host# set server-group Campus-A 198.51.100.100
user@host# set server-group Campus-A 198.51.100.101
user@host# set server-group Campus-B 198.51.100.55
user@host# set server-group Campus-B 198.51.100.56
#
# Default server group applied globally.
user@host# set active-server-group Default
#
# Interface groups with application of active server groups
user@host# set group Campus-A-v10-DHCP-RELAY interface ge-1/1/0.1
user@host# set group Campus-A-v10-DHCP-RELAY interface ge-1/1/0.2
user@host# set group Campus-A-v10-DHCP-RELAY interface ge-1/1/0.3
user@host# set group Campus-A-v10-DHCP-RELAY active-server-group Campus-A
user@host# set group Campus-B-v200-DHCP-RELAY interface ge-2/2/0.4
user@host# set group Campus-B-v200-DHCP-RELAY interface ge-2/2/0.5
user@host# set group Campus-B-v200-DHCP-RELAY interface ge-2/1/0.6
user@host# set group Campus-B-v200-DHCP-RELAY active-server-group Campus-B
```

In some configurations, servers in an active server group maintain redundant information about the DHCP clients. If the binding server later becomes inaccessible, the client is

unable to renew the lease from that server. When the client attempts to rebind to a server, other servers in the group with the client information can reply with an ACK message. By default, instead of forwarding the ACK to the DHCP client, the relay agent drops any such ACKs that it receives from any server other than the binding server because the new server address does not match the expected server address in the DHCP client entry. Consequently the lease cannot be extended by any of the redundant servers.

Starting in Junos OS Release 16.2R1, you can enable a DHCPv4 relay agent to forward DHCP request (renew or rebind) ACKs from any server in the active server group (thus, any trusted server). The relay agent updates the client entry with the new server address. Because the servers in the group are expected to mirror the client information exactly, the lease option is expected to be the same as for the original server and the relay agent does not need to verify the lease option.

Starting in Junos OS Release 18.4R1, this capability is extended to allow a DHCP relay agent to forward DHCP information request (DHCPINFORM) ACK messages from any server in the active server group.

To enable ACK forwarding from any server in the active server group:

- Enable forwarding for the active server group.

```
[edit forwarding-options dhcp-relay active-server-group]
user@host# set allow-server-change
```

- [Grouping Interfaces and Applying a Common DHCP Configuration to the Group on page 575](#)

## Grouping Interfaces and Applying a Common DHCP Configuration to the Group

You use the group feature to group a set of interfaces and then apply a common DHCP configuration such as extended DHCP local server, DHCPv6 local server, DHCP relay agent, and DHCPv6 relay agent to the named interface group. For more information, read this topic.

- [Grouping Interfaces with Common DHCP Configurations on page 576](#)
- [Guidelines for Configuring Interface Ranges for Groups of DHCP Interfaces on page 576](#)
- [Configuring Group-Specific DHCP Local Server Options on page 578](#)
- [Configuring Group-Specific DHCP Relay Options on page 578](#)

## Grouping Interfaces with Common DHCP Configurations

You use the group feature to group a set of interfaces and then apply a common DHCP configuration to the named interface group. The extended DHCP local server, DHCPv6 local server, DHCP relay agent, and DHCPv6 relay agent all support interface groups.

The following steps create a DHCP local server group; the steps are similar for the DHCPv6 local server, DHCP relay agent, and DHCPv6 relay agent.

To configure a DHCP local server interface group:

1. Specify that you want to configure DHCP local server.

```
[edit system services]
user@host# edit dhcp-local-server
```

2. Create the group and assign a name.

```
[edit system services dhcp-local-server]
user@host# edit group boston
```

3. Specify the names of one or more interfaces on which the extended DHCP application is enabled. You can repeat the **interface interface-name** statement to specify multiple interfaces within the group, but you cannot use the same interface in more than one group.

```
[edit system services dhcp-local-server group boston]
user@host# set interface fe-1/0/1.1
user@host# set interface fe-1/0/1.2
```

4. (Optional) You can use the **upto** option to specify a range of interfaces for a group.

```
[edit system services dhcp-local-server group boston]
user@host# set interface fe-1/0/1.3 upto fe-1/0/1.9
```

5. (Optional) You can use the **exclude** option to exclude a specific interface or a specified range of interfaces from the group. For example:

```
[edit system services dhcp-local-server group boston]
user@host# set interface fe-1/0/1.1 upto fe-1/0/1.102
user@host# set interface fe-1/0/1.6 exclude
user@host# set interface fe-1/0/1.70 upto fe-1/0/1.80 exclude
```

## Guidelines for Configuring Interface Ranges for Groups of DHCP Interfaces

This topic describes guidelines to consider when configuring interface ranges for named interface groups for DHCP local server and DHCP relay. The guidelines refer to the following configuration statement:

```
user@host# set interface interface-name upto upto-interface-name
```

- The start subunit, **interface *interface-name***, serves as the key for the stanza. The remaining configuration settings are considered attributes.
- If the subunit is not included, an implicit .0 subunit is enforced. The implicit subunit is applied to all interfaces when autoconfiguration is enabled. For example, **interface ge-2/2/2** is treated as **interface ge-2/2/2.0**.
- Ranged entries contain the **upto** option, and the configuration applies to all interfaces within the specified range. The start of a ranged entry must be less than the end of the range. Discrete entries apply to a single interface, except in the case of autoconfiguration, in which a 0 (zero) subunit acts as a wildcard.
- Interface stanzas defined within the same router or switch context are dependent and can constrain each other—both DHCP local server and DHCP relay are considered. Interface stanzas defined across different router (switch) contexts are independent and do not constrain one another.
- Each interface stanza, whether discrete or ranged, has a unique start subunit across a given router context. For example, the following configuration is not allowed within the same group because **ge-1/0/0.10** is the start subunit for both.

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.10
```

- Two groups cannot share interface space. For example, the following configuration is not allowed because the three stanzas share the same space and interfere with one another—interface **ge-1/0/0.26** is common to all three.

```
dhcp-relay group diamond interface ge-1/0/0.10 upto ge-1/0/0.30
dhcp-local-server group ruby interface ge-1/0/0.26
dhcp-relay group sapphire interface ge-1/0/0.25 upto ge-1/0/0.35
```

- Two ranges cannot overlap, either within a group or across groups. Overlapping occurs when two interface ranges share common subunit space but neither range is a proper subset of the other. The following ranges overlap:

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.20 upto ge-1/0/0.40
```

- A range can contain multiple nested ranges. A nested range is a proper subset of another range. When ranges are nested, the smallest matching range applies.

In the following example, the three ranges nest properly:

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.12 upto ge-1/0/0.15 exclude
interface ge-1/0/0.25 upto ge-1/0/0.29 exclude
```

- Discrete interfaces take precedence over ranges. In the following example, interface **ge-1/0/0.20** takes precedence and enforces an interface client limit of 5.

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.15 upto ge-1/0/0.25 exclude
interface ge-1/0/0.20 overrides interface-client-limit 5
```

## Configuring Group-Specific DHCP Local Server Options

You can include the following statements at the **[edit system services dhcp-local-server group group-name]** hierarchy level to set group-specific DHCP local server configuration options. Statements configured at the **[edit system services dhcp-local-server group group-name]** hierarchy level apply only to the named group of interfaces, and override any global DHCP local server settings configured with the same statements at the **[edit system services dhcp-local-server]** hierarchy level.

DHCPv6 local server supports the same set of statements with the exception of the **dynamic-profile** statement.

- **authentication**—Configure the parameters the router sends to the external AAA server.
- **dynamic-profile**—Specify the dynamic profile that is attached to a group of interfaces.
- **interface**—Specify one or more interfaces, or a range of interfaces, that are within the specified group.
- **liveness-detection**—Configure bidirectional failure detection timers and authentication criteria for static routes, or Layer 2 liveness detection using ARP and Neighbor Discovery packets. For more information, see [“DHCP Liveness Detection Overview” on page 580](#).
- **overrides**—Override the default configuration settings for the extended DHCP local server. For information, see [“Overriding the Default DHCP Local Server Configuration Settings Overview” on page 536](#).

## Configuring Group-Specific DHCP Relay Options

You can include the following statements at the **[edit forwarding-options dhcp-relay group group-name]** hierarchy level to set group-specific DHCP relay agent configuration options. Group-specific statements apply only to the named group of interfaces, and override any global DHCP relay agent settings for the same statement.

Include the statements at the **[edit forwarding-options dhcp-relay dhcpv6 group group-name]** hierarchy level to configure group-specific options for DHCPv6 relay agent.

- **active-server-group**—Configure an active server group to apply a common DHCP relay agent configuration for a named group of DHCP server addresses. For information, see [“Configuring Active Server Groups to Apply a Common DHCP Relay Agent Configuration to Named Server Groups” on page 573](#).
- **authentication**—Configure the parameters the router (or switch) sends to the external AAA server.
- **dynamic-profile**—Specify the dynamic profile that is attached to a group of interfaces.
- **interface**—Specify one or more interfaces, or a range of interfaces, that are within the specified group.

- **liveness-detection**—Configure bidirectional failure detection timers and authentication criteria for static routes, or Layer 2 liveness detection using ARP and Neighbor Discovery packets. For more information, see [“DHCP Liveness Detection Overview” on page 580](#).
- **overrides**—Override the default configuration settings for the extended DHCP relay agent. For information, see [“Overriding the Default DHCP Relay Configuration Settings” on page 533](#).
- **relay-agent-interface-id**—(DHCPv6 only) Insert the DHCPv6 Relay Agent Interface-ID option (option 18) in DHCPv6 packets destined for the DHCPv6 server.
- **relay-agent-remote-id**—(DHCPv6 only) Insert the DHCPv6 Relay Agent Remote-ID option (option 37) in DHCPv6 packets destined for the DHCPv6 server.
- **relay-option**—Configure selective processing, which uses DHCP options in client packets to identify and filter client traffic, and to specify the action DHCP relay agent takes with the traffic. For more information, see *Using DHCP Option Information to Selectively Process DHCP Client Traffic*.
- **relay-option-82**—(DHCPv4 only) Enable or disable the insertion of option 82 information in packets destined for a DHCP server. For information, see [“Using DHCP Relay Agent Option 82 Information” on page 539](#).
- **service-profile**—Specify the default subscriber service, (or default profile) which is activated when the subscriber (or DHCP client) logs in and no other service is activated by a RADIUS server or a provisioning server. For more information, see *Default Subscriber Service Overview*.

## Configuring High Availability in the DHCP Access Network

DHCP liveness detection for DHCP subscriber IP or DHCP client IP sessions utilizes an active liveness detection protocol to institute liveness detection checks for relevant clients. For more information, read this topic.

- [DHCP Liveness Detection Overview on page 580](#)
- [Configuring Detection of DHCP Relay or DHCP Relay Proxy Client Connectivity with BFD on page 581](#)
- [Configuring Detection of DHCP Local Server Client Connectivity with BFD on page 583](#)
- [Example: Configuring Global Liveness Detection with BFD for DHCP Relay Agent Clients on page 585](#)

## DHCP Liveness Detection Overview

Unlike PPP, DHCP does not define a native keepalive mechanism as part of either the DHCPv4 or DHCPv6 protocols. Without a keepalive mechanism, DHCP local server, DHCP relay, and DHCP relay proxy are unable to quickly detect if any of them has lost connectivity with a subscriber or a DHCP client. Instead, they must rely on standard DHCP subscriber session or DHCP client session termination messages.

DHCP clients often do not send DHCP release messages before exiting the network. The discovery of their absence is dependent on existing DHCP lease time and release request mechanisms. These mechanisms are often insufficient when serving as session health checks for clients in a DHCP subscriber access or a DHCP-managed network. Because DHCP lease times are typically too long to provide an adequate response time for a session health failure, and configuring short DHCP lease times can pose an undue burden on control plane processing, implementing a DHCP liveness detection mechanism enables better monitoring of bound DHCP clients. When configured with a liveness detection protocol, if a given subscriber (or client) fails to respond to a configured number of consecutive liveness detection requests, the subscriber (or client) binding is deleted and its resources released.

DHCP liveness detection for DHCP subscriber IP or DHCP client IP sessions utilizes an active liveness detection protocol to institute liveness detection checks for relevant clients. Clients must respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, then the liveness detection check fails and a failure action is implemented.

Using DHCP liveness detection, IP sessions are acted upon as soon as liveness detection checks fail. This faster response time serves to:

- Provide more accurate time-based accounting of subscriber (or DHCP client) sessions.
- Better preserve router (switch) resources.
- Help to reduce the window of vulnerability to some security attacks.

Examples of liveness detection protocols include Bidirectional Forwarding Detection (BFD) for both DHCPv4 and DHCPv6 subscribers, IPv4 Address Resolution Protocol (ARP) for DHCPv4 subscribers, and IPv6 Neighbor Unreachability Detection (NUD) using Neighbor Discovery (ND) packets for DHCPv6 subscribers.

Starting in Junos OS Release 17.4R1, the use of ARP packets for DHCPv4 and ND packets for DHCPv6 is supported on MX Series routers for Layer 2 liveness detection in addition to BFD liveness detection. In earlier releases, only BFD is supported for all platforms.

The two liveness detection methods are mutually exclusive.

When configuring BFD liveness detection, keep the following in mind:

- You can configure liveness detection for both DHCP local server and DHCP relay.
- You can configure DHCPv4 and DHCPv6 liveness detection either globally or per DHCPv4 or DHCPv6 group.
- DHCPv4 or DHCPv6 subscriber access clients that do not support BFD are not affected by the liveness detection configuration. These clients can continue to access the network (after they are validated) even if BFD liveness detection is enabled on the router (or switch).
- When configured, DHCPv4 or DHCPv6 initiates liveness detection checks for clients that support BFD when those clients enter a bound state.
- After protocol-specific messages are initiated for a BFD client, they are periodically sent to the subscriber (or client) IP address of the client and responses to those liveness detection requests are expected within a configured amount of time.
- If liveness detection responses are not received from clients that support BFD within the configured amount of time for a configured number of consecutive attempts, the liveness detection check is deemed to have failed. A configured failure action to clear the client binding is applied.
- The only failure action supported for Layer 2 Liveness detection is **clear-binding**.

When configuring DHCP ARP and ND Layer 2 liveness detection on MX Series, keep the following in mind:

- You can configure liveness detection for both DHCP local server and DHCP relay.
- You can configure DHCPv4 and DHCPv6 ARP and ND liveness detection globally, per DHCPv4 or DHCPv6 group, and per dual-stack group.
- ARP/ND liveness detection applies only to DHCP clients that:
  - Are directly connected over dynamic VLANs.
  - Have permanent Layer 2 entries.
- DHCPv6 clients must have a unique source MAC address and link-local address. Only single liveness detection entry is used for all IPv6 addresses associated with a specific client session.

## Configuring Detection of DHCP Relay or DHCP Relay Proxy Client Connectivity with BFD

You can configure liveness detection with Bidirectional Forwarding Detection (BFD) for DHCP subscriber IP sessions or DHCP client IP sessions to check the connectivity of DHCP relay clients. Clients must respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, then the liveness detection check fails and a failure action is implemented.

To configure liveness detection for DHCP relay:

1. Specify that you want to configure liveness detection.

- For DHCP global configuration:

```
[edit forwarding-options dhcp-relay]
user@host# edit liveness-detection
```

- For DHCP group configuration:

```
[edit forwarding-options dhcp-relay group group-name]
user@host# edit liveness-detection
```

**NOTE:** Liveness detection is also supported for DHCPv6 configurations. To configure DHCPv6 liveness detection, include the **liveness-detection** statement, and any subsequent configuration statements, at the **[edit forwarding-options dhcp-relay dhcpv6]** or **[edit forwarding-options dhcp-relay dhcpv6 group *group-name*]** hierarchy level.

2. (Optional) Specify that you want to use DHCP relay proxy mode.

```
[edit forwarding-options dhcp-relay group group-name]
user@host# set overrides proxy-mode
```

3. Specify that you want to configure the liveness detection method.

- For DHCP global configuration:

```
[edit forwarding-options dhcp-relay liveness-detection]
user@host# edit method
```

- For DHCP group configuration:

```
[edit forwarding-options dhcp-relay group group-name liveness-detection]
user@host# edit method
```

4. Specify the liveness detection method that you want DHCP to use.

**NOTE:** In releases earlier than Junos OS Release 17.4R1, the only method supported for liveness detection on all platforms is BFD.

Starting in Junos OS Release 17.4R1, the use of ARP packets for DHCPv4 and ND packets for DHCPv6 is supported on MX Series routers for Layer 2 liveness detection in addition to BFD liveness detection. The two liveness detection methods are mutually exclusive. See [DHCP Liveness Detection Using ARP and Neighbor Discovery Packets](#) for information about configuring ARP and ND Layer 2 liveness detection.

- For DHCP global configuration:

```
[edit forwarding-options dhcp-relay liveness-detection method]
user@host# edit bfd
```

- For DHCP group configuration:

```
[edit forwarding-options dhcp-relay group group-name liveness-detection method]
user@host# edit bfd
```

5. Configure the liveness detection method as desired.

See “[Example: Configuring Global Liveness Detection with BFD for DHCP Relay Agent Clients](#)” on page 585 for an example of how to globally configure DHCP relay liveness detection with BFD.

6. Configure the action the router takes when a liveness detection failure occurs.

- For DHCP global configuration:

```
[edit forwarding-options dhcp-relay liveness-detection]
user@host# edit failure-action action
```

- For DHCP group configuration:

```
[edit forwarding-options dhcp-relay group group-name liveness-detection]
user@host# edit failure-action action
```

- See Also**
- [Extended DHCP Relay Agent Overview on page 524](#)
  - *Example: Configuring Group Liveness Detection with BFD for DHCP Local Server Clients*

## Configuring Detection of DHCP Local Server Client Connectivity with BFD

You can configure liveness detection with Bidirectional Forwarding Detection (BFD) for DHCP subscriber IP sessions or DHCP client IP sessions to check the connectivity of DHCP local server clients. Clients must respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, then the liveness detection check fails and a failure action is implemented.

**NOTE:** You can also configure DHCP liveness detection for DHCP relay.

To configure liveness detection for DHCP local server:

1. Specify that you want to configure liveness detection.

- For DHCP global configuration:

```
[edit system services dhcp-local-server]
user@host# edit liveness-detection
```

- For DHCP group configuration:

```
[edit system services dhcp-local-server group group-name]
user@host# edit liveness-detection
```

**NOTE:** Liveness detection is also supported for DHCPv6 configurations. To configure DHCPv6 liveness detection, include the **liveness-detection** statement, and any subsequent configuration statements, at the **[edit system services dhcp-local-server dhcpv6]** or **[edit system services dhcp-local-server dhcpv6 group *group-name*]** hierarchy level.

2. Specify that you want to configure the liveness detection method.

- For DHCP global configuration:

```
[edit system services dhcp-local-server liveness-detection]
user@host# edit method
```

- For DHCP group configuration:

```
[edit system services dhcp-local-server group group-name liveness-detection]
user@host# edit method
```

3. Specify the liveness detection method that you want DHCP to use.

**NOTE:** In releases earlier than Junos OS Release 17.4R1, the only method supported for liveness detection on all platforms is BFD.

Starting in Junos OS Release 17.4R1, the use of ARP packets for DHCPv4 and ND packets for DHCPv6 is supported on MX Series routers for Layer 2 liveness detection in addition to BFD liveness detection. The two liveness detection methods are mutually exclusive. See [DHCP Liveness Detection Using ARP and Neighbor Discovery Packets](#) for information about configuring ARP and ND Layer 2 liveness detection.

- For DHCP global configuration:

```
[edit system services dhcp-local-server liveness-detection method]
user@host# edit bfd
```

- For DHCP group configuration:

```
[edit system services dhcp-local-server group group-name liveness-detection method]
user@host# edit bfd
```

4. Configure the liveness detection method as desired.

See *Example: Configuring Group Liveness Detection with BFD for DHCP Local Server Clients* for an example of how to configure DHCPv4 groups for DHCP local server liveness detection with BFD.

5. Configure the action the router takes when a liveness detection failure occurs.

- For DHCP global configuration:

```
[edit system services dhcp-local-server liveness-detection]
user@host# edit failure-action action
```

- For DHCP group configuration:

```
[edit system services dhcp-local-server group group-name liveness-detection]
user@host# edit failure-action action
```

## Example: Configuring Global Liveness Detection with BFD for DHCP Relay Agent Clients

This example shows how to configure liveness detection for DHCP relay agent subscribers using Bidirectional Forwarding Detection (BFD) as the liveness detection method.

- [Requirements on page 585](#)
- [Overview on page 586](#)
- [Configuration on page 586](#)

### Requirements

This example uses the following hardware and software components:

- Juniper Networks MX Series routers.
- Junos OS Release 12.1 or later

Before you begin:

- Configure DHCP relay agent. See “[Extended DHCP Relay Agent Overview](#)” on page 524.

## Overview

---

In this example, you configure liveness detection for DHCP relay agent subscribers by completing the following operations:

1. Enable liveness detection globally for DHCP relay subscribers.
2. Specify BFD as the liveness detection method for all dynamically created DHCP relay subscribers.
3. Configure BFD-specific statements to define how the protocol behaves.
4. Configure the action the router takes when a liveness detection failure occurs.

**NOTE:** This example explains how to configure liveness detection for a DHCPv4 network. Liveness detection is also supported for DHCPv6 configurations. To configure DHCPv6 liveness detection, include the [liveness-detection](#) statement, and any subsequent configuration statements, at the [edit forwarding-options dhcp-relay dhcpv6] or [edit forwarding-options dhcp-relay dhcpv6 group *group-name*] hierarchy level.

## Configuration

---

### Step-by-Step Procedure

To configure liveness detection for DHCP relay:

1. Specify that you want to configure liveness detection.

```
[edit forwarding-options dhcp-relay]
user@host# edit liveness-detection
```

2. Specify that you want to configure the liveness detection method.

```
[edit forwarding-options dhcp-relay liveness-detection]
user@host# edit method
```

3. Specify BFD as the liveness detection method that you want DHCP to use.

```
[edit forwarding-options dhcp-relay liveness-detection method]
user@host# edit bfd
```

4. Configure the detection time threshold (in milliseconds) at which a trap is produced.

```
[edit forwarding-options dhcp-relay liveness-detection method bfd]
```

```
user@host# set detection-time threshold 50000
```

5. Configure the time (in milliseconds) for which BFD holds a session up notification.

```
[edit forwarding-options dhcp-relay liveness-detection method bfd]
user@host# set holddown-interval 50
```

6. Configure the BFD minimum transmit and receive interval (in milliseconds).

```
[edit forwarding-options dhcp-relay liveness-detection method bfd]
user@host# set minimum-interval 45000
```

7. Configure the minimum receive interval (in milliseconds).

```
[edit forwarding-options dhcp-relay liveness-detection method bfd]
user@host# set minimum-receive-interval 60000
```

8. Configure a multiplier value for the detection time.

```
[edit forwarding-options dhcp-relay liveness-detection method bfd]
user@host# set multiplier 100
```

9. Disable the ability for BFD interval timers to change or adapt to network situations.

```
[edit forwarding-options dhcp-relay liveness-detection method bfd]
user@host# set no-adaptation
```

10. Configure the BFD session mode.

```
[edit forwarding-options dhcp-relay liveness-detection method bfd]
user@host# set session-mode automatic
```

11. Configure the threshold and minimum interval for the BFD transmit interval.

```
[edit forwarding-options dhcp-relay liveness-detection method bfd]
user@host# set transmit-interval threshold 60000 minimum-interval 45000
```

12. Configure the BFD protocol version you want to detect.

```
[edit forwarding-options dhcp-relay liveness-detection method bfd]
user@host# set version automatic
```

13. Configure the action the router takes when a liveness detection failure occurs. In this example, the failure action is to clear the client session only when a liveness detection failure occurs and the local interface is detected as being up.

```
[edit forwarding-options dhcp-relay liveness-detection]
user@host# edit failure-action action
```

**Results** From configuration mode, confirm your configuration by entering the **show forwarding-options** command. If the output does not display the intended configuration, repeat the instructions in this example to correct it. The following output also shows a range of configured interfaces in group frankfurt.

```
[edit]
user@host# show forwarding-options
dhcp-relay {
  liveness-detection {
    failure-action clear-binding-if-interface-up;
    method {
      bfd {
        version automatic;
        minimum-interval 45000;
        minimum-receive-interval 60000;
        multiplier 100;
        no-adaptation;
        transmit-interval {
          minimum-interval 45000;
          threshold 60000;
        }
        detection-time {
          threshold 50000;
        }
        session-mode automatic;
        holddown-interval 50;
      }
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Securing DHCP Messages Sent Between DHCP Clients and Servers in Different VRFs

Junos OS allows you to use the DHCP relay agent to provide additional security when exchanging DHCP messages between different VRFs. To exchange DHCP messages between different VRFs, you must enable both the server side and the client side of the DHCP relay agent recognize and forward acceptable traffic based on DHCP option

information in the packets. The DHCP relay agent can ensure that there is no direct routing between the client virtual routing and forwarding instance (VRF) and the DHCP server VRF, and that only acceptable DHCP packets are relayed across the two VRFs. For more information, read this topic.

- [DHCP Message Exchange Between DHCP Clients and DHCP Server in Different VRFs on page 589](#)
- [Configuring DHCP Message Exchange Between DHCP Server and Clients in Different Virtual Routing Instances on page 590](#)

## DHCP Message Exchange Between DHCP Clients and DHCP Server in Different VRFs

In some service provider networks, the service network in which the DHCP server resides is isolated from the actual subscriber network. This separation of the service and subscriber networks can sometimes introduce potential security issues, such as route leaking. Starting in Junos OS Release 14.2, you can use the DHCP relay agent to provide additional security when exchanging DHCP messages between different VRFs. The DHCP relay agent can ensure that there is no direct routing between the client virtual routing and forwarding instance (VRF) and the DHCP server VRF, and that only acceptable DHCP packets are relayed across the two VRFs. Subscriber management supports the cross-VRF message exchange for both DHCP and DHCPv6 packets.

To exchange DHCP messages between different VRFs, you must enable both the server side and the client side of the DHCP relay agent to recognize and forward acceptable traffic based on DHCP option information in the packets. The message exchange uses the Agent Circuit ID (DHCP option 82 suboption 1) for DHCPv4 packets and the Relay Agent Interface-ID (DHCPv6 option 18) for DHCPv6 packets to identify traffic to be relayed.

Statistics for DHCP packets using the cross-VRF message exchange are counted in the client VRF.

The following list describe how DHCP relay agent exchanges messages between the DHCP clients and DHCP server in different VRFs:

- Packets from DHCP client to DHCP server—DHCP relay agent receives the DHCP packet from the client in the client VRF, and then inserts the appropriate DHCP option 82 suboption 1 or DHCPv6 option 18 attribute into the packet. The relay agent then forwards the packet to the DHCP server in the server's VRF.
- Packets from DHCP server to DHCP client—DHCP relay agent receives the DHCP reply message from the DHCP server in the server VRF. The relay agent derives the client's interface, including VRF, from the DHCP option 82 suboption 1 or DHCPv6 option 18 attribute in the packet in the DHCP server VRF. The relay agent then forwards the reply message to the DHCP client in the client's VRF.

## Configuring DHCP Message Exchange Between DHCP Server and Clients in Different Virtual Routing Instances

Starting in Junos OS Release 14.2, you can configure DHCP relay agent to provide additional security when exchanging DHCP messages between a DHCP server and DHCP clients that reside in different virtual routing and forwarding instances (VRFs).

You can configure DHCP relay agent to provide additional security when exchanging DHCP messages between a DHCP server and DHCP clients that reside in different virtual routing instances. This type of configuration is for a *stateless* DHCP relay connection between a DHCP server and a DHCP client, when the DHCP server resides in a network that must be isolated from the client network.

A stateless DHCP relay agent does not maintain dynamic state information about the DHCP clients and does not maintain a static route for the traffic to flow between the client and server routing instances.

To enable the DHCP message exchange between the two VRFs, you configure each side of the DHCP relay to recognize and forward acceptable traffic based on the DHCP option information in the packets. The acceptable traffic is identified by either the Agent Circuit ID (DHCP option 82 suboption 1) for DHCPv4 packets or the Relay Agent Interface-ID (DHCPv6 option 18) for DHCPv6 packets.

The following list provides an overview of the tasks required to create the DHCP message exchange between the different VRFs:

- Client-side support—Configure the DHCP relay agent **forward-only** statement to specify the VRF location of the DHCP server, to which the DHCP relay agent forwards the client packets with the appropriate DHCP option information. The **forward-only** statement ensures that DHCP relay agent does not create a new session or perform any other subscriber management operations (such as creating dynamic interfaces or maintaining leases).

You can optionally configure a specific logical system and routing instance for the server VRF. If you do not specify a logical system or routing instance, then DHCP uses the local logical system and routing instance from which the configuration is added.

- Server-side support—Configure the DHCP relay agent **forward-only-replies** statement so the DHCP relay agent forwards the reply packets that have the appropriate DHCP option information. This statement also ensures that DHCP relay agent does not create a new session or perform any other subscriber management operations.

**NOTE:** You do not need to configure the **forward-only-replies** statement if the DHCP client and DHCP server reside in the same logical system/routing instance.

---

- DHCP local server support—Configure the DHCP local server to support option 82 information in DHCP NAK and forcerenew messages. By default, the two message types do not support option 82.
- Additional support—Ensure that the following required support is configured:
  - Proxy ARP support must be enabled on the server-facing interface in the DHCP server VRF so that the DHCP relay agent can receive and respond to the ARP requests for clients and the client-facing interface in the DHCP server VRF.
  - Routes must be available to receive the DHCP packets from the DHCP server in the server VRF for the clients reachable in the client VRF.

The following procedures describe the configuration tasks for creating the DHCP message exchange between the DHCP server and clients in different VRFs.

- [Client-Side Support on page 591](#)
- [Server-Side Support on page 592](#)
- [DHCP Local Server Support on page 592](#)

### Client-Side Support

To configure support on the client side of the DHCP relay agent:

1. Enable DHCP relay agent configuration.

```
[edit forwarding-options]
user@host# edit dhcp-relay
```

2. Specify the DHCP server VRF to which the DHCP relay agent forwards the packets from the DHCP client. DHCP relay agent forwards the acceptable packets that have the appropriate DHCP option information, but does not perform any additional subscriber management operations. You can configure the **forward-only** statement globally or for a named group of interfaces, and for DHCPv4 or DHCPv6. You can specify the current, default, or a specific logical system or routing instance for the server VRF.

The following example configures the **forward-only** statement globally for DHCPv4, and specifies the default logical system and routing instance:

```
[edit forwarding-options dhcp-relay]
user@host# set forward-only logical-system default routing-instance default
```

**NOTE:** For local DHCPv4 clients, the DHCP relay agent adds the Agent Circuit ID option. However, if the Agent Circuit ID option is already present in the packet, you must ensure that the DHCP server supports the option 82 Vendor-Specific Information suboption (suboption 9).

If the **forward-only** statement is configured at the [edit forwarding-options dhcp-relay relay-option] hierarchy level, then that relay-option action takes precedence over the configuration of the **forward-only** statement for the DHCP cross-VRF message exchange.

---

### Server-Side Support

To configure the cross-VRF message exchange support on the server side of the DHCP relay:

**NOTE:** You do not need to configure the **forward-only-replies** statement if the DHCP client and DHCP server reside in the same logical system/routing instance.

1. Enable DHCP relay agent configuration.

```
[edit forwarding-options]
user@host# edit dhcp-relay
```

2. Configure the DHCP relay agent to forward the DHCP packets from the DHCP server VRF to the client. DHCP relay agent only forwards the packets, and does not perform any additional subscriber management operations. You can configure the **forward-only-replies** statement globally for DHCPv4 and DHCPv6.

The following example configures the **forward-only-replies** statement globally for DHCPv4.

```
[edit forwarding-options dhcp-relay]
user@host# set forward-only-replies
```

---

### DHCP Local Server Support

To configure the DHCP local server to support option 82 information in NAK and forcerenew messages; the cross-VRF message exchange feature uses the option 82 or DHCPv6 option 18 information to determine the client VRF:

1. Enable DHCP local server configuration.

```
[edit system services]
user@host# edit dhcp-local-server
```

- Specify that you want to configure an override option.

```
[edit system services dhcp-local-server]
user@host# edit overrides
```

- Configure DHCP local server to override the default behavior and support option 82 information in DHCP NAK and forcerenew messages. You can configure the override action globally, for a group of interfaces, or for a specific interface.

```
[edit system services dhcp-local-server overrides]
user@host# set include-option-82 forcerenew nak
```

Release History Table

| Release | Description                                                                                                                                                                                                                                         |

## Assigning IP Addresses for DHCP

Address pool is a set of Internet Protocol addresses available for allocation to users, such as in host configurations with the DHCP. An address-assignment pool can support either IPv4 address or IPv6 addresses. You can create centralized IPv4 and IPv6 address pools independently of the client applications that use the pools. For more information, read this topic.

- [Address-Assignment Pools Overview on page 594](#)
- [Configuring How the Extended DHCP Local Server Determines Which Address-Assignment Pool to Use on page 595](#)
- [Example: Extended DHCP Local Server Configuration with Optional Pool Matching on page 596](#)
- [Assign a Specific IP Address to a Client Using DHCP Option 50 and DHCPv6 IA\\_NA Option on page 597](#)
- [Multiple Address Assignment for DHCPv6 Clients on page 598](#)

## Address-Assignment Pools Overview

The address-assignment pool feature supports subscriber management and DHCP management functionality by enabling you to create centralized IPv4 and IPv6 address pools independently of the client applications that use the pools. The authd process manages the pools and the address allocation, whether the addresses come from local pools or from a RADIUS server. For example, multiple client applications, such as DHCP, can use the same address-assignment pool to provide addresses for their particular clients. Client applications can acquire addresses for either authenticated or unauthenticated clients. The pool selected for a subscriber, based on the RADIUS server or network matching or other rule, is called the matching pool for the subscriber.

Address-assignment pools support both dynamic and static address assignment. In dynamic address assignment, a client is automatically assigned an address from the address-assignment pool. In static address assignment, which is supported for IPv4 pools only, you reserve an address that is then always used by a particular client. Addresses that are reserved for static assignment are removed from the dynamic address pool and cannot be assigned to other clients.

You can configure named address ranges within an address-assignment pool. A named range is a subset of the overall address range. A client application can use named ranges to manage address assignment based on client-specific criteria. For example, for IPv4 address-assignment pools, you might create a named range that is based on a specific DHCP option 82 value. Then, when a DHCP client request matches the specified option 82 value, an address from the specified range is assigned to the client.

Starting in Junos OS Release 18.1R1, you can exclude a specified address or range of consecutive addresses to prevent them from being allocated from an address pool. For example, you might want to reserve certain addresses or ranges to be used only for static subscribers. When you configure an address or range to be excluded, and the address or an address within the range, has already been allocated, that subscriber is logged out, the address is deallocated, and the address is marked for exclusion.

You can link address-assignment pools together to provide backup pools for address assignment. When no addresses are found to be available in the primary or matching address pool, the router or switch automatically proceeds to the linked (secondary) address pool to search for an available address to allocate.

Although the first pool in a chain of linked pools is generally considered the primary pool, a matching pool is not necessarily the first pool in the chain. For example, in a chain of three pools, A, B, and C, where A is the primary pool, pool B might be matched for certain subscribers based on information returned by the RADIUS server. The search for an available address for those subscribers begins in pool B.

Starting in Junos OS Release 18.1R1, the behavior changes for how the search for an available address proceeds through a chain of linked pools. By default, the matching pool is searched first, then the search moves to the first pool in the chain and proceeds through the chain until an available address is found and allocated, or until the search determines no addresses are free. In each pool, all address ranges are fully searched for an address. This behavior enables addresses to be assigned contiguously.

Alternatively, you can configure the **linked-pool-aggregation** statement to search first within a block of addresses in each range in the matching pool and then successively through the linked pools. The search then moves back to the first pool in the chain and searches all addresses in all ranges in each pool through the last pool in the chain.

The address-assignment pool hold-down feature enables you to specify that no additional address are allocated from an existing active address-assignment pool. This configuration gracefully transforms the active pool to an inactive state as the previously allocated addresses are returned to the pool. When the pool is inactive, you can safely perform maintenance on the pool without affecting any active subscribers.

You can also explicitly identify that an address-assignment pool is used for NDRA.

**NOTE:** This feature requires a license. To understand more about Subscriber Access Licensing, see [Subscriber Access Licensing Overview](#). Please refer to the [Juniper Licensing Guide](#) for general information about License Management. Please refer to the product [Data Sheets](#) for details, or contact your Juniper Account Team or Juniper Partner.

### Benefits of Address Assignment Pools

- You can create centralized pools of addresses independent of client applications.
- You can specify blocks of addresses, named ranges, so that a given address pool can be used to supply different addresses for different client applications or for subscribers that match different sets of criteria.
- You can link pools together to ensure that pools are searched for free addresses in a specific manner, contiguously or noncontiguously.
- You can gracefully transition an address pool from active to inactive by specifying that no further addresses are allocated from the pool.

## Configuring How the Extended DHCP Local Server Determines Which Address-Assignment Pool to Use

You can specify the match order in which the extended DHCP local server uses the client data to determine the address-assignment pool that provides the IP address and configuration for a DHCP client. You use the **pool-match-order** statement to specify the match order. If you do not specify the **pool-match-order**, the router (or switch) uses the default **ip-address-first** matching to select the address pool. After DHCP local server determines the address assignment pool to use, the server performs the matching based on the criteria you specified in the pool configuration.

In the default **ip-address-first** matching, the server selects the address-assignment pool to use by matching the IP address in the client DHCP request with the network address of the address-assignment pool. If the client request contains the gateway IP address (giaddr), the local server matches the giaddr to the address-assignment pool's address. If there is no giaddr in the request, then the DHCP local server matches the IP address of the receiving interface to the address of the address-assignment pool.

In **external-authority** matching, the DHCP local server receives the address assignment from an external authority, such as RADIUS or Diameter. If RADIUS is the external authority, the DHCP local server uses the Framed-IPv6-Pool attribute (RADIUS attribute 100) to select the pool. If Diameter is the external authority, the server uses the Diameter counterpart of the Framed-IPv6-Pool attribute to determine the pool.

For IPv4 address-assignment pools, you can optionally configure the extended DHCP local server to match the DHCP relay agent information option (option 82) in the client DHCP packets to a named range in the address-assignment pool used for the client. Named ranges are subsets within the overall address-assignment pool address range, which you can configure when you create the address-assignment pool.

**NOTE:** To use the DHCP local server option 82 matching feature with an IPv4 address-assignment pool, you must ensure that the **option-82** statement is included in the **dhcp-attributes** statement for the address-assignment pool.

To configure the matching order the extended DHCP local server uses to determine the address-assignment pool used for a client:

1. Access the **pool-match-order** configuration.

```
[edit system services dhcp-local-server]
user@host# edit pool-match-order
```

2. Specify the pool matching methods in the order in which the router (switch) performs the methods. You can specify the methods in any order. All methods are optional—the router (switch) uses the **ip-address-first** method by default.

- Configure the router (switch) to use an external addressing authority.

```
[edit system services dhcp-local-server pool-match-order]
user@host# set external-authority
```

- Configure the router (switch) to use the ip-address-first method.

```
[edit system services dhcp-local-server pool-match-order]
user@host# set ip-address-first
```

- (IPv4 address-assignment pools only) Specify the option 82 matching method.

```
[edit system services dhcp-local-server pool-match-order]
user@host# set option-82
```

## Example: Extended DHCP Local Server Configuration with Optional Pool Matching

This example shows an extended DHCP local server configuration that includes optional IPv4 address-assignment pool matching and interface groups. For pool matching, this

configuration specifies that the DHCP local server first check the response from an external authentication authority (for example, RADIUS) and use the Framed-IPv6-Pool attribute to determine the address-assignment pool to use for the client address. If no external authority match is found, the DHCP local server then uses ip-address-first matching together with the option 82 information to match the named address range for client IPv4 address assignment. The option 82 matching must also be included in the address-assignment pool configuration.

```
[edit system services]
dhcp-local-server {
  group group_one {
    interface fe-0/0/2.0;
    interface fe-0/0/2.1;
  }
  group group_two {
    interface fe-0/0/3.0;
    interface fe-0/0/3.1;
  }
  pool-match-order {
    external-authority
    ip-address-first;
    option-82;
  }
}
```

**NOTE:** The interface type in this topic is just an example. The fe- interface type is not supported by EX Series switches.

## Assign a Specific IP Address to a Client Using DHCP Option 50 and DHCPv6 IA\_NA Option

Subscriber management or DHCP management enables you to specify that DHCP local server assign a particular address to a client. For example, if a client is disconnected, you might use this capability to assign the same address that the client was using prior to being disconnected. If the requested address is available, DHCP assigns it to the client. If the address is unavailable, the DHCP local server offers another address, based on the address allocation process.

Both DHCP local server and DHCPv6 local server support the specific address request feature. DHCP local server uses DHCP option 50 in DHCP discover messages to request a particular address, while DHCPv6 local server uses the IA\_NA option (Identity Association for Non-Temporary Addresses) in DHCPv6 solicit messages.

**NOTE:** Subscriber management (DHCP management) supports only one address for each of the DHCPv6 IA\_NA or IA\_PD address types. If the DHCPv6 client requests more than one address for a given type, the DHCPv6 local server uses only the first address and ignores the other addresses.

## Multiple Address Assignment for DHCPv6 Clients

For a DHCPv6 local server, you can assign multiple addresses to a single DHCPv6 client. Multiple address support is enabled by default, and is activated when the DHCPv6 local server receives a DHCPv6 Solicit message from a DHCP client that contains multiple addresses.

For example, if you are implementing this feature on the routers, you might use the multiple address assignment feature when a customer premises equipment (CPE) device requires a host address and a delegated prefix.

You can use either local address pools or RADIUS when assigning multiple addresses to a DHCP client. When at least one address is successfully allocated, the switch creates a DHCP client entry and binds the entry to the assigned address. If both addresses are successfully allocated, the switch creates a single DHCP client entry and binds both addresses to that entry.

You can also configure a delegated address pool, which explicitly specifies the address pool that DHCP management uses to assign IPv6 prefixes for DHCP clients.

## Suppressing DHCP Access

The DHCP process adds access-internal and destination routes for DHCPv4 sessions, and access-internal and access routes for DHCPv6 sessions during the DHCP client binding operation. However, you can override the default behavior and prevent DHCP from automatically installing the route information. For more information, read this topic.

- [Suppressing DHCP Access, Access-Internal, and Destination Routes on page 599](#)
- [Preventing DHCP from Installing Access, Access-Internal, and Destination Routes by Default on page 600](#)

## Suppressing DHCP Access, Access-Internal, and Destination Routes

During the DHCP client binding operation, the DHCP process adds route information for the DHCP sessions by default. The DHCP process adds access-internal and destination routes for DHCPv4 sessions, and access-internal and access routes for DHCPv6 sessions. In some scenarios, you might want to override the default behavior and prevent DHCP from automatically installing the route information. For example, DHCP relay installs destination (host) routes by default—this action is required in certain configurations to enable address renewals from the DHCP server to work properly. However, the default installation of destination routes might cause a conflict when you configure DHCP relay with static subscriber interfaces. To avoid such configuration conflicts you can override the default behavior and prevent DHCP relay from installing the routes.

**NOTE:** You cannot suppress access-internal routes when the subscriber is configured with both IA\_NA and IA\_PD addresses over IP demux interfaces—the IA\_PD route relies on the IA\_NA route for next hop connectivity.

You can configure both DHCP local server and DHCP relay agent to override the default route installation behavior, and you can specify the override for both DHCPv4 and DHCPv6 sessions. You can override the route installation globally or for named interface groups. For DHCPv4 you can override the installation of destination routes only or access-internal routes (the access-internal option prevents installation of both destination and access-internal routes). For DHCPv6 you can specify access routes, access-internal routes, or both.

  - [DHCPv6 Relay Agent Overview on page 554](#)

## Preventing DHCP from Installing Access, Access-Internal, and Destination Routes by Default

You can configure both DHCP local server and DHCP relay agent to override the default installation of access, access-internal, and destination routes. For DHCPv4 you can override the installation of destination routes only or access-internal routes (the access-internal option prevents installation of both destination and access-internal routes). For DHCPv6 you can specify access routes, access-internal routes, or both. You can configure the override globally or for named interface groups.

**NOTE:** You cannot suppress access-internal routes when the subscriber is configured with both IA\_NA and IA\_PD addresses over IP demux interfaces—the IA\_PD route relies on the IA\_NA route for next hop connectivity.

**NOTE:** The `no-arp` statement is deprecated and the function is replaced by the `route-suppression` statement.

To configure route suppression and prevent DHCP from installing specific types of routes:

- For DHCP local server route suppression (for example, a global configuration):

```
[edit system services dhcp-local-server]
user@host# set route-suppression access-internal
```

- For DHCP relay (for example, a group-specific configuration):

```
[edit forwarding-options dhcp-relay group southeast]
user@host# set route-suppression destination
```

- For DHCPv6 local server (for example, a group-specific configuration):

```
[edit system services dhcp-local-server group southern3]
user@host# set dhcpv6 route-suppression access access-internal
```

- For DHCPv6 relay (for example, a global configuration):

```
[edit forwarding-options dhcp-relay]
user@host# set dhcpv6 route-suppression access
```

## DHCP Snooping

---

DHCP snooping on Junos OS device validates DHCP messages and drops invalid traffic. You can configure how DHCP relay agent handles DHCP snooped packets. Depending on the configuration, DHCP relay agent either forwards or drops the snooped packets it receives.

- [DHCP Snooping Support on page 601](#)
- [Example: Configuring DHCP Snooping Support for DHCP Relay Agent on page 602](#)
- [Configuring DHCP Snooped Packets Forwarding Support for DHCP Relay Agent on page 604](#)

### DHCP Snooping Support

DHCP snooping provides DHCP security by identifying incoming DHCP packets. In the default DHCP snooping configuration, all traffic is snooped. You can optionally use the **forward-snooped-clients** statement to evaluate the snooped traffic and to determine if the traffic is forwarded or dropped, based on whether or not the interface is configured as part of a group.

In Junos OS, DHCP snooping is enabled in a routing instance when you configure either the **dhcp-relay** statement at the **[edit forwarding-options]** hierarchy level, or the **dhcp-local-server** statement at the **[edit system services]** hierarchy level in that routing instance. The router discards snooped packets by default if there is no subscriber associated with the packet. To enable normal processing of snooped packets, you must explicitly configure the **allow-snooped-clients** statement at the **[edit forwarding-options dhcp-relay]** hierarchy level.

You can configure DHCP snooping support for a specific routing instance for the following:

- DHCPv4 relay agent—Override the router's (or switch's) default snooping configuration and specify that DHCP snooping is enabled or disabled globally, for a named group of interfaces, or for a specific interface within a named group.

In a separate procedure, you can set a global configuration to specify whether the DHCPv4 relay agent forwards or drops snooped packets for all interfaces, only configured interfaces, or only nonconfigured interfaces. The router also uses the global DHCP relay agent snooping configuration to determine whether to forward or drop snooped BOOTREPLY packets. A renew request may be unicast directly to the DHCP server. This is a BOOTPREQUEST packet and is snooped.

- DHCPv6 relay agent—As you can with snooping support for the DHCPv4 relay agent, you can override the default DHCPv6 relay agent snooping configuration on the router to explicitly enable or disable snooping support globally, for a named group of interfaces, or for a specific interface with a named group of interfaces.

In multi-relay topologies where more than one DHCPv6 relay agent is between the DHCPv6 client and the DHCPv6 server, snooping enables intervening DHCPv6 relay agents between the client and the server to correctly receive and process the unicast traffic from the client and forward it to the server. The DHCPv6 relay agent snoops

incoming unicast DHCPv6 packets by setting up a filter with UDP port 547 (the DHCPv6 UDP server port) on a per-forwarding table basis. The DHCPv6 relay agent then processes the packets intercepted by the filter and forwards the packets to the DHCPv6 server.

Unlike the DHCPv4 relay agent, the DHCPv6 relay agent does not support global configuration of forwarding support for DHCPv6 snooped packets.

- DHCP local server—Configure whether DHCP local server forwards or drops snooped packets for all interfaces, only configured interfaces, or only nonconfigured interfaces.
- You can also disable snooping filters. In the preceding configurations, all DHCP traffic is forwarded to the slower routing plane of the routing instance before it is either forwarded or dropped. Disabling snooping filters causes DHCP traffic that can be forwarded directly from the faster hardware control plane to bypass the routing control plane.

## Example: Configuring DHCP Snooping Support for DHCP Relay Agent

This example shows how to configure DHCP snooping support for DHCP relay agent.

- [Requirements on page 602](#)
- [Overview on page 602](#)
- [Configuration on page 603](#)

### Requirements

---

- Configure DHCP relay agent. See “[Extended DHCP Relay Agent Overview](#)” on page 524.

### Overview

---

In this example, you configure DHCP snooping support for DHCP relay agent by completing the following operations:

- Override the default DHCP snooping configuration and enable DHCP snooping support for the interfaces in group **frankfurt**.
- Configure DHCP relay agent to forward snooped packets to only configured interfaces.

**NOTE:** By default, DHCP snooping is disabled globally.

---

## Configuration

### Step-by-Step Procedure

To configure DHCP relay support for DHCP snooping:

1. Specify that you want to configure DHCP relay agent.

```
[edit]
user@host# edit forwarding-options dhcp-relay
```

2. Specify the named group of interfaces on which DHCP snooping is supported.

```
[edit forwarding-options dhcp-relay]
user@host# edit group frankfurt
```

3. Specify the interfaces that you want to include in the group. DHCP relay agent considers these as the configured interfaces when determining whether to forward or drop traffic.

```
[edit forwarding-options dhcp-relay group frankfurt]
user@host# set interface fe-1/0/1.3 upto fe-1/0/1.9
```

4. Specify that you want to override the default configuration for the group.

```
[edit forwarding-options dhcp-relay group frankfurt]
user@host# edit overrides
```

5. Enable DHCP snooping support for the group.

```
[edit forwarding-options dhcp-relay group frankfurt overrides]
user@host# set allow-snooped-clients
```

6. Return to the **[edit forwarding-options dhcp-relay]** hierarchy level to configure the forwarding action and specify that DHCP relay agent forward snooped packets on only configured interfaces:

```
[edit forwarding-options dhcp-relay group frankfurt overrides]
user@host# up 2
```

7. Enable DHCP snooped packet forwarding for DHCP relay agent.

```
[edit forwarding-options dhcp-relay]
user@host# edit forward-snooped-clients
```

8. Specify that snooped packets are forwarded on only configured interfaces (the interfaces in group **frankfurt**).

```
[edit forwarding-options dhcp-relay forward-snooped-clients]
user@host# set configured-interfaces
```

**Results** From configuration mode, confirm your configuration by entering the **show forwarding-options** command. If the output does not display the intended configuration, repeat the instructions in this example to correct it. The following output also shows a range of configured interfaces in group frankfurt.

```
[edit]
user@host# show forwarding-options
dhcp-relay {
  forward-snooped-clients configured-interfaces;
  group frankfurt {
    overrides {
      allow-snooped-clients;
    }
    interface fe-1/0/1.3 {
      upto fe-1/0/1.9;
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

**See Also** • [Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent](#)

## Configuring DHCP Snooped Packets Forwarding Support for DHCP Relay Agent

You can configure how DHCP relay agent handles DHCP snooped packets. Depending on the configuration, DHCP relay agent either forwards or drops the snooped packets it receives.

DHCP relay uses a two-part configuration to determine how to handle DHCP snooped packets. This topic describes how you use the [forward-snooped-clients](#) statement to manage whether DHCP relay agent forwards or drops snooped packets, depending on the type of interface on which the packets are snooped. In the other part of the DHCP relay agent snooping configuration, which is described in *Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent*, you enable or disable the DHCP relay snooping feature.

[Table 48 on page 605](#) shows the action the router or switch takes on snooped packets when DHCP snooping is enabled by the [allow-snooped-clients](#) statement.

[Table 49 on page 605](#) shows the action the router (or switch) takes on snooped packets when DHCP snooping is disabled by the [no-allow-snooped-clients](#) statement.

The router or switch also uses the configuration of the DHCP relay agent forwarding support to determine how to handle snooped BOOTREPLY packets. [Table 50 on page 605](#) shows the action the router (or switch) takes for the snooped BOOTREPLY packets.

**NOTE:** Configured interfaces have been configured with the `group` statement in the `[edit forwarding-options dhcp-relay]` hierarchy. Non-configured interfaces are in the logical system/routing instance but have not been configured by the `group` statement.

**Table 48: Actions for DHCP Relay Agent Snooped Packets When DHCP Snooping Is Enabled**

| forward-snooped-clients Configuration         | Action on Configured Interfaces                             | Action on Non-Configured Interfaces |
|-----------------------------------------------|-------------------------------------------------------------|-------------------------------------|
| <b>forward-snooped-clients</b> not configured | snooped packets result in subscriber (DHCP client) creation | dropped                             |
| <b>all-interfaces</b>                         | forwarded                                                   | forwarded                           |
| <b>configured-interfaces</b>                  | forwarded                                                   | dropped                             |
| <b>non-configured-interfaces</b>              | snooped packets result in subscriber (DHCP client) creation | forwarded                           |

**Table 49: Actions for DHCP Relay Agent Snooped Packets When DHCP Snooping Is Disabled**

| forward-snooped-clients Configuration         | Action on Configured Interfaces | Action on Non-Configured Interfaces |
|-----------------------------------------------|---------------------------------|-------------------------------------|
| <b>forward-snooped-clients</b> not configured | dropped                         | dropped                             |
| <b>all-interfaces</b>                         | dropped                         | forwarded                           |
| <b>configured-interfaces</b>                  | dropped                         | dropped                             |
| <b>non-configured-interfaces</b>              | dropped                         | forwarded                           |

**Table 50: Actions for Snooped BOOTREPLY Packets**

| forward-snooped-clients Configuration             | Action                                                            |
|---------------------------------------------------|-------------------------------------------------------------------|
| <b>forward-snooped-clients</b> not configured     | snooped <b>BOOTREPLY</b> packets dropped if client is not found   |
| <b>forward-snooped-clients</b> all configurations | snooped <b>BOOTREPLY</b> packets forwarded if client is not found |

To configure DHCP snooped packet forwarding and BOOTREPLY snooped packet forwarding for DHCP relay agent:

1. Specify that you want to configure DHCP relay agent.

```
[edit]
user@host# edit forwarding-options dhcp-relay
```

2. Enable DHCP snooped packet forwarding.

```
[edit forwarding-options dhcp-relay]
user@host# edit forward-snooped-clients
```

3. Specify the interfaces that are supported for snooped packet forwarding.

```
[edit forwarding-options dhcp-relay forward-snooped-clients]
user@host# set (all-interfaces | configured-interfaces | non-configured-interfaces)
```

For example, to configure DHCP relay agent to forward DHCP snooped packets on only configured interfaces:

```
[edit]
forwarding-options {
  dhcp-relay {
    forward-snooped-clients configured-interfaces;
  }
}
```

## DHCP Overview

---

The Dynamic Host Configuration Protocol (DHCP) can serve as a DHCP local server, a DHCP client, or a DHCP relay agent.

### DHCP Overview

A Dynamic Host Configuration Protocol (DHCP) server can automatically allocate IP addresses and also deliver configuration settings to client hosts on a subnet. DHCP lets network administrators centrally manage a pool of IP addresses among hosts and automate the assignment of IP addresses in a network. An IP address can be leased to a host for a limited period of time, allowing the DHCP server to share a limited number of IP addresses among a group of hosts that do not need permanent IP addresses.

The Juniper Networks device acts as the DHCP server, providing IP addresses and settings to hosts, such as PCs, that are connected to device interfaces. The DHCP server is compatible with the DHCP servers of other vendors on the network.

The device can also operate as a DHCP client and DHCP relay agent.

DHCP is based on BOOTP, a bootstrap protocol that allows a client to discover its own IP address, the IP address of a server host, and the name of a bootstrap file. DHCP servers can handle requests from BOOTP clients, but provide additional capabilities beyond

BOOTP, such as the automatic allocation of reusable IP addresses and additional configuration options.

**NOTE:** Although a Juniper Networks device can act as a DHCP server, a DHCP client, or DHCP relay agent at the same time, you cannot configure more than one DHCP role on a single interface.

DHCP provides two primary functions:

- Allocate temporary or permanent IP addresses to clients.
- Store, manage, and provide client configuration parameters.

**NOTE:** On all SRX Series devices, DHCPv4 is supported only in Layer 3 mode; the DHCP server and DHCP client are not supported in Layer 2 transparent mode.

## DHCP Local Server

You can enable an SRX Series device to function as a DHCP local server, and then configure its options on the device. The DHCP local server provides an IP address and other configuration information in response to a client request.

To configure the DHCP local server on the device, include the **dhcp-local-server** statement at the **[edit system services]** hierarchy level.

**NOTE:** You cannot configure the DHCP local server and the DHCP relay agent on the same interface.

### DHCP Client, DHCP Local Server, and Address-Assignment Pool Interaction

In a typical branch network configuration, the DHCP client is on the subscriber's computer, and the DHCP local server is configured on the device. The following steps provide a high-level description of the interaction among the DHCP client, DHCP local server, and address-assignment pools.

1. The DHCP client sends a discover packet to one or more DHCP local servers in the network to obtain configuration parameters and an IP address for the subscriber.
2. Each DHCP local server that receives the discover packet then searches its address-assignment pool for the client address and configuration options. Each local server creates an entry in its internal client table to keep track of the client state, then sends a DHCP offer packet to the client.

3. On receipt of the offer packet, the DHCP client selects the DHCP local server from which to obtain configuration information and sends a request packet indicating the DHCP local server selected to grant the address and configuration information.
4. The selected DHCP local server sends an acknowledgement packet to the client that contains the client address lease and configuration parameters. The server and client installs the host route and ARP entry, and then monitors the lease state.

### DHCP Local Server and Address-Assignment Pools

In a DHCP local server operation, the client address and configuration information reside in centralized address-assignment pools, that are managed independently from the DHCP local server and they can be shared by different client applications.

Configuring a DHCP environment that includes a DHCP local server requires two independent configuration operations, which you can complete in any order. In one operation, you configure the DHCP local server on the device and specify how the DHCP local server determines which address-assignment pool to use. In the other operation, you configure the address-assignment pools used by the DHCP local server. The address-assignment pools contain the IP addresses, named address ranges, and configuration information for DHCP clients.

**NOTE:** The DHCP local server and the address-assignment pools used by the server must be configured in the same routing instance.

## DHCP Client

DHCP configuration consists of configuring DHCP clients and a DHCP local server. A client configuration determines how clients send a message requesting an IP address, while a server configuration enables the server to send an IP address back to the client.

For the device to operate as a DHCP client, you configure a logical interface on the device to obtain an IP address from the DHCP local server in the network. You set the vendor class ID, lease time, DHCP server address, retransmission attempts, and retry interval.

## DHCP Relay Agent

You can configure DHCP relay options on the device and enable the device to function as a DHCP relay agent. A DHCP relay agent forwards DHCP request and reply packets between a DHCP client and a DHCP local server.

To configure the DHCP relay agent on the router, include the **dhcp-relay** statement at the **[edit forwarding-options]** hierarchy level.

You can also include the **dhcp-relay** statement at the following hierarchy level:

**[edit routing-instances routing-instance-name forwarding-options]**

## DHCP Client, DHCP Relay Agent, and DHCP Local Servers

In a typical branch network configuration, the DHCP client is on the subscriber's computer, and the DHCP relay agent is configured on the device between the DHCP client and one or more DHCP local servers.

The following steps describe, at a high level, how the DHCP client, DHCP relay agent, and DHCP local server interact in a configuration that includes two DHCP local servers.

1. The DHCP client sends a discover packet to find a DHCP local server in the network from which to obtain configuration parameters for the subscriber, including an IP address.
2. The DHCP relay agent receives the discover packet and forwards copies to each of the two DHCP local servers. The DHCP relay agent then creates an entry in its internal client table to keep track of the client's state.
3. In response to receiving the discover packet, each DHCP local server sends an offer packet to the client. The DHCP relay agent receives the offer packets and forwards them to the DHCP client.
4. On receipt of the offer packets, the DHCP client selects the DHCP local server from which to obtain configuration information. Typically, the client selects the server that offers the longest lease time on the IP address.
5. The DHCP client sends a request packet that specifies the DHCP local server from which to obtain configuration information.
6. The DHCP local server requested by the client sends an acknowledgement (ACK) packet that contains the client's configuration parameters.
7. The DHCP relay agent receives the ACK packet and forwards it to the client.
8. The DHCP client receives the ACK packet and stores the configuration information.
9. If configured to do so, the DHCP relay agent installs a host route and Address Resolution Protocol (ARP) entry for this client.
10. After establishing the initial lease on the IP address, the DHCP client and the DHCP local server use unicast transmission to negotiate lease renewal or release.

## Considerations

The following considerations apply when you enable a DHCP local server, DHCP relay agent, or DHCP client in a routing instance:

- The DHCP local server, DHCP relay agent, and DHCP client can be configured in one routing instance, but the functionality is mutually exclusive on one interface. If the DHCP client is enabled on one interface, the DHCP local server or the DHCP relay agent cannot be enabled on that interface.
- The DHCP client, DHCP relay agent and DHCP local server services act independently in their respective routing instance. The following features can function simultaneously on a device:
  - DHCP client and DHCP local server
  - DHCP client and DHCP relay agent
  - Multiple routing instances. Each instance can have a DHCP local server, DHCP relay agent, or DHCP client, or each routing instance can have a DHCP client and DHCP local server or a DHCP client and DHCP relay agent.
- In Junos Release 12.1X46, autoinstallation is not compatible with jDHCPd:

```
version 12.1X46-D40.2;
system {
    /* not compatible with jDHCPd */    <<<<<<
    autoinstallation {
        usb {
            disable;
        }
    }
}
```

**NOTE:** Before you enable DHCP services in a routing instance, you must remove all the configuration related to DHCP services that does not include routing instance support. If you do not do this, the old default routing instance configuration will override the new routing instance configuration.

**NOTE:** On all SRX Series devices, logical systems and routing instances are not supported for a DHCP client in chassis cluster mode.

## DHCP Settings and Restrictions Overview

### Propagation of TCP/IP Settings for DHCP

The Juniper Networks device can operate simultaneously as a client of the DHCP server in the untrust zone and a DHCP server to the clients in the trust zone. The device takes the TCP/IP settings that it receives as a DHCP client and forwards them as a DHCP server to the clients in the trust zone. The device interface in the untrust zone operates as the DHCP client, receiving IP addresses dynamically from an Internet service provider (ISP) on the external network.

During the DHCP protocol exchange, the device receives TCP/IP settings from the external network on its DHCP client interface. Settings include the address of the ISP's DHCP

name server and other server addresses. These settings are propagated to the DHCP server pools configured on the device to fulfill host requests for IP addresses on the device's internal network.

### DHCP Conflict Detection and Resolution

---

A client that receives an IP address from the device operating as a DHCP server performs a series of Address Resolution Protocol (ARP) tests to verify that the address is available and no conflicts exist. If the client detects an address conflict, it informs the DHCP server about the conflict and can request another IP address from the DHCP server.

The device maintains a log of all client-detected conflicts and removes addresses with conflicts from the DHCP address pool. To display the conflicts list, you use the **show system services dhcp conflict** command. The addresses in the conflicts list remain excluded until you use the **clear system services dhcp conflict** command to manually clear the list.

### DHCP Interface Restrictions

---

The device supports DHCP client requests received on any Ethernet interface. DHCP requests received from a relay agent are supported on all interface types.

DHCP is not supported on interfaces that are part of a virtual private network (VPN).

## DHCP Server

---

A Dynamic Host Configuration Protocol (DHCP) server provides a framework to pass configuration information to client hosts on a TCP/IP network. A device acting as a DHCP server can dynamically allocate IP addresses and other configuration parameters, minimizing the overhead that is required to add clients to the network. Read this topic for more information.

- [Understanding DHCP Server Operation on page 612](#)
- [DHCP Server Configuration Overview on page 613](#)
- [Minimum DHCP Local Server Configuration on page 615](#)

- [Verifying and Managing DHCP Local Server Configuration on page 622](#)

### Understanding DHCP Server Operation

As a DHCP server, a Juniper Networks device can provide temporary IP addresses from an IP address pool to all clients on a specified subnet, a process known as dynamic

binding. Juniper Networks devices can also perform static binding, assigning permanent IP addresses to specific clients based on their media access control (MAC) addresses. Static bindings take precedence over dynamic bindings.

This section contains the following topics:

- [DHCP Options on page 613](#)
- [Compatibility with Autoinstallation on page 613](#)
- [Chassis Cluster Support on page 613](#)

---

### DHCP Options

In addition to its primary DHCP server functions, you can also configure the device to send configuration settings like the following to clients through DHCP:

- IP address of the DHCP server (Juniper Networks device)
- List of Domain Name System (DNS) and NetBIOS servers
- List of gateway routers
- IP address of the boot server and the filename of the boot file to use
- DHCP options defined in RFC 2132, *DHCP Options and BOOTP Vendor Extensions*

---

### Compatibility with Autoinstallation

The functions of a Juniper Networks device acting as a DHCP server are compatible with the autoinstallation feature. The DHCP server automatically checks any autoinstallation settings for conflicts and gives the autoinstallation settings priority over corresponding DHCP settings. For example, an IP address set by autoinstallation takes precedence over an IP address set by the DHCP server.

---

### Chassis Cluster Support

DHCP server operations are supported on all SRX Series devices in chassis cluster mode.

## DHCP Server Configuration Overview

A typical DHCP server configuration provides the following configuration settings for a particular subnet on a device interface:

- An IP address pool, with one address excluded from the pool.
- Default and maximum lease times.
- Domain search suffixes. These suffixes specify the domain search list used by a client when resolving hostnames with DNS.

- A DNS name server.
- Device solicitation address option (option 32). The IP address excluded from the IP address pool is reserved for this option.

In addition, the DHCP server might assign a static address to at least one client on the subnet. [Table 51 on page 614](#) provides the settings and values for the sample DHCP server configuration.

**Table 51: Sample DHCP Server Configuration Settings**

| Setting                                                | Sample Value               |
|--------------------------------------------------------|----------------------------|
| <b>DHCP Subnet Configuration</b>                       |                            |
| Address pool subnet address                            | 192.168.2.0/24             |
| High address in the pool range                         | 192.168.2.254              |
| Low address in the pool range                          | 192.168.2.2                |
| Address pool default lease time, in seconds            | 1,209,600 (14 days)        |
| Address pool maximum lease time, in seconds            | 2,419,200 (28 days)        |
| Domain search suffixes                                 | mycompany.net<br>mylab.net |
| Address to exclude from the pool                       | 192.168.2.33               |
| DNS server address                                     | 192.168.10.2               |
| Identifier code for router solicitation address option | 32                         |
| Type choice for router solicitation address option     | Ip address                 |
| IP address for router solicitation address option      | 192.168.2.33               |
| <b>DHCP MAC Address Configuration</b>                  |                            |
| Static binding MAC address                             | 01:03:05:07:09:0B          |
| Fixed address                                          | 192.168.2.50               |

## Minimum DHCP Local Server Configuration

The following sample output shows the minimum configuration you must use to configure an SRX300, SRX320, SRX340, SRX345, SRX550M, or SRX1500 device as a DHCP local server. In this output, the server group is named `mobileusers`, and the DHCP local server is enabled on interface `ge-1/0/1.0` within the group. The address pool is named `acmenetwork` from low range of `192.168.1.10/24` to a high range of `192.168.1.20/24`.

```
[edit access]
address-assignment {
  pool acmenetwork {
    family inet {
      network 192.168.1.0/24;
      range r1 {
        low 192.168.1.10;
        high 192.168.1.20;
      }
    }
  }
}
```

```
edit system services
dhcp-local-server {
  group mobileusers {
    interface ge-1/0/1.0
  }
}
```

```
edit interfaces ge-1/0/1 unit 0
family {
  inet {
    address 192.168.1.1/24
  }
}
```

**NOTE:** You can configure the DHCP local server in a routing instance by using the `dhcp-local server`, `interface`, and `address-assignment` statements in the `[edit routing-instances]` hierarchy level.

**See Also** • [Configuring Address-Assignment Pools on page 624](#)

## Enabling TCP/IP Propagation on a DHCP Local Server

This topic describes how to configure TCP/IP settings on a DHCP local server, which includes a DHCP client and a DHCP local server.

**NOTE:** This feature is supported on SRX300, SRX320, SRX340, SRX345, SRX550M, and SRX1500 devices.

To enable TCP/IP setting propagation on a DHCP local server:

1. Configure the **update-server** option on the DHCP client.

```
[edit interfaces ge-0/0/1 unit 0 family inet]
dhcp-client {
  update-server;
}
```

2. Configure the address pool to specify the interface (where **update-server** is configured) from which TCP/IP settings can be propagated.

```
[edit access]
address-assignment {
  pool sprint family inet {
    network 192.168.2.0/24;
    dhcp-attributes {
      propagate-settings ge-0/0/1.0;
    }
  }
}
```

3. Configure the DHCP local server.

```
edit system services
dhcp-local-server {
  group bob {
    interface ge-1/0/1.0
  }
}
```

**See Also** • [Minimum DHCP Local Server Configuration on page 615](#)

## Example: Configuring the Device as a DHCP Server

This example shows how to configure the device as a DHCP server.

For information on how to configure JDHCP in a routing instance, see [How to configure JDHCP in a routing instance](#).

- [Requirements on page 617](#)
- [Overview on page 617](#)
- [Configuration on page 617](#)
- [Verification on page 621](#)

## Requirements

Before you begin:

- Determine the IP address pools and the lease durations to use for each subnet.
- Obtain the MAC addresses of the clients that require permanent IP addresses. Determine the IP addresses to use for these clients.
- List the IP addresses that are available for the servers and devices on your network; for example, DNS, NetBIOS servers, boot servers, and gateway devices. See the *Understanding Management Predefined Policy Applications*.
- Determine the DHCP options required by the subnets and clients in your network.

## Overview

In this example, you configure the device as a DHCP server. You specify the IP address pool as 192.168.2.0/24 and from a low range of 192.168.2.2 to a high range of 192.168.2.254. You set the maximum-lease-time to 2,419,200. Then you specify the DNS server IP address as 192.168.10.2.

**WARNING:** Starting with Junos OS Release 15.1X49-D60 and Junos OS Release 17.3R1, the legacy DHCPD (DHCP daemon) configuration on all SRX Series devices is being deprecated, and only the new JDHCP CLI is supported. When you upgrade to Junos OS Release 15.1X49-D60 and later releases on a device that already has the DHCPD configuration, the following warning messages are displayed:

**WARNING:** The DHCP configuration command used will be deprecated in future Junos releases.

**WARNING:** Please see documentation for updated commands.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **set access** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/2 unit 0 family inet address 192.168.2.1/24
```

```
set system services dhcp-local-server group g1 interface ge-0/0/2.0
set access address-assignment pool p1 family inet network 192.168.2.0/24
set access address-assignment pool p1 family inet range r1 low 192.168.2.2
set access address-assignment pool p1 family inet range r1 high 192.168.2.254
set access address-assignment pool p1 family inet dhcp-attributes maximum-lease-time
2419200
set access address-assignment pool p1 family inet dhcp-attributes name-server
192.168.10.2
```

**GUI Step-by-Step  
Procedure**

To configure the device as a DHCP server, specify the DHCP pool information, server information, lease time, and option information:

1. In the J-Web interface, select **Configure > DHCP > DHCP Services**.
2. Select DHCP Pools. Click **Add**.
3. Specify the IP address that is used as the source address the DHCP server includes in IP packets when communicating with clients. The address is included in the DHCP packet in option 54.
4. Specify the subnet information for the IPv4 address-assignment pool. Type **192.168.2.0/24**.
5. In the Address Range Low, type **192.168.2.2**.
6. In the Address Range High, type **192.168.2.254**.
7. In the Exclude Addresses box, type the addresses you want excluded from a DHCP address pool. Type **192.168.2.0/24**
8. Specify the server identifier to assign to any DHCP clients in this address pool. The identifier can be used to identify a DHCP server in a DHCP message.
9. Specify the domain name to assign to any DHCP clients in this address pool.
10. Specify the next server that DHCP clients need to contact. Type **192.168.10.2**
11. Define the maximum amount of time (in seconds) that DHCP should lease an address. Type **2419200**.
12. Define DHCP option 32, the device solicitation address option. You must enter a numeric value for option code. Select the option type from the list that corresponds to the option code.

13. Click **OK**.

14. If you are done configuring the device, click **Commit** > **Commit**.

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the device as a DHCP server:

1. Configure an interface with an IP address on which the DHCP server will be reachable.

```
[edit]
user@host# set interfaces ge-0/0/2 unit 0 family inet address 192.168.2.1/24
```

2. Configure the DHCP server.

```
[edit]
user@host# set system services dhcp-local-server group g1 interface ge-0/0/2.0
```

3. Create an address pool for IPv4 addresses that can be assigned to clients. The addresses in the pool must be on the subnet in which the DHCP clients reside. Do not include addresses that are already in use on the network.

```
[edit]]
user@host# set access address-assignment pool p1 family inet network
192.168.2.0/24
```

4. (Optional) Specify the IP address pool range. Define a range of addresses in the address-assignment pool. The range is a subset of addresses within the pool that can be assigned to clients. If no range is specified, then all addresses within the pool are available for assignment. Configure the name of the range and the lower and upper boundaries of the addresses in the range.

```
[edit]]
user@host# set access address-assignment pool p1 192.168.2.0/24 address-range
low 192.168.2.2 high 192.168.2.254
```

5. (Optional) Configure one or more routers as the default gateway on the client's subnet.

```
[edit]
user@host# set access address-assignment pool p1 family inet dhcp-attributes
router 192.168.10.3
```

6. (Optional) Configure the IP address that is used as the source address for the DHCP server in messages exchanged with the client. Clients use this information to distinguish between lease offers.

```
[edit]
user@host# set access address-assignment pool pool1 family inet dhcp-attributes
server-identifier 192.168.10.1
```

7. (Optional) Specify the maximum time period, in seconds, that a client holds the lease for an assigned IP address if the client does not renew the lease.

```
[edit]
user@host# set access address-assignment pool pool1 family inet dhcp-attributes
maximum-lease-time 2419200
```

8. (Optional) Specify user-defined options to be included in DHCP packets

```
[edit]
user@host# set access address-assignment pool pool1 family inet dhcp-attributes
option 98 string test98
```

9. Assign a fixed IP address with the MAC address of the client.

```
[edit]
user@host# set access address-assignment pool pool1 family inet host host1
ip-address 192.168.2.100 hardware-address 2c:56:dc:72:99:f3
```

- Results**
- From configuration mode, confirm your configuration by entering the **show access address-assignment** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show access address-assignment
pool p1 {
  family inet {
    network 192.168.2.0/24;
    range r1 {
      low 192.168.2.2;
      high 192.168.2.254;
    }
    dhcp-attributes {
      maximum-lease-time 2419200;
      name-server {
        192.168.10.2;
      }
    }
  }
}
```

```
}
```

- From configuration mode, confirm your configuration by entering the **show system services dhcp-local-server** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show system services dhcp-local-server
group gl {
  interface ge-0/0/2.0;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

- [Verifying the DHCP Binding Database on page 621](#)
- [Verifying DHCP Server Operation on page 622](#)

#### *Verifying the DHCP Binding Database*

**Purpose** Verify that the DHCP binding database reflects the DHCP server configuration.

**Action** From operational mode, enter these commands:

- **show dhcp server binding** command to display all active bindings in the database.
- **show dhcp server binding *address* detail** command (where *address* is the IP address of the client) to display more information about a client.

These commands produce following sample output:

```
user@host> show dhcp server binding
```

| IP Address | Hardware Address  | Type    | Lease expires at        |
|------------|-------------------|---------|-------------------------|
| 30.1.1.20  | 00:12:1e:a9:7b:81 | dynamic | 2007-05-11 11:14:43 PDT |

```
user@host> show dhcp server binding address detail
```

```
IP address      192.0.2.2
Hardware address 00:a0:12:00:13:02
Pool            192.0.2.0/24
Interface fe-0/0/0, relayed by 192.0.2.200
```

Lease information:

```
Type           DHCP
Obtained at     2004-05-02 13:01:42 PDT
Expires at      2004-05-03 13:01:42 PDT
State           active
```

DHCP options:

```
Name: name-server, Value: { 6.6.6.6, 6.6.6.7 }
```

```
Name: domain-name, Value: mydomain.tld
Code: 32, Type: ip-address, Value: 192.0.2.33
```

### ***Verifying DHCP Server Operation***

**Purpose** Verify that the DHCP server operation has been configured.

**Action** From operational mode, enter the following command:

- **show dhcp server statistics** command to verify the DHCP server statistics.

```
user@host> show dhcp server statistics
```

```
Packets dropped:
  Total                0

Messages received:
  BOOTREQUEST          45

## **Verifying and Managing DHCP Local Server Configuration**

**Purpose** View or clear information about client address bindings and statistics for the extended DHCP local server.

**NOTE:** If you delete the DHCP server configuration, DHCP server bindings might still remain. To ensure that DHCP bindings are removed, issue the `clear dhcp server binding` command before you delete the DHCP server configuration.

- Action**
- To display the address bindings in the client table on the extended DHCP local server:

```
user@host> show dhcp server binding routing-instance customer routing instance
```

- To display extended DHCP local server statistics:

```
user@host> show dhcp server statistics routing-instance customer routing instance
```

- To clear the binding state of a DHCP client from the client table on the extended DHCP local server:

```
user@host> clear dhcp server binding routing-instance customer routing instance
```

- To clear all extended DHCP local server statistics:

```
user@host> clear dhcp server statistics routing-instance customer routing instance
```

#### Release History Table

| Release     | Description                                                                                                                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15.1X49-D60 | Starting with Junos OS Release 15.1X49-D60 and Junos OS Release 17.3R1, the legacy DHCPD (DHCP daemon) configuration on all SRX Series devices is being deprecated. and only the new JDHCP CLI is supported. |

#### Related Documentation

- [DHCP Client on page 626](#)
- [DHCP Relay Agent on page 636](#)
- [DHCPv6 Server on page 652](#)

## DHCP Address-Assignment Pools

Address pool is a set of Internet Protocol addresses available for allocation to users, such as in host configurations with the DHCP. An address-assignment pool can support either IPv4 address or IPv6 addresses. You cannot use the same pool for both types of address. For more information, read this topic.

- [Configuring Address-Assignment Pools on page 624](#)
- [Configuring an Address-Assignment Pool Name and Addresses on page 624](#)
- [Configuring a Named Address Range for Dynamic Address Assignment on page 625](#)

- [Configuring Static Address Assignments on page 625](#)
- [Configuring Address-Assignment Pool Linking on page 626](#)

## Configuring Address-Assignment Pools

The address-assignment pool feature for SRX300, SRX320, SRX340, SRX345, SRX550M, and SRX1500 devices enables you to create address pools that can be shared by different client applications such as DHCPv4 or DHCPv6.

To configure an address-assignment pool:

1. Configure the address-assignment pool name and specify the addresses for the pool.  
See [“Configuring an Address-Assignment Pool Name and Addresses” on page 624](#).
2. (Optional) Configure named ranges (subsets) of addresses.  
See [“Configuring a Named Address Range for Dynamic Address Assignment” on page 625](#).
3. (Optional;IPv4 only) Create static address bindings.  
See [“Configuring Static Address Assignments” on page 625](#).
4. (Optional) Configure attributes for DHCP clients.  
See [“Configuring DHCP Client-Specific Attributes for Address-Assignment Pools” on page 628](#).

## Configuring an Address-Assignment Pool Name and Addresses

When configuring an address-assignment pool on SRX300, SRX320, SRX340, SRX345, SRX1500, and SRX550M devices, you must specify the name of the pool and its addresses.

To configure an IPv4 address-assignment pool:

1. Configure the name of the pool and specify the IPv4 family.

```
[edit access]
user@host# edit address-assignment pool blr-pool family inet
```

2. Configure the network address and the prefix length of the addresses in the pool.

```
[edit access address-assignment pool blr-pool family inet]
user@host# set network 192.168.0.0/16
```

**NOTE:** You can configure an IPv4 address-assignment pool in a routing instance by configuring the address-assignment statements in the `[edit routing-instances]` hierarchy level.

## Configuring a Named Address Range for Dynamic Address Assignment

You can optionally configure multiple named ranges, or subsets, of addresses within an address-assignment pool. During a dynamic address assignment, a client can be assigned an address from a specific named range. To create a named range, you specify a name for the range and define the address range.

**NOTE:** Supported only on SRX300, SRX320, SRX340, SRX345, SRX1500, and SRX550M devices.

To create a named range within an IPv4 address-assignment pool:

1. Specify the name of the address-assignment pool.

```
[edit access]
user@host# edit address-assignment pool blr-pool family inet
```

2. Configure the name of the range and the lower and upper boundaries of the addresses in the range.

```
[edit access address-assignment pool isp_1 family inet]
user@host# set range southeast low 192.168.102.2 high 192.168.102.254
```

**NOTE:** To configure named address ranges in a routing instance, configure the address-assignment statements in the [edit routing-instances] hierarchy level.

## Configuring Static Address Assignments

You can optionally create a static IPv4 address binding by reserving a specific address for a particular client. The address is removed from the address-assignment pool so that it is not assigned to another client. When you reserve an address, you identify the client host and create a binding between the client MAC address and the assigned IP address.

**NOTE:** This feature is supported on SRX300, SRX320, SRX340, SRX345, SRX550M, and SRX1500 devices.

To configure a static IPv4 address binding:

1. Specify the name of the IPv4 address-assignment pool containing the IP address you want to reserve for the client.

```
[edit access]
user@host# edit address-assignment pool blr-pool family inet
```

- Specify the name of the client for the static binding, the client MAC address, and the IP address to reserve for the client. This configuration specifies that the client with MAC address 01:03:05:07:09:0b is always assigned IP address 192.168.10.2.

```
[edit access address-assignment pool blr-pool family inet]
user@host# set host svale6_boston_net hardware-address 01:03:05:07:09:0b
ip-address 192.168.10.2
```

**NOTE:** To configure static binding for an IPv4 address in a routing instance, configure the address-assignment statements in the [edit routing-instances] hierarchy.

## Configuring Address-Assignment Pool Linking

Address-assignment pool linking enables you to specify a secondary address pool for the device to use when the primary address-assignment pool is fully allocated. When the primary pool has no available addresses remaining, the device automatically switches over to the linked secondary pool and begins allocating addresses from that pool. The device uses a secondary pool only when the primary address-assignment pool is fully allocated.

You can create a chain of multiple linked pools. For example, you can link pool A to pool B, and link pool B to pool C. When pool A has no available addresses, the device switches to pool B for addresses. When pool B is exhausted, the device switches to pool C. There is no limit to the number of linked pools in a chain. However, you cannot create multiple links to or from the same pool—a pool can be linked to only one secondary pool, and a secondary pool can be linked from only one primary pool.

To link a primary address-assignment pool named pool1 to a secondary pool named pool2 on SRX1500, SRX5400, SRX5600, or SRX5800 devices:

```
[edit access address-assignment]
user@host# set pool pool1 link pool2
```

### Related Documentation

- [DHCP Overview on page 607](#)
- [DHCP Server on page 612](#)
- [DHCP Client on page 626](#)
- [DHCP Relay Agent on page 636](#)

## DHCP Client

SRX Series device can act as a DHCP client, receiving its TCP/IP settings and the IP address for any physical interface in any security zone from an external DHCP server. The

device can also act as a DHCP server, providing TCP/IP settings and IP addresses to clients in any zone. For more information, read this topic.

- [Understanding DHCP Client Operation on page 627](#)
- [Minimum DHCP Client Configuration on page 627](#)
- [Configuring DHCP Client-Specific Attributes for Address-Assignment Pools on page 628](#)
- [Configuring Optional DHCP Client Attributes on page 629](#)
- [Verifying and Managing DHCP Client Configuration on page 630](#)
- [Example: Configuring the Device as a DHCP Client on page 630](#)

## Understanding DHCP Client Operation

A Juniper Networks device can act as a DHCP client, receiving its TCP/IP settings and the IP address for any physical interface in any security zone from an external DHCP server. The device can also act as a DHCP server, providing TCP/IP settings and IP addresses to clients in any zone. When the device operates as a DHCP client and a DHCP server simultaneously, it can transfer the TCP/IP settings learned through its DHCP client module to its default DHCP server module. For the device to operate as a DHCP client, you configure a logical interface on the device to obtain an IP address from the DHCP server in the network. You set the vendor class ID, lease time, DHCP server address, retransmission attempts, and retry interval. You can renew DHCP client releases.

DHCP client operations are supported on all SRX Series devices in chassis cluster mode.

- *DHCP Server, Client, and Relay Agent Overview*
  - [Understanding DHCP Relay Agent Operation on page 636](#)
  - *DHCP Settings and Restrictions Overview*

## Minimum DHCP Client Configuration

The following sample output shows the minimum configuration you must use to configure an SRX300, SRX320, SRX340, SRX345, SRX550M, or SRX1500 device as a DHCP client. In this output, the interface is ge-0/0/0 and the logical unit is 0.

```
[edit interfaces]
  ge-0/0/0 {
    unit 0 {
      family inet {
        dhcp-client
      }
    }
  }
```

**NOTE:** To configure a DHCP client in a routing instance, add the interface in a routing instance using the [edit routing-instances] hierarchy.

## Configuring DHCP Client-Specific Attributes for Address-Assignment Pools

You use the address-assignment pool feature to include application-specific attributes when clients obtain an address. The client application, such as DHCP, uses the attributes to determine how addresses are assigned and to provide optional application-specific characteristics to the client. For example, the DHCP application might specify that a client that matches certain prerequisite information is dynamically assigned an address from a particular named range. Based on which named range is used, DHCP specifies additional DHCP attributes such as the boot file that the client uses, the DNS server, and the maximum lease time.

**NOTE:** This feature is supported on SRX300, SRX320, SRX340, SRX345, SRX550M, and SRX1500 devices.

You use the **dhcp-attributes** statement to configure DHCP client-specific attributes for address-assignment pools.

To configure address-assignment pool attributes for DHCP clients:

1. Specify the name of the address-assignment pool.

```
[edit access]
user@host# edit address-assignment pool blr-pool family inet
```

2. Configure optional DHCP client attributes.

```
[edit access address-assignment pool blr-pool family inet]
user@host# set dhcp-attributes maximum-lease-time 2419200
user@host# set dhcp-attributes name-server 192.168.10.2
user@host# set dhcp-attributes boot-file boot-file.txt
user@host# set dhcp-attributes boot-file boot-server example.com
```

**NOTE:** To configure DHCP client-specific attributes in a routing instance, configure the **dhcp-attributes** statements in the **[edit routing-instances]** hierarchy.

## Configuring Optional DHCP Client Attributes

For the device to operate as a DHCP client, you configure a logical interface on the device to obtain an IP address from the DHCP local server in the network. You can then set the client-identifier, options no-hostname, lease time, retransmission attempts, retry interval, preferred DHCP local server address, and vendor class ID.

To configure optional DHCP client attributes on SRX300, SRX320, SRX340, SRX550M, and SRX1500 devices:

1. Configure the DHCP client identifier prefix as the routing instance name.

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]  
user@host# set client-identifier prefix host
```

2. Configure the DHCP options no-hostname if you do not want the client to send hostname (RFC option code 12) in the packets.

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]  
user@host# set options no-hostname
```

3. Set the DHCP lease time.

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]  
user@host# set lease-time 86400
```

4. Set the number of attempts allowed to retransmit a DHCP packet.

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]  
user@host# set retransmission-attempt 6
```

5. Set the interval (in seconds) allowed between retransmission attempts. The range is 4 through 64. The default is 4 seconds.

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]  
user@host# set retransmission-interval 5
```

6. Set the IPv4 address of the preferred DHCP local server.

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]  
user@host# set server-address 10.1.1.1
```

7. Set the vendor class ID for the DHCP client.

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]  
user@host# set vendor-id ether
```

**NOTE:** To configure the DHCP client in a routing instance, configure the interface in the [edit routing-instances] hierarchy.

## Verifying and Managing DHCP Client Configuration

**Purpose** View or clear information about client address bindings and statistics for the DHCP client on SRX300, SRX320, SRX340, SRX550M, and SRX1500 devices.

**Action** • To display the address bindings in the client table on the DHCP client:

```
user@host> show dhcp client binding
```

• To display DHCP client statistics:

```
user@host> show dhcp client statistics
```

• To clear the binding state of a DHCP client from the client table on the DHCP client:

```
user@host> clear dhcp client binding
```

• To clear all DHCP client statistics:

```
user@host> clear dhcp client statistics
```

**NOTE:** To clear or view information about client bindings and statistics in a routing instance, run the following commands:

- `show dhcp client binding routing instance <routing-instance name>`
- `show dhcp client statistics routing instance <routing-instance name>`
- `clear dhcp client binding routing instance <routing-instance name>`
- `clear dhcp client statistics routing instance <routing-instance name>`

## Example: Configuring the Device as a DHCP Client

This example shows how to configure the device as a DHCP client.

- [Requirements on page 631](#)
- [Overview on page 631](#)
- [Configuration on page 632](#)
- [Verification on page 634](#)

## Requirements

Before you begin:

- Determine the IP address pools and the lease durations to use for each subnet. You can use the **show system services dhcp pool** CLI command to view information on DHCP address pools.
- Obtain the MAC addresses of the clients that require permanent IP addresses. Determine the IP addresses to use for these clients.
- List the IP addresses that are available for the servers and devices on your network; for example, DNS, NetBIOS servers, boot servers, and gateway devices. See the *Understanding Management Predefined Policy Applications*.
- Determine the DHCP options required by the subnets and clients in your network. See [“Creating User-Defined DHCP Options Not Included in the Default Junos Implementation of the DHCP Server” on page 459](#)

## Overview

In this example, you configure the device as a DHCP client. You specify the interface as ge-0/0/2, set the logical unit as 0, and create a DHCP inet family. You then specify the DHCP client identifier as 00:0a:12:00:12:12 in hexadecimal. You use hexadecimal if the client identifier is a MAC address. You set the options no-hostname if you do not want the DHCP client to send the hostname with the packets. You set the DHCP lease time as 86,400 seconds. The range is from 60 through 2,147,483,647 seconds.

Then you set the number of retransmission attempts to 6. The range is from 0 through 50,000, and the default is 4. You set the retransmission interval to 5 seconds. The range is from 4 through 64, and the default is 4 seconds. Set the force-discover option if you want to force the DHCP client to send a DHCP discover packet after one to three failed dhcp-request attempts. The force-discover option ensures that the DHCP server will assign the same or a new IP address to the client. Finally, you set the IPv4 address of the preferred DHCP server to 10.1.1.1 and the vendor class ID to ether.

**WARNING:** Starting with Junos OS Release 15.1X49-D60 and Junos OS Release 17.3R1, the legacy DHCPD (DHCP daemon) configuration on all SRX Series devices is being deprecated and only the new JDHCP CLI is supported. When you upgrade to Junos OS Release 15.1X49-D60 and later releases on a device that already has the DHCPD configuration, the following warning messages are displayed:

**WARNING:** The DHCP configuration command used will be deprecated in future Junos releases.

**WARNING:** Please see documentation for updated commands.

**NOTE:** Starting with Junos OS Release 17.3R1, on all SRX Series devices and vSRX instances, the CLI option `dhcp-client` at `[edit interfaces interface-name unit logical-unit-number family inet]` hierarchy is changed to `dhcp` to align with other Junos platforms. There is no change in the functionality.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set interfaces ge-0/0/2 unit 0 family inet dhcp-client client-identifier prefix host-name
set interfaces ge-0/0/2 unit 0 family inet dhcp-client lease-time 86400
set interfaces ge-0/0/2 unit 0 family inet dhcp-client retransmission-attempt 6
set interfaces ge-0/0/2 unit 0 family inet dhcp-client retransmission-interval 5
set interfaces ge-0/0/2 unit 0 family inet dhcp-client force-discover
set interfaces ge-0/0/2 unit 0 family inet dhcp-client server-address 192.168.2.1
set interfaces ge-0/0/2 unit 0 family inet dhcp-client vendor-id ether
set interfaces ge-0/0/2 unit 0 family inet dhcp-client options no-hostname
```

### GUI Step-by-Step Procedure

To configure the device as a DHCP client:

1. In the J-Web interface, select **Configure > Services > DHCP > DHCP Client**.
2. Under Interfaces, add **ge-0/0/2.0**.
3. Configure the DHCP client identifier as either an ASCII or hexadecimal value.
4. From the Client identifier choice list, select **hexadecimal**.
5. In the Hexadecimal box, type the client identifier—**00:0a:12:00:12:12**.
6. Set the DHCP lease time in seconds. This is the lease time in seconds requested in a DHCP client protocol packet; the range is 60 through 2,147,483,647. Type **86400**.
7. Set the retransmission number of attempts to 6. This is the number of attempts to retransmit the DHCP client protocol packet. The range is 0 through 6.
8. Set the retransmission interval in seconds to 5. This is the number of seconds between successive transmissions. The range is 4 through 64. The default is 4 seconds.
9. Configure the force-discover option to force the DHCP client to send a DHCP discover packet after one to three failed **dhcp-request** attempts.

10. Set the IPv4 address of the preferred DHCP server. Type **192.168.2.1**.
11. Set the vendor class ID. This is the vendor class identification for the DHCP client. Type **ether**.
12. Configure options no-hostname if you do not want the client to send hostname in the packets (RFC option code 12).
13. Click **OK**.
14. If you are done configuring the device, click **Commit** >.

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the device as a DHCP client:

1. Specify the DHCP client interface.

```
[edit]
user@host# edit interfaces ge-0/0/2 unit 0 family inet dhcp-client
```

2. Configure the DHCP client identifier as a hexadecimal value.

```
[edit interfaces ge-0/0/2 unit 0 family inet dhcp-client]
user@host# set client-identifier prefix host
```

3. Set the DHCP lease time.

```
[edit interfaces ge-0/0/2 unit 0 family inet dhcp-client]
user@host# set lease-time 86400
```

4. Set the number of attempts allowed to retransmit a DHCP packet.

```
[edit interfaces ge-0/0/2 unit 0 family inet dhcp-client]
user@host# set retransmission-attempt 6
```

5. Set the interval (in seconds) allowed between retransmission attempts. The range is 4 through 64. The default is 4 seconds.

```
[edit interfaces ge-0/0/2 unit 0 family inet dhcp-client]
user@host# set retransmission-interval 5
```

6. Configure the force-discover option.

```
[edit interfaces ge-0/0/2 unit 0 family inet dhcp-client]
user@host# set force-discover.
```

7. Set the IPv4 address of the preferred DHCP server.

```
[edit interfaces ge-0/0/2 unit 0 family inet dhcp-client]
user@host# set server-address 192.168.2.1
```

8. Set the vendor class ID for the DHCP client.

```
[edit interfaces ge-0/0/2 unit 0 family inet dhcp-client]
user@host# set vendor-id ether
```

9. Configure options no-hostname if you do not want the client to send the hostname in packets.

```
[edit interfaces ge-0/0/2 unit 0 family inet dhcp-client]
user@host# set options no-hostname
```

**Results** From configuration mode, confirm your configuration by entering the **show interfaces ge-0/0/2 unit 0 family inet** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces ge-0/0/2 unit 0 family inet
dhcp-client {
  client-identifier hexadecimal 00:0a:12:00:12:12;
  options no-hostname;
  lease-time 86400;
  retransmission-attempt 6;
  retransmission-interval 5;
  force-discover;
  server-address 192.168.2.1;
  update-server;
  vendor-id ether;
}
```

If you are done configuring the device, enter **commit** from configuration mode.

---

### Verification

Confirm that the configuration is working properly.

- [Verifying the DHCP Client on page 634](#)

#### *Verifying the DHCP Client*

**Purpose** Verify that the DHCP client information has been configured.

**Action** From operational mode, enter these commands:

- **show dhcp client binding** command to display the binding state of a Dynamic Host Configuration Protocol (DHCP) client.
- **show dhcp client statistics** command to display client statistics.

These commands produce the following sample output:

```
user@host> show dhcp client binding
```

| IP address  | Hardware address  | Expires | State | Interface  |
|-------------|-------------------|---------|-------|------------|
| 192.168.2.2 | 88:a2:5e:0a:d6:03 | 2419093 | BOUND | ge-0/0/2.0 |

```
user@host> show dhcp client statistics
```

Packets dropped:

|            |   |
|------------|---|
| Total      | 2 |
| Send error | 2 |

Messages received:

|                |   |
|----------------|---|
| BOOTREPLY      | 6 |
| DHCPOFFER      | 4 |
| DHCPACK        | 2 |
| DHCPNAK        | 0 |
| DHCPFORCERENEW | 0 |

Messages sent:

|              |    |

## Release History Table

| Release     | Description                                                                                                                                                                                                                                                                     |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 17.3R1      | Starting with Junos OS Release 17.3R1, on all SRX Series devices and vSRX instances, the CLI option <b>dhcp-client</b> at <b>[edit interfaces interface-name unit logical-unit-number family inet]</b> hierarchy is changed to <b>dhcp</b> to align with other Junos platforms. |
| 15.1X49-D60 | Starting with Junos OS Release 15.1X49-D60 and Junos OS Release 17.3R1, the legacy DHCPD (DHCP daemon) configuration on all SRX Series devices is being deprecated and only the new JDHCP CLI is supported.                                                                     |

## Related Documentation

- [DHCP Overview on page 607](#)
- [DHCP Server on page 612](#)
- [DHCP Address-Assignment Pools on page 623](#)
- [DHCP Relay Agent on page 636](#)
- [DHCPv6 Server on page 652](#)

## DHCP Relay Agent

The DHCP relay agent operates as the interface between DHCP clients and the server. The DHCP Relay Agent relays DHCP messages between DHCP clients and DHCP servers on different IP networks. For more information, read this topic.

- [Understanding DHCP Relay Agent Operation on page 636](#)
- [Example: Minimum DHCP Relay Agent Configuration on page 637](#)
- [Example - Configuring JDHCP Relay Configuration on page 637](#)
- [Example: Configuring the Device as a BOOTP or DHCP Relay Agent using Legacy DHCP Daemon Command on page 648](#)

### Understanding DHCP Relay Agent Operation

A Juniper Networks device operating as a DHCP relay agent forwards incoming requests from BOOTP and DHCP clients to a specified BOOTP or DHCP server. Client requests can pass through virtual private network (VPN) tunnels.

You cannot configure a single device interface to operate as both a DHCP client and a DHCP relay.

**NOTE:** The DHCP requests received on an interface are associated to a DHCP pool that is in the same subnet as the primary IP address/subnet on an interface. If an interface is associated with multiple IP addresses/subnets, the device uses the lowest numerically assigned IP address as the primary IP address/subnet for the interface. To change the IP address/subnet that is listed as the primary address on an interface, use the `set interfaces < interface name > unit 0 family inet xxx.xxx.xxx.xxx/yy primary` command and commit the change.

- See Also**
- *DHCP Server, Client, and Relay Agent Overview*
  - [Understanding DHCP Server Operation on page 612](#)
  - *DHCP Settings and Restrictions Overview*

### Example: Minimum DHCP Relay Agent Configuration

This example shows the minimum configuration you need to use the extended DHCP relay agent on the router or switch:

```
[edit forwarding-options]
dhcp-relay {
  server-group {
    test 203.0.113.21;
  }
  active-server-group test;
  group all {
    interface fe-0/0/2.0;
  }
}
```

**NOTE:** The interface type in this topic is just an example. The `fe-` interface type is not supported by EX Series switches.

This example creates a server group and an active server group named **test** with IP address 203.0.113.21. The DHCP relay agent configuration is applied to a group named **all**. Within this group, the DHCP relay agent is enabled on interface `fe-0/0/2.0`.

### Example - Configuring JDHCP Relay Configuration

The DHCP relay agent operates as the interface between DHCP clients and the server. The DHCP Relay Agent relays DHCP messages between DHCP clients and DHCP servers on different IP networks.

This example describes how to configure the DHCP relay agent on the SRX Series device. SRX series device acting as DHCP relay agent is responsible for forwarding the requests

and responses between the DHCP clients and the server which are part of different routing instances.

- [Requirements on page 638](#)
- [Overview on page 638](#)
- [Configuration on page 639](#)
- [Verification on page 647](#)

## Requirements

This example uses the following hardware and software components:

- SRX Series devices with Junos OS 15.1X49-D10 or later.

## Overview

You can configure DHCP relay agent to provide additional security when exchanging DHCP messages between a DHCP server and DHCP clients that reside in different virtual routing instances. This type of configuration is for DHCP relay connection between a DHCP server and a DHCP client, when the DHCP server resides in a network that is isolated from the client network.

### Topology

To exchange DHCP messages between different routing instances, you must enable both the server-facing interface and the client-facing interface of the DHCP relay agent to recognize and forward DHCP packets.

The following [Figure 33 on page 638](#) shows DHCP performance as DHCP local server, DHCP client, and DHCP relay agent

**Figure 33: Understanding DHCP Services in a Routing Instance**

The following list provides an overview of the tasks required to create the DHCP message exchange between the different routing instances:

- Configure the client-facing side of the DHCP relay agent.
- Configure the server-facing side of the DHCP relay agent.
- Configure SRX Series device to function as a DHCP local server.
- Configure the Security Zone to Allow the DHCP protocol.

Table1: DHCP Relay Parameters:

| Parameters        | Cleint-Side-Details | Server-Side-Details |
|-------------------|---------------------|---------------------|
| interface         | ge-0/0/3.0          | ge-0/0/3.0          |
| routing interface | trust-vr            | untrust-vr          |
| ip address        | 10.1.1.2/24         | 20.1.1.1/24         |

**NOTE:** In order to make this setup work, the DHCP server connecting route and relay agent interface route must be in both routing-instances. For example, in the above topology, the server route 30.1.1.0/24 needs to be shared with the dhcp-relay VR, and the dhcp-relay interface route 10.1.1.0/24 exact needs to be shared with the default routing instance.

Also, a dummy dhcp-relay config must be added in the routing instance with the DHCP server. If this is not configured, dhcp-relay will not be able to receive packets from the DHCP server.

### Configuration

#### CLI Quick Configuration

The following procedures describe the configuration tasks for creating the DHCP message exchange between the DHCP server and clients in different routing instances. To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

Quick configuration for Client-Facing Support:

```
set routing-instances trust-vr instance-type virtual-router
set routing-instances trust-vr interface ge-0/0/3.0
set interfaces ge-0/0/3 unit 0 family inet address 10.1.1.2/24
```

Quick configuration for Server-Facing Support:

```
set routing-instances untrust-vr instance-type virtual-router
set routing-instances untrust-vr interface ge-0/0/4.0
set interfaces ge-0/0/4 unit 0 family inet address 20.1.1.1/24
```

Quick configuration for DHCP Local Server Support:

```
set routing-instances trust-vr system services dhcp-local-server group GROUP-1 interface
ge-0/0/15.0
set routing-instances trust-vr access address-assignment pool TRUST-VR-POOL family
inet network 6.6.6.0/24
```

```

set routing-instances trust-vr access address-assignment pool TRUST-VR-POOL family
  inet dhcp-attributes router 6.6.6.1
set routing-instances trust-vr access address-assignment pool TRUST-VR-POOL family
  inet dhcp-attributes name-server 8.8.8.8
set routing-instances trust-vr access address-assignment pool TRUST-VR-POOL family
  inet range TRUST-VR-RANGE low 6.6.6.66
set routing-instances trust-vr access address-assignment pool TRUST-VR-POOL family
  inet range TRUST-VR-RANGE high 6.6.6.67
set routing-instances trust-vr forwarding-options dhcp-relay server-group server-1 30.1.1.2
set routing-instances trust-vr forwarding-options dhcp-relay active-server-group server-1
set routing-instances untrust-vr forwarding-options dhcp-relay server-group
  dummy-config
set routing-instances trust-vr forwarding-options dhcp-relay group relay-in-vr interface
  ge-0/0/3.0
set routing-instances trust-vr routing-options interface-routes rib-group inet untrust-trust
set routing-instances trust-vr routing-options static route 30.1.1.2/32 next-hop 20.1.1.2
set routing-instances trust-vr routing-options instance-import export_dhcp_server_route
set routing-instances untrust-vr routing-options interface-routes rib-group inet
  untrust-trust
set routing-instances untrust-vr routing-options instance-import
  import_relay_route_to_server_vr
set policy-options policy-statement export_dhcp_server_route term 1 from instance
  untrust-vr
set policy-options policy-statement export_dhcp_server_route term 1 from route-filter
  30.1.1.0/24 exact
set policy-options policy-statement export_dhcp_server_route term 1 then accept
set policy-options policy-statement export_dhcp_server_route term 2 then reject
set policy-options policy-statement import_relay_route_to_server_vr term 1 from instance
  trust-vr
set policy-options policy-statement import_relay_route_to_server_vr term 1 from route-filter
  10.1.1.0/24 exact
set policy-options policy-statement import_relay_route_to_server_vr term 1 then accept
set policy-options policy-statement import_relay_route_to_server_vr term 2 then reject
set routing-options static route 30.1.1.2/32 next-table untrust-vr.inet.0
set routing-options rib-groups untrust-trust import-rib untrust-vr.inet.0
set routing-options rib-groups untrust-trust import-rib trust-vr.inet.0

```

Quick configuration for Security Zone to Allow the DHCP Protocol:

```

set security policies default-policy permit-all
set security zones security-zone untrust interfaces ge-0/0/4.0 host-inbound-traffic
  system-services all
set security zones security-zone untrust interfaces ge-0/0/4.0 host-inbound-traffic
  protocols all
set security zones security-zone trust interfaces ge-0/0/3.0 host-inbound-traffic
  system-services all
set security zones security-zone trust interfaces ge-0/0/3.0 host-inbound-traffic protocols
  all

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure support on the client-facing side of the DHCP relay agent:

1. Set a routing instance type as virtual router.

```
[edit]
user@host# set routing-instances trust-vr instance-type virtual-router
```

2. Set an interface to the virtual router

```
[edit]
user@host# set routing-instances trust-vr interface ge-0/0/3.0
```

3. Set the IP address to the interface.

```
[edit]
user@host# set interfaces ge-0/0/3 unit 0 family inet address 10.1.1.2/24
```

**Step-by-Step Procedure** To configure support on the server-facing side of the DHCP relay agent:

1. Set a virtual router.

```
[edit]
user@host# set routing-instances untrust-vr instance-type virtual-router
```

2. Set an interface to the virtual router.

```
[edit]
user@host# set routing-instances untrust-vr interface ge-0/0/4.0
```

3. Set the IP address to the interface.

```
[edit]
user@host# set interfaces ge-0/0/4 unit 0 family inet address 20.1.1.1/24
```

**Step-by-Step Procedure** To configure the DHCP local server to support:

1. Set the DHCP local server configuration

```
[edit ]
user@host# set routing-instances trust-vr system services dhcp-local-server group
GROUP-1 interface ge-0/0/15.0
```

2. Set an IPv4 address-assignment pool in a routing instance.

```
[edit ]
user@host# set routing-instances trust-vr access address-assignment pool
TRUST-VR-POOL family inet network 6.6.6.0/24
user@host# set routing-instances trust-vr access address-assignment pool
TRUST-VR-POOL family inet dhcp-attributes router 6.6.6.1
user@host# set routing-instances trust-vr access address-assignment pool
TRUST-VR-POOL family inet dhcp-attributes name-server 8.8.8.8
user@host# set routing-instances trust-vr access address-assignment pool
TRUST-VR-POOL family inet range TRUST-VR-RANGE low 6.6.6.66
user@host# set routing-instances trust-vr access address-assignment pool
TRUST-VR-POOL family inet range TRUST-VR-RANGE high 6.6.6.67
```

3. Set the server group by specifying the name of the group and DHCP server addresses for the use by the extended DHCP relay agent.

```
[edit ]
user@host# set routing-instances trust-vr forwarding-options dhcp-relay
server-group server-1 30.1.1.2
```

4. Set an active server group to apply a common DHCP relay agent configuration to a named group of DHCP server addresses.

```
[edit ]
user@host# set routing-instances trust-vr forwarding-options dhcp-relay
active-server-group server-1
```

5. Set a dummy dhcp-relay in DHCP server routing instance.

```
[edit ]
user@host# set routing-instances untrust-vr forwarding-options dhcp-relay
server-group dummy-config
user@host# set routing-instances trust-vr forwarding-options dhcp-relay group
relay-in-vr interface ge-0/0/3.0
```

6. Set the configuration in dhcp-relay routing instance.

```
[edit ]
user@host# set routing-instances trust-vr routing-options interface-routes rib-group
inet untrust-trust
user@host# set routing-instances trust-vr routing-options static route 30.1.1.2/32
next-hop 20.1.1.2
user@host# set routing-instances trust-vr routing-options instance-import
export_dhcp_server_route
user@host# set routing-instances untrust-vr routing-options interface-routes
rib-group inet untrust-trust
user@host# set routing-instances untrust-vr routing-options instance-import
import_relay_route_to_server_vr
```

7. Set the configuration to share routes between routing instances.

```
[edit ]
user@host# set policy-options policy-statement export_dhcp_server_route term 1
  from instance untrust-vr
user@host# set policy-options policy-statement export_dhcp_server_route term 1
  from route-filter 30.1.1.0/24 exact
user@host# set policy-options policy-statement export_dhcp_server_route term 1
  then accept
user@host# set policy-options policy-statement export_dhcp_server_route term 2
  then reject
user@host# set policy-options policy-statement import_relay_route_to_server_vr
  term 1 from instance trust-vr
user@host# set policy-options policy-statement import_relay_route_to_server_vr
  term 1 from route-filter 10.1.1.0/24 exact
user@host# set policy-options policy-statement import_relay_route_to_server_vr
  term 1 then accept
user@host# set policy-options policy-statement import_relay_route_to_server_vr
  term 2 then reject
user@host# set routing-options static route 30.1.1.2/32 next-table untrust-vr.inet.0
user@host# set routing-options rib-groups untrust-trust import-rib untrust-vr.inet.0
```

**NOTE:** You can enable an SRX Series device to function as a DHCP local server. The DHCP local server provides an IP address and other configuration information in response to a client request.

#### Step-by-Step Procedure

To configure the security zone to allow the DHCP Protocol:

1. Set the default security policy to permit all traffic.

```
[edit ]
user@host# set security policies default-policy permit-all
```

2. Set all system services and protocols on interface ge-0/0/4.0.

```
[edit ]
user@host# set security zones security-zone untrust interfaces ge-0/0/4.0
  host-inbound-traffic system-services all
user@host# set security zones security-zone untrust interfaces ge-0/0/4.0
  host-inbound-traffic protocols all
```

3. Set all system services and protocols on interface ge-0/0/3.0.

```
[edit ]
user@host# set security zones security-zone trust interfaces ge-0/0/3.0
  host-inbound-traffic system-services all
```

```
user@host# set security zones security-zone trust interfaces ge-0/0/3.0
host-inbound-traffic protocols all
```

### Results

- Result for Client-facing Support:

From configuration mode, confirm your configuration by entering the **show routing-instances** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show routing-instances
trust-vr {
    instance-type virtual-router;
    interface ge-0/0/3.0;
}
```

- Result for Server-Facing Support:

From configuration mode, confirm your configuration by entering the **show routing-instances** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show routing-instances
untrust-vr {
    instance-type virtual-router;
    interface ge-0/0/4.0;
}
```

- Result for DHCP Local Server Support:

From configuration mode, confirm your configuration by entering the **show routing-instances**, **show policy-options** and **show routing-options** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show routing-instances

## Example: Configuring the Device as a BOOTP or DHCP Relay Agent using Legacy DHCP Deamon Command

This example shows how to configure the device as a BOOTP or DHCP relay agent.

- [Requirements on page 648](#)
- [Overview on page 648](#)
- [Configuration on page 649](#)
- [Verification on page 652](#)

### Requirements

---

No special configuration beyond device initialization is required before configuring this feature.

### Overview

---

In this example, you enable the DHCP relay agent to relay BOOTP or DHCP messages to a BOOTP server. You specify the IP time-to-live value to be set in responses to the client as 20. The range is from 1 through 255. You then set the maximum number of hops allowed per packet to 10. The range is from 1 through 16.

Then you specify the minimum number of seconds before requests are forwarded as 300. The range is from 0 through 30,000 seconds.

You then specify the IP time-to-live value to be set in responses to the client as 30. The range is from 1 through 255. You set the description of the server as text and the DHCP option as 82. You set the maximum number of hops allowed per packet to 16 and specify the minimum number of seconds as 400 before requests are forwarded.

**WARNING:** Starting with Junos OS Release 15.1X49-D60 and Junos OS Release 17.3R1, the legacy DHCPD (DHCP daemon) configuration on all SRX Series devices is being deprecated and only the new JDHCP CLI is supported. When you upgrade to Junos OS Release 15.1X49-D60 and later releases on a device that already has the DHCPD configuration, the following warning messages are displayed:

**WARNING:** The DHCP configuration command used will be deprecated in future Junos releases.

**WARNING:** Please see documentation for updated commands.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set forwarding-options helpers bootp client-response-ttl 20
set forwarding-options helpers bootp maximum-hop-count 10
set forwarding-options helpers bootp minimum-wait-time 300
set forwarding-options helpers bootp description text
set forwarding-options helpers bootp interface ge-0/0/0 client-response-ttl 30
set forwarding-options helpers bootp interface ge-0/0/0 description text
set forwarding-options helpers bootp interface ge-0/0/0 dhcp-option82
set forwarding-options helpers bootp interface ge-0/0/0 maximum-hop-count 16
set forwarding-options helpers bootp interface ge-0/0/0 minimum-wait-time 400
```

### GUI Step-by-Step Procedure

To configure the device as a BOOTP/DHCP relay agent:

1. In the Client response TTL box, type **20**.
2. In the Maximum hop count box, type **10**.
3. In the Minimum wait time box, type **300**.
4. In the Description box, type the description of the server.
5. In the Client response TTL box, type **30**.

6. In the Description box, type the description of the server.
7. Select the **Dhcp option 82** check box.
8. In the Maximum hop count box, type **16**.
9. In the Minimum wait time box, type **400**.
10. Click **OK** until you return to the Configuration page.
11. Click **OK** to check your configuration and save it as a candidate configuration.
12. If you are done configuring the device, click **Commit Options>Commit**.

**Step-by-Step  
Procedure**

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the device as a BOOTP or DHCP relay agent:

1. Specify the IP time-to-live value in BOOTP response messages sent to a BOOTP client.

```
[edit forwarding-options helpers bootp]  
user@host# set client-response-ttl 20
```

2. Specify the maximum number of hops allowed per packet.

```
[edit forwarding-options helpers bootp]  
user@host# set maximum-hop-count 10
```

3. Specify the minimum wait time in seconds.

```
[edit forwarding-options helpers bootp]  
user@host# set minimum-wait-time 300
```

4. Specify the description of the server.

```
[edit forwarding-options helpers bootp]  
user@host# set description text
```

5. Define the incoming BootP request forwarding interface.

```
[edit forwarding-options helpers bootp]
```

```
user@host# set interface ge-0/0/0
```

6. Define the IP time-to-live value.

```
[edit forwarding-options helpers bootp interface ge-0/0/0]
user@host# set client-response-ttl 30
```

7. Specify the description of the server.

```
[edit forwarding-options helpers bootp interface ge-0/0/0]
user@host# set description text
```

8. Set the DHCP option 82.

```
[edit forwarding-options helpers bootp interface ge-0/0/0]
user@host# set dhcp-option82
```

9. Specify the maximum number of hops allowed per packet.

```
[edit forwarding-options helpers bootp interface ge-0/0/0]
user@host# set forwarding-options helpers bootp interface ge-0/0/0
maximum-hop-count 16
```

10. Specify the minimum wait time.

```
[edit forwarding-options helpers bootp interface ge-0/0/0]
user@host# set minimum-wait-time 400
```

**Results** From configuration mode, confirm your configuration by entering the **show forwarding-options** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show forwarding-options
helpers {
  bootp {
    description text;
    maximum-hop-count 10;
    minimum-wait-time 300;
    client-response-ttl 20;
  }
  interface {
    ge-0/0/0 {
      description text;
      maximum-hop-count 16;
      minimum-wait-time 400;
      client-response-ttl 30;
    }
  }
}
```

```

        dhcp-option82;
    }
}
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

#### Verifying DHCP Relay Statistics

**Purpose** Verify that the DHCP Relay statistics have been configured.

**Action** From operational mode, enter the **show system services dhcp relay-statistics** command.

```
user@host> show system services dhcp relay-statistics
```

```

Received Packets:    4 Forwarded Packets          4 Dropped Packets
      4      Due to missing interface in relay database: 4      Due to missing
matching routing instance: 0      Due to an error during packet read: 0      Due
to an error during packet send: 0      Due to invalid server address: 0      Due
to missing valid local address: 0      Due to missing route to server/client: 0

### Release History Table

| Release     | Description                                                                                                                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15.1X49-D60 | Starting with Junos OS Release 15.1X49-D60 and Junos OS Release 17.3R1, the legacy DHCPD (DHCP daemon) configuration on all SRX Series devices is being deprecated and only the new JDHCP CLI is supported. |

## DHCPv6 Server

SRX Series device can act as a DHCPv6 server and allocates IP addresses to IPv6 clients. DHCPv6 server also delivers configuration settings to client hosts on a subnet or to the

requesting devices that need an IPv6 prefix. For the DHCPv6 server to allow DHCPv6 requests, you must create a security policy to enable DHCPv6 traffic. For more information, read this topic.

- [DHCPv6 Server Overview on page 653](#)
- [Creating a Security Policy to Enable DHCPv6 Traffic on page 654](#)
- [Example: Configuring DHCPv6 Server Options on page 654](#)

- [Example - Configuring DHCPv6 Prefix Delegation \(PD\) over Point-to-Point Protocol over Ethernet \(PPPoE\) on page 660](#)

## DHCPv6 Server Overview

A Dynamic Host Configuration Protocol version 6 (DHCPv6) server can automatically allocate IP addresses to IPv6 clients and deliver configuration settings to client hosts on a subnet or to the requesting devices that need an IPv6 prefix. A DHCPv6 server allows network administrators to manage pool of IP addresses centrally among hosts and to automate the assignment of IP addresses in a network.

**NOTE:** SRX Series devices do not support DHCP client authentication. In a DHCPv6 deployment, security policies control access through the device for any DHCP client that has received an address and other attributes from the DHCPv6 server.

Some features include:

- Configuration for a specific interface or a group of interfaces
- Stateless address autoconfiguration (SLAAC)
- Prefix delegation, including access-internal route installation
- DHCPv6 server groups

The DHCPv6 server configuration usually consists of DHCPv6 options for clients, an IPv6 prefix, an address pool that contains IPv6 address ranges and options, and a security policy to allow DHCPv6 traffic. In a typical setup the provider Juniper Networks device is configured as an IPv6 prefix delegation server that assigns addresses to the customer edge device. The customer's edge router then provides addresses to internal devices.

To configure DHCPv6 local server on a device, you include the DHCPv6 statement at the **[edit system services dhcp-local-server]** hierarchy level. You then create an address assignment pool for DHCPv6 that is configured in the **[edit access address-assignment pool]** hierarchy level using the **family inet6** statement.

You can also include the **dhcpv6** statement at the **[edit routing-instances routing-instance-name system services dhcp-local-server]** hierarchy.

**NOTE:** Existing DHCPv4 configurations in the `[edit system services dhcp]` hierarchy are not affected when you upgrade to Junos OS Release 10.4 from an earlier version or enable DHCPv6 server.

## Creating a Security Policy to Enable DHCPv6 Traffic

For the DHCPv6 server to allow DHCPv6 requests, you must create a security policy to enable DHCPv6 traffic. In this example, the zone `my-zone` allows DHCPv6 traffic from the zone `untrust`, and the `ge-0/0/3.0` interface is configured with the IPv6 address `2001:db8:3001::1`.

To create a security zone policy to allow DHCPv6 on SRX1500, SRX5400, SRX5600, and SRX5800 devices:

1. Create the zone and add an interface to that zone.

```
[edit security zones]
user@host# edit security-zone my-zone interfaces ge-0/0/3.0
```

2. Configure host inbound traffic system services to allow DHCPv6.

```
[edit security zones security-zone my-zone interfaces ge-0/0/3.0]
user@host# set host-inbound-traffic system-services dhcpv6
```

3. If you are done configuring the device, enter **commit** from configuration mode.

- See Also**
- [Example: Configuring an Address-Assignment Pool for IPv6 Addresses on page 689](#)

## Example: Configuring DHCPv6 Server Options

This example shows how to configure DHCPv6 server options on SRX1500, SRX5400, SRX5600, and SRX5800 devices.

- [Requirements on page 655](#)
- [Overview on page 655](#)
- [Configuration on page 655](#)
- [Verification on page 657](#)

## Requirements

Before you begin:

- Determine the IPv6 address pool range.
- Determine the IPv6 prefix. See the *Understanding Address Books*.
- Determine the grace period, maximum lease time, or any custom options that should be applied to clients.
- List the IP addresses that are available for the devices on your network; for example, DNS and SIP servers.

## Overview

In this example, you set a default client limit as 100 for all DHCPv6 groups. You then create a group called my-group that contains at least one interface. In this case, the interface is ge-0/0/3.0. You set a range of interfaces using the upto command and set a custom client limit as 200 for group my-group that overrides the default limit. Finally, you configure interface ge-0/0/3.0 with IPv6 address 2001:db8:3001::1/64 and set router advertisement for interface ge-0/0/3.0. Starting with Junos OS Release 15.X49-D70 and Junos OS Release 17.3R1, you can add the option **dynamic-server** to dynamically support prefix and attributes that are updated by the WAN server.

**NOTE:** A DHCPv6 group must contain at least one interface.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set system services dhcp-local-server dhcpv6 overrides interface-client-limit 100
set system services dhcp-local-server dhcpv6 group my-group interface ge-0/0/3.0
set system services dhcp-local-server dhcpv6 group my-group interface ge-0/0/3.0 upto
  ge-0/0/6.0
set system services dhcp-local-server dhcpv6 group my-group overrides
  interface-client-limit 200
set interfaces ge-0/0/3 unit 0 family inet6 address 2001:db8:3000::1/64
set protocols router-advertisement interface ge-0/0/3.0 prefix 2001:db8:3000::/64
```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure DHCPv6 server options:

1. Configure a DHCP local server.

```
[edit]
user@host# edit system services dhcp-local-server dhcpv6
```

2. Set a default limit for all DHCPv6 groups.

```
[edit system services dhcp-local-server dhcpv6]
user@host# set overrides interface-client-limit 100
```

3. Specify a group name and interface.

```
[edit system services dhcp-local-server dhcpv6]
user@host# set group my-group interface ge-0/0/3.0
```

4. Set a range of interfaces.

```
[edit system services dhcp-local-server dhcpv6]
user@host# set group my-group interface ge-0/0/3.0 upto ge-0/0/6.0
```

5. Set a custom client limit for the group.

```
[edit system services dhcp-local-server dhcpv6]
user@host# set group my-group overrides interface-client-limit 200
```

6. Configure an interface with an IPv6 address.

```
[edit interfaces]
user@host# set ge-0/0/3 unit 0 family inet6 address 2001:db8:3000::1/64
```

7. Set router advertisement for the interface.

```
[edit protocols]
user@host# set router-advertisement interface ge-0/0/3.0 prefix
2001:db8:3000::/64
```

**Results** From configuration mode, confirm your configuration by entering the **show system services dhcp-local-server**, **show interfaces ge-0/0/3**, and **show protocols** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show system services dhcp-local-server
dhcpv6 {
  overrides {
    interface-client-limit 100;
  }
}
```

```

group my-group {
  overrides {
    interface-client-limit 200;
  }
  interface ge-0/0/3.0 {
    upto ge-0/0/6.0;
  }
}
[edit]
user@host# show interfaces ge-0/0/3
unit 0 {
  family inet6 {
    address 2001:db8:3000::1/64;
  }
}
[edit]
user@host# show protocols
router-advertisement {
  interface ge-0/0/3.0 {
    prefix 2001:db8:3000::1/64;
  }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

#### Verifying DHCPv6 Local Server Configuration

**Purpose** Verify that the client address bindings and statistics for the DHCPv6 local server have been configured

**Action** From operational mode, enter the **show dhcpv6 server binding** command to display the address bindings in the client table on the DHCPv6 local server.

| Prefix                     | Session Id                             | Expires | State | Interface  | Client DUID |
|----------------------------|----------------------------------------|---------|-------|------------|-------------|
| 2001:bd8:1111:2222::/64 6  | LL_TIME0x1-0x2e159c0-00:10:94:00:00:01 | 86321   | BOUND | ge-1/0/0.0 |             |
| 2001:bd8:1111:2222::/64 7  | LL_TIME0x1-0x2e159c0-00:10:94:00:00:02 | 86321   | BOUND | ge-1/0/0.0 |             |
| 2001:bd8:1111:2222::/64 8  | LL_TIME0x1-0x2e159c0-00:10:94:00:00:03 | 86321   | BOUND | ge-1/0/0.0 |             |
| 2001:bd8:1111:2222::/64 9  | LL_TIME0x1-0x2e159c1-00:10:94:00:00:04 | 86321   | BOUND | ge-1/0/0.0 |             |
| 2001:bd8:1111:2222::/64 10 | LL_TIME0x1-0x2e159c1-00:10:94:00:00:05 | 86321   | BOUND | ge-1/0/0.0 |             |

From operational mode, enter the **show dhcpv6 server statistics** command to display the DHCPv6 local server statistics.

```
Dhcpv6 Packets dropped:
  Total                0

Messages received:
  DHCPV6_DECLINE        0

## Understanding Cascaded DHCPv6 Prefix Delegating

You can use DHCPv6 client prefix delegation to automate the delegation of IPv6 prefixes to the customer premises equipment (CPE). With prefix delegation, a delegating device delegates IPv6 prefixes to a requesting device. The requesting device then uses the prefixes to assign global IPv6 addresses to the devices on the subscriber LAN. The requesting device can also assign subnet addresses to subnets on the LAN.

With cascaded prefix delegation, the IPv6 address block is delegated to a DHCPv6 client that is running on the WAN interface of a customer edge device. The identity association (IA) for the client is used for the identity association for prefix delegation (IA\_PD). The CE device requests, through DHCPv6, an IPv6 address with the IA type of nontemporary addresses (IA\_NA). Both IA\_PD and IA\_NA are requesting in the same DHCPv6 exchange.

Figure 34: IPv6 Prefix Delegation

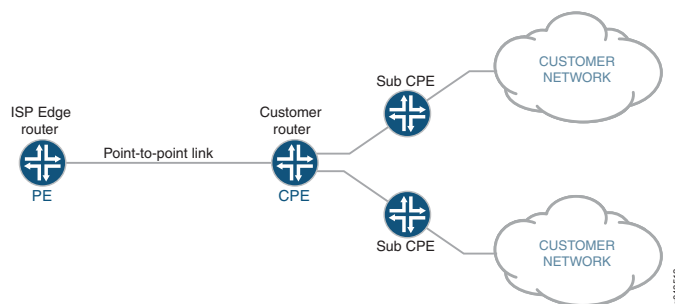

The topology in [Figure 34 on page 659](#) shows an SRX Series device acting as the CPE. The WAN interface links to the provider edge (PE) device and the LAN interfaces link to the customer networks. The service provider delegates a prefix (delegated-prefix) and an IPv6 address (cpe-wan-ipv6-address) to a DHCPv6 client. When a requesting device receives that IPv6 address through the DHCPv6 client, the device must install the IPv6 address on its WAN interface. The DHCPv6 client then divides the delegated prefix into sub-prefixes and subsequently assigns them to the connected LAN interfaces of the CPE device, making some subset of the remaining space available for sub-prefix delegation.

A CPE assigns sub-prefixes to its LAN interfaces and broadcasts the sub-prefixes through device advertisement. In this scenario, the CPE acts as a sub-PE and delegates sub-prefixes and assigns them to sub-CPEs.

**NOTE:** The requirements of sub-prefix delegation are the same as for the prefix delegation defined in RFC 3769.

Figure 35: Sub-prefix Delegation

There can be multi-level sub prefix delegations, see [Figure 35 on page 659](#). The top level CPE gets a delegated prefix from the PE and delegates the sub prefixes to second level sub-CPEs, then to the third level sub-CPEs, and finally to the end levels. The end level sub-CPEs assign the IPv6 address to end hosts through SLAAC, stateless DHCPv6 or stateful DHCPv6. This is called cascaded prefix delegating.

## Example - Configuring DHCPv6 Prefix Delegation (PD) over Point-to-Point Protocol over Ethernet (PPPoE)

This example shows how to configure DHCPv6 PD over PPPoE on SRX Series devices.

- [Requirements on page 660](#)
- [Overview on page 660](#)
- [Configuration on page 660](#)
- [Verification on page 676](#)

### Requirements

No special configuration beyond the device initialization is required before configuring this feature.

### Overview

The example uses SRX550M devices for configuring DHCPv6 PD over PPPoE. Before you begin, configure DHCPv6 server to permit in host-inbound traffic and receive DHCPv6 packet. Provide a host-name to establish PPPoE session. To enable IPv6, chassis reboot is required.

Configuring DHCPv6 PD over PPPoE involves the following configurations:

- Configuring DHCPv6 Server
- DHCPv6 Client (PD)
- DHCPv6 Client (Auto)

### Topology

The following illustration describes DHCPv6 PD over PPPoE topology which provide a configuration suite using SRX Series devices.

[Figure 36 on page 660](#) shows the topology used in this example.

**Figure 36: Configuring SRX Series Devices for DHCPv6 PD over PPPoE**

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

Quick configuration for DHCPv6 Server:

- DHCPv6 server configuration

```
set interfaces ge-0/0/2 unit 0 family inet6
set system services dhcp-local-server dhcpv6 overrides interface-client-limit 100
set system services dhcp-local-server dhcpv6 group my-group overrides
  interface-client-limit 200
set system services dhcp-local-server dhcpv6 group my-group overrides delegated-pool
  v6-pd-pool
set system services dhcp-local-server dhcpv6 group my-group interface pp0.0
```

- PPPoE configuration

```
set system host-name SRX550M
set interfaces ge-0/0/1 unit 0 encapsulation ppp-over-ether
set interfaces pp0 unit 0 ppp-options chap access-profile prof-ge001
set interfaces pp0 unit 0 pppoe-options underlying-interface ge-0/0/1.0
set interfaces pp0 unit 0 pppoe-options server
set interfaces pp0 unit 0 family inet6 address 3000::1/64
```

- Router advertisement configuration

```
set protocols router-advertisement interface pp0.0 max-advertisement-interval 20
set protocols router-advertisement interface pp0.0 min-advertisement-interval 10
set protocols router-advertisement interface pp0.0 managed-configuration
set protocols router-advertisement interface pp0.0 other-stateful-configuration
set protocols router-advertisement interface pp0.0 prefix 3000::1/64
```

- Enable IPv6

```
set security forwarding-options family inet6 mode flow-based
```

- PPPoE profile configuration

```
set access profile prof-ge001 client test_user chap-secret test
```

- PD address pool configuration

```
set access address-assignment pool v6-pd-pool family inet6 prefix 2001:1:1::/48
set access address-assignment pool v6-pd-pool family inet6 range vp-pd prefix-length
  48
set access address-assignment pool v6-pd-pool family inet6 dhcp-attributes dns-server
  3000::1
```

- Security zone configuration

```
set security zones security-zone trust interface pp0.0 host-inbound-traffic
  system-services dhcpv6
```

Quick configuration for DHCPv6 Client (PD):

- DHCPv6 server configuration for autoconfig device

```
set interfaces ge-0/0/2 unit 0 family inet6
set system services dhcp-local-server dhcpv6 overrides interface-client-limit 10
```

```
set system services dhcp-local-server dhcpv6 overrides process-inform pool p1
set system services dhcp-local-server dhcpv6 group ipv6 interface ge-0/0/2.0
```

- PPPoE configuration

```
set system host-name SRX550M
set interfaces ge-0/0/1 unit 0 encapsulation ppp-over-ether
set interfaces pp0 unit 0 ppp-options chap default-chap-secret test
set interfaces pp0 unit 0 ppp-options chap local-name test_user
set interfaces pp0 unit 0 ppp-options chap passive
set interfaces pp0 unit 0 pppoe-options underlying-interface ge-0/0/1.0
set interfaces pp0 unit 0 pppoe-options client
```

- DHCPv6 client configuration

```
set interfaces pp0 unit 0 family inet6 dhcpv6-client client-type statefull
set interfaces pp0 unit 0 family inet6 dhcpv6-client client-ia-type ia-pd
set interfaces pp0 unit 0 family inet6 dhcpv6-client update-router-advertisement
  interface ge-0/0/2.0 other-stateful-configuration
set interfaces pp0 unit 0 family inet6 dhcpv6-client update-router-advertisement
  interface ge-0/0/2.0 max-advertisement-interval 10
set interfaces pp0 unit 0 family inet6 dhcpv6-client update-router-advertisement
  interface ge-0/0/2.0 min-advertisement-interval 5
set interfaces pp0 unit 0 family inet6 dhcpv6-client client-identifier duid-type duid-ll
set interfaces pp0 unit 0 family inet6 dhcpv6-client req-option dns-server
set interfaces pp0 unit 0 family inet6 dhcpv6-client update-server
set protocols router-advertisement interface pp0.0
```

- Enable IPv6

```
set security forwarding-options family inet6 mode flow-based
```

- DHCPv6 server propagate configuration

```
set access address-assignment pool p1 family inet6 prefix 2001::/16
set access address-assignment pool p1 family inet6 dhcp-attributes propagate-settings
  pp0.0
```

- Security zone configuration

```
set security zones security-zone untrust interface pp0.0 host-inbound-traffic
  system-services dhcpv6
set security zones security-zone trust interface ge-0/0/2.0 host-inbound-traffic
  system-services dhcpv6
```

Quick configuration for DHCPv6 Client (Auto):

- DHCPv6 client configuration

```
set interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client client-type autoconfig
set interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client client-ia-type ia-na
set interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client client-identifier duid-type
  duid-ll
set interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client req-option dns-server
```

- Router advertisement configuration

```
set protocols router-advertisement interface fe-0/0/0.0
```

- Enable IPv6

```
set security forwarding-options family inet6 mode flow-based
```

- Security zone configuration

```
set security zones security-zone trust interface fe-0/0/0.0 host-inbound-traffic
system-services dhcpv6
```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. To configure DHCPv6 server on SRX550M device:

- a. Set the interface.

```
[edit]
user@host# set interfaces ge-0/0/2 unit 0 family inet6
```

- b. Configure a DHCP local server.

```
[edit ]
user@host# set system services dhcp-local-server dhcpv6
```

- c. Set a default limit for all DHCPv6 groups.

```
[edit system services dhcp-local-server dhcpv6]
user@host# set overrides interface-client-limit 100
```

- d. Set a custom client limit for the group.

```
[edit system services dhcp-local-server dhcpv6]
user@host# set group my-group overrides interface-client-limit 200
```

- e. Specify delegated pool name.

```
[edit system services dhcp-local-server dhcpv6]
user@host# set group my-group overrides delegated-pool v6-pd-pool
```

- f. Create a group called my-group that contains pp0 interface.

```
[edit system services dhcp-local-server dhcpv6]
user@host# set group my-group interface pp0.0
```

2. Configuring PPPoE:

- a. Set interface to encapsulate PPPoE.

```
[edit]
user@host# set interfaces ge-0/0/1 unit 0 encapsulation ppp-over-ether
```

- b. Set chap access profile value.

```
[edit system interface]
user@host# set interface pp0 unit 0 ppp-options chap access-profile prof-ge001
```

- c. Set underlying interface name.

```
[edit system interface]
user@host# set interface pp0 unit 0 pppoe-options underlying-interface
ge-0/0/1.0
```

- d. Set PPPoE-options server.

```
[edit system interface]
user@host# set interface pp0 unit 0 pppoe-options server
```

- e. Set family name and address.

```
[edit system interface]
user@host# set interface pp0 unit 0 family inet6 address 3000::1/64
```

3. Configuring Router advertisement:

- a. Set max advertisement interval limit.

```
[edit system protocol]
user@host# set protocols router-advertisement interface pp0.0
max-advertisement-interval 20
```

- b. Set minimum advertisement interval limit.

```
[edit system protocol]
user@host# set protocols router-advertisement interface pp0.0
min-advertisement-interval 10
```

- c. Set the configuration state to managed configuration.

```
[edit system protocol]
user@host# set protocols router-advertisement interface pp0.0
managed-configuration
```

- d. Set the configuration state to other stateful configuration.

```
[edit system protocol]
user@host# set protocols router-advertisement interface pp0.0
other-stateful-configuration
```

- e. Set the prefix value.

```
[edit system protocol]
user@host# set protocols router-advertisement interface pp0.0 prefix 3000::1/64
```

4. Enable IPv6:
  - a. Set the family name and mode to enable IPv6.

```
[edit]  
user@host# set security forwarding-options family inet6 mode flow-based
```

5. Configuring PPPoE profile:
  - a. Set access profile name, client name and chap secret.

```
[edit]  
user@host# set access profile prof-ge001 client test_user chap-secret test
```

6. Configuring PD address pool:
  - a. Set address-assignment pool name, family name and prefix.

```
[edit]  
user@host# set access address-assignment pool v6-pd-pool family inet6 prefix  
2001:1:1::/48
```

- b. Set range and prefix length.

```
[edit]  
user@host# set access address-assignment pool v6-pd-pool family inet6 range  
vp-pd prefix-length 48
```

- c. Set dhcp attributes with dns server value.

```
[edit]  
user@host# set access address-assignment pool v6-pd-pool family inet6  
dhcp-attributes dns-server 3000::1
```

7. Configuring Security zone:
  - a. Set the zone name, interface and host-inbound-traffic system-services.

```
[edit]  
user@host# set security zones security-zone trust interface pp0.0  
host-inbound-traffic system-services dhcpv6
```

**Step-by-Step  
Procedure**

1. To configure DHCPv6 client (PD) on SRX550M device:

- a. Set the interface.

```
[edit]
user@host# set interfaces ge-0/0/2 unit 0 family inet6
```

- b. Set DHCPv6 local server to override the interface client limit.

```
[edit]
user@host# set system services dhcp-local-server dhcpv6 overrides
interface-client-limit 10
```

- c. Set the process-inform pool name.

```
[edit]
user@host# set system services dhcp-local-server dhcpv6 overrides
process-inform pool p1
```

- d. Set group name and interface.

```
[edit]
user@host# set system services dhcp-local-server dhcpv6 group ipv6 interface
ge-0/0/2.0
```

2. Configuring PPPoE:

- a. Set the interface to encapsulate ppp over ethernet.

```
[edit system interface]
user@host# set interface ge-0/0/1 unit 0 encapsulation ppp-over-ether
```

- b. Set default chap secret.

```
[edit system interface]
user@host# set interfaces pp0 unit 0 ppp-options chap default-chap-secret
test
```

- c. Set chap local name.

```
[edit system interface]
user@host# set interfaces pp0 unit 0 ppp-options chap local-name test_user
```

- d. Set PPP options chap state.

```
[edit system interface]
user@host# set interfaces pp0 unit 0 ppp-options chap passive
```

- e. Set underlying-interface.

```
[edit system interface]
user@host# set interfaces pp0 unit 0 pppoe-options underlying-interface
ge-0/0/1.0
```

- f. Set pppoe-options.

```
[edit system interface]
user@host# set interfaces pp0 unit 0 pppoe-options client
```

3. Configuring DHCPv6 client:

- a. Set the family name and dhcpv6 client type.

```
[edit]
user@host# set interfaces pp0 unit 0 family inet6 dhcpv6-client client-type
statefull
```

- b. Set the dhcpv6 client identity association type.

```
[edit]
user@host# set interfaces pp0 unit 0 family inet6 dhcpv6-client client-ia-type
ia-pd
```

- c. Set update-router-advertisement interface and other stateful-configuration.

```
[edit]
user@host# set interfaces pp0 unit 0 family inet6 dhcpv6-client
update-router-advertisement interface ge-0/0/2.0 other-stateful-configuration
```

- d. Set maximum advertisement interval value.

```
[edit]
user@host# set interfaces pp0 unit 0 family inet6 dhcpv6-client
update-router-advertisement interface ge-0/0/2.0 max-advertisement-interval
10
```

- e. Set minimum advertisement interval value.

```
[edit]
user@host# set interfaces pp0 unit 0 family inet6 dhcpv6-client
update-router-advertisement interface ge-0/0/2.0 min-advertisement-interval
5
```

- f. Set client-identifier duid type.

```
[edit]
user@host# set interfaces pp0 unit 0 family inet6 dhcpv6-client client-identifier
duid-type duid-11
```

- g. Set requested option for DHCPv6 client.

```
[edit]
user@host# set interfaces pp0 unit 0 family inet6 dhcpv6-client req-option
dns-server
```

- h. Update the server.

```
[edit]
user@host# set interfaces pp0 unit 0 family inet6 dhcpv6-client update-server
```

- i. Set the protocols and the interface.

```
[edit]
user@host# set protocols router-advertisement interface pp0.0
```

4. Enable IPv6
  - a. Set the family name and mode to enable IPv6.

```
[edit]
user@host# set security forwarding-options family inet6 mode flow-based
```

5. Configuring DHCPv6 server to propagate DNS server information to end device:
  - a. Set address assignment pool name, family name and prefix.

```
[edit]
user@host# set access address-assignment pool p1 family inet6 prefix 2001::/16
```

- b. Set the interface name for propagating TCP/IP settings to pool.

```
[edit]
user@host# set access address-assignment pool p1 family inet6 dhcp-attributes
propagate-settings pp0.0
```

6. Configuring security zone:
  - a. Set the zone name, untrust interface and system services.

```
[edit]
user@host# set security zones security-zone trust interface pp0.0
host-inbound-traffic system-services dhcpv6
```

- b. Set the trust interface.

```
[edit]
user@host# set security zones security-zone trust interface ge-0/0/2.0
host-inbound-traffic system-services dhcpv6
```

**Step-by-Step  
Procedure**

1. To configure DHCPv6 client (Auto) on SRX550M device:

- a. Set the interface, unit value, family name and DHCPv6 client type.

```
[edit system interface]
user@host# set interfaces fe-0/0/0 unit 0 family inet6 dhcpv6-client client-type
autoconfig
```

- b. Set Dhcpx6 client identity association type.

```
[edit system interface]
user@host# set interfaces fe-0/0/0 unit 0 family inet6 dhcpv6-client
client-ia-type ia-na
```

- c. Set client-identifier type.

```
[edit system interface]
user@host# set interfaces fe-0/0/0 unit 0 family inet6 dhcpv6-client
client-identifier duid-type duid-11
```

- d. Set DHCPV6 client requested option.

```
[edit system interface]
user@host# set interfaces fe-0/0/0 unit 0 family inet6 dhcpv6-client req-option
dns-server
```

2. Configuring router advertisement:

- a. Set the protocol and interface.

```
[edit]
user@host# set protocols router-advertisement interface fe-0/0/0.0
```

3. Enable IPv6.

- a. Set family name and mode.

```
[edit]
user@host# set security forwarding-options family inet6 mode flow-based
```

4. Configuring security zone:

5. Set the zone name, trust interface and system services.

```
[edit]
user@host# set security zones security-zone trust interface pp0.0
host-inbound-traffic system-services dhcpv6
```

## Results

- Result for DHCPv6 Server:

From configuration mode, confirm your configuration by entering the **show system services dhcp-local-server**, **show interfaces**, **show protocols**, **show security forwarding-options**, **show access profile prof-ge001**, **show access address-assignment pool**, and **show security zones** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```

```

### Verification

Confirm that the configuration is working properly.

#### Verifying DHCPv6 Server Configuration

**Purpose** Verify that the DHCPv6 Server has been configured.

**Action** • From operational mode, enter the **show dhcpv6 server binding** command.

The following output shows the options for the **show dhcpv6 server binding** command.

```

[edit]
user@host>show dhcpv6 server binding detail
  Session Id: 75
    Client IPv6 Prefix: 2001:1:1::/48
    Client DUID: LL0x1-3c:94:d5:98:90:01
    State:
      BOUND(DHCPV6_LOCAL_SERVER_STATE_BOUND)

```

```

Lease Expires:                2016-03-26 10:12:37 JST
Lease Expires in:             86213 seconds
Lease Start:                  2016-03-25 10:12:37 JST
Last Packet Received:         2016-03-25 10:12:50 JST
Incoming Client Interface:     pp0.0
Server Ip Address:             0.0.0.0
Client Prefix Pool Name:       v6-pd-pool
Client Id Length:              10
Client Id:                     /0x00030001/0x3c94d598/0x9001

```

- From operational mode, enter the **show route table inet6.0** command.

The following output shows the options for the **show route table inet6.0** command.

```

[edit]
user@host>show route table inet6.0

### Verifying DHCPv6 client (Auto) Configuration

**Purpose** Verify that the DHCPv6 client (Auto) has been configured.

- Action** • From operational mode, enter the **show dhcpv6 client binding detail** command.

The following output shows the options for the **show dhcpv6 client binding detail** command.

```
[edit]
user@host>show dhcpv6 client binding detail
Client Interface: fe-0/0/0.0
  Hardware Address:      00:26:88:38:b5:00
  State:                 BOUND(DHCPV6_CLIENT_STATE_BOUND)
  ClientType:            AUTO
  Lease Expires:         2016-03-26 10:15:35 JST
  Lease Expires in:     86395 seconds
  Lease Start:          2016-03-25 10:15:35 JST
  Bind Type:             IA_NA
  Client DUID:           LL0x3-00:26:88:38:b5:00
  Rapid Commit:         Off
  Server Ip Address:     fe80::3e94:d5ff:fe98:8602
  Client IP Address:     2001:1:1:1:226:88ff:fe38:b500/128
  Client IP Prefix:      2001:1:1:1::/64

DHCP options:
  Name: server-identifier, Value: VENDOR0x00000583-0x414c3131
```

- From operational mode, enter the **show route table inet6.0** command.

The following output shows the options for the **show route table inet6.0** command.

```
[edit]
user@host>show route table inet6.0

## DHCPv6 Client

SRX Series device can act as a DHCPv6 client, receiving its TCP/IP settings and the IPv6 address for any physical interface in any security zone from an external DHCPv6 server. To enable a device to operate as a DHCPv6 client, you must configure a logical interface on the device to obtain an IPv6 address from the DHCPv6 local server in the network. For more information, read this topic.

- [DHCPv6 Client Overview on page 682](#)
- [Minimum DHCPv6 Client Configuration on page 682](#)
- [Configuring DHCP Client-Specific Attributes on page 684](#)
- [Configuring Optional DHCPv6 Client Attributes on page 685](#)
- [Configuring the DHCPv6 Client Rapid Commit Option on page 686](#)
- [Configuring a DHCPv6 Client in Autoconfig Mode on page 687](#)
- [Configuring TCP/IP Propagation on a DHCPv6 Client on page 688](#)

## DHCPv6 Client Overview

A Juniper Networks device can act as a Dynamic Host Configuration Protocol version 6 (DHCPv6) client, receiving its TCP/IP settings and the IPv6 address for any physical interface in any security zone from an external DHCPv6 server. When the device operates as a DHCPv6 client and a DHCPv6 server simultaneously, it can transfer the TCP/IP settings learned through its DHCPv6 client module to its default DHCPv6 server module. For the device to operate as a DHCPv6 client, you configure a logical interface on the device to obtain an IPv6 address from the DHCPv6 server in the network.

DHCPv6 client support for Juniper Networks devices includes the following features:

- Identity association for nontemporary addresses (IA\_NA)
- Identity association for prefix delegation (IA\_PD)
- Rapid commit
- TCP/IP propagation
- Auto-prefix delegation
- Autoconfig mode (stateful and stateless)

To configure the DHCPv6 client on the device, include the **dhcpv6-client** statement at the **[edit interfaces]** hierarchy level.

**NOTE:** To configure a DHCPv6 client in a routing instance, add the interface in a routing instance using the **[edit routing-instances]** hierarchy.

**NOTE:** On all SRX Series devices, DHCPv6 client authentication is not supported.

**NOTE:** On SRX300, SRX320, SRX340, SRX345, and SRX550M devices, DHCPv6 client does not support:

- Temporary addresses
- Reconfigure messages
- Multiple identity association for nontemporary addresses (IA\_NA)
- Multiple prefixes in a single identity association for prefix delegation (IA\_PD)
- Multiple prefixes in a single router advertisement

## Minimum DHCPv6 Client Configuration

This topic describes the minimum configuration you must use to configure an SRX300, SRX320, SRX340, SRX345, SRX550M, or SRX1500 device as a DHCPv6 client.

To configure the device as a DHCPv6 client:

1. Specify the DHCPv6 client interface.

```
[edit]
user@host# set interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client
```

2. Configure the DHCPv6 client type. The client type can be **autoconfig** or **statefull**.

- To enable DHCPv6 auto configuration mode, configure the client type as **autoconfig**.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-type autoconfig
```

- For stateful address assignment, configure the client type as **statefull**.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-type statefull
```

3. Specify the identity association type.

- To configure identity association for nontemporary address (IA\_NA) assignment, specify the **client-ia type** as **ia-na**.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-ia-type ia-na
```

- To configure identity association for prefix delegation (IA\_PD), specify the **client-ia-type** as **ia-pd**.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-ia-type ia-pd
```

4. Configure the DHCPv6 client identifier by specifying the DHCP unique identifier (DUID) type. The following DUID types are supported:

- Link Layer address (duid-ll)
- Link Layer address plus time (duid-llt)
- Vendor-assigned unique ID based on enterprise number (vendor)

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-identifier duid-type duid-ll
```

**NOTE:** To configure a DHCPv6 client in a routing instance, add the interface to a routing instance using the [edit routing-instances] hierarchy.

## Configuring DHCP Client-Specific Attributes

You use the address-assignment pool feature to include application-specific attributes when clients obtain an address. A client application, such as DHCPv6, uses the attributes to determine how addresses are assigned and to provide optional application-specific characteristics to the client. For example, the DHCPv6 application might specify that a client that matches certain prerequisite information is dynamically assigned an address from a particular named range. Based on which named range is used, DHCPv6 specifies additional DHCPv6 attributes such as the DNS server or the maximum lease time for clients.

**NOTE:** For SRX1500, SRX5400, SRX5600, and SRX5800 devices only.

You use the **dhcp-attributes** statement to configure DHCPv6 client-specific attributes for address-assignment pools at the **[edit access address-assignment pool *pool-name* family inet6]** hierarchy.

Table 52 on page 684 describes the DHCPv6 client attributes for configuring IPv6 address-assignment pools.

*Table 52: DHCPv6 Attributes*

| Attribute                     | Description                                                      | DHCPv6 Option |
|-------------------------------|------------------------------------------------------------------|---------------|
| <b>dns-server</b>             | IPv6 address of DNS server to which clients can send DNS queries | 23            |
| <b>grace-period</b>           | Grace period offered with the lease                              | —             |
| <b>maximum-lease-time</b>     | Maximum lease time allowed by the DHCPv6 server                  | —             |
| <b>option</b>                 | User-defined options                                             | —             |
| <b>sip-server-address</b>     | IPv6 address of SIP outbound proxy server                        | 22            |
| <b>sip-server-domain-name</b> | Domain name of the SIP outbound proxy server                     | 21            |

**See Also**

- [Configuring a Named Address Range and DHCPv6 Attributes for Dynamic Address Assignment on page 692](#)

## Configuring Optional DHCPv6 Client Attributes

To enable a device to operate as a DHCPv6 client, you configure a logical interface on the device to obtain an IPv6 address from the DHCPv6 local server in the network. You can then specify the retransmission attempts, client requested configuration options, interface used to delegate prefixes, rapid commit, and update server options.

To configure optional DHCPv6 client attributes:

1. Specify one of the following DHCPv6 client requested configuration options:

- dns-server
- domain
- ntp-server
- sip-domain
- sip-server

For example, to specify the DHCPv6 client requested option as **dns-server**:

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set req-option dns-server
```

2. Set the number of attempts allowed to retransmit a DHCPv6 client protocol packet.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set retransmission-attempt 6
```

3. Configure the **update-server** option on the DHCPv6 client.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set update-server
```

4. Specify the interface used to delegate prefixes.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set update-router-advertisement interface ge-0/0/0
```

5. Configure the two-message (rapid commit) exchange option for address assignment.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set rapid-commit
```

**NOTE:** To configure a DHCPv6 client in a routing instance, add the interface to a routing instance using the [edit routing-instances] hierarchy.

**NOTE:** On all SRX Series devices, DHCPv6 client authentication is not supported.

**NOTE:** On SRX300, SRX320, SRX340, and SRX345, and SRX550M devices, DHCPv6 client does not support:

- Temporary addresses
- Reconfigure messages
- Multiple identity association for nontemporary addresses (IA\_NA)
- Multiple prefixes in a single identity association for prefix delegation (IA\_PD)
- Multiple prefixes in a single router advertisement

---

## Configuring the DHCPv6 Client Rapid Commit Option

The DHCPv6 client can obtain configuration parameters from a DHCPv6 server through a rapid two-message exchange (solicit and reply). When the rapid commit option is enabled by both the DHCPv6 client and the DHCPv6 server, the two-message exchange is used, rather than the default four-method exchange (solicit, advertise, request, and reply). The two-message exchange provides faster client configuration and is beneficial in environments in which networks are under a heavy load.

To configure the DHCPv6 client to support the DHCPv6 rapid commit option on SRX300, SRX320, SRX340, SRX550M, and SRX1500 devices:

1. Specify the DHCPv6 client interface.

```
[edit]
```

```
user@host# set interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client
```

2. Configure the two-message exchange option for address assignment.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
```

```
user@host# set rapid-commit
```

## Configuring a DHCPv6 Client in Autoconfig Mode

A DHCPv6 client configured in autoconfig mode acts as a stateful client, a stateless client (DHCPv6 server is required for TCP/IP configuration), and stateless–no DHCP client, based on the managed (M) and other configuration (O) bits in the received router advertisement messages.

If the managed bit is 1 and the other configuration bit is 0, the DHCPv6 client acts as a stateful client. In stateful mode, the client receives IPv6 addresses from the DHCPv6 server, based on the identity association for nontemporary addresses (IA\_NA) assignment.

If the managed bit is 0 and the other configuration bit is 1, the DHCPv6 client acts as a stateless client. In stateless mode, the addresses are automatically configured, based on the prefixes in the router advertisement messages received from the router. The stateless client receives configuration parameters from the DHCPv6 server.

If the managed bit is 0 and the other configuration bit is also 0, the DHCPv6 client acts as a stateless–no DHCP client. In the stateless–no DHCP mode, the client receives IPv6 addresses from the router advertisement messages.

To configure DHCPv6 client in autoconfig mode on SRX300, SRX320, SRX340, SRX550M, and SRX1500 devices:

1. Configure the DHCPv6 client type as **autoconfig**.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-type autoconfig
```

2. Specify the identity association type as **ia-na** for nontemporary addresses.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-ia-type ia-na
```

3. Specify the interface on which to configure router advertisement.

```
[edit protocols router-advertisement]
user@host# set interface ge-0/0/0
```

## Configuring TCP/IP Propagation on a DHCPv6 Client

You can enable or disable the propagation of TCP/IP settings received on the device acting as a DHCPv6 client. The settings can be propagated to the server pool running on the device. This topic describes how to configure TCP/IP settings on a DHCPv6 client, where both the DHCPv6 client and DHCPv6 server are on the same device.

**NOTE:** This feature is supported on SRX300, SRX320, SRX340, SRX550M, and SRX1500 devices.

To configure TCP/IP setting propagation on a DHCPv6 client:

1. Configure the **update-server** option on the DHCPv6 client.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set update-server
```

2. Configure the address pool to specify the interface (where **update-server** is configured) from which TCP/IP settings can be propagated.

```
[edit access]
user@host# set address-assignment pool 2 family inet6 dhcp-attributes
propagate-settings ge-0/0/0
```

## Understanding DHCPv6 Client and Server Identification

Each DHCPv6 client and server is identified by a DHCP unique identifier (DUID). The DUID is unique across all DHCPv6 clients and servers, and it is stable for any specific client or server. DHCPv6 clients use DUIDs to identify a server in messages where a server needs to be identified. DHCPv6 servers use DUIDs to determine the configuration parameters to be used for clients and in the association of addresses with clients.

**NOTE:** This feature is supported on SRX300, SRX320, SRX340, SRX550M, and SRX1500 devices.

The DUID is a 2-octet type code represented in network byte order, followed by a variable number of octets that make up the actual identifier; for example, 00:02:00:01:02:03:04:05:07:a0. A DUID can be up to 128 octets in length (excluding the type code). The following types are currently defined for the DUID parameter:

- Type 1—Link Layer address plus time (duid-llt)
- Type 2—Vendor-assigned unique ID based on enterprise number (vendor)
- Type 3—Link Layer address (duid-ll)

The duid-llt DUID consists of a 2-octet type field that contains the value 1, a 2-octet hardware type code, 4 octets that signify a time value, followed by the Link Layer address of any one network interface that is connected to the DHCP device at the time that the DUID is generated.

The vendor DUID is assigned by the vendor to the device and contains the vendor's registered private enterprise number as maintained by the identity association for nontemporary addresses (IA\_NA) assignment, followed by a unique identifier assigned by the vendor.

The duid-ll DUID contains a 2-octet type field that stores the value 3, and a 2-octet network hardware type code, followed by the Link Layer address of any one network interface that is permanently connected to the client or server device.

## DHCPv6 Address-Assignment Pools

Address pool is a set of Internet Protocol addresses available for allocation to users, such as in host configurations with the DHCP. An address-assignment pool can support either IPv4 address or IPv6 addresses. You cannot use the same pool for both types of address. For more information, read this topic.

- [Example: Configuring an Address-Assignment Pool for IPv6 Addresses on page 689](#)
- [Configuring a Named Address Range and DHCPv6 Attributes for Dynamic Address Assignment on page 692](#)
- [Configuring an Address-Assignment Pool for Router Advertisement on page 693](#)
- [Configuring Nontemporary Address Assignment on page 693](#)
- [Configuring Identity Associations for Nontemporary Addresses and Prefix Delegation on page 694](#)
- [Configuring Auto-Prefix Delegation on page 695](#)

### Example: Configuring an Address-Assignment Pool for IPv6 Addresses

This example shows how to configure an address-assignment pool on SRX1500, SRX5400, SRX5600, and SRX5800 devices.

- [Requirements on page 690](#)
- [Overview on page 690](#)
- [Configuration on page 690](#)
- [Verification on page 691](#)

## Requirements

---

Before you begin:

- Specify the name of the address-assignment pool and configure addresses for the pool.
- Set DHCPv6 attributes for the address-assignment pool.

## Overview

---

In this example, you configure an address-pool called my-pool and specify the IPv6 family as inet6. You configure the IPv6 prefix as 2001:db8:3000:1::/64, the range name as range1, and the IPv6 range for DHCPv6 clients from a low of 2001:db8:3000:1::/64 to a high of 2001:db8:3000:200::/64. You can define the range based on the lower and upper boundaries of the prefixes in the range or based on the length of the prefixes in the range. Finally, you specify the DHCPv6 attribute for the DNS server as 2001:db8:3001::1, the grace period as 3600, and the maximum lease time as 120.

## Configuration

---

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

```
set access address-assignment pool my-pool family inet6 prefix 2001:db8:3000:1::/64
set access address-assignment pool my-pool family inet6 range range1 low
  2001:db8:3000:1::/64 high 2001:db8:3000:200::/64
set access address-assignment pool my-pool family inet6 dhcp-attributes dns-server
  2001:db8:3001::1
set access address-assignment pool my-pool family inet6 dhcp-attributes grace-period
  3600
set access address-assignment pool my-pool family inet6 dhcp-attributes
  maximum-lease-time 120
```

### Step-by-Step Procedure

The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure an IPv6 address-assignment pool:

1. Configure an address-pool and specify the IPv6 family.

```
[edit access]
user@host# edit address-assignment pool my-pool family inet6
```

2. Configure the IPv6 prefix, the range name, and IPv6 range for DHCPv6 clients.

```
[edit access address-assignment pool my-pool family inet6]
```

```
user@host# set prefix 2001:db8:3000:1::/64
user@host# set range range1 low 2001:db8:3000:1::/64 high
2001:db8:3000:200::/64
```

3. Configure the DHCPv6 attribute for the DNS server for the address pool.

```
[edit access address-assignment pool my-pool family inet6]
user@host# set dhcp-attributes dns-server 2001:db8:3001::1
```

4. Configure the DHCPv6 attribute for the grace period.

```
[edit access address-assignment pool my-pool family inet6]
user@host# set dhcp-attributes grace-period 3600
```

5. Configure the DHCPv6 attribute for the maximum lease time.

```
[edit access address-assignment pool my-pool family inet6]
user@host# set dhcp-attributes maximum-lease-time 120
```

**Results** From configuration mode, confirm your configuration by entering the **show access address-assignment** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show access address-assignment
pool my-pool {
  family inet6 {
    prefix 2001:db8:3000:1::/64;
    range range1 {
      low 2001:db8:3000:1::/64 ;
      high 2001:db8:3000:200::/64;
    }
    dhcp-attributes {
      maximum-lease-time 120;
      grace-period 3600;
      dns-server {
        2001:db8:3001::1;
      }
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the configuration is working properly.

### *Verifying Configuration*

**Purpose** Verify that the address-assignment pool has been configured.

**Action** From operational mode, enter the **show access address-assignment** command.

- See Also**

  - [Example: Configuring DHCPv6 Server Options on page 654](#)
  - [Creating a Security Policy to Enable DHCPv6 Traffic on page 654](#)

## Configuring a Named Address Range and DHCPv6 Attributes for Dynamic Address Assignment

You can optionally configure multiple named ranges, or subsets of addresses, within an address-assignment pool. During dynamic address assignment, a client can be assigned an address from a specific named range. To create a named range, you specify a name for the range and define the address range and DHCPv6 attributes.

**NOTE:** Supported only on SRX1500, SRX5400, SRX5600, and SRX5800 devices.

To configure a named address range for dynamic address assignment:

1. Specify the name of the address-assignment pool and the IPv6 family.

```
[edit access]
user@host# edit address-assignment pool my-pool2 family inet6
```

2. Configure the IPv6 prefix and then define the range name and IPv6 range for DHCPv6 clients. You can define the range based on the lower and upper boundaries of the prefixes in the range, or based on the length of the prefixes in the range.

```
[edit access address-assignment pool my-pool2 family inet6]
user@host# set prefix 2001:db8:3000:5::/64
user@host# set range range2 low 2001:db8:3000:2::/64 high 2001:db8:3000:300::/64
```

3. Configure DHCPv6 attributes for the address pool.

```
[edit access address-assignment pool my-pool2 family inet6]
user@host# set dhcp-attributes dns-server 2001:db8:18:: grace-period 3600
maximum-lease-time 120
```

4. If you are done configuring the device, enter **commit** from configuration mode.

**See Also** • [Configuring Address-Assignment Pool Linking on page 626](#)

## Configuring an Address-Assignment Pool for Router Advertisement

For SRX1500, SRX5400, SRX5600, and SRX5800 devices, you can create an address-assignment pool that is explicitly used for router advertisement address assignment. You populate the address-assignment pool using the standard procedure, but you additionally specify that the pool is used for router advertisement.

To configure an address-assignment pool that is used for router advertisement:

1. Create the IPv6 address-assignment pool. See [“Example: Configuring an Address-Assignment Pool” on page 689](#).
2. Specify that the address-assignment pool is used for router advertisement.

```
[edit access address-assignment]
user@host# set neighbor-discovery-router-advertisement router1
```

3. If you are done configuring the device, enter **commit** from configuration mode.

## Configuring Nontemporary Address Assignment

Nontemporary address assignment is also known as stateful address assignment. In the stateful address assignment mode, the DHCPv6 client requests global addresses from the DHCPv6 server. Based on the DHCPv6 server's response, the DHCPv6 client assigns the global addresses to interfaces and sets a lease time for all valid responses. When the lease time expires, the DHCPv6 client renews the lease from the DHCPv6 server.

**NOTE:** This feature is supported on SRX300, SRX320, SRX340, SRX550M, and SRX1500 devices.

To configure nontemporary (stateful) address assignment:

1. Specify the DHCPv6 client interface.

```
[edit]
user@host# set interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client
```

2. Configure the client type as **statefull**.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-type statefull
```

3. Specify the IA\_NA assignment.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-ia-type ia-na
```

**See Also** • [Minimum DHCPv6 Client Configuration on page 682](#)

## Configuring Identity Associations for Nontemporary Addresses and Prefix Delegation

The DHCPv6 client requests IPv6 addresses and prefixes from the DHCPv6 server. Based on the DHCPv6 server's response, the DHCPv6 client assigns the IPv6 addresses to interfaces and sets a lease time for all valid responses. When the lease time expires, the DHCPv6 client renews the lease from the DHCPv6 server.

To configure identity association for nontemporary addresses (IA\_NA) and identity association for prefix delegation (IA\_PD) on SRX300, SRX320, SRX340, SRX550M, and SRX1500 devices:

1. Specify the DHCPv6 client interface.

```
[edit]
user@host# set interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client
```

2. Configure the client type as **statefull**.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-type statefull
```

3. Specify the IA\_NA.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-ia-type ia-na
```

4. Specify the IA\_PD.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-ia-type ia-pd
```

**See Also** • [Minimum DHCPv6 Client Configuration on page 682](#)

## Configuring Auto-Prefix Delegation

You can use DHCPv6 client prefix delegation to automate the delegation of IPv6 prefixes to the customer premises equipment (CPE). With prefix delegation, a delegating router delegates IPv6 prefixes to a requesting router. The requesting router then uses the prefixes to assign global IPv6 addresses to the devices on the subscriber LAN. The requesting router can also assign subnet addresses to subnets on the LAN.

To configure auto-prefix delegation for SRX300, SRX320, SRX340, SRX345, SRX550M, and SRX1500 devices:

1. Configure the DHCPv6 client type as **statefull**.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-type statefull
```

2. Specify the identity association type as **ia-na** for nontemporary addresses.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-ia-type ia-na
```

3. Specify the identity association type as **ia-pd** for prefix delegation.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-ia-type ia-pd
```

4. Configure the DHCPv6 client identifier by specifying the DUID type.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set client-identifier duid-type duid-ll
```

5. Specify the interface used to delegate prefixes.

```
[edit interfaces ge-0/0/0 unit 0 family inet6 dhcpv6-client]
user@host# set update-router-advertisement interface ge-0/0/0
```

## DHCP In Chassis Cluster Mode

---

Junos OS allows you to configure two SRX Series devices as DHCP clients and a third SRX Series device as a DHCP server and setup high availability between the two DHCP clients in chassis cluster mode.

Similarly, you can also configure two SRX Series devices as DHCP servers in chassis cluster mode and a third SRX Series device as a DHCP client. For more information, read this topic.

- [Example: Configuring the Device as a DHCP Server in Chassis Cluster Mode on page 696](#)
- [Example: Configuring the Device as a DHCP Client in Chassis Cluster Mode on page 702](#)

### Example: Configuring the Device as a DHCP Server in Chassis Cluster Mode

This example shows how to configure a DHCP server in chassis cluster mode.

- [Requirements on page 696](#)
- [Overview on page 696](#)
- [Configuration on page 697](#)
- [Verification on page 701](#)

#### Requirements

---

This example uses the following hardware and software components:

- Two SRX Series devices as DHCP servers
- One SRX Series device as DHCP client
- Junos OS Release 12.1X47-D10 or later for SRX Series Services Gateways

Before you begin:

- Determine the IP address pools and the lease durations to use for each subnet.
- Obtain the MAC addresses of the clients that require permanent IP addresses. Determine the IP addresses to use for these clients.
- List the IP addresses that are available for the servers and devices on your network; for example, DNS, NetBIOS servers, boot servers, and gateway devices.
- Determine the DHCP options required by the subnets and clients in your network.

#### Overview

---

In this example, you configure two SRX Series devices as DHCP servers and a third SRX Series device as a DHCP client. Configure the two DHCP servers in chassis cluster mode.

For the DHCP server, configure the SRX Series device as a DHCP local server with minimum DHCP local server configurations. You specify the server group as g1 and enable the DHCP local server on interface reth1.

For the DHCP client, you specify the interface as ge-0/0/1, set the logical unit as 0, and create a DHCP inet family. You then specify the DHCP client identifier as 00:0a:12:00:12:12 in hexadecimal. You use hexadecimal if the client identifier is a MAC address. You set the DHCP lease time as 86,400 seconds. The range is from 60 through 2,147,483,647 seconds.

You set the number of retransmission attempts to 6. The range is from 0 through 6, and the default is 4. You set the retransmission interval to 5 seconds. The range is from 4 through 64, and the default is 4 seconds. Finally, you set the IPv4 address of the preferred DHCP server to 10.1.1.1 and the vendor class ID to ether.

**WARNING:** Starting with Junos OS Release 15.1X49-D60 and Junos OS Release 17.3R1, the legacy DHCPD (DHCP daemon) configuration on all SRX Series devices has been deprecated and only the new DHCP CLI is supported. When you upgrade to Junos OS Release 15.1X49-D60 and later releases on a device that already has the DHCPD configuration, the following warning messages are displayed:

**WARNING:** The DHCP configuration command used will be deprecated in future Junos releases.

**WARNING:** Please see documentation for updated commands.

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

Configure DHCP Server 1 and Server 2:

```
set system services dhcp-local-server group g1 interface reth1
set access address-assignment pool p1 family inet network 203.0.113.1/10
set access address-assignment pool p1 family inet range r1 low 203.0.113.5
set access address-assignment pool p1 family inet range r1 high 203.0.113.20
```

Configure chassis cluster on DHCP Server 1 and DHCP Server 2:

```
set chassis cluster reth-count 4
set chassis cluster control-link-recovery
set chassis cluster heartbeat-interval 2000
set chassis cluster redundancy-group 0 node 0 priority 200
set chassis cluster redundancy-group 0 node 1 priority 1
set interfaces ge-0/0/1 gigether-options redundant-parent reth1
set interfaces ge-6/0/1 gigether-options redundant-parent reth1
set interfaces reth1 redundant-ether-options redundancy-group 1
set interfaces reth1 unit 0 family inet address 10.1.1.1/24
```

Configure the DHCP client:

```

set interfaces ge-0/0/1 unit 0 family inet dhcp-client
set interfaces ge-0/0/1 unit 0 family inet dhcp-client client-identifier user-id ascii
00:0a:12:00:12:12
set interfaces ge-0/0/1 unit 0 family inet dhcp-client lease-time 86400
set interfaces ge-0/0/1 unit 0 family inet dhcp-client retransmission-attempt 6
set interfaces ge-0/0/1 unit 0 family inet dhcp-client retransmission-interval 5
set interfaces ge-0/0/1 unit 0 family inet dhcp-client server-address 10.1.1.1
set interfaces ge-0/0/1 unit 0 family inet dhcp-client vendor-id ether

```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the devices as DHCP servers:

1. Configure the DHCP local server.

```

[edit system services]
user@host# set dhcp-local-server group g1 interface reth1

```

2. Configure an address pool.

```

[edit access]
user@host# set address-assignment pool p1 family inet network 203.0.113.1/10
user@host# set address-assignment pool p1 family inet range r1 low 203.0.113.5
user@host# set address-assignment pool p1 family inet range r1 high 203.0.113.20

```

**Step-by-Step Procedure** To configure the DHCP servers in chassis cluster mode:

1. Specify the number of redundant Ethernet interfaces for the chassis cluster.

```

{primary:node0}[edit]
user@host# set chassis cluster reth-count 4

```

2. Enable control link recovery.

```

{primary:node0}[edit]
user@host# set chassis cluster control-link-recovery

```

3. Configure heartbeat settings.

```

{primary:node0}[edit]
user@host# set chassis cluster heartbeat-interval 2000

```

4. Configure the redundancy groups.

```

{primary:node0}[edit]

```

```
user@host# set chassis cluster redundancy-group 0 node 0 priority 200
user@host# set chassis cluster redundancy-group 0 node 1 priority 1
```

5. Configure redundant Ethernet interfaces.

```
{primary:node0}[edit]
user@host# set interfaces ge-0/0/1 gigether-options redundant-parent reth1
user@host# set interfaces ge-6/0/1 gigether-options redundant-parent reth1
user@host# set interfaces reth1 redundant-ether-options redundancy-group 1
user@host# set interfaces reth1 unit 0 family inet address 10.1.1.1/24
```

### Step-by-Step Procedure

To configure the device as DHCP client:

1. Specify the DHCP client interface.

```
[edit]
user@host# edit interfaces ge-0/0/1 unit 0 family inet dhcp-client
```

2. Configure the DHCP client identifier as a hexadecimal value.

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]
user@host# set client-identifier user-id ascii 00:0a:12:00:12:12
```

3. Set the DHCP lease time.

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]
user@host# set lease-time 86400
```

4. Set the number of attempts allowed to retransmit a DHCP packet.

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]
user@host# set retransmission-attempt 6
```

5. Set the interval (in seconds) allowed between retransmission attempts. The range is 4 through 64. The default is 4 seconds.

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]
user@host# set retransmission-interval 5
```

6. Set the IPv4 address of the preferred DHCP server.

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]
user@host# set server-address 10.1.1.1
```

7. Set the vendor class ID for the DHCP client.

```
[edit interfaces ge-0/0/1 unit 0 family inet dhcp-client]
user@host# set vendor-id ether
```

**Results** From configuration mode, confirm your configuration by entering the **show** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show system services
dhcp-local-server {
  group g1 {
    interface reth1.0;
  }
}
```

```
[edit]
user@host# show access address-assignment
pool p1 {
  family inet {
    network 203.0.113.1/10;
    range r1 {
      low 203.0.113.5;
      high 203.0.113.20;
    }
  }
}
```

```
[edit]
user@host# show chassis cluster
control-link-recovery;
reth-count 4;
heartbeat-interval 2000;
redundancy-group 0 {
  node 0 priority 200;
  node 1 priority 1;
}
```

```
[edit]
user@host# show interfaces reth1
redundant-ether-options {
  redundancy-group 1;
}
unit 0 {
  family inet {
    address 10.1.1.1.24;
  }
}
```

```
[edit]
user@host# show interfaces ge-0/0/1 unit 0 family inet
```

```

dhcp-client {
  client-identifier user-id ascii 00:0a:12:00:12:12;
  lease-time 86400;
  retransmission-attempt 6;
  retransmission-interval 5;
  server-address 10.1.1.1;
  vendor-id ether;
}

```

If you are done configuring the device, enter **commit** from configuration mode.

## Verification

### Verifying the DHCP Server in Chassis Cluster Mode

**Purpose** Verify that the DHCP server is working in chassis cluster mode.

**Action** From operational mode, enter the **show dhcp server binding** and **show dhcp server statistics** commands.

```
user@host> show dhcp server binding
```

| IP address | Session Id | Hardware address  | Expires | State | Interface |
|------------|------------|-------------------|---------|-------|-----------|
| 10.1.1.1   | 1          | 64:87:88:79:a3:81 | 81855   | BOUND | reth1     |

```
user@host> show dhcp server statistics
```

```

Packets dropped:
  Total                0
  dhcp-service total   0

Messages received:
  BOOTREQUEST          2
  DHCPDECLINE          0
  DHCPDISCOVER         1
  DHCPINFORM           0
  DHCPRELEASE          0
  DHCPREQUEST          1

Messages sent:
  BOOTREPLY            2
  DHCPOFFER            1
  DHCPACK              0
  DHCPNAK              0
  DHCPFORCERENEW       0

```

**Meaning** The sample output shows that DHCP servers configured in the example work in a chassis cluster.

**See Also** • [Understanding DHCP Server Operation on page 612](#)

## Example: Configuring the Device as a DHCP Client in Chassis Cluster Mode

This example shows how to configure the device as a DHCP client in chassis cluster mode.

- [Requirements on page 702](#)
- [Overview on page 702](#)
- [Configuration on page 703](#)
- [Verification on page 706](#)

### Requirements

---

This example uses the following hardware and software components:

- Two SRX Series devices as DHCP client
- One SRX Series device as DHCP server
- Junos OS Release 12.1X47-D10 or later for SRX Series Services Gateways

Before you begin:

- Determine the IP address pools and the lease durations to use for each subnet.
- Obtain the MAC addresses of the clients that require permanent IP addresses. Determine the IP addresses to use for these clients.
- List the IP addresses that are available for the servers and devices on your network; for example, DNS, NetBIOS servers, boot servers, and gateway devices.
- Determine the DHCP options required by the subnets and clients in your network.

### Overview

---

In this example, you configure two SRX Series devices as DHCP clients and a third SRX Series device as a DHCP server. Configure the two DHCP clients in chassis cluster mode.

For DHCP clients, you specify the interface as reth1, set the logical unit as 0, and create a DHCP inet family. You then specify the DHCP client identifier as 00:0a:12:00:12:12 in hexadecimal. You use hexadecimal if the client identifier is a MAC address. You set the options no-hostname if you do not want the DHCP client to send the hostname with the packets. You set the DHCP lease time as 86,400 seconds. The range is from 60 through 2,147,483,647 seconds. You set the number of retransmission attempts to 6. The range is from 0 through 6, and the default is 4. You set the retransmission interval to 5 seconds. The range is from 4 through 64, and the default is 4 seconds. Finally, you set the IPv4 address of the preferred DHCP server to 203.0.113.1 and the vendor class ID to ether.

For the DHCP server, configure the SRX Series device as a DHCP local server with minimum DHCP local server configurations. You specify the server group as g1 and enable the DHCP local server on interface ge-0/0/2.0.

## Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, copy and paste the commands into the CLI at the **[edit]** hierarchy level, and then enter **commit** from configuration mode.

Configure DHCP Client 1 and Client 2:

```
set interfaces reth1 unit 0 family inet dhcp-client
set interfaces reth1 unit 0 family inet dhcp-client client-identifier user-id ascii
00:0a:12:00:12:12
set interfaces reth1 unit 0 family inet dhcp-client options no-hostname
set interfaces reth1 unit 0 family inet dhcp-client lease-time 86400
set interfaces reth1 unit 0 family inet dhcp-client retransmission-attempt 6
set interfaces reth1 unit 0 family inet dhcp-client retransmission-interval 5
set interfaces reth1 unit 0 family inet dhcp-client server-address 203.0.113.1
set interfaces reth1 unit 0 family inet dhcp-client vendor-id ether
```

Configure chassis cluster on Client 1 and Client 2:

```
set chassis cluster reth-count 2
set chassis cluster control-link-recovery
set chassis cluster heartbeat-interval 1000
set chassis cluster redundancy-group 1 node 0 priority 100
set chassis cluster redundancy-group 1 node 1 priority 1
set chassis cluster redundancy-group 0 node 0 priority 100
set chassis cluster redundancy-group 0 node 1 priority 1
set interfaces ge-0/0/1 gigether-options redundant-parent reth1
set interfaces ge-4/0/1 gigether-options redundant-parent reth1
set interfaces reth1 redundant-ether-options redundancy-group 1
```

Configure the DHCP server:

```
set system service dhcp-local-server group g1 interface ge-0/0/2.0
set interfaces ge-0/0/2 unit 0 family inet address 203.0.113.1/24
set access address-assignment pool p1 family inet network 203.0.113.0/24
set access address-assignment pool p1 family inet range r1 low 203.0.113.5
set access address-assignment pool p1 family inet range r1 high 203.0.113.20
```

**Step-by-Step Procedure** The following example requires you to navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure the devices as DHCP clients:

1. Specify the DHCP client interface.

```
[edit]
user@host# edit interfaces reth1 unit 0 family inet dhcp-client
```

2. Configure the DHCP client identifier as a hexadecimal value.

```
[edit interfaces reth1 unit 0 family inet dhcp-client]
user@host# set client-identifier user-id ascii 00:0a:12:00:12:12
```

3. Set the hostname if you do not want the DHCP client to send hostname in the packets (RFC option code 12).

```
[edit interfaces reth1 unit 0 family inet dhcp-client]
user@host# set options no-hostname
```

4. Set the DHCP lease time.

```
[edit interfaces reth1 unit 0 family inet dhcp-client]
user@host# set lease-time 86400
```

5. Set the number of attempts allowed to retransmit a DHCP packet.

```
[edit interfaces reth1 unit 0 family inet dhcp-client]
user@host# set retransmission-attempt 6
```

6. Set the interval (in seconds) allowed between retransmission attempts. The range is 4 through 64. The default is 4 seconds.

```
[edit interfaces reth1 unit 0 family inet dhcp-client]
user@host# set retransmission-interval 5
```

7. Set the IPv4 address of the preferred DHCP server.

```
[edit interfaces reth1 unit 0 family inet dhcp-client]
user@host# set server-address 203.0.113.1
```

8. Set the vendor class ID for the DHCP client.

```
[edit interfaces reth1 unit 0 family inet dhcp-client]
user@host# set vendor-id ether
```

#### Step-by-Step Procedure

To configure the DHCP clients in chassis cluster mode:

1. Specify the number of redundant Ethernet interfaces for the chassis cluster.

```
{primary:node0}[edit]
user@host# set chassis cluster reth-count 2
```

2. Enable control link recovery.

```
{primary:node0}[edit]
user@host# set chassis cluster control-link-recovery
```

3. Configure heartbeat settings.

```
{primary:node0}[edit]
user@host# set chassis cluster heartbeat-interval 1000
```

4. Configure the redundancy groups.

```
{primary:node0}[edit]
user@host# set chassis cluster redundancy-group 1 node 0 priority 100
user@host# set chassis cluster redundancy-group 1 node 1 priority 1
user@host# set chassis cluster redundancy-group 0 node 0 priority 100
user@host# set chassis cluster redundancy-group 0 node 1 priority 1
```

5. Configure redundant Ethernet interfaces.

```
{primary:node0}[edit]
user@host# set interfaces ge-0/0/1 gigether-options redundant-parent reth1
user@host# set interfaces reth1 redundant-ether-options redundancy-group 1
```

### Step-by-Step Procedure

To configure the device as DHCP server:

1. Configure the DHCP local server.

```
[edit system services]
user@host# set dhcp-local-server group g1 interface ge-0/0/2.0
```

2. Configure IP address of the server.

```
[edit interfaces]
user@host# set interfaces ge-0/0/2 unit 0 family inet address 203.0.113.1/24
```

3. Configure an address pool.

```
[edit access]
user@host# set address-assignment pool p1 family inet network 203.0.113.0/24
user@host# set address-assignment pool p1 family inet range r1 low 203.0.113.5
user@host# set address-assignment pool p1 family inet range r1 high 203.0.113.20
```

**Results** From configuration mode, confirm your configuration by entering the **show** commands. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit]
user@host# show interfaces reth1 unit 0 family inet
dhcp-client {
  client-identifier user-id ascii 00:0a:12:00:12:12;
  options no-hostname;
  lease-time 86400;
  retransmission-attempt 6;
  retransmission-interval 5;
  server-address 203.0.113.1;
  vendor-id ether;
}
```

```
[edit]
user@host# show chassis cluster
control-link-recovery;
reth-count 2;
heartbeat-interval 1000;
redundancy-group 0 {
  node 0 priority 100;
  node 1 priority 1;
}
redundancy-group 1 {
  node 0 priority 100;
  node 1 priority 1;
}
```

```
[edit]
user@host# show interfaces reth1
redundant-ether-options {
  redundancy-group 1;
}
```

```
[edit]
user@host# show access address-assignment
pool p1 {
  family inet {
    network 203.0.113.0/24;
    range r1 {
      low 203.0.113.5;
      high 203.0.113.20;
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

---

### Verification

Confirm that the configuration is working properly.

#### *Verifying the DHCP Client in Chassis Cluster Mode*

**Purpose** Verify that the DHCP client is working in chassis cluster mode.

**Action** From operational mode, enter the **show dhcp client binding**, **show dhcp client statistics** and **show dhcp client binding interface reth1 detail** commands.

```
user@host> show dhcp client binding
```

| IP address   | Hardware address  | Expires | State | Interface |
|--------------|-------------------|---------|-------|-----------|
| 203.0.113.14 | 00:1f:12:e3:34:01 | 84587   | BOUND | reth1.0   |

```
user@host> show dhcp client statistics
```

```
Packets dropped:
  Total          4
  Send error     4

Messages received:
  BOOTREPLY      3
  DHCPPOFFER     1
  DHCPACK        2
  DHCPNAK        0
  DHCPFORCERENEW 0

Messages sent:
  BOOTREQUEST    0
  DHCPDECLINE    0
  DHCPDISCOVER   5
  DHCPREQUEST    8
  DHCPINFORM     0
  DHCPRELEASE    1
  DHCPRENEW      0
  DHCPREBIND     0
```

```
user@host> show dhcp client binding interface reth1 detail
```

```
Client Interface: reth1.0
  Hardware Address:      00:10:db:ff:10:01
  State:                 BOUND(LOCAL_CLIENT_STATE_BOUND)
  Lease Expires:         2013-12-18 10:15:36 CST
  Lease Expires in:      30 seconds
  Lease Start:           2013-12-17 10:15:36 CST
  Server Identifier:      203.0.113.1
  Client IP Address:      10.1.1.14
  Update Server          No

DHCP options:
  Name: dhcp-lease-time, Value: 1 day
  Name: server-identifier, Value: 10.1.1.1
  Name: subnet-mask, Value: 255.255.255.0
```

**Meaning** The sample output shows that DHCP clients configured in the example work in a chassis cluster.

**Release History Table**

| Release     | Description                                                                                                                                                                                                |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15.1X49-D60 | Starting with Junos OS Release 15.1X49-D60 and Junos OS Release 17.3R1, the legacy DHCPD (DHCP daemon) configuration on all SRX Series devices has been deprecated and only the new DHCP CLI is supported. |

## access

**Syntax**

```
access {
  address-assignment
  pool pool-name
  address-pool pool-name
  profile profile-name {
    accounting (Access Profile) {
      accounting-stop-on-access-deny;
      accounting-stop-on-failure;
      (authentication-order (Access Profile) (ldap radius | none);
      order (radius | none);
    }
    radius {
      accounting-server [server-addresses];
      authentication-server [server-addresses];
    }
  }
}
```

**Hierarchy Level** [edit]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.

**Description** Configure authentication, authorization, and accounting (AAA) services.  
  
The remaining statements are explained separately. See [CLI Explorer](#).

**NOTE:** The [edit access] hierarchy is not available on QFabric systems.

**Default** Not enabled

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## access (Dynamic Access Routes)

**Syntax**

```
access {
  route prefix {
    next-hop next-hop;
    metric route-cost;
    preference route-distance;
    tag route-tag;
    tag2 route-tag2;
  }
}
```

**Hierarchy Level**

```
[edit dynamic-profiles profile-name routing-instances $junos-routing-instance
 routing-options],
[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options
 rib routing-table-name],
[edit dynamic-profiles profile-name routing-options]
```

**Release Information** Statement introduced in Junos OS Release 9.5.  
Support at the [edit dynamic-profiles *profile-name* routing-instances \$junos-routing-instance routing-options] and [edit dynamic-profiles *profile-name* routing-instances \$junos-routing-instance routing-options rib *routing-table-name*] hierarchy levels introduced in Junos OS Release 10.1.

**Description** Dynamically configure access routes in a dynamic client profile.

**NOTE:** Starting in Junos OS Release 15.1, we recommend that you use only access routes for framed route support. We recommend that you do not use access-internal routes. If you configure the access-internal statement in the dynamic profile, it is ignored. The subscriber's address is stored in the session database entry before the dynamic profile installs the framed route, enabling the next-hop address to be resolved when it is not explicitly specified in the Framed-Route RADIUS attribute [22] or Framed-IPv6-Route attribute [99].

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level**

routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## access-internal (Dynamic Access-Internal Routes)

**Syntax**

```
access-internal {
  route subscriber-ip-address {
    qualified-next-hop underlying-interface {
      mac-address address;
    }
  }
}
```

**Hierarchy Level**

```
[edit dynamic-profiles profile-name routing-instances $junos-routing-instance
routing-options],
[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options
rib routing-table-name],
[edit dynamic-profiles routing-options]
```

**Release Information** Statement introduced in Junos OS Release 9.5.  
Support at the `[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options]` and `[edit dynamic-profiles profile-name routing-instances $junos-routing-instance routing-options rib routing-table-name]` hierarchy levels introduced in Junos OS Release 10.1.

**Description** (Releases earlier than Junos OS Release 15.1) Dynamically configure access-internal routes in a dynamic client profile. Access-internal routes are optional, but are used instead of access routes if the next-hop address is not specified in the Framed-Route Attribute [22] for IPv4 or the Framed-IPv6-Route attribute [99] for IPv6.

**NOTE:** Starting in Junos OS Release 15.1, we recommend that you use only access routes for framed route support. We recommend that you do not use access-internal routes. If you configure the access-internal statement in the dynamic profile, it is ignored. The subscriber's address is stored in the session database entry before the dynamic profile installs the framed route, enabling the next-hop address to be resolved when it is not explicitly specified in the Framed-Route RADIUS attribute (22) or Framed-IPv6-Route attribute [99].

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level**

routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Apply a DHCP relay agent configuration to the named group of DHCP server addresses. The server group itself is configured with the <b>server-group</b> statement. You can apply an active server group globally or for specific groups of interfaces, configured with the <b>group</b> statement. An active server group applied to an interface group overrides a global configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>             | <p><b>allow-server-change</b>—(Optional) (DHCPv4 only) Enable the relay agent to accept and forward a DHCP request (renew or rebind) ACK message to the client from any DHCP local server in the active server group. Starting in Junos OS Release 18.4R1, this option also applies to DHCP information request (DHCPINFORM) ACK messages.</p> <p><b>Default:</b> Forward ACK messages from only the original binding server.</p> <p><b>server-group-name</b>—Name of the group of DHCP or DHCPv6 server addresses to which the DHCP or DHCPv6 relay agent configuration applies.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

## accounting (Access Profile)

**Syntax**

```
accounting {
  accounting-stop-on-access-deny;
  accounting-stop-on-failure;
  order (radius | none);
}
```

**Hierarchy Level** [edit access profile *profile-name*]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.

**Description** Configure the authentication order for authentication, authorization, and accounting (AAA) services.

**Default** Not enabled

**Options** **none**—Use no authentication for specified subscribers.  
**radius**—Use RADIUS authentication for specified subscribers.  
The remaining statements are explained separately. See [CLI Explorer](#).

**NOTE:** The [edit access] hierarchy is not available on QFabric systems.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Override the DHCP relay agent information option (option 82) in DHCP packets destined for a DHCP server. Using this option allows the DHCP relay agent to perform one of the following actions, depending on the configuration:</p> <ul style="list-style-type: none"><li>• If the DHCP relay agent is configured to add option 82 information to the DHCP packets, the DHCP relay agent clears the existing option 82 values from the DHCP packets and inserts the new values before forwarding the packets to the DHCP server.</li><li>• If the DHCP relay agent is not configured to add option 82 information to DHCP packets, the DHCP relay agent clears the existing option 82 values from the packets, but does not add any new values before forwarding the packets to the DHCP server.</li></ul> |

| Description              | <p>Configure RADIUS accounting to send an Acct-Stop message when a subscriber session has been successfully authenticated and authorized, but then fails before an Acct-Start message is sent. By default, an Acct-Stop message is sent only if an Acct-Start message has been exchanged with the accounting server.</p> <p>Consider a situation where RADIUS address pools are used to assign IP/IPv6 addresses. After a subscriber session is successfully authenticated, the RADIUS server authorizes the session by assigning an IP address from the RADIUS address pool and conveying that address in the Framed-IP-Address attribute. If a negotiation failure occurs at this point, the session is terminated before activating. The Acct-Start message is never sent because it is initiated by session activation. By default, an Acct-Stop message cannot be sent because the Acct-Start is never sent. However, if the <b>acct-stop-on-failure</b> statement is configured, the negotiation failure causes the Acct-Stop message to be sent, which explicitly notifies the RADIUS server that the session is disconnected and that it can free the allocated IP address back to the pool.</p> |
|                          | <p> <b>NOTE:</b> The [edit access] hierarchy is not available on QFabric systems.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 18.4R1 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | <p>Configure the NAS-Port-ID attribute to include the text description of the interface to which a RADIUS client is connected. The NAS-Port-ID is a RADIUS attribute that is included in the Access-Request message sent from a client to the RADIUS server. By default, the attribute is populated with the name of the logical interface. Including the text description provides more information to the RADIUS server, which can use the information to assign the client to a different VLAN or apply a firewall filter for authentication.</p> <p>The text description of the interface is configured under the [edit interfaces <i>interface-name</i>] hierarchy level. When you configure the <b>add-interface-text-description</b> option under the [edit protocols <a href="#">dot1x authenticator radius-options</a>] hierarchy level, the text description is appended to the interface name in the Access-Request message in the format <i>interface-name#interface-text-description</i>.</p> <p>If there is a text description configured for the logical interface, it is used in the NAS-Port-ID; otherwise, the text description for the physical interface is used. If neither is configured then the NAS-Port-ID will only contain the interface name.</p> <p>There is no character limit for the interface text description; however, the total length of the NAS-Port-ID with the interface name and description combined is restricted to 253 characters. If the total length exceeds 253 characters, the description is truncated.</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Release Information      | Statement introduced in Junos OS Release 10.4 for SRX300, SRX320, SRX340, SRX345, SRX550HM devices.                                                                                                                                                                                            |
| Description              | The address-assignment pool feature enables you to create IPv4 and IPv6 address pools that different client applications can share. For example, multiple client applications, such as DHCPv4 or DHCPv6, can use an address-assignment pool to provide addresses for their particular clients. |

Hierarchy Level [edit access]

**Release Information** Statement introduced in Junos OS Release 9.0.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description** Configure address-assignment pools that can be used by different client applications.

**NOTE:** Support for subordinate statements is platform-specific. See individual statement topics for support information.

**Options** *pool-name*—Name assigned to an address-assignment pool.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## address-pool

**Syntax**

```
address-pool pool-name {
    address address-or-prefix;
    address-range <low lower-limit> <high upper-limit>;
}
```

**Hierarchy Level** [edit access]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Allocate IP addresses for clients.

**NOTE:** This statement is not supported for L2TP LNS on MX Series routers.

**Options** *pool-name*—Name assigned to an address pool.  
  
The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## address-pool (Access)

---

**Syntax**

```
address-pool pool-name {  
    address address or address prefix;  
    address-range {  
        high upper-limit;  
        low lower-limit;  
        mask network-mask;  
    }  
    primary-dns IP address;  
    primary-wins IP address;  
    secondary-dns IP address;  
    secondary-wins IP address;  
}
```

**Hierarchy Level** [edit access]

**Release Information** Statement introduced in Junos OS Release 10.4.

**Description** Create an address-pool for L2TP clients.

- Options**
- **pool-name**—Name assigned to the address-pool.
  - **address**—Configure subnet information for the address-pool.
  - **address-range**—Defines the address range available for clients.
  - **primary-dns**—Specify the primary-dns IP address.
  - **secondary-dns**—Specify the secondary-dns IP address.
  - **primary-wins**—Specify the primary-wins IP address.
  - **secondary-wins**—Specify the secondary-wins IP address.

**Required Privilege Level**

| <b>Description</b>         | <p>Prevent IPv4 addresses and IPv6 prefixes from being assigned to more than one subscriber session when you use AAA to supply IPv4 addresses.</p> <p>For IPv4:</p> <p>If enabled, the router checks the following attributes received from external servers:</p> <ul style="list-style-type: none"> <li>• <i>Framed-IP-Address</i></li> <li>• <i>Framed-Pool</i></li> </ul> <p>The router then takes one of the following actions:</p> <ul style="list-style-type: none"> <li>• If an address matches an address in an address pool, the address is taken from the pool, provided it is available.</li> <li>• If the address is already in use, it is rejected as unavailable.</li> </ul> <p>For IPv6:</p> <p>If enabled, the router checks the following attributes received from external servers:</p> <ul style="list-style-type: none"> <li>• <i>Framed-IPv6-Prefix</i></li> <li>• <i>Framed-IPv6-Pool</i></li> </ul> <p>The router then takes one of the following actions:</p> <ul style="list-style-type: none"> <li>• If a prefix matches a prefix in an address pool, the prefix is taken from the pool, provided it is available.</li> <li>• If the prefix is already in use, it is rejected as unavailable.</li> <li>• If the prefix length requested from the external server does not exactly match the pool's prefix length, the authentication request is denied. If configured, the Acct-Stop message includes the cause for termination.</li> </ul> |

**Options** **reassign-on-match**—Enable reassignment of an address from an existing subscriber to a new subscriber requesting that address. The address in use must not be part of a locally configured pool and address protection must be enabled. The request from the new subscriber is still rejected, but the existing subscriber is sent a disconnect request to begin the logout process. This enables the new subscriber to renegotiate and be assigned that IP address.

If the requested address is in a locally configured pool, the existing subscriber is not disconnected.

**NOTE:** This option is not supported for IPv6.

**Default:** Rejects the address request from the new subscriber; the existing subscriber remains intact with the IP address.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## address-range

**Syntax** address-range <low *lower-limit*> <high *upper-limit*>;

**Hierarchy Level** [edit access [address-pool](#) *pool-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure the address range.

**Options**

- **high *upper-limit***—Upper limit of an address range.
- **low *lower-limit***—Lower limit of an address range.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6 for MX Series and T Series routers.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.<br>Statement introduced in Junos OS Release 11.1 for the QFX Series.<br>Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.                                                                                                                                                      |
| <b>Description</b>              | <p>Configure an interval for LLDP advertisement.</p> <p>For switches configured for Link Layer Discovery Protocol, configure the frequency at which LLDP advertisements are sent.</p> <p>The <b>advertisement-interval</b> value must be greater than or equal to four times the <b>transmit-delay</b> value, or an error will be returned when you attempt to commit the configuration.</p>                                                                                                                                                         |
|                                 | <p> <b>NOTE:</b> The default value of <b>transmit-delay</b> is 2 seconds. If you configure the <b>advertisement-interval</b> as less than 8 seconds and you do not configure a value for <b>transmit-delay</b>, the default value of <b>transmit-delay</b> is automatically changed to 1 second in order to satisfy the requirement that the <b>advertisement-interval</b> value must be greater than or equal to four times the <b>transmit-delay</b> value.</p> |
| <b>Default</b>                  | Disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b>seconds</b>—Interval between LLDP advertisement.</p> <p><b>Default:</b> 30</p> <p><b>Range:</b> 5 through 32768</p>                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Release Information | Statement introduced in Junos OS Release 18.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Description         | <p>Configure authorizations for operational mode commands using regular expressions. You can use the <b>allow-commands-regexps</b> statement to explicitly allow authorization for commands that would otherwise be denied by an access privilege level.</p> <p>For <b>allow/deny-commands-regexps</b> statements, you configure a set of strings in which each string is a regular expression, enclosed in double quotes and separated with a space operator. Each string is evaluated against the full path of the command, which provides faster matching than the <b>allow/deny-command</b> statements. You can also include values for variables in the regular expressions, which is not supported using <b>allow/deny-commands</b>.</p> <p>The statement <b>deny-commands-regexps</b> takes precedence if it is used in the same login class definition.</p> |
|                     | <p> <b>NOTE:</b> The <b>allow/deny-commands</b> and <b>allow/deny-commands-regexps</b> statements are mutually exclusive and cannot be configured together for a login class. At a given point in time, a login class can include either the <b>allow/deny-commands</b> statement, or the <b>allow/deny-commands-regexps</b> statement. If you have existing configurations using the <b>allow/deny-commands</b> statements, using the same configuration options with the <b>allow/deny-commands-regexps</b> statements might not produce the same results, as the search and match methods differ in the two forms of these statements.</p>                                                                                                                                    |
|                     | <p>Authorizations can also be configured remotely by specifying Juniper Networks vendor-specific TACACS+ attributes in your authentication server's configuration. For a remote user, when the authorization parameters are configured both remotely and locally, authorization parameters configured remotely and locally are both considered together for authorization. For a local user, only the authorization parameters configured locally for the class are considered.</p>                                                                                                                                                                                                                                                                                                                                                                                 |
| Default             | If you do not configure authorizations for operational mode commands using <b>allow/deny-commands</b> or <b>allow/deny-commands-regexps</b> , users can edit only those commands for which they have access privileges set with the <b>permissions</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Options**    *regular expression*—Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks. Enter as many expressions as needed.

**Required Privilege Level**    admin—To view this statement in the configuration.  
                                         admin-control—To add this statement to the configuration.

| Release Information      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Description              | <p>Explicitly allow configuration access to the specified levels in the hierarchy even if the permissions set with the <b>permissions</b> statement do not grant such access by default.</p> <p>When specifying extended regular expressions using the <b>allow/deny-commands</b> and <b>allow/deny-configuration</b> statements, each expression separated by a pipe ( ) symbol must be a complete standalone expression, and must be enclosed in parentheses ( ). Do not use spaces between regular expressions separated with parentheses and connected with the pipe ( ) symbol.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>NOTE:</b> The <b>allow/deny-configuration</b> and <b>allow/deny-configuration-regexps</b> statements are mutually exclusive and cannot be configured together for a login class. At a given point in time, a login class can include either the <b>allow/deny-configuration</b> statement, or the <b>allow/deny-configuration-regexps</b> statement. If you have existing configurations using the <b>allow/deny-configuration</b> statements, using the same configuration options with the <b>allow/deny-configuration-regexps</b> statements might not produce the same results, as the search and match methods differ in the two forms of these statements.</p> </div> |
| Default                  | If you omit this statement and the <b>deny-configuration</b> statement, users can edit only those commands for which they have access privileges through the <b>permissions</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Options                  | <p><b>regular-expression</b>—Extended (modern) regular expression as defined in POSIX 1003.2.</p> <p>If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Release Information      | Statement introduced in Junos OS Release 11.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Description              | <p>Explicitly allow configuration access to specified hierarchies using regular expressions even if the permissions set with the <b>permissions</b> statement allow that access.</p> <p>The statement <b>deny-configuration-regexps</b> takes precedence if it is used in the same login class definition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                          | <p> <b>NOTE:</b> The <b>allow/deny-configuration</b> and <b>allow/deny-configuration-regexps</b> statements are mutually exclusive and cannot be configured together for a login class. At a given point in time, a login class can include either the <b>allow/deny-configuration</b> statement, or the <b>allow/deny-configuration-regexps</b> statement. If you have existing configurations using the <b>allow/deny-configuration</b> statements, using the same configuration options with the <b>allow/deny-configuration-regexps</b> statements might not produce the same results, as the search and match methods differ in the two forms of these statements.</p> |
| Default                  | If you do not configure this statement or the <b>deny-configuration-regexps</b> statement, users can edit only those commands for which they have access privileges set with the <b>permissions</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Options                  | <p><b>regular expression</b>—Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks. Enter as many expressions as needed..</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Required Privilege Level | <p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | <p>Override the DHCP relay agent information option (option 82) in DHCP packets destined for a DHCP server. The use of this option causes the DHCP relay agent to perform one of the following actions, depending on how it is configured:</p> <ul style="list-style-type: none"> <li>• If the DHCP relay agent is configured to add option 82 information to DHCP packets, it clears the existing option 82 values from the DHCP packets and inserts the new values before forwarding the packets to the DHCP server.</li> <li>• If the DHCP relay agent is not configured to add option 82 information to DHCP packets, it clears the existing option 82 values from the packets, but does not add any new values before forwarding the packets to the DHCP server.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Parameters include <b>archive-sites</b>, <b>transfer-interval</b>, and <b>transfer-on-commit</b>.</p>                                                                                                                                                                                                                                                |
| <p> <b>NOTE:</b> The [edit system archival] hierarchy is not available on QFabric systems.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <p><b>archive-sites</b>—Specify where to transfer the current configuration files. When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks ( " ") and enclose the IPv6 host address in brackets ( [ ]). For example: "<b>scp://username&lt;:password&gt;@[ipv6-host-address]&lt;:port&gt;/url-path</b>".</p> <p>If you specify more than one archive site, the router or switch attempts to transfer the configuration files to the first archive site in the list, moving to the next only if the transfer fails. The destination filename is saved in the following format, where <i>n</i> corresponds to the number of the compressed configuration rollback file that has been archived:</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

```
router-name_YYYYMMDD_HHMMSS_juniper.conf.n.gz
```

**NOTE:** The time included in the destination filename is always in Coordinated Universal Time (UTC) regardless of whether the time on the router or switch is configured as UTC or the local time zone. The default time zone on the router or switch is UTC.

**transfer-interval**—The frequency, in minutes, for transferring the current configuration to an archive site. Valid intervals are 15 to 2880 minutes.

**transfer-on-commit**—Configure the router or switch to transfer its currently active configuration to an archive site each time you commit a candidate configuration.

**routing-instance**—Defines the routing instance through a server is reachable.

## archive-sites

**Syntax**

```
archive-sites {
  site-name;
}
```

**Hierarchy Level** [edit accounting-options [file](#) *filename*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure an archive site. If more than one site name is configured, an ordered list of archive sites for the accounting-data log files is created. When a file is archived, the router or switch attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with a filename of the format ***router-name\_log-filename\_timestamp***.

**Options** ***site-name***—Any valid FTP/SCP URL to a destination.

**Required Privilege Level** snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

| <b>Description</b>              | Configure how many attempts are made to reconfigure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces before reconfiguration is considered to have failed. A group configuration takes precedence over a DHCP local server configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

                vendor-attribute vsa-number;
            }
        }
    }
```

**Hierarchy Level** [edit access profile *profile-name* **radius**]

**Release Information** Statement introduced in Junos OS Release 9.1.  
Statement introduced in Junos OS Release 9.1 for EX Series switches.

**Description** Specify how the router or switch processes RADIUS attributes.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Description</b>         | Authentication methods that a user can use to log in to the router or switch. You can assign multiple authentication methods to a single user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>             | <p><b>encrypted-password "password"</b>—Message Digest 5 (MD5) or other encrypted authentication. Specify the MD5 or other password. You can specify only one encrypted password for each user.</p> <p>You cannot configure a blank password for <b>encrypted-password</b> using blank quotation marks (" "). You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.</p> <p><b>load-key-file URL filename</b>—Load previously-generated RSA (SSH version 2) and DSA (SSH version 2) public keys from a named file at a specified URL location. The file contains one or more SSH keys.</p> <p>For information on valid filename and URL formats, see <i>Format for Specifying Filenames and URLs in Junos OS CLI Commands</i>.</p> <p><b>plain-text-password</b>—When using this option, the command-line interface (CLI) prompts you for the password and then encrypts it.</p> <p><b>no-public-keys</b>—Disables public key authentication for the user specified.</p> <p><b>ssh-dsa "public-key"</b>—SSH version 2 authentication. Specify the DSA public key. You can specify one or more public keys for each user.</p> <p><b>ssh-ecdsa "public-key"</b>—SSH version 2 authentication. Specify the ECDSA public key. You can specify one or more public keys for each user.</p> <p><b>ssh-rsa "public-key"</b>—SSH version 2 authentication. Specify the RSA public key. You can specify one or more public keys for each user.</p> |

## authentication (DHCP Local Server)

**Syntax**

```
authentication {
  password password-string;
  username-include {
    circuit-type;
    client-id;
    delimiter delimiter-character;
    domain-name domain-name-string;
    interface-description (device-interface | logical-interface);
    interface-name;
    logical-system-name;
    mac-address;
    option-60;
    option-82 <circuit-id> <remote-id>;
    relay-agent-interface-id;
    relay-agent-remote-id;
    relay-agent-subscriber-id;
    routing-instance-name;
    user-prefix user-prefix-string;
    vlan-tags;
  }
}
```

**Hierarchy Level**

```

[edit routing-instances routing-instance-name system services dhcp-local-server ...]
```

**Release Information** Statement introduced in Junos OS Release 9.1.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** Configure the parameters the router sends to the external AAA server. A group configuration takes precedence over a global DHCP relay or DHCP local server configuration.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## authentication (DHCP Relay Agent)

**Syntax**

```
authentication {
  password password-string;
  username-include {
    circuit-type;
    client-id;
    delimiter delimiter-character;
    domain-name domain-name-string;
  }
  interface-description (device-interface | logical-interface);
  interface-name;
  logical-system-name;
  mac-address;
  option-60;
  option-82 <circuit-id> <remote-id>;
  relay-agent-interface-id;
  relay-agent-remote-id;
  relay-agent-subscriber-id;
  routing-instance-name;
  user-prefix user-prefix-string;
  vlan-tags;
}
```

**Hierarchy Level**

```
[edit forwarding-options dhcp-relay],
[edit forwarding-options dhcp-relay dhcpv6],
[edit forwarding-options dhcp-relay dhcpv6 group group-name],
[edit forwarding-options dhcp-relay dual-stack-group dual-stack-group-name],

[edit logical-systems logical-system-name forwarding-options dhcp-relay ...],
[edit logical-systems logical-system-name routing-instances routing-instance-name
 forwarding-options dhcp-relay ...],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay ...]
```

**Release Information**

Statement introduced in Junos OS Release 9.1.  
 Statement introduced in Junos OS Release 12.3R2 for EX Series switches.  
 Support at the **[edit ... dhcpv6]** hierarchy levels introduced in Junos OS Release 11.4.  
 Support at the **[edit ... dual-stack-group dual-stack-group-name]** hierarchy level introduced in Junos OS Release 15.1.

**Description**

Configure the parameters the router sends to the external AAA server. A group configuration takes precedence over a global DHCP relay configuration. Use the statement at the **[edit...dhcpv6]** hierarchy levels to configure DHCPv6 support.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level**

interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

| Release Information      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                        |
| Description              | Configure the order in which the software tries different user authentication methods when attempting to authenticate a user. For each login attempt, the software tries the authentication methods in order, starting with the first one, until the password matches.                                                                                                                                                                           |
| Default                  | If you do not include the <b>authentication-order</b> statement, users are verified based on their configured passwords.                                                                                                                                                                                                                                                                                                                         |
| Options                  | One or more of the following authentication methods listed in the order in which they must be tried: <ul style="list-style-type: none"><li>• <b>password</b>—Use the password configured for the user with the <b>authentication</b> statement at the <code>[edit system login user]</code> hierarchy level.</li><li>• <b>radius</b>—Use RADIUS authentication services.</li><li>• <b>tacplus</b>—Use TACACS+ authentication services.</li></ul> |
| Required Privilege Level | system—To view this statement in the configuration.<br>system-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                |

| Release Information | Statement introduced in Junos OS Release 15.1R3 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Description         | <p>Configure the preferred order of authentication methods that the switch will use when attempting to authenticate a client. If multiple authentication methods are configured on a single interface, when one authentication method fails, the switch falls back to another method. You can configure the <b>authentication-order</b> statement to specify whether 802.1X authentication or MAC RADIUS authentication must be the first authentication method tried.</p> <p>By default, the switch attempts to authenticate a client by using 802.1X authentication first. If 802.1X authentication fails because there is no response from the client, and MAC RADIUS authentication is configured on the interface, the switch falls back to MAC RADIUS authentication. If MAC RADIUS fails, and captive portal is configured on the switch, the switch falls back to captive portal.</p> <p>Configuring MAC RADIUS authentication as the first method can help prevent the fallback timeout period which occurs after an 802.1X authentication attempt is made for a host that does not support 802.1X authentication. If MAC RADIUS authentication is configured as the first authentication method on an interface, then on receiving data from any client on that interface, the switch attempts to authenticate the client by using MAC RADIUS authentication. If MAC RADIUS authentication fails, then the switch falls back to 802.1X authentication. If 802.1X authentication fails, and captive portal is configured on the interface, the switch falls back to captive portal.</p> <p>802.1X authentication always has the highest priority, even if a client has been authenticated using another method. If the switch receives an EAP packet from a client that has been authenticated using MAC RADIUS authentication, the switch acknowledges the EAP packet and upgrades the authentication using 802.1X authentication credentials. Similarly, if a client has been authenticated through fallback to captive portal, and the switch receives an EAP packet from that client, the switch attempts to authenticate the client by using 802.1X authentication.</p> <p>The switch attempts authentication using only methods that are configured on the interface. If an authentication method is included in the authentication order, but is not configured on the interface, the switch ignores that method and attempts authentication using the next method in the order that is enabled. However, if a method is enabled on the interface, but is not included in the authentication order, the switch does not attempt using that method. For example, if captive portal is enabled for an interface, but the authentication order is configured as <b>[mac-radius dot1x]</b>, the authentication method for that interface does not fall back to captive portal.</p> |

The authentication order can be configured for all interfaces by using the **interface all** option. If the authentication order is configured for an individual interface, and there is also an authentication order configured for all interfaces, then the order for the individual interface is followed. If there is no authentication order configured for an individual interface, and there is an authentication order configured for all interfaces, then the configuration for all interfaces is followed.

Use the following guidelines when configuring the **authentication-order** statement:

- The authentication order must include at least two methods of authentication.
- 802.1X authentication must be one of the methods included in the authentication order.
- If captive portal is included in the authentication order, it must be the last method in the order.
- If **mac-radius-restrict** is configured on an interface, then the authentication order cannot be configured.

The valid combinations for **authentication-order** are as follows:

- **[dot1x mac-radius captive-portal]**
- **[dot1x captive-portal]**
- **[dot1x mac-radius]**
- **[mac-radius dot1x captive-portal]**

**Default** If **authentication-order** is not configured, the switch attempts to authenticate the client by using 802.1X authentication first, followed by MAC RADIUS authentication, and then captive portal, as follows:

1. 802.1X authentication—If 802.1X is configured on the interface, the switch sends EAPoL requests to the end device and attempts to authenticate the end device through 802.1X authentication. If the end device does not respond to the EAP requests, the switch checks whether MAC RADIUS authentication is configured on the interface.
2. MAC RADIUS authentication—If MAC RADIUS authentication is configured on the interface, the switch sends the MAC RADIUS address of the end device to the authentication server. If MAC RADIUS authentication is not configured, the switch checks whether captive portal is configured on the interface.
3. Captive portal authentication—If captive portal is configured on the interface, the switch attempts to authenticate the end device by using this method after attempting any other configured authentication methods.

| Release Information      | Statement introduced in Junos OS Release 15.1R3 for EX Series switches.<br>The <b>eap-peap</b> was introduced in Junos OS Release 17.2R1 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Description              | Specify the protocol to be used by a supplicant to provide authentication credentials for MAC RADIUS authentication. The protocols supported for MAC RADIUS authentication are EAP-MD5, which is the default, Protected Extensible Authentication Protocol (EAP-PEAP), and Password Authentication Protocol (PAP).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Default                  | If <b>authentication-protocol</b> is not configured, the EAP-MD5 authentication protocol is used for MAC RADIUS authentication.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Options                  | <p><b>eap-md5</b>—Use the EAP-MD5 protocol for MAC RADIUS authentication. EAP-MD5 is an authentication method belonging to the Extensible Authentication Protocol (EAP) authentication framework. EAP-MD5 uses MD5 to hash the username and password. EAP-MD5 provides for a one-way client authentication. The server sends the client a random request for which the client must provide a response containing an encryption of the request and its password for establishing its identity.</p> <p><b>eap-peap</b>—Use the EAP-PEAP protocol, also known as Protected EAP or PEAP, for MAC RADIUS authentication. EAP-PEAP is a protocol that encapsulates EAP within a potentially encrypted and authenticated Transport Layer Security (TLS) tunnel. By encapsulating the authentication process in a TLS tunnel, PEAP addresses the vulnerabilities of an EAP like EAP-MD5.</p> <p><b>pap</b>—Use the PAP authentication protocol for MAC RADIUS authentication. PAP provides a simple password-based authentication for users to establish their identity by using a two-way handshake. PAP transmits plaintext passwords over the network without encryption. PAP must be configured if the Lightweight Directory Access Protocol (LDAP), which supports only plaintext passwords for client authentication, is used for RADIUS authentication.</p> |

## authenticator

**Syntax**

```
authenticator {
  authentication-profile-name access-profile-name;
  interface (all | [ interface-names ]) {
    disable;
    guest-vlan ( vlan-id | vlan-name );
    lldp-med-bypass;
    mac-radius <restrict>;
    maximum-requests number;
    no-reauthentication;
    quiet-period seconds;
    reauthentication interval;
    retries number;
    server-fail (deny | permit | use-cache | vlan-id | vlan-name);
    server-reject-vlan (vlan-id | vlan-name) {
      eapol-block;
      block-interval block-interval;
    }
    server-timeout seconds;
    supplicant (single | single-secure | multiple);
    supplicant-timeout seconds;
    transmit-period seconds;
  }
  no-mac-table-binding {
    interface interface-names;
    static mac-address;
  }
  radius-options {
    use-vlan-id;
    use-vlan-name;
  }
  static mac-address {
    vlan-assignment vlan-identifier;
  }
}
```

**Hierarchy Level** [edit protocols [dot1x](#)]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series.

**Description** Configure an authenticator for 802.1X authentication.

The remaining statements are explained separately. See [CLI Explorer](#).

**NOTE:** You cannot configure 802.1X user authentication on interfaces that have been enabled for Q-in-Q tunneling.

| Release Information | Statement introduced in Junos OS Release 17.4R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Description         | <p>Configure the time interval at which the JUNOS device has to fetch the authorization profile configuration from the TACACS+ server and refresh the authorization profile stored locally on the JUNOS device. The TACACS+ server sends the authorization profile once by default after the user is successfully authenticated, and the authorization profile is stored locally on the JUNOS device. The authorization profile refresh feature enables the JUNOS device to check the authorization profile configured remotely on the TACACS+ server at the configured time interval.</p> <p>If there is a change in the remote authorization profile, the device fetches the authorization profile from the TACACS+ server and the authorization profile configured locally under the login class hierarchy. The device refreshes the authorization profile stored locally by combining the remote and locally-configured authorization profiles. This ensures that any changes made to the authorization profile configuration on the TACACS+ server are reflected on the JUNOS device without the user having to restart the authentication process.</p> <p>To enable periodic refresh of the authorization profile, you must set the time interval at which the JUNOS device has to fetch the authorization profile configuration from the TACACS+ server and refresh the authorization profile stored locally. The time interval can be configured directly on the TACACS+ server or locally on the JUNOS device using the CLI. Use the following guidelines to determine which time interval configuration takes precedence:</p> <ul style="list-style-type: none"><li>• If there is no refresh time interval configured on the TACACS server for periodic refresh, the JUNOS device does not receive the time interval value in the authorization response. In this case, the value configured locally on the JUNOS device will take effect.</li><li>• If the refresh time interval is configured on the TACACS server and there is no refresh time interval configured locally on the JUNOS device, the value configured on the TACACS server will take effect.</li><li>• If refresh time interval is configured on the TACACS server and also on the JUNOS device locally, the value configured on the TACACS server will take precedence.</li><li>• If there is no refresh time interval configured on the TACACS server and there is no refresh time interval configured on the JUNOS device, there will be no periodic refresh.</li><li>• If the refresh time interval configured on the TACACS server is out of range or invalid, the refresh time interval value configured locally will take effect.</li></ul> |

- If the refresh time interval configured on the TACACS server is out of range or invalid and there is no refresh time interval configured locally, there will be no periodic refresh.

After the periodic refresh time interval is set, if the user changes the refresh interval before the authorization request is sent from the JUNOS device, the updated refresh interval takes effect after the next immediate periodic refresh.

**Default** If the authorization time interval is not configured, the authorization profile is not refreshed during a TACACS+ authentication session.

**Options** *minutes*—The time interval at which the authorization profile that is configured on the TACACS+ server is fetched by the JUNOS device during a TACACS+ authentication session.

**Range:** 15 to 1440 minutes.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| Description              | <p>Set the order in which AAA tries different methods to verify that a client is authorized access to the router or switch. For each login attempt, AAA tries the authorization methods in order, from first to last.</p> <p>A given subscriber does not undergo both authentication and authorization as separate steps. When both <b>authentication-order</b> and <b>authorization-order</b> are specified, DHCP subscribers honor the configured authorization order, all other subscribers use the configured authentication-order.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Options                  | <p><b><i>authorization-methods</i></b>—Ordered list of methods to use for authorization attempts. The list includes one or more of the following methods in any combination:</p> <ul style="list-style-type: none"><li>• <b>jsrc</b>—Use the JSRC application in an SRC environment to request authorization from the SAE when verifying that a subscriber can access the router or switch.<ul style="list-style-type: none"><li>• When you configure both this option and <b>authentication-order</b>, AAA ignores the authentication order setting for DHCP subscribers. For non-DHCP subscribers, AAA ignores the authorization order and applies only the authentication order.</li><li>• When you configure only this option, AAA applies the authorization order to both DHCP and non-DHCP subscribers.</li></ul></li><li>• <b>nasreq</b>—Use the NASREQ application to communicate with a NASREQ server for authorization of any subscriber type as an alternative to RADIUS authorization.</li><li>• <b>none</b>—No authorization is performed. Can be used, for example, when the Diameter function Gx-Plus is employed for notification during subscriber provisioning.</li></ul> |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | Configure the order in which the software tries different user authentication methods when attempting to authenticate a user. For each login attempt, the software tries the authentication methods in order, starting with the first one, until the password matches.                                                                                                                                                                               |
| <b>Default</b>                  | If you do not include the <b>authentication-order</b> statement, users are verified based on their configured passwords.                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | One or more of the following authentication methods listed in the order in which they must be tried: <ul style="list-style-type: none"> <li>• <b>password</b>—Use the password configured for the user with the <b>authentication</b> statement at the <code>[edit system login user]</code> hierarchy level.</li> <li>• <b>radius</b>—Use RADIUS authentication services.</li> <li>• <b>tacplus</b>—Use TACACS+ authentication services.</li> </ul> |
| <b>Required Privilege Level</b> | system—To view this statement in the configuration.<br>system-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                    |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                        |
| <b>Description</b>              | For J Series Services Routers and EX Series switches only. Set the boot file advertised to DHCP clients. After the client receives an IP address and the boot file location from the DHCP server, the client uses the boot image stored in the boot file to complete DHCP setup. |
| <b>Options</b>                  | <i>filename</i> —The location of the boot file on the boot server. The filename can include a pathname.                                                                                                                                                                          |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.2X51-D20 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | <p>Set the boot-loader password for accessing the U-Boot CLI during the boot process. The password can be entered either as a plain-text password or as an encrypted password.</p> <p>Encrypted passwords must be entered in Message Digest 5 (MD5) format. Plain-text passwords are encrypted by using MD5 by default. The encryption format for plain-text passwords can be changed by using the <b>set system login password format</b> command.</p> <p>Encrypted passwords must be between 1 and 128 characters long. The password must be enclosed in quotation marks and cannot be blank within the quotation marks (" ").</p> <p>The default requirements for plain-text passwords are as follows:</p> <ul style="list-style-type: none"> <li>• The password must be between 6 and 128 characters long</li> <li>• You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.</li> <li>• The password must contain at least one change of case or character class.</li> </ul> |
| <b>Options</b>                  | <p><b>encrypted-password <i>password</i></b>— Enter a password that has already been encrypted. You can specify only one encrypted password.</p> <p><b>plain-text-password</b>—Enter a plain-text password. The CLI prompts you for the password and then encrypts it. The CLI displays the encrypted version, and the software places the encrypted version in its user database. You can specify only one plain-text password.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Description              | <p>Configure the server that NTP queries when the SRX Series device boots to determine the local date and time.</p> <p>When you boot the SRX Series device, it issues an <b>ntpdate</b> request, which polls a network server to determine the local date and time. You need to configure a server that the SRX Series device uses to determine the time when the SRX Series device boots. You can configure either an IP address or a hostname for the boot server. If you configure a hostname instead of an IP address, the <b>ntpdate</b> request resolves the hostname to an IP address when the SRX Series device boots up.</p> <p>If you configure an NTP boot server, then when the SRX Series device boots, it immediately synchronizes with the boot server even if the NTP process is explicitly disabled or if the time difference between the client and the boot server exceeds the threshold value of 1000 seconds.</p> |

| Description              | Configure the SRX Series device to operate in broadcast mode with the remote system at the specified address. In this mode, the SRX Series device sends periodic broadcast messages to a client population at the specified broadcast or multicast address. Normally, you include this statement only when the SRX Series device is operating as a transmitter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Options                  | <p><b>address</b>—The broadcast address on one of the local networks or a multicast address assigned to NTP. You must specify an address, not a hostname. If the multicast address is used, it must be <b>224.0.1.1</b>.</p> <p><b>key key-number</b>—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number.<br/><b>Range:</b> Any unsigned 32-bit integer</p> <p><b>routing-instance-name routing-instance-name</b>—(Optional) The routing instance name in which the interface has an address in the broadcast subnet.<br/><b>Default:</b> The default routing instance is used to broadcast packets.</p> <p><b>ttl value</b>—(Optional) Time-to-live (TTL) value to use.<br/><b>Range:</b> 1 through 255<br/><b>Default:</b> 1</p> <p><b>version value</b>—(Optional) Specify the version number to be used in outgoing NTP packets.<br/><b>Range:</b> 1 through 4<br/><b>Default:</b> 4</p> |
| Required Privilege Level | system—To view this statement in the configuration.<br>system-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## certificates

**Syntax**

```

certificates {
  cache-size bytes;
  cache-timeout-negative seconds;
  certification-authority ca-profile-name {
    ca-name ca-identity;
    crt file-name;
    encoding (binary | pem);
    enrollment-url url-name;
    file certificate-filename;
    ldap-url url-name;
  }
  enrollment-retry attempts;
  local certificate-name {
    certificate-key-string;
    load-key-file URL filename;
  }
  maximum-certificates number;
  path-length certificate-path-length;
}

```

**Hierarchy Level** [edit security]

**Release Information**

Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** (Encryption interface on M Series and T Series routers and EX Series switches only)  
Configure the digital certificates for IPsec.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**

admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| Release Information      | Statement introduced in Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                         |
| Description              | Set requirements for using character sets in plain-text passwords. When you combine this statement with the <b>minimum-changes</b> statement, you can check for the total number of character sets included in the password or for the total number of character-set changes in the password. Newly created passwords must meet these requirements.           |
| Options                  | Specify one of the following: <ul style="list-style-type: none"><li>• <b>character-sets</b>—The number of character sets in the password. Valid character sets include uppercase letters, lowercase letters, numbers, punctuation, and other special characters.</li><li>• <b>set-transitions</b>—The number of transitions between character sets.</li></ul> |
| Required Privilege Level | system—To view this statement in the configuration.<br>system-control—To add this statement to the configuration.                                                                                                                                                                                                                                             |

group-name relay-option-82]
```

**Release Information**

Statement introduced in Junos OS Release 8.3.  
Statement introduced in Junos OS Release 12.3 for EX Series switches.  
**include-irb-and-l2** , **no-vlan-interface-name**, and **use-vlan-id** options added in Junos OS Release 14.1.

**Description**

Specify the Agent Circuit ID suboption (suboption 1) of the DHCP relay agent information option (option 82) to include in DHCP packets destined for a DHCP server. Optionally specify that the suboption includes a prefix, textual description, or VLAN tag.

**NOTE:** For Layer 3 interfaces, when you configure *relay-option-82* only, the Agent Circuit ID is the default. If no VLAN tags are configured, then the default is the logical interface device (IFL) name. For integrated routing and bridging (IRB) interfaces, the default is the Layer 2 IFL name and bridge domain name.

The interface to bridge domain relationship may be implicit (the interface is mapped to the bridge domain by the system based on VLAN tag) or explicit (the interface is mapped to the bridge domain by configuring it in the bridge domain definition). For the explicit case, tagging might not be relevant for the mapping.

The format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces that do not use virtual LANs (VLANs), stacked VLANs (S-VLANs), or bridge domains is as follows:

```
(fe | ge)-fpc/pic/port.subunit
```

**NOTE:** For remote systems, the *subunit* is required and is used to differentiate an interface for remote systems.

The format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces that use VLANs is as follows:

```
(fe | ge)-fpc/pic/port:vlan-id
```

The format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces that use S-VLANs is as follows:

```
(fe | ge)-fpc/pic/port:svlan-id-vlan-id
```

In the case of an IRB interface, the format displays the Layer 2 interface instead of the IRB interface along with the bridge domain name. For IRB interfaces (or other pseudo devices) the default format is as follows:

- IRB interfaces that use bridge domains but do not use VLANs or S-VLANs:

```
(fe | ge)-fpc/pic/port.subunit:bridge-domain-name
```

- IRB interfaces that use VLANs:

```
(fe | ge)-fpc/pic/port.subunit:vlan-name
```

To include the IRB interface name with the Layer 2 interface name, configure the **include-irb-and-l2** statement. The format is as follows:

- IRB interfaces that use bridge domains but do not use VLANs or S-VLANs:

```
(fe | ge)-fpc/pic/port:bridge-domain-name+irb.subunit
```

- IRB interfaces that use VLANs:

```
(fe | ge)-fpc/pic/port:vlan-name+irb.subunit
```

To include only the IRB interface name without the Layer 2 interface and bridge domain or VLAN, configure the **no-vlan-interface-name** statement. The format is as follows:

```
irb.subunit
```

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

| <b>Description</b>              | Delete all DHCP clients or only the DHCP clients serviced by the specified group of interfaces when reconfiguration fails; that is, when the maximum number of retry attempts have been made without success. A group configuration takes precedence over a DHCP local server configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Default</b>                  | Restores the original client configuration when reconfiguration fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
