## routing-engine-profile

---

**Syntax**

```
routing-engine-profile profile-name {  
    fields {  
        field-name;  
    }  
    file filename;  
    interval minutes;  
}
```

**Hierarchy Level** [edit accounting-options]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Create a Routing Engine profile to collect selected Routing Engine statistics and write them to a file in the `/var/log` directory.

**Options** *profile-name*—Name of the Routing Engine statistics profile.  
  
The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>         | Specify that the routing instance name be concatenated with the username during the subscriber authentication or DHCP client authentication process. No routing instance name is concatenated if the configuration is in the default routing instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Description         | <p>Specify that the routing instance name is concatenated with the username during the subscriber authentication or client authentication process. No routing instance name is concatenated if the configuration is in the default routing instance. Use the statement at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels to configure DHCPv6 support.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## scp

---

**Syntax** `scp (recursive | source-path | destination-path | source-address | routing-instance);`

**Release Information** Statement introduced in Junos OS Release 15.1X49-D110 for SRX300, SRX320, SRX340, and SRX345 devices.  
Statement introduced in Junos OS Release 18.4R1 for MX240, MX480, MX960, MX2010, MX2020, and vMX routers.  
Options **source-address** and **routing-instance** added in Junos OS Release 18.4R1.

**Description** Initiates a secure copy (**scp**) connection from the Junos CLI shell.

**Options**

- recursive—Copy files recursively.
- source-path— (Mandatory) Specify the source file location.
- destination-path—(Mandatory) Specify the destination file location.
- source-address—(Optional) Specify the local address to use in originating the secure copy connection.
- routing-instance—(Optional) Specify the name of the routing instance for the secure copy session. Default is inet.0.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

Documentation**

## secret

---

**Syntax** `secret password;`

**Hierarchy Level** `[edit system accounting destination radius server server-address],`  
`[edit system accounting destination tacplus server server-address],`  
`[edit system radius-server server-address],`  
`[edit system tacplus-server server-address]`

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure the password to use with the RADIUS or TACACS+ server. The secret password used by the local router or switch must match that used by the server.

**NOTE:** To ensure better security, we recommend you to configure TACACS+ secret password with a minimum of 14 characters.

**Options** *password*—Password to use; can include spaces included in quotation marks.

**Required Privilege  
Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

| Description              | <p>For NTP, configure the SRX Series device to operate in client mode with the remote system at the specified address. In this mode, the SRX Series device can be synchronized with the remote system, but the remote system can never be synchronized with the SRX Series device.</p> <p>If the NTP client time drifts so that the difference in time from the NTP server exceeds 128 milliseconds, the client is automatically stepped back into synchronization. If the offset between the NTP client and server exceeds the 1000-second threshold, the client still synchronizes with the server, but it also generates a system log message noting that the threshold was exceeded.</p>     |
| Options                  | <p><b>address</b>—Address of the remote system. You must specify an address, not a hostname.</p> <p><b>key key-number</b>—(Optional) Use the specified key number to encrypt authentication fields in all packets sent to the specified address.</p> <p><b>Range:</b> Any unsigned 32-bit integer</p> <p><b>prefer</b>—(Optional) Mark the remote system as the preferred host, which means that if all other things are equal, this remote system is chosen for synchronization among a set of correctly operating systems.</p> <p><b>version value</b>—(Optional) Specify the version number to be used in outgoing NTP packets.</p> <p><b>Range:</b> 1 through 4</p> <p><b>Default:</b> 4</p> |
| Required Privilege Level | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>              | <p>Specify the DNS or TFTP server for forwarding DNS or TFTP requests, or specify a destination server address for forwarding LAN broadcast packets as unicast traffic for a custom-configured UDP port.</p> <p>When configuring port helpers, in releases prior to Junos OS Release 17.2, only one server can be specified for a given port. For Junos OS Release 17.2 and later, multiple servers can be specified for a given port at the global or interface-specific level. When multiple servers are specified, the same packet, with the originator IP address and port requests, is forwarded to the different configured servers; the payload of the UDP packet is not modified.</p> |
| <b>Options</b>                  | <p><b>address</b>—IP address of the server.</p> <p><b>logical-system <i>logical-system-name</i></b>—(Optional) Logical system name of the server.</p> <p><b>routing-instance [ <i>routing-instance-names</i> ]</b>—(Optional) Set the routing instance name or names that belong to the DNS server or TFTP server.</p>                                                                                                                                                                                                                                                                                                                                                                        |

| Release Information | Statement introduced in Junos OS Release 9.3 for EX Series switches.<br>Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Description         | <p>Configure authentication fallback options to specify how end devices connected to a switch are supported if the RADIUS authentication server becomes unavailable. Server fail fallback is triggered most often during reauthentication when the already configured and in-use RADIUS server becomes inaccessible. However, server fail fallback can also be triggered by a supplicant's initial attempt at authentication through the RADIUS server.</p> <p>When you configure the server fail fallback feature you must specify an action that the switch applies to end devices when the authentication servers are unavailable. The switch can accept or deny access to supplicants or maintain the access already granted to supplicants before the RADIUS timeout occurred. You can also configure the switch to move the supplicants to a specific VLAN. The VLAN must already be configured on the switch.</p> |
|                     | <p> <b>NOTE:</b> The <code>server-fail</code> statement is specifically for data traffic. For VoIP tagged traffic, use the <code>server-fail-voip</code> statement. The same interface can have a <code>server-fail</code> VLAN and a <code>server-fail-voip</code> VLAN configured.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Default             | If the <code>server-fail</code> statement is not configured, in the event that the RADIUS authentication server becomes unavailable, the end device is not authenticated and is denied access to the network.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Options             | <p><b>deny</b>—Force fail the supplicant authentication. No traffic will flow through the interface.</p> <p><b>permit</b>—Force succeed the supplicant authentication. Traffic will flow through the interface as if it were successfully authenticated by the RADIUS server.</p> <p><b>use-cache</b>—Force succeed the supplicant authentication only if it was previously authenticated successfully. This action ensures that already authenticated supplicants are not affected.</p> <p><b>vlan-id</b>—Move supplicant on the interface to the VLAN specified by this numeric identifier. This action is allowed only if it is the first supplicant connecting to the interface. If an authenticated supplicant is already connected, then the supplicant is not moved</p>                                                                                                                                           |

to the VLAN and is not authenticated. The VLAN must already be configured on the switch.

**vlan-name**—Move supplicant on the interface to the VLAN specified by this name. This action is allowed only if it is the first supplicant connecting to an interface. If an authenticated supplicant is already connected, then the supplicant is not moved to the VLAN and is not authenticated. The VLAN must already be configured on the switch.

| Release Information | Statement introduced in Junos OS Releases 14.1X53-D40 and 15.1R4 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Description         | <p>Configure authentication fallback options to specify how VoIP clients sending voice traffic are supported if the RADIUS authentication server becomes unavailable. Server fail fallback is triggered most often during reauthentication when the already configured and in-use RADIUS server becomes inaccessible. However, server fail fallback can also be triggered by a supplicant's initial attempt at authentication through the RADIUS server.</p> <p>When you configure the server fail fallback feature you must specify an action that the switch applies to end devices when the authentication servers are unavailable. The switch can accept or deny access to supplicants or maintain the access already granted to supplicants before the RADIUS timeout occurred. You can also configure the switch to move the supplicants to a specific VLAN. The VLAN must already be configured on the switch.</p> <p>The <b>server-fail-voip</b> statement is specific to the VoIP-tagged traffic sent by clients. VoIP clients still require that the <b>server-fail</b> statement be configured for the un-tagged traffic that they generate. Therefore, when you configure the <b>server-fail-voip</b> statement you must also configure the <b>server-fail</b> statement.</p> |
|                     | <p> <b>NOTE:</b> An option other than <b>server-fail deny</b> must be configured for <b>server-fail-voip</b> to successfully commit.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Default             | If the <b>server-fail-voip</b> statement is not configured, in the event that the RADIUS authentication server becomes unavailable, a VoIP client that begins authentication by sending voice traffic is not authenticated, and the voice traffic is dropped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Options             | <p><b>deny</b>—Force fail the supplicant authentication. No traffic will flow through the interface.</p> <p><b>permit</b>—Force succeed the supplicant authentication. Traffic will flow through the interface as if it were successfully authenticated by the RADIUS server.</p> <p><b>use-cache</b>—Force succeed the supplicant authentication only if it was previously authenticated successfully. This action ensures that already authenticated supplicants are not affected. This option can be used only for reauthentication.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**vlan-name**—Move supplicant on the interface to the VLAN specified by this name. This action is allowed only if it is the first supplicant connecting to an interface. If an authenticated supplicant is already connected, then the supplicant is not moved to the VLAN and is not authenticated. The VLAN must already be configured on the switch.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| Description              | <p>Specify the name of a group of DHCP server addresses for use by the extended DHCP relay agent. Apply the group with the <a href="#">active-server-group</a> statement globally for all interfaces or for a named group of interfaces configured with the <a href="#">group</a> statement. This mechanism enables you to apply different DHCP relay configurations for different groups of servers, with a common configuration for the servers within a server group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Options                  | <p><b>server-group-name</b>—Name of the group of DHCP or DHCPv6 server addresses.</p> <p><b>server-ip-address</b>—IP address of the DHCP server belonging to this named server group. Use IPv6 addresses when configuring DHCPv6 support. Starting in Junos OS Release 18.4R1, you can configure up to 32 server IP addresses per group for DHCPv4 servers. In earlier releases, you can configure only up to 5 server IP addresses for DHCPv4 servers. For DHCPv6 servers, you can configure only up to 32 addresses in all releases. The configuration fails commit check if you configure more than the maximum number of server addresses.</p>                                                                                                                                                                                                                                           |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>              | <p>Configure a server identifier. The identifier can be used to identify a DHCP server in a DHCP message. It can also be used as a destination address from clients to servers (for example, when the boot file is set, but not the boot server).</p> <p>Servers include the server identifier in <b>DHCPOFFER</b> messages so that clients can distinguish between multiple lease offers. Clients include the server identifier in <b>DHCPREQUEST</b> messages to select a lease and indicate which offer is accepted from multiple lease offers. Also, clients can use the server identifier to send unicast request messages to specific DHCP servers to renew a current lease.</p> <p>This address must be a manually assigned, static IP address. The server cannot send a request and receive an IP address from itself or another DHCP server.</p> |
| <b>Default</b>                  | If no server identifier is set, the DHCP server sets the server identifier based on the primary interface address used by the server to receive a client request. For example, if the client sends a DHCP request and the server receives it on <b>fe-0/0/0</b> and the primary interface address is 1.1.1.1, then the server identifier is set to 1.1.1.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <b><i>address</i></b> —IPv4 address of the server. This address must be accessible by all clients served within a specified range of addresses (based on an address pool or static binding).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.3 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>For EX Series switches configured for 802.1X authentication, specify that when the switch receives an Extensible Authentication Protocol Over LAN (EAPoL) Access-Reject message during the authentication process between the switch and the RADIUS authentication server, supplicants attempting access to the LAN are granted access and moved to a specific VLAN. Any VLAN name or VLAN ID sent by a RADIUS server as part of the EAPoL Access-Reject message is ignored.</p> <p>When you specify the VLAN ID or VLAN name, the VLAN must already be configured on the switch.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p> |
| <b>Default</b>                  | None                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>                  | <p><b>vlan-id</b>—Numeric identifier of the VLAN to which the supplicant is moved.</p> <p><b>vlan-name</b>—Name of the VLAN to which the supplicant is moved.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Hierarchy Level** [edit system]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
**extension-service** option added in Junos OS Release 16.1 for MX80, MX104, MX240, MX480, MX960, MX2010, MX2020, vMX Series.  
**grpc** option added in Junos OS Release 16.2 for MX80, MX104, MX240, MX480, MX960, MX2010, MX2020, vMX Series.

**Description** Configure the router or switch so that users on remote systems can access the local router or switch through the DHCP server, DTCP over SSH, finger, rlogin, SSH, telnet, Web management, Junos XML protocol SSL, and network utilities, or enable Junos OS to work with the Session and Resource Control (SRC) software. Also, enable configuration of third-party applications developed using the Juniper Extension Toolkit (JET) to run on Junos OS.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

| Release Information      | Statement introduced in Junos OS Release 10.1 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Description              | <p>The <b>session-expiry</b> statement is used to locally configure the number of seconds before the captive portal authentication session times out and the client must reattempt authentication.</p> <div> <b>NOTE:</b> If the authentication server sends an authentication session timeout to the client, this takes priority over the value configured locally using the <b>session-expiry</b> statement. The session timeout value is sent from the server to the client as an attribute of the RADIUS Access-Accept message.</div> |

| Description              | Specify attributes of an accounting-data log file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Options                  | <p><b>bytes</b>—Maximum size of each log file, in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB). When a log file (for example, <b>profilelog</b>) reaches its maximum size, it is renamed <b>profilelog.0</b>, then <b>profilelog.1</b>, and so on, until the maximum number of log files is reached. Then the oldest log file is overwritten. If you do not specify a size, the file is closed, archived, and renamed when the time specified for the transfer interval is exceeded.</p> <p><b>Syntax:</b> <i>x</i> to specify bytes, <i>xk</i> to specify KB, <i>xm</i> to specify MB, <i>xg</i> to specify GB</p> <p><b>Range:</b> 256 KB through 1 GB</p> |

## source-address (NTP, RADIUS, System Logging, or TACACS+)

**Syntax** `source-address source-address <routing-instance routing-instance-name>;`

**Hierarchy Level**

```
[edit system accounting destination radius server server-address],
[edit system accounting destination tacplus server server-address],
[edit system ntp],
[edit system radius-server server-address],
[edit system syslog],
[edit system tacplus-server server-address]
```

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** Specify a source address for each configured TACACS+ server, RADIUS server, or NTP server, or the source address to record in system log messages that are directed to a remote machine.

**Options** *source-address*—A valid IP address configured on one of the SRX Series devices. For system logging, the address is recorded as the message source in messages sent to the remote machines specified in all **host hostname** statements at the **[edit system syslog]** hierarchy level, but not for messages directed to the other Routing Engine.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## ssh

**List of Syntax**   [Syntax on page 1386](#)  
[Syntax \(EX Series Switch and the QFX Series\) on page 1386](#)

**Syntax**

```
ssh host
<bypass-routing>
<inet | inet6>
<interface interface-name>
<logical-system logical-system-name>
<routing-instance routing-instance-name>
<source address>
<v2>
<port port-number>
```

**Syntax (EX Series Switch and the QFX Series)**

```
ssh host
<bypass-routing>
<inet | inet6>
<interface interface-name>
<routing-instance routing-instance-name>
<source address>
<v2>
<port port-number>
```

**Release Information**   Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.  
 Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.

**Description**   Use the SSH program to open a connection between a local router or switch and a remote system and execute commands on the remote system. You can issue the **ssh** command from the Junos OS CLI to log in to a remote system or from a remote system to log in to the local router or switch. When executing this command, you include one or more CLI commands by enclosing them in quotation marks and separating the commands with semicolons:

```
ssh address 'cli-command1 ; cli-command2 '
```

**Options**   **host**—Name or address of the remote system.

**bypass-routing**—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

**inet | inet6**—(Optional) Create an IPv4 or IPv6 connection, respectively.

**interface *interface-name***—(Optional) Interface name for the SSH session. (This option does not work when *default-address-selection* is configured at the **[edit system]** hierarchy level, because this configuration uses the loopback interface as the source address for all locally generated IP packets.)

**logical-system *logical-system-name***—(Optional) Name of a particular logical system for the SSH attempt.

**routing-instance *routing-instance-name***—(Optional) Name of the routing instance for the SSH attempt.

**source *address***—(Optional) Source address of the SSH connection.

**v2**—(Optional) Use SSH version 2 when connecting to a remote host.

**port *port-number***—(Optional) Specify a port number for the SSH connection.

**Additional Information** To configure an SSH (version 2) key for your user account, include the **authentication dsa-rsa** statement at the **[edit system login user *user-name*]** hierarchy level.

You can limit the number of times a user can attempt to enter a password while logging in through SSH. To specify the number of times a user can attempt to enter a password to log in through SSH, include the **retry-options** statement at the **[edit system login]** hierarchy level.

**Required Privilege Level** network

**Related Documentation** • [Configuring SSH Host Keys for Secure Copying of Data on page 231](#)

**List of Sample Output** [ssh on page 1387](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

ssh

```
user@switch> ssh user
Host key not found from the list of known hosts.
Are you sure you want to continue connecting (yes/no)? yes
Host 'user' added to the list of known hosts.
user@device's password:

## ssh-known-hosts

---

Syntax	<pre>ssh-known-hosts {   host <i>host-name</i> {     fetch-from-server <i>host-name</i>;     load-key-file <i>file-name</i>;   } }</pre>
Hierarchy Level	[edit security ssh-known-hosts]
Release Information	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
Description	Configure SSH support for known hosts and for administering SSH host key updates.
Options	<p><b>host <i>host-name</i></b>—Hostname of the SSH known host entry. This option has the following suboptions:</p> <ul style="list-style-type: none"><li>• <b>fetch-from-server <i>host-name</i></b>—Retrieve SSH public host key information from a specified server.</li><li>• <b>load-key-file <i>filename</i></b>—Import SSH host key information from the <code>/var/tmp/ssh-known-hosts</code> file.</li></ul>
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Understanding Security Features on the QFabric System</a></li><li>• <a href="#">Configuring SSH Host Keys for Secure Copying of Data on page 231</a></li></ul>

## ssh-known-hosts

**Syntax**

```
ssh-known-hosts {
  fetch-from-server server-name;
  host hostname {
    dsa-key dsa-key;
    ecdsa-sha2-nistp256-key ecdsa-sha2-nistp256-key;
    ecdsa-sha2-nistp384-key ecdsa-sha2-nistp384-key;
    ecdsa-sha2-nistp521-key ecdsa-sha2-nistp521-key;
    ed25519-key ed25519-key;
    rsa-key rsa-key;
    rsa1-key rsa1-key;
  }
  load-key-file key-file;
}
```

**Hierarchy Level** [edit security]

**Release Information** Statement modified in Junos OS Release 8.5.

**Description** Configure SSH support for known hosts and for administering SSH host key updates.

- Options**
- **fetch-from-server *server-name***—Retrieve SSH public host key information from a specified server.
  - **load-key-file *key-file***—Import SSH host-key information from the specified `/var/tmp/ssh-known-hosts` file.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level**

security—To view this statement in the configuration.  
security-control—To add this statement to the configuration.

**Related Documentation**

## ssh-dsa

---

<b>Syntax</b>	<code>ssh-dsa "public-key";</code>
<b>Hierarchy Level</b>	[edit system root-authentication] [edit system login user authentication]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
<b>Description</b>	Specify the DSA (SSH version 2) public key. You can specify one or more public keys.
<b>Options</b>	<code>ssh-dsa "public-key"</code> —SSH version 2 authentication.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Root Password on page 138</a></li><li>• <i>authentication</i></li><li>• <a href="#">root-authentication on page 1317</a></li></ul>

## ssh-rsa

<b>Syntax</b>	<code>ssh-dsa "public-key";</code>
<b>Hierarchy Level</b>	[edit system root-authentication] [edit system login user authentication]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
<b>Description</b>	Specify the RSA (SSH version 2) public key. You can specify one or more public keys.
<b>Options</b>	<code>ssh-rsa "public-key"</code> —SSH version 2 authentication. Specify the RSA (SSH version 2) public key. You can specify one or more public keys.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the Root Password</i></li> <li>• <i>authentication</i></li> <li>• <a href="#">root-authentication on page 1317</a></li> </ul>

## ssl-renegotiation

<b>Syntax</b>	<code>ssl-renegotiation;</code>
<b>Hierarchy Level</b>	[edit system services xnm-ssl]
<b>Release Information</b>	Statement introduced in Junos Os Release 13.3.
<b>Description</b>	Enable or disable SSL re-negotiation for xnm-ssl service.
<b>Default</b>	SSL re-negotiation for xnm-ssl service is disabled by default.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring clear-text or SSL Service for Junos XML Protocol Client Applications</i></li> </ul>

## start-time

---

Syntax	<code>start-time <i>time</i>;</code>
Hierarchy Level	<code>[edit accounting-options <a href="#">file</a> <i>filename</i>]</code>
Release Information	Statement introduced in Junos OS Release 8.2. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Specify the start time for transfer of an accounting-data log file.
Options	<i>time</i> —Start time for file transfer. Syntax: <i>YYYY-MM-DD.hh:mm</i>
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <i>Configuring the Start Time for File Transfer</i></li></ul>

## start-time (Authentication Key Transmission)

<b>Syntax</b>	<code>start-time (now   yyyy-mm-dd.hh:mm:ss);</code>
<b>Hierarchy Level</b>	<code>[edit security authentication-key-chains key-chain <i>key-chain-name</i> key <i>key</i>]</code>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 7.6.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the BFD protocol introduced in Junos OS Release 9.6.</p> <p>Support for the BFD protocol introduced in Junos OS Release 9.6 for EX Series switches.</p> <p>Support for IS-IS introduced in Junos OS Release 11.2.</p> <p>Statement introduced in Junos OS Release 11.3 for QFX Series switches.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
<b>Description</b>	<p>Specify a start time for key transmission. You do not need to specify an end time for the key. If a new key is present with a new start time, the keychain rolls over to the new one. The start time must be unique within the keychain.</p>
<b>Options</b>	<p><b>now</b>—Start time as the current year, month, day, hour, minute, and second.</p> <p><b>daydays</b>—Start time as the specified number of days after the current day. For example, if the current day is the 12th and you configure <b>start-time 2day</b>, the start time will be on the 14th, exactly two days after the configuration is entered.</p> <p><b>hourhours</b>—Start time as the specified number of hours after the current hour. For example, if the current hour is 9:00 and you configure <b>start-time 3hour</b>, the start time will be in 12:00, exactly three hours after the configuration is entered.</p> <p><b>minuteminutes</b>—Start time as the specified number of minutes after the current minute. For example, if the current minute is 27 minutes after the hour and you configure <b>start-time 5min</b>, the start time will be in 32 minutes after the hour, exactly five minutes after the configuration is entered.</p> <p><b>monthmonths</b>—Start time as the specified number of months after the current month. For example, if the current month is March and you configure <b>start-time 4month</b>, the start time will be in July, exactly four months after the configuration is entered.</p> <p><b>secondseconds</b>—Start time as the specified number of seconds after the current second. For example, if the current second is 10:20:40 and you configure <b>start-time 10seconds</b>, the start time will be 10:20:50, exactly 10 seconds after the configuration is entered.</p> <p><b>yearyears</b>—Start time as the specified number of years after the current year. For example, if the current year is 2011 and you configure <b>start-time 1year</b>, the start time will be in 2012, exactly one year after the configuration is entered.</p> <p><b>yyyy-mm-dd.hh:mm:ss</b>—Start time in UTC (Coordinated Universal Time). The start time must be unique within the keychain.</p>

<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Authentication Key Update Mechanism for BGP and LDP Routing Protocols on page 220</a></li><li>• <i>Example: Configuring BFD Authentication for Securing Static Routes</i></li><li>• <i>Example: Configuring BFD Authentication for Securing Static Routes</i></li><li>• <i>Example: Configuring Hitless Authentication Key Rollover for IS-IS</i></li></ul>

## static (Protocols 802.1X)

<b>Syntax</b>	<pre>static mac-address {   interface interface-names;   vlan-assignment (vlan-id  vlan-name ); }</pre>
<b>Hierarchy Level</b>	[edit protocols <a href="#">dot1x authenticator</a> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series.</p>
<b>Description</b>	<p>Configure MAC addresses to exclude from 802.1X authentication. The static MAC list provides an authentication bypass mechanism for supplicants connecting to a port, permitting devices such as printers that are not 802.1X-enabled to be connected to the network on 802.1X-enabled ports.</p> <p>Using this 802.1X authentication-bypass mechanism, the supplicant connected to the MAC address is assumed to be successfully authenticated and the port is opened for it. No further authentication is done for the supplicant.</p> <p>You can optionally configure the VLAN that the supplicant is moved to or the interfaces on which the MAC address can gain access from.</p>
<b>Options</b>	<p><b>mac-address</b> —The MAC address of the device for which 802.1X authentication should be bypassed and the device permitted access to the port.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show dot1x static-mac-address on page 1697</a></li> <li>• <a href="#">Example: Configuring Static MAC Bypass of 802.1X and MAC RADIUS Authentication on an EX Series Switch on page 356</a></li> <li>• <a href="#">Configuring 802.1X Interface Settings (CLI Procedure) on page 280</a></li> <li>• <a href="#">Configuring 802.1X Authentication (J-Web Procedure)</a></li> <li>• <a href="#">Understanding Authentication on Switches on page 256</a></li> </ul>

## static (Protocols 802.1X)

<b>Syntax</b>	<pre>static mac-address {   interface interface-names;   vlan-assignment (vlan-id  vlan-name ); }</pre>
<b>Hierarchy Level</b>	[edit protocols <a href="#">dot1x authenticator</a> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series.</p>
<b>Description</b>	<p>Configure MAC addresses to exclude from 802.1X authentication. The static MAC list provides an authentication bypass mechanism for supplicants connecting to a port, permitting devices such as printers that are not 802.1X-enabled to be connected to the network on 802.1X-enabled ports.</p> <p>Using this 802.1X authentication-bypass mechanism, the supplicant connected to the MAC address is assumed to be successfully authenticated and the port is opened for it. No further authentication is done for the supplicant.</p> <p>You can optionally configure the VLAN that the supplicant is moved to or the interfaces on which the MAC address can gain access from.</p>
<b>Options</b>	<p><b>mac-address</b> —The MAC address of the device for which 802.1X authentication should be bypassed and the device permitted access to the port.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show dot1x static-mac-address on page 1697</a></li> <li>• <a href="#">Example: Configuring Static MAC Bypass of 802.1X and MAC RADIUS Authentication on an EX Series Switch on page 356</a></li> <li>• <a href="#">Configuring 802.1X Interface Settings (CLI Procedure) on page 280</a></li> <li>• <a href="#">Configuring 802.1X Authentication (J-Web Procedure)</a></li> <li>• <a href="#">Understanding Authentication on Switches on page 256</a></li> </ul>

## static-binding

<b>Syntax</b>	<pre>static-binding <i>mac-address</i> {   client-identifier (ascii <i>client-id</i>   hexadecimal <i>client-id</i>);   fixed-address {     <i>address</i>;   }   host-name <i>client-hostname</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit system services dhcp], [edit system services <b>dhcp</b>]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	<p>For J Series Services routers and EX Series switches only. Set static bindings for DHCP clients. A static binding is a mapping between a fixed IP address and the client's MAC address or client identifier.</p>
<b>Options</b>	<p><b><i>mac-address</i></b>—The MAC address of the client. This is a hardware address that uniquely identifies a client on the network.</p> <p><b><i>fixed-address address</i></b>—Fixed IP address assigned to the client. Typically a client has one address assigned, but you can assign more.</p> <p><b><i>host-name client-hostname</i></b>—Hostname of the client requesting the DHCP server. The name can include the local domain name. Otherwise, the name is resolved based on the <b>domain-name</b> statement.</p> <p><b><i>client-identifier (ascii client-id   hexadecimal client-id)</i></b>—Used by the DHCP server to index the database of address bindings. The client identifier is an ASCII string or hexadecimal number and can include a type-value pair as specified in RFC 1700, <i>Assigned Numbers</i>. Either a client identifier or the client's MAC address must be configured to uniquely identify the client on the network.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	

## static-subscribers

---

<b>Syntax</b>	<pre>static-subscribers {   disable; }</pre>
<b>Hierarchy Level</b>	[edit system processes]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Associate subscribers with statically configured interfaces, and provide dynamic service activation for these subscribers.
<b>Options</b>	<b>disable</b> —Disable the static subscribers process.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

## statistics (Access Profile)

---

<b>Syntax</b>	<pre>statistics (time   volume-time);</pre>
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> <b>accounting</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.1. Statement introduced in Junos OS Release 9.1 for EX Series switches. <b>volume-time</b> option added in Junos OS Release 9.4.
<b>Description</b>	Configure the router or switch to collect time statistics, or both volume and time statistics, for the sessions being managed by AAA.
<b>Options</b>	<b>time</b> —Collect uptime statistics only.  <b>volume-time</b> —Collect both volume and uptime statistics.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Authentication and Accounting Parameters for Subscriber Access</i></li></ul>

---

## statistics-service

---

<b>Syntax</b>	<pre>statistics-service {   command <i>binary-file-path</i>;   disable; }</pre>
<b>Hierarchy Level</b>	[edit system processes]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify the Packet Forwarding Engine (PFE) statistics service management process.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>command <i>binary-file-path</i></b>—Path to the binary process.</li><li>• <b>disable</b>—Disable the Packet Forwarding Engine (PFE) statistics service management process.</li></ul>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

## strict (DHCP Local Server)

<b>Syntax</b>	strict;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.4.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Specify whether the server denies a client to bind when the client does not indicate that it accepts reconfigure messages. This feature is available only for DHCPv6.
<b>Default</b>	Accept solicit messages from clients that do not support reconfiguration and permit them to bind.
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Dynamic Client Reconfiguration of Extended Local Server Clients Overview on page 568</a></li> <li>• <a href="#">Preventing Binding of Clients That Do Not Support Reconfigure Messages on page 521</a></li> </ul>

## sub-prefix-length

<b>Syntax</b>	<code>sub-prefix-length <i>sub-prefix-length</i>;</code>
<b>Hierarchy Level</b>	<pre>[edit interfaces interface-name unit logical-unit-number family family dhcpv6-client   prefix-delegating] [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i>   family inet6 dhcpv6-client prefix-delegating] [edit tenants <i>tenant-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6   dhcpv6-client prefix-delegating]</pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.3X48-D30 and in Junos OS Release 15.1X49-D100.</p> <p>The <b>logical-systems</b> and <b>tenants</b> options are introduced in Junos OS Release 18.4R1.</p>
<b>Description</b>	Allows you to configure DHCPv6 client sub prefix length. The DHCPv6 client separates the delegated prefix according to sub-prefix lengths. If the delegated prefix is not enough for all interfaces, the client sends out a syslog message.
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">preferred-prefix-length on page 1231</a></li> </ul>

## subscriber-management-helper

---

Syntax	<pre>subscriber-management-helper {   command <i>binary-file-path</i>;   disable;   failover (alternate-media   other-routing-engine); }</pre>
Hierarchy Level	[edit system processes]
Release Information	Statement introduced in Junos OS Release 8.5.
Description	Specify the subscriber management helper process.
Options	<ul style="list-style-type: none"><li>• <b>command <i>binary-file-path</i></b>—Path to the binary process.</li><li>• <b>disable</b>—Disable the subscriber management helper process.</li><li>• <b>failover</b>—Configure the device to reboot if the software process fails four times within 30 seconds, and specify the software to use during the reboot.<ul style="list-style-type: none"><li>• <b>alternate-media</b>—Configure the device to switch to backup media that contains a version of the system if a software process fails repeatedly.</li><li>• <b>other-routing-engine</b>—Instruct the secondary Routing Engine to take mastership if a software process fails. If this statement is configured for a process, and that process fails four times within 30 seconds, then the device reboots from the secondary Routing Engine.</li></ul></li></ul>
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

## supplicant

<b>Syntax</b>	supplicant (multiple   single   single-secure);
<b>Hierarchy Level</b>	[edit protocols <a href="#">dot1x authenticator interface</a> (all   [ <i>interface-names</i> ])], [edit services <a href="#">captive-portal interface</a> (all   <i>interface-names</i> )]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement added to the <b>[edit services captive-portal interface]</b> hierarchy in Junos OS Release 10.1 for EX Series switches Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series.
<b>Description</b>	Configure the MAC-based method used to authenticate clients for 802.1X or captive portal authentication.
<b>Default</b>	single
<b>Options</b>	<p><b>single</b>—Authenticates only the first client that connects to an authenticator port. All other clients connecting to the authenticator port after the first are permitted free access to the port without further authentication. If the first authenticated client logs out, all other supplicants are locked out until a client authenticates again.</p> <p><b>single-secure</b>—Authenticates only one client to connect to an authenticator port. The host must be directly connected to the switch.</p> <p><b>multiple</b>—Authenticates multiple clients individually on one authenticator port. You can configure the number of clients per port. If you also configure a maximum number of devices that can be connected to a port through port security settings, the lower of the configured values is used to determine the maximum number of clients allowed per port.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Setting Up 802.1X for Single-Supplicant or Multiple-Supplicant Configurations on an EX Series Switch on page 325</a></li> <li>• <a href="#">Example: Setting Up Captive Portal Authentication on an EX Series Switch on page 361</a></li> <li>• <a href="#">Understanding Authentication on Switches on page 256</a></li> <li>• <a href="#">Configuring Captive Portal Authentication (CLI Procedure) on page 366</a></li> </ul>

## supplicant-timeout

---

Syntax	supplicant-timeout <i>seconds</i> ;
Hierarchy Level	[edit protocols <a href="#">dot1x authenticator interface (802.1X)</a> (all   [ <i>interface-name</i> ])
Release Information	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series.
Description	For 802.1X authentication, configure how long the port waits for a response when relaying a request from the authentication server to the supplicant before resending the request.
Default	30 seconds
Options	<i>seconds</i> —Number of seconds. <b>Range:</b> 1 through 60 seconds <b>Default:</b> 30 seconds
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">supplicant on page 1403</a></li><li>• <a href="#">Example: Setting Up 802.1X for Single-Supplicant or Multiple-Supplicant Configurations on an EX Series Switch on page 325</a></li><li>• <a href="#">Understanding Authentication on Switches on page 256</a></li></ul>

## system

```
Syntax  system {
    accounting {

**Hierarchy Level** [edit]

**Release Information** Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure system management properties.

**NOTE:** The `radius-server source-address` and `radius-options` statements are not available on the QFabric system.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

---

## system

---

**Syntax** system { ... }

**Hierarchy Level** [edit]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure system management properties.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation**

- *System Management Configuration Statements*

## system-generated-certificate

<b>Syntax</b>	system-generated-certificate;
<b>Hierarchy Level</b>	[edit <a href="#">system services web-management https</a> ]
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for EX Series switches.
<b>Description</b>	Configure the automatically generated self-signed certificate for enabling HTTPS services.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Enabling HTTPS and XNM-SSL Services on Switches Using Self-Signed Certificates (CLI Procedure)</i></li></ul>

## tacplus

Syntax	<pre> tacplus {   server {     server-address {       port port-number;       routing-instance (Accounting and Authentication) routing-instance;       secret password;       single-connection;       timeout seconds;     }   } } </pre>
Hierarchy Level	[edit system accounting destination]
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>routing-instance</b> option introduced in Junos OS Release 17.4R1.</p>
Description	Configure the Terminal Access Controller Access Control System Plus (TACACS++).
Options	<p><b>server-address</b>—Address of the TACACS++ authentication server.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <li><a href="#">Configuring TACACS+ System Accounting on page 214</a></li> </ul>

## tacplus

<b>Syntax</b>	<pre> tacplus {   server <i>server-address</i> {     port <i>port-number</i>;     secret <i>password</i>;     single-connection;     source-address <i>source-address</i>;     timeout <i>seconds</i>;   } } </pre>
<b>Hierarchy Level</b>	[edit system accounting destination]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	Configure the TACACS+ accounting server.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b><i>server-address</i></b>—Specify the address of the TACACS+ authentication server.</li> <li>• <b><i>port number</i></b>—Configure the port number on which to contact the TACACS+ server.</li> <li>• <b><i>single-connection</i></b>—Optimize attempts to connect to a TACACS+ server. The software maintains one open TCP connection to the server for multiple requests rather than opening a connection for each connection attempt.</li> <li>• <b><i>source-address address</i></b>—Configure a source address for each configured TACACS+ server.</li> <li>• <b><i>timeout seconds</i></b>—Configure the amount of time that the local device waits to receive a response from a TACACS+ server.</li> </ul>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring a TACACS+ Server for System Authentication on page 205</a></li> </ul>

## tacplus-options

Syntax	<pre> tacplus-options {   (exclude-cmd-attribute   no-cmd-attribute-value);   enhanced-accounting;   strict-authorization   service-name <i>service-name</i>;   timestamp-and-timezone; } </pre>
Hierarchy Level	[edit system]
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>no-cmd-attribute-value</b> and <b>exclude-cmd-attribute</b> options introduced in Junos OS Release 9.3.</p> <p>Statement introduced in Junos OS Release 11.1 for QFX Series.</p> <p><b>timestamp-and-timezone</b> option introduced in Junos OS Release 12.2.</p> <p><b>strict-authorization</b> option introduced in Junos OS Release 13.3 for EX Series, M Series, MX Series, PTX Series, and T Series.</p> <p><b>enhanced-accounting</b> option introduced in Junos OS Release 14.1.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.</p>
Description	Configure TACACS+ options for authentication and accounting.
Options	<p><b>enhanced-accounting</b>—View the attribute values of a logged in user.</p> <p><b>exclude-cmd-attribute</b>—Exclude the <b>cmd</b> attribute value completely from start and stop accounting records to enable logging of accounting records in the correct log file on a TACACS+ server.</p> <p><b>no-cmd-attribute-value</b>—Set the <b>cmd</b> attribute value to an empty string in the TACACS+ accounting start and stop requests to enable logging of accounting records in the correct log file on a TACACS+ server.</p> <p><b>service-name <i>service-name</i></b>—Name of the authentication service used when you configure multiple TACACS+ servers to use the same authentication service.</p> <p><b>Default:</b> <b>junos-exec</b></p> <p><b>strict-authorization</b>—Deny login if authorization request fails. When a user is logging in, Junos OS issues two TACACS+ requests—first the authentication request followed by the authorization request. By default, when the authorization request is rejected by the TACACS+ server, Junos OS ignores this and allows full access to the user. When the <b>set system tacplus-options strict-authorization</b> statement is set, Junos OS denies access to the user even on failure of the authorization request.</p>

**timestamp-and-timezone**—Include this statement if you want start time, stop time, and timezone attributes included in start/stop accounting records.

**Required Privilege Level**    system—To view this statement in the configuration.  
                                     system-control—To add this statement to the configuration.

## tacplus-server

Syntax	<pre>tacplus-server server-address {   routing-instance (Accounting and Authentication) routing-instance;   secret password;   single-connection;   source-address source-address;   timeout seconds; }</pre>
Hierarchy Level	[edit system]
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>routing-instance</b> option introduced in Junos OS Release 17.4R1.</p>
Description	Configure the IPv4 or IPv6 TACACS++ server.
Options	<p><b>server-address</b>—Address of the IPv4 or IPv6 TACACS++ authentication server.</p>
<div>  <p><b>NOTE:</b> Wildcard characters cannot be used in the TACACS+ server address or source address. This is because the TACACS+ server and source can accept both IPv4 and IPv6 addresses and, if you use wildcard characters for these addresses, Junos OS cannot validate mismatching server and source address families.</p> </div>	
<p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>	
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <li><a href="#">Configuring TACACS+ Authentication on page 202</a></li> </ul>

## tacplus-server

**Syntax** `tacplus-server server-address {  
     port port-number;  
     secret password;  
     single-connection;  
     source-address source-address;  
     timeoutseconds;  
 }`

**Hierarchy Level** [edit system]

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure the TACACS+ server.

**Options** • **server-address**—Address of the TACACS+ authentication server.

**NOTE:** Wildcard characters cannot be used in the TACACS server address or source address. This is because the TACACS server and source can accept both IPv4 and IPv6 addresses and, if you use wildcard characters for these addresses, Junos OS cannot validate mismatching server and source address families.

- **port**—Port number of TACACS+ authentication server.
- **secret**—Password to use with the RADIUS or TACACS+ server. The secret password used by the local router or switch must match that used by the server. Password to use; can include spaces included in quotation marks.
- **single-connection**—Optimize attempts to connect to a TACACS+ server. The software maintains one open TCP connection to the server for multiple requests rather than opening a connection for each connection attempt.
- **source-address**—Source address for each configured TACACS+ server, RADIUS server, NTP server, or the source address to record in system log messages that are directed to a remote machine. Configure a valid IP address on one of the device interfaces. For system logging, the address is recorded as the message source in messages sent to the remote machines specified in all **host *hostname*** statements at the **[edit system syslog]** hierarchy level.
- **timeout**—The amount of time that the local device waits to receive a response from a RADIUS or TACACS+ server. The timeout range is 1 through 90 seconds. The default is 3 seconds.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation**

- [Example: Configuring a TACACS+ Server for System Authentication on page 205](#)

---

## targets

---

**Syntax**

```
targets {  
    address;  
}
```

**Hierarchy Level** [edit snmp trap-group *group-name*]

**Release Information** Statement introduced before Junos OS Release 7.4 for MX, M, T, ACX and PTX Series routers and SRX firewalls.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure one or more systems to receive SNMP traps.

**Options** *address*—IPv4 or IPv6 address of the system to receive traps. You must specify an address, not a hostname.

**Required Privilege Level** snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

**Related Documentation**

- [Configuring SNMP Trap Groups](#)

  
[Configuring SNMP Trap Groups](#)

## telnet

<b>Syntax</b>	<pre>telnet {   authentication-order [authentication-methods];   connection-limit limit;   rate-limit limit; }</pre>
<b>Hierarchy Level</b>	[edit system services]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
<b>Description</b>	<p>Provide Telnet connections from remote systems to the local router or switch.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Telnet Service for Remote Access to a Router or Switch on page 224</a></li> </ul>

## telnet

- List of Syntax**    [Syntax on page 1420](#)  
                          [Syntax \(EX Series Switches\) on page 1420](#)  
                          [Syntax \(Junos OS Evolved\) on page 1420](#)

**Syntax**    `telnet host`  
                  `<8bit>`  
                  `<inet | inet6>`  
                  `<port port-number>`  
                  `<routing-instance routing-instance-name>`

**Syntax (EX Series Switches)**    `telnet host`  
                          `<8bit>`  
                          `<bypass-routing>`  
                          `<inet | inet6>`  
                          `<interface interface-name>`  
                          `<no-resolve>`  
                          `<port port-number>`  
                          `<routing-instance routing-instance-name>`  
                          `<source source-address>`

**Syntax (Junos OS Evolved)**    `telnet host`  
                          `<8bit>`  
                          `<inet | inet6>`  
                          `<port port-number>`  
                          `<routing-instance routing-instance-name>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                          Command introduced in Junos OS Release 9.0 for EX Series switches.  
                          The following options are deprecated in Junos OS Evolved Release 18.3R1: **bypass-routing**, **interface**, **no-resolve**, and **source**.

**Description**    Open a telnet session to a remote system. Type Ctrl+] to escape from the telnet session to the telnet command level, and then type **quit** to exit from telnet.

**NOTE:** For Junos OS Evolved, use the `routing-instance mgmt_junos` option to access a remote system through the management interface.

**Options**    **host**—Name or address of the remote system.

**8bit**—(Optional) Use an 8-bit data path.

**bypass-routing**—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached

network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

**inet | inet6**—(Optional) Open an IPv4 or IPv6 session, respectively.

**interface *interface-name***—(Optional) Interface name for the telnet session. (This option does not work when **default-address-selection** is configured at the **[edit system]** hierarchy level, because this configuration uses the loopback interface as the source address for all locally generated IP packets.)

**logical-system *logical-system-name***—(Optional) Name of a particular logical system for the telnet attempt.

**no-resolve**—(Optional) This option is not supported for Junos OS Evolved Release 18.3R1. Do not attempt to determine the hostname that corresponds to the IP address.

**port *port-number***—(Optional) Port number or service name on the remote system.

**routing-instance *routing-instance-name***—(Optional) Name of the routing instance for the telnet attempt.

**source *source-address***—(Optional) This option is not supported for Junos OS Evolved Release 18.3R1. Source address of the telnet connection.

**Additional Information** You can limit the number of times a user can attempt to enter a password while logging in through telnet. To specify the number of times a user can attempt to enter a password to log in through telnet, include the [retry-options](#) statement at the **[edit system login]** hierarchy level.

**Required Privilege Level** network

**List of Sample Output** [telnet on page 1421](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### telnet

```
user@host> telnet 192.154.1.254
Trying 192.154.169.254...
Connected to level5.company.net.
Escape character is '^]'.
ttypa
login:
```

## tftp

---

Syntax	<pre>tftp {   description <i>text-description</i>;   interface <i>interface-name</i> {     broadcast;     description <i>text-description</i>;     no-listen;     server address &lt;logical-system <i>logical-system-name</i>&gt; &lt;routing-instance       <i>routing-instance-name</i>&gt;;   }   server address &lt;logical-system <i>logical-system-name</i>&gt; &lt;routing-instance     <i>routing-instance-name</i>&gt;; }</pre>
Hierarchy Level	[edit forwarding-options helpers]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Enable TFTP request packet forwarding.  The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
Required Privilege Level	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <i>Configuring DNS and TFTP Packet Forwarding</i></li></ul>

## threshold (detection-time)

Syntax	<code>threshold <i>milliseconds</i>;</code>
Hierarchy Level	<pre>[edit system services dhcp-local-server liveness-detection method bfd <b>detection-time</b>], [edit system services dhcp-local-server dhcpv6 liveness-detection method bfd <b>detection-time</b>], [edit forwarding-options dhcp-relay liveness-detection method bfd <b>detection-time</b>], [edit forwarding-options dhcp-relay dhcpv6 liveness-detection method bfd <b>detection-time</b>], [edit system services dhcp-local-server group <i>group-name</i> liveness-detection method bfd <b>detection-time</b>], [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method bfd <b>detection-time</b>], [edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method bfd <b>detection-time</b>], [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method bfd <b>detection-time</b>]</pre>
Release Information	<p>Statement introduced in Junos OS Release 12.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
Description	<p>Specify the threshold for the adaptation of the detection time. When the BFD session detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.</p>
<div>  <p><b>NOTE:</b> The threshold time must be greater than or equal to the minimum-interval or the minimum-receive-interval.</p> </div>	
Options	<p><b><i>milliseconds</i></b>— Value for the detection time adaptation threshold.</p> <p><b>Range:</b> 1 through 255,000</p>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Group Liveness Detection with BFD for DHCP Local Server Clients</a></li> <li>• <a href="#">Example: Configuring Global Liveness Detection with BFD for DHCP Relay Agent Clients on page 585</a></li> </ul>

## threshold (transmit-interval)

Syntax	<code>threshold <i>milliseconds</i>;</code>
Hierarchy Level	<p>[edit system services dhcp-local-server liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit forwarding-options dhcp-relay liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method bfd <a href="#">transmit-interval</a>]</p>
Release Information	Statement introduced in Junos OS Release 12.1.
Description	Specify the threshold for detecting the adaptation of the transmit interval. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent.
Options	<p><i>milliseconds</i> — Threshold value.</p> <p>Range: 0 through 4,294,967,295 (<math>2^{32} - 1</math>)</p>
<div>  <p><b>NOTE:</b> The threshold value specified in the <code>threshold</code> statement must be greater than the value specified in the <code>minimum-interval</code> statement for the <code>transmit-interval</code> statement.</p> </div>	
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Group Liveness Detection with BFD for DHCP Local Server Clients</a></li> <li>• <a href="#">Example: Configuring Global Liveness Detection with BFD for DHCP Relay Agent Clients on page 585</a></li> </ul>

## timeout (System)

<b>Syntax</b>	<code>timeout <i>seconds</i>;</code>
<b>Hierarchy Level</b>	<code>[edit system <a href="#">radius-server</a> <i>server-address</i>],</code> <code>[edit system <a href="#">tacplus-server</a> <i>server-address</i>],</code> <code>[edit system accounting destination radius server <i>server-address</i>],</code> <code>[edit system accounting destination tacplus server <i>server-address</i>]</code>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	Configure the amount of time that the local router or switch waits to receive a response from a RADIUS or TACACS+ server.
<b>Options</b>	<p><b><i>seconds</i></b>—Amount of time to wait.</p> <p><b>Range:</b> 1 through 90 seconds</p> <p><b>Default:</b> 3 seconds</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring RADIUS Server Authentication on page 180</a></li> <li>• <a href="#">Configuring TACACS+ Authentication on page 202</a></li> <li>• <a href="#">retry on page 1310</a></li> </ul>

## timeout (DHCP Local Server)

<b>Syntax</b>	<code>timeout <i>timeout-value</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">reconfigure</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit system services dhcp-local-server <a href="#">reconfigure</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.0.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Support at the <a href="#">[edit ... dhcpv6 ...]</a> hierarchy levels introduced in Junos OS Release 10.4.</p>
<b>Description</b>	Configure the initial value in seconds between attempts to reconfigure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces.
<b>Options</b>	<p><i>timeout-value</i>—Initial retry timeout value.</p> <p><b>Range:</b> 1 through 10 seconds</p> <p><b>Default:</b> 2 seconds</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

## timeout (Access Control Service)

<b>Syntax</b>	<code>timeout <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit services <a href="#">unified-access-control</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2 for EX Series switches.
<b>Description</b>	Configure the amount of time that the switch waits to receive a response from the Junos Pulse Access Control Service.
<b>Options</b>	<p><i>seconds</i>—Amount of time to wait.</p> <p><b>Range:</b> 2 through 1000 seconds</p> <p><b>Default:</b> 300 seconds</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring an EX Series Switch to Use Junos Pulse Access Control Service for Network Access Control (CLI Procedure) on page 389</a></li> <li>• <a href="#">Configuring the EX Series Switch for Captive Portal Authentication with Junos Pulse Access Control Service (CLI Procedure) on page 392</a></li> </ul>

## timeout (RADIUS)

Syntax	timeout <i>seconds</i> ;
Hierarchy Level	[edit access <b>radius-server</b> <i>server-address</i> ], [edit access profile <i>profile-name</i> <b>radius-server</b> <i>server-address</i> ]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Configure the amount of time that the local router or switch waits to receive a response from RADIUS authentication and accounting servers. You can override the timeout value for accounting servers with the <i>accounting-timeout</i> statement.
	<p> <b>NOTE:</b> To successfully set a timeout value for the accounting servers different from the authentication servers, you must configure both the <i>accounting-retry</i> and <i>accounting-timeout</i> statements. If you configure only one of these statements, then the value you configure is ignored in favor of the values configured with the <i>retry</i> and <i>timeout</i> statements.</p> <p> <b>NOTE:</b> The maximum retry duration (the number of retries times the length of the timeout) cannot exceed 2700 seconds. An error message is displayed if you configure a longer duration.</p>
Options	<p><b>seconds</b>—Amount of time to wait.</p> <p><b>Range:</b> 1 through 1000 seconds</p> <p><b>Default:</b> 3 seconds</p>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"> <li><i>RADIUS Authentication and Accounting Server Definition</i></li> <li><i>Configuring Authentication and Accounting Parameters for Subscriber Access</i></li> <li><i>Example: Configuring CHAP Authentication with RADIUS</i></li> <li><i>Configuring RADIUS Authentication for L2TP</i></li> </ul>

## timeout (System)

<b>Syntax</b>	<code>timeout <i>seconds</i>;</code>
<b>Hierarchy Level</b>	<code>[edit system <a href="#">radius-server</a> <i>server-address</i>],</code> <code>[edit system <a href="#">tacplus-server</a> <i>server-address</i>],</code> <code>[edit system accounting destination radius server <i>server-address</i>],</code> <code>[edit system accounting destination tacplus server <i>server-address</i>]</code>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	Configure the amount of time that the local router or switch waits to receive a response from a RADIUS or TACACS+ server.
<b>Options</b>	<p><b><i>seconds</i></b>—Amount of time to wait.</p> <p><b>Range:</b> 1 through 90 seconds</p> <p><b>Default:</b> 3 seconds</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring RADIUS Server Authentication on page 180</a></li> <li>• <a href="#">Configuring TACACS+ Authentication on page 202</a></li> <li>• <a href="#">retry on page 1310</a></li> </ul>

## timeout-action (Access Control Service)

---

<b>Syntax</b>	timeout-action ( close   no-change);
<b>Hierarchy Level</b>	[edit services <a href="#">unified-access-control</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2 for EX Series switches.
<b>Description</b>	Specify the action to be taken when the timeout is reached for the switch's connection with the Junos Pulse Access Control Service.
<b>Options</b>	<b>close</b> —Remove existing sessions and block further traffic. <b>no-change</b> —Preserve existing connections, but block new sessions. <b>Default:</b> close
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">timeout (Access Control Service) on page 1427</a></li><li>• <a href="#">Configuring an EX Series Switch to Use Junos Pulse Access Control Service for Network Access Control (CLI Procedure) on page 389</a></li><li>• <a href="#">Configuring the EX Series Switch for Captive Portal Authentication with Junos Pulse Access Control Service (CLI Procedure) on page 392</a></li></ul>

## tlv-filter

<b>Syntax</b>	<code>tlv-filter <i>tlv-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit protocols lldp],</code> <code>[edit protocols <b>lldp-med</b>],</code> <code>[edit protocols lldp interface <i>interface-name</i>],</code> <code>[edit protocols lldp-med interface <i>interface-name</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 18.3 for EX Series switches.
<b>Description</b>	<p>Select the type, length, and value (TLV) messages that should not be advertised by Link Layer Discovery Protocol (LLDP) or LLDP Media Endpoint Discovery (LLEP-MED) protocol. LLDP-capable devices transmit information in type, length, and value (TLV) messages to neighbor devices. Device information can include information such as chassis and port identification and system name and system capabilities.</p> <p>In multi-vendor networks, it might not be desirable to send TLV messages because they can contain sensitive information about a network device. You can configure LLDP or LLDP-MED to disable any non-mandatory TLV message. Mandatory TLVs are: chassis-id, port-id, and time-to-live.</p> <p>When you configure the <b>tlv-filter</b> statement, you specify the TLVs that you want to disable. This is useful when you want to allow most, but not all, TLVs.</p> <p>You can also disable TLVs using the <b>tlv-select</b> statement. When you configure the <b>tlv-select</b> statement, you specify the TLVs that you want to be advertised by LLDP or LLDP-MED. All other non-mandatory TLVs are disabled.</p>
	<p> <b>NOTE:</b> The <b>tlv-select</b> and <b>tlv-filter</b> are mutually exclusive and cannot be used on the same configuration stanza at the same time.</p>
<b>Default</b>	All TLVs for LLDP and LLDP-MED are enabled by default.
<b>Options</b>	<p>The following options can be configured using <b>tlv-filter</b> at the <code>[edit protocols lldp]</code> and <code>[edit protocols lldp interface <i>interface-name</i>]</code> hierarchy levels:</p> <p><b>port-description</b>—The user-configured port description.</p> <p><b>system-name</b>—The user-configured name of the local system.</p> <p><b>system-description</b>—The user-configured name of the local system.</p>

**system-capabilities**—The primary function performed by the system. The capabilities that system supports are defined; for example, bridge or router. This information cannot be configured, but is based on the model of the product.

**management-address**— IP management address of the local system.

**mac-phy-config-status**—Advertises information about the physical interface, such as autonegotiation status and support and MAU (medium attachment unit) type.

**power-vi-mdi**—Advertises MDI (media dependent interface) power support, PSE (power sourcing equipment) power pair, and power class information.

**link-aggregation**—Advertises whether the port is aggregated and its aggregated port ID.

**maximum-frame-size**—The maximum transmission unit (MTU) of the interface sending LLDP frames.

**jnpr-chassis-serial**—The chassis serial number.

**jnpr-vcp**—Juniper virtual chassis port.

**port-vid**—Indicates the port VLAN ID that will be associated with an untagged or priority tagged data frame received on the VLAN port.

**vlan-name**—Indicates the assigned name of any VLAN at the device.

The following options can be configured using **tlv-filter** at the **[edit protocols lldp-med]** and **[edit protocols lldp-med interface *interface-name*]** hierarchy levels:

**ext-power-via-mdi**—The power type, power source, power priority, and power value of the port. It is the responsibility of the PSE device (network connectivity device) to advertise the power priority on a port.

**location-id**—The physical location of the endpoint.

**med-capabilities**—The primary function of the port.

**network-policy**—The port VLAN configuration and associated Layer 2 and Layer 3 attributes. Attributes include the policy identifier, application types, such as voice or streaming video, 802.1Q VLAN tagging, and 802.1p priority bits and Diffserv code points.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## token (DHCP Local Server)

<b>Syntax</b>	<code>token <i>token-value</i>;</code>
<b>Hierarchy Level</b>	<pre> [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">reconfigure</a>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> <a href="#">reconfigure</a>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>], [edit logical-systems <i>logical-system-name</i> system services dhcp-local-server <a href="#">reconfigure</a>], [edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>], [edit logical-systems <i>logical-system-name</i> system services dhcp-local-server group <i>group-name</i> <a href="#">reconfigure</a>], [edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>], [edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">reconfigure</a>], [edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>], [edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> <a href="#">reconfigure</a>], [edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>], [edit system services dhcp-local-server <a href="#">reconfigure</a>], [edit system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>], [edit system services dhcp-local-server group <i>group-name</i> <a href="#">reconfigure</a>], [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>] </pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.0.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Support at the <code>[edit ... dhcpv6 ...]</code> hierarchy levels introduced in Junos OS Release 10.4.</p>
<b>Description</b>	<p>Configure a plain-text token for all DHCP clients or only the DHCP clients serviced by the specified group of interfaces. The token enables rudimentary entity authentication to protect against inadvertently instantiated DHCP servers. A null token (empty string) indicates that the configuration token functionality is not enabled. A group configuration takes precedence over a DHCP local server configuration. For more information about tokens, see RFC 3118, <i>Authentication for DHCP Messages</i>, section 4.</p>
<b>Options</b>	<p><b><i>token-value</i></b>—Plain-text alphanumeric string.</p> <p><b>Default:</b> null (empty string)</p>
<b>Required Privilege Level</b>	<p><b>system</b>—To view this statement in the configuration.</p> <p><b>system-control</b>—To add this statement to the configuration.</p>

## trace (DHCP Relay Agent)

<b>Syntax</b>	trace;
<b>Hierarchy Level</b>	<pre>[edit forwarding-options dhcp-relay dhcpv6 group group-name interface interface-name], [edit forwarding-options dhcp-relay group group-name interface interface-name], [edit logical-systems logical-system-name forwarding-options dhcp-relay dhcpv6 group group-name interface interface-name], [edit logical-systems logical-system-name forwarding-options dhcp-relay group group-name interface interface-name], [edit logical-systems logical-system-name routing-instances routing-instance-name forwarding-options dhcp-relay dhcpv6 group group-name interface interface-name], [edit logical-systems logical-system-name routing-instances routing-instance-name forwarding-options dhcp-relay group group-name interface interface-name], [edit routing-instances routing-instance-name forwarding-options dhcp-relay dhcpv6 group group-name interface interface-name], [edit routing-instances routing-instance-name forwarding-options dhcp-relay group group-name interface interface-name]</pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.4.</p> <p>Support at the <b>[edit ... dhcpv6]</b> hierarchy levels introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.1 for EX Series switches.</p>
<b>Description</b>	<p>Enable trace operations for a group of interfaces or for a specific interface within a group. Use the statement at the <b>[edit ... dhcpv6]</b> hierarchy levels to configure DHCPv6 support.</p> <p>EX Series switches do not support DHCPv6.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring an Extended DHCP Relay Server on EX Series Switches (CLI Procedure) on page 517</a></li> <li>• <i>Tracing Extended DHCP Operations</i></li> <li>• <i>Tracing Extended DHCP Operations for Specific Interfaces</i></li> </ul>

## traceoptions

**Syntax**

```
traceoptions {
  file filename <files number> <size size>;
  flag all;
  flag certificates;
  flag database;
  flag general;
  flag ike;
  flag parse;
  flag policy-manager;
  flag routing-socket;
  flag timer;
  level
  no-remote-trace
}
```

**Hierarchy Level** [edit security],  
[edit services ipsec-vpn]

Trace options can be configured at either the [edit security] or the [edit services ipsec-vpn] hierarchy level, but not at both levels.

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** Configure security trace options.

To specify more than one trace option, include multiple **flag** statements. Trace option output is recorded in the `/var/log/kmd` file.

**NOTE:** The `traceoptions` statement is not supported on QFabric systems.

**Options** **files *number***—(Optional) Maximum number of trace files. When a trace file (for example, `kmd`) reaches its maximum size, it is renamed `kmd.0`, then `kmd.1`, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 0 files

**size** *size*—(Optional) Maximum size of each trace file, in kilobytes (KB). When a trace file (for example, **kmd**) reaches this size, it is renamed, **kmd.0**, then **kmd.1** and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Default:** 1024 KB

**flag** *flag*—Trace operation to perform. To specify more than one trace operation, include multiple **flag** statements.

- **all**—Trace all security events.
- **certificates**—Trace certificate events.
- **database**—Trace database events.
- **general**—Trace general events.
- **ike**—Trace IKE module processing.
- **parse**—Trace configuration processing.
- **policy-manager**—Trace policy manager processing.
- **routing-socket**—Trace routing socket messages.
- **timer**—Trace internal timer events.

**level** *level*—(Optional) Set traceoptions level.

- **all**—match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match conditions that should be handled specially.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**no-remote-trace**—(Optional) Disable remote tracing

<b>Required Privilege</b>	admin—To view the configuration.
<b>Level</b>	admin-control—To add this statement to the configuration.

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Tracing Operations</i></li></ul>
------------------------------	-----------------------------------------------------------------------------------------

## traceoptions (DNS, Port, and TFTP Packet Forwarding)

<b>Syntax</b>	<pre> traceoptions {   file <i>filename</i> &lt;files <i>number</i>&gt; &lt;match <i>regular-expression</i>&gt; &lt;size <i>bytes</i>&gt; &lt;world-readable       no-world-readable&gt;;   flag <i>flag</i>;   level <i>level</i>;   &lt;no-remote-trace&gt;; } </pre>
<b>Hierarchy Level</b>	[edit forwarding-options helpers]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement standardized and <b>match</b> option introduced in Junos OS Release 8.0.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	Configure tracing operations for BOOTP, DNS, TFTP, or custom UDP port packet forwarding.
<b>Default</b>	If you do not include this statement, no tracing operations are performed.
<b>Options</b>	<p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks (" "). All files are placed in a file named <b>fud</b> in the directory <b>/var/log</b>. If you include the <b>file</b> statement, you must specify a filename.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option and a filename.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>address</b>—Trace address management events</li> <li>• <b>all</b>—Trace all events</li> <li>• <b>bootp</b>—Trace BOOTP or DHCP services events</li> <li>• <b>config</b>—Trace configuration events</li> <li>• <b>domain</b>—Trace DNS service events</li> <li>• <b>ifdb</b>—Trace interface database operations</li> </ul>

- **io**—Trace I/O operations
- **main**—Trace main loop events
- **port**—Trace arbitrary protocol events
- **rtsock**—Trace routing socket operations
- **tftp**—Trace TFTP service events
- **trace**—Trace tracing operations
- **ui**—Trace user interface operations
- **util**—Trace miscellaneous utility operations

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—(Optional) Disable remote tracing globally or for a specific tracing operation.

**no-world-readable**—(Optional) Restrict file access to the owner.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** file again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option and filename.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 0 bytes through 4,294,967,295 KB

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

<b>Required Privilege</b>	interface—To view this statement in the configuration.
<b>Level</b>	interface-control—To add this statement to the configuration.

## traceoptions (802.1X)

<b>Syntax</b>	<pre> traceoptions {   file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt; &lt;match     <i>regex</i>&gt;;   flag <i>flag</i>; } </pre>
<b>Hierarchy Level</b>	[edit protocols <a href="#">dot1x</a> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for the <b>dot1x-event</b> and <b>dot1x-ipc</b> options introduced in Junos OS Release 13.2X50 for EX Series switches.</p>
<b>Description</b>	Define tracing operations for the 802.1X protocol.
<b>Default</b>	Tracing operations are disabled.
<b>Options</b>	<p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size by using the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—All tracing operations.</li> <li>• <b>config-internal</b>—Trace internal configuration operations.</li> <li>• <b>dot1x-event</b>—(Switches with ELS only) Trace 802.1x events.</li> <li>• <b>dot1x-debug</b>—(Switches without ELS) Trace 802.1x events.</li> <li>• <b>dot1x-ipc</b>—(Switches with ELS only) Trace IPC interactions.</li> <li>• <b>eapol</b>—Trace EAPOL packets transmitted and received.</li> <li>• <b>esw-if</b>—(Switches without ELS) Trace ESW interactions.</li> <li>• <b>general</b>—Trace general operations.</li> <li>• <b>normal</b>—Trace normal operations.</li> </ul>

- **parse**—Trace reading of the configuration.
- **regex-parse**—Trace regular-expression parsing operations.
- **state**—Trace protocol state changes.
- **task**—Trace protocol task operations.
- **timer**—Trace protocol timer operations.
- **vlan**—Trace VLAN transactions.

**match *regex***—(Optional) Refine the output to include lines that contain the regular expression.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files with the **files** option, you also must specify a maximum file size.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## traceoptions (Address-Assignment Pool)

<b>Syntax</b>	<pre> traceoptions {   file <i>filename</i> {     files <i>number</i>;     size <i>maximum-file-size</i>;     match <i>regex</i>;     (world-readable   no-world-readable);   }   flag address-assignment;   flag all;   flag configuration;   flag framework;   flag ldap;   flag local-authentication;   flag radius; } </pre>
<b>Hierarchy Level</b>	[edit system processes general-authentication-service]
<b>Release Information</b>	<p>Flag for tracing address-assignment pool operations introduced in Junos OS Release 9.0.</p> <p><b>option-name</b> option introduced in Junos OS Release 8.3.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	Configure tracing options.
<b>Options</b>	<p><b>file <i>filename</i></b>—Name of the file that receives the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option and a filename.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>address-assignment</b>—All address-assignment events</li> <li>• <b>all</b>—All tracing operations</li> <li>• <b>configuration</b>—Configuration events</li> <li>• <b>framework</b>—Authentication framework events</li> </ul>

- **ldap**—LDAP authentication events
- **local-authentication**—Local authentication events
- **radius**—RADIUS authentication events

**match *regex***—(Optional) Refine the output to include lines that contain the regular expression.

**no-world-readable**—(Optional) Restrict access to the originator of the trace operation only.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option and filename.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

<b>Required Privilege</b>	admin—To view this statement in the configuration.
<b>Level</b>	admin-control—To add this statement to the configuration.

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Address-Assignment Pool Configuration Overview</i></li></ul>

## traceoptions (DHCP)

<b>Syntax</b>	<pre> traceoptions {   file <i>filename</i> &lt;files <i>number</i>&gt; &lt;match <i>regular-expression</i>&gt; &lt;size <i>maximum-file-size</i>&gt;     &lt;world-readable   no-world-readable&gt;;   flag <i>flag</i>;   level (all   error   info   notice   verbose   warning);   no-remote-trace; } </pre>
<b>Hierarchy Level</b>	<p>[edit system processes dhcp-service] [edit security dynamic-address]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 11.4. Statement introduced in Junos OS Release 12.1 for EX Series switches. Statement introduced in Junos OS Release 18.4R1.</p>
<b>Description</b>	<p>Define global tracing operations for extended DHCP local server and extended DHCP relay agent processes.</p> <p>This statement replaces the deprecated <b>traceoptions</b> statements at the <b>[edit forwarding-options dhcp-relay]</b> and <b>[edit system services dhcp-local-server]</b> hierarchy levels.</p>
<div style="display: flex; align-items: center;">  <div> <p><b>NOTE:</b> Traceoptions does not differentiate between a logical system and tenant system, and can be configured under the root logical system.</p> </div> </div>	
<b>Options</b>	<p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 <b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all events.</li> <li>• <b>auth</b>—Trace authentication events.</li> <li>• <b>database</b>—Trace database events.</li> <li>• <b>fwd</b>—Trace firewall process events.</li> </ul>

- **general**—Trace miscellaneous events.
- **ha**—Trace high availability-related events.
- **interface**—Trace interface operations.
- **io**—Trace I/O operations.
- **liveness-detection**—Trace liveness detection operations.
- **packet**—Trace packet and option decoding operations.
- **performance**—Trace performance measurement operations.
- **profile**—Trace profile operations.
- **rpd**—Trace routing protocol process events.
- **rtsock**—Trace routing socket operations.
- **security-persistence**—Trace security persistence events.
- **session-db**—Trace session database events.
- **state**—Trace changes in state.
- **statistics**—Trace baseline statistics.
- **ui**—Trace user interface operations.

**level**—Level of tracing to perform; also known as severity level. The option you configure enables tracing of events at that level and all higher (more restrictive) levels. You can specify any of the following levels:

- **all**—Match messages of all levels.
- **error**—Match error messages.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages. This is the lowest (least restrictive) severity level; when you configure **verbose**, messages at all higher levels are traced. Therefore, the result is the same as when you configure **all**.
- **warning**—Match warning messages.

**Default:** **error**

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access, allowing only the user **root** and users who have the Junos OS **maintenance** permission to access the trace files.

**size** *maximum-file-size*—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (*maximum-file-sizek*), megabytes (*maximum-file-sizem*), or gigabytes (*maximum-file-sizeg*). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Range:** 10,240 through 1,073,741,824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

<b>Required Privilege</b>	trace—To view this statement in the configuration.
<b>Level</b>	trace-control—To add this statement to the configuration.

## traceoptions (DHCP Server)

---

Syntax	<pre>traceoptions {   file <i>filename</i> &lt;files <i>number</i>&gt; &lt;match <i>regex</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable       no-world-readable&gt;;   flag <i>flag</i>; }</pre>
Hierarchy Level	[edit system services <a href="#">dhcp</a> ]
Release Information	Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Define tracing operations for DHCP processes.
Options	<p><b>file <i>filename</i></b>—Name of the file that receives the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b><i>trace-file</i></b> reaches its maximum size, it is renamed <b><i>trace-file.0</i></b>, then <b><i>trace-file.1</i></b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option and a filename.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>all</b>—All tracing operations</li><li>• <b>binding</b>—Trace binding operations</li><li>• <b>config</b>—Log reading of configuration</li><li>• <b>conflict</b>—Trace user-detected conflicts for IP addresses</li><li>• <b>event</b>—Trace important events</li><li>• <b>ifdb</b>—Trace interface database operations</li><li>• <b>io</b>— Trace I/O operations</li><li>• <b>lease</b>—Trace lease operations</li><li>• <b>main</b>—Trace main loop operations</li><li>• <b>misc</b>— Trace miscellaneous operations</li><li>• <b>packet</b>—Trace DHCP packets</li></ul>

- **options**—Trace DHCP options
- **pool**—Trace address pool operations
- **protocol**—Trace protocol operations
- **rtsock**—Trace routing socket operations
- **scope**—Trace scope operations
- **signal**—Trace DHCP signal operations
- **trace**—All tracing operations
- **ui**—Trace user interface operations

**match *regex***—(Optional) Refine the output to include lines that contain the regular expression.

- **all**—All tracing operations
- **binding**—Trace binding operations
- **config**—Log reading of configuration
- **conflict**—Trace user-detected conflicts for IP addresses
- **event**—Trace important events
- **ifdb**—Trace interface database operations
- **io**—Trace I/O operations
- **lease**—Trace lease operations
- **main**—Trace main loop operations
- **match *regex***—Refine the output to include lines that contain the regular expression.
- **misc**—Trace miscellaneous operations
- **packet**—Trace DHCP packets
- **options**—Trace DHCP options
- **pool**—Trace address pool operations
- **protocol**—Trace protocol operations
- **rtsock**—Trace routing socket operations
- **scope**—Trace scope operations
- **signal**—Trace DHCP signal operations
- **trace**—All tracing operations
- **ui**—Trace user interface operations

**no-world-readable**—(Optional) Disable unrestricted file access.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option and filename.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
---------------------------------	-------------------------------------------------------------------------------------------------------------------

## traceoptions (LLDP)

<b>Syntax</b>	<pre> traceoptions {   file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt; &lt;no-stamp&gt;   &lt;replace&gt;;   flag <i>flag</i> &lt;disable&gt;; } </pre>
<b>Hierarchy Level</b>	[edit protocols <a href="#">lldp</a> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Define tracing operations for the Link Layer Discovery Protocol (LLDP). You can trace messages under LLDP for LLDP and PTOPO MIBs.
	<div>  <p><b>NOTE:</b> The traceoptions statement is not supported on the QFX3000 QFabric system.</p> </div>
<b>Default</b>	Tracing operations are disabled.
<b>Options</b>	<p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum <b>xk</b> to specify KB, <b>xm</b> to specify MB, or <b>xg</b> to specify GB number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—All tracing operations.</li> <li>• <b>configuration</b>—Trace configuration operations.</li> <li>• <b>interface</b>—Trace interface update events.</li> <li>• <b>netbios</b>—Trace NetBIOS events.</li> </ul>

- **packet**—Trace packet events.
- **rtsock**—Trace routing socket operations.
- **snmp**—Trace SNMP configuration operations.
- **vlan**—Trace VLAN update events.

**no-stamp**—(Optional) Do not timestamp the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**replace**—(Optional) Replace an existing trace file if there is one rather than appending output to it.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**world-readable**—(Optional) Enable unrestricted file access.

**NOTE:** The **traceoptions** statement is not supported on the QFX3000 QFabric system.

---

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## traceoptions (Outbound SSH)

<b>Syntax</b>	<pre> traceoptions {   file {     filename ;     files <i>number</i>;     match <i>regular-expression</i>;     size <i>maximum-file-size</i>;     (world-readable   no-world-readable);   }   flag <i>flag</i>;   no-remote-trace; } </pre>
<b>Hierarchy Level</b>	[edit system services outbound-ssh]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.4.
<b>Description</b>	Set the trace options.
<b>Options</b>	<ul style="list-style-type: none"> <li><b>file</b>—Configure the trace file information. <ul style="list-style-type: none"> <li><b>filename</b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code>. By default, the name of the file is the name of the process being traced.</li> <li><b>files <i>number</i></b>—Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed to <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. The oldest archived file is overwritten.</li> </ul> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option and a filename.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 10 files</p> </li> <li><b>match <i>regular-expression</i></b>—Refine the output to include lines that contain the regular expression.</li> <li><b>size <i>maximum-file-size</i></b>—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named <b>trace-file</b> reaches this size, it is renamed <b>trace-file.0</b>. When <b>trace-file</b> again reaches its maximum size, <b>trace-file.0</b> is renamed <b>trace-file.1</b> and <b>trace-file</b> is renamed <b>trace-file.0</b>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</li> </ul> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option and a filename.</p>

**Syntax:** x K to specify KB, x m to specify MB, or x g to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

- **world-readable | no-world-readable**—By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.
- **flag**—Specify the tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags.
  - **all**—Trace all events.
  - **configuration**—Trace configuration events.
  - **connectivity**—Trace TCP connection handling.
- **no-remote-trace**—Disable remote tracing.

<b>Required Privilege</b>	trace—To view this statement in the configuration.
<b>Level</b>	trace-control—To add this statement to the configuration.

------------------------------	-----------------------------------------------------------------------------------------

## traceoptions (SBC Configuration Process)

<b>Syntax</b>	<pre> traceoptions {   file <i>filename</i> &lt;files <i>number</i>&gt; &lt;match <i>regex</i>&gt; &lt;size <i>size</i>&gt;     &lt;world-readable   no-world-readable&gt;;   flag <i>flag</i>; } </pre>
<b>Hierarchy Level</b>	[edit system processes sbc-configuration-process]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.5.</p> <p>Statement introduced in Junos OS Release 9.5 for EX Series switches.</p>
<b>Description</b>	Configure trace options for the session border controller (SBC) process of the border signaling gateway (BSG).
<b>Options</b>	<p><b>file <i>filename</i></b>—Name of the file that receives the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the directory <b>/var/log</b>. You can include the following file options:</p> <ul style="list-style-type: none"> <li><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</li> </ul> <p>If you specify a maximum number of files, you must also specify a maximum file size with the <b>size</b> option and a filename.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <ul style="list-style-type: none"> <li><b>match <i>regex</i></b>—(Optional) Refine the output to include lines that contain the regular expression.</li> <li><b>no-world-readable</b>—(Optional) Disable unrestricted file access.</li> <li><b>size <i>size</i></b>—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named <b>trace-file</b> reaches this size, it is renamed <b>trace-file.0</b>. When the trace-file again reaches its maximum size, <b>trace-file.0</b> is renamed <b>trace-file.1</b> and <b>trace-file</b> is renamed <b>trace-file.0</b>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and filename.</li> </ul> <p><b>Syntax:</b> <b>xk</b> to specify KB, <b>xm</b> to specify MB, or <b>xg</b> to specify GB.</p> <p><b>Range:</b> 10 KB through 1 GB</p> <p><b>Default:</b> 128 KB</p>

- **world-readable**—(Optional) Enable unrestricted file access.

**flag flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all trace-level**—Trace all SBC process operations.
- **common trace-level**—Trace common events.
- **configuration trace-level**—Trace configuration events.
- **device-monitor trace-level**—Trace device monitor events.
- **ipc trace-level**—Trace IPC events.
- **memory—pool trace-level**—Trace memory pool events.
- **trace-level**—Trace level options are related to the severity of the event being traced. When you choose a trace level, messages at that level and higher levels are captured. Enter one of the following trace levels as the **trace-level**:
  - **debug**—Log all code flow of control.
  - **error**—Log failures with a short-term effect.
  - **info**—Log summary for normal operations, such as the policy decisions made for a call.
  - **trace**—Log program trace START and EXIT macros.
  - **warning**—Log failure recovery events or failure of an external entity.
- **ui trace-level**—Trace user interface operations.

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

## transfer-interval

<b>Syntax</b>	<code>transfer-interval <i>minutes</i>;</code>
<b>Hierarchy Level</b>	[edit accounting-options <a href="#">file</a> <i>filename</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify the length of time the file remains open and receives new statistics before it is closed and transferred to an archive site.
<b>Options</b>	<b><i>minutes</i></b> —Time the file remains open and receives new statistics before it is closed and transferred to an archive site. <b>Range:</b> 5 through 2880 minutes <b>Default:</b> 30 minutes
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Transfer Interval of the File</i></li></ul>

## transfer-interval (Configuration)

---

<b>Syntax</b>	<code>transfer-interval <i>interval</i>;</code>
<b>Hierarchy Level</b>	[edit system archival configuration]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the router or switch to periodically transfer its currently active configuration to an archive site.
<b>Options</b>	<i>interval</i> —Interval at which to transfer the current configuration to an archive site. <b>Range:</b> 15 through 2880 minutes

**NOTE:** The [edit system archival] hierarchy is not available on QFabric systems.

---

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Periodic Transfer of the Active Configuration to an Archive Site</i></li><li>• <i>archive</i></li><li>• <a href="#">configuration on page 853</a></li><li>• <a href="#">transfer-on-commit on page 1459</a></li></ul>

## transfer-on-commit

<b>Syntax</b>	<code>transfer-on-commit;</code>
<b>Hierarchy Level</b>	<code>[edit system archival configuration]</code>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.</p>
<b>Description</b>	<p>Configure the router or switch to transfer its currently active configuration to an archive site each time you commit a candidate configuration.</p> <p>.....</p> <p> <b>NOTE:</b> When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (") and enclose the IPv6 host address in brackets ([ ]). For example, <code>"ftp://username&lt;:password&gt;@[ipv6-host-address]&lt;:port&gt;/url-path"</code> .</p> <p>.....</p> <p> <b>NOTE:</b> The <code>[edit system archival]</code> hierarchy is not available on QFabric systems.</p> <p>.....</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the Transfer of the Currently Active Configuration When a Configuration Is Committed</i></li> <li>• <i>archive</i></li> <li>• <a href="#">configuration on page 853</a></li> <li>• <a href="#">transfer-interval on page 1458</a></li> </ul>

## transmit-interval

<b>Syntax</b>	<pre>transmit-interval {   threshold milliseconds;   minimum-interval milliseconds; }</pre>
<b>Hierarchy Level</b>	<p>[edit system services dhcp-local-server liveness-detection method <a href="#">bfd</a>],  [edit system services dhcp-local-server dhcpv6 liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay liveness-detection method <a href="#">bfd</a>], [edit forwarding-options dhcp-relay dhcpv6 liveness-detection method <a href="#">bfd</a>],  [edit system services dhcp-local-server group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],  [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method <a href="#">bfd</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.1.  Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	<p>Configure the Bidirectional Forwarding Detection (BFD) transmit interval.</p> <p>The remaining statements are explained separately. Search for a statement in <a href="#">CLI Explorer</a> or click a linked statement in the Syntax section for details.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.  routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Configuring Group Liveness Detection with BFD for DHCP Local Server Clients</i></li> <li>• <a href="#">Example: Configuring Global Liveness Detection with BFD for DHCP Relay Agent Clients on page 585</a></li> </ul>

## transmit-period

<b>Syntax</b>	<code>transmit-period <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit protocols <code>dot1x authenticator interface (802.1X)</code> (all   [ <i>interface-name</i> ])
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series.
<b>Description</b>	For 802.1X authentication, how long the port waits before retransmitting the initial EAPOL PDUs to the supplicant.
<b>Default</b>	30 seconds
<b>Options</b>	<i>seconds</i> —Number of seconds the port waits before retransmitting the initial EAPOL PDUs to the supplicant. <b>Range:</b> 1 through 65,535 seconds <b>Default:</b> 30 seconds
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring 802.1X Interface Settings (CLI Procedure) on page 280</a></li> <li>• <a href="#">802.1X for Switches Overview on page 277</a></li> </ul>

## transmit-delay

---

Syntax	<code>transmit-delay <i>seconds</i>;</code>
Hierarchy Level	[edit protocols <a href="#">lldp</a> ]
Release Information	Statement introduced in Junos OS Release 11.1 for EX Series switches.
Description	<p>Specify the number of seconds the device delays before sending advertisements to neighbors after a change is made in a TLV (type, length, or value) element in the Link Layer Discovery Protocol (LLDP) or in the state of the local system, such as a change in hostname or management address. You can set this value to reduce the delay in notifying neighbors of a change in the local system.</p> <p>The <b>advertisement-interval</b> value must be greater than or equal to four times the <b>transmit-delay</b> value, or an error will be returned when you attempt to commit the configuration.</p>
Default	Enabled
Options	<p><b>seconds</b>—Delay after a change to the local TLVs or system state before LLDP advertisements are sent.</p> <p><b>Range:</b> 1 through 8192 seconds</p> <p><b>Default:</b></p> <ul style="list-style-type: none"><li>• 2 seconds if the <b>advertisement-interval</b> value is set to 8 seconds or more</li><li>• 1 second if the <b>advertisement-interval</b> value is set to less than 8 seconds</li></ul>
Required Privilege Level	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">show lldp on page 1712</a></li><li>• <a href="#">Configuring LLDP (CLI Procedure) on page 432</a></li><li>• <a href="#">Understanding LLDP and LLDP-MED on EX Series Switches on page 438</a></li></ul>

## trap-group

**List of Syntax**    Syntax: MX, M, T, ACX and PTX Series routers, OCX1100, EX and QFX Series Switches and SRX and vSRX firewalls on page 1463  
 Syntax: QFX and EX Series Switches and OCX1100 on page 1463

Syntax: MX, M, T, ACX and PTX Series routers, OCX1100, EX and QFX Series Switches and SRX and vSRX firewalls

```
trap-group group-name {
  categories {
    category;
  }
  destination-port port-number;
  routing-instance instance;
  targets {
    address;
  }
  version (all | v1 | v2);
}
```

Syntax: QFX and EX Series Switches and OCX1100

```
trap-group group-name {
  categories {
    category;
  }
  destination-port port-number;
  targets {
    address;
  }
}
```

**Hierarchy Level**    [edit snmp]

**Release Information**    Statement introduced before Junos OS Release 7.4 for MX, M, T, ACX and PTX Series routers, and SRX and vSRX firewalls.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.1 for QFX Series switches.  
 Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.

**Description**    Create a named group of hosts to receive the specified trap notifications. The name of the trap group is embedded in SNMP trap notification packets as one variable binding (varbind) known as the community name. At least one trap group must be configured for SNMP traps to be sent.

**Options**    *group-name*—Name of the trap group. If the name includes spaces, enclose it in quotation marks (" ").

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege** snmp—To view this statement in the configuration.  
**Level** snmp-control—To add this statement to the configuration.

**Related** • *Configuring SNMP Trap Groups*  
**Documentation** • *Configuring SNMP Trap Groups*

## trap-options

<b>List of Syntax</b>	<p>Syntax: MX, M, T, ACX and PTX Series Routers, EX Series Switches and SRX Firewalls on page 1465</p> <p>QFX Series Switches, EX4600, OCX1100 on page 1465</p>
<b>Syntax: MX, M, T, ACX and PTX Series Routers, EX Series Switches and SRX Firewalls</b>	<pre> trap-options {   agent-address outgoing-interface;   context-oid;   enterprise-oid;   logical-system <i>logical-system-name</i> {     routing-instance <i>routing-instance-name</i> {       source-address <i>address</i>;     }   }   routing-instance <i>routing-instance-name</i> {     source-address <i>address</i>;   } } </pre>
<b>QFX Series Switches, EX4600, OCX1100</b>	<pre> trap-options {   agent-address outgoing-interface;   source-address <i>address</i>; } </pre>
<b>Hierarchy Level</b>	[edit snmp]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4 for MX, M, T, ACX and PTX Series Routers, and SRX Firewalls.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p><b>context-oid</b> option introduced in Junos OS Release 17.1.</p>
<b>Description</b>	<p>Using SNMP trap options, you can set the source address of every SNMP trap packet sent by the router or switch to a single address, regardless of the outgoing interface. In addition, you can set the agent address of each SNMPv1 trap. For more information about the contents of SNMPv1 traps, see RFC 1157.</p>
<b>Default</b>	Disabled
<b>Options</b>	<p><b>context-oid</b>—Add context oid in varbind of all traps originating from non-default logical system and routing instance. If your network management system is not able to handle prefixes such as &lt;routing-instance name&gt;@&lt;trap-group-name&gt; or &lt;logical-system name&gt;/&lt;routing-instance name&gt;@&lt;trap-group-name&gt;, setting the</p>

**context-oid** configuration statement will send only the **<trap-group-name>** and add **<logical-system name>/<routing-instance name>** as an additional varbind.

The remaining statements are explained separately. See [CLI Explorer](#).

<b>Required Privilege</b>	snmp—To view this statement in the configuration.
<b>Level</b>	snmp-control—To add this statement to the configuration.

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring SNMP Trap Options</i></li></ul>

## tries-before-disconnect

---

<b>Syntax</b>	<code>tries-before-disconnect <i>number</i>;</code>
<b>Hierarchy Level</b>	<code>[edit system login <a href="#">retry-options</a>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.0.
<b>Description</b>	Configure the maximum number of times the user is allowed to enter a password to attempt to log in to the router through SSH or Telnet.
<b>Options</b>	<p><i>number</i>—Maximum number of times a user is allowed to attempt to enter a password to log in through SSH or Telnet.</p> <p><b>Range:</b> 1 through 10</p> <p><b>Default:</b> 10</p>
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Limiting the Number of User Login Attempts for SSH and Telnet Sessions on page 58</a></li><li>• <a href="#">retry-options on page 1311</a></li></ul>

## trust-option-82

<b>Syntax</b>	<code>trust-option-82;</code>
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay <a href="#">overrides</a>],  [edit forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],  [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],  [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],  [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],  [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],  [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.3.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	<p>Enable processing of DHCP client packets that have a gateway IP address (giaddr) of 0 (zero) and contain option 82 information. By default, the DHCP relay agent treats such packets as if they originated at an untrusted source, and drops them without further processing.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Enable Processing of Untrusted Packets So Option 82 Information Can Be Used on page 548</a></li> <li>• <a href="#">Overriding the Default DHCP Relay Configuration Settings on page 533</a></li> </ul>

## trusted-key

---

<b>Syntax</b>	<code>trusted-key [key-numbers];</code>
<b>Hierarchy Level</b>	<code>[edit system ntp]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	For NTP, configure the keys you are allowed to use when you configure the SRX Series device to synchronize its time with other systems on the network.
<b>Options</b>	<b>key-numbers</b> —One or more key numbers. Each key can be any 32-bit unsigned integer except 0.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">ntp on page 1175</a></li></ul>

## uac-policy

---

<b>Syntax</b>	<code>uac-policy;</code>
<b>Hierarchy Level</b>	<code>[edit ethernet-switching-options]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2 for EX Series switches.
<b>Description</b>	Configure Junos Pulse Access Control Service as the access policy to authenticate and authorize users connected to the switch for admission to the network and for access to protected network resources.
<b>Default</b>	The Access Control Service access policy is disabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring an EX Series Switch to Use Junos Pulse Access Control Service for Network Access Control (CLI Procedure) on page 389</a></li><li>• <a href="#">Configuring the EX Series Switch for Captive Portal Authentication with Junos Pulse Access Control Service (CLI Procedure) on page 392</a></li></ul>

## uac-service

<b>Syntax</b>	<pre>uac-service {   timeout {   timeout-action {</pre>
<b>Hierarchy Level</b>	[edit system processes]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2 for EX Series switches.
<b>Description</b>	Configure Junos Pulse Access Control Service as one of the system processes.
<b>Default</b>	Junos Pulse Access Control Service process is disabled.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring an EX Series Switch to Use Junos Pulse Access Control Service for Network Access Control (CLI Procedure) on page 389</a></li><li>• <a href="#">Configuring the EX Series Switch for Captive Portal Authentication with Junos Pulse Access Control Service (CLI Procedure) on page 392</a></li><li>• <a href="#">Understanding Centralized Network Access Control and EX Series Switches on page 387</a></li></ul>

## uac-service

---

Syntax	<pre>uac-service {   command <i>binary-file-path</i>;   disable;   failover (alternate-media   other-routing-engine); }</pre>
Hierarchy Level	[edit system processes]
Release Information	Statement introduced in Junos OS Release 8.5.
Description	Specify the unified access control daemon process.
Options	<ul style="list-style-type: none"><li>• <b>command <i>binary-file-path</i></b>—Path to the binary process.</li><li>• <b>disable</b>—Disable the unified access control daemon process.</li><li>• <b>failover</b>—Configure the device to reboot if the software process fails four times within 30 seconds, and specify the software to use during the reboot.<ul style="list-style-type: none"><li>• <b>alternate-media</b>—Configure the device to switch to backup media that contains a version of the system if a software process fails repeatedly.</li><li>• <b>other-routing-engine</b>—Instruct the secondary Routing Engine to take mastership if a software process fails. If this statement is configured for a process, and that process fails four times within 30 seconds, then the device reboots from the secondary Routing Engine.</li></ul></li></ul>
Required Privilege Level	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"><li>• <i>Firewall User Authentication Overview</i></li></ul>

---

## uid

---

<b>Syntax</b>	<code>uid <i>uid-value</i>;</code>
<b>Hierarchy Level</b>	[edit system login <a href="#">user</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Numeric identifier associated with the user account name, either assigned by an administrator or assigned automatically when you commit the user configuration. It is used by applications that request numeric identifiers, such as some RADIUS queries or secure applications such as flow-tap monitoring.
<b>Options</b>	<b><i>uid-value</i></b> —Number associated with the login account. This value must be unique on the router or switch. <b>Range:</b> 100 through 64000
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Junos OS User Accounts by Using a Configuration Group on page 74</a></li></ul>

## unattended-boot

---

Syntax	unattended-boot;
Hierarchy Level	[edit <a href="#">system</a> ]
Release Information	Statement introduced in Junos OS Release 13.2X51-D20 for EX Series switches.
Description	<p>Set the switch to unattended mode for U-Boot to prevent unauthorized access to the system before the JUNOS OS login prompt appears. In unattended mode, access to the loader CLI is blocked, as well as recovery mechanisms such as password recovery by using single-user mode and booting the switch by using a USB flash drive. In order to access the CLI in U-Boot mode, the user must enter a boot-loader password that has been previously configured.</p> <div><p><b>NOTE:</b> If the root password is lost while the switch is in unattended mode, the switch must be reset to the factory default configuration using the LCD panel. For more information see <i>Reverting to the Default Factory Configuration for the EX Series Switch</i>.</p></div>
Default	Unattended mode is not enabled by default.
Required Privilege Level	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Using Unattended Mode for U-Boot to Prevent Unauthorized Access on page 268</a></li><li>• <a href="#">boot-loader-authentication on page 809</a></li></ul>

## unified-access-control

<b>Syntax</b>	<pre> unified-access-control {   infranet-controller <i>hostname</i> {     address <i>ip-address</i>;     interface <i>interface-name</i>;     password <i>password</i>;     port <i>port-number</i>;   } </pre>
<b>Hierarchy Level</b>	[edit services]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.2 for EX Series switches.
<b>Description</b>	<p>Configure Junos Pulse Access Control Service to authenticate and authorize users connected to the switch for admission to the network and for access to protected network resources.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Default</b>	Junos Pulse Access Control Service is disabled.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring an EX Series Switch to Use Junos Pulse Access Control Service for Network Access Control (CLI Procedure) on page 389</a></li> <li>• <a href="#">Configuring the EX Series Switch for Captive Portal Authentication with Junos Pulse Access Control Service (CLI Procedure) on page 392</a></li> </ul>

## update-interval

<b>Syntax</b>	<code>update-interval <i>minutes</i>;</code>
<b>Hierarchy Level</b>	<code>[edit access profile <i>profile-name</i> <b>accounting</b>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.1. Statement introduced in Junos OS Release 9.1 for EX Series switches.
<b>Description</b>	<p>Enable interim accounting updates and configure the amount of time that the router or switch waits before sending a new accounting update.</p> <p>Interim accounting updates are included in the exchange of messages between the client and the accounting server. In RADIUS accounting, the client is the network access server (NAS), which can be the router or switch. The NAS sends Accounting-Request messages to the server, which acknowledges receipt of the requests with Accounting-Response messages. Interim accounting updates are sent in Accounting-Request packets with the Acct-Status-Type attribute set to Interim-Update.</p> <p>When a user is authenticated, the authentication server issues an Access-Accept message in response to a successful Access-Request message. The interval between interim updates can be configured directly on the server using the Acct-Interim-Interval attribute of the Access-Accept message. However, if the update interval is configured on the NAS using <b>update-interval</b>, then the locally configured value overrides the value found in an Access-Accept message from the server.</p>
	<p> <b>NOTE:</b> All information in an interim update message is cumulative from the beginning of the session, not from the last interim update message.</p>
<b>Default</b>	No interim updates are sent from the client to the accounting server.
<b>Options</b>	<p><b>minutes</b>—Amount of time between updates, in minutes. All values are rounded to the next higher multiple of 10. For example, the values 811 through 819 are all accepted by the CLI, but are all rounded up to 820.</p> <p><b>Range:</b> 10 through 1440 minutes</p>
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Configuring Authentication and Accounting Parameters for Subscriber Access</i></li> <li><i>Configuring Immediate Interim Accounting Updates to RADIUS in Response to ANCP Notifications</i></li> </ul>

## update-router-advertisement

<b>Syntax</b>	<code>update-router-advertisement (interface <i>interface-name</i>);</code>
<b>Hierarchy Level</b>	<pre>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> dhcpv6-client] [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 dhcpv6-client] [edit tenants <i>tenant-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet6 dhcpv6-client]</pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.1X45-D10.</p> <p>The <b>logical-systems</b> and <b>tenant</b> options are introduced in Junos OS Release 18.4R1.</p>
<b>Description</b>	Specify the interface used to delegate prefixes.
<b>Options</b>	<b>interface <i>interface-name</i></b> —Interface on which to delegate prefixes
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	

## update-server

---

<b>Syntax</b>	update-server;
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet dhcp]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5 for J Series devices. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 9.2 for SRX Series devices. Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.
<b>Description</b>	Propagate TCP/IP settings learned from an external DHCP server to the DHCP server running on the switch, router, or device.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring a DHCP Client (CLI Procedure) on page 497</a></li><li>• <a href="#">Example: Configuring the Device as a DHCP Client on page 630</a></li><li>• <i>interfaces</i></li><li>• <i>unit</i></li><li>• <i>family</i></li></ul>

## update-server (dhcp-client)

<b>Syntax</b>	update-server;
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> dhcp-client]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X44-D10 for SRX300, SRX320, SRX340, SRX345, SRX550M, and SRX1500 devices. Starting with Junos OS Release 17.3R1, on all SRX Series devices and vSRX instances, the CLI option <b>dhcp-clinet</b> at [edit interfaces <b>interface-name</b> unit <b>logical-unit-number</b> family <b>inet</b> ] hierarchy is changed to <b>dhcp</b> to keep consistent with other Junos platforms. There is no change in the functionality with the changed CLI option <b>dhcp</b> .
<b>Description</b>	Propagate DHCP options to a local DHCP server.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	

## update-server (dhcpv6-client)

<b>Syntax</b>	update-server;
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> dhcpv6-client]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X45-D10 for SRX300, SRX320, SRX340, SRX550M, and SRX1500 devices.
<b>Description</b>	Propagate TCP/IP settings to the DHCPv6 server.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	

## use-interface

---

<b>Syntax</b>	<code>use-interface-description {logical  device};</code>
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> dhcp-client client-identifier]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X44-D10 for SRX300, SRX320, SRX340, SRX345, SRX550M, and SRX1500 devices.
<b>Description</b>	The description configured at the physical or logical interface level is used for client identification.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	

## use-interface-description

Syntax	<code>use-interface-description (logical   device);</code>
Hierarchy Level	<pre>[edit forwarding-options dhcp-relay <b>dhcpv6</b> (<b>relay-agent-interface-id</b>   relay-agent-remote-id)], [edit forwarding-options dhcp-relay <b>dhcpv6</b> group <i>group-name</i> (<b>relay-agent-interface-id</b>   relay-agent-remote-id)], [edit forwarding-options dhcp-relay relay-option-82 (<b>circuit-id</b>   remote-id)], [edit forwarding-options dhcp-relay group <i>group-name</i> relay-option-82 (<b>circuit-id</b>   remote-id)], [edit logical-systems <i>logical-system-name</i> ... forwarding-options dhcp-relay dhcpv6 (<b>relay-agent-interface-id</b>   relay-agent-remote-id)], [edit logical-systems <i>logical-system-name</i> ... forwarding-options dhcp-relay ... relay-option-82 (<b>circuit-id</b>   remote-id)], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 (<b>relay-agent-interface-id</b>   relay-agent-remote-id)], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay ... relay-option-82 (<b>circuit-id</b>   remote-id)], [edit vlans <i>vlan-name</i> forwarding-options dhcp-security dhcpv6-options option-18], [edit vlans <i>vlan-name</i> forwarding-options dhcp-security dhcpv6-options option-37]</pre>
Release Information	<p>Statement introduced in Junos OS Release 9.6.</p> <p>Support at the <code>[edit ... <b>dhcpv6</b>]</code> hierarchy levels introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.3 for EX Series switches.</p> <p>Support at the <code>[edit ... <b>relay-agent-remote-id</b>]</code> and <code>[edit ... <b>remote-id</b>]</code> hierarchy levels introduced in Junos OS Release 14.1.</p> <p>Support at the <code>[edit vlans <i>vlan-name</i> dhcp-security dhcpv6-options option-18]</code> and <code>[edit vlans <i>vlan-name</i> dhcp-security dhcpv6-options option-37]</code> hierarchy levels introduced in Junos OS Release 14.1X53-D10 for EX Series switches.</p>
Description	<p>Use the textual interface description instead of the interface identifier in the DHCP base option 82 Agent Circuit ID (suboption 1) or Agent Remote ID (suboption 2) information, or in the DHCPv6 option 18 (Relay Agent Interface ID) or option 37 (Relay Agent Remote ID) information in DHCP packets that the DHCP relay agent sends to a DHCP server.</p>

**NOTE:** For integrated routing and bridging (IRB) interfaces, the option 82 field must be able to uniquely identify the incoming interface based on either the Agent Circuit ID or Agent Remote ID. You can modify the information in the textual interface description to match the raw IFD (physical interface without a subunit) name and configure the option 82 field to use the interface description.

The textual description is configured using the **description** statement at the `[edit interfaces interface-name]` hierarchy level. If you specify that the textual description be used and no description is configured for the interface, DHCP relay defaults to using the Layer 2

interface name. When you use the interface description rather than the interface name, the interface description has to be specified under interface unit ("set interfaces ge-0/0/0 unit 0 description "client"). If you do not do this, then the interface name is used.

In the case of integrated routing and bridging (IRB) interfaces, the textual description of the Layer 2 interface is used instead of the IRB interface. If there is no description configured, the Layer 2 logical interface name is used. To include the IRB interface description instead of the Layer 2 interface description, configure the **use-interface-description** and the **no-vlan-interface-name** statements. If no description is configured for the IRB interface, DHCP relay defaults to using the IRB interface name.

**NOTE:** The **use-interface-description** statement is mutually exclusive with the **use-vlan-id** statement.

---

If you specify the textual interface description, rather than accepting the default syntax, the identification is for packets returned from the server, and only for instances where that identification would be required by the DHCP relay, such as a stateless pass-through.

**NOTE:** By default, DHCP relay accepts a maximum of 253 ASCII characters. If the textual interface description exceeds 253 characters, DHCP relay drops the packet, which results in the DHCP client failing to bind.

---

**Options**    **logical**—Use the textual description that is configured for the logical interface.  
**device**—Use the textual description that is configured for the device interface.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                         interface-control—To add this statement to the configuration.

Description	<p>Specify the dynamic profile to configure as the primary dynamic profile. The primary dynamic profile is instantiated when the first subscriber logs in. Subsequent subscribers are not assigned the primary dynamic profile; instead, they are assigned the dynamic profile specified for the interface. When the first subscriber logs out, the next subscriber that logs in is assigned the primary dynamic profile.</p> <p>Use the statement at the [edit ... <b>dhcpv6</b>] hierarchy levels to configure DHCPv6 support.</p> <p>EX Series switches do not support DHCPv6.</p>

**Options**    *primary-profile-name*—Name of the dynamic profile to configure as the primary dynamic profile

**Required Privilege**    system—To view this statement in the configuration.

**Level**    system-control—To add this statement to the configuration.

**Related Documentation**    • *Attaching Dynamic Profiles to DHCP Subscriber Interfaces or DHCP Client Interfaces*

## use-vlan-id

<b>Syntax</b>	<code>use-vlan-id;</code>
<b>For Platforms with Enhanced Layer 2 Software (ELS)</b>	<code>[edit forwarding-options helpers bootp dhcp-option82-circuit-id]</code> <code>[edit forwarding-options helpers bootp interface <i>interface-name</i> dhcp-option82-circuit-id]</code>
<b>For MX Series Platforms</b>	<code>[edit bridge-domains <i>bridge-domain-name</i> forwarding-options dhcp-security option-82 circuit-id]</code>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.3 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p>Hierarchy level <code>[edit vlans <i>vlan-name</i> forwarding-options dhcp-security]</code> introduced in Junos OS Release 13.2X50-D10. (See <i>Using the Enhanced Layer 2 Software CLI</i> for information about ELS.)</p> <p>Hierarchy level <code>[edit bridge-domains <i>bridge-domain-name</i> forwarding-options dhcp-security]</code> introduced in Junos OS Release 14.1 for the MX Series.</p>

**NOTE:** The EX Series switches that support the `use-vlan-id` statement are the EX4300, EX4600, and EX9200 switches.

**Description** Use the VLAN ID rather than the VLAN name (the default) in the circuit ID or remote ID value in the DHCP option 82 information.

**NOTE:** The `use-vlan-id` statement is mutually exclusive with the `use-interface-description` and `no-vlan-interface-name` statements.

The `use-vlan-id` statement only applies to interfaces in a bridge domain. The format of the Agent Circuit ID or Agent Remote ID information for Fast Ethernet or Gigabit Ethernet interfaces is as follows:

```
(fe | ge)-fpc/pic/port.subunit:svlan_id-vlan_id
```

**NOTE:** The *subunit* is required and used to differentiate the interface for remote systems, and *svlan\_id-vlan\_id* represents the VLANs associated with the bridge domain.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Setting Up DHCP Option 82 Using the Same VLAN</i></li> <li>• <i>Example: Setting Up DHCP Option 82</i></li> <li>• RFC 3046, <i>DHCP Relay Agent Information Option</i>, at <a href="http://tools.ietf.org/html/rfc3046">http://tools.ietf.org/html/rfc3046</a>.</li> </ul>

## user (Access)

<b>Syntax</b>	<pre> user username {   authentication {     (encrypted-password "password"   plain-text-password);     load-key-file URL;     remote-debug-permission (qfabric-admin   qfabric-operator   qfabric-user);     ssh-dsa "public-key" &lt;from hostname&gt;;     ssh-rsa "public-key" &lt;from hostname&gt;;   }   class class-name;   full-name "complete-name";   uid uid-value; } </pre>
<b>Hierarchy Level</b>	[edit system login]
<b>Release Information</b>	Statement introduced in Junos OS Release 14.1X53-D20 for OCX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure access permission for individual users.
<b>Options</b>	The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Junos OS User Accounts</i></li> <li>• <a href="#">class on page 838</a></li> </ul>

## user (Access)

Syntax	<pre> user username {   authentication {     cli {       prompt name;     }     class class-name;     (encrypted-password "password"   plain-text-password);     full-name complete-name;     load-key-file URL filename;     ssh-dsa "public-key" &lt;from hostname&gt;;     ssh-rsa "public-key" &lt;from hostname&gt;;     uid uid-value;   } } </pre>
Hierarchy Level	[edit system <a href="#">login</a> ]
Release Information	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
Description	Configure access permission for individual users. Starting in Junos OS Release 18.3R1, the <b>ssh-dsa</b> hostkey algorithm is deprecated— rather than immediately removed—to provide backward compatibility and a chance to bring your configuration into compliance with the new configuration.
Options	The remaining statements are explained separately. Search for a statement in <a href="#">CLI Explorer</a> or click a linked statement in the Syntax section for details.
Required Privilege Level	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>

## user-defined-option-82

<b>Syntax</b>	<code>user-defined-option-82 <i>string</i>;</code>
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay group <i>group-name</i> interface <i>interface-name</i> overrides user-defined-option82 <i>string</i>],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> overrides user-defined-option82 <i>string</i>],</p> <p>[edit forwarding-options dhcp-relay overrides user-defined-option82 <i>string</i>]</p>
<b>Release Information</b>	Statement introduced in Junos OS Release 17.2 for QFX Series switches.
<b>Description</b>	<p>Configure a custom text string to use as the interface description in the DHCP option 82 Agent Circuit ID (suboption 1) information. This text string is defined independently of the interface description that is configured using the <b>description</b> statement at the [edit <b>interfaces</b> <i>interface-name</i>] hierarchy level.</p> <p>The custom text string is configured using the <b>user-defined-option-82</b> statement at the following hierarchy levels:</p> <ul style="list-style-type: none"> <li>To configure a custom string on an interface level: <div>[edit forwarding-options dhcp-relay group <i>group-name</i> interface <i>interface-name</i> overrides user-defined-option82 <i>string</i>]</div> </li> <li>To configure a custom string at the group level: <div>[edit forwarding-options dhcp-relay group <i>group-name</i> overrides user-defined-option82 <i>string</i>]</div> </li> <li>To configure a custom string globally: <div>[edit forwarding-options dhcp-relay overrides user-defined-option82 <i>string</i>]</div> </li> </ul> <p>You can define a custom string up to 251 characters in length. To include the custom string in the DHCP option 82 Agent Circuit ID, you must configure the <b>user-defined</b> statement at the [edit forwarding-options dhcp-relay group <i>group-name</i> relay-option-82 circuit-id] hierarchy level.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Including a Textual Description in DHCP Options</a></li> <li><a href="#">Using DHCP Relay Agent Option 82 Information on page 539</a></li> </ul>

## user-id

---

<b>Syntax</b>	<code>user-id {ascii <i>ascii</i> hexadecimal <i>hexadecimal</i>};</code>
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> dhcp-client client-identifier]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X44-D10 for SRX300, SRX320, SRX340, SRX345, SRX550M, and SRX1500 devices.
<b>Description</b>	Specify an ASCII or hexadecimal user ID for the Dynamic Host Configuration Protocol (DHCP) client.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	

## usb-control

---

<b>Syntax</b>	<pre>usb-control {   command <i>binary-file-path</i>;   disable; }</pre>
<b>Hierarchy Level</b>	[edit system processes]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5 for SRX300, SRX320, SRX340, SRX345, and SRX550M devices.
<b>Description</b>	Specify the universal serial bus (USB) supervise process.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>command <i>binary-file-path</i></b>—Path to the binary process.</li><li>• <b>disable</b>—Disable the universal serial bus (USB) supervise process.</li></ul>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

## user-keepalive

<b>Syntax</b>	<code>user-keepalive <i>minutes</i>;</code>
<b>Hierarchy Level</b>	[edit services <b>captive-portal interface</b> (all   <i>interface-names</i> ) ]
<b>Release Information</b>	Statement introduced in Junos OS Release 16.1 for EX Series switches.
<b>Description</b>	The <b>user-keepalive</b> statement is used to extend a captive portal authentication session after the MAC table aging timer expires. The keep-alive timer is started when the MAC address of the authenticated host ages out of the Ethernet switching table. If traffic is received within the keep-alive timeout period, the timer is deleted. If there is no traffic within the keep-alive timeout period, the session is deleted, and the host must re-authenticate.
<b>Default</b>	Disabled. The captive portal authentication session ends when the associated MAC address ages out of the Ethernet switching table.
<b>Options</b>	<b><i>minutes</i></b> —Duration of keep-alive period. <b>Range:</b> 7 through 65535
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing—control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Setting Up Captive Portal Authentication on an EX Series Switch on page 361</a></li> <li>• <a href="#">Configuring Captive Portal Authentication (CLI Procedure) on page 366</a></li> <li>• <a href="#">Understanding Authentication Session Timeout on page 264</a></li> </ul>

## user-prefix (DHCP Local Server)

Syntax	<code>user-prefix <i>user-prefix-string</i>;</code>
Hierarchy Level	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>dhcpv6 authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <b>group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server <b>dhcpv6 authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 <b>group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server <b>group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>dhcpv6 authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <b>group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>group group-name authentication username-include</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>dhcpv6 authentication username-include</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <b>group group-name authentication username-include</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>group group-name authentication username-include</b>],</p> <p>[edit system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit system services dhcp-local-server <b>dhcpv6 authentication username-include</b>],</p> <p>[edit system services dhcp-local-server dhcpv6 <b>group group-name authentication username-include</b>],</p> <p>[edit system services dhcp-local-server <b>group group-name authentication username-include</b>]</p>
Release Information	<p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
Description	Specify the user prefix that is concatenated with the username during the subscriber authentication or DHCP client authentication process.
Options	<i>user-prefix-string</i> —User prefix string.

**Required Privilege** system—To view this statement in the configuration.  
**Level** system-control—To add this statement to the configuration.

**Related Documentation** • [Using External AAA Authentication Services with DHCP on page 557](#)

## username-include (DHCP Local Server)

Syntax	<pre> username-include {   circuit-type;   client-id;   delimiter <i>delimiter-character</i>;   domain-name <i>domain-name-string</i>;   interface-description (device-interface   logical-interface);   interface-name;   logical-system-name;   mac-address;   option-60;   option-82 &lt;circuit-id&gt; &lt;remote-id&gt;;   relay-agent-interface-id;   relay-agent-remote-id;   relay-agent-subscriber-id;   routing-instance-name;   user-prefix <i>user-prefix-string</i>;   vlan-tags; } </pre>
Hierarchy Level	<pre> [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server</b> ...], [edit logical-systems <i>logical-system-name</i> system services <b>dhcp-local-server</b> ...], [edit routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server</b> ...], [edit system services <b>dhcp-local-server authentication</b>], [edit system services dhcp-local-server <b>dhcpv6 authentication</b>], [edit system services dhcp-local-server dhcpv6 <b>group group-name authentication</b>], [edit system services dhcp-local-server <b>group group-name authentication</b>] </pre>
Release Information	<p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p><b>vlan-tags</b> option added in Junos OS Release 18.3R1 on MX Series routers.</p>
Description	<p>Configure the username that the router or switch passes to the external AAA server. You must include at least one of the optional statements for the username to be valid. If you do not configure a username, the router (or switch) accesses the local authentication service only and does not use external authentication services, such as RADIUS.</p> <p>The following statements are not supported in the DHCPv6 hierarchy levels:</p> <ul style="list-style-type: none"> <li>• <b>option-60</b></li> <li>• <b>option-82</b></li> </ul> <p>The following statements are supported in the DHCPv6 hierarchy levels only:</p> <ul style="list-style-type: none"> <li>• <b>client-id</b></li> <li>• <b>relay-agent-interface-id</b></li> <li>• <b>relay-agent-remote-id</b></li> </ul>

- **relay-agent-subscriber-id**

**Options**    **vlan-tags**—Include the subscriber session VLAN tags in the username for interactions with an external authority. Both single-tagged and double-tagged VLANs are supported: The tags are added in the format **outer-vlan-tag-inner-vlan-tag**. The outer tag is always included; the inner tag is included for double-tagged VLANs.

Use this option instead of the **interface-name** option when the outer VLAN tag is unique across the system and you do not need the underlying physical interface name to be part of the format.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level**    system—To view this statement in the configuration.  
                                         system-control—To add this statement to the configuration.

**Related Documentation**    • [Using External AAA Authentication Services with DHCP on page 557](#)  
                                         • [Creating Unique Usernames for DHCP Clients on page 559](#)

## username-include (DHCP Relay Agent)

**Syntax**

```
username-include {
  circuit-type;
  client-id;
  delimiter delimiter-character;
  domain-name domain-name-string;
  interface-description (device-interface | logical-interface);
  interface-name;
  logical-system-name;
  mac-address;
  option-60;
  option-82 <circuit-id> <remote-id>;
  relay-agent-interface-id;
  relay-agent-remote-id;
  relay-agent-subscriber-id;
  routing-instance-name;
  user-prefix user-prefix-string;
  vlan-tags;
}
```

**Hierarchy Level**

```
[edit forwarding-options dhcp-relay authentication],
[edit forwarding-options dhcp-relay dhcpv6 authentication],
[edit forwarding-options dhcp-relay dhcpv6 group group-name authentication],
[edit forwarding-options dhcp-relay dual-stack-group dual-stack-group-name authentication],
[edit forwarding-options dhcp-relay group group-name authentication],
[edit logical-systems logical-system-name forwarding-options dhcp-relay ...],
[edit logical-systems logical-system-name routing-instances routing-instance-name
 forwarding-options dhcp-relay ...],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay ...]
```

**Release Information**

Statement introduced in Junos OS Release 9.1.

Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

Support at the **[edit ... dhcpv6]** hierarchy levels introduced in Junos OS Release 11.4.

Support at the **[edit ... dual-stack-group dual-stack-group-name]** hierarchy level introduced in Junos OS Release 15.1.

**vlan-tags** option added in Junos OS Release 18.3R1 on MX Series routers.

**Description**

Configure the username that the router (or switch) passes to the external AAA server. You must include at least one of the optional statements for the username to be valid. If you do not configure a username, the router (or switch) accesses the local authentication service only and does not use external authentication services, such as RADIUS. Use the statement at the **[edit...dhcpv6]** hierarchy levels to configure DHCPv6 support.

The following statements are not supported in the DHCPv6 hierarchy levels:

- **option-60**
- **option-82**

The following statements are supported in the DHCPv6 hierarchy levels only:

- **client-id**
- **relay-agent-interface-id**
- **relay-agent-remote-id**
- **relay-agent-subscriber-id**

**Options**    **vlan-tags**—Include the subscriber session VLAN tags in the username for interactions with an external authority. Both single-tagged and double-tagged VLANs are supported: The tags are added in the format ***outer-vlan-tag-inner-vlan-tag***. The outer tag is always included; the inner tag is included for double-tagged VLANs.

Use this option instead of the **interface-name** option when the outer VLAN tag is unique across the system and you do not need the underlying physical interface name to be part of the format.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                         interface-control—To add this statement to the configuration.

**Related Documentation**    • [Creating Unique Usernames for DHCP Clients on page 559](#)  
                                         • [Using External AAA Authentication Services with DHCP on page 557](#)

## vendor-id

---

Syntax	<code>vendor-id <i>vendor-id</i>;</code>
Hierarchy Level	<code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> dhcp-client]</code>
Release Information	<p>Statement introduced in Junos OS Release 12.1X44-D10 for SRX300, SRX320, SRX340, SRX345, SRX550M, and SRX1500 devices.</p> <p>Starting with Junos OS Release 17.3R1, on all SRX Series devices and vSRX instances, the CLI option <b>dhcp-clinet</b> at <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>inet</i>]</code> hierarchy is changed to <b>dhcp</b> to keep consistent with other Junos platforms. There is no change in the functionality with the changed CLI option <b>dhcp</b>.</p>
Description	Configure a vendor class ID for the Dynamic Host Configuration Protocol (DHCP) client.
Options	<b>vendor-id</b> —Vendor class ID.
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	

## vendor-option

**Syntax**

```
vendor-option {
  default-local-server-group local-server-group-name |
  default-relay-server-group server-group-name
  drop;
  equals
  starts-with
}
```

**Hierarchy Level** [edit forwarding-options dhcp-relay relay-option-60]

**Release Information** Statement introduced before Junos OS Release 12.1 for EX Series switches.  
Statement deprecated in Junos OS Release 12.3 for EX Series switches.

**Description** Configure the match criteria when you use the DHCP vendor class identifier option (option 60) in DHCP client packets to forward client traffic to specific DHCP servers. The extended DHCP relay agent compares the option 60 vendor-specific strings received in DHCP client packets against the match criteria that you specify. If there is a match, you can define certain actions for the associated DHCP client packets.

**NOTE:** The `vendor-option` statement has been deprecated and might be removed from future product releases. We recommend that you phase out its use. See [option-number](#).

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation**

## vendor-option

**Syntax**

```
vendor-option {
  (default-relay-server-group server-group-name | default-local-server-group
    local-server-group-name | drop);
  (equals | starts-with) (ascii match-string | hexadecimal match-hex) {
    (drop | local-server-group local-server-group-name | relay-server-group
      server-group-name);
  }
}
```

**Hierarchy Level**

```
[edit forwarding-options dhcp-relay relay-option-60],
[edit forwarding-options dhcp-relay group group-name relay-option-60],
[edit logical-systems logical-system-name forwarding-options dhcp-relay relay-option-60],
[edit logical-systems logical-system-name forwarding-options dhcp-relay group group-name
  relay-option-60],
[edit logical-systems logical-system-name routing-instances routing-instance-name
  forwarding-options dhcp-relay relay-option-60],
[edit logical-systems logical-system-name routing-instances routing-instance-name
  forwarding-options dhcp-relay group group-name relay-option-60],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay
  relay-option-60],
[edit routing-instances routing-instance-name forwarding-options dhcp-relay group
  group-name relay-option-60]
```

**Release Information** Statement introduced in JUNOS Release 9.0.

**Description** Configure the match criteria when you use the DHCP vendor class identifier option (option 60) in DHCP client packets to forward client traffic to specific DHCP servers. The extended DHCP relay agent compares the option 60 vendor-specific strings received in DHCP client packets against the match criteria that you specify. If there is a match, you can define certain actions for the associated DHCP client packets.

The **vendor-option** statement enables you to specify either an exact, left-to-right match (with the **equals** statement) or a partial match (with the **starts-with** statement), and configure either an ASCII match string (with the **ascii** statement) or a hexadecimal match string (with the **hexadecimal** statement).

You can configure an unlimited number of match strings. Match strings do not support the use of wildcard attributes.

**Options** **equals**—Exact, left-to-right match of the ASCII or hexadecimal match string with the option 60 string.

**starts-with**—Partial match of the ASCII or hexadecimal match string with the option 60 string. The option 60 string can contain a superset of the ASCII or hexadecimal match string, provided that the leftmost characters of the option 60 string entirely match the characters in the configured match string. When you use the **starts-with**

statement, the longest match rule applies; that is, the router matches the string "test123" before it matches the string "test".

**ascii *match-string***—ASCII match string of 1 through 255 alphanumeric characters.

**hexadecimal *match-hex***—Hexadecimal match string of 1 through 255 hexadecimal characters (0 through 9, a through f, A through F).

The remaining statements are explained separately. See [CLI Explorer](#).

<b>Required Privilege</b>	interface—To view this statement in the configuration.
<b>Level</b>	interface-control—To add this statement to the configuration.

## vlan (VoIP)

---

<b>Syntax</b>	<code>vlan (vlan-id   vlan-name   untagged);</code>
<b>Hierarchy Level</b>	[edit <a href="#">ethernet-switching-options voip interface (VoIP)</a> (all   [ <i>interface-name</i>   access-ports])
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	(EX Series switches only) Specify the VLAN name or VLAN tag identifier associated with the VLAN to be sent from the authenticating server to the IP phone.
<b>Options</b>	<p><i>vlan-name</i>—Name of a VLAN.</p> <p><i>vlan-id</i>—The VLAN tag identifier.</p> <p><b>Range:</b> 0 through 4095. Tags 0 and 4095 are reserved by Junos OS; do not configure them.</p> <p><i>untagged</i>—Allow untagged VLAN traffic.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch on page 396</a></li><li>• <a href="#">Example: Configuring VoIP on an EX Series Switch Without Including 802.1X Authentication on page 414</a></li><li>• <a href="#">Example: Configuring VoIP on an EX Series Switch Without Including LLDP-MED Support on page 409</a></li></ul>

## vlan-assignment

<b>Syntax</b>	<code>vlan-assignment (vlan-id   vlan-name);</code>
<b>Hierarchy Level</b>	<p>[edit protocols <a href="#">dot1x authenticator authentication-profile-name static (Protocols 802.1X)</a> <a href="#">mac-address</a>];</p> <p>[edit <a href="#">ethernet-switching-options authentication-whitelist</a>];</p> <p>[edit switch-options <a href="#">authentication-whitelist</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement added to the <a href="#">[edit ethernet-switching-options authentication-whitelist]</a> hierarchy in Junos OS Release 10.1 for EX Series switches.</p> <p>Statement added to the <a href="#">[edit switch-options authentication-whitelist]</a> hierarchy in Junos OS Release 13.2X50-D10 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 14.1X53-D30 for the QFX Series.</p>
<b>Description</b>	Configure the VLAN that is associated with the list of MAC addresses that are excluded from RADIUS authentication.
<b>Options</b>	<code>vlan-id   vlan-name</code> —The name of the VLAN or the VLAN tag identifier to associate with the device. The VLAN already exists on the switch.
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show dot1x static-mac-address on page 1697</a></li> <li>• <a href="#">Example: Configuring Static MAC Bypass of 802.1X and MAC RADIUS Authentication on an EX Series Switch on page 356</a></li> <li>• <a href="#">Example: Setting Up Captive Portal Authentication on an EX Series Switch on page 361</a></li> <li>• <a href="#">Understanding Authentication on Switches on page 256</a></li> <li>• <a href="#">Example: Setting Up Captive Portal Authentication on an EX Series Switch on page 361</a></li> <li>• <a href="#">Configuring Captive Portal Authentication (CLI Procedure) on page 366</a></li> </ul>

## vlan-nas-port-stacked-format

---

<b>Syntax</b>	<code>vlan-nas-port-stacked-format;</code>
<b>Hierarchy Level</b>	<code>[edit access profile <i>profile-name</i> radius <a href="#">options</a>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.1. Statement introduced in Junos OS Release 9.1 for EX Series switches.
<b>Description</b>	Configure RADIUS attribute 5 (NAS-Port) to include the S-VLAN ID, in addition to the VLAN ID, for subscribers on Ethernet interfaces.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Access Profile Options for Interactions with RADIUS Servers</i></li><li>• <i>Configuring Authentication and Accounting Parameters for Subscriber Access</i></li></ul>

## vpn (Forwarding Options)

---

<b>Syntax</b>	<code>vpn;</code>
<b>Hierarchy Level</b>	<code>[edit forwarding-options dhcp-relay]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0. Statement changed from <b>vpn</b> to <b>source-ip-change</b> in Junos OS Release 15.1X49-D130 and later releases.
<b>Description</b>	For Dynamic Host Configuration Protocol (DHCP) client request forwarding, enable source IP change for the device to use address of egress interface as source IP address.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>DHCP Server, Client, and Relay Agent Overview</i></li></ul>

## version (SNMP)

<b>Syntax</b>	<code>version (all   v1   v2);</code>
<b>Hierarchy Level</b>	<code>[edit snmp trap-group <i>group-name</i>]</code>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4 for MX, M, T, ACX and PTX Series routers, EX Series switches and SRX firewalls.</p> <p>Statement introduced in Junos OS Release 9.0 for EX4600 switches.</p> <p>Statement introduced in Junos OS Release 14.1X53-D20 for OCX1100 switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Specify the version number of SNMP traps.
<b>Default</b>	<b>all</b> —Send an SNMPv1 and SNMPv2 trap for every trap condition.
<b>Options</b>	<p><b>all</b>—Send an SNMPv1 and SNMPv2 trap for every trap condition.</p> <p><b>v1</b>—Send SNMPv1 traps only.</p> <p><b>v2</b>—Send SNMPv2 traps only.</p>

## what

---

Syntax	<code>what <i>number</i>;</code>
Hierarchy Level	[edit protocols <a href="#">lldp-med interface</a> (all   <i>interface-name</i> ) <a href="#">location civic-based</a> ]
Release Information	Statement introduced in Junos OS Release 9.0 for EX Series switches. Modified in Junos OS Release 9.2 for EX Series switches to display new default.
Description	<p>For Link Layer Discovery Protocol–Media Endpoint Device (LLDP-MED), configure the location to which the DHCP entry refers. This information is advertised, along with other location information, from the switch to the MED. It is used during emergency calls to identify the location of the MED.</p> <p>Options <b>0</b> and <b>1</b> should not be used unless it is known that the DHCP client is in close physical proximity to the server or network element.</p>
Default	1
Options	<p><i>number</i>—Location:</p> <ul style="list-style-type: none"><li>• <b>0</b>—Location of the DHCP server.</li><li>• <b>1</b>—Location of a network element believed to be closest to the client.</li><li>• <b>2</b>—Location of the client.</li></ul>
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">show lldp on page 1712</a></li><li>• <a href="#">Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch on page 396</a></li><li>• <a href="#">Configuring LLDP-MED (CLI Procedure) on page 441</a></li></ul>

## wait-for-acct-on-ack (Access Profile)

<b>Syntax</b>	<code>wait-for-acct-on-ack;</code>
<b>Hierarchy Level</b>	<code>[edit access profile <i>profile-name</i> <b>accounting</b>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	<p>Configure the router's authd process to wait for an Acct-On-Ack response message from RADIUS before sending new authentication and accounting updates to the RADIUS server. This configuration ensures that when a new subscriber session starts, the authentication and accounting information for the new session does not get deleted when RADIUS clears previously existing session state information.</p> <p>At subscriber session startup, the Junos OS authd process sends an Acct-On message to the RADIUS server and the new session starts authentication and accounting operations. However, in some service provider environments, upon receipt of the Acct-On message, the RADIUS server cleans up the previous session state and removes accounting statistics. In this scenario, the RADIUS server's cleanup operation can inadvertently delete the new session's authentication and accounting information, which might include customer billing information.</p> <p>To ensure that the new session's authentication and accounting information is not deleted, you can include the <b>wait-for-acct-on-ack</b> statement to configure authd to wait for an Acct-On-Ack response message from the RADIUS accounting server, so the RADIUS cleanup can finish before authd sends any new authentication and accounting updates.</p>
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Configuring Per-Subscriber Session Accounting</i></li> <li><i>RADIUS Servers and Parameters for Subscriber Access</i></li> </ul>

## watchdog

---

<b>Syntax</b>	<pre>watchdog {   disable;   enable;   timeout <i>value</i>; }</pre>
<b>Hierarchy Level</b>	[edit system processes]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Enable or disable the watchdog timer when Junos OS encounters a problem.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>disable</b>—Disable the watchdog timer.</li><li>• <b>enable</b>—Enable the watchdog timer.</li><li>• <b>timeout <i>value</i></b>—Specify amount of time to wait in seconds. <b>Range:</b> 1 through 3600 seconds.</li></ul>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

## web-management

<b>Syntax</b>	<pre>web-management {   http {     interfaces [ <i>interface-names</i> ];     port <i>port</i>;   }   https {     interfaces [ <i>interface-names</i> ];     local-certificate <i>name</i>;     port <i>port</i>;   } }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">system services</a> ]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	<p>Configure settings for HTTP or HTTPS access. HTTP access allows management of the router or switch using the browser-based J-Web graphical user interface. HTTPS access allows secure management of the router or switch using the J-Web interface. With HTTPS access, communication between the router or switch Web server and your browser is encrypted.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Secure Management Access Configuration Summary</i></li> <li>• <i>J-Web Interface User Guide</i></li> <li>• <a href="#">http on page 1026</a></li> <li>• <a href="#">https on page 1027</a></li> <li>• <a href="#">port on page 1223</a></li> </ul>

## web-management

---

<b>Syntax</b>	<pre>web-management {   disable;   failover (alternate-media   other-routing-engine); }</pre>
<b>Hierarchy Level</b>	[edit system processes]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5.
<b>Description</b>	Specify the Web management process.
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>disable</b>—Disable the Web management process.</li><li>• <b>failover</b>—Configure the device to reboot if the software process fails four times within 30 seconds, and specify the software to use during the reboot.<ul style="list-style-type: none"><li>• <b>alternate-media</b>—Configure the device to switch to backup media that contains a version of the system if a software process fails repeatedly.</li><li>• <b>other-routing-engine</b>—Instruct the secondary Routing Engine to take mastership if a software process fails. If this statement is configured for a process, and that process fails four times within 30 seconds, then the device reboots from the secondary Routing Engine.</li></ul></li></ul>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

## web-management (System Services)

```
Syntax web-management {
    http {
        interfaces interface-names ;
        port port;
    }
    https {
        interfaces interface-names;
        local-certificate name;
        pki-local-certificate name;
        system-generated-certificate name;
        port port;
    }
    management url management url;
    session {
        idle-timout minutes;
        session-limit number;
    }
    traceoptions {
        file {
            filename;
            files number;
            match regular-expression;
            size maximum-file-size;
            (no-world-readable | world-readable);
        }
        flag flag;
        level level;
        no-remote-trace;
    }
}
```

Hierarchy Level [edit system services]

**Release Information** Statement introduced in Junos OS Release 9.0.  
Support for **https** introduced for SRX5400, SRX5600, and SRX5800 devices starting from Junos OS Release 12.1X44-D10 and on vSRX, SRX300, SRX320, SRX340, SRX345, SRX550M, and SRX1500 devices starting from Junos OS Release 15.1X49-D40.

**Description** Configure settings for HTTP or HTTPS access. HTTP access allows management of the device using the J-Web interface. HTTPS access allows secure management of the device using the J-Web interface. With HTTPS access, communication is encrypted between your browser and the webserver for your device.

**NOTE:** On SRX340 and SRX345 devices, the factory-default configuration has a generic HTTP configuration. To use ge and fxp0 ports as management ports, you must use the set system services web-management http command.

The Web management HTTP and HTTPS interfaces are changed to fxp0.0 and from ge-0/0/1.0 through ge-0/0/7.0.

.....

**Options**    **control**—Disable the SBC process.

- **max-threads**—Maximum simultaneous threads to handle requests.

**Range:** 0 through 16

**http**—Configure HTTP.

- **interface** *[value]*—Interface value that accepts HTTP access.
- **port** *number*—TCP port for incoming HTTP connections.

**Range:** 1 through 65,535

**https**—Configure HTTPS.

- **interface** *[value]*—Interface value that accept HTTP access.
- **port** *number*—TCP port for incoming HTTP connections.  
**Range:** 1 through 65,535
- **local-certificate**—X.509 certificate to use from the configuration.
- **pki-local-certificate**—X.509 certificate to use from the PKI local store.
- **system-generated-certificate**—X.509 certificate generated automatically by the system.

**management url** *management url*—URL path for Web management access.

**session**—Configure the Web-management session.

- **idle-timeout** *minutes*—Default timeout of Web-management sessions in minutes.
- **session-limit** *number*—Maximum number of Web-management sessions to allow.

**traceoptions**—Set the trace options.

- **file**—Configure the trace file information.
  - *filename*—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the directory */var/log*. By default, the name of the file is the name of the process being traced.
  - **files** *number*—Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you also must specify a maximum file size with the **size** *maximum file-size* option.

**Range:** 2 through 1000 files

**Default:** 10 files

- **match *regular-expression***—Refine the output to include lines that contain the regular expression.
- **size *maximum-file-size***—Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB).

**Range:** 10 KB through 1 GB

**Default:** 128 KB

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files *number*** option.

- **(world-readable | no-world-readable)**— By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.
- **flag *flag***—Specify which tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags.
  - **all**—Trace all areas.
  - **configuration**—Trace configuration.
  - **dynamic-vpn**—Trace dynamic VPN events.
  - **init**—Trace the daemon init process.
  - **mgd**—Trace MGD requests.
  - **webauth**—Trace Web authentication requests.
- **level *level*** —Specify the level of debugging output.
  - **all**—Match all levels.
  - **error**—Match error conditions.
  - **info**—Match informational messages.
  - **notice**—Match conditions that should be handled specially.
  - **verbose**—Match verbose messages.
  - **warning**—Match warning messages.
- **no-remote-trace**—Disable remote tracing.

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

## wins-server (System)

<b>Syntax</b>	<pre>wins-server {     address; }</pre>
<b>Hierarchy Level</b>	<pre>[edit system services dhcp], [edit system services <b>dhcp</b>], [edit system services dhcp pool], [edit system services dhcp static-binding]</pre>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	For J Series Services Routers and EX Series switches only. Specify one or more NetBIOS Name Servers. When a DHCP client is added to the network and assigned an IP address, the NetBIOS Name Server manages the Windows Internet Name Service (WINS) database that matches IP addresses (such as <b>192.168.1.3</b> ) to Windows NetBIOS names (such as <b>\\Marketing</b> ). List servers in order of preference.
<b>Options</b>	<b>address</b> —IPv4 address of the NetBIOS Name Server running WINS. To configure multiple servers, include multiple <b>address</b> options.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	

## wins-server (System)

---

Syntax	<pre>wins-server {     address; }</pre>
Hierarchy Level	<pre>[edit system services dhcp], [edit system services <b>dhcp</b>], [edit system services dhcp pool], [edit system services dhcp static-binding]</pre>
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	For J Series Services Routers and EX Series switches only. Specify one or more NetBIOS Name Servers. When a DHCP client is added to the network and assigned an IP address, the NetBIOS Name Server manages the Windows Internet Name Service (WINS) database that matches IP addresses (such as <b>192.168.1.3</b> ) to Windows NetBIOS names (such as <b>\\Marketing</b> ). List servers in order of preference.

## xnm-clear-text

<b>Syntax</b>	<pre>xnm-clear-text {   connection-limit limit;   rate-limit limit; }</pre>
<b>Hierarchy Level</b>	[edit system <a href="#">services</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	<p>Allow Junos XML protocol clear-text requests from remote systems to the local router.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring clear-text or SSL Service for Junos XML Protocol Client Applications</i></li></ul>

## xnm-ssl

**Syntax**

```
xnm-ssl {
  connection-limit limit;
  local-certificate name;
  rate-limit limit;
  ssl-renegotiation ;
}
```

**Hierarchy Level** [edit system services]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Support for the **ssl-renegotiation** statement added in Junos OS Release 13.3.

**Description** Allow Junos XML protocol SSL requests from remote systems to the local router.  
The remaining statements are explained separately.

**WARNING:** Starting with Junos OS Release 15.1, the **ssl3-support** option is not available for configuration with the **set system services xnm-ssl** and **file copy** commands. SSLv3 is no longer supported and available.

For all releases prior to and including Junos OS Release 14.2, SSLv3 is disabled by default at runtime. The **ssl3-support** option is hidden and deprecated in Junos OS Release 14.2 and earlier releases. However, you can use the **set system services xnm-ssl ssl3-support** command to enable SSLv3 for a Junos XML protocol client application to use as the protocol to connect to the Junos XML protocol server on a router, and you can use the **file copy source destination ssl3-support** command to enable the copying of files from an SSLv3 URL.

Using SSLv3 presents a potential security vulnerability, and we recommend that you not use SSLv3. For more details about this security vulnerability, go to <https://kb.juniper.net/InfoCenter/index?page=content&id=JSA10656>.

**NOTE:** When FIPS mode is enabled on the device, the **xnm-ssl** service does not support TLS 1.0. For a device in FIPS mode, the clients must communicate with the **xnm-ssl** service using TLS 1.1 or later. In non-FIPS mode, clients can communicate with the **xnm-ssl** service using TLS 1.0 or later. The **xnm-ssl** service never negotiates with the SSLv2 or SSLv3 (the predecessors to TLS 1.0) even if the FIPS mode is enabled or disabled.

<b>Required Privilege</b>	system—To view this statement in the configuration.
<b>Level</b>	system-control—To add this statement to the configuration.

## clear captive-portal

<b>Syntax</b>	<code>clear captive-portal (firewall [<i>interface-names</i>]   interface (802.1X) (all   [<i>interface-names</i>])   mac-address [<i>mac-addresses</i>])</code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.1 for EX Series switches. Command introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
<b>Description</b>	Reset the authentication state of a captive portal interface or captive portal firewall statistics on one or more interfaces.
<b>Options</b>	<p><b>firewall [<i>interface-names</i>]</b>—Resets captive portal statistics on all interfaces or on the specified interface.</p> <p><b>interface (all   <i>interface-names</i>)</b>—Resets the authentication state of users connected to all interfaces or the specified interfaces.</p> <p><b>mac-address <i>mac-addresses</i></b>—Resets the authentication state for the specified MAC addresses.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show captive-portal authentication-failed-users on page 1612</a></li> <li>• <a href="#">show captive-portal interface on page 1616</a></li> <li>• <a href="#">show captive-portal firewall on page 1614</a></li> <li>• <a href="#">Example: Setting Up Captive Portal Authentication on an EX Series Switch on page 361</a></li> <li>• <a href="#">Configuring Captive Portal Authentication (CLI Procedure) on page 366</a></li> </ul>

<b>Output Fields</b>	Table 54 on page 1529 lists the output fields for the <b>clear captive-portal interface</b> command. (The <b>clear captive-portal firewall</b> and <b>clear captive-portal mac-address</b> commands have no output). Output fields are listed in the approximate order in which they appear.

Table 54: clear captive-portal interface Output Fields

Field Name	Field Description
Interface	Interface on which captive portal has been configured.

Table 54: clear captive-portal interface Output Fields (continued)

Field Name	Field Description
<b>State</b>	<p>The state of the port:</p> <ul style="list-style-type: none"> <li>• <b>Authenticated</b>—The client has been authenticated through the RADIUS server or has been permitted access through server fail fallback.</li> <li>• <b>Authenticating</b>—The client is authenticating through the RADIUS server.</li> <li>• <b>Connecting</b>—Switch is attempting to contact the RADIUS server.</li> <li>• <b>Initialize</b>—The interface link is down.</li> <li>• <b>Held</b>—An action has been triggered through server fail fallback during a RADIUS server timeout. A supplicant is denied access, permitted access through a specified VLAN, or maintains the authenticated state granted to it before the RADIUS server timeout occurred.</li> </ul>
<b>MAC address</b>	The MAC address of the connected client on the interface.
<b>User</b>	Users connected to the captive portal interface.

## Sample Output

### clear captive-portal interface

```
user@switch> clear captive-portal interface
ge-0/0/3.0
```

### clear captive-portal interface

```
user@switch> clear captive-portal interface

Captive Portal Information:
Interface      State      MAC address      User
ge-0/0/3.0     Authenticated  00:03:47:e1:ba:b9  aclallow
ge-0/0/5.0     Connecting
ge-0/0/7.0     Connecting
ge-0/0/9.0     Connecting
```

### clear captive-portal mac-address

```
user@switch> clear captive-portal mac-address 00:03:47:e1:ba:b9
This command has no output.
```

### clear captive-portal firewall

```
user@switch> clear captive-portal firewall
This command has no output.
```

## clear dhcp client binding

<b>Syntax</b>	clear dhcp client binding [all interface <interface-name>] [routing-instance <routing-instance-name>]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X44-D10 for for SRX300, SRX320, SRX340, SRX345, SRX550M, and SRX1500 devices.
<b>Description</b>	Clear the binding state of a Dynamic Host Configuration Protocol (DHCP) client from the DHCP client table.
<b>Options</b>	<p><b>all</b>—(Optional) Clear the binding state for all DHCP clients.</p> <p><b>interface &lt;interface-name&gt;</b>—(Optional) Clear the binding state for DHCP clients on the specified interface.</p> <p><b>routing-instance &lt;routing-instance-name&gt;</b>—(Optional) Clear the binding state for DHCP clients on the specified routing instance. If you do not specify a routing instance, binding state is cleared for DHCP clients on the default routing instance.</p>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show dhcp client binding on page 1632</a></li> </ul>
<b>Output Fields</b>	This command produces no output.

## clear dhcp client statistics

---

<b>Syntax</b>	<code>clear dhcp client statistics</code> <code>&lt;all&gt;</code> <code>&lt;interface&gt;</code> <code>&lt;routing-instance&gt;</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X44-D10 for SRX300, SRX320, SRX340, SRX345, SRX550M, and SRX1500 devices.
<b>Description</b>	Clear all Dynamic Host Configuration Protocol (DHCP) client statistics.
<b>Options</b>	<p><b>all</b>—(Optional) Clear all the DHCP client statistics.</p> <p><b>interface</b>—(Optional) Clear the statistics for DHCP clients on the specified interface.</p> <p><b>routing-instance</b> —(Optional) Clear the statistics for DHCP clients on the specified routing instance. If you do not specify a routing instance, statistics are cleared for the default routing instance.</p>
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show dhcp client statistics on page 1635</a></li></ul>
<b>Output Fields</b>	This command produces no output.

## clear dhcp relay binding

<b>Syntax</b>	<pre>clear dhcp relay binding &lt;all   ip-address   mac-address&gt; &lt;interface interface-name&gt; &lt;routing-instance routing-instance-name&gt;</pre>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X44-D10 for SRX300, SRX320, SRX340, SRX345, SRX550M, and SRX1500 devices.
<b>Description</b>	Clear the binding state of a Dynamic Host Configuration Protocol (DHCP) client from the client table.
<b>Options</b>	<p><b>all</b>—(Optional) Clear the binding state for all DHCP clients.</p> <p><b>ip-address</b>— (Optional) Clear the binding state for the DHCP client, using the specified IP address.</p> <p><b>mac-address</b>—(Optional) Clear the binding state for the DHCP client, using the specified MAC address.</p> <p><b>interface interface-name</b>—(Optional) Clear the binding state for DHCP clients on the specified interface</p> <p><b>routing-instance routing-instance-name</b>—(Optional) Clear the binding state for DHCP clients on the specified routing instance. If you do not specify a routing instance, the binding state is cleared for the default routing instance.</p>
<b>Required Privilege Level</b>	clear

## clear dhcp relay statistics

---

<b>Syntax</b>	<code>clear dhcp relay statistics &lt;routing-instance routing-instance-name&gt;</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X44-D10 for SRX300, SRX320, SRX340, SRX345, SRX550M, and SRX1500 devices.
<b>Description</b>	Clear all Dynamic Host Configuration Protocol (DHCP) relay statistics.
<b>Options</b>	<b>routing-instance routing-instance-name</b> —(Optional) Clear the DHCP relay statistics on the specified routing instance. If you do not specify a routing instance name, statistics are cleared for the default routing instance.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show dhcp relay statistics on page 1641</a></li></ul>
<b>Output Fields</b>	This command produces no output.

## clear dhcp server binding

<b>Syntax</b>	<pre>clear dhcp server binding &lt;all   ip-address   mac-address&gt; &lt;interface interface-name&gt; &lt;routing-instance routing-instance-name&gt;</pre>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X44-D10 for SRX300, SRX320, SRX340, SRX345, SRX550M, and SRX1500 devices.
<b>Description</b>	Clear the binding state of a Dynamic Host Configuration Protocol (DHCP) client from the client table on the DHCP local server.
<b>Options</b>	<p><b>all</b>—(Optional) Clear the binding state for all DHCP clients.</p> <p><b>ip-address</b>— (Optional) Clear the binding state for the DHCP client, using the specified IP address.</p> <p><b>mac-address</b>—(Optional) Clear the binding state for the DHCP client, using the specified MAC address.</p> <p><b>interface interface-name</b>—(Optional) Clear the binding state for DHCP clients on the specified interface.</p> <p><b>routing-instance routing-instance-name</b>—(Optional) Clear the binding state for DHCP clients on the specified routing instance.</p>

### clear dhcpv6 relay binding all

The following command clears all DHCP relay agent bindings:

```
user@host> clear dhcpv6 relay binding all
```

### clear dhcpv6 relay binding dual-stack all

The following command clears all DHCPv6 relay agent bindings for all DHCPv6 clients and the associated DHCPv4 bindings in the single-session DHCP dual stack. DHCPv4 clients created in a DHCPv4-only stack are not affected.

```
user@host> clear dhcpv6 relay binding dual-stack all
```

### clear dhcpv6 relay binding interface

The following command clears DHCPv6 relay agent bindings on a specific interface:

```
user@host> clear dhcpv6 relay binding interface fe-0/0/2
```

### clear dhcpv6 relay binding <interfaces-vlan>

The following command uses the *interfaces-vlan* option to clear all DHCPv6 relay agent bindings on top of the underlying interface **ae0**, which clears DHCPv6 bindings on all demux VLANs on top of **ae0**:

```
user@host> clear dhcpv6 relay binding interface ae0
```

### clear dhcpv6 relay binding <interfaces-wildcard>

The following command uses the *interfaces-wildcard* option to clear all DHCPv6 relay agent bindings over a specific interface:

```
user@host> clear dhcpv6 relay binding ge-1/0/0.*
```

## clear dhcpv6 server binding

---

**Syntax**

```
clear dhcpv6 server binding
<address>
<all>
<interface interface-name>
<interfaces-vlan>
<interfaces-wildcard>
<logical-system logical-system-name>
<routing-instance routing-instance-name>
<dual-stack>
```

**Release Information** Command introduced in Junos OS Release 9.6.  
Options *interfaces-vlan* and *interfaces-wildcard* added in Junos OS Release 12.1.  
Command updated with **dual-stack** statement in Junos OS Release 17.3.

**Description** Clear the binding state of a Dynamic Host Configuration Protocol for IPv6 (DHCPv6) client from the client table on the extended DHCPv6 local server.

**Options** **address**—(Optional) Clear the binding state for the DHCPv6 client, using one of the following entries:

- *CID*—The specified Client ID (CID).
- *ipv6-prefix*—The specified IPv6 prefix.
- *session-id*—The specified session ID.

**all**—(Optional) Clear the binding state for all DHCPv6 clients.

**interface *interface-name***—(Optional) Clear the binding state for DHCPv6 clients on the specified interface.

***interfaces-vlan***—(Optional) Clear the binding state on the interface VLAN ID and S-VLAN ID.

***interfaces-wildcard***—(Optional) Clear bindings on a set of interfaces. This option supports the use of the wildcard character (\*).

**logical-system *logical-system-name***—(Optional) Clear the binding state for DHCPv6 clients on the specified logical system.

**routing-instance *routing-instance-name***—(Optional) Clear the binding state for DHCPv6 clients on the specified routing instance.

**dual-stack**—(Optional) Remove either both arms or single arm of dual-stack.

**NOTE:**

- The **dual-stack** command is added in the syntax removes both arms of the dual-stack with a single command entry.
- When the **dual-stack** command is not added in the syntax, the **clear dhcpv6 server binding** command clears only the family specific arm of the dual-stack.

**Required Privilege Level** clear

## Sample Output

### clear dhcpv6 server binding all

The following command clears all DHCPv6 local server bindings:

```
user@host> clear dhcpv6 server binding all
```

### clear dhcpv6 server binding <ipv6-prefix>

The following command clears DHCPv6 local server bindings for a specific IPv6 prefix:

```
user@host> clear dhcpv6 server binding 14/0x00010001/0x02b3be8f/0x00109400/0x0005
```

### clear dhcpv6 server binding interface

The following command clears DHCPv6 local server bindings on a specific interface:

```
user@host> clear dhcpv6 server binding interface fe-0/0/2
```

### `clear dhcpv6 server binding <interfaces-vlan>`

The following command uses the *interfaces-vlan* option to clear all DHCPv6 local server bindings on top of the underlying interface **ae0**, which clears DHCPv6 bindings on all demux VLANs on top of **ae0**:

```
user@host> clear dhcpv6 server binding interface ae0
```

### `clear dhcpv6 server binding <interfaces-wildcard>`

The following command uses the *interfaces-wildcard* option to clear all DHCPv6 local server bindings over a specific interface:

```
user@host> clear dhcpv6 server binding ge-1/0/0.*
```

### `clear dhcpv6 server binding dual-stack all`

The following command clears all the dual-stack local server bindings.

```
user@host> clear dhcpv6 server binding dual-stack all
```

## clear dhcpv6 server binding (Local Server)

**Syntax** `clear dhcpv6 server binding  
<all | client-id | ip-address | session-id>  
<interface interface-name>  
<routing-instance routing-instance-name>`

**Release Information** Command introduced in Junos OS Release 10.4.

**Description** Clear the binding state of a DHCPv6 client from the client table on the DHCPv6 local server.

- Options**
- *all*—(Optional) Clear the binding state for all DHCPv6 clients.
  - *client-id*—(Optional) Clear the binding state for the DHCPv6 client with the specified client ID (option 1).
  - *ip-address*—(Optional) Clear the binding state for the DHCPv6 client with the specified address.
  - *session-id*—(Optional) Clear the binding state for the DHCPv6 client with the specified session ID.
  - interface *interface-name*—(Optional) Clear the binding state for DHCPv6 clients on the specified interface.
  - routing-instance *routing-instance-name*—(Optional) Clear the binding state for DHCPv6 clients on the specified routing instance.

**Required Privilege Level** clear

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show dhcpv6 server statistics (View) on page 1680</a></li></ul>

## clear dot1x

**Syntax** `clear dot1x (firewall <counter-name> | interface <[interface-name]> | mac-address [mac-addresses] | statistics <interface interface-name>)`

**Release Information** Command introduced in Junos OS Release 9.0 for EX Series switches.  
**firewall** option added in Junos OS Release 9.5 for EX Series switches.  
 Command introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.  
 Command introduced in Junos OS Release 14.1X53-D30 for the QFX Series.  
 Support for **eapol-block** introduced in Junos OS Releases 14.1X53-D40 and 15.1X53-D51 for EX Series switches.

**Description** Reset the authentication state of an interface or delete 802.1X statistics from the switch. When you reset an interface using the **interface** or **mac-address** options, reauthentication on the interface is also triggered. The switch sends out a multicast message on the interface to restart the authentication of all connected supplicants. If a MAC address is reset, then the switch sends out a unicast message to that specific MAC address to restart authentication.

If a supplicant is sending traffic when the **clear dot1x interface** command is issued, the authenticator immediately initiates reauthentication. This process happens quickly, and it might seem that reauthentication did not occur. To verify that reauthentication has happened, issue the **show dot1x interface detail** command. The values for **Reauthentication due** and **Reauthentication interval** will be about the same.

**CAUTION:** When you clear the learned MAC addresses from an interface using the **clear dot1x interface** command, all MAC addresses are cleared, including those in static MAC bypass list.

If you have enabled Media Access Control Security (MACsec) using static secure association key (SAK) security mode on an EX Series switch, the SAKs are rotated when the **clear dot1x** command is entered. The **clear dot1x** command has no impact on MACsec when MACsec is enabled using static connectivity association keys (CAK) or any other security mode.

**Options** **eapol-block**—Clear EAPOL block on the interface and allow the switch to receive EAPOL messages from a supplicant connected to that interface.

**firewall <counter-name>**—Clear 802.1X firewall counter statistics. If the *counter-name* option is specified, clear 802.1X firewall statistics for that counter.

**interface <[interface-name]>**—Reset the authentication state of all the supplicants (also, clears all the authentication bypassed clients) connected to the specified

interface (when the interface is an authenticator) or reset the authentication state for the interface itself (when the interface is a supplicant).

**mac-address** [*mac-addresses*]  
—Reset the authentication state of the specified MAC addresses.

**statistics** <interface *interface-name*>  
—Clear 802.1X statistics on all 802.1X-enabled interfaces. If the **interface** option is specified, clear 802.1X firewall statistics for that interface or interfaces.

**Required Privilege Level**

## clear security pki local-certificate

---

**Syntax** clear security pki local-certificate  
<all | certificate-id *certificate-id-name* | system-generated>

**Release Information** Command introduced in Junos OS Release 11.1 for EX Series switches.

**Description** Delete local digital certificates, certificate requests, and the corresponding public/private key pairs from the switch.

**Options** all—(Optional) Delete all local digital certificates, certificate requests, and the corresponding public and private key pairs from the router.

**NOTE:** This option does not delete the automatically generated self-signed certificate or its public/private key pair.

---

**certificate-id** *certificate-id-name*—(Optional) Delete the specified local digital certificate and corresponding public and private key pair.

**system-generated**—(Optional) Delete the automatically generated self-signed certificate.

**Required Privilege Level** clear

**Related Documentation**

- [Deleting Self-Signed Certificates \(CLI Procedure\) on page 249](#)

**List of Sample Output** [clear security pki local-certificate all on page 1556](#)

**Output Fields** This command produces no output.

### Sample Output

clear security pki local-certificate all

```
user@switch> clear security pki local-certificate all
```

## clear security ssh key-pair-identity

<b>Syntax</b>	clear security ssh key-pair-identity <all>   <identity-name>
<b>Release Information</b>	Command introduced in Junos OS Release 15.1X49-D70.
<b>Description</b>	Clear private and public SSH key pair for the specified files.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>all</b>— Clear all the key-pair files.</li> <li>• <b>identity-name</b>—Clear identity name.</li> </ul>
<b>Required Privilege Level</b>	clear

## request dhcp client renew

---

<b>Syntax</b>	<code>request dhcp client renew</code> <code>[all interface &lt;interface-name&gt;]</code> <code>routing-instance &lt;routing-instance-name&gt;</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X44-D10 for SRX300, SRX320, SRX340, SRX345, SRX550M, and SRX1500 devices.
<b>Description</b>	Initiates a renew request for the specified clients if they are in the bound state.
<b>Options</b>	<p><b>all</b>—Initiate renew requests for all DHCP clients. If you specify a routing instance, renew requests are initiated for all DHCP clients within that routing instance.</p> <p><b>interface &lt;interface-name&gt;</b>—Initiate renew requests for DHCP clients on the specified interface.</p> <p><b>routing-instance &lt;routing-instance-name&gt;</b>—Initiate renew requests for DHCP clients in the specified routing instance. If you do not specify a routing instance, renew requests are initiated on the default routing instance.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">request dhcpv6 client renew on page 1569</a></li></ul>
<b>Output Fields</b>	This command produces no output.

## request dhcp server reconfigure

**Syntax** `request dhcp server reconfigure (all | address | interface interface-name | logical-system logical-system-name | routing-instance routing-instance-name)`

**Release Information** Command introduced in Junos OS Release 10.0.  
Command introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** Initiate reconfiguration processing for the specified DHCP clients if they are in the bound state. If the clients are in the reconfiguring state, this command has no effect. If the clients are in any state other than bound or reconfiguring, this command has the same effect as the **clear dhcp server binding** command.

When the local server state machine starts the reconfiguration process on a bound client, the client transitions to the reconfiguring state and the local server sends a forcerenew message to the client. Because the client was in the bound state before entering the reconfiguring state, all subscriber (or DHCP client) services, such as forwarding and statistics, continue to work. An exponential back-off timer determines the interval at which the forcerenew message is sent. If the final attempt is unsuccessful, the client is returned to its original state by default. You can optionally include the **clear-on-abort** statement to configure the client to be cleared when reconfiguration fails.

**Options** **all**—Initiate reconfiguration for all DHCP clients.

***address***—Initiate reconfiguration for DHCP client with the specified IP address or MAC address.

**interface *interface-name***—Initiate reconfiguration for all DHCP clients on this logical interface (clients whose initial login requests were received over the specified interface).

**NOTE:** You cannot use the interface *interface-name* option with the **request dhcp server reconfigure** command for DHCP passive clients (clients that are added as a result of DHCP snooped packets). For passive clients, the interface is not guaranteed to be the next-hop interface to the client, as is the case for active clients.

**logical-system *logical-system-name***—Initiate reconfiguration for all DHCP clients on the specified logical system.

**routing-instance *routing-instance-name***—Initiate reconfiguration reconfigured for all DHCP clients in the specified routing instance.

**Required Privilege Level** view

user@host> request message message "Maintenance window in 10 minutes" user maria
Message from user@host on tty0 at 20:27 ...
Maintenance window in 10 minutes
EOF
```

## request security certificate enroll (Signed)

**Syntax** `request security certificate enroll filename filename subject subject  
alternative-subject alternative-subject certification-authority certification-authority encoding  
(binary | pem) key-file key-file domain-name domain-name`

**Release Information** Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** (Encryption interface on M Series and T Series routers and EX Series switches only)  
Obtain a signed certificate from a certificate authority (CA). The signed certificate validates the CA and the owner of the certificate. The results are saved in a specified file to the `/var/etc/ikecert` directory.

**NOTE:** For FIPS mode, the digital security certificates must be compliant with the National Institute of Standards and Technology (NIST) SP 800-131A standard. The `request security key-pair` command is deprecated and not available with Junos in FIPS mode because it generates RSA and DSA keys with sizes of 512 and 1024 bits that are not compliant with the NIST SP 800-131A standard.

**Options** `filename filename`—File that stores the certificate.

`subject subject`—Distinguished name (**dn**), which consists of a set of components—for example, an organization (**o**), an organization unit (**ou**), a country (**c**), and a locality (**l**).

`alternative-subject alternative-subject`—Tunnel source address.

`certification-authority certification-authority`—Name of the certificate authority profile in the configuration.

`encoding (binary | pem)`—File format used for the certificate. The format can be a binary file or privacy-enhanced mail (PEM), an ASCII base64-encoded format. The default format is binary.

`key-file key-file`—File containing a local private key.

`domain-name domain-name`—Fully qualified domain name.

**Required Privilege Level** maintenance

**List of Sample Output** `request security certificate enroll filename subject alternative-subject  
certification-authority key-file domain-name (Signed) on page 1573`

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

`request security certificate enroll filename subject alternative-subject certification-authority key-file domain-name (Signed)`

```
user@host> request security certificate enroll filename host.crt subject c=uk,o=london  
alternative-subject 10.50.1.4 certification-authority verisign key-file host-1.prv domain-name  
host.example.com
```

```
CA name: example.com CA file: ca_verisign  
local pub/private key pair: host.prv  
subject: c=uk,o=london domain name: host.example.com  
alternative subject: 10.50.1.4  
Encoding: binary  
Certificate enrollment has started. To view the status of your enrollment, check  
the key management process (kmd) log file at /var/log/kmd. <-----
```

## request security certificate enroll (Unsigned)

---

<b>Syntax</b>	<code>request security certificate enroll filename <i>filename</i> ca-file <i>ca-file</i> ca-name <i>ca-name</i> encoding (binary   perm) url <i>url</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	(Encryption interface on M Series and T Series routers and EX Series switches only) Obtain a certificate from a certificate authority (CA). The results are saved in a specified file to the <code>/var/etc/ikecert</code> directory.
<b>Options</b>	<b>filename <i>filename</i></b> —File that stores the public key certificate.  <b>ca-file <i>ca-file</i></b> —Name of the certificate authority profile in the configuration.  <b>ca-name <i>ca-name</i></b> —Name of the certificate authority.  <b>encoding (binary   pem)</b> —File format used for the certificate. The format can be a binary file or privacy-enhanced mail (PEM), an ASCII base64-encoded format. The default value is <b>binary</b> .  <b>url <i>url</i></b> —Certificate authority URL.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">request security certificate enroll filename ca-file ca-name url (Unsigned) on page 1574</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request security certificate enroll filename ca-file ca-name url (Unsigned)

```
user@host> request security certificate enroll filename ca_verisign ca-file verisign ca-name
example.com urlxyzcompany URL

http://<verisign ca-name xyzcompany url>/cgi-bin/pkiclient.exe CA name: example.com
CA file: verisign Encoding: binary
Certificate enrollment has started. To view the status of your enrollment, check
the key management process (kmd) log file at /var/log/kmd. <-----
```

## request security key-pair

**Syntax** `request security key-pair filename`  
`<size key-size>`  
`<type (rsa | dsa)>`

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** (Encryption interface on M Series and T Series routers and EX Series switches only)  
 Generate a public and private key pair for a digital certificate.

**NOTE:** The `request security-certificates` command is deprecated and are not available with Junos in FIPS mode because security certificates are not compliant with the NIST SP 800-131A standard.

**Options** *filename*—Name of a file in which to store the key pair.

*size key-size*—(Optional) Key size, in bits. The key size can be **512**, **1024**, or **2048**. The default value is **1024**.

*type*—(Optional) Algorithm used to encrypt the key:

- **rsa**—RSA algorithm. This is the default.
- **dsa**—Digital signature algorithm with Secure Hash Algorithm (SHA).

**Required Privilege Level** maintenance

**List of Sample Output** [request security key-pair on page 1575](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

`request security key-pair`

```
user@host> request security key-pair security-key-file
```

## request security pki generate-key-pair

---

<b>Syntax</b>	<code>request security pki generate-key-pair certificate-id <i>certificate-id-name</i></code> <code>&lt;size (512   1024   2048)&gt;</code> <code>&lt;type (dsa   rsa)&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for EX Series switches.
<b>Description</b>	Generate a public key infrastructure (PKI) public/private key pair for a local digital certificate.
<b>Options</b>	<p><b>certificate-id <i>certificate-id-name</i></b>—Name of the local digital certificate and the public/private key pair.</p> <p><b>size</b>—(Optional) Key pair size. The key pair size can be <b>512</b>, <b>1024</b>, or <b>2048</b> bits. If a key pair size is not specified, the default value, <b>1024</b> bits, is applied.</p> <p><b>type</b>—(Optional) The algorithm to be used for encrypting the public/private key pair. The encryption algorithm can be <b>dsa</b> or <b>rsa</b>. If an encryption algorithm is not specified, the default value, <b>rsa</b>, is applied.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Manually Generating Self-Signed Certificates on Switches (CLI Procedure) on page 250</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request security pki generate-key-pair on page 1576</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request security pki generate-key-pair

```
user@switch> request security pki generate-key-pair certificate-id billy size 2048
Generated key pair billy, key size 2048 bits
```

## request security pki local-certificate generate-self-signed

<b>Syntax</b>	<code>request security pki local-certificate generate-self-signed certificate-id <i>certificate-id-name</i> domain-name <i>domain-name</i> ip-address <i>ip-address</i> email <i>email-address</i> subject <i>subject-distinguished-name</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for EX Series switches.
<b>Description</b>	Manually generate a self-signed certificate for the given distinguished name.
<b>Options</b>	<p><b>certificate-id <i>certificate-id-name</i></b>—Name of the local digital certificate and the public/private key pair.</p> <p><b>domain-name <i>domain-name</i></b>—Fully qualified domain name (FQDN). The FQDN provides the identity of the certificate owner for Internet Key Exchange (IKE) negotiations and provides an alternative to the subject name.</p> <p><b>email <i>email-address</i></b>—E-mail address of the certificate holder.</p> <p><b>ip-address <i>ip-address</i></b>—IP address of the switch.</p> <p><b>subject <i>subject-distinguished-name</i></b>—Distinguished name format that contains the common name, department, company name, state, and country:</p> <ul style="list-style-type: none"> <li>• <b>CN</b>—Common name</li> <li>• <b>OU</b>—Organizational unit name</li> <li>• <b>O</b>—Organization name</li> <li>• <b>ST</b>—State</li> <li>• <b>C</b>—Country</li> </ul>
<b>Required Privilege Level</b>	<p>maintenance</p> <p>security</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Manually Generating Self-Signed Certificates on Switches (CLI Procedure) on page 250</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request security pki local-certificate generate-self-signed on page 1578</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request security pki local-certificate generate-self-signed

```
user@switch> request security pki local-certificate generate-self-signed certificate-id self-cert  
subject cn=abc domain-name abc.net email jdoe@abc.net  
Self-signed certificate generated and loaded successfully
```

## request security ssh key-pair-identity generate

**Syntax** `request security ssh key-pair-identity generate <identity-name> passphrase passphrase`

**Release Information** Command introduced in Junos OS Release 15.1X49-D70.

**Description** Generate the SSH private and public key pair for a specified identity. The private and public key files are stored in the `/var/db` directory, which is accessible through root only. Filenames are based on the **identity-name** with extensions. The files are similar to the certificate files that are stored in Junos OS.

- Options**
- **identity-name**—Identity name.
  - **passphrase *passphrase***— An SSH identity generated with a passphrase. The passphrase is used to protect the private key file stored in the file system. This option does not allow the user to enter a weak passphrase, which ensures stronger security. A private key is used to connect to a remote server and is never displayed or transferred between servers, even if the system is compromised. The private key cannot be used to connect to a remote server if the passphrase is not known.

**NOTE:** By default, the **passphrase** uses Advanced Encryption Standard (AES) 128 in cipher block chaining (CBC) mode to encrypt a private key. All generated keys are stored in the `/var/db/ssh_key` directory.

**Required Privilege Level** maintenance

- Related Documentation**
- [show security ssh key-pair-identity on page 1784](#)
  - [clear security ssh key-pair-identity on page 1557](#)

**List of Sample Output** [request security ssh key-pair-identity with passphrase on page 1579](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

`request security ssh key-pair-identity with passphrase`

```
user@host> request security ssh key-pair-identity generate myident passphrase 1q2w3e
Created SSH key myident
```

## request security tpm master-encryption-password set

---

<b>Syntax</b>	<code>request security tpm master-encryption-password set plain-text-password</code>
<b>Release Information</b>	Command introduced in Junos OS Release 15.1X49-D80.
<b>Description</b>	Use this command to set or replace the password (in plain text).
<b>Options</b>	<b>plain-text-password</b> —Set or replace the password (in plain text).
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show security tpm status on page 1782</a></li></ul>
<b>List of Sample Output</b>	<a href="#">show security tpm status on page 1580</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### show security tpm status

```
user@host> request security tpm master-encryption-password set plain-text-password

Enter new master encryption password:
Repeat new master encryption password:
Binding password with TPM
Master encryption password is bound to TPM
Encoding master password ..
Successfully encoded master password
Encrypted key-pair files
```

## request system autorecovery state

<b>Syntax</b>	<code>request system autorecovery state (save   recover   clear)</code>
<b>Release Information</b>	Command introduced in Junos OS Release 15.1X49-D35 for SRX300, SRX320, SRX345, and SRX550M devices.
<b>Description</b>	Prepare the system for autorecovery of configuration, licenses, and disk information.
<b>Options</b>	<p><b>save</b>—Save the current state of the disk partitioning, configuration, and licenses for autorecovery.</p> <p>The active Junos OS configuration is saved as the Junos rescue configuration, after which the rescue configuration, licenses, and disk partitioning information is saved for autorecovery. Autorecovery information must be initially saved using this command for the autorecovery feature to verify integrity of data on every bootup.</p> <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <p> <b>NOTE:</b></p> <ul style="list-style-type: none"> <li>Any recovery performed at a later stage will restore the data to the same state as it was when the save command was executed.</li> <li>A fresh rescue configuration is generated when the command is executed. Any existing rescue configuration will be overwritten.</li> </ul> </div> <p><b>recover</b>—Recover the disk partitioning, configuration, and licenses.</p> <p>After autorecovery data has been saved, the integrity of saved items is always checked automatically on every bootup. The recovery command allows you to forcibly re-run the tests at any time if required.</p> <p><b>clear</b>—Clear all saved autorecovery information.</p> <p>Only the autorecovery information is deleted; the original copies of the data used by the router are not affected. Clearing the autorecovery information also disables all autorecovery integrity checks performed during bootup.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">show system autorecovery state on page 1839</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system autorecovery state save on page 1582</a> <a href="#">request system autorecovery state recover on page 1582</a>

[request system autorecovery state clear on page 1582](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

[request system autorecovery state save](#)

```
user@host> request system autorecovery state save
Saving config recovery information
  Saving license recovery information
  Saving bsdlablel recovery information
```

## Sample Output

[request system autorecovery state recover](#)

```
user@host> request system autorecovery state recover

Configuration:

```

## Sample Output

[request system autorecovery state clear](#)

```
user@host> request system autorecovery state clear
Clearing config recovery information
  Clearing license recovery information
  Clearing bsdlablel recovery information
```

## request system decrypt password

<b>Syntax</b>	request system decrypt password
<b>Release Information</b>	Statement introduced in Junos OS Release 15.1X49-D50 for SRX Series devices. Statement introduced in Junos OS Release 16.2 for M, MX, PTX, and T Series devices.
<b>Description</b>	Use to display plain text versions of obfuscated (\$9) or encrypted (\$8) passwords. If the password was encrypted using the new \$8\$ method, you are prompted for the master password.
<b>Options</b>	<ul style="list-style-type: none"> <li><b>decrypt</b>—Decrypt a \$8\$-encrypted or \$9\$-encrypted password.</li> </ul>
<b>Required Privilege Level</b>	system
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">master-password on page 1117</a></li> <li><a href="#">Hardening Shared Secrets in Junos OS on page 153</a></li> </ul>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

```
// Decrypting a $9 password
user@host> request system decrypt password $9$ABC123
Plaintext password: mysecret
```

### Sample Output

```
// Decrypting a $8 password
user@host> request system decrypt password $8$ABC123
Master password:
Plaintext password: mysecret
(Simple passwords like "mysecret" are discouraged. This is an example only.)
```

## request system download abort

---

**Syntax** `request system download abort <download-id>`

**Release Information** Command introduced in Junos OS Release 11.2 for SRX300, SRX320, SRX340, SRX345, and SRX550M devices.  
Command introduced in Junos OS Release 13.2X50-D15 for EX Series switches.

**Description** Abort a download. The download instance is stopped and cannot be resumed. Any partially downloaded file is automatically deleted to free disk space. Information regarding the download is retained and can be displayed with the **show system download** command until a **request system download clear** operation is performed.

**NOTE:** Only downloads in the active, paused, and error states can be aborted.

**Options** `download-id`—(Required) The ID number of the download to be aborted.

**Required Privilege Level** maintenance

**Related Documentation**

- [request system download start on page 1588](#)
- [request system download pause on page 1586](#)
- [request system download resume on page 1587](#)
- [request system download clear on page 1585](#)

**List of Sample Output** [request system download abort on page 1584](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### request system download abort

```
user@host> request system download abort 1
Aborted download #1
```

## request system download clear

<b>Syntax</b>	request system download clear
<b>Release Information</b>	Command introduced in Junos OS Release 11.2 for SRX300, SRX320, SRX340, SRX345, and SRX550M devices. Command introduced in Junos OS Release 13.2X50-D15 for EX Series switches.
<b>Description</b>	Delete the history of completed and aborted downloads.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request system download start on page 1588</a></li> <li>• <a href="#">request system download pause on page 1586</a></li> <li>• <a href="#">request system download resume on page 1587</a></li> <li>• <a href="#">request system download abort on page 1584</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system download clear on page 1585</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system download clear

```
user@host> request system download clear
Cleared information on completed and aborted downloads
```

## request system download pause

---

<b>Syntax</b>	<code>request system download pause &lt;download-id&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.2 for SRX300, SRX320, SRX340, SRX345, and SRX550M devices. Command introduced in Junos OS Release 13.2X50-D15 for EX Series switches.
<b>Description</b>	Suspend a particular download instance.
	<div> <b>NOTE:</b> Only downloads in the active state can be paused.</div>
<b>Options</b>	<b>download-id</b> —(Required) The ID number of the download to be paused.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">request system download start on page 1588</a></li><li>• <a href="#">request system download resume on page 1587</a></li><li>• <a href="#">request system download abort on page 1584</a></li><li>• <a href="#">request system download clear on page 1585</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request system download pause on page 1586</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system download pause

```
user@host> request system download pause 1
Paused download #1
```

## request system download resume

<b>Syntax</b>	<code>request system download resume <i>download-id</i> &lt;max-rate&gt;</code>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 11.2 for SRX300, SRX320, SRX340, SRX345, and SRX550M devices.</p> <p>Command introduced in Junos OS Release 13.2X50-D15 for EX Series switches.</p>
<b>Description</b>	<p>Resume a download that has been paused. Download instances that are not in progress because of an error or that have been explicitly paused by the user can be resumed by the user. The file will continue downloading from the point where it paused. By default, the download resumes with the same bandwidth specified with the <b>request system download start</b> command. The user can optionally specify a new (maximum) bandwidth with the <b>request system download resume</b> command.</p>
	<p> <b>NOTE:</b> Only downloads in the paused and error states can be resumed.</p>
<b>Options</b>	<p><b>download-id</b>—(Required) The ID number of the download to be resumed.</p> <p><b>max-rate</b>—(Optional) The maximum bandwidth for the download.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request system download start on page 1588</a></li> <li>• <a href="#">request system download pause on page 1586</a></li> <li>• <a href="#">request system download abort on page 1584</a></li> <li>• <a href="#">request system download clear on page 1585</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system download resume on page 1587</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system download resume

```
user@host> request system download resume 1
Resumed download #1
```

## request system download start

<b>Syntax</b>	<code>request system download start (sftp-url   delay   identity-file   login   max-rate   passphrase   save as )</code>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 11.2 for SRX300, SRX320, SRX340, SRX345, and SRX550M devices.</p> <p>Command introduced in Junos OS Release 13.2X50-D15 for EX Series switches.</p>
<b>Description</b>	Create a download instance and identify it with a unique integer called the download ID.
<b>Options</b>	<p><b>sftp-url</b>—(Required) The FTP or HTTP URL location of the file to be downloaded securely.</p> <p><b>delay</b>—(Optional) The number of hours after which the download should start (range from 1 through 48 hours).</p> <p><b>identity-file</b>—(Required) The name of the file requesting a Secure FTP (SFTP) download. The SFTP in smart download leverages public key authentication to authenticate a download request. Users need to generate a private or public key pair before starting a download, and then upload a public key to an SFTP server.</p> <p><b>login</b>—(Optional) The username and password for the server in the format <code>username:password</code>.</p> <p><b>max-rate</b>—(Optional) The maximum average bandwidth for the download. Numbers with the suffix k or K, m or M, and g or G are interpreted as Kbps, Mbps, or Gbps, respectively.</p> <p><b>passphrase</b>—(Required) The passphrase to protect the private key file stored on the file system. This option does not allow the user to enter a weak passphrase, which ensures stronger security.</p> <p><b>save-as</b>—(Optional) The filename to be used for saving the file in the <code>/var/tmp</code> location.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request system download pause on page 1586</a></li> <li>• <a href="#">request system download resume on page 1587</a></li> <li>• <a href="#">request system download abort on page 1584</a></li> <li>• <a href="#">request system download clear on page 1585</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system download start on page 1589</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system download start

```
user@host> request system download start identity-file mytestkey  
sftp://mysftpserver/homes/kelly/test.tgz max-rate 200 save as newfile.tgz  
Starting download #8
```

## request system firmware upgrade

<b>Syntax</b>	<code>request system firmware upgrade</code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.2.
<b>Description</b>	Upgrade firmware on a system.
<b>Options</b>	<p><b>fpc</b>—Upgrade FPC ROM monitor.</p> <p><b>pic</b>—Upgrade PIC firmware.</p> <p><b>re</b>—Upgrade baseboard BIOS/FPGA. There is an active BIOS image and a backup BIOS image.</p> <ul style="list-style-type: none"> <li>• <b>bios</b>—(Optional) Upgrade BIOS.</li> <li>• <b>fpga</b>—(Optional) Upgrade baseboard FPGA.</li> <li>• <b>ssd</b>—(Optional) Upgrade Routing Engine solid-state drive (SSD) firmware.</li> </ul> <p><b>disk1</b>—Upgrade SSD disk1 firmware.</p> <p><b>disk2</b>—Upgrade SSD disk2 firmware.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>NOTE:</b> Starting in Junos OS Release 17.2R1, you can upgrade the SSD firmware on MX Series routers with the RE-S-X6-64G and RE-MX2K-X8-64G Routing Engines.</p> </div> <p><b>vcpu</b>—Upgrade VCPU ROM monitor.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request system license update on page 1592</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system firmware upgrade on page 1590</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### request system firmware upgrade

```
user@host> request system firmware upgrade re bios
```

Part	Type	Tag	Current version	Available version	Status
Routing Engine 0	RE BIOS	0	1.5	1.9	OK
Routing Engine 0	RE BIOS Backup	1	1.7	1.9	OK

Perform indicated firmware upgrade ? [yes,no] (no) yes

user@host> request system firmware upgrade re bios backup

Part	Type	Tag	Current version	Available version	Status
Routing Engine 0	RE BIOS	0	1.5	1.9	OK
Routing Engine 0	RE BIOS Backup	1	1.7	1.9	OK

Perform indicated firmware upgrade ? [yes,no] (no) yes

user@host> request system firmware upgrade re ssd disk1

Part	Type	Tag	Current version	Available version	Status
Routing Engine 0	RE SSD1	4	12028	12029	OK

Perform indicated firmware upgrade ? [yes,no] (no) yes

Firmware upgrade initiated, use "show system firmware" to monitor status.

## request system license update

<b>Syntax</b>	<code>request system license update</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.5.
<b>Description</b>	Starts autoupdating license keys from the license portal.
	<p> <b>NOTE:</b></p> <ul style="list-style-type: none"> <li>The <code>request system license update</code> command always uses the default Juniper license server: <a href="https://ae1.juniper.net/">https://ae1.juniper.net/</a>.</li> <li>The <code>request system license update</code> command is supported only on SRX, vSRX, and QFX Series devices.</li> </ul> <p> <b>NOTE:</b> The products supported by the <a href="#">Juniper Agile Licensing (JAL)</a> portal includes: QFX series, SRX Series, EX Series, NFX, vBNG, vMX, vSRX, and ACX. For other Juniper products (SPACE, JSA, SBR Carrier, Screen OS and so on) access the <a href="#">License Management System (LMS)</a>.</p>
<b>Options</b>	<code>trial</code> —Immediately updates trial license keys from the license portal.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">request system license update on page 1592</a> <a href="#">request system license update trial on page 1592</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system license update

```
user@host> request system license update
```

```
Trying to update license keys from https://ae1.juniper.net has been sent, use
show system license to check status.
```

### request system license update trial

```
user@host> request system license update trial
```

Request to automatically update trial license keys from <https://ae1.juniper.net> has been sent, use `show system license` to check status.

## request system reboot

<b>List of Syntax</b>	<a href="#">Syntax on page 1594</a> <a href="#">Syntax (EX Series Switches and EX Series Virtual Chassis) on page 1594</a> <a href="#">Syntax (MX Series Routers and MX Series Virtual Chassis, EX9200 Switches and EX9200 Virtual Chassis) on page 1594</a> <a href="#">Syntax (QFabric Systems) on page 1594</a> <a href="#">Syntax (QFX Series Switches and QFX Series Virtual Chassis, Virtual Chassis Fabric) on page 1595</a> <a href="#">Syntax (TX Matrix Router) on page 1595</a> <a href="#">Syntax (TX Matrix Plus Router) on page 1595</a>
<b>Syntax</b>	<pre>request system reboot &lt;at <i>time</i>&gt; &lt;both-routing-engines&gt; &lt;in <i>minutes</i>&gt; &lt;media (compact-flash   disk   removable-compact-flash   usb)&gt; &lt;message "<i>text</i>"&gt; &lt;other-routing-engine&gt;</pre>

Syntax (TX Matrix Plus Router)	<pre> request system reboot &lt;all-chassis   all-lcc   lcc number   sfc number&gt; &lt;at time&gt; &lt;both-routing-engines&gt; &lt;in minutes&gt; &lt;media (compact-flash   disk)&gt; &lt;message "text"&gt; &lt;other-routing-engine&gt; &lt;partition (1   2   alternate)&gt; </pre>
Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Option <b>other-routing-engine</b> introduced in Junos OS Release 8.0.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Option <b>sfc</b> introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Option <b>partition</b> changed to <b>slice</b> in Junos OS Release 10.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Option <b>both-routing-engines</b> introduced in Junos OS Release 12.1.</p>
Description	<p>Reboot the software.</p> <p>This command can be used on standalone devices and on devices supported in a Virtual Chassis, Virtual Chassis Fabric, or QFabric system.</p>

**NOTE:** Starting with Junos OS Release 15.1F3, the statement `request system reboot` reboots only the guest operating system on the PTX5000 with RE-PTX-X8-64G and, MX240, MX480, and MX960 with RE-S-X6-64G.

Starting with Junos OS Release 15.1F5, the statement `request system reboot` reboots only the guest operating system on the MX2010, and MX2020 with REMX2K-X8-64G.

**NOTE:** Starting from Junos OS Release 17.2R1, PTX10008 routers do not support the `request system reboot` command. Starting from Junos OS Release 17.4R1, PTX10016 routers do not support the `request system reboot` command. Use the `request vmhost reboot` command instead of the `request system reboot` command on the PTX10008 and PTX10016 routers to reboot the Junos OS software package or bundle on the router. See *request vmhost reboot*.

**NOTE:** On a QFabric system, to avoid traffic loss on the network Node group, switch mastership of the Routing Engine to the backup Routing Engine, and then reboot.

**Options** The options described here are not all supported on every platform or release of Junos OS. Refer to the Syntax sections for the options commonly available on each type of platform.

**none**—Reboot the software immediately.

**all-chassis**—(Optional) On a TX Matrix router or TX Matrix Plus router, reboot all routers connected to the TX Matrix or TX Matrix Plus router, respectively.

**all-lcc**—(Optional) On a TX Matrix router or TX Matrix Plus router, reboot all line card chassis connected to the TX Matrix or TX Matrix Plus router, respectively.

**all-members | local | member *member-id***—(Optional) Specify which member of the Virtual Chassis to reboot:

- **all-members**—Reboots each switch that is a member of the Virtual Chassis.
- **local**—Reboots only the local switch (switch where you are logged in).
- **member *member-id***—Reboots the specified member switch of the Virtual Chassis

**at *time***—(Optional) Time at which to reboot the software, specified in one of the following ways:

- **now**—Stop or reboot the software immediately. This is the default.
- **+minutes**—Number of minutes from now to reboot the software.
- **yymmddhhmm**—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.
- **hh:mm**—Absolute time on the current day at which to stop the software, specified in 24-hour time.

**both-routing-engines**—(Optional) Reboot both Routing Engines at the same time.

**hypervisor**—(Optional) Reboot Junos OS, host OS, and any installed guest VMs.

**in minutes**—(Optional) Number of minutes from now to reboot the software. This option is an alias for the **at +minutes** option.

**junos**—(Optional) Reboot from the Junos OS (main) volume.

**lcc number**—(Optional) Line-card chassis (LLC) number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**media (compact-flash | disk | removable-compact-flash | usb)**—(Optional) Use the indicated boot medium for the next boot.

**media (external | internal)**—(Optional) Use the indicated boot medium for the next boot:

- **external**—Reboot the device using a software package stored on an external boot source, such as a USB flash drive.
- **internal**—Reboot the device using a software package stored in an internal memory source.

**message "text"**—(Optional) Message to display to all system users before stopping or rebooting the software.

**network**—(Optional) Reboot using the Preboot Execution Environment (PXE) boot method over the network.

**oam**—(Optional) Reboot from the maintenance volume (OAM volume, usually the compact flash drive).

**other-routing-engine**—(Optional) Reboot the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is rebooted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is rebooted.

**partition *partition***—(Optional) Reboot using the specified partition on the boot media. This option is equivalent to the **slice** option that is supported on some devices. Specify one of the following *partition* values:

- 1—Reboot from partition 1.
- 2—Reboot from partition 2.
- **alternate**—Reboot from the alternate partition.

**scc**—(Optional) Reboot the Routing Engine on the TX Matrix switch-card chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted.

**sfc *number***—(Optional) Reboot the Routing Engine on the TX Matrix Plus switch-fabric chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted. Replace *number* with 0.

**slice *slice***—(Optional) Reboot using the specified partition on the boot media. This option was originally the **partitiion** option but was renamed to **slice** on EX Series and QFX Series switches. Specify one of the following *slice* values:

- 1—Reboot from partition 1.
- 2—Reboot from partition 2.
- **alternate**—Reboot from the alternate partition (which did not boot the switch at the last bootup).

**NOTE:** The slice option is not supported on QFX Series switches that have no alternate slice when Junos OS boots as a Virtual Machine (VM). To switch to the previous version of Junos OS, issue the **request system software rollback** command.

---

**usb**—(Optional) Reboot from a USB device.

The following options are available only on QFabric Systems:

**all**—(Optional) Reboots the software on the Director group, fabric control Routing Engines, fabric manager Routing Engines, Interconnect devices, and network and server Node groups.

**director-device *name***—(Optional) Reboots the software on the Director device and the default partition (QFabric CLI).

**director-group**—(Optional) Reboots the software on the Director group and the default partition (QFabric CLI).

**fabric**—(Optional) Reboots the fabric control Routing Engines and the Interconnect devices.

**node-group *name***—(Optional) Reboots the software on a server Node group or a network Node group.

**graceful**—(Optional) Enables the QFabric component to reboot with minimal impact to network traffic. This sub-option is only available for the **all**, **fabric**, and **director-group** options.

**Additional Information** Reboot requests are recorded in the system log files, which you can view with the **show log** command (see *show log*). Also, the names of any running processes that are scheduled to be shut down are changed. You can view the process names with the **show system processes** command (see *show system processes*).

On a TX Matrix or TX Matrix Plus router, if you issue the **request system reboot** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are rebooted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are rebooted.

**NOTE:** Before issuing the **request system reboot** command on a TX Matrix Plus router with no options or the **all-chassis**, **all-lcc**, **lcc *number***, or **sfc** options, verify that master Routing Engine for all routers in the routing matrix are in the same slot number. If the master Routing Engine for a line-card chassis is in a different slot number than the master Routing Engine for a TX Matrix Plus router, the line-card chassis might become logically disconnected from the routing matrix after the **request system reboot** command.

**NOTE:** To reboot a router that has two Routing Engines, reboot the backup Routing Engine (if you have upgraded it) first, and then reboot the master Routing Engine.

**Required Privilege Level** maintenance

**Related Documentation**

- *clear system reboot*
- *request system halt*

- [Routing Matrix with a TX Matrix Plus Router Solutions Page](#)
- `request vmhost reboot`

**List of Sample Output**

- [request system reboot on page 1600](#)
- [request system reboot \(at 2300\) on page 1600](#)
- [request system reboot \(in 2 Hours\) on page 1600](#)
- [request system reboot \(Immediately\) on page 1600](#)
- [request system reboot \(at 1:20 AM\) on page 1600](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### `request system reboot`

```
user@host> request system reboot
Reboot the system ? [yes,no] (no)
```

### `request system reboot (at 2300)`

```
user@host> request system reboot at 2300 message ?Maintenance time!?
Reboot the system ? [yes,no] (no) yes

shutdown: [pid 186]
*** System shutdown message from root@test.example.net ***
System going down at 23:00
```

### `request system reboot (in 2 Hours)`

The following example, which assumes that the time is 5 PM (17:00), illustrates three different ways to request the system to reboot in two hours:

```
user@host> request system reboot at +120
user@host> request system reboot in 120
user@host> request system reboot at 19:00
```

### `request system reboot (Immediately)`

```
user@host> request system reboot at now
```

### `request system reboot (at 1:20 AM)`

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system reboot at 06060120

request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

## request system reboot (SRX Series)

**Syntax** `request system reboot <at time> <in minutes> <media> <message "text">`

**Release Information** Command introduced in Junos OS Release 10.1.  
 Command **hypervisor** option introduced in Junos OS Release 15.1X49-D10 for vSRX.  
 Command introduced in Junos OS Release 15.1X49-D50 for SRX1500 devices.

**Description** Reboot the software.

- Options**
- *at time* (Optional)— Specify the time at which to reboot the device. You can specify time in one of the following ways:
    - *now*— Reboot the device immediately. This is the default.
    - *+minutes*— Reboot the device in the number of minutes from now that you specify.
    - *yymmddhhmm*— Reboot the device at the absolute time on the date you specify. Enter the year, month, day, hour (in 24-hour format), and minute.
    - *hh:mm*— Reboot the device at the absolute time you specify, on the current day. Enter the time in 24-hour format, using a colon (:) to separate hours from minutes.
  - *in minutes* (Optional)— Specify the number of minutes from now to reboot the device. This option is a synonym for the *at +minutes* option
  - *media type* (Optional)— Specify the boot device to boot the device from:
    - *disk/internal*— Reboot from the internal media. This is the default.
    - *usb*— Reboot from the USB storage device.
    - *compact flash*— Reboot from the external CompactFlash card.

**NOTE:** The *media* command option is not available on vSRX.

- *message "text"* (Optional)— Provide a message to display to all system users before the device reboots.

Example: **request system reboot at 5 in 50 media internal message stop**

**Required Privilege Level** maintenance

**Related Documentation**

- [request system software rollback \(SRX Series\) on page 1608](#)

## request system services dhcp

---

Syntax	<code>request system services dhcp (release <i>interface-name</i>   renew <i>interface-name</i>)</code>
Release Information	Command introduced in Junos OS Release 8.5.
Description	<p>Release or renew the acquired IP address for a specific interface.</p> <p>To view the status of the Dynamic Host Configuration Protocol (DHCP) clients on the specified interfaces, enter the <b>show system services dhcp client <i>interface-name</i></b> command.</p>
Options	<ul style="list-style-type: none"><li>• <b>release <i>interface-name</i></b> —Clears other resources received earlier from the server, and reinitializes the client state to INIT for the particular interface.</li><li>• <b>renew <i>interface-name</i></b> —Reacquires an IP address from the server for the interface. When you use this option, the command sends a discover message if the client state is INIT and a renew request message if the client state is BOUND. For all other states it performs no action.</li></ul>
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none"><li>• <i>dhcp</i></li><li>• <a href="#">show system services dhcp client on page 1850</a></li></ul>
Output Fields	This command produces no output.

## request system snapshot (Maintenance)

**Syntax** request system snapshot  
 <config-partition>  
 <media (compact-flash | hard-disk | internal | usb)>  
 <partition>  
 <root-partition>  
 <factory>  
 <node (all | local | node-id | primary)>  
 <slice (alternate) >

**Release Information** Command introduced in Junos OS Release 10.2.

**Description** Back up the currently running and active file system partitions on the device.

- Options**
- **config-partition**— Creates a snapshot of the configuration partition only and stores it onto the default **/altconfig** on the hard disk device or an **/altconfig** on a USB device.
  - **root-partition**— Creates a snapshot of the root partition only and stores it onto the default **/altroot** on the hard disk device or an **/altroot** on a USB device.
  - **factory**— (Optional) Specifies that only the files shipped from the factory are included in the snapshot.
  - **media**—(Optional) Specify the boot device the software is copied to:
    - **compact-flash**—Copy software to the primary compact flash drive.
    - **hard-disk**— Copy software to the hard disk.
    - **usb**— Copy software to the device connected to the USB port.
    - **internal**— Copy software to an internal flash drive. This is the default option.

**NOTE:** USB option is available on all SRX series devices; hard disk and compact-flash options are available only on SRX5800, SRX5600, and SRX5400 devices; media internal option is available only on SRX300, SRX320, SRX340, SRX345, and SRX550M devices.

- **external**— Copies software to an external storage device. This option is available for the compact flash on the SRX650 Services Gateway.
- **node**—(Optional) Specify the archive data and executable areas of a specific node. If you do not specify the node option, the device considers the current node as default option.
  - **node-id**—Specify for node (0, 1).
  - **all**—Specify for all nodes.

- **local**—Specify for local nodes.
- **primary**— Specify for primary nodes.
- **partition**—(Default) Specify that the target media should be repartitioned before the backup is saved to it.

**NOTE:** The target media is partitioned whether or not it is specified in the command, because this is a mandatory option.

Example: `request system snapshot media usb partition`

Example: `request system snapshot media usb partition factory`

- **slice**—(Optional) Take a snapshot of the root partition the system has currently booted from to another slice in the same media.
- **alternate**—(Optional) Store the snapshot on the other root partition in the system.

**NOTE:** The slice option cannot be used along with the other `request system snapshot` options, because the options are mutually exclusive. If you use the `factory`, `media`, or `partition` option, you cannot use the `slice` option; if you use the `slice` option, you cannot use any of the other options.

Required Privilege Level	maintenance
List of Sample Output	<a href="#">request system snapshot config-partition on page 1604</a> <a href="#">request system snapshot root-partition on page 1605</a> <a href="#">request system snapshot media hard-disk on page 1605</a> <a href="#">request system snapshot media usb (when usb device is missing on page 1605</a> <a href="#">request system snapshot media compact-flash on page 1605</a> <a href="#">request system snapshot partition on page 1605</a>
Output Fields	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### `request system snapshot config-partition`

```
user@host> request system snapshot config-partition
Doing the initial labeling...
Verifying compatibility of destination media partitions...
Running newfs (391MB) on hard-disk media /config partition (ad1s1e)...
Copying '/dev/ad0s1e' to '/dev/ad1s1e' .. (this may take a few minutes)
The following filesystems were archived: /config

### request system snapshot partition

```

user@host> request system snapshot partition

Verifying compatibility of destination media partitions...
Running newfs (439MB) on internal media / partition (da0s1a)...
Running newfs (46MB) on internal media /config partition (da0s1e)...
Copying '/dev/da1s1a' to '/dev/da0s1a' .. (this may take a few minutes)
Copying '/dev/da1s1e' to '/dev/da0s1e' .. (this may take a few minutes)
The following filesystems were archived: / /config

```

## request system software abort in-service-upgrade (ICU)

---

Syntax	request system software abort in-service-upgrade
Release Information	Command introduced in Junos OS Release 11.2 for SRX300, SRX320, SRX340, SRX345, and SRX550M devices.
Description	Abort an in-band cluster upgrade (ICU). This command must be issued from a router session other than the one on which you issued the <b>request system in-service-upgrade</b> command that launched the ICU. If an ICU is in progress, this command aborts it. If the node is being upgraded, this command will cancel the upgrade. The command is also helpful in recovering the node in case of a failed ICU.  <div> <b>NOTE:</b> We recommend that you use the command only when there is an issue with the ongoing session of ISSU. You may need to manually intervene to bring the system to sane state if after issuing the command the system does not recover from the abort.</div>
Options	This command has no options.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"><li><a href="#">request system software in-service-upgrade (Maintenance)</a></li></ul>
List of Sample Output	<a href="#">request system software abort in-service-upgrade on page 1606</a>
Output Fields	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### request system software abort in-service-upgrade

```
user@host> request system software abort in-service-upgrade
In-Service-Upgrade aborted
```

---

## request system software add (Maintenance)

---

Syntax	<code>request system software add <i>package-name</i></code>
Release Information	Partition option introduced in the command in Junos OS Release 10.1.
Description	Install the new software package on the device, for example: <b>request system software add junos-srxsme-10.0R2-domestic.tgz no-copy no-validate partition reboot</b> .
Options	<ul style="list-style-type: none"><li>• <b>delay-restart</b>—Install the software package but does not restart the software process.</li><li>• <b>best-effort-load</b>—Activate a partial load and treat parsing errors as warnings instead of errors.</li><li>• <b>no-copy</b>—Install the software package but does not saves the copies of package files.</li><li>• <b>no-validate</b>—Do not check the compatibility with current configuration before installation starts.</li><li>• <b>partition</b>—Format and re-partition the media before installation.</li><li>• <b>reboot</b>—Reboot the device after installation is completed.</li><li>• <b>unlink</b>—Remove the software package after successful installation.</li><li>• <b>validate</b>—Check the compatibility with current configuration before installation starts.</li></ul>
Required Privilege Level	maintenance
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">request system reboot (SRX Series) on page 1601</a></li></ul>

## request system software rollback (SRX Series)

---

<b>Syntax</b>	<code>request system software rollback &lt;node-id&gt;</code>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 10.1.</p> <p>Command introduced in Junos OS Release 15.1X49-D50 for SRX1500 devices.</p> <p>Command introduced in Junos OS Release 17.4R1 for SRX4100 and SRX4200 devices.</p>
<b>Description</b>	<p>Revert to the software that was loaded at the last successful <b>request system software add</b> command. The upgraded FreeBSD 11.x (supported in Junos OS Release 17.4R1) Junos OS image provides an option to save a recovery image in an Operation, Administration, and Maintenance (OAM) partition, but that option will save only the Junos OS image, not the Linux image. If a user saves the Junos OS image and recovers it later, it might not be compatible with the Linux software loaded on the system.</p>
<b>Options</b>	<p><i>node-id</i>—Identification number of the chassis cluster node. It can be 0 or 1.</p>
<b>Required Privilege Level</b>	<p>maintenance</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">request system reboot (SRX Series) on page 1601</a></li><li>• <i>Upgrading Junos OS with Upgraded FreeBSD</i></li><li>• <i>Release Information for Junos OS with Upgraded FreeBSD</i></li><li>• <i>What Is Junos OS with Upgraded FreeBSD?</i></li></ul>

## request system zeroize

**Syntax** `request system zeroize <media>`

**Description** Erases all configuration information and resets all key values. The command removes all data files, including customized configuration and log files, by unlinking the files from their directories.

The command removes all user-created files from the system including all plain-text passwords, secrets, and private keys for SSH, local encryption, local authentication, IPsec, RADIUS, TACACS+, and SNMP.

This command reboots the device and sets it to the factory default configuration. After the reboot, you cannot access the device through the management Ethernet interface. Log in through the console as root and start the Junos OS CLI by typing `cli` at the prompt.

**Options** **media**—(Optional) In addition to removing all configuration and log files, the media option causes memory and the media to be scrubbed, removing all traces of any user-created files. Every storage device attached to the system is scrubbed, including disks, flash drives, removable USBs, and the like. The duration of the scrubbing process is dependent on the size of the media being erased. As a result, the request system zeroize media operation can take considerably more time than the request system zeroize operation. However, the critical security parameters are all removed at the beginning of the process.

**NOTE:** The media option is not supported on SRX5000 line devices.

**Required Privilege Level** Not applicable.

## Show SNMP

There are several commands that you can access in Junos OS operational mode to monitor SNMP information. Some of the commands are:

- **show snmp health-monitor**, which displays the health monitor log and alarm information.
- **show snmp mib**, which displays information from the MIBs, such as device and system information.
- **show snmp statistics**, which displays SNMP statistics such as the number of packets, silent drops, and invalid output values.
- **show snmp rmon**, which displays the RMON alarm, event, history, and log information

The following example provides sample output from the **show snmp health-monitor** command:

```
user@switch> show snmp health-monitor
```

Alarm			
Index	Variable description	Value	State
32768	Health Monitor: root file system utilization jnxHrStoragePercentUsed.1	58	active
32769	Health Monitor: /config file system utilization jnxHrStoragePercentUsed.2	0	active
32770	Health Monitor: RE 0 CPU utilization jnxOperatingCPU.9.1.0.0	0	active

```

32773 Health Monitor: RE 0 Memory utilization
      jnxOperatingBuffer.9.1.0.0                35 active

32775 Health Monitor: jkernel daemon CPU utilization
      Init daemon                             0 active
      Chassis daemon                          50 active
      Firewall daemon                         0 active
      Interface daemon                        5 active
      SNMP daemon                             11 active
      MIB2 daemon                             42 active
      ...

```

The following example provides sample output from the **show snmp mib** command:

```
user@switch> show snmp mib walk system
```

```

sysDescr.0    = Juniper Networks, Inc. qfx3500s internet router, kernel
JUNOS 11.1-20100926.0 #0: 2010-09-26 06:17:38 UTC builder@abc.example.net:

sysContact.0  = J Smith
sysName.0     = Lab QFX3500
sysLocation.0 = Lab
sysServices.0 = 4

```

The following example provides sample output from the **show snmp statistics** command:

```
user@switch> show snmp statistics
```

```

SNMP statistics:
  Input:
    Packets: 0, Bad versions: 0, Bad community names: 0,

## show captive-portal authentication-failed-users

<b>Syntax</b>	<b>show captive-portal authentication-failed-users</b>
<b>Release Information</b>	Command introduced in Junos OS Release 10.1 for EX Series switches. Command introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
<b>Description</b>	Display the users that have failed captive portal authentication.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show captive-portal interface on page 1616</a></li> <li>• <a href="#">show captive-portal firewall on page 1614</a></li> <li>• <a href="#">clear captive-portal on page 1529</a></li> <li>• <a href="#">Example: Setting Up Captive Portal Authentication on an EX Series Switch on page 361</a></li> <li>• <a href="#">Configuring Captive Portal Authentication (CLI Procedure) on page 366</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show captive-portal authentication-failed-users on page 1612</a>
<b>Output Fields</b>	<a href="#">Table 55 on page 1612</a> lists the output fields for the <b>show captive-portal authentication-failed-users</b> command. Output fields are listed in the approximate order in which they appear.

*Table 55: show captive-portal authentication-failed-users Output Fields*

Field Name	Field Description	Level of Output
<b>Interface</b>	The MAC address configured to bypass captive portal authentication.	all
<b>MAC address</b>	The MAC address configured statically on the interface.	all
<b>User</b>	Name of the user that has failed captive portal authentication.	all
<b>Failure Count</b>	The number of times that 802.1X authentication has failed on the interface.	all

## Sample Output

show captive-portal  
authentication-failed-users

```
user@host> show captive-portal authentication-failed-users
```

Interface	MAC address	User	Failure Count
ge-0/0/17.0	00:37:00:00:00:00	003700000000	28
ge-0/0/20.0	00:04:10:00:00:00	000410000000	32
ge-0/0/18.0	00:00:03:00:0a:00	000003000a00	4
ge-0/0/19.0	00:00:03:00:0b:00	000003000b00	18

## show captive-portal firewall

---

Syntax	<pre>show captive-portal firewall &lt;brief   detail&gt; &lt;interface-name&gt; &lt;interface-name detail&gt;</pre>
Release Information	Command introduced in Junos OS Release 10.1 for EX Series switches. Command introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	Display information about the firewall filters for each user that is authenticated on each captive portal interface.
Options	<p><b>none</b>—Display all the firewall filters on all captive portal interfaces.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>interface-name</b>—(Optional) Display all the terms of the firewall filters for the specified interface.</p> <p><b>interface-name detail</b>—(Optional) Display all of the terms of the firewall filters for the specified interface.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">show captive-portal authentication-failed-users on page 1612</a></li><li>• <a href="#">show captive-portal interface on page 1616</a></li><li>• <a href="#">clear captive-portal on page 1529</a></li><li>• <a href="#">Example: Setting Up Captive Portal Authentication on an EX Series Switch on page 361</a></li><li>• <a href="#">Configuring Captive Portal Authentication (CLI Procedure) on page 366</a></li></ul>
List of Sample Output	<a href="#">show captive-portal firewall brief on page 1615</a> <a href="#">show captive-portal firewall (Specific Interface) on page 1615</a> <a href="#">show captive-portal firewall on page 1615</a>
Output Fields	Output fields for the <b>show captive-portal firewall</b> command include any action modifier specified in firewall filters except policers. Policers are not supported in the terms of the internally generated dynamic firewall filters that are created when multiple supplicants authenticate on 802.1X-enabled interfaces.

## Sample Output

### show captive-portal firewall brief

```
user@switch> show captive-portal firewall brief
```

Captive Portal Information:

Interface	State	MAC address	User
ge-0/0/1.0	Connecting		
ge-0/0/10.0	Connecting	00:30:48:8c:66:bd	No User

### show captive-portal firewall (Specific Interface)

```
user@switch> show captive-portal firewall ge-0/0/10.0
```

## show captive-portal interface

---

Syntax	<b>show captive-portal interface</b> <b>&lt;interface-name&gt;</b> <b>detail</b>
Release Information	Command introduced in Junos OS Release 10.1 for EX Series switches. Command introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
Description	Display the current operational state of all captive portal interfaces with the list of connected users and the configured values of captive portal attributes on the interfaces.
Options	<b>none</b> —Display all captive portal interfaces.  <b>interface-name</b> —(Optional) Display the state for the specified captive portal interface and lists the MAC address and user names of any clients authenticated on the interface.  <b>interface-name detail</b> —(Optional) Display the configured values of captive portal attributes on the specified captive portal interface.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">show captive-portal authentication-failed-users on page 1612</a></li><li>• <a href="#">show captive-portal firewall on page 1614</a></li><li>• <a href="#">captive-portal on page 818</a></li><li>• <a href="#">clear captive-portal on page 1529</a></li><li>• <a href="#">Example: Setting Up Captive Portal Authentication on an EX Series Switch on page 361</a></li><li>• <a href="#">Configuring Captive Portal Authentication (CLI Procedure) on page 366</a></li></ul>
List of Sample Output	<a href="#">show captive-portal interface (Only Captive Portal Enabled) on page 1618</a> <a href="#">show captive-portal interface (802.1X Authentication and Captive Portal Enabled) on page 1618</a> <a href="#">show captive-portal interface detail (Only Captive Portal Enabled) on page 1618</a> <a href="#">show captive-portal interface detail (802.1X Authentication and Captive Portal Enabled) on page 1619</a>
Output Fields	<a href="#">Table 56 on page 1617</a> lists the output fields for the <b>show captive-portal interface</b> command. Output fields are listed in the approximate order in which they appear.

Table 56: show captive-portal interface Output Fields

Field Name	Field Description	Level of Output
<b>Interface</b>	Interface on which captive portal has been configured.	All levels
<b>State</b>	<p>The state of the interface:</p> <ul style="list-style-type: none"> <li>• <b>Authenticated</b>—The client has been authenticated through the RADIUS server or has been permitted access through server fail fallback.</li> <li>• <b>Authenticating</b>—The client is authenticating through the RADIUS server.</li> <li>• <b>Connecting</b>—Switch is attempting to contact the RADIUS server.</li> <li>• <b>Initialize</b>—The interface link is down.</li> <li>• <b>Held</b>—An action has been triggered through server fail fallback during a RADIUS server timeout. A supplicant is denied access, permitted access through a specified VLAN, or maintains the authenticated state granted to it before the RADIUS server timeout occurred.</li> </ul>	All levels
<b>MAC address</b>	The MAC address of the connected client on the interface..	brief
<b>User</b>	Users connected to the captive portal interface.	brief
<b>Fallen back</b>	<p>Indicates when 802.1X authentication and captive portal are both enabled on an interface:</p> <ul style="list-style-type: none"> <li>• If 802.1X authentication and captive portal are both enabled, <b>CP fallen back</b> status is <b>Yes</b>.</li> <li>• If 802.1X authentication and captive portal are not both enabled, <b>CP fallen back</b> status is <b>No</b>.</li> </ul>	
<b>Supplicant mode</b>	Mode used to authenticate clients—multiple, single, or single-supplicant.	detail
<b>Number of retries</b>	Number of times the user can attempt to submit authentication information.	detail
<b>Quiet period</b>	Time, in seconds, after a user exceeds the maximum number of retries before they can attempt to authenticate.	detail
<b>Configured CP session timeout</b>	Time, in seconds, that a client can be idle before the session expires.	detail
<b>Server timeout</b>	Time, in seconds, that an interface will wait for a reply when relaying a response from the client to the authentication server before timing out and invoking the server-fail action.	detail
<b>Configured CP User-keepalive timeout</b>	Time, in minutes, that a captive portal authentication session is extended after the MAC aging timer expires.	detail

Table 56: show captive-portal interface Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Number of connected supplicants</b>	<p>Number of users connecting through the captive portal interface. Information for each user includes:</p> <ul style="list-style-type: none"> <li><b>Supplicant</b>—User name and MAC address.</li> <li><b>Operational state</b>—See State (above).</li> <li><b>Dynamic CP session timeout</b>—Timeout value dynamically downloaded from the RADIUS server for this user, if any.</li> <li><b>CP Session expiration due in</b>—Time remaining in session.</li> <li><b>Eapol-Block</b>—Shows whether EAPOL block is in effect or not.</li> <li><b>CP Session User-keepalive Expiration due in</b>—Time, in seconds, remaining in the keep-alive period.</li> </ul>	detail

## Sample Output

### show captive-portal interface (Only Captive Portal Enabled)

```
user@switch> show captive-portal interface
```

```
Captive Portal Information:
Interface      State          MAC address    User           Fallen back
ge-0/0/1.0     Connecting
ge-0/0/10.0    Connecting     00:30:48:8c:66:bd  No User
ge-6/0/5.0     Authenticated  00:30:48:8d:7a:9b  abcdeX        No
```

### show captive-portal interface (802.1X Authentication and Captive Portal Enabled)

```
user@switch> show captive-portal interface
```

```
Captive Portal Information:
Interface      State          MAC address    User           Fallen back
ge-0/0/1.0     Connecting
ge-0/0/10.0    Connecting     00:30:48:8c:66:bd  No User
ge-6/0/5.0     Authenticated  00:30:48:8d:7a:9b  abcdeX        Yes
```

### show captive-portal interface detail (Only Captive Portal Enabled)

```
user@switch> show captive-portal interface detail ge-6/0/5.0
```

```
Supplicant mode: Multiple
Number of retries: 3
Quiet period: 60 seconds
Configured CP session timeout: 3600 seconds
Server timeout: 15 seconds
Configured CP User-keepalive timeout: 7 minutes
CP fallen back: No
Number of connected supplicants: 1
  Supplicant: abcdeX, 00:30:48:8d:7a:9b
    Operational state: Authenticated
    Dynamic CP Session Timeout: 3600 seconds
    CP Session Expiration due in: 3583 seconds
    Eapol-Block: In Effect
    CP session User-keepalive Expiration due in: 420 seconds
```

**show captive-portal interface detail (802.1X Authentication and Captive Portal Enabled)**

```
user@switch> show captive-portal interface detail ge-6/0/5.0
```

```
Supplicant mode: Multiple
Number of retries: 3
Quiet period: 60 seconds
Configured CP session timeout: 3600 seconds
Server timeout: 15 seconds
CP fallen back: Yes
Number of connected supplicants: 1
  Supplicant: abcdeX, 00:30:48:8d:7a:9b
    Operational state: Authenticated
    Dynamic CP Session Timeout: 3600 seconds

**Output Fields** For QFX Series, QFabric, NFX Series, EX4600 and OCX1100:

Table 57 on page 1621 lists the output fields for the **show ethernet-switching interfaces** command on QFX Series, QFabric, NFX Series, EX4600 and OCX1100. Output fields are listed in the approximate order in which they appear.

*Table 57: show ethernet-switching interfaces Output Fields*

Field Name	Field Description	Level of Output
<b>Interface</b>	Name of a switching interface.	All levels
<b>State</b>	Interface state. Values are <b>up</b> or <b>down</b> .	none, <b>brief</b> , <b>detail</b> , <b>summary</b>
<b>VLAN members</b>	Name of a VLAN.	none, <b>brief</b> , <b>detail</b> , <b>summary</b>
<b>Blocking</b>	Forwarding state of the interface: <ul style="list-style-type: none"> <li>• <b>blocked</b>—Traffic is not being forwarded on the interface.</li> <li>• <b>unblocked</b>—Traffic is forwarded on the interface.</li> <li>• <b>MAC limit exceeded</b>—The interface is temporarily disabled because of a MAC limiting error. The disabled interface is automatically restored to service when the disable timeout expires.</li> <li>• <b>MAC move limit exceeded</b>—The interface is temporarily disabled because of a MAC move limiting error. The disabled interface is automatically restored to service when the disable timeout expires.</li> <li>• <b>Storm control in effect</b> —The interface is temporarily disabled because of a storm control error. The disabled interface is automatically restored to service when the disable timeout expires.</li> <li>• <b>Storm control shutdown in effect</b> —The interface is temporarily disabled because of a storm control shutdown error. The disabled interface is automatically restored to service when the disable timeout expires.</li> </ul>	none, <b>brief</b> , <b>detail</b> , <b>summary</b>
<b>Index</b>	VLAN index internal to Junos OS software.	<b>detail</b>
<b>untagged   tagged</b>	Specifies whether the interface forwards IEEE802.1Q-tagged or untagged traffic.	<b>detail</b>

Output fields for EX Series:

Table 58 on page 1622 lists the output fields for the **show ethernet-switching interfaces** command on EX Series switches. Output fields are listed in the approximate order in which they appear.

*Table 58: show ethernet-switching interfaces Output Fields*

Field Name	Field Description	Level of Output
<b>Interface</b>	Name of a switching interface.	none, <b>brief</b> , <b>detail</b> , <b>summary</b>
<b>Index</b>	VLAN index internal to Junos OS.	<b>detail</b>
<b>State</b>	Interface state. Values are <b>up</b> and <b>down</b> .	none, <b>brief</b> , <b>detail</b>
<b>Port mode</b>	The <b>access</b> mode is the port mode default and works with a single VLAN. Port mode can also be <b>trunk</b> , which accepts tagged packets from multiple VLANs on other switches. The third port mode value is <b>tagged-access</b> , which accepts tagged packets from access devices.	<b>detail</b>
<b>Reflective Relay Status</b>	Reflective relay allows packets to use the same interface for both upstream and downstream traffic. When reflective relay has been configured, the status displayed is always <b>enabled</b> . When reflective relay is not configured, this entry does not appear in the command output.	<b>detail</b>
<b>Ether type for the interface</b>	Ether type is a two-octet field in an Ethernet frame used to indicate which protocol is encapsulated in the payload of an incoming Ethernet packet. Both 802.1Q packets and Q-in-Q packets use this field. The output displayed for this particular field indicates the interface's Ether type, which is used to match the Ether type of incoming 802.1Q packets and Q-in-Q packets. The indicated Ether type field is also added to the interface's outgoing 802.1Q and Q-in-Q packets.	<b>detail</b>
<b>VLAN membership</b>	Names of VLANs that belong to this interface.	none, <b>brief</b> , <b>detail</b> ,
<b>Tag</b>	Number of the 802.1Q tag.	none, <b>brief</b> , <b>detail</b> ,
<b>Tagging</b>	Specifies whether the interface forwards 802.1Q <b>tagged</b> or <b>untagged</b> traffic.	none, <b>brief</b> , <b>detail</b> ,

Table 58: show ethernet-switching interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Blocking</b>	<p>The forwarding state of the interface:</p> <ul style="list-style-type: none"> <li>• <b>unblocked</b>—Traffic is forwarded on the interface.</li> <li>• <b>blocked</b>—Traffic is not being forwarded on the interface.</li> <li>• <b>Disabled by bpdu control</b>—The interface is disabled due to receiving BPDUs on a protected interface. If the <b>disable-timeout</b> statement has been included in the BPDU configuration, the interface automatically returns to service after the timer expires.</li> <li>• <b>blocked by RTG</b>—The specified redundant trunk group is disabled.</li> <li>• <b>blocked by STP</b>—The interface is disabled due to a spanning-tree protocol error.</li> <li>• <b>MAC limit exceeded</b>—The interface is temporarily disabled due to a MAC limit error. The disabled interface is automatically restored to service when the disable timeout expires.</li> <li>• <b>MAC move limit exceeded</b>—The interface is temporarily disabled due to a MAC move limit error. The disabled interface is automatically restored to service when the disable timeout expires.</li> <li>• <b>Storm control in effect</b>—The interface is temporarily disabled due to a storm control error. The disabled interface is automatically restored to service when the disable timeout expires.</li> </ul>	none, <b>brief</b> , <b>detail</b> ,
<b>Number of MACs learned on IFL</b>	Number of MAC addresses learned by this interface.	<b>detail</b>
<b>mapping</b>	<p>When mapping is configured, the status is one of the following C-VLAN to S-VLAN mapping types:</p> <ul style="list-style-type: none"> <li>• <b>dot1q-tunneled</b>—The interface maps all traffic to the S-VLAN (all-in-one bundling).</li> <li>• <b>native</b>—The interface maps untagged and priority tagged packets to the S-VLAN.</li> <li>• <b>push</b>—The interface maps packets to a firewall filter to an S-VLAN.</li> <li>• <b>policy-mapped</b>—The interface maps packets to a specifically defined S-VLAN.</li> <li>• <b>integer</b>—The interface maps packets to the specified S-VLAN.</li> </ul> <p>When mapping is not configured, this entry does not appear in the command output.</p>	<b>detail</b>

## Sample Output for QFX Series Switches, QFabric, NFX Series, EX4600 and OCX1100

### show ethernet-switching interfaces

```
user@switch> show ethernet-switching interfaces
```

```

Interface  State  VLAN members  Blocking

```

## show chassis routing-engine (View)

<b>Syntax</b>	show chassis routing-engine
<b>Release Information</b>	Command introduced in Junos OS Release 9.5.
<b>Description</b>	Display the Routing Engine status of the chassis cluster.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">cluster (Chassis)</a></li> <li>• <a href="#">request system snapshot (Maintenance)</a> on page 1603</li> </ul>
<b>List of Sample Output</b>	<a href="#">show chassis routing-engine (Sample 1 - SRX550M)</a> on page 1629 <a href="#">show chassis routing-engine (Sample 2 - vSRX)</a> on page 1629
<b>Output Fields</b>	Table 59 on page 1628 lists the output fields for the <b>show chassis routing-engine</b> command. Output fields are listed in the approximate order in which they appear.

Table 59: show chassis routing-engine Output Fields

Field Name	Field Description
Temperature	Routing Engine temperature. (Not available for vSRX deployments.)
CPU temperature	CPU temperature. (Not available for vSRX deployments.)
Total memory	Total memory available on the system.  <b>NOTE:</b> Starting with Junos OS Release 15.1x49-D70 and Junos OS Release 17.3R1, there is a change in the method for calculating the memory utilization by a Routing Engine. The inactive memory is now subtracted from the total available memory. There is thus, a decrease in the reported value for used memory; as the inactive memory is now considered as free.
Control plane memory	Memory available for the control plane.
Data plane memory	Memory reserved for data plane processing.
CPU utilization	Current CPU utilization statistics on the control plane core.
User	Current CPU utilization in user mode on the control plane core.
Background	Current CPU utilization in nice mode on the control plane core.
Kernel	Current CPU utilization in kernel mode on the control plane core.

Table 59: show chassis routing-engine Output Fields (continued)

Field Name	Field Description
<b>Interrupt</b>	Current CPU utilization in interrupt mode on the control plane core.
<b>Idle</b>	Current CPU utilization in idle mode on the control plane core.
<b>Model</b>	Routing Engine model.
<b>Start time</b>	Routing Engine start time.
<b>Uptime</b>	Length of time the Routing Engine has been up (running) since the last start.
<b>Last reboot reason</b>	Reason for the last reboot of the Routing Engine.
<b>Load averages</b>	The average number of threads waiting in the run queue or currently executing over 1-, 5-, and 15-minute periods.

## Sample Output

### show chassis routing-engine (Sample 1 - SRX550M)

```

user@host> show chassis routing-engine

Routing Engine status:
  Temperature           38 degrees C / 100 degrees F
  CPU temperature       36 degrees C / 96 degrees F
  Total memory          512 MB Max   435 MB used ( 85 percent)
  Control plane memory  344 MB Max   296 MB used ( 86 percent)
  Data plane memory    168 MB Max   138 MB used ( 82 percent)
  CPU utilization:
    User                8 percent
    Background          0 percent
    Kernel              4 percent
    Interrupt           0 percent
    Idle                88 percent
  Model                 RE-SRX5500-LOWMEM
  Serial ID             AAP8652
  Start time            2009-09-21 00:04:54 PDT
  Uptime                52 minutes, 47 seconds
  Last reboot reason    0x200:chassis control reset
  Load averages:        1 minute   5 minute   15 minute
                        0.12       0.15       0.10

```

## Sample Output

### show chassis routing-engine (Sample 2 - vSRX)

```

user@host> show chassis routing-engine

Routing Engine status:
  Total memory          1024 MB Max   358 MB used ( 35 percent)
  Control plane memory  1024 MB Max   358 MB used ( 35 percent)
  5 sec CPU utilization:
    User                2 percent

```

Background	0 percent
Kernel	4 percent
Interrupt	6 percent
Idle	88 percent
Model	VSRX RE
Start time	2015-03-03 07:04:18 UTC
Uptime	2 days, 11 hours, 51 minutes, 11 seconds
Last reboot reason	Router rebooted after a normal shutdown.
Load averages:	1 minute   5 minute   15 minute
	0.07            0.04            0.06

## show cli directory

---

**Syntax**     `show cli directory`

**Release Information**     Command introduced before Junos OS Release 7.4.

**Description**     Display the current working directory.

```
user@host> show cli directory
Current directory: /var/tmp
```

**Required Privilege Level**     view

## show dhcp client binding

---

<b>Syntax</b>	<pre>show dhcp client binding [&lt;address&gt;   interface &lt;interface-name&gt;] routing-instance &lt;routing-instance name&gt; [brief   detail   summary ] logical-system tenant</pre>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X44-D10. The <b>logical-system</b> and <b>tenant</b> options are introduced in Junos OS Release 18.4R1.
<b>Description</b>	Display the address bindings in the Dynamic Host Configuration Protocol (DHCP) client table.
<b>Options</b>	<p><b>address</b>—(Optional) Display DHCP binding information for a specific client identified by one of the following entries:</p> <ul style="list-style-type: none"><li>• <b>ip-address</b>—The specified IP address.</li><li>• <b>mac-address</b>—The specified MAC address.</li></ul> <p><b>routing-instance &lt;routing-instance name&gt;</b>—(Optional) Display DHCP binding information for DHCP clients on the specified routing instance.</p> <p><b>interface &lt;interface-name&gt;</b>—(Optional) Perform this operation on the specified interface.</p> <p><b>brief</b>—(Optional) Display brief information about the active client bindings.</p> <p><b>detail</b>—(Optional) Display detailed client binding information.</p> <p><b>summary</b>—(Optional) Display a summary of DHCP client information.</p> <p><b>logical-system</b>—(Optional) Displays the DHCP binding information for DHCP clients on the specified logical system.</p> <p><b>tenant</b>—(Optional) Displays the DHCP binding information for DHCP clients on the specified tenant system.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">clear dhcp client binding on page 1531</a></li></ul>
<b>List of Sample Output</b>	<a href="#">show dhcp client binding on page 1633</a>

**Output Fields** Table 60 on page 1633 lists the output fields for the **show dhcp client binding** command. Output fields are listed in the approximate order in which they appear.

*Table 60: show dhcp client binding Output Fields*

Field Name	Field Description
IP address	IP address of the DHCP client.
Hardware address	Hardware address of the DHCP client.
Server	IP address of the DHCP server.
Expires	Number of seconds in which the lease expires.
State	State of the address binding table on the DHCP local server.
Interface	Interface on which the request was received.
Lease Expires	Date and time at which the client's IP address lease expires.
Lease Expires in	Number of seconds in which the lease expires.
Lease Start	Date and time at which the client's IP address lease started.
Vendor Identifier	Vendor identifier.
Server Identifier	IP address of the DHCP server.
Client IP Address	IP address of the DHCP client.

## Sample Output

### show dhcp client binding

```

## show dhcp relay binding

<b>Syntax</b>	Show dhcp relay binding [<address>   interface <interface-name>] routing-instance <routing-instance name> [brief   detail   summary]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X44-D10 for SRX300, SRX320, SRX340, SRX345, SRX550M, and SRX1500 devices.
<b>Description</b>	Display the address bindings in the Dynamic Host Configuration Protocol (DHCP) relay client table.
<b>Options</b>	<p><b>address</b>—(Optional) Display DHCP binding information for a specific client identified by one of the following entries:</p> <ul style="list-style-type: none"> <li>ip-address—The specified IP address.</li> <li>mac-address—The specified MAC address.</li> </ul> <p><b>routing-instance &lt;routing-instance name&gt;</b>—(Optional) Display DHCP binding information on the specified routing instance.</p> <p><b>interface &lt;interface-name&gt;</b>—(Optional) Perform this operation on the specified interface.</p> <p><b>brief</b>—(Optional) Display brief information about the active client bindings.</p> <p><b>detail</b>—(Optional) Display detailed client binding information.</p> <p><b>summary</b>—(Optional) Display a summary of DHCP client information.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">clear dhcp relay binding on page 1533</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show dhcp relay binding on page 1639</a>
<b>Output Fields</b>	<a href="#">Table 62 on page 1638</a> lists the output fields for the <b>show dhcp relay binding</b> command. Output fields are listed in the approximate order in which they appear.

*Table 62: show dhcp relay binding Output Fields*

Field Name	Field Description
IP address	IP address of the DHCP client.
Hardware address	Hardware address of the DHCP client.

Table 62: show dhcp relay binding Output Fields (continued)

Field Name	Field Description
Request received on	Interface on which the request was received.
Type	Type of DHCP packet processing performed on the device.
Obtained at	Date and time at which the client's IP address lease started.
Expires at	Date and time at which the client's IP address lease expires.
State	State of the address binding table on the DHCP local server.

## Sample Output

### show dhcp relay binding

```
user@host> show dhcp relay binding detail
```

```
IP address      Hardware address  Type      Lease expires      State

## show dhcpv6 client binding

<b>Syntax</b>	show dhcpv6 client binding interface <i>interface-name</i> routing-instance < <i>routing-instance-name</i> > [brief   detail   summary]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1X45-D10 for SRX300, SRX320, SRX340, SRX345, SRX550M, and SRX1500 devices.
<b>Description</b>	Display the address bindings in the Dynamic Host Configuration Protocol version 6 (DHCPv6) client table.
<b>Options</b>	<p><b>interface <i>interface-name</i></b>—(Optional) Perform this operation on the specified interface.</p> <p><b>routing-instance <i>routing-instance-name</i></b>—(Optional) Display DHCPv6 binding information for DHCPv6 clients on the specified routing instance.</p> <p><b>brief</b>—(Optional) Display brief information about the active client bindings.</p> <p><b>detail</b>—(Optional) Display detailed client binding information.</p> <p><b>summary</b>—(Optional) Display a summary of DHCPv6 client information.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear dhcpv6 client binding on page 1537</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show dhcpv6 client binding on page 1648</a>
<b>Output Fields</b>	Table 66 on page 1647 lists the output fields for the <b>show dhcpv6 client binding</b> command. Output fields are listed in the approximate order in which they appear.

Table 66: show dhcpv6 client binding Output Fields

Field Name	Field Description
Hardware Address	Hardware address of the DHCPv6 client.
State	State of the address-binding table on the DHCPv6 local server.
Lease Expires	Date and time at which the client's IP address lease expires.
Lease Expires in	Number of seconds until the lease expires.
Lease Start	Date and time at which the client's IP address lease started.

Table 66: show dhcpv6 client binding Output Fields (continued)

Field Name	Field Description
Client DUID	The DHCPv6 client's unique identifier.
Bind type	The bind type.
Client Type	The type of DHCPv6 client. The client type can be autoconfig or stateful.
Rapid Commit	Two-message exchange option for address assignment.
Server IP Address	IP address of the DHCPv6 server.
Client IP Address	IP address of the DHCPv6 client.

## Sample Output

## show dhcpv6 relay binding

---

**Syntax**    **show dhcpv6 relay binding**  
              <address>  
              <brief>  
              <detail>  
              <interface *interface-name*>  
              <interfaces-vlan>  
              <interfaces-wildcard>  
              <logical-system *logical-system-name*>  
              <routing-instance *routing-instance-name*>  
              <summary>

**Release Information**    Command introduced in Junos OS Release 11.4.  
                              *interfaces-vlan* and *interfaces-wildcard* options introduced in Junos OS Release 12.1.

**Description**    Display the DHCPv6 address bindings in the Dynamic Host Configuration Protocol (DHCP) client table.

**Options**    **address**—(Optional) One of the following identifiers for the DHCPv6 client whose binding state you want to show:

- *CID*—The specified Client ID (CID).
- *ipv6-prefix*—The specified IPv6 prefix.
- *session-id*—The specified session ID.

**brief**—(Optional) Display brief information about the active client bindings. This is the default, and produces the same output as **show dhcpv6 relay binding**.

**detail**—(Optional) Display detailed client binding information.

**interface *interface-name***—(Optional) Perform this operation on the specified interface. You can optionally filter on VLAN ID and S-VLAN ID.

***interfaces-vlan***—(Optional) Interface VLAN ID or S-VLAN ID interface on which to show binding state information.

***interfaces-wildcard***—(Optional) Set of interfaces on which to show binding state information. This option supports the use of the wildcard character (\*).

**logical-system *logical-system-name***—(Optional) Perform this operation on the specified logical system.

**routing-instance *routing-instance-name***—(Optional) Perform this operation on the specified routing instance.

**summary**—(Optional) Display a summary of DHCPv6 client information.

**Required Privilege Level** view

**Output Fields** [Table 68 on page 1653](#) lists the output fields for the **show dhcpv6 relay binding** command. Output fields are listed in the approximate order in which they appear.

*Table 68: show dhcpv6 relay binding Output Fields*

Field Name	Field Description	Level of Output
<i>number clients, (number init, number bound, number selecting, number requesting, number renewing, number rebinding, number releasing)</i>	Summary counts of the total number of DHCPv6 clients and the number of DHCPv6 clients in each state.	<b>summary</b>
Client IPv6 Prefix	Prefix of the DHCPv6 client.	<b>brief detail</b>
Client IPv6 Excluded Prefix	IPv6 Prefix of the DHCP client excluded.	<b>detail</b>
Client DUID	DHCP for IPv6 Unique Identifier (DUID) of the client.	<b>brief detail</b>
Client IPv6 Address	IPv6 address assigned to the subscriber.	<b>detail</b>
Session Id	Session ID of the subscriber session.	<b>brief detail</b>
Expires	Number of seconds in which the lease expires.	<b>brief detail</b>

Table 68: show dhcpv6 relay binding Output Fields (continued)

Field Name	Field Description	Level of Output
<b>State</b>	<p>State of the DHCPv6 relay address binding table on the DHCPv6 client:</p> <ul style="list-style-type: none"> <li>• <b>BOUND</b>—Client has an active IP address lease.</li> <li>• <b>INIT</b>—Initial state.</li> <li>• <b>REBINDING</b>—Client is broadcasting a request to renew the IP address lease.</li> <li>• <b>RECONFIGURE</b>—Client is broadcasting a request to reconfigure the IP address lease.</li> <li>• <b>RELEASE</b>—Client is releasing the IP address lease.</li> <li>• <b>RENEWING</b>—Client is sending a request to renew the IP address lease.</li> <li>• <b>REQUESTING</b>—Client is requesting a DHCPv6 server.</li> <li>• <b>SELECTING</b>—Client is receiving offers from DHCPv6 servers.</li> </ul>	<b>brief detail</b>
<b>Interface</b>	Incoming client interface.	<b>brief</b>
<b>Lease Expires</b>	Date and time at which the client's IP address lease expires.	<b>detail</b>
<b>Lease Expires in</b>	Number of seconds in which the lease expires.	<b>detail</b>
<b>Preferred Lease Expires</b>	Date and UTC time at which the client's IPv6 prefix expires.	<b>detail</b>
<b>Preferred Lease Expires in</b>	Number of seconds at which the client's IPv6 prefix expires.	<b>detail</b>
<b>Lease Start</b>	Date and time at which the client's IP address lease started.	<b>detail</b>
<b>Lease time violated</b>	Lease time violation has occurred.	<b>detail</b>
<b>Incoming Client Interface</b>	Client's incoming interface.	<b>detail</b>
<b>Server Address</b>	<p>IP address of the DHCPv6 server.</p> <p>Displays <b>unknown</b> for a DHCPv6 relay agent in a multi-relay topology that is not directly adjacent to the DHCPv6 server and does not detect the IP address of the server. In that case, the output instead displays the <b>Next Hop Server Facing Relay</b> field.</p>	<b>detail</b>
<b>Next Hop Server Facing Relay</b>	Next-hop address in the direction of the DHCPv6 server.	<b>detail</b>
<b>Server Interface</b>	Interface of the DHCPv6 server.	<b>detail</b>
<b>Relay Address</b>	IP address of the relay.	<b>detail</b>
<b>Client Pool Name</b>	Address pool that granted the client lease.	<b>detail</b>
<b>Client ID Length</b>	Length of client ID.	All levels

Table 68: show dhcpv6 relay binding Output Fields (continued)

Field Name	Field Description	Level of Output
Client Id	Client ID.	All levels
Generated Circuit ID	Circuit ID generated by the DHCPv6 Interface-ID option (option 18)	<b>detail</b>
Generated Remote ID Enterprise Number	The Juniper Networks IANA private enterprise number	<b>detail</b>
Generated Remote ID	Remote ID generated by the DHCPv6 Remote-ID option (option 37)	<b>detail</b>
Dual Stack Group	Name of the dual-stack group for the DHCPv6 binding.	<b>detail</b>
Dual Stack Peer Address	Address of the dual-stack DHCPv4 peer.	<b>detail</b>

## show dhcpv6 relay statistics

Syntax	<pre>show dhcpv6 relay statistics &lt;bulk-leasequery-connections&gt; &lt;leasequery&gt; &lt;logical-system <i>logical-system-name</i>&gt; &lt;routing-instance <i>routing-instance-name</i>&gt;</pre>
Release Information	<p>Command introduced in Junos OS Release 11.4.</p> <p>Command introduced in Junos OS Release 12.1X48R3 for PTX Series Packet Transport Switches.</p> <p>Command introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p><b>bulk-leasequery-connections</b> option introduced in Junos OS Release 16.1.</p>
Description	Display Dynamic Host Configuration Protocol for IPv6 (DHCPv6) relay statistics.
Options	<p><b>bulk-leasequery-connections</b>—(Optional) Display DHCPv6 relay bulk leasequery statistics.</p> <p><b>leasequery</b>—(Optional) Display information about DHCPv6 relay individual leasequery statistics.</p> <p><b>logical-system <i>logical-system-name</i></b>—(Optional) Perform this operation on the specified logical system. If you do not specify a logical system name, statistics are displayed for the default logical system.</p> <p><b>routing-instance <i>routing-instance-name</i></b>—(Optional) Perform this operation on the specified routing instance. If you do not specify a routing instance name, statistics are displayed for the default routing instance.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"> <li>• <a href="#">clear dhcpv6 relay statistics on page 1542</a></li> <li>• <i>DHCPv6 Client MAC Address Validation to Prevent Session Hijacking</i></li> </ul>
List of Sample Output	<p><a href="#">show dhcpv6 relay statistics on page 1663</a></p> <p><a href="#">show dhcpv6 relay statistics bulk-leasequery-connections on page 1664</a></p>
Output Fields	<p><a href="#">Table 69 on page 1662</a> lists the output fields for the <b>show dhcpv6 relay statistics</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 69: show dhcpv6 relay statistics Output Fields

Field Name	Field Description
DHCPv6 Packets dropped	<p>Number of packets discarded by the extended DHCPv6 relay agent application due to errors. Only nonzero statistics appear in the <b>Packets dropped</b> output. When all of the Packets dropped statistics are 0 (zero), only the <b>Total</b> field appears.</p> <ul style="list-style-type: none"> <li><b>Total</b>—Total number of packets discarded by the DHCPv6 relay agent application.</li> <li><b>Bad options</b>—Number of packets discarded because invalid options were specified.</li> <li><b>Bad send</b>—Number of packets that the extended DHCP relay application could not send.</li> <li><b>Bad src address</b>—Number of packets discarded because the family type was not AF_INET6.</li> <li><b>Client MAC validation</b>—Number of packets discarded because validation of the client MAC address failed.</li> <li><b>No client id</b>—Number of packets discarded because they could not be matched to a client.</li> <li><b>Lease Time Violation</b>—Number of packets discarded because of a lease time violation</li> <li><b>No safd</b>—Number of packets discarded because they arrived on an unconfigured interface.</li> <li><b>Short packet</b>—Number of packets discarded because they were too short.</li> <li><b>Relay hop count</b>—Number of packets discarded because the hop count in the packet exceeded 32.</li> </ul>
Messages received	<p>Number of DHCPv6 messages received.</p> <ul style="list-style-type: none"> <li><b>DHCPv6_DECLINE</b>—Number of DHCPv6 PDUs of type DECLINE received</li> <li><b>DHCPv6_SOLICIT</b>—Number of DHCPv6 PDUs of type SOLICIT received</li> <li><b>DHCPv6_INFORMATION_REQUEST</b>—Number of DHCPv6 PDUs of type INFORMATION-REQUEST received</li> <li><b>DHCPv6_RELEASE</b>—Number of DHCPv6 PDUs of type RELEASE received</li> <li><b>DHCPv6_REQUEST</b>—Number of DHCPv6 PDUs of type REQUEST received</li> <li><b>DHCPv6_CONFIRM</b>—Number of DHCPv6 PDUs of type CONFIRM received</li> <li><b>DHCPv6_RENEW</b>—Number of DHCPv6 PDUs of type RENEW received</li> <li><b>DHCPv6_REBIND</b>—Number of DHCPv6 PDUs of type REBIND received</li> <li><b>DHCPv6_RELAY_REPL</b>—Number of DHCPv6 PDUs of type RELAY-REPL received</li> <li><b>DHCPv6_RELAY_FORW</b>—Number of DHCPv6 RELAY-FORW PDUs received.</li> <li><b>DHCPv6_LEASEQUERY_REPLY</b>—Number of DHCPv6 replies received from the DHCPv6 sever</li> <li><b>DHCPv6_LEASEQUERY_DATA</b>—xxxx</li> <li><b>DHCPv6_LEASEQUERY_DONE</b>—The leasequery is complete</li> </ul>
Messages sent	<p>Number of DHCPv6 messages sent.</p> <ul style="list-style-type: none"> <li><b>DHCPv6_ADVERTISE</b>—Number of DHCPv6 ADVERTISE PDUs transmitted</li> <li><b>DHCP_REPLY</b>—Number of DHCPv6 REPLY PDUs transmitted</li> <li><b>DHCP_RECONFIGURE</b>—Number of DHCPv6 RECONFIGURE PDUs transmitted</li> <li><b>DHCP_RELAY_FORW</b>—Number of DHCPv6 RELAY-FORW PDUs transmitted</li> <li><b>DHCPv6_RELAY_REPL</b>—Number of DHCPv6 RELAY-REPL PDUs transmitted.</li> <li><b>DHCPv6_LEASEQUERY</b>—Number of DHCP leasequery messages transmitted</li> </ul>
Packets forwarded	<p>Number of packets forwarded by the extended DHCPv6 relay agent application.</p> <ul style="list-style-type: none"> <li><b>FWD REQUEST</b>—Number of DHCPv6 REQUEST packets forwarded</li> <li><b>FWD REPLY</b>—Number of DHCPv6 REPLY packets forwarded</li> </ul>

Table 69: show dhcpv6 relay statistics Output Fields (continued)

Field Name	Field Description
<b>External Server Response</b>	State of the external DHCP server responsiveness.
<b>Total Requested Servers</b>	Total number of servers with which the DHCP relay agent has requested a bulk leasequery connection.
<b>Total Attempted Servers</b>	Total number of servers with which the DHCP relay agent has attempted to create a bulk leasequery connection.
<b>Total Connected</b>	Total number of servers that have formed a bulk leasequery connection with the DHCP relay agent.
<b>Total Terminated by Server</b>	Total number of servers that have terminated a bulk leasequery connection with the DHCP relay agent.
<b>Total Max Attempted</b>	Total number of servers where the DHCP relay agent reached the maximum retry limit when it attempted to create a bulk leasequery connection.
<b>Total Closed due to Errors</b>	Total number of bulk leasequery connections that closed due to an internal error on the DHCP relay agent.
<b>In-Flight Connected</b>	Number of current bulk leasequery connections on the DHCP relay agent.
<b>Bulk Leasequery Reply Packet Retries</b>	Number of bulk leasequery reply packets that the DHCP relay agent has retried.

## Sample Output

### show dhcpv6 relay statistics

```
user@host> show dhcpv6 relay statistics
```

```
DHCPv6 Packets dropped:
```

```
  Total                2
  Lease Time Violation  1
  Client MAC validation 1
```

```
Messages received:
```

```

## show dhcpv6 server binding

<b>Syntax</b>	<pre>show dhcpv6 server binding &lt;address&gt; &lt;brief   detail   summary&gt; &lt;interface interface-name&gt; &lt;interfaces-vlan&gt; &lt;interfaces-wildcard&gt; &lt;logical-system logical-system-name&gt; &lt;routing-instance routing-instance-name&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.6.</p> <p>Options <i>interfaces-vlan</i> and <i>interfaces-wildcard</i> added in Junos OS Release 12.1.</p>
<b>Description</b>	Display the address bindings in the client table on the extended Dynamic Host Configuration Protocol for IPv6 (DHCPv6) local server.
<b>Options</b>	<p><b>address</b>—(Optional) One of the following identifiers for the DHCPv6 client whose binding state you want to show:</p> <ul style="list-style-type: none"> <li>• <i>CID</i>—The specified Client ID (CID).</li> <li>• <i>ipv6-prefix</i>—The specified IPv6 prefix.</li> <li>• <i>session-id</i>—The specified session ID.</li> </ul> <p><b>brief   detail   summary</b>—(Optional) Display the specified level of output about active client bindings. The default is <b>brief</b>, which produces the same output as <b>show dhcpv6 server binding</b>.</p> <p><b>interface interface-name</b>—(Optional) Display information about active client bindings on the specified interface. You can optionally filter on VLAN ID and SVLAN ID.</p> <p><b>interfaces-vlan</b>—(Optional) Interface VLAN ID or S-VLAN ID interface on which to show binding state information.</p> <p><b>interfaces-wildcard</b>—(Optional) Set of interfaces on which to show binding state information. This option supports the use of the wildcard character (*).</p> <p><b>logical-system logical-system-name</b>—(Optional) Display information about active client bindings for DHCPv6 clients on the specified logical system.</p> <p><b>routing-instance routing-instance-name</b>—(Optional) Display information about active client bindings for DHCPv6 clients on the specified routing instance.</p>

**Output Fields** [Table 70 on page 1666](#) lists the output fields for the **show dhcpv6 server binding** command. Output fields are listed in the approximate order in which they appear.

*Table 70: show dhcpv6 server binding Output Fields*

Field Name	Field Description	Level of Output
<i>number clients, (number init, number bound, number selecting, number requesting, number renewing, number releasing)</i>	Summary counts of the total number of DHCPv6 clients and the number of DHCPv6 clients in each state.	<b>summary</b>
<b>Prefix</b>	Client's DHCPv6 prefix, or prefix used to support multiple address assignment.	<b>brief detail</b>
<b>Session Id</b>	Session ID of the subscriber session.	<b>brief detail</b>
<b>Expires</b>	Number of seconds in which lease expires.	<b>brief detail</b>
<b>State</b>	State of the address binding table on the extended DHCPv6 local server: <ul style="list-style-type: none"> <li>• <b>BOUND</b>—Client has active IP address lease.</li> <li>• <b>INIT</b>—Initial state.</li> <li>• <b>RECONFIGURE</b>—Server has sent reconfigure message to client.</li> <li>• <b>RELEASE</b>—Client is releasing IP address lease.</li> <li>• <b>RENEWING</b>—Client sending request to renew IP address lease.</li> <li>• <b>REQUESTING</b>—Client requesting a DHCPv6 server.</li> <li>• <b>SELECTING</b>—Client receiving offers from DHCPv6 servers.</li> </ul>	<b>brief detail</b>
<b>Interface</b>	Interface on which the DHCPv6 request was received.	<b>brief</b>
<b>Client IPv6 Address</b>	Client's IPv6 address.	<b>detail</b>
<b>Client IPv6 Prefix</b>	Client's IPv6 prefix.	<b>detail</b>

Table 70: show dhcpv6 server binding Output Fields (continued)

Field Name	Field Description	Level of Output
Client IPv6 Excluded Prefix	IPv6 Prefix of the DHCP client excluded.	detail
Client DUID	Client's DHCP Unique Identifier (DUID).	brief detail
Lease expires	Date and time at which the client's IP address lease expires.	detail
Lease expires in	Number of seconds in which lease expires.	detail
Preferred Lease Expires	Date and UTC time at which the client's IPv6 prefix expires.	detail
Preferred Lease Expires in	Number of seconds at which client's IPv6 prefix expires.	detail
Lease Start	Date and time at which the client's address lease was obtained.	detail
Lease time violated	Lease time violation has occurred.	detail
Incoming Client Interface	Client's incoming interface.	detail
Server IP Address	IP address of DHCPv6 server.	detail
Server Interface	Interface of DHCPv6 server.	detail
Client Pool Name	Address pool used to assign IPv6 address.	detail
Client Prefix Pool Name	Address pool used to assign IPv6 prefix.	detail
Client Id length	Length of the DHCPv6 client ID, in bytes.	detail
Client Id	ID of the DHCPv6 client.	detail
Server Id	DHCP unique identifier (DUID) for the DHCPv6 server.	detail
Client Interface Svlan Id	S-VLAN ID of the client's incoming interface.	detail
Client Interface Vlan Id	VLAN ID of the client's incoming interface.	detail
Dual Stack Group	DHCPv6 server profile name.	detail
Dual Stack Peer Address	DHCPv6 Peer IP address.	detail

## show dhcpv6 server statistics

---

Syntax	<pre>show dhcpv6 server statistics &lt;bulk-leasequery-connections&gt; &lt;logical-system <i>logical-system-name</i>&gt; &lt;routing-instance <i>routing-instance-name</i>&gt;</pre>
Release Information	Command introduced in Junos OS Release 9.6. <b>bulk-leasequery-connections</b> option introduced in Junos OS Release 16.1.
Description	Display extended Dynamic Host Configuration Protocol for IPv6 (DHCPv6) local server statistics.
Options	<p><b>bulk-leasequery-connections</b>—(Optional) Display information about DHCPv6 local server bulk leasequery statistics.</p> <p><b>logical-system <i>logical-system-name</i></b>—(Optional) Display information about extended DHCPv6 local server statistics on the specified logical system. If you do not specify a logical system, statistics are displayed for the default logical system.</p> <p><b>routing-instance <i>routing-instance-name</i></b>—(Optional) Display information about extended DHCPv6 local server statistics on the specified routing instance. If you do not specify a routing instance, statistics are displayed for the default routing instance.</p>
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">clear dhcpv6 server statistics on page 1548</a></li><li>• <i>DHCPv6 Client MAC Address Validation to Prevent Session Hijacking</i></li></ul>
List of Sample Output	<a href="#">show dhcpv6 server statistics on page 1678</a> <a href="#">show dhcpv6 server statistics bulk-leasequery-connections on page 1679</a>
Output Fields	<a href="#">Table 72 on page 1677</a> lists the output fields for the <b>show dhcpv6 server statistics</b> command. Output fields are listed in the approximate order in which they appear.

Table 72: show dhcpv6 server statistics Output Fields

Field Name	Field Description
<b>Packets dropped</b>	<p>Number of packets discarded by the extended DHCPv6 local server because of errors. Only nonzero statistics appear in the Packets dropped output. When all of the Packets dropped statistics are 0 (zero), only the Total field appears.</p> <ul style="list-style-type: none"> <li>• <b>Total</b>—Total number of packets discarded by the extended DHCPv6 local server</li> <li>• <b>Strict Reconfigure</b>—Number of solicit messages discarded because the client does not support reconfiguration</li> <li>• <b>Bad hardware address</b>—Number of packets discarded because an invalid hardware address was specified</li> <li>• <b>Bad opcode</b>—Number of packets discarded because an invalid operation code was specified</li> <li>• <b>Bad options</b>—Number of packets discarded because invalid options were specified</li> <li>• <b>Client MAC validation</b>—Number of packets discarded because validation of the client MAC address failed.</li> <li>• <b>Invalid server address</b>—Number of packets discarded because an invalid server address was specified</li> <li>• <b>Lease Time Violation</b>—Number of packets discarded because of a lease time violation</li> <li>• <b>No available addresses</b>—Number of packets discarded because there were no addresses available for assignment</li> <li>• <b>No interface match</b>—Number of packets discarded because they did not belong to a configured interface</li> <li>• <b>No routing instance match</b>—Number of packets discarded because they did not belong to a configured routing instance</li> <li>• <b>No valid local address</b>—Number of packets discarded because there was no valid local address</li> <li>• <b>Packet too short</b>—Number of packets discarded because they were too short</li> <li>• <b>Read error</b>—Number of packets discarded because of a system read error</li> <li>• <b>Send error</b>—Number of packets that the extended DHCPv6 local server could not send</li> </ul>
<b>Advertise Delay</b>	<p>Number of DHCP advertise messages delayed.</p> <ul style="list-style-type: none"> <li>• <b>DELAYED</b>—Number of DHCPv6 advertise packets that have been sent after being delayed.</li> <li>• <b>INPROGRESS</b>—Number of DHCPv6 advertise packets that are in the delay queue.</li> <li>• <b>TOTAL</b>—Total number of delayed DHCPv6 advertise messages; sum of <b>DELAYED</b> and <b>INPROGRESS</b>.</li> </ul>
<b>Messages received</b>	<p>Number of DHCPv6 messages received.</p> <ul style="list-style-type: none"> <li>• <b>DHCPV6_CONFIRM</b>—Number of DHCPv6 CONFIRM PDUs received.</li> <li>• <b>DHCPV6_DECLINE</b>—Number of DHCPv6 DECLINE PDUs received.</li> <li>• <b>DHCPV6_INFORMATION_REQUEST</b>—Number of DHCPv6 INFORMATION-REQUEST PDUs received.</li> <li>• <b>DHCPV6_REBIND</b>—Number of DHCPv6 REBIND PDUs received.</li> <li>• <b>DHCPV6_RELAY_FORW</b>—Number of DHCPv6 RELAY-FORW PDUs received.</li> <li>• <b>DHCPV6_RELAY_REPL</b>—Number of DHCPv6 RELAY-REPL PDUs received.</li> <li>• <b>DHCPV6_RELEASE</b>—Number of DHCPv6 RELEASE PDUs received.</li> <li>• <b>DHCPV6_RENEW</b>—Number of DHCPv6 RENEW PDUs received.</li> <li>• <b>DHCPV6_REQUEST</b>—Number of DHCPv6 REQUEST PDUs received.</li> <li>• <b>DHCPV6_SOLICIT</b>—Number of DHCPv6 SOLICIT PDUs received.</li> <li>• <b>DHCPV6_LEASEQUERY</b>—Number of DHCPv6 leasequery messages received.</li> </ul>

Table 72: show dhcpv6 server statistics Output Fields (continued)

Field Name	Field Description
<b>Messages sent</b>	<p>Number of DHCPv6 messages sent.</p> <ul style="list-style-type: none"> <li><b>DHCPV6_ADVERTISE</b>—Number of DHCPv6 ADVERTISE PDUs transmitted.</li> <li><b>DHCPV6_REPLY</b>—Number of DHCPv6 ADVERTISE PDUs transmitted.</li> <li><b>DHCPV6_LOGICAL_NAK</b>—Number of logical NAK messages sent, signifying T1 and T2 timers with values of zero; subset of <b>DHCPV6_REPLY</b> counter. (Displays only at <b>verbose</b> level.</li> <li><b>DHC6_RECONFIGURE</b>—Number of DHCPv6 RECONFIGURE PDUs transmitted.</li> <li><b>DHCPV6_RELAY_REPL</b>—Number of DHCPv6 RELAY-REPL PDUs transmitted.</li> <li><b>DHCPV6_RELAY_FORW</b>—Number of DHCPv6 RELAY-FORW PDUs transmitted.</li> <li><b>DHCPV6_LEASEQUERY_REPLY</b>—Number of DHCPv6 leasequery replies transmitted to the DHCPv6 relay agent.</li> <li><b>DHCPV6_LEASEQUERY_DATA</b>—Number of DHCPv6 LEASEQUERY-DATA packets transmitted.</li> <li><b>DHCPV6_LEASEQUERY_DONE</b>—Number of DHCPv6 LEASEQUERY-DONE packets sent.</li> </ul>

## show firewall (View)

**Syntax** `show firewall`  
`<filter filter-name>`  
`<counter counter-name>`  
`<log>`  
`<prefix-action-stats>`  
`<terse>`

**Release Information** Command introduced before Junos OS Release 10.0 .

**Description** Display statistics about configured firewall filters.

**Options** **none**—Display statistics about configured firewall filters.

**filter *filter-name***—Name of a configured filter.

**counter *counter-name***—Name of a filter counter.

**log**—Display log entries for firewall filters.

**prefix-action-stats**—Display prefix action statistics for firewall filters.

**terse**—Display firewall filter names only.

**Required Privilege Level** view

**Related Documentation** • *firewall*

**List of Sample Output** [show firewall on page 1684](#)

**Output Fields** [Table 74 on page 1683](#) lists the output fields for the **show firewall** command. Output fields are listed in the approximate order in which they appear.

*Table 74: show firewall Output Fields*

Field Name	Field Description
<b>Filter</b>	<p>Name of a filter that has been configured with the <b>filter</b> at the <b>[edit firewall]</b> hierarchy level.</p> <p>When an interface-specific filter is displayed, the name of the filter is followed by the full interface name and by either <b>-i</b> for an input filter or <b>-o</b> for an output filter.</p> <p>When dynamic filters are displayed, the name of the filter is followed by the full interface name and by either <b>-in</b> for an input filter or <b>-out</b> for an output filter. When a logical system-specific filter is displayed, the name of the filter is prefixed with two underscore (__) characters and the name of the logical system (for example, <b>__ls1/filter1</b>).</p>

Table 74: show firewall Output Fields (continued)

Field Name	Field Description
<b>Counters</b>	<p>Display filter counter information:</p> <ul style="list-style-type: none"> <li>• <b>Name</b>—Name of a filter counter that has been configured with the <b>counter</b> firewall filter action.</li> <li>• <b>Bytes</b>—Number of bytes that match the filter term under which the <b>counter</b> action is specified.</li> <li>• <b>Packets</b>—Number of packets that matched the filter term under which the <b>counter</b> action is specified.</li> </ul>
<b>Policers</b>	<p>Display policer information:</p> <ul style="list-style-type: none"> <li>• <b>Name</b>—Name of policer.</li> <li>• <b>Bytes</b>—Number of bytes that match the filter term under which the policer action is specified. This is only the number out-of-specification (out-of-spec) byte counts, not all the bytes in all packets policed by the policer.</li> <li>• <b>Packets</b>—Number of packets that matched the filter term under which the policer action is specified. This is only the number of out-of-specification (out-of-spec) packet counts, not all packets policed by the policer.</li> </ul>

## Sample Output

## show dot1x

<b>Syntax</b>	<pre>show dot1x &lt;brief   detail&gt; &lt;interface <i>interface-name</i>&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 14.1X53-D30 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.</p>
<b>Description</b>	<p>Display the current operational state of all ports with the list of connected users.</p> <p>This command displays the list of connected supplicants received from the RADIUS authentication server regardless of the session state—that is, for both authenticated supplicants and for supplicants that attempted authentication.</p>
<b>Options</b>	<p><b>none</b>—Display information for all authenticator ports.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Display information for the specified port with a list of connected supplicants.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear dot1x on page 1550</a></li> <li>• <a href="#">Example: Setting Up 802.1X for Single-Supplicant or Multiple-Supplicant Configurations on an EX Series Switch on page 325</a></li> <li>• <a href="#">Example: Configuring 802.1X Authentication Options When the RADIUS Server Is Unavailable to an EX Series Switch on page 297</a></li> <li>• <a href="#">Example: Configuring Fallback Options on EX Series Switches for EAP-TTLS Authentication and Odyssey Access Clients on page 303</a></li> <li>• <a href="#">Filtering 802.1X Supplicants by Using RADIUS Server Attributes on page 285</a></li> <li>• <a href="#">Verifying 802.1X Authentication on page 309</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show dot1x interface brief on page 1689</a></p> <p><a href="#">show dot1x interface detail on page 1689</a></p>
<b>Output Fields</b>	<p><a href="#">Table 75 on page 1686</a> lists the output fields for the <b>show dot1x</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 75: show dot1x Output Fields

Field Name	Field Description	Level of Output
<b>Interface</b>	Name of a port.	All levels
<b>MAC address</b>	The MAC address of the connected supplicant on the port.	All levels
<b>Role</b>	The 802.1X authentication role of the interface. When 802.1X is enabled on an interface, the role is <b>Authenticator</b> . As <b>Authenticator</b> , the interface blocks LAN access until a supplicant is authenticated through 802.1X or MAC RADIUS authentication.	<b>brief, detail</b>
<b>State</b>	<p>The state of the port:</p> <ul style="list-style-type: none"> <li>• <b>Authenticated</b>—The supplicant has been authenticated through the RADIUS server or has been permitted access through server fail fallback.</li> <li>• <b>Authenticating</b>—The supplicant is authenticating through the RADIUS server.</li> <li>• <b>Held</b>—An action has been triggered through server fail fallback during a RADIUS server timeout. A supplicant is denied access, permitted access through a specified VLAN, or maintains the authenticated state granted to it before the RADIUS server timeout occurred.</li> </ul>	<b>brief</b>
<b>User</b>	The username of the connected supplicant.	<b>brief</b>
<b>Administrative state</b>	<p>The administrative state of the port:</p> <ul style="list-style-type: none"> <li>• <b>auto</b>—Traffic is allowed through the port based on the authentication result (by default).</li> <li>• <b>force-authorize</b>—All traffic flows through the port irrespective of the authentication result. This state is not allowed on an interface whose VLAN membership has been set to <b>dynamic</b>.</li> <li>• <b>force-unauthorize</b>—All traffic drops on the port irrespective of the authentication result. This state is not allowed on an interface whose VLAN membership has been set to <b>dynamic</b>.</li> </ul>	<b>detail</b>
<b>Supplicant</b>	<p>The mode for the supplicant:</p> <ul style="list-style-type: none"> <li>• <b>single</b>—Only the first supplicant is authenticated. All other supplicants who connect later to the port are allowed full access without any further authentication. They effectively “piggyback” on the first supplicant’s authentication.</li> <li>• <b>single-secure</b>—Only one supplicant is allowed to connect to the port. No other supplicant is allowed to connect until the first supplicant logs out.</li> <li>• <b>multiple</b>—Multiple supplicants are allowed to connect to the port. Each supplicant is authenticated individually.</li> </ul>	<b>detail</b>
<b>Quiet period</b>	The number of seconds the port waits following a failed authentication exchange with the supplicant before reattempting the authentication. The default value is 60 seconds. The range is 0 through 65,535 seconds.	<b>detail</b>
<b>Transmit period</b>	The number of seconds the port waits before retransmitting the initial EAPOL PDUs to the supplicant. The default value is 30 seconds. The range is 1 through 65,535 seconds.	<b>detail</b>

Table 75: show dot1x Output Fields (continued)

Field Name	Field Description	Level of Output
<b>MAC radius</b>	MAC RADIUS authentication: <ul style="list-style-type: none"> <li>• <b>enabled</b>—The switch sends an EAPOL request to the connecting host to attempt 802.1X authentication and if the connecting host is unresponsive, the switch tries to authenticate the host by using the MAC address.</li> <li>• <b>disabled</b>—The default. The switch does not attempt to authenticate the MAC address of the connecting host.</li> </ul>	<b>detail</b>
<b>MAC radius authentication protocol</b>	MAC RADIUS authentication protocol: <ul style="list-style-type: none"> <li>• <b>EAP-MD5</b>—The EAP-MD5 protocol is used for MAC RADIUS authentication. EAP-MD5 is an authentication method belonging to the Extensible Authentication Protocol (EAP) authentication framework. EAP-MD5 is the default authentication protocol.</li> <li>• <b>PAP</b>—The Password Authentication Protocol (PAP) authentication protocol is used for MAC RADIUS authentication.</li> </ul>	<b>detail</b>
<b>MAC radius restrict</b>	The authentication method is restricted to MAC RADIUS only. 802.1X authentication is not enabled.	<b>detail</b>
<b>Reauthentication</b>	The reauthentication state: <ul style="list-style-type: none"> <li>• <b>disable</b>—Periodic reauthentication of the client is disabled.</li> <li>• <b>interval</b>—Sets the periodic reauthentication time interval. The default value is 3600 seconds. The range is 1 through 65,535 seconds.</li> </ul>	<b>detail</b>
<b>Supplicant timeout</b>	The number of seconds the port waits for a response when relaying a request from the authentication server to the supplicant before resending the request. The default value is 30 seconds. The range is 1 through 60 seconds.	<b>detail</b>
<b>Server timeout</b>	The number of seconds the port waits for a reply when relaying a response from the supplicant to the authentication server before timing out. The default value is 30 seconds. The range is 1 through 60 seconds.	<b>detail</b>
<b>Maximum EAPOL requests</b>	The maximum number of times an EAPOL request packet is retransmitted to the supplicant before the authentication session times out. The default value is 2. The range is 1 through 10.	<b>detail</b>
<b>Number of clients bypassed because of authentication</b>	The number of non-802.1X clients granted access to the LAN by means of static MAC bypass. The following fields are displayed: <ul style="list-style-type: none"> <li>• <b>Client</b>—MAC address of the client.</li> <li>• <b>vlan</b>—The name of the VLAN to which the client is connected.</li> </ul>	<b>detail</b>
<b>Guest VLAN member</b>	The VLAN to which a supplicant is connected when the supplicant is authenticated using a guest VLAN. If a guest VLAN is not configured on the interface, this field displays <b>&lt;not configured&gt;</b> .	<b>detail</b>
<b>Multi domain data session count</b>	The number of data sessions that have been authenticated on a multi-domain authentication interface.	<b>detail</b>

Table 75: show dot1x Output Fields (continued)

Field Name	Field Description	Level of Output
Number of connected supplicants	The number of supplicants connected to a port.	detail
Supplicant	The username and MAC address of the connected supplicant.	detail
Authentication method	<p>The authentication method used for a supplicant:</p> <ul style="list-style-type: none"> <li>• <b>CWA Authentication</b>—A supplicant is authenticated by the central Web authentication (CWA) server.</li> <li>• <b>Fail</b>—Authentication failed and supplicant is in <b>Held</b> state.</li> <li>• <b>Guest VLAN</b>—A supplicant is connected to the LAN through the guest VLAN.</li> <li>• <b>MAC RADIUS</b>—A nonresponsive host is authenticated based on its MAC address. The MAC address is configured as permitted on the RADIUS server, the RADIUS server lets the switch know that the MAC address is a permitted address, and the switch opens LAN access to the nonresponsive host on the interface to which it is connected.</li> <li>• <b>RADIUS</b>—A supplicant is configured on the RADIUS server, the RADIUS server communicates this to the switch, and the switch opens LAN access on the interface to which the supplicant is connected.</li> <li>• <b>Server-fail</b>—One of the following fallback actions is in effect because the RADIUS server is unreachable. Indicates whether EAPOL block is in effect, and the amount of time remaining for EAPOL block (in seconds). <ul style="list-style-type: none"> <li>• <b>deny</b>—The supplicant is denied access to the LAN, preventing traffic from flowing from the supplicant through the interface. This is the default server fail fallback action.</li> <li>• <b>permit</b>—The supplicant is permitted access to the LAN as if the supplicant had been successfully authenticated by the RADIUS server.</li> <li>• <b>use-cache</b>—In the event that the RADIUS server times out when the supplicant is attempting reauthentication, the supplicant is reauthenticated only if it was previously authenticated; otherwise, the supplicant is denied LAN access.</li> <li>• <b>VLAN</b>—The supplicant is configured to be moved to a specified VLAN if the RADIUS server is unavailable to reauthenticate the supplicant. (The VLAN must already exist on the switch.)</li> </ul> </li> <li>• <b>Server-reject VLAN</b>—The supplicant received a RADIUS access-reject message from the authentication server and was moved to a server-reject VLAN, a specified VLAN already configured on the switch.</li> </ul>	detail
Authenticated VLAN	The VLAN to which the supplicant is connected.	detail
Dynamic filter	User policy filter sent by the RADIUS server.	detail
Session Reauth interval	The configured reauthentication interval.	detail
Reauthentication due in	The number of seconds in which reauthentication will occur again for the connected supplicant.	detail
Session Accounting Interim Interval	The number of seconds between interim RADIUS accounting messages.	detail

Table 75: show dot1x Output Fields (continued)

Field Name	Field Description	Level of Output
Accounting Update due in	The number of seconds until the next interim RADIUS accounting update is due.	detail
CWA Redirect URL	The URL used to redirect the supplicant to a central Web server for authentication.	detail
Eapol Block	Shows whether EAPOL block is in effect or not in effect.	detail

## Sample Output

### show dot1x interface brief

```
user@switch> show dot1x interface brief
```

```
802.1X Information:
```

Interface	Role	State	MAC address	User
ge-0/0/1	Authenticator	Authenticated	00:a0:d2:18:1a:c8	user1
ge-0/0/2	Authenticator	Connecting		
ge-0/0/3	Authenticator	Held	00:a6:55:f2:94:ae	user3

### show dot1x interface detail

```
user@switch> show dot1x interface ge-0/0/16.0 detail
```

```
ge-0/0/16.0
Role: Authenticator
Administrative state: Auto
Supplicant mode: Single
Number of retries: 3
Quiet period: 60 seconds
Transmit period: 30 seconds
Mac Radius: Enabled
Mac Radius Restrict: Disabled
Mac Radius Authentication Protocol: PAP
Reauthentication: Enabled
Configured Reauthentication interval: 3600 seconds
Supplicant timeout: 30 seconds
Server timeout: 30 seconds
Maximum EAPOL requests: 2
Guest VLAN member: <not configured>
Number of connected supplicants: 2
  Supplicant: abc, 00:30:48:8C:66:BD
    Operational state: Authenticated
    Authentication method: Radius
    Authenticated VLAN: v200
    Session Reauth interval: 3600 seconds
    Reauthentication due in 3587 seconds
    Eapol-Block: Not In Effect
  Supplicant: 000303030303, 00:03:03:03:03:03
    Operational state: Authenticated
    Backend Authentication state: Idle
    Authentication method: Mac Radius
    Authenticated VLAN: dyn_vlan2
```

Session Reauth interval: 3600 seconds  
Reauthentication due in 3587 seconds  
Eap01-Block: In Effect

## show dot1x accounting attribute

<b>Syntax</b>	<b>show dot1x accounting attribute</b>
<b>Release Information</b>	Command introduced in JUNOS Release 16.1 for EX Series switches.
<b>Description</b>	<p>Display the RADIUS accounting attributes sent by the switch, operating as the network access server (NAS), to the RADIUS accounting server. RADIUS accounting attributes convey information that is used to account for a service provided to an authenticated user. The user session statistics are recorded by the accounting server in an accounting log file.</p> <p>RADIUS accounting attributes are included in Accounting-Request messages sent from the switch to the accounting server. Attribute information is created only if the data for the attribute is available.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show dot1x on page 1685</a></li> <li>• <a href="#">clear dot1x on page 1550</a></li> <li>• <a href="#">Example: Configuring Static MAC Bypass of 802.1X and MAC RADIUS Authentication on an EX Series Switch on page 356</a></li> <li>• <a href="#">Example: Setting Up 802.1X for Single-Suppliant or Multiple-Suppliant Configurations on an EX Series Switch on page 325</a></li> <li>• <a href="#">Filtering 802.1X Suplicants by Using RADIUS Server Attributes on page 285</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show dot1x accounting-attributes on page 1692</a>
<b>Output Fields</b>	<a href="#">Table 76 on page 1692</a> lists the output fields for the <b>show dot1x accounting-attributes</b> command. Output fields are listed in the approximate order in which they appear.

Table 76: show dot1x accounting attribute Output Fields

Field Name	Field Description
<b>Accounting attributes</b>	<p>Shows the value for the RADIUS accounting attributes sent from the NAS to the server. An attribute is displayed only if data is available for that attribute value. The following RADIUS accounting attributes are supported:</p> <ul style="list-style-type: none"> <li>• User-Name—The name of the authenticated user.</li> <li>• NAS-Port—The physical port number of the NAS which is authenticating the user.</li> <li>• Framed-IP-Address—The IP address of the authenticated user.</li> <li>• Filter-ID—The name of the filter list for the authenticated user.</li> <li>• Framed-MTU—The maximum transmission unit that can be configured for user.</li> <li>• Client-System-Name—This is a vendor-specific attribute (VSA) used to indicate the client host name. Supported for LLDP-capable devices only.</li> <li>• Session-Timeout—The maximum number of seconds that a session will stay active before termination of the session or prompt.</li> <li>• Called-Station-ID—Allows the NAS to send the phone number that the user called, using Dialed Number Identification (DNIS) or similar technology.</li> <li>• Calling-Station-ID—Allows the NAS to send the phone number that the call came from, using Dialed Number Identification (DNIS) or similar technology.</li> <li>• NAS-Identifier—Contains a string identifying the NAS originating the Accounting-Request.</li> <li>• Acct-Status-Type—Indicates whether this Accounting-Request marks the beginning of the user session (Start) or the end (Stop). Can also be used for an interim update (Interim-Update).</li> <li>• Acct-Authentic—Indicates whether the user was authenticated locally (Local), by the RADIUS server (RADIUS), or by another remote authentication protocol (Remote).</li> <li>• Acct-Session-ID—A unique ID for a specific accounting session that can be used to match start and stop records for a session in the log file.</li> <li>• Event-Timestamp—Records the time an event occurred.</li> <li>• NAS-Port-ID—The port of the NAS that is authenticating the user.</li> <li>• Framed-IPv6-Address—The IPv6 address of the authenticated user.</li> </ul>

## Sample Output

### show dot1x accounting-attributes

```
user@switch> show dot1x accounting-attributes
```

```
Accounting Attribute:
  Calling Station Id:      88-e0-f3-1f-c5-e0
  Called station Id:      00-10-94-00-00-02
  Framed Ipv6 Address     :2001:db8:0:1:2a0:a514:0:24d
  Accounting Session ID:  802.1x812f00250002dcc6
  Client System Name:     AVX149485
  Session-Timeout:        120s
  Framed-MTU:             492
  Acct-Authentic:         RADIUS
  Nas-Port-ID             ge-0/0/5.0
```

## show dot1x authentication-failed-users

<b>Syntax</b>	show dot1x authentication-failed-users
<b>Release Information</b>	Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 14.1X53-D30 for the QFX Series.
<b>Description</b>	Display the supplicants (users) that have failed 802.1X authentication.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear dot1x on page 1550</a></li> <li>• <a href="#">Example: Configuring Static MAC Bypass of 802.1X and MAC RADIUS Authentication on an EX Series Switch on page 356</a></li> <li>• <a href="#">Configuring 802.1X Interface Settings (CLI Procedure) on page 280</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show dot1x authentication-failed-users on page 1693</a>
<b>Output Fields</b>	<a href="#">Table 77 on page 1693</a> lists the output fields for the <b>show dot1x authentication-failed-users</b> command. Output fields are listed in the approximate order in which they appear.

*Table 77: show dot1x authentication-failed-users Output Fields*

Field Name	Field Description	Level of Output
<b>Interface</b>	The MAC address configured to bypass 802.1X authentication.	all
<b>MAC address</b>	The MAC address configured statically on the interface.	all
<b>User</b>	The user that is configured on the RADIUS server and that has failed 802.1X authentication.	all
<b>Failure Count</b>	The number of times that 802.1X authentication has failed on the interface.	all

## Sample Output

### show dot1x authentication-failed-users

```
user@switch> show dot1x authentication-failed-users
```

Interface	MAC address	User	Failure Count
ge-0/0/17.0	00:37:00:00:00:00	003700000000	28
ge-0/0/20.0	00:04:10:00:00:00	000410000000	32

ge-0/0/18.0	00:00:03:00:0a:00	000003000a00	4
ge-0/0/19.0	00:00:03:00:0b:00	000003000b00	18

## show dot1x firewall

<b>Syntax</b>	<code>show dot1x firewall &lt;interface <i>interface-name</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.5 for EX Series switches. Command introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.
<b>Description</b>	Display information about the firewall filters for each user or nonresponsive host that is authenticated on each 802.1X-enabled interface that is configured for multiple supplicants. For example, if the firewall filter is configured with a term for counters, the command shows the count for each user.
<b>Options</b>	<b>none</b> —Display information for all interfaces.  <b>interface <i>interface-names</i></b> —(Optional) Display information for the specified interface.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear dot1x on page 1550</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show dot1x firewall on page 1695</a> <a href="#">show dot1x firewall on page 1695</a>
<b>Output Fields</b>	Output fields include any action modifier that is specified in firewall filters.

## Sample Output

### show dot1x firewall

(Showing counter action)

```
user@switch> show dot1x firewall
Filter: dot1x-filter-ge-0/0/3
Counters
  counter1_dot1x_ge-0/0/3_user1    342
  counter1_dot1x_ge-0/0/3_user2    857
```

### show dot1x firewall

(Showing policer action)

```
user@switch> show dot1x firewall
Filter: dot1x_ge-0/0/0
Counters
```

p1-t1 494946

## show dot1x static-mac-address

<b>Syntax</b>	<code>show dot1x static-mac-address &lt;(interface [<i>interface-name</i>])&gt;</code>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 14.1X53-D30 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.2 for MX240, MX480, and MX960 routers in enhanced LAN mode.</p>
<b>Description</b>	Display all the static MAC addresses that are configured to bypass 802.1X authentication on the switch.
<b>Options</b>	<p><b>none</b>—Display static MAC addresses for all interfaces.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Display static MAC addresses for a specific interface.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear dot1x on page 1550</a></li> <li>• <a href="#">Example: Configuring Static MAC Bypass of 802.1X and MAC RADIUS Authentication on an EX Series Switch on page 356</a></li> <li>• <a href="#">Adding a Static MAC Address Entry to the Ethernet Switching Table on a Switch with ELS Support</a></li> <li>• <a href="#">Configuring 802.1X Interface Settings (CLI Procedure) on page 280</a></li> <li>• <a href="#">Understanding Authentication on Switches on page 256</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show dot1x static-mac-address on page 1698</a></p> <p><a href="#">show dot1x static-mac-address interface (Specific Interface) on page 1698</a></p>
<b>Output Fields</b>	<a href="#">Table 78 on page 1697</a> lists the output fields for the <b>show dot1x static-mac-address</b> command. Output fields are listed in the approximate order in which they appear.

*Table 78: show dot1x static-mac-address Output Fields*

Field Name	Field Description	Level of Output
MAC address	The MAC address of the device that is configured to bypass 802.1X authentication.	all
VLAN-Assignment	The name of the VLAN to which the device is assigned.	all
Interface	The name of the interface on which authentication is bypassed for a given MAC address.	all

## Sample Output

### show dot1x static-mac-address

```
user@switch> show dot1x static-mac-address
```

MAC address	VLAN-Assignment	Interface
00:00:00:11:22:33

**List of Sample Output** [show dot1x statistics interface on page 1700](#)

**Output Fields** [Table 76 on page 1692](#) lists the output fields for the **show dot1x statistics** command. Output fields are listed in the approximate order in which they appear.

*Table 79: show dot1x statistics Output Fields*

Field Name	Field Description
TxReqId	The number of EAP-Request/Identity messages transmitted on the interface.
TxReq	The number of transmitted EAP-Request frames that were not EAP-Request/Identity.
TxTotal	The total number of EAPOL messages transmitted on the interface.
RxStart	The number of EAPOL-Start messages received on the interface.
RxLogoff	The number of EAP-Logoff messages received on the interface.
RxRespId	The number of EAP-Response/Identity frames received on the interface.

*Table 79: show dot1x statistics Output Fields (continued)*

Field Name	Field Description
RxResp	The number of EAP-Response messages received that were not EAP-Response/Identity.
CoA-Request	The number of Change of Authorization (CoA) Request messages received on the interface.
CoA-Ack	The number of CoA-Ack messages transmitted on the interface.
CoA-Nak	The number of CoA-Nak messages transmitted on the interface.
RxInvalid	The number of invalid EAPOL messages received on the interface.
RxLenErr	The number of EAPOL messages with incorrect length received on the interface.
RxTotal	The total number of EAPOL messages received on the interface.
LastRxVersion	The version number of the last EAPOL message received on the interface.
LastRxCsrcMac	The source MAC address in the last EAPOL message received on the interface.
PortBounceReqRx	The number of port bounce requests received on the port.

## Sample Output

### show dot1x statistics interface

```
user@host> show dot1x statistics interface ge-0/0/0
```

```
Interface: ge-0/0/0.0
TxReqId = 4 TxReq = 0 TxTotal = 4
RxStart = 0 RxLogoff = 0 RxRespId = 0 RxResp = 0

**Output Fields** For QFX Series, QFabric, NFX Series, EX4600 and OCX1100:

Table 57 on page 1621 lists the output fields for the **show ethernet-switching interfaces** command on QFX Series, QFabric, NFX Series, EX4600 and OCX1100. Output fields are listed in the approximate order in which they appear.

*Table 80: show ethernet-switching interfaces Output Fields*

Field Name	Field Description	Level of Output
<b>Interface</b>	Name of a switching interface.	All levels
<b>State</b>	Interface state. Values are <b>up</b> or <b>down</b> .	none, <b>brief</b> , <b>detail</b> , <b>summary</b>
<b>VLAN members</b>	Name of a VLAN.	none, <b>brief</b> , <b>detail</b> , <b>summary</b>
<b>Blocking</b>	Forwarding state of the interface: <ul style="list-style-type: none"> <li>• <b>blocked</b>—Traffic is not being forwarded on the interface.</li> <li>• <b>unblocked</b>—Traffic is forwarded on the interface.</li> <li>• <b>MAC limit exceeded</b>—The interface is temporarily disabled because of a MAC limiting error. The disabled interface is automatically restored to service when the disable timeout expires.</li> <li>• <b>MAC move limit exceeded</b>—The interface is temporarily disabled because of a MAC move limiting error. The disabled interface is automatically restored to service when the disable timeout expires.</li> <li>• <b>Storm control in effect</b> —The interface is temporarily disabled because of a storm control error. The disabled interface is automatically restored to service when the disable timeout expires.</li> <li>• <b>Storm control shutdown in effect</b> —The interface is temporarily disabled because of a storm control shutdown error. The disabled interface is automatically restored to service when the disable timeout expires.</li> </ul>	none, <b>brief</b> , <b>detail</b> , <b>summary</b>
<b>Index</b>	VLAN index internal to Junos OS software.	<b>detail</b>
<b>untagged   tagged</b>	Specifies whether the interface forwards IEEE802.1Q-tagged or untagged traffic.	<b>detail</b>

Output fields for EX Series:

Table 58 on page 1622 lists the output fields for the **show ethernet-switching interfaces** command on EX Series switches. Output fields are listed in the approximate order in which they appear.

*Table 81: show ethernet-switching interfaces Output Fields*

Field Name	Field Description	Level of Output
<b>Interface</b>	Name of a switching interface.	none, <b>brief</b> , <b>detail</b> , <b>summary</b>
<b>Index</b>	VLAN index internal to Junos OS.	<b>detail</b>
<b>State</b>	Interface state. Values are <b>up</b> and <b>down</b> .	none, <b>brief</b> , <b>detail</b>
<b>Port mode</b>	The <b>access</b> mode is the port mode default and works with a single VLAN. Port mode can also be <b>trunk</b> , which accepts tagged packets from multiple VLANs on other switches. The third port mode value is <b>tagged-access</b> , which accepts tagged packets from access devices.	<b>detail</b>
<b>Reflective Relay Status</b>	Reflective relay allows packets to use the same interface for both upstream and downstream traffic. When reflective relay has been configured, the status displayed is always <b>enabled</b> . When reflective relay is not configured, this entry does not appear in the command output.	<b>detail</b>
<b>Ether type for the interface</b>	Ether type is a two-octet field in an Ethernet frame used to indicate which protocol is encapsulated in the payload of an incoming Ethernet packet. Both 802.1Q packets and Q-in-Q packets use this field. The output displayed for this particular field indicates the interface's Ether type, which is used to match the Ether type of incoming 802.1Q packets and Q-in-Q packets. The indicated Ether type field is also added to the interface's outgoing 802.1Q and Q-in-Q packets.	<b>detail</b>
<b>VLAN membership</b>	Names of VLANs that belong to this interface.	none, <b>brief</b> , <b>detail</b> ,
<b>Tag</b>	Number of the 802.1Q tag.	none, <b>brief</b> , <b>detail</b> ,
<b>Tagging</b>	Specifies whether the interface forwards 802.1Q <b>tagged</b> or <b>untagged</b> traffic.	none, <b>brief</b> , <b>detail</b> ,

Table 81: show ethernet-switching interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Blocking</b>	<p>The forwarding state of the interface:</p> <ul style="list-style-type: none"> <li>• <b>unblocked</b>—Traffic is forwarded on the interface.</li> <li>• <b>blocked</b>—Traffic is not being forwarded on the interface.</li> <li>• <b>Disabled by bpdu control</b>—The interface is disabled due to receiving BPDUs on a protected interface. If the <b>disable-timeout</b> statement has been included in the BPDU configuration, the interface automatically returns to service after the timer expires.</li> <li>• <b>blocked by RTG</b>—The specified redundant trunk group is disabled.</li> <li>• <b>blocked by STP</b>—The interface is disabled due to a spanning-tree protocol error.</li> <li>• <b>MAC limit exceeded</b>—The interface is temporarily disabled due to a MAC limit error. The disabled interface is automatically restored to service when the disable timeout expires.</li> <li>• <b>MAC move limit exceeded</b>—The interface is temporarily disabled due to a MAC move limit error. The disabled interface is automatically restored to service when the disable timeout expires.</li> <li>• <b>Storm control in effect</b>—The interface is temporarily disabled due to a storm control error. The disabled interface is automatically restored to service when the disable timeout expires.</li> </ul>	none, <b>brief</b> , <b>detail</b> ,
<b>Number of MACs learned on IFL</b>	Number of MAC addresses learned by this interface.	<b>detail</b>
<b>mapping</b>	<p>When mapping is configured, the status is one of the following C-VLAN to S-VLAN mapping types:</p> <ul style="list-style-type: none"> <li>• <b>dot1q-tunneled</b>—The interface maps all traffic to the S-VLAN (all-in-one bundling).</li> <li>• <b>native</b>—The interface maps untagged and priority tagged packets to the S-VLAN.</li> <li>• <b>push</b>—The interface maps packets to a firewall filter to an S-VLAN.</li> <li>• <b>policy-mapped</b>—The interface maps packets to a specifically defined S-VLAN.</li> <li>• <b>integer</b>—The interface maps packets to the specified S-VLAN.</li> </ul> <p>When mapping is not configured, this entry does not appear in the command output.</p>	<b>detail</b>

Reflective Relay Status: Enabled
Ether type for the interface: 0x8100
VLAN membership:
    VLAN_Purple VLAN_Orange VLAN_Blue, 802.1Q Tag: 450, tagged, unblocked
Number of MACs learned on IFL: 0
```

## show ethernet-switching interface

**Syntax** `show ethernet-switching interface`  
`<brief | detail | extensive>`  
`<interface-name>`

**Release Information** Command introduced in Junos OS Release 12.3R2.  
 Command introduced in Junos OS Release 12.3R2 for EX Series switches.  
 Command introduced in Junos OS Release 13.2x51 for QFX Series switches.

**Description** Display Layer 2 learning information for all the interfaces.

**Options** **none**—Display Ethernet-switching information for all interfaces.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**interface-name**—(Optional) Display Ethernet-switching information for the specified interface.

**Required Privilege Level** view

**Related Documentation**

**List of Sample Output** [show ethernet switching interface \(Specific Interface\) on page 1710](#)  
[show ethernet-switching interface detail on page 1711](#)

**Output Fields** [Table 82 on page 1709](#) describes the output fields for the `show ethernet-switching interface` command. Output fields are listed in the approximate order in which they appear.

*Table 82: show ethernet-switching interface Output Fields*

Field Name	Field Description
Logical interface	Name of the logical interface.
VLAN members	VLANs associated with this interface.
Tag	VLAN ID.
MAC limit	Number of MAC addresses that can be associated with the interface.
STP state	Spanning Tree protocol (STP) state.

Table 82: show ethernet-switching interface Output Fields (continued)

Field Name	Field Description
Logical interface flags	Status of Layer 2 learning properties for each interface: <ul style="list-style-type: none"> <li>• <b>DL</b>—MAC learning is disabled.</li> <li>• <b>LH</b>—MAC interface limit has been reached.</li> <li>• <b>AD</b>—Packets are dropped after the MAC interface limit is reached.</li> <li>• <b>DN</b>—The MAC interface is down.</li> <li>• <b>MMAS</b>—The MAC interface is disabled after a MAC address move.</li> <li>• <b>SCTL</b>—The MAC interface is disabled after a configured storm-control level is exceeded.</li> </ul>
Tagging	Tagging state of the VLAN.

## Sample Output

### show ethernet switching interface (Specific Interface)

```
user@host> show ethernet-switching interface ae10.0
```

```
Logical Interface flags (DL - disable learning, AD - packet action drop,  
LH - MAC limit hit, DN - interface down)
```

Logical interface	Vlan members	TAG	MAC limit	STP state	Logical interface flags	Tagging tagged
ae10.0	VLAN70..	701	1024	Forwarding		
	VLAN70..	702	1024	Forwarding		
	VLAN70..	703	1024	Forwarding

## show lldp

---

**Syntax**    `show lldp  
<detail>`

**Release Information**    Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Display information about Link Layer Discovery Protocol (LLDP) and Link Level Discovery Protocol—Media Endpoint Discovery (LLDP-MED) configuration and capabilities on the switch. LLDP and LLDP-MED are used to learn about and to distribute device information on network links.

**NOTE:** LLDP-MED is not available on the QFX Series.

---

**Options**    **none**—Display LLDP information for all interfaces.  
**detail**—(Optional) Display detailed LLDP information for all interfaces.

**Required Privilege Level**    view

**Related Documentation**

[show lldp \(EX4300 switches\) on page 1716](#)  
[show lldp detail \(EX4300 switches\) on page 1716](#)  
[show lldp detail \(EX3400 switches with VLAN name TLV\) on page 1717](#)

**Output Fields**    [Table 83 on page 1713](#) lists the output fields for the **show lldp** command. Output fields are listed in the approximate order in which they appear.

Table 83: show lldp Output Fields

Field Name	Field Description	Level of Output
LLDP	LLDP operating state. The state can be <b>enabled</b> or <b>disabled</b> .  <b>NOTE:</b> If a VLAN that has been configured for untagged packets on an interface also has Layer 2 protocol tunneling (L2PT) enabled for LLDP, the LLDP operating state for that interface is displayed as <b>disabled</b> .	All levels
Advertisement interval	Frequency, in seconds, at which LLDP advertisements are sent.  This value is set by the <b>advertisement-interval</b> configuration statement.	All levels
Transmit delay	Seconds of delay before advertisements are sent to neighbors following a change to a TLV (type, length, or value) element in the LLDP protocol or to the state of the local system, such as a change in hostname or management address. You can set this value to reduce the delay in notifying neighbors of a change in the local system.  This value is set by the <b>transmit-delay</b> configuration statement.	All levels
Hold timer	On EX4300 switches, the hold timer shows the length of time LLDP information is held before it is discarded. The hold timer value is equal to the advertisement interval multiplied by the hold multiplier.  On all other switches, the hold timer shows the value of the hold multiplier.  The hold multiplier value is set by the <b>hold-multiplier</b> configuration statement.	All levels
Notification interval	How often LLDP trap notifications are generated as a result of LLDP database changes. If the interval value is 0, LLDP trap notifications on database changes are disabled.  This value is set by the <b>lldp-configuration-notification-interval</b> configuration statement.	All levels
Config Trap Interval	How often LLDP trap notifications are generated as a result of changes in topology—for example, when an endpoint connects or disconnects. If the interval value is 0, LLDP trap notifications on topology changes are disabled.  This value is set by the <b>ptopo-configuration-trap-interval</b> configuration statement.	All levels
Connection Hold timer	Amount of time the system maintains dynamic topology entries.  This value is set by the <b>ptopo-configuration-maximum-hold-time</b> configuration statement.	All levels
LLDP-MED	LLDP-MED operating state. The state can be <b>Enabled</b> or <b>Disabled</b> .	All levels
MED fast start count	Number of advertisements sent from a switch to a device, such as a VoIP telephone, when the device is first detected by the switch. These increased advertisements are temporary. After a device and a switch exchange information and can communicate, advertisements are reduced to one per second.  This value is set by using the <b>fast-start</b> configuration statement.  <b>NOTE:</b> <b>fast-start</b> is not available on the QFX Series.	All levels

Table 83: show lldp Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Interface</b>	Name of the interface for which LLDP configuration information is being reported.	All levels
<b>Parent Interface</b>	Name of the aggregated Ethernet interface, if any, to which the interface belongs.	All levels
<b>LLDP</b>	LLDP operating state. The state can be <b>Enabled</b> or <b>Disabled</b> .	All levels
<b>Power Negotiation</b>	LLDP power negotiation operating state. The state can be <b>Enabled</b> or <b>Disabled</b> .	All levels
<b>Neighbor count</b>	Total number of new LLDP neighbors detected since the last switch reboot.	<b>detail</b>
<b>Interface</b>	Name of the interface that is advertising VLAN information.	All levels
<b>Vlan-id</b>	VLAN tag associated with the interface sending LLDP frames. If the interface is not a member of a VLAN, the VLAN ID is advertised as 0.	<b>detail</b>
<b>Vlan-name</b>	VLAN name associated with the VLAN ID.  For switches running Junos OS releases with Enhanced Layer 2 Software (ELS), this column displays the string <b>vlan-vlan-id</b> by default. Starting in Junos OS Release 15.1X53-D59 and 18.2R1, you can configure the <b>vlan-name-tlv-option name</b> option at the <b>[edit protocols lldp]</b> hierarchy level to transmit the VLAN name in the LLDP VLAN name TLV in place of the VLAN ID, and display the actual VLAN name in this output field instead.	<b>detail</b>
<b>LLDP basic TLVs supported</b>	Basic TLVs supported on the switch: <ul style="list-style-type: none"> <li>• <b>Chassis identifier</b>—TLV that advertises the MAC address associated with the local system.</li> <li>• <b>Port identifier</b>—TLV that advertises the port identification for the specified port in the local system.</li> <li>• <b>Port description</b>—Interface name for the port.</li> <li>• <b>System name</b>—TLV that advertises the user-configured name of the local system.</li> <li>• <b>System description</b>—TLV that advertises the system description containing information about the software and current image running on the system. This information is taken from the software and is not configurable.</li> <li>• <b>System capabilities</b>—TLV that advertises the primary functions performed by the system—for example, bridge or router.</li> <li>• <b>Management address</b>—TLV that advertises the IP management address of the local system.</li> </ul>	<b>detail</b>

Table 83: show lldp Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Supported LLDP 802 TLVs</b>	<p>802.3 TLVs supported on the switch:</p> <ul style="list-style-type: none"> <li>• <b>MAC/PHY configuration status</b>—TLV that advertises information about the physical interface, such as autonegotiation status and support and MAU type. The information is based on the physical interface structure and is not configurable.</li> <li>• <b>Power via MDI</b>—TLV that advertises MDI power support, PSE power pair, and power class information.</li> <li>• <b>Link aggregation</b>—TLV that advertises if the interface is aggregated and its aggregated interface ID.</li> <li>• <b>Maximum frame size</b>—TLV that advertises the maximum transmission unit (MTU) of the interface sending LLDP frames.</li> <li>• <b>Port VLAN tag</b>—TLV that advertises the VLAN tag configured on the interface.</li> <li>• <b>Port VLAN name</b>—TLV that advertises the VLAN name configured on the interface.</li> </ul>	<b>detail</b>
<b>Supported LLDP MED TLVs</b>	<p>LLDP-MED TLVs supported on the switch:</p> <ul style="list-style-type: none"> <li>• <b>LLDP MED capabilities</b>—TLV that advertises the primary function of the port. The capabilities values range from 0 through 15: <ul style="list-style-type: none"> <li>• 0—Capabilities</li> <li>• 1—Network Policy</li> <li>• 2—Location Identification</li> <li>• 3—Extended Power via MDI-PSE</li> <li>• 4—Inventory</li> <li>• 5–15—Reserved</li> </ul> </li> <li>• <b>Network policy</b>—TLV that advertises the port VLAN configuration and associated Layer 2 and Layer 3 attributes. Attributes include the policy identifier, application types—such as voice or streaming video—802.1Q VLAN tagging, and 802.1p priority bits and DiffServ code points.</li> <li>• <b>Endpoint location</b>—TLV that advertises the physical location of the endpoint.</li> <li>• <b>Extended power Via MDI</b>—TLV that advertises the power type, power source, power priority, and power value of the port. It is the responsibility of the PSE device (network connectivity device) to advertise the power priority on a port.</li> </ul>	<b>detail</b>

## Sample Output

### show lldp (EX3200 switches)

```

user@switch> show lldp

LLDP                : Enabled
Advertisement interval : 30 seconds
Transmit delay       : 2 seconds
Hold timer           : 4 seconds
Notification interval : 0 Second(s)
Config Trap Interval : 0 seconds
Connection Hold timer : 300 seconds

LLDP MED             : Disabled

```

```
MED fast start count : 3 Packets
```

Interface	Parent Interface	LLDP	LLDP-MED	Power Negotiation
all	-	Enabled	Enabled	Enabled

## show lldp neighbors

**Syntax** `<show lldp neighbors>`  
`<interface interface-ids>`

**Release Information** Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display learned information about Link Layer Discovery Protocol (LLDP) on all neighboring interfaces or on selected interfaces.

**Options** **none**—Display learned LLDP information on all neighboring interfaces and devices.

**interface interface-ids**—(Optional) Display learned LLDP information on the selected interfaces or devices.

**NOTE:** When a port with DCBX enabled begins to exchange type, length, and value (TLV) entries, optional LLDP TLVs on that port are not advertised to neighbors in order to interoperate with a wider variety of converged network adapters (CNAs). As a result, information for those ports will not be listed in the output for this command.

**Required Privilege Level** view

**List of Sample Output** [show lldp neighbors on page 1724](#)  
[show lldp neighbors interface on page 1724](#)

**Output Fields** [Table 85 on page 1721](#) lists the output fields for the **show lldp neighbors** command. Output fields are listed in the approximate order in which they appear.

*Table 85: show lldp neighbors Output Fields*

Field Name	Field Description
Local Interface	List of local interfaces for which neighbor information is available.
Parent Interface	List of aggregated Ethernet interfaces, if any, to which the local interfaces belong.
Chassis ID	List of chassis identifiers for neighbors.

Table 85: show lldp neighbors Output Fields (continued)

Field Name	Field Description
Port info	List of port information gathered from neighbors. This could be the port identifier or port description.
System name	List of system names gathered from neighbors.
LLDP Neighbor Information	Information about both the local system (the switch) and a neighbor system on the interface (appears when the <b>interface</b> option is used).
Local Information	Information about the local system (appears when the <b>interface</b> option is used).
Index	Local interface index (appears when the <b>interface</b> option is used).
Time to live	Number of seconds for which this information is valid (appears when the <b>interface</b> option is used).
Time mark	Date and timestamp of information (appears when the <b>interface</b> option is used).
Local Interface	Name of the local physical interface (appears when the <b>interface</b> option is used).
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the interface belongs (appears when the <b>interface</b> option is used).
Local Port ID	Local interface SNMP index (appears when the <b>interface</b> option is used).
Ageout Count	Number of times the complete set of information advertised by the neighbor has been deleted from LLDP neighbor information maintained by the local system because the information timeliness interval has expired (appears when the <b>interface</b> option is used).
Neighbor Information	Information about a neighbor system on the interface (appears when the <b>interface</b> option is used).
Chassis type	Type of chassis identifier supplied, such as <b>MAC address</b> (appears when the <b>interface</b> option is used).
Chassis ID	Chassis identifier of the chassis type listed (appears when the <b>interface</b> option is used).
Port type	Type of port identifier supplied, such as <b>locally assigned</b> (appears when the <b>interface</b> option is used).
Port ID	Port identifier of the port type listed (appears when the <b>interface</b> option is used).
Port description	Port description (appears when the <b>interface</b> option is used).

Table 85: show lldp neighbors Output Fields (continued)

Field Name	Field Description
System name	Name supplied by the system on the interface (appears when the <b>interface</b> option is used).
System Description	Description supplied by the system on the interface (appears when the <b>interface</b> option is used).
System capabilities	Capabilities (such as <b>Bridge</b> , <b>Router</b> , and <b>Telephone</b> ) that are supported or enabled by the system on the interface (appears when the <b>interface</b> option is used).
Management Info	<p>Details of management information: <b>Type</b> (such as <b>ipv4</b> or <b>ipv6</b>), <b>Address</b> (such as <b>10.204.34.35</b>), <b>Port ID</b>, <b>Subtype</b>, <b>Interface Subtype</b>, and organization identifier (<b>OID</b>) (appears when the <b>interface</b> option is used).</p> <p>The <b>Interface Subtype</b> displays:</p> <ul style="list-style-type: none"> <li><b>ifIndex(2)</b>— IP address of the neighbor's management Ethernet interface (<b>me0</b>) or virtual management Ethernet (<b>VME</b>) interface address (for a virtual chassis) is used to manage the switch.</li> <li><b>unknown(1)</b>—Neighbor's IP management address has been configured with set <b>protocols lldp management-address</b>.</li> </ul>
Media Info	Additional details about the endpoint device appear when a device that supports LLDP-MED is attached to the interface. The specific details depend upon the capabilities of the device. Details might include <b>Media endpoint class</b> (such as Class 3 for communication devices such as IP phones), <b>MED Hardware revision</b> , <b>MED Firmware revision</b> , <b>MED Software revision</b> , <b>MED Serial number</b> , <b>MED Manufacturer name</b> , or <b>MED Model name</b> .
Organization Info	One or more entries listing remote information by organizationally unique identifier ( <b>OUI</b> ), <b>Subtype</b> , <b>Index</b> , and <b>Info</b> (appears when the <b>interface</b> option is used).
Age	How long the neighbor has been identified (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).
Local Interface	Name of the local physical interface (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the interface belongs (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).
Chassis ID	Chassis identifier of the chassis type listed (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).
Port description	Port description (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).
System name	NetBIOS name of the host (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).

## show lldp neighbors

**Syntax** `show lldp neighbors`  
`<interface interface>`

**Release Information** Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Display the information about neighboring devices learned by the switch by using the Link Layer Discovery Protocol (LLDP).

**NOTE:** The Chassis ID TLV has a subtype for Network Address Family. The supported network address families are IPv4 and IPv6. LLDP frames are validated only if the Network Address subtype of the Chassis ID TLV has a value of 1 (IPv4) or 2 (IPv6). For any other value, the transmitting device is detected by LLDP as a neighbor and displayed in the output of the `show lldp neighbors` command, but is not assigned to the VLAN.

**Options** `interface interface`—(Optional) Display LLDP neighbor information for a selected interface.

**Required Privilege Level** view

**Related Documentation**

**Output Fields** [Table 85 on page 1721](#) lists the output fields for the `show lldp neighbors` command. Output fields are listed in the approximate order in which they appear.

*Table 86: show lldp neighbors Output Fields*

Field Name	Field Description
Local Interface	List of local interfaces for which neighbor information is available.
Parent Interface	List of aggregated Ethernet interfaces, if any, to which the local interfaces belong.

Table 86: show lldp neighbors Output Fields (continued)

Field Name	Field Description
Chassis ID	List of chassis identifiers for neighbors.
Port info	This field displays the port information received from neighbors.
System name	List of system names gathered from neighbors. Includes the host name and the domain name.
LLDP Neighbor Information	Information about both the local system (the switch) and a neighbor system on the interface (appears when the <b>interface</b> option is used).
Local Information	Information about the local system (appears when the <b>interface</b> option is used).
Index	Local interface index (appears when the <b>interface</b> option is used).
Time to live	Number of seconds for which this information is valid (appears when the <b>interface</b> option is used).
Time mark	Date and timestamp of information (appears when the <b>interface</b> option is used).
Local Interface	Name of the local physical interface (appears when the <b>interface</b> option is used).
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the interface belongs (appears when the <b>interface</b> option is used).
Local Port ID	Local interface SNMP index (appears when the <b>interface</b> option is used).
Ageout Count	Number of times the complete set of information advertised by the neighbor has been deleted from LLDP neighbor information maintained by the local system because the information timeliness interval expired (appears when the <b>interface</b> option is used).
Neighbor Information	Information about a neighbor system on the interface (appears when the <b>interface</b> option is used).
Chassis type	Type of chassis identifier supplied, such as <b>Mac address</b> (appears when the <b>interface</b> option is used).
Chassis ID	Chassis identifier of the chassis type listed (appears when the <b>interface</b> option is used).
Port type	Type of port identifier supplied, such as <b>Locally assigned</b> (appears when the <b>interface</b> option is used).
Port ID	Port identifier of the port type listed (appears when the <b>interface</b> option is used).

Table 86: show lldp neighbors Output Fields (continued)

Field Name	Field Description
Port description	The port description field uses the configured port description, the port name or the SNMP ifIndex (appears when the <b>interface</b> option is used).
System name	Name supplied by the system on the interface (appears when the <b>interface</b> option is used).
System Description	Description supplied by the system on the interface (appears when the <b>interface</b> option is used).
System capabilities	Capabilities (such as <b>Bridge</b> , <b>Bridge Router</b> , and <b>Bridge Telephone</b> ) that are supported or enabled by the system on the interface (appears when the <b>interface</b> option is used).
Management Info	<p>Details of management information: <b>Type</b> (such as <b>IPv4</b> or <b>IPv6</b>), <b>Address</b> (such as <b>10.204.34.35</b>), <b>Port ID</b>, <b>Subtype</b>, <b>Interface Subtype</b>, and organization identifier (<b>OID</b>) (appears when the <b>interface</b> option is used).</p> <p>The <b>Interface Subtype</b> displays:</p> <ul style="list-style-type: none"> <li>• <b>ifindex(2)</b>— IP address of the neighbor's management Ethernet interface (<b>me0</b>) or virtual management Ethernet (<b>VME</b>) interface address (for a Virtual Chassis) is used to manage the switch.</li> <li>• <b>unknown(1)</b>—Neighbor's IP management address has been configured with set <b>protocols lldp management-address</b>.</li> </ul>
Media Info	Additional details about the endpoint device appear when a device that supports LLDP-MED is attached to the interface. The specific details depend upon the capabilities of the device. Details might include: <b>Media endpoint class</b> (such as <b>Class 3</b> for communication devices such as IP phones), <b>MED Hardware revision</b> , <b>MED Firmware revision</b> , <b>MED Software revision</b> , <b>MED Serial number</b> , <b>MED Manufacturer name</b> , <b>MED Model name</b> .
Organization Info	One or more entries (indexed by the <b>Index</b> element) listing more remote interface information by organizationally unique identifier ( <b>OUI</b> ), <b>Subtype</b> , and <b>Info</b> (appears when the <b>interface</b> option is used).
Age	How long the neighbor has been identified (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).
Local Interface	Name of the local physical interface (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).
Parent Interface	Name of the aggregated Ethernet interface, if any, to which the interface belongs (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).
Chassis ID	Chassis identifier of the chassis type listed (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).

## show lldp statistics

<b>Syntax</b>	<code>show lldp statistics</code> <code>&lt;interface <i>interface-ids</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.
<b>Description</b>	Display LLDP statistics on all or selected interfaces.
<b>Options</b>	<b>none</b> —Display LLDP statistics on all interfaces and devices.  <b>interface <i>interface-ids</i></b> —(Optional) Display LLDP statistics on the selected devices.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding LLDP on page 431</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show lldp statistics on page 1734</a>
<b>Output Fields</b>	<a href="#">Table 87 on page 1733</a> lists the output fields for the <b>show lldp statistics</b> command. Output fields are listed in the approximate order in which they appear.

*Table 87: show lldp statistics Output Fields*

Field Name	Field Description	Level of Output
<b>Interface</b>	Name of an interface.	All levels
<b>Received</b>	Total number of LLDP frames received on an interface.	All levels
<b>Unknown-TLVs</b>	Number of unrecognized LLDP TLVs received on an interface.	All levels
<b>With Errors</b>	Number of LLDP frames received that contain errors.	All levels
<b>Discarded TLVs</b>	Number of LLDP TLVs received and then discarded on an interface.	All levels
<b>Transmitted</b>	Total number of LLDP frames transmitted on an interface.	All levels
<b>Untransmitted</b>	Total number of LLDP frames not transmitted on an interface.	All levels

## Sample Output

### show lldp statistics

```
user@switch> show lldp statistics
```

Interface	Received	Unknown TLVs	With Errors	Discarded TLVs	Transmitted
me0.0	0	0	0	0	8003
ge-0/0/0.0	8002	0	0	0	8003
ge-0/0/1.0	8002	0	0	0	8003

## show lldp statistics

**Syntax** `show lldp statistics`  
`<interface interface>`

**Release Information** Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Display LLDP statistics for all interfaces or for the specified interface.

**Options** **none**—Display LLDP statistics for all interfaces.

**interface *interface***—(Optional) Display LLDP statistics for the specified interface.

**Required Privilege Level** view

**Related Documentation**

- [Understanding LLDP and LLDP-MED on EX Series Switches on page 438](#)

**List of Sample Output** [show lldp statistics on page 1736](#)  
[show lldp statistics interface xe-3/0/0.0 on page 1736](#)

**Output Fields** [Table 87 on page 1733](#) lists the output fields for the **show lldp statistics** command. Output fields are listed in the approximate order in which they appear.

*Table 88: show lldp statistics Output Fields*

Field Name	Field Description
<b>Interface</b>	Name of the interface.
<b>Parent Interface</b>	Name of the aggregated Ethernet interface, if any, to which the interface belongs.  <b>NOTE:</b> Because LLDP packets are transmitted and received on member interfaces only, statistics are available only for the member interfaces, not for the aggregated interface.
<b>Received</b>	Total number of LLDP frames received on an interface.
<b>Unknown TLVs</b>	Number of unrecognized LLDP TLVs received on an interface.
<b>With Errors</b>	Number of invalid LLDP TLVs received on an interface.
<b>Discarded</b>	Number of LLDP TLVs received and then discarded on an interface.
<b>Transmitted</b>	Total number of LLDP frames that were transmitted on an interface.

Table 88: show lldp statistics Output Fields (continued)

Field Name	Field Description
<b>Untransmitted</b>	Total number of LLDP frames that were untransmitted on an interface.

## Sample Output

### show lldp statistics

```
user@switch> show lldp statistics
```

Interface	Parent Interface	Received	Unknown TLVs	With Errors
xe-3/0/0.0	ae31.0	1564	0	0

## show lldp remote-global-statistics

<b>Syntax</b>	show lldp remote-global-statistics
<b>Release Information</b>	Command introduced in Junos OS Release 10.0 for EX Series switches.
<b>Description</b>	Display remote Link Layer Discovery Protocol (LLDP) global statistics.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring LLDP (CLI Procedure) on page 432</a></li> <li>• <a href="#">Understanding LLDP and LLDP-MED on EX Series Switches on page 438</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show lldp remote-global-statistics on page 1738</a>
<b>Output Fields</b>	<a href="#">Table 89 on page 1737</a> describes the output fields for the <b>show lldp remote-global-statistics</b> command. Output fields are listed in the approximate order in which they appear.

*Table 89: show lldp remote-global-statistics Output Fields*

Field Name	Field Description
LLDP Remote Database Table Counters	Information about remote database table counters.
LastchangeTime	Time elapsed between LLDP agent startup and the last change to the remote database table information.
Inserts	Number of insertions made in the remote database table.
Deletes	Number of deletions made in the remote database table.
Drops	Number of LLDP frames dropped from the remote database table because of errors.
Ageouts	Number of remote database table entries that have aged out of the table.

## Sample Output

### show lldp remote-global-statistics

```
user@host> show lldp remote-global-statistics
```

```
user@host> show lldp remote-global-statistics
```

```
LLDP Remote Database Table Counters
```

LastchangeTime	Inserts	Deletes	Drops	Ageouts
00:00:76 (76 sec)	192	0	0	0

## show network-access aaa statistics accounting

<b>Syntax</b>	show network-access aaa statistics accounting;
<b>Release Information</b>	Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for QFX Series switches.
<b>Description</b>	Display authentication, authorization, and accounting (AAA) accounting statistics.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">accounting-server on page 745</a></li> <li>• <a href="#">accounting-stop-on-access-deny on page 747</a></li> <li>• <a href="#">Configuring 802.1X RADIUS Accounting (CLI Procedure) on page 323</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show network-access aaa statistics accounting on page 1739</a>
<b>Output Fields</b>	<a href="#">Table 90 on page 1739</a> lists the output fields for the <b>show network-access aaa statistics accounting</b> command. Output fields are listed in the approximate order in which they appear.

*Table 90: show network-access aaa statistics accounting Output Fields*

Field Name	Field Description
Requests received	The number of accounting-request packets sent from a switch to a RADIUS accounting server.
Accounting Response failures	The number of accounting-response failure packets sent from the RADIUS accounting server to the switch.
Accounting Response Success	The number of accounting-response success packets sent from the RADIUS accounting server to the switch.
Requests timedout	The number of requests-timedout packets sent from the RADIUS accounting server to the switch.

## Sample Output

### show network-access aaa statistics accounting

```
user@switch> show network-access aaa statistics accounting
Accounting module statistics
  Requests received: 1
  Accounting Response failures: 0
  Accounting Response Success: 1
  Requests timedout: 0
```

## show network-access aaa statistics authentication

<b>Syntax</b>	<b>show network-access aaa statistics authentication</b>
<b>Release Information</b>	Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for QFX Series switches.
<b>Description</b>	Display authentication, authorization, and accounting (AAA) authentication statistics.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">authentication-server on page 785</a></li> <li>• <a href="#">Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch on page 290</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show network-access aaa statistics authentication on page 1741</a> <a href="#">show network-access aaa statistics authentication (in QFX Series Switches) on page 1742</a>
<b>Output Fields</b>	<a href="#">Table 91 on page 1741</a> lists the output fields for the <b>show network-access aaa statistics authentication</b> command. Output fields are listed in the approximate order in which they appear.

*Table 91: show network-access aaa statistics authentication Output Fields*

Field Name	Field Description
Requests received	The number of authentication requests received by the switch.
Accepts	The number of authentication accepts received by the RADIUS server.
Rejects	The number authentication rejects sent by the RADIUS server.
Challenges	The number of authentication challenges sent by the RADIUS server.

## Sample Output

### show network-access aaa statistics authentication

```

user@switch> show network-access aaa statistics authentication

Authentication module statistics
Requests received: 2
Accepts: 1
Rejects: 0
Challenges: 1

```

### show network-access aaa statistics authentication (in QFX Series Switches)

```
user@switch> show network-access aaa statistics authentication
```

```
Authentication module statistics
```

```
Requests received: 2
```

```
Accepts: 1
```

```
Rejects: 0
```

```
Challenges: 1
```

## show network-access aaa statistics dynamic-requests

<b>Syntax</b>	<code>show network-access aaa statistics dynamic-requests;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for QFX Series switches.
<b>Description</b>	Display authentication, authorization, and accounting (AAA) authentication statistics for disconnects.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">authentication-server on page 785</a></li> <li>• <a href="#">Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch on page 290</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show network-access aaa statistics authentication on page 1743</a>
<b>Output Fields</b>	<a href="#">Table 92 on page 1743</a> lists the output fields for the <b>show network-access aaa statistics dynamic-requests</b> command. Output fields are listed in the approximate order in which they appear.

*Table 92: show network-access aaa statistics dynamic-requests Output Fields*

Field Name	Field Description
Requests received	The number of dynamic requests received by the RADIUS server.
Processed successfully	The number of dynamic requests successfully processed by the RADIUS server.
Errors during processing	The number of errors that occurred while the RADIUS server was processing the dynamic request.
Silently dropped	The number of silently dropped requests.

## Sample Output

### show network-access aaa statistics authentication

```

user@switch> show network-access aaa statistics dynamic-requests
Dynamic-requests module statistics
Requests received: 0
Processed successfully: 0
Errors during processing: 0
Silently dropped: 0

```

## show route extensive

<b>List of Syntax</b>	<a href="#">Syntax on page 1745</a> <a href="#">Syntax (EX Series Switches) on page 1745</a>
<b>Syntax</b>	<pre>show route extensive &lt;destination-prefix&gt; &lt;logical-system (all   logical-system-name)&gt;</pre>
<b>Syntax (EX Series Switches)</b>	<pre>show route extensive &lt;destination-prefix&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	Display extensive information about the active entries in the routing tables.
<b>Options</b>	<p><b>none</b>—Display all active entries in the routing table.</p> <p><b>destination-prefix</b>—(Optional) Display active entries for the specified address or range of addresses.</p> <p><b>logical-system (all   logical-system-name)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show route extensive on page 1752</a> <a href="#">show route extensive (Access Route) on page 1759</a> <a href="#">show route extensive (BGP PIC Edge) on page 1760</a> <a href="#">show route extensive (FRR and LFA) on page 1760</a> <a href="#">show route extensive (IS-IS) on page 1761</a> <a href="#">show route extensive (Route Reflector) on page 1761</a> <a href="#">show route label detail (Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 1762</a> <a href="#">show route label detail (Multipoint LDP with Multicast-Only Fast Reroute) on page 1762</a> <a href="#">show route extensive (Flexible VXLAN Tunnel Profile) on page 1763</a>
<b>Output Fields</b>	<p><a href="#">Table 93 on page 1745</a> describes the output fields for the <b>show route extensive</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 93: show route extensive Output Fields

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).

Table 93: show route extensive Output Fields (continued)

Field Name	Field Description
<i>number destinations</i>	Number of destinations for which there are routes in the routing table.
<i>number routes</i>	<p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive).</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul>
<i>route-destination</i> (entry, announced)	<p>Route destination (for example: 10.0.0.1/24). The <b>entry</b> value is the number of route for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul>
<b>TSI</b>	Protocol header information.
<b>label stacking</b>	<p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of two or more exits this router with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>
<b>[protocol, preference]</b>	<p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+—</b>A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>—</b>A hyphen indicates the last active route.</li> <li>• <b>*—</b>An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>

Table 93: show route extensive Output Fields (continued)

Field Name	Field Description
<b>Level</b>	(IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.
<b>Route Distinguisher</b>	IP subnet augmented with a 64-bit prefix.
<b>PMSI</b>	Provider multicast service interface (MVPN routing table).
<b>Next-hop type</b>	Type of next hop. For a description of possible values for this field, see the Output Field table in the <i>show route detail</i> command.
<b>Next-hop reference count</b>	Number of references made to the next hop.
<b>Flood nexthop branches exceed maximum message</b>	Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.
<b>Source</b>	IP address of the route source.
<b>Next hop</b>	Network layer address of the directly reachable neighboring system.
<b>via</b>	Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b> . This field can also contain the following information: <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul>
<b>Label-switched-path lsp-path-name</b>	Name of the LSP used to reach the next hop.
<b>Label operation</b>	MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).
<b>Offset</b>	Whether the metric has been increased or decreased by an offset value.
<b>Interface</b>	(Local only) Local interface name.
<b>Protocol next hop</b>	Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop.

Table 93: *show route extensive* Output Fields (continued)

Field Name	Field Description
<b><i>label-operation</i></b>	MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).
<b>Indirect next hops</b>	<p>When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved.</p> <p>When BGP PIC Edge is enabled, the output lines that contain <b>Indirect next hop: weight</b> follow next hops that the software can use to repair paths where a link failure occurs. The next-hop weight has one of the following values:</p> <ul style="list-style-type: none"><li>• 0x1 indicates active next hops.</li><li>• 0x4000 indicates passive next hops.</li></ul>
<b>State</b>	State of the route (a route can be in more than one state). See the Output Field table in the <i>show route detail</i> command.
<b>Session ID</b>	The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA).
<b>Weight</b>	<p>Weight for the backup path. If the weight of an indirect next hop is larger than zero, the weight value is shown.</p> <p>For sample output, see <b>show route table</b>.</p>

Table 93: show route extensive Output Fields (continued)

Field Name	Field Description
Inactive reason	<p>If the route is inactive, the reason for its current state is indicated. Typical reasons include:</p> <ul style="list-style-type: none"> <li>• <b>Active preferred</b>—Currently active route was selected over this route.</li> <li>• <b>Always compare MED</b>—Path with a lower multiple exit discriminator (MED) is available.</li> <li>• <b>AS path</b>—Shorter AS path is available.</li> <li>• <b>Cisco Non-deterministic MED selection</b>—Cisco nondeterministic MED is enabled and a path with a lower MED is available.</li> <li>• <b>Cluster list length</b>—Path with a shorter cluster list length is available.</li> <li>• <b>Forwarding use only</b>—Path is only available for forwarding purposes.</li> <li>• <b>IGP metric</b>—Path through the next hop with a lower IGP metric is available.</li> <li>• <b>IGP metric type</b>—Path with a lower OSPF link-state advertisement type is available.</li> <li>• <b>Interior &gt; Exterior &gt; Exterior via Interior</b>—Direct, static, IGP, or EBGp path is available.</li> <li>• <b>Local preference</b>—Path with a higher local preference value is available.</li> <li>• <b>Next hop address</b>—Path with a lower metric next hop is available.</li> <li>• <b>No difference</b>—Path from a neighbor with a lower IP address is available.</li> <li>• <b>Not Best in its group</b>—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process. When this reason is displayed, an additional reason is provided (typically one of the other reasons listed).</li> <li>• <b>Number of gateways</b>—Path with a higher number of next hops is available.</li> <li>• <b>Origin</b>—Path with a lower origin code is available.</li> <li>• <b>OSPF version</b>—Path does not support the indicated OSPF version.</li> <li>• <b>RIB preference</b>—Route from a higher-numbered routing table is available.</li> <li>• <b>Route distinguisher</b>—64-bit prefix added to IP subnets to make them unique.</li> <li>• <b>Route metric or MED comparison</b>—Route with a lower metric or MED is available.</li> <li>• <b>Route preference</b>—Route with a lower preference value is available.</li> <li>• <b>Router ID</b>—Path through a neighbor with a lower ID is available.</li> <li>• <b>Unusable path</b>—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved.</li> <li>• <b>Update source</b>—Last tiebreaker is the lowest IP address value.</li> </ul>
Local AS	Autonomous system (AS) number of the local routing device.
Age	How long the route has been known.
AI GP	Accumulated interior gateway protocol (AIGP) BGP attribute.
Metric	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
MED-plus-IGP	Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.
TTL-Action	<p>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.</p> <p>For sample output, see <b>show route table</b>.</p>

Table 93: show route extensive Output Fields (continued)

Field Name	Field Description
<b>Task</b>	Name of the protocol that has added the route.
<b>Announcement bits</b>	<p>List of protocols that are consumers of the route. Using the following output as an example, <b>Announcement bits (3): 0-KRT 5-Resolve tree 2 8-BGP RT Background</b> there are (3) announcement bits to reflect the three clients (protocols) that have state for this route: Kernel (0-KRT), 5 (resolution tree process 2), and 8 (BGP).</p> <p>The notation <b><i>n</i>-Resolve inet</b> indicates that the route is used for route resolution for next hops found in the routing table. <i>n</i> is an index used by Juniper Networks customer support only.</p>
<b>AS path</b>	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>
<b>validation-state</b>	<p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGp peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>
<b>FECs bound to route</b>	Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.
<b>AS path: I &lt;Originator&gt;</b>	(For route reflected output only) Originator ID attribute set by the route reflector.

Table 93: show route extensive Output Fields (continued)

Field Name	Field Description
<b>route status</b>	<p>Indicates the status of a BGP route:</p> <ul style="list-style-type: none"> <li>• <b>Accepted</b>—The specified BGP route is imported by the default BGP policy.</li> <li>• <b>Import</b>—The route is imported into a Layer 3 VPN routing instance.</li> <li>• <b>Import-Protect</b>—A remote instance egress that is protected.</li> <li>• <b>Multipath</b>—A BGP multipath active route.</li> <li>• <b>MultipathContrib</b>—The route is not active but contributes to the BGP multipath.</li> <li>• <b>Protect</b>—An egress route that is protected.</li> <li>• <b>Stale</b>—A route that is marked stale due to graceful restart.</li> </ul>
Primary Upstream	When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.
RPF Nexthops	When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.
Label	Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.
weight	Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.
VC Label	MPLS label assigned to the Layer 2 circuit virtual connection.
MTU	Maximum transmission unit (MTU) of the Layer 2 circuit.
VLAN ID	VLAN identifier of the Layer 2 circuit.
Cluster list	(For route reflected output only) Cluster ID sent by the route reflector.
Originator ID	(For route reflected output only) Address of router that originally sent the route to the route reflector.
Prefixes bound to route	Forwarding Equivalent Class (FEC) bound to this route. Applicable only to routes installed by LDP.
Communities	Community path attribute for the route. See the Output Field table in the <i>show route detail</i> command for all possible values for this field.
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).
control flags	Control flags: <b>none</b> or Site Down.
mtu	Maximum transmission unit (MTU) information.
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.

Table 93: show route extensive Output Fields (continued)

Field Name	Field Description
<b>status vector</b>	Layer 2 VPN and VPLS network layer reachability information (NLRI).
<b>Localpref</b>	Local preference value included in the route.
<b>Router ID</b>	BGP router ID as advertised by the neighbor in the open message.
<b>Primary Routing Table</b>	In a routing table group, the name of the primary routing table in which the route resides.
<b>Secondary Tables</b>	In a routing table group, the name of one or more secondary tables in which the route resides.
<b>Originating RIB</b>	Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of inet.0 resolving through inet.0 and inet.3, this field indicates which routing table, inet.0 or inet.3, provided the best path for a particular prefix.
<b>Node path count</b>	Number of nodes in the path.
<b>Forwarding nexthops</b>	Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.

## Sample Output

## show route instance

<b>Syntax</b>	<pre>show route instance &lt;brief   detail   summary&gt; &lt;instance-name&gt; &lt;operational&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p>
<b>Description</b>	(QFabric systems only) Display routing instance information.
<b>Options</b>	<p><b>none</b>—(Same as <b>brief</b>) Display standard information about all routing instances.</p> <p><b>brief   detail   summary</b>—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to <b>brief</b>. (These options are not available with the <b>operational</b> keyword.)</p> <p><b>instance-name</b>—(Optional) Display information for a specified routing instance.</p> <p><b>operational</b>—(Optional) Display operational routing instances.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<p><a href="#">show route instance on page 1765</a></p> <p><a href="#">show route instance detail on page 1765</a></p> <p><a href="#">show route instance operational on page 1766</a></p> <p><a href="#">show route instance summary on page 1767</a></p>
<b>Output Fields</b>	Table 94 on page 1764 lists the output fields for the <b>show route instance</b> command. Output fields are listed in the approximate order in which they appear.

Table 94: show route instance Output Fields

Field Name	Field Description	Level of Output
Instance or <i>instance-name</i>	Name of the routing instance.	All levels
Operational Routing Instances	( <b>operational</b> keyword only) Names of all operational routing instances.	—
Type	Type of routing instance: <b>forwarding</b> or <b>virtual-router</b> .	All levels
State	State of the routing instance: <b>active</b> or <b>inactive</b> .	<b>detail</b>
Interfaces	Name of interfaces belonging to this routing instance.	<b>detail</b>

Table 94: show route instance Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Tables</b>	Tables (and number of routes) associated with this routing instance.	<b>detail</b>
<b>Router ID</b>	Identifier for the router.	<b>detail</b>
<b>Primary RIB</b>	Primary table for this routing instance.	<b>brief none summary</b>
<b>Active/holddown/hidden</b>	Number of active, hold-down, and hidden routes.	All levels

**Syntax (EX Series Switches)**    `show route protocol protocol`  
                                          `<brief | detail | extensive | terse>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              **ospf2** and **ospf3** options introduced in Junos OS Release 9.2.  
                              **ospf2** and **ospf3** options introduced in Junos OS Release 9.2 for EX Series switches.  
                              **flow** option introduced in Junos OS Release 10.0.  
                              **flow** option introduced in Junos OS Release 10.0 for EX Series switches.

**Description**    Display the route entries in the routing table that were learned from a particular protocol.

**Options**    **brief | detail | extensive | terse**—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to **brief**.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

***protocol***—Protocol from which the route was learned:

- **access**—Access route for use by DHCP application
- **access-internal**—Access-internal route for use by DHCP application
- **aggregate**—Locally generated aggregate route
- **arp**—Route learned through the Address Resolution Protocol
- **atmvpn**—Asynchronous Transfer Mode virtual private network
- **bgp**—Border Gateway Protocol
- **ccc**—Circuit cross-connect
- **direct**—Directly connected route
- **dvmrp**—Distance Vector Multicast Routing Protocol
- **esis**—End System-to-Intermediate System
- **flow**—Locally defined flow-specification route
- **frr**—Precomputed protection route or backup route used when a link goes down

- **isis**—Intermediate System-to-Intermediate System
- **ldp**—Label Distribution Protocol
- **l2circuit**—Layer 2 circuit
- **l2vpn**—Layer 2 virtual private network
- **local**—Local address
- **mpls**—Multiprotocol Label Switching
- **msdp**—Multicast Source Discovery Protocol
- **ospf**—Open Shortest Path First versions 2 and 3
- **ospf2**—Open Shortest Path First versions 2 only
- **ospf3**—Open Shortest Path First version 3 only
- **pim**—Protocol Independent Multicast
- **rip**—Routing Information Protocol
- **ripng**—Routing Information Protocol next generation
- **rsvp**—Resource Reservation Protocol
- **rtarget**—Local route target virtual private network
- **static**—Statically defined route
- **tunnel**—Dynamic tunnel
- **vpn**—Virtual private network

**NOTE:** EX Series switches run a subset of these protocols. See the switch CLI for details.

**Required Privilege Level** view

## show security tpm status

<b>Syntax</b>	show security tpm status
<b>Release Information</b>	Command introduced in Junos OS Release 15.1X49-D80. TPM Family and TPM Firmware version details are introduced in Junos OS Release 15.1X49-D120.
<b>Description</b>	Display the current status of the Trusted Platform Module (TPM). You can use this <b>show security tpm status</b> command to check the status of TPM ownership, master binding key, master encryption password, family version, and firmware version.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	security
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Using Trusted Platform Module to Bind Secrets on SRX Series Devices on page 155</a></li> <li>• <a href="#">request security tpm master-encryption-password set on page 1580</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show security tpm status on page 1782</a>

### Sample Output

#### show security tpm status

```
user@host> show security tpm status
TPM Status:
  Enabled: yes
  Owned: yes
  Master Binding Key: not-created
  Master Encryption Key: not-configured
  TPM Family: 1.2
  TPM Firmware version: 4.40
```

[Table 95 on page 1782](#) lists the output fields for the **show security tpm status** command.

*Table 95: show security tpm status Output Fields*

Field Name	Field Description
Enabled	Specifies whether TPM is enabled or disabled.
Owned	Specifies the TPM ownership. TPM can be owned even if the Master Encryption Key and Master Encryption Key are not created/configured.

*Table 95: show security tpm status Output Fields (continued)*

Field Name	Field Description
Master Binding Key	Displays the TPM's Master Binding Key status whether it is created or not created. TPM generates cryptographic keys and encrypts them so that those can only be decrypted by the TPM. This process is know as binding. Each TPM has a master binding key, which is also know as storage root key.
Master Encryption Key	Displays Master Encryption Password status whether it is set or not set. The encrypted data and the hash of the configuration is protected by the TPM module using the master encryption password.
TPM Family	Displays Trusted Computing Group's (TCG) TPM family version.
TPM Firmware version	Displays the firmware version loaded in TPM.

## show security ssh key-pair-identity

**Syntax** `show security ssh key-pair-identity  
( brief <identity-name> | public identity-name )`

**Release Information** Command introduced in Junos OS Release 15.1X49-D70.

**Description** Display the SSH key pair identity information.

- Options**
- **brief *identity-name***—Display the brief information for a specified identity. The *identity-name* variable is optional, if an identity is not specified, the command will list brief information of all identities.
  - **public *identity-name*** —Display the public key for a specified identity.

**NOTE:** The public and brief options are mutually exclusive

**Required Privilege Level** view

- Related Documentation**
- [request security ssh key-pair-identity generate on page 1579](#)
  - [clear security ssh key-pair-identity on page 1557](#)

**List of Sample Output** [show security ssh key-pair-identity brief on page 1784](#)  
[show security ssh key-pair-identity brief sample on page 1784](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### show security ssh key-pair-identity brief

```
user@host> show security ssh key-pair-identity brief

SSH Key Pair Identity Information:
  Name           Create Time      Encrypted
  sample         Dec 28, 17:40    yes
  identity-name  Dec 28, 17:26    yes
```

### show security ssh key-pair-identity brief sample

```
user@host> show security ssh key-pair-identity brief sample
```

**SSH Key Pair Identity Information:**

Name	Create Time	Encrypted
sample	Dec 28, 17:34	yes

## show security pki local-certificate

**Syntax** `show security pki local-certificate  
<brief | detail>  
<certificate-id certificate-id-name>  
<system-generated>`

**Release Information** Command introduced in Junos OS Release 11.1 for EX Series switches.

**Description** Display information about the local digital certificates and the corresponding public keys installed in the switch.

**Options** **none**—(Same as brief) Display information about all local digital certificates and corresponding public keys.

**brief | detail**—(Optional) Display information about local digital certificates and corresponding public keys for the specified level of output.

**certificate-id *certificate-id-name***—(Optional) Display information about only the specified the local digital certificate and corresponding public keys.

**system-generated**—(Optional) Display information about the automatically generated self-signed certificate.

**Required Privilege Level** view

**Related Documentation**

- [Manually Generating Self-Signed Certificates on Switches \(CLI Procedure\) on page 250](#)

**List of Sample Output** [show security pki local-certificate on page 1788](#)  
[show security pki local-certificate detail on page 1788](#)

**Output Fields** [Table 96 on page 1786](#) lists the output fields for the **show security pki local-certificate** command. Output fields are listed in the approximate order in which they appear.

*Table 96: show security pki local-certificate Output Fields*

Field Name	Field Description	Level of Output
<b>Certificate identifier</b>	Name of the digital certificate.	All levels
<b>Certificate version</b>	Revision number of the digital certificate.	<b>detail</b>
<b>Serial number</b>	Unique serial number of the digital certificate.	<b>detail</b>
<b>Issued by</b>	Authority that issued the digital certificate.	<b>none brief</b>

Table 96: show security pki local-certificate Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Issued to</b>	Device that was issued the digital certificate.	none <b>brief</b>
<b>Issuer</b>	Authority that issued the digital certificate, including details of the authority organized using the distinguished name format. Possible subfields are: <ul style="list-style-type: none"> <li>• <b>Common name</b>—Name of the authority.</li> <li>• <b>Organization</b>—Organization of origin.</li> <li>• <b>Organizational unit</b>—Department within an organization.</li> <li>• <b>State</b>—State of origin.</li> <li>• <b>Country</b>—Country of origin.</li> </ul>	<b>detail</b>
<b>Subject</b>	Details of the digital certificate holder organized using the distinguished name format. Possible subfields are: <ul style="list-style-type: none"> <li>• <b>Common name</b>—Name of the authority.</li> <li>• <b>Organization</b>—Organization of origin.</li> <li>• <b>Organizational unit</b>—Department within an organization.</li> <li>• <b>State</b>—State of origin.</li> <li>• <b>Country</b>—Country of origin.</li> </ul>	<b>detail</b>
<b>Alternate subject</b>	Domain name or IP address of the device related to the digital certificate.	<b>detail</b>
<b>Validity</b>	Time period when the digital certificate is valid. Values are: <ul style="list-style-type: none"> <li>• <b>Not before</b>—Start time when the digital certificate becomes valid.</li> <li>• <b>Not after</b>—End time when the digital certificate becomes invalid.</li> </ul>	All levels
<b>Public key algorithm</b>	Encryption algorithm used with the private key, such as <b>rsaEncryption (1024 bits)</b> .	All levels
<b>Public key verification status</b>	Public key verification status: <b>Failed</b> or <b>Passed</b> . The <b>detail</b> output also provides the verification hash.	All levels
<b>Signature algorithm</b>	Encryption algorithm that the CA used to sign the digital certificate, such as <b>sha1WithRSAEncryption</b> .	<b>detail</b>
<b>Fingerprint</b>	Secure Hash Algorithm (SHA1) and Message Digest 5 (MD5) hashes used to identify the digital certificate.	<b>detail</b>
<b>Distribution CRL</b>	Distinguished name information and URL for the certificate revocation list (CRL) server.	<b>detail</b>
<b>Use for key</b>	Use of the public key, such as <b>Certificate signing</b> , <b>CRL signing</b> , <b>Digital signature</b> , or <b>Key encipherment</b> .	<b>detail</b>

## Sample Output

### show security pki local-certificate

```
user@switch> show security pki local-certificate

Certificate identifier: local-entrust2
Issued to: router2.juniper.net, Issued by: juniper
Validity:
  Not before: 2005 Nov 21st, 23:28:22 GMT
  Not after: 2008 Nov 21st, 23:58:22 GMT
Public key algorithm: rsaEncryption(1024 bits)
Public key verification status: Passed
```

## show services unified-access-control authentication-table

<b>Syntax</b>	<code>show services unified-access-control authentication-table</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.4. Options updated in Junos OS Release 12.1.
<b>Description</b>	<p>Display a summary of the authentication table entries configured from the IC Series UAC Appliance. Authentication tables store mappings between traffic sessions and Unified Access Control (UAC) roles. The IC Series appliance uses the roles specified in the mappings to help determine which UAC policies to apply to a session.</p> <p>Use this command when you have configured the SRX Series device to act as a Junos OS Enforcer in a UAC deployment. When deployed as a Junos OS Enforcer, the SRX Series device enforces the policies that are defined on the UAC's IC Series appliance.</p> <p>You can also use this command to display the content of the authentication table in a user role firewall implementation. The table, pushed from a supporting UAC device, provides the user roles associated with incoming traffic.</p>
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>detail</b>—Display a detailed view of all authentication table entries.</li> <li>• <b>extended</b>—Display a view of all authentication table entries with the user roles listed.</li> <li>• <b>identifier <i>id</i></b>—Display all authentication table entries with the specified identifier number.</li> <li>• <b>ip <i>source-ip-address</i></b>—Display any authentication table entry for the specified IP address.</li> <li>• <b>role <i>role-name</i></b>—Display all authentication table entries for the specified role name.</li> <li>• <b>user <i>username</i></b>—Display all authentication table entries for the specified user.</li> </ul>

## show services unified-access-control status

---

**Syntax**      `show services unified-access-control status`

**Release Information**      Command introduced in Junos OS Release 9.4.

**Description**      Display the status of the connection between the SRX Series device and the IC Series UAC Appliance as well as statistics to help debug connections to the IC Series appliance.

Use this command when you have configured the SRX Series device to act as a Junos OS Enforcer in a Unified Access Control (UAC) deployment. When deployed as a Junos OS Enforcer, the SRX Series device enforces the policies that are defined on the UAC's IC Series appliance.

## show snmp statistics

<b>Syntax</b>	<code>show snmp statistics</code> <code>&lt;subagents&gt;</code>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for OCX Series switches.</p> <p>Option <b>subagents</b> introduced in Junos OS Release 14.2.</p>
<b>Description</b>	Display statistics about Simple Network Management Protocol (SNMP) packets sent and received by the router or switch.
<b>Options</b>	<b>subagents</b> —(Optional) Display the statistics of the protocol data unit (PDU), the number of SNMP requests and responses per subagent, and the SNMP statistics received from each subagent per logical system.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>clear snmp statistics</i></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show snmp statistics on page 1800</a></p> <p><a href="#">show snmp statistics subagents on page 1800</a></p>
<b>Output Fields</b>	<p><a href="#">Table 97 on page 1796</a> describes the output fields for the <b>show snmp statistics</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 97: *show snmp statistics Output Fields*

Field Name	Field Description
<b>Input</b>	<p>Information about received packets:</p> <ul style="list-style-type: none"> <li>• <b>Packets(snmplnPkts)</b>—Total number of messages delivered to the SNMP entity from the transport service.</li> <li>• <b>Bad versions—(snmplnBadVersions)</b> Total number of messages delivered to the SNMP entity that were for an unsupported SNMP version.</li> <li>• <b>Bad community names—(snmplnBadCommunityNames)</b> Total number of messages delivered to the SNMP entity that used an SNMP community name not known to the entity.</li> <li>• <b>Bad community uses—(snmplnBadCommunityUses)</b> Total number of messages delivered to the SNMP entity that represented an SNMP operation that was not allowed by the SNMP community named in the message.</li> <li>• <b>ASN parse errors—(snmplnASNParseErrs)</b> Total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages.</li> <li>• <b>Too big—(snmplnTooBigs)</b> Total number of SNMP PDUs delivered to the SNMP entity with an error status field of <b>tooBig</b>.</li> <li>• <b>No such names—(snmplnNoSuchNames)</b> Total number of SNMP PDUs delivered to the SNMP entity with an error status field of <b>noSuchName</b>.</li> <li>• <b>Bad values—(snmplnBadValues)</b> Total number of SNMP PDUs delivered to the SNMP entity with an error status field of <b>badValue</b>.</li> <li>• <b>Read only—(snmplnReadOnly)</b> Total number of valid SNMP PDUs delivered to the SNMP entity with an error status field of <b>readOnly</b>. Only incorrect implementations of SNMP generate this error.</li> </ul>

Table 97: *show snmp statistics Output Fields (continued)*

Field Name	Field Description
Input (continued)	<ul style="list-style-type: none"> <li>• <b>General errors—(snmpInGenErrs)</b> Total number of SNMP PDUs delivered to the SNMP entity with an error status field of <b>genErr</b>.</li> <li>• <b>Total requests varbinds—(snmpInTotalReqVars)</b> Total number of MIB objects retrieved successfully by the SNMP entity as a result of receiving valid SNMP <b>GetRequest</b> and <b>GetNext</b> PDUs.</li> <li>• <b>Total set varbinds—(snmpInSetVars)</b> Total number of MIB objects modified successfully by the SNMP entity as a result of receiving valid SNMP <b>SetRequest</b> PDUs.</li> <li>• <b>Get requests—(snmpInGetRequests)</b> Total number of SNMP <b>GetRequest</b> PDUs that have been accepted and processed by the SNMP entity.</li> <li>• <b>Get nexts—(snmpInGetNexts)</b> Total number of SNMP <b>GetNext</b> PDUs that have been accepted and processed by the SNMP entity.</li> <li>• <b>Set requests—(snmpInSetRequests)</b> Total number of SNMP <b>SetRequest</b> PDUs that have been accepted and processed by the SNMP entity.</li> <li>• <b>Get responses—(snmpInGetResponses)</b> Total number of SNMP <b>GetResponse</b> PDUs that have been accepted and processed by the SNMP entity.</li> <li>• <b>Traps—(snmpInTraps)</b> Total number of SNMP traps generated by the SNMP entity.</li> <li>• <b>Silent drops—(snmpSilentDrops)</b> Total number of <b>GetRequest</b>, <b>GetNextRequest</b>, <b>GetBulkRequest</b>, <b>SetRequests</b>, and <b>InformRequest</b> PDUs delivered to the SNMP entity that were silently dropped because the size of a reply containing an alternate response PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the requests.</li> <li>• <b>Proxy drops—(snmpProxyDrops)</b> Total number of <b>GetRequest</b>, <b>GetNextRequest</b>, <b>GetBulkRequest</b>, <b>SetRequests</b>, and <b>InformRequest</b> PDUs delivered to the SNMP entity that were silently dropped because the transmission of the message to a proxy target failed in such a way (other than a timeout) that no response PDU could be returned.</li> <li>• <b>Commit pending drops</b>—Number of SNMP packets for <b>Set</b> requests dropped because of a previous pending SNMP <b>Set</b> request on the committed configuration.</li> <li>• <b>Throttle drops</b>—Number of SNMP packets for any requests dropped reaching the throttle limit.</li> </ul>

Table 97: show snmp statistics Output Fields (continued)

Field Name	Field Description
V3 Input	<p>Information about SNMP version 3 packets:</p> <ul style="list-style-type: none"> <li>• <b>Unknown security models—(snmpUnknownSecurityModels)</b> Total number of packets received by the SNMP engine that were dropped because they referenced a security model that was not known to or supported by the SNMP engine.</li> <li>• <b>Invalid messages—(snmpInvalidMsgs)</b> Number of packets received by the SNMP engine that were dropped because there were invalid or inconsistent components in the SNMP message.</li> <li>• <b>Unknown pdu handlers—(snmpUnknownPDUHandlers)</b> Number of packets received by the SNMP engine that were dropped because the PDU contained in the packet could not be passed to an application responsible for handling the PDU type.</li> <li>• <b>Unavailable contexts—(snmpUnavailableContexts)</b> Number of requests received for a context that is known to the SNMP engine, but is currently unavailable.</li> <li>• <b>Unknown contexts—(snmpUnknownContexts)</b> Total number of requests received for a context that is unknown to the SNMP engine.</li> <li>• <b>Unsupported security levels—(usmStatsUnsupportedSecLevels)</b> Total number of packets received by the SNMP engine that were dropped because they requested a security level unknown to the SNMP engine (or otherwise unavailable).</li> <li>• <b>Not in time windows—(usmStatsNotInTimeWindows)</b> Total number of packets received by the SNMP engine that were dropped because they appeared outside the authoritative SNMP engine's window.</li> <li>• <b>Unknown user names—(usmStatsUnknownUserNames)</b> Total number of packets received by the SNMP engine that were dropped because they referenced a user that was not known to the SNMP engine.</li> <li>• <b>Unknown engine ids—(usmStatsUnknownEngineIDs)</b> Total number of packets received by the SNMP engine that were dropped because they referenced an SNMP engine ID that was not known to the SNMP engine.</li> <li>• <b>Wrong digests—(usmStatsWrongDigests)</b> Total number of packets received by the SNMP engine that were dropped because they did not contain the expected digest value.</li> <li>• <b>Decryption errors—(usmStatsDecryptionErrors)</b> Total number of packets received by the SNMP engine that were dropped because they could not be decrypted.</li> </ul>

Table 97: *show snmp statistics Output Fields (continued)*

Field Name	Field Description
<b>Output</b>	<p>Information about transmitted packets:</p> <ul style="list-style-type: none"> <li>• <b>Packets—(snmpOutPkts)</b> Total number of messages passed from the SNMP entity to the transport service.</li> <li>• <b>Too big—(snmpOutTooBigs)</b> Total number of SNMP PDUs generated by the SNMP entity with an error status field of <b>tooBig</b>.</li> <li>• <b>No such names—(snmpOutNoSuchNames)</b> Total number of SNMP PDUs delivered to the SNMP entity with an error status field of <b>noSuchName</b>.</li> <li>• <b>Bad values—(snmpOutBadValues)</b> Total number of SNMP PDUs generated by the SNMP entity with an error status field of <b>badValue</b>.</li> <li>• <b>General errors—(snmpOutGenErrs)</b> Total number of SNMP PDUs generated by the SNMP entity with an error status field of <b>genErr</b>.</li> <li>• <b>Get requests—(snmpOutGetRequests)</b> Total number of SNMP <b>GetRequest</b> PDUs generated by the SNMP entity.</li> <li>• <b>Get nexts—(snmpOutGetNexts)</b> Total number of SNMP <b>GetNext</b> PDUs generated by the SNMP entity.</li> <li>• <b>Set requests—(snmpOutSetRequests)</b> Total number of SNMP <b>SetRequest</b> PDUs generated by the SNMP entity.</li> <li>• <b>Get responses—(snmpOutGetResponses)</b> Total number of SNMP <b>GetResponse</b> PDUs generated by the SNMP entity.</li> <li>• <b>Traps—(snmpOutTraps)</b> Total number of SNMP traps generated by the SNMP entity.</li> </ul>

Table 98 on page 1799 describes the output fields for the **show snmp statistics subagents** command. Output fields are listed in the approximate order in which they appear.

Table 98: *show snmp statistics subagents Output Fields*

Field Name	Field Description
<b>Subagent</b>	Location of the SNMP subagent.
<b>Request PDUs</b>	Number of PDUs requested by the SNMP manager.
<b>Response PDUs</b>	Number of response PDUs sent by the SNMP subagent.
<b>Request Variables</b>	Number of variable bindings on the PDUs requested by the SNMP manager.
<b>Response Variables</b>	Number of variable bindings on the PDUs sent by the SNMP subagent.
<b>Average Response Time</b>	Average time taken by the SNMP subagent to send statistics response.
<b>Maximum Response Time</b>	Maximum time taken by the SNMP subagent to send the statistics response.

## show ssl-certificates

<b>Syntax</b>	show ssl certificates
<b>Release Information</b>	Command introduced in Junos OS Release 17.2R1 for EX Series switches.
<b>Description</b>	Display information about the Secure Sockets Layer (SSL) certificates installed on the switch. When you configure PEAP as the authentication protocol for MAC RADIUS authentication, you must load the server-side Secure Sockets Layer (SSL) certificate on the switch. PEAP requires an SSL certificate to create a secure TLS tunnel to protect user authentication, and uses server-side public key certificates to authenticate the server. It then creates an encrypted TLS tunnel between the client and the authentication server. The key for this encryption are transported using the server's public key. The ensuing exchange of authentication information inside the tunnel to authenticate the client is then encrypted and user credentials are safe from eavesdropping.
<b>Options</b>	<p><b>none</b>—Display information about all SSL certificates.</p> <p><b>detail</b>—Display information about SSL certificates for the specified level of output.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring PEAP for MAC RADIUS Authentication</i></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show ssl-certificates on page 1804</a></p> <p><a href="#">show ssl-certificates detail on page 1804</a></p>
<b>Output Fields</b>	<a href="#">Table 96 on page 1786</a> lists the output fields for the <b>show ssl-certificates</b> command. Output fields are listed in the approximate order in which they appear.

*Table 99: show ssl-certificates Output Fields*

Field Name	Field Description	Level of Output
<b>Issuer</b>	<p>Authority that issued the digital certificate, including details of the authority organized using the distinguished name format. Possible subfields are:</p> <ul style="list-style-type: none"> <li>• <b>C</b>—Country of origin.</li> <li>• <b>ST</b>—State or province name.</li> <li>• <b>L</b>—Locality.</li> <li>• <b>O</b>—Organization of origin.</li> <li>• <b>OU</b>—Organizational unit.</li> <li>• <b>CN</b>—Common name of the authority.</li> </ul>	All levels
<b>Valid from</b>	Start time when the digital certificate becomes valid.	<b>detail</b>

Table 99: show ssl-certificates Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Valid from</b>	End time when the digital certificate becomes invalid.	<b>detail</b>
<b>Serial number</b>	Unique serial number of the digital certificate.	<b>detail</b>
<b>Subject</b>	<p>Details of the digital certificate holder organized using the distinguished name format. Possible subfields are:</p> <ul style="list-style-type: none"> <li>• <b>C</b>—Country of origin.</li> <li>• <b>ST</b>—State or province name.</li> <li>• <b>L</b>—Locality.</li> <li>• <b>O</b>—Organization of origin.</li> <li>• <b>OU</b>—Organizational unit.</li> <li>• <b>CN</b>—Common name of the authority.</li> </ul>	<b>detail</b>

## Sample Output

### show ssl-certificates

```
user@root> show ssl-certificates
```

```
  Issuer:
/C=IN/ST=KA/L=B1r/O=JNPR/OU=CP/CN=User-Radius/emailAddress=user@juniper.net
```

### show ssl-certificates detail

```
user@root> show ssl-certificates detail
```

```
  Issuer:
/C=IN/ST=KA/L=B1r/O=JNPR/OU=CP/CN=User-Radius/emailAddress=user@juniper.net
  Valid From:    May 30 17:41:04 2016 GMT
  Valid Till:    May 29 17:41:04 2026 GMT
  Serial Number: 0
  Subject:
/C=IN/ST=KA/L=B1r/O=JNPR/OU=CP/CN=User-Radius/emailAddress=user@juniper.net
```

## show subscribers

**Syntax** `show subscribers`  
`<detail | extensive | terse>`  
`<aci-interface-set-name aci-interface-set-name>`  
`<address address>`  
`<agent-circuit-identifier agent-circuit-identifier>`  
`<agent-remote-identifier agent-remote-identifier>`  
`<aggregation-interface-set-name interface-set-name>`  
`<client-type client-type>`  
`<count>`  
`<id session-id <accounting-statistics>>`  
`<interface interface <accounting-statistics>>`  
`<logical-system logical-system>`  
`<mac-address mac-address>`  
`<physical-interface physical-interface-name>`  
`<profile-name profile-name>`  
`<routing-instance routing-instance>`  
`<stacked-vlan-id stacked-vlan-id>`  
`<subscriber-state subscriber-state>`  
`<user-name user-name>`  
`<vci vci-identifier>`  
`<vpi vpi-identifier>`  
`<vlan-id vlan-id>`

**Release Information** Command introduced in Junos OS Release 9.3.  
 Command introduced in Junos OS Release 9.3 for EX Series switches.  
**client-type**, **mac-address**, **subscriber-state**, and **extensive** options introduced in Junos OS Release 10.2.  
**count** option usage with other options introduced in Junos OS Release 10.2.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.  
 Options **aci-interface-set-name** and **agent-circuit-identifier** introduced in Junos OS Release 12.2.  
 The **physical-interface** and **user-name** options introduced in Junos OS Release 12.3.  
 Options **vci** and **vpi** introduced in Junos OS Release 12.3R3 and supported in later 12.3Rx releases.  
 Options **vci** and **vpi** supported in Junos OS Release 13.2 and later releases. (Not supported in Junos OS Release 13.1.)  
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.  
 Enhanced subscriber management supported in Junos OS Release 15.1R3 on MX Series routers.  
**accounting-statistics** option added in Junos OS Release 15.1R3 and 17.4R1 on MX Series routers.  
**aggregation-interface-set-name** option added in Junos OS Release 18.4R1 on MX Series routers.

**Description** Display information for active subscribers.

**Options** **detail | extensive | terse**—(Optional) Display the specified level of output.

**aci-interface-set-name**—(Optional) Display all dynamic subscriber sessions that use the specified agent circuit identifier (ACI) interface set. Use the ACI interface set name generated by the router, such as aci-1003-ge-1/0/0.4001, and not the actual ACI value found in the DHCP or PPPoE control packets.

**address**—(Optional) Display subscribers whose IP address matches the specified address. You must specify the IPv4 or IPv6 address prefix without a netmask (for example, 192.0.2.0). If you specify the IP address as a prefix with a netmask (for example, 192.0.2.0/32), the router displays a message that the IP address is invalid, and rejects the command.

**agent-circuit-identifier**—(Optional) Display all dynamic subscriber sessions whose ACI value matches the specified string. You can specify either the complete ACI string or a substring. To specify a substring, you must enter characters that form the beginning of the string, followed by an asterisk (\*) as a wildcard to substitute for the remainder of the string. The wildcard can be used only at the end of the specified substring; for example:

```
user@host1> show subscribers agent-circuit-identifier substring*
```

Junos OS Release	Substring Support
Junos OS Release 13.3R1	You can specify a substring without a wildcard.
Starting in Junos OS Release 14.1R1	You must specify the complete ACI string; you cannot specify a wildcard.
Starting in Junos OS Release 15.1R7, 16.1R7, 16.2R3, 17.1R3, 17.2R3, 17.3R3, 17.4R2, 18.1R2, 18.2R1	You can specify a substring, but you must include the wildcard character at the end of the substring.

**agent-remote-identifier**—(Optional) Display all dynamic subscriber sessions whose ARI value matches the specified string. You must specify the complete ACI string; you cannot specify a wildcard.

**aggregation-interface-set-name** *interface-set-name*—(Optional) Display summary information for the specified aggregation node interface set, including interface, VLAN ID, username and LS:RI.

**client-type**—(Optional) Display subscribers whose client type matches one of the following client types:

- **dhcp**—DHCP clients only.
- **dotlx**—DotLx clients only.
- **essm**—ESSM clients only.
- **fwauth**—FwAuth (authenticated across a firewall) clients only.
- **l2tp**—L2TP clients only.
- **mlppp**—MLPPP clients only.

- **ppp**—PPP clients only.
- **pppoe**—PPPoE clients only.
- **static**—Static clients only.
- **vlan**—VLAN clients only.
- **vlan-oob**—VLAN out-of-band (ANCP-triggered) clients only.
- **vpls-pw**—VPLS pseudowire clients only.
- **xauth**—Xauth clients only.

**count**—(Optional) Display the count of total subscribers and active subscribers for any specified option. You can use the **count** option alone or with the **address**, **client-type**, **interface**, **logical-system**, **mac-address**, **profile-name**, **routing-instance**, **stacked-vlan-id**, **subscriber-state**, or **vlan-id** options.

**id session-id**—(Optional) Display a specific subscriber session whose session ID matches the specified subscriber ID. You can display subscriber IDs by using the **show subscribers extensive** or the **show subscribers interface extensive** commands.

**id session-id accounting-statistics**—(Optional) Display accurate subscriber accounting statistics for a subscriber session with the specified ID. Requires the **actual-transmit-statistics** statement to be configured in the dynamic profile for the dynamic logical interface. If the statement is not configured, a value of 0 is displayed for accounting statistics.

**interface**—(Optional) Display subscribers whose interface matches the specified interface.

**interface accounting-statistics**—(Optional) Display subscriber accounting statistics for the specified interface. Requires the **actual-transmit-statistics** statement to be configured in the dynamic profile for the dynamic logical interface.

**logical-system**—(Optional) Display subscribers whose logical system matches the specified logical system.

**mac-address**—(Optional) Display subscribers whose MAC address matches the specified MAC address.

**physical-interface-name**—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose physical interface matches the specified physical interface.

**profile-name**—(Optional) Display subscribers whose dynamic profile matches the specified profile name.

**routing-instance**—(Optional) Display subscribers whose routing instance matches the specified routing instance.

**stacked-vlan-id**—(Optional) Display subscribers whose stacked VLAN ID matches the specified stacked VLAN ID.

**subscriber-state**—(Optional) Display subscribers whose subscriber state matches the specified subscriber state (ACTIVE, CONFIGURED, INIT, TERMINATED, or TERMINATING).

**user-name**—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose username matches the specified subscriber name.

**vci-identifier**—(MX Series routers with MPCs and ATM MICs with SFP only) (Optional) Display active ATM subscribers whose ATM virtual circuit identifier (VCI) matches the specified VCI identifier. The range of values is 0 through 255.

**vpi-identifier**—(MX Series routers with MPCs and ATM MICs with SFP only) (Optional) Display active ATM subscribers whose ATM virtual path identifier (VPI) matches the specified VPI identifier. The range of values is 0 through 65,535.

**vlan-id**—(Optional) Display subscribers whose VLAN ID matches the specified VLAN ID, regardless of whether the subscriber uses a single-tagged or double-tagged VLAN. For subscribers using a double-tagged VLAN, this option displays subscribers where the inner VLAN tag matches the specified VLAN ID. To display only subscribers where the specified value matches only double-tagged VLANs, use the **stacked-vlan-id** option to match the outer VLAN tag.

**NOTE:** Because of display limitations, logical system and routing instance output values are truncated when necessary.

**Output Fields** Table 100 on page 1810 lists the output fields for the **show subscribers** command. Output fields are listed in the approximate order in which they appear.

*Table 100: show subscribers Output Fields*

Field Name	Field Description
<b>Interface</b>	Interface associated with the subscriber. The router or switch displays subscribers whose interface matches or begins with the specified interface.  The * character indicates a continuation of addresses for the same session.
<b>IP Address/VLAN ID</b>	Subscriber IP address or VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i>  No IP address or VLAN ID is assigned to an L2TP tunnel-switched session. For these subscriber sessions the value is <b>Tunnel-switched</b> .
<b>User Name</b>	Name of subscriber.
<b>LS:RI</b>	Logical system and routing instance associated with the subscriber.
<b>Type</b>	Subscriber client type (DHCP, GRE, L2TP, PPP, PPPoE, STATIC-INTERFACE, VLAN).
<b>IP Address</b>	Subscriber IPv4 address.
<b>IP Netmask</b>	Subscriber IP netmask.  (MX Series) This field displays 255.255.255.255 by default. For tunneled or terminated PPP subscribers only, this field displays the actual value of Framed-IP-Netmask when the SDB_FRAMED_PROTOCOL attribute in the session database is equal to AUTHD_FRAMED_PROTOCOL_PPP. This occurs in the use case where the LNS generates access-internal routes when it receives Framed-IP-Netmask from RADIUS during authorization. When it receives Framed-Pool from RADIUS, the pool mask is ignored and the default /32 mask is used.
<b>Primary DNS Address</b>	IP address of primary DNS server.  This field is displayed with the <b>extensive</b> option only when the address is provided by RADIUS.
<b>Secondary DNS Address</b>	IP address of secondary DNS server.  This field is displayed with the <b>extensive</b> option only when the address is provided by RADIUS.
<b>IPv6 Primary DNS Address</b>	IPv6 address of primary DNS server.  This field is displayed with the <b>extensive</b> option only when the address is provided by RADIUS.
<b>IPv6 Secondary DNS Address</b>	IPv6 address of secondary DNS server.  This field is displayed with the <b>extensive</b> option only when the address is provided by RADIUS.
<b>Domain name server inet</b>	IP addresses for the DNS server, displayed in order of configuration.  This field is displayed with the <b>extensive</b> option only when the addresses are derived from the access profile or the global access configuration.

Table 100: show subscribers Output Fields (continued)

Field Name	Field Description
<b>Domain name server inet6</b>	IPv6 addresses for the DNS server, displayed in order of configuration.  This field is displayed with the <b>extensive</b> option only when the addresses are derived from the access profile or the global access configuration.
<b>Primary WINS Address</b>	IP address of primary WINS server.
<b>Secondary WINS Address</b>	IP address of secondary WINS server.
<b>IPv6 Address</b>	Subscriber IPv6 address, or multiple addresses.
<b>IPv6 Prefix</b>	Subscriber IPv6 prefix. If you are using DHCPv6 prefix delegation, this is the delegated prefix.
<b>IPv6 User Prefix</b>	IPv6 prefix obtained through NDRA.
<b>IPv6 Address Pool</b>	Subscriber IPv6 address pool. The IPv6 address pool is used to allocate IPv6 prefixes to the DHCPv6 clients.
<b>IPv6 Network Prefix Length</b>	Length of the network portion of the IPv6 address.
<b>IPv6 Prefix Length</b>	Length of the subscriber IPv6 prefix.
<b>Logical System</b>	Logical system associated with the subscriber.
<b>Routing Instance</b>	Routing instance associated with the subscriber.
<b>Interface</b>	(Enhanced subscriber management for MX Series routers) Name of the enhanced subscriber management logical interface, in the form <b>demux0.nnnn</b> (for example, <b>demux0.3221225472</b> ), to which access-internal and framed subscriber routes are mapped.
<b>Interface Type</b>	Whether the subscriber interface is <b>Static</b> or <b>Dynamic</b> .

Table 100: show subscribers Output Fields (continued)

Field Name	Field Description
<b>Interface Set</b>	<p>Internally generated name of the dynamic ACI or ALI interface set used by the subscriber session. The prefix of the name indicates the string received in DHCP or PPPoE control packets on which the interface set is based. For ALI interface sets, the prefix indicates that the value is configured as a trusted option to identify the subscriber line.</p> <p>The name of the interface set uses one of the following prefixes:</p> <ul style="list-style-type: none"> <li>• <b>aci</b>—ACI; for example, aci-1033-demux0.3221225524. This is the only prefix allowed for ACI interface sets.</li> <li>• <b>ari</b>—ARI; for example, ari-1033-demux0.3221225524.</li> <li>• <b>aci+ari</b>—Both the ACI and ARI; for example, aci+ari-1033-demux0.3221225524.</li> <li>• <b>noids</b>—Neither the ACI nor the ARI were received; for example, noids-1033-demux0.3221225524.</li> </ul> <p><b>NOTE:</b> ACI interface sets are configured with the <b>agent-circuit-identifier</b> autoconfiguration stanza. ALI interface sets are configured with the <b>line-identity</b> autoconfiguration stanza.</p> <p>Besides dynamic ACI and ALI interface sets, this field can be an interface set based on a substring of the ARI string. This occurs when the dynamic profile includes the predefined variable \$junos-pon-id-interface-set-name, and the profile is applied for a passive optical network (PON). The ARI string is inserted by the optical line terminal (OLT). The final substring in the string, unique for the PON, identifies individual subscriber circuits, and is used as the name of the interface set.</p>
<b>Interface Set Type</b>	Interface type of the ACI interface set: <b>Dynamic</b> . This is the only ACI interface set type currently supported.
<b>Interface Set Session ID</b>	Identifier of the dynamic ACI interface set entry in the session database.
<b>Underlying Interface</b>	Name of the underlying interface for the subscriber session.
<b>Dynamic Profile Name</b>	Dynamic profile used for the subscriber.
<b>Dynamic Profile Version</b>	Version number of the dynamic profile used for the subscriber.
<b>MAC Address</b>	MAC address associated with the subscriber.
<b>State</b>	Current state of the subscriber session ( <b>Init</b> , <b>Configured</b> , <b>Active</b> , <b>Terminating</b> , <b>Tunneled</b> ).
<b>L2TP State</b>	Current state of the L2TP session, <b>Tunneled</b> or <b>Tunnel-switched</b> . When the value is <b>Tunnel-switched</b> , two entries are displayed for the subscriber; the first entry is at the LNS interface on the LTS and the second entry is at the LAC interface on the LTS.
<b>Tunnel switch Profile Name</b>	Name of the L2TP tunnel switch profile that initiates tunnel switching.
<b>Local IP Address</b>	IP address of the local gateway (LAC).
<b>Remote IP Address</b>	IP address of the remote peer (LNS).
<b>VLAN Id</b>	VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> .

Table 100: show subscribers Output Fields (continued)

Field Name	Field Description
Stacked VLAN Id	Stacked VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> .
RADIUS Accounting ID	RADIUS accounting ID associated with the subscriber.
Agent Circuit ID	<p>For the <b>dhcp</b> client type, option 82 agent circuit ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.</p> <p>For the <b>vlan-oob</b> client type, the agent circuit ID or access-loop circuit identifier that identifies the subscriber line based on the subscriber-facing DSLAM interface on which the subscriber request originates.</p>
Agent Remote ID	<p>For the <b>dhcp</b> client type, option 82 agent remote ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.</p> <p>For the <b>vlan-oob</b> client type, the agent remote ID or access-loop remote identifier that identifies the subscriber line based on the NAS-facing DSLAM interface on which the subscriber request originates.</p>
Aggregation Interface-set Name	<p>Value of the \$junos-aggregation-interface-set-name predefined variable; one of the following:</p> <ul style="list-style-type: none"> <li>When the <b>hierarchical-access-network-detection</b> option is configured for the access lines and the value of the Access-Aggregation-Circuit-ID-ASCII attribute (TLV 0x0003) received either in the ANCP Port Up message or PPPoE PADR IA tags begins with a <b>#</b> character, then the variable takes the value of the remainder of the string after the <b>#</b> character.</li> <li>When the <b>hierarchical-access-network-detection</b> option is not configured, or if the string does not begin with the <b>#</b> character, then the variable takes the value specified with the <b>predefined-variable-defaults</b> statement.</li> </ul>
Accounting Statistics	Actual transmitted subscriber accounting statistics by session ID or interface. Service accounting statistics are not included. These statistics do not include overhead bytes or dropped packets; they are the accurate statistics used by RADIUS. The statistics are counted when the <b>actual-transmit-statistics</b> statement is included in the dynamic profile.
DHCP Relay IP Address	IP address used by the DHCP relay agent.
ATM VPI	(MX Series routers with MPCs and ATM MICs with SFP only) ATM virtual path identifier (VPI) on the subscriber's physical interface.
ATM VCI	(MX Series routers with MPCs and ATM MICs with SFP only) ATM virtual circuit identifier (VCI) for each VPI configured on the subscriber interface.
Login Time	Date and time at which the subscriber logged in.
DHCPV6 Options	<b>len</b> = number of hex values in the message. The hex values specify the type, length, value (TLV) for DHCPv6 options.
Server DHCP Options	<b>len</b> = number of hex values in the message. The hex values specify the type, length, value (TLV) for DHCP options.
ServerDHCPV6 Options	<b>len</b> = number of hex values in the message. The hex values specify the type, length, value (TLV) for DHCPv6 options.

Table 100: show subscribers Output Fields (continued)

Field Name	Field Description
DHCPV6 Header	len = number of hex values in the message. The hex values specify the type, length, value (TLV) for DHCPv6 options.
Effective shaping-rate	Actual downstream traffic shaping rate for the subscriber, in kilobits per second.
IPv4 Input Service Set	Input service set in access dynamic profile.
IPv4 Output Service Set	Output service set in access dynamic profile.
PCEF Profile	PCEF profile in access dynamic profile.
PCEF Rule/Rulebase	PCC rule or rulebase used in dynamic profile.
Dynamic configuration	Values for variables that are passed into the dynamic profile from RADIUS.
Service activation time	Time at which the first family in this service became active.
IPv4 rpf-check Fail Filter Name	Name of the filter applied by the dynamic profile to IPv4 packets that fail the RPF check.
IPv6 rpf-check Fail Filter Name	Name of the filter applied by the dynamic profile to IPv6 packets that fail the RPF check.
DHCP Options	len = number of hex values in the message. The hex values specify the type, length, value (TLV) for DHCP options, as defined in RFC 2132.
Session ID	ID number for a subscriber session.
Underlying Session ID	For DHCPv6 subscribers on a PPPoE network, displays the session ID of the underlying PPPoE interface.
Service Sessions	Number of service sessions (that is, a service activated using RADIUS CoA) associated with the subscribers.
Service Session ID	ID number for a subscriber service session.
Service Session Name	Service session profile name.
Session Timeout (seconds)	Number of seconds of access provided to the subscriber before the session is automatically terminated.
Idle Timeout (seconds)	Number of seconds subscriber can be idle before the session is automatically terminated.
IPv6 Delegated Address Pool	Name of the pool used for DHCPv6 prefix delegation.
IPv6 Delegated Network Prefix Length	Length of the prefix configured for the IPv6 delegated address pool.

Table 100: show subscribers Output Fields (continued)

Field Name	Field Description
<b>IPv6 Interface Address</b>	Address assigned by the Framed-Ipv6-Prefix AAA attribute. This field is displayed only when the predefined variable \$junos-ipv6-address is used in the dynamic profile.
<b>IPv6 Framed Interface Id</b>	Interface ID assigned by the Framed-Interface-Id AAA attribute.
<b>ADF IPv4 Input Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>ADF IPv4 Output Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>ADF IPv6 Input Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>ADF IPv6 Output Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>IPv4 Input Filter Name</b>	Name assigned to the IPv4 input filter (client or service session).
<b>IPv4 Output Filter Name</b>	Name assigned to the IPv4 output filter (client or service session).
<b>IPv6 Input Filter Name</b>	Name assigned to the IPv6 input filter (client or service session).
<b>IPv6 Output Filter Name</b>	Name assigned to the IPv6 output filter (client or service session).
<b>IFL Input Filter Name</b>	Name assigned to the logical interface input filter (client or service session).
<b>IFL Output Filter Name</b>	Name assigned to the logical interface output filter (client or service session).
<b>DSL type</b>	PPPoE subscriber's access line type reported by the PPPoE intermediate agent in a PADI or PADO packet in the Vendor-Specific-Tags TLV in subattribute DSL-Type (0x0091). The DSL type is one of the following types: <b>ADSL</b> , <b>ADSL2</b> , <b>ADSL2+</b> , <b>OTHER</b> , <b>SDSL</b> , <b>VDSL</b> , or <b>VDSL2</b> .
<b>Frame/Cell Mode</b>	<p>Mode type of the PPPoE subscriber's access line determined by the PPPoE daemon based on the received subattribute DSL-Type (0x0091):</p> <ul style="list-style-type: none"> <li>• <b>Cell</b>—When the DSL line type is one of the following: <b>ADSL</b>, <b>ADSL2</b>, or <b>ADSL2+</b>.</li> <li>• <b>Frame</b>—When the DSL line type is one of the following: <b>OTHER</b>, <b>SDSL</b>, <b>VDSL</b>, or <b>VDSL2</b>.</li> </ul> <p>The value is stored in the subscriber session database.</p>
<b>Overhead accounting bytes</b>	Number of bytes added to or subtracted from the actual downstream cell or frame overhead to account for the technology overhead of the DSL line type. The value is determined by the PPPoE daemon based on the received subattribute DSL-Type (0x0091). The value is stored in the subscriber session database.

Table 100: show subscribers Output Fields (continued)

Field Name	Field Description
<b>Actual upstream data rate</b>	Unadjusted upstream data rate for the PPPoE subscriber's access line reported by the PPPoE intermediate agent in a PADI or PADO packet in the Vendor-Specific-Tags TLV in subattribute Actual-Net-Data-Rate-Upstream (0x0081).
<b>Actual downstream data rate</b>	Unadjusted downstream data rate for the PPPoE subscriber's access line reported by the PPPoE intermediate agent in a PADI or PADO packet in the Vendor-Specific-Tags TLV in subattribute Actual-Net-Data-Rate-Downstream (0x0082).
<b>Adjusted downstream data rate</b>	Adjusted downstream data rate for the PPPoE subscriber's access line, calculated by the PPPoE daemon and stored in the subscriber session database.
<b>Adjusted upstream data rate</b>	Adjusted upstream data rate for the PPPoE subscriber's access line, calculated by the PPPoE daemon and stored in the subscriber session database.

## Sample Output

### show subscribers (IPv4)

```
user@host> show subscribers
```

Interface	IP Address/VLAN ID	User Name	LS:RI
ge-1/3/0.1073741824	10		default:default
demux0.1073741824	203.0.113.10	WHOLESALE-CLIENT	default:default
demux0.1073741825	203.0.113.3	RETAILER1-CLIENT	test1:retailer1
demux0.1073741826	203.0.113.3	RETAILER2-CLIENT	test1:retailer2

### show subscribers (IPv6)

```
user@host> show subscribers
```

Interface	IP Address/VLAN ID	User Name	LS:RI
ge-1/0/0.0	2001:db8:c0:0:0:0/74	WHOLESALE-CLIENT	default:default
*	2001:db8:1/128	subscriber-25	default:default

### show subscribers (IPv4 and IPv6 Dual Stack)

```
user@host> show subscribers
```

Interface	IP Address/VLAN ID	User Name
LS:RI		
demux0.1073741834	0x8100.1002 0x8100.1	
default:default

## show system autorecovery state

<b>Syntax</b>	show system autorecovery state
<b>Release Information</b>	Command introduced in Junos OS Release 11.2 for SRX300, SRX320, SRX340, SRX345, and SRX550M devices.
<b>Description</b>	Perform checks and show status of all autorecovered items.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">request system autorecovery state on page 1581</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system autorecovery state on page 1839</a>
<b>Output Fields</b>	Table 101 on page 1839 lists the output fields for the <b>show system autorecovery state</b> command. Output fields are listed in the approximate order in which they appear.

Table 101: show system autorecovery state Output Fields

Field Name	Field Description
File	The name of the file on which autorecovery checks are performed.
Slice	The disk partition on which autorecovery checks are performed.
Recovery Information	Indicates whether autorecovery information for the file or slice has been saved.
Integrity Check	Displays the status of the file's integrity check (passed or failed).
Action / Status	Displays the status of the item, or the action required to be taken for that item.

## Sample Output

### show system autorecovery state

```
user@host> show system autorecovery state
```

```
Configuration:
File          Recovery Information Integrity Check Action / Status
rescue.conf.gz Saved          Passed          None
Licenses:
File          Recovery Information Integrity Check Action / Status
JUNOS282736.lic Saved          Passed          None
JUNOS282737.lic Not Saved      Not checked     Requires save
BSD Labels:
Slice         Recovery Information Integrity Check Action / Status
```

s1	Saved	Passed	None
s2	Saved	Passed	None
s3	Saved	Passed	None
s4	Saved	Passed	None

## show system license (View)

<b>Syntax</b>	show system license <installed   keys   status   usage>
<b>Release Information</b>	Command introduced in Junos OS Release 9.5. Logical system status option added in Junos OS Release 11.2.
<b>Description</b>	Display licenses and information about how licenses are used.
<b>Options</b>	<p><b>none</b>—Display all license information.</p> <p><b>installed</b>—(Optional) Display installed licenses only.</p> <p><b>keys</b>—(Optional) Display a list of license keys. Use this information to verify that each expected license key is present.</p> <p><b>status</b>—(Optional) Display license status for a specified logical system or for all logical systems.</p> <p><b>usage</b>—(Optional) Display the state of licensed features.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Adding New Licenses (CLI Procedure)</i></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show system license on page 1842</a></p> <p><a href="#">show system license installed on page 1842</a></p> <p><a href="#">show system license keys on page 1843</a></p> <p><a href="#">show system license usage on page 1843</a></p> <p><a href="#">show system license status logical-system all on page 1843</a></p>
<b>Output Fields</b>	<a href="#">Table 102 on page 1841</a> lists the output fields for the <b>show system license</b> command. Output fields are listed in the approximate order in which they appear.

Table 102: show system license Output Fields

Field Name	Field Description
<b>Feature name</b>	Name assigned to the configured feature. You use this information to verify that all the features for which you installed licenses are present.
<b>Licenses used</b>	Number of licenses used by the device. You use this information to verify that the number of licenses used matches the number configured. If a licensed feature is configured, the feature is considered used.

Table 102: show system license Output Fields (continued)

Field Name	Field Description
Licenses installed	Information about the installed license key: <ul style="list-style-type: none"> <li>• <b>License identifier</b>—Identifier associated with a license key.</li> <li>• <b>License version</b>—Version of a license. The version indicates how the license is validated, the type of signature, and the signer of the license key.</li> <li>• <b>Valid for device</b>—Device that can use a license key.</li> <li>• <b>Features</b>—Feature associated with a license.</li> </ul>
Licenses needed	Number of licenses required for features being used but not yet properly licensed.
Expiry	Time remaining in the grace period before a license is required for a feature being used.
Logical system license status	Displays whether a license is enabled for a logical system.

## Sample Output

### show system license

```
user@host> show system license
```

```
License usage:

ax411-wlan-ap	0	2	0	permanent

### show system license status logical-system all

```
user@host> show system license status logical-system all
```

```
Logical system license status:
```

logical system name	license status
root-logical-system	enabled
LSYS0	enabled
LSYS1	enabled
LSYS2	enabled

## show system login logout

**Syntax** `show system login logout`

**Release Information** Command introduced in Junos OS Release 11.2.

**Description** Display the usernames locked after unsuccessful login attempts.

**Required Privilege Level** view and system

**Related Documentation**

- [lockout-period on page 1104](#)
- [clear system login logout on page 1558](#)

**List of Sample Output** [show system login logout on page 1844](#)

**Output Fields** [Table 103 on page 1844](#) lists the output fields for the **show system login logout** command. Output fields are listed in the approximate order in which they appear.

*Table 103: show system login logout*

Field Name	Field Description	Level of Output
User	Username	All levels
Lockout start	Date and time the username was locked	All levels
Lockout end	Date and time the username was unlocked	All levels

## Sample Output

### show system login logout

```
user@host> show system login logout
```

```
User          Lockout start      Lockout end
root          2011-05-11 09:11:15 UTC 2011-05-11 09:13:15 UTC
```

## show system download

<b>Syntax</b>	<code>show system download &lt;download-id&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.2 for SRX300, SRX320, SRX340, SRX345, and SRX550M devices.
<b>Description</b>	Display a brief summary of all the download instances along with their current state and extent of progress. If a <b>download-id</b> is provided, the command displays a detailed report of the particular download instance.
<b>Options</b>	<ul style="list-style-type: none"> <li><b>download-id</b>—(Optional) The ID number of the download instance.</li> </ul>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">request system download start on page 1588</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system download on page 1845</a> <a href="#">show system download 1 on page 1846</a>
<b>Output Fields</b>	Table 104 on page 1845 lists the output fields for the <b>show system download</b> command. Output fields are listed in the approximate order in which they appear.

Table 104: show system download Output Fields

Field Name	Field Description
ID	Displays the download identification number.
Status	Displays the state of a particular download.
Start Time	Displays the start time of a particular download.
Progress	Displays the percentage of a download that has been completed.
URL	Displays the URL from which the file was downloaded.

## Sample Output

### show system download

```
user@host> show system download
Download Status Information:
ID  Status      Start Time      Progress  URL
```

1	Active	May 4 06:28:36	5%	ftp://ftp-server//tftpboot/1m_file
2	Active	May 4 06:29:07	3%	ftp://ftp-server//tftpboot/5m_file
3	Error	May 4 06:29:22	Unknown	ftp://ftp-server//tftpboot/badfile
4	Completed	May 4 06:29:40	100%	ftp://ftp-server//tftpboot/smallfile

### show system download 1

```
user@host> show system download 1
```

```
Download ID      : 1
Status           : Active

Start Time       : May 4 06:28:37
Error Count      : 0
```

## show system services dhcp binding

<b>Syntax</b>	show system services dhcp binding <detail> <address>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	(EX Series switches only) Display Dynamic Host Configuration Protocol (DHCP) server client binding information.
<b>Options</b>	<b>none</b> —Display brief information about all active client bindings.  <b>detail</b> —(Optional) Display detailed information about all active client bindings.  <b>address</b> —(Optional) Display detailed client binding information for the specified IP address only.
<b>Required Privilege Level</b>	view and system
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">clear system services dhcp binding on page 1559</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system services dhcp binding on page 1848</a> <a href="#">show system services dhcp binding address on page 1848</a> <a href="#">show system services dhcp binding address detail on page 1848</a>
<b>Output Fields</b>	<a href="#">Table 105 on page 1847</a> describes the output fields for the <b>show system services dhcp binding</b> command. Output fields are listed in the approximate order in which they appear.

Table 105: show system services dhcp binding Output Fields

Field Name	Field Description	Level of Output
<b>Allocated address</b>	List of IP addresses the DHCP server has assigned to clients.	All levels
<b>MAC address</b>	Corresponding media access control (MAC) hardware address of the client.	All levels
<b>Client identifier</b>	( <b>address</b> option only) Client's unique identifier (represented by an ASCII string or hexadecimal digits). This identifier is used by the DHCP server to index its database of address bindings.	All levels
<b>Binding Type</b>	Type of binding assigned to the client. DHCP servers can assign a dynamic binding from a pool of IP addresses or a static binding to one or more specific IP addresses.	All levels
<b>Lease Expires at</b>	Time the lease expires or <b>never</b> for leases that do not expire.	All levels

Table 105: show system services dhcp binding Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Lease Obtained at</b>	( <i>address</i> option only) Time the client obtained the lease from the DHCP server.	<b>detail</b>
<b>State</b>	Status of the binding. Bindings can be active or expired.	<b>detail</b>
<b>Pool</b>	Address pool that contains the IP address assigned to the client.	<b>detail</b>
<b>Request received on</b>	Interface on which the DHCP message exchange occurs. The IP address pool is configured based on the interface's IP address. If a relay agent is used, its IP address is also displayed.	<b>detail</b>
<b>DHCP options</b>	User-defined options created for the DHCP server. If no options have been defined, this field is blank.	<b>detail</b>

## Sample Output

### show system services dhcp binding

```
user@host> show system services dhcp binding
```

```

Allocated address  MAC address      Binding Type  Lease expires at

```

## show system services dhcp client

<b>Syntax</b>	<b>show system services dhcp client</b> <b>&lt; interface-name &gt;</b> <b>&lt;statistics&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 8.5. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Display information about DHCP clients.
<b>Options</b>	<ul style="list-style-type: none"> <li>• <b>none</b>—Display DHCP information for all interfaces.</li> <li>• <b>interface-name</b>—(Optional) Display DHCP information for the specified interface.</li> <li>• <b>statistics</b>—(Optional) Display DHCP client statistics.</li> </ul>
<b>Required Privilege Level</b>	view and system
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>dhcp (Interfaces)</i></li> <li>• <a href="#">request system services dhcp on page 1602</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system services dhcp client on page 1851</a> <a href="#">show system services dhcp client ge-0/0/34.0 on page 1852</a> <a href="#">show system services dhcp client statistics on page 1852</a>
<b>Output Fields</b>	<a href="#">Table 106 on page 1850</a> lists the output fields for the <b>show system services dhcp client</b> command. Output fields are listed in the approximate order in which they appear.

*Table 106: show system services dhcp client Output Fields*

Field Name	Field Description
Logical Interface Name	Name of the logical interface.
Client Status	State of the client binding.
Vendor Identifier	Vendor ID.
Server Address	IP address of the DHCP server.
Address obtained	IP address obtained from the DHCP server.
Lease Obtained at	Date and time the lease was obtained.
Lease Expires in	(EX Series switches only) Time the current lease expires in (seconds).

Table 106: show system services dhcp client Output Fields (continued)

Field Name	Field Description
Lease Expires at	Date and time the lease expires.
DHCP Options	<ul style="list-style-type: none"> <li>• <b>Name:</b> server-identifier, <b>Value:</b> IP address of the name server.</li> <li>• <b>Name:</b> device, <b>Value:</b> IP address of the name device.</li> <li>• <b>Name:</b> domain-name, <b>Value:</b> Name of the domain.</li> </ul>
Packets dropped	Total packets dropped.
Messages received	<p>Number of the following DHCP messages received:</p> <ul style="list-style-type: none"> <li>• <b>DHCPOFFER</b>—First packet received on a logical interface when DHCP is enabled.</li> <li>• <b>DHCPACK</b>—When received from the server, the client sends an ARP request for that address and adds a (ARP response) timer for 4 seconds and stops the earlier timer added for DHCPACK.</li> <li>• <b>DHCPNAK</b>—When a DHCPNAK is received instead of DHCPACK, the logical interface sends a DHCPDISCOVER packet.</li> </ul>
Messages sent	<p>Number of the following DHCP messages sent:</p> <ul style="list-style-type: none"> <li>• <b>DHCPDECLINE</b>—Packet sent when ARP response is received and there is a conflict. The logical interface sends a new DHCPDISCOVER packet.</li> <li>• <b>DHCPDISCOVER</b>—Packet sent on the interface for which the DHCP client is enabled.</li> <li>• <b>DHCPREQUEST</b>—Packet sent to the DHCP server after accepting the DHCPOFFER. After sending the DHCPREQUEST, the device adds a retransmission-interval timer.</li> <li>• <b>DHCPINFORM</b>—Packet sent to the DHCP server for local configuration parameters.</li> <li>• <b>DHCPRELEASE</b>—Packet sent to the DHCP server to relinquish network address and cancel remaining lease.</li> <li>• <b>DHCPRENEW</b>—Packet sent to the DHCP server to renew the address. The next message to be sent will be a DHCPREQUEST message, which will be unicast directly to the server.</li> <li>• <b>DHCPREBIND</b>—Packet sent to any server to renew the address. The next message to be sent will be a DHCPREQUEST message, which will be broadcast.</li> </ul>

## Sample Output

### show system services dhcp client

```
user@host> show system services dhcp client
```

```
Logical Interface name      ge-0/0/34.0
Hardware address           00:1f:12:38:5f:e5
Client status               bound
Address obtained            10.0.0.2
Update server               disabled
Lease obtained at           2013-12-23 08:11:40 UTC
Lease expires in            93
Lease expires at            2013-12-23 08:13:20 UTC
```

#### DHCP options:

```
Name: server-identifier, Value: 10.0.0.1
Code: 1, Type: ip-address, Value: 255.255.255.0
```

## Sample Output

### show system services dhcp client ge-0/0/34.0

```
user@host> show system services dhcp client ge-0/0/34.0
```

Logical Interface name	ge-0/0/34.0
Hardware address	00:1f:12:38:5f:e5
Client status	bound
Address obtained	10.0.0.2
Update server	disabled
Lease obtained at	2013-12-23 08:11:40 UTC
Lease expires in	87
Lease expires at	2013-12-23 08:13:20 UTC

#### DHCP options:

Name:	server-identifier,	Value:	10.0.0.1
Code:	1,	Type:	ip-address, Value: 255.255.255.0

## Sample Output

### show system services dhcp client statistics

```
user@host> show system services dhcp client statistics
```

Packets dropped:	
Total	0
Messages received:	
DHCP OFFER	0
DHCP ACK	8
DHCP NAK	0
Messages sent:	
DHCP DECLINE	0
DHCP DISCOVER	0
DHCP REQUEST	1
DHCP INFORM	0
DHCP RELEASE	0
DHCP RENEW	7
DHCP REBIND	0

## show system services dhcp conflict

<b>Syntax</b>	show system services dhcp conflict
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	(J Series routers only and EX Series switches) Display Dynamic Host Configuration Protocol (DHCP) client-detected conflicts for IP addresses. When a conflict is detected, the DHCP server removes the address from the address pool.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view and system
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">clear system services dhcp conflict on page 1560</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system services dhcp conflict on page 1853</a>
<b>Output Fields</b>	<a href="#">Table 107 on page 1853</a> describes the output fields for the <b>show system services dhcp conflict</b> command. Output fields are listed in the approximate order in which they appear.

*Table 107: show system services dhcp conflict Output Fields*

Field Name	Field Description
<b>Detection time</b>	Date and time the client detected the conflict.
<b>Detection method</b>	How the conflict was detected.
<b>Address</b>	IP address where the conflict occurs. The addresses in the conflicts list remain excluded from the pool until you use a <b>clear system services dhcp conflict</b> command to manually clear the list.

## Sample Output

### show system services dhcp conflict

```
user@host> show system services dhcp conflict
```

Detection time	Detection method	Address
2004-08-03 19:04:00 PDT	ARP	10.0.0.1
2004-08-04 04:23:12 PDT	Ping	10.0.0.2
2004-08-05 21:06:44 PDT	Client	10.0.0.3

## show system services dhcp global

<b>Syntax</b>	show system services dhcp global
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	(J Series routers and EX Series switches only) Display Dynamic Host Configuration Protocol (DHCP) global configuration options. Global options apply to all scopes and clients served by the DHCP server. Global options are overridden if specified otherwise in scope or client options. Scope options apply to specific subnets or ranges of addresses. Client options apply to specific clients.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view and system
<b>List of Sample Output</b>	<a href="#">show system services dhcp global on page 1855</a>
<b>Output Fields</b>	<a href="#">Table 108 on page 1854</a> describes the output fields for the <b>show system services dhcp global</b> command. Output fields are listed in the approximate order in which they appear.

*Table 108: show system services dhcp global Output Fields*

Field Name	Field Description
BOOTP lease length	Length of lease time assigned to BOOTP clients.
Default lease time	Lease time assigned to clients that do not request a specific lease time.
Minimum lease time	Minimum time a client retains an IP address lease on the server.
Maximum lease time	Maximum time a client can retain an IP address lease on the server.
DHCP options	User-defined options created for the DHCP server. If no options have been defined, this field is blank.

## Sample Output

### show system services dhcp global

```
user@host> show system services dhcp global

Global settings:
  BOOTP lease length      infinite

DHCP lease times:
  Default lease time      1 hour
  Minimum lease time      2 hours
  Maximum lease time      infinite

DHCP options:
  Name: name-server, Value: { 6.6.6.6, 6.6.6.7 }
  Name: domain-name, Value: mydomain.tld
  Code: 19, Type: flag, Value: off
  Code: 40, Type: string, Value: domain.tld
  Code: 32, Type: ip-address, Value: 3.3.3.33
```

## show system services dhcp pool

<b>Syntax</b>	show system services dhcp pool <detail> <subnet-address>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	(J Series routers and EX Series switches only) Display Dynamic Host Configuration Protocol (DHCP) server IP address pools.
<b>Options</b>	<b>none</b> —Display brief information about all IP address pools.  <b>detail</b> —(Optional) Display detailed information.  <b>subnet-address</b> —(Optional) Display information for the specified subnet address.
<b>Required Privilege Level</b>	view and system
<b>List of Sample Output</b>	<a href="#">show system services dhcp pool on page 1857</a> <a href="#">show system services dhcp pool subnet-address on page 1857</a> <a href="#">show system services dhcp pool subnet-address detail on page 1857</a>
<b>Output Fields</b>	<a href="#">Table 109 on page 1856</a> describes the output fields for the <b>show system services dhcp pool</b> command. Output fields are listed in the approximate order in which they appear.

Table 109: show system services dhcp pool Output Fields

Field Name	Field Description	Level of Output
Pool name	Subnet on which the IP address pool is defined.	None specified
Low address	Lowest address in the IP address pool.	None specified
High address	Highest address in the IP address pool.	None specified
Excluded addresses	Addresses excluded from the address pool.	None specified
Subnet	( <i>subnet-address</i> option only) Subnet to which the specified address pool belongs.	None specified
Address range	( <i>subnet-address</i> option only) Range of IP addresses in the address pool.	None specified
Addresses assigned	Number of IP addresses in the pool that are assigned to DHCP clients and the total number of IP addresses in the pool.	detail
Active	Number of assigned IP addresses in the pool that are active.	detail

Table 109: show system services dhcp pool Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Excluded</b>	Number of assigned IP addresses in the pool that are excluded.	<b>detail</b>
<b>Default lease time</b>	Lease time assigned to clients that do not request a specific lease time.	<b>detail</b>
<b>Minimum lease time</b>	Minimum time a client can retain an IP address lease on the server.	<b>detail</b>
<b>Maximum lease time</b>	Maximum time a client can retain an IP address lease on the server.	<b>detail</b>
<b>DHCP options</b>	User-defined options created for the DHCP server. If no options have been defined, this field is blank.	<b>detail</b>

## Sample Output

### show system services dhcp pool

```
user@host> show system services dhcp pool
```

```
Pool name      Low address    High address    Excluded addresses
192.0.2.0/24  192.0.2.2      192.0.2.254     192.0.2.1
```

### show system services dhcp pool subnet-address

```
user@host> show system services dhcp pool 192.0.2.0/24
```

```
Pool information:
  Subnet                192.0.2.0/24
  Address range          192.0.2.2 - 192.0.2.254
  Addresses assigned      2/253
```

### show system services dhcp pool subnet-address detail

```
user@host> show system services dhcp pool 192.0.2.0/24 detail
```

```
Pool information:
  Subnet                192.0.2.0/24
  Address range          192.0.2.2 - 192.0.2.254
  Addresses assigned      2/253
  Active: 1, Excluded: 1

DHCP lease times:
  Default lease time     1 hour
  Minimum lease time     2 hours
  Maximum lease time     infinite

DHCP options:
  Name: name-server, Value: { 6.6.6.6, 6.6.6.7 }
  Name: domain-name, Value: mydomain.tld
```

```
Name: router, Value: { 192.0.2.1 }  
Name: server-identifier, Value: 192.0.2.1  
Code: 19, Type: flag, Value: off  
Code: 40, Type: string, Value: domain.tld  
Code: 32, Type: ip-address, Value: 192.0.2.1
```

## show system services dhcp relay-statistics

<b>Syntax</b>	<code>show system services dhcp relay-statistics</code>
<b>Release Information</b>	Command introduced in Junos OS Release 8.5 .
<b>Description</b>	Display information about the DHCP relay.
<b>Required Privilege Level</b>	view and system
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>dhcp</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system services dhcp relay-statistics on page 1860</a>
<b>Output Fields</b>	<a href="#">Table 110 on page 1859</a> lists the output fields for the <b>show system services dhcp relay-statistics</b> command. Output fields are listed in the approximate order in which they appear.

*Table 110: show system services dhcp relay-statistics Output Fields*

Field Name	Field Description
Received packets	Total DHCP packets received.
Forwarded packets	Total DHCP packet forwarded.
Dropped packets	<p>Total DHCP packets dropped for the following reasons:</p> <ul style="list-style-type: none"> <li>• <b>Due to a missing interface in the relay database</b>—Number of packets discarded because they did not belong to a configured interface.</li> <li>• <b>Due to a missing matching routing instance</b>—Number of packets discarded because they did not belong to a configured routing instance.</li> <li>• <b>Due to an error during packet read</b>—Number of packets discarded because of a system read error.</li> <li>• <b>Due to an error during packet send</b>—Number of packets that the DHCP relay application could not send.</li> <li>• <b>Due to an invalid server address</b>—Number of packets discarded because an invalid server address was specified.</li> <li>• <b>Due to a missing valid local address</b>—Number of packets discarded because there was no valid local address.</li> <li>• <b>Due to a missing route to the server or client</b>—Number of packets discarded because there were no addresses available for assignment.</li> </ul>

## Sample Output

### show system services dhcp relay-statistics

```
user@host> show system services dhcp relay-statistics
Received packets: 4
Forwarded packets: 4
Dropped packets: 4
  Due to missing interface in relay database: 4
  Due to missing matching routing instance: 0
  Due to an error during packet read: 0
  Due to an error during packet send: 0
  Due to invalid server address: 0
  Due to missing valid local address: 0
  Due to missing route to server/client: 0
```

## show system services dhcp statistics

<b>Syntax</b>	show system services dhcp statistics
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	(J Series routers and EX Series switches only) Display Dynamic Host Configuration Protocol (DHCP) server statistics.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view and system
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear system services dhcp statistics on page 1561</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system services dhcp statistics on page 1862</a>
<b>Output Fields</b>	<a href="#">Table 111 on page 1861</a> describes the output fields for the <b>show system services dhcp statistics</b> command. Output fields are listed in the approximate order in which they appear.

*Table 111: show system services dhcp statistics Output Fields*

Field Name	Field Description
Default lease time	Lease time assigned to clients that do not request a specific lease time.
Minimum lease time	Minimum time a client can retain an IP address lease on the server.
Maximum lease time	Maximum time a client can retain an IP address lease on the server.
Packets dropped	Total number of packets dropped and number of packets dropped because of: <ul style="list-style-type: none"> <li>• Invalid hardware address</li> <li>• Invalid opcode</li> <li>• Invalid server address</li> <li>• No available address</li> <li>• No interface match</li> <li>• No routing instance match</li> <li>• No valid local addresses</li> <li>• Packet too short</li> <li>• Read error</li> <li>• Send error</li> </ul>

Table 111: show system services dhcp statistics Output Fields (continued)

Field Name	Field Description
<b>Messages received</b>	Number of the following message types sent from DHCP clients and received by the DHCP server: <ul style="list-style-type: none"> <li>• BOOTREQUEST</li> <li>• DHCPDECLINE</li> <li>• DHCPDISCOVER</li> <li>• DHCPINFORM</li> <li>• DHCPRELEASE</li> <li>• DHCPREQUEST</li> </ul>
<b>Messages sent</b>	Number of the following message types sent from the DHCP server to DHCP clients: <ul style="list-style-type: none"> <li>• BOOTREPLY</li> <li>• DHCPACK</li> <li>• DHCPOFFER</li> <li>• DHCPNAK</li> </ul>

## Sample Output

### show system services dhcp statistics

```
user@host> show system services dhcp statistics
```

```
DHCP lease times:
  Default lease time      1 hour
  Minimum lease time      2 hours

## show system services service-deployment

<b>Syntax</b>	show system services service-deployment
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.</p>
<b>Description</b>	Display information about a Session and Resource Control (SRC) client.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	<p>system</p> <p>view</p>
<b>List of Sample Output</b>	<a href="#">show system services service-deployment on page 1864</a>
<b>Output Fields</b>	<a href="#">Table 112 on page 1864</a> lists the output fields for the <b>show system services service-deployment</b> command. Output fields are listed in the approximate order in which they appear.

*Table 112: show system services service-deployment Output Fields*

Field Name	Field Description
PDT Keepalive settings	Configured PDT keepalive interval, in seconds.
Keepalives sent	Number of keepalives sent.
Notifications sent	Number of notifications sent.
Last update from peer	Time at which the last update from a peer was received.

## Sample Output

### show system services service-deployment

```
user@host> show system services service-deployment
```

```
Connected to 192.0.2.0 port 10288 since 2004-05-03 11:04:34 PDT Keepalive settings:
Interval 15 seconds Keepalives sent: 750 Notifications sent: 0 Last update from
peer: 00:00:06 ago
```

## show system snapshot media

<b>Syntax</b>	<code>show system snapshot &lt; media (compact-flash   external   harddisk   internal   usb) &gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.2 .
<b>Description</b>	Display information about the partitioning scheme present on the media. Information for only one root is displayed for single-root partitioning, whereas information for both roots is displayed for dual-root partitioning.
<b>Options</b>	<ul style="list-style-type: none"> <li>compact-flash— Show snapshot information from the CompactFlash card. (Supported on SRX5400, SRX5600, SRX5800)</li> <li>external— Show snapshot information from the external CompactFlash card. (Not supported on SRX5000 Series devices)</li> <li>hard-disk— Show snapshot information from the Hard Disk. (Supported on SRX5400, SRX5600, SRX5800)</li> <li>internal— Show snapshot information from internal media. (Not supported on SRX5000 Series devices)</li> <li>usb— Show snapshot information from device connected to USB port.</li> </ul>
<b>Required Privilege Level</b>	View
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Example: Creating a Snapshot and Using It to Boot an SRX Series Device</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system snapshot media compact-flash on page 1866</a> <a href="#">show system snapshot media external on page 1866</a> <a href="#">show system snapshot media internal on page 1866</a> <a href="#">show system snapshot media usb on page 1866</a> <a href="#">show system snapshot media hard-disk on page 1866</a>
<b>Output Fields</b>	Table 113 on page 1865 lists the output fields for the <b>show system snapshot media</b> command. Output fields are listed in the approximate order in which they appear.

*Table 113: show system snapshot media Output Fields*

Field Name	Field Description
Creation date	Date and time of the last snapshot.
JUNOS version on snapshot	Junos OS release number of individual software packages.

## Sample Output

### show system snapshot media compact-flash

#### show system snapshot media compact-flash

```
Information for snapshot on compact-flash (ad0s1)
Creation date: Aug 21 11:58:14 2017
JUNOS version on snapshot:
  junos : 12.3X48-D40.5-domestic
```

### show system snapshot media external

#### show system snapshot media external

```
Information for snapshot on      external (/dev/da1s2a) (primary)
Creation date: Apr 9 09:41:16 2018
JUNOS version on snapshot:
  junos : 12.3X48-D40.5-domestic
Information for snapshot on      external (/dev/da1s1a) (backup)
Creation date: Apr 9 09:41:16 2018
JUNOS version on snapshot:
  junos : 12.3X48-D40.5-domestic
```

### show system snapshot media internal

#### show system snapshot media internal

```
Information for snapshot on      internal (/dev/da0s1a) (primary)
Creation date: Jan 15 10:43:26 2010
JUNOS version on snapshot:
  junos : 10.1B3-domestic
Information for snapshot on      internal (/dev/da0s2a) (backup)
Creation date: Jan 15 10:15:32 2010
JUNOS version on snapshot:
  junos : 10.2-20100112.0-domestic
```

### show system snapshot media usb

#### show system snapshot media usb

```
Information for snapshot on usb (da0s1)
Creation date: Apr 9 08:44:46 2018
JUNOS version on snapshot:
  junos : 12.3X48-D40.5-domestic
```

### show system snapshot media hard-disk

#### show system snapshot media hard-disk

```
Information for snapshot on hard-disk (ad2s1)
Creation date: Apr 9 16:40:18 2018
JUNOS version on snapshot:
  junos : 12.3X48-D40.5-domestic
```

## show system storage partitions

<b>List of Syntax</b>	<a href="#">Syntax (EX Series) on page 1867</a> <a href="#">Syntax (SRX Series) on page 1867</a>
<b>Syntax (EX Series)</b>	<pre>show system storage partitions &lt;all-members&gt; &lt;local&gt; &lt;member <i>member-id</i>&gt;</pre>
<b>Syntax (SRX Series)</b>	<pre>show system storage partitions</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 10.2 for SRX300, SRX320, SRX340, SRX345, and SRX550HM devices.</p> <p>Command introduced in Junos OS Release 11.1 for EX Series switches.</p>
<b>Description</b>	Display information about the disk partitioning scheme.
<b>Options</b>	<p><b>none</b>—Display partition information.</p> <p><b>all-members</b>—(Virtual Chassis systems only) (Optional) Display partition information for all members of the Virtual Chassis.</p> <p><b>local</b>—(Virtual Chassis systems only) (Optional) Display partition information for the local Virtual Chassis member.</p> <p><b>member <i>member-id</i></b>—(Virtual Chassis systems only) (Optional) Display partition information for the specified member of the Virtual Chassis configuration.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Verifying Junos OS and Boot Loader Software Versions on an EX Series Switch</a></li> <li>• <a href="#">Example: Installing Junos OS on SRX Series Devices Using the Partition Option</a></li> </ul>

**Syntax**    `show system users`  
                  `<no-resolve>`

**Syntax (TX Matrix Router)**    `show system users`  
                                          `<all-chassis | all-lcc | lccnumber | scc>`  
                                          `<no-resolve>`

**Syntax (TX Matrix Plus Router)**    `show system users`  
                                          `<detail>`  
                                          `<all-chassis | all-lcc | lcc number | sfc number> <no-resolve>`

**Syntax (MX Series Router)**    `show system users`  
                                          `<all-members>`  
                                          `<local>`  
                                          `<member member-id>`  
                                          `<no-resolve>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                  **sfc** option introduced for the TX Matrix Plus router in JUNOS OS Release 9.6.  
                                  Command introduced in Junos OS Release 11.1 for the QFX Series.  
                                  Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**    List information about the users who are currently logged in to the router or switch.

**NOTE:** The `show system users` command lists the information about administrative users that are logged in to a router or switch using the CLI, J-Web, or an SSH client. The output does not list information about web users or automated users that are logged in from a remote client application using Junos XML APIs, such as NETCONF.

**Options**    **none**—List information about the users who are currently logged in to the router or switch.

**all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show users currently logged in to all the routers in the chassis.

**all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show users currently logged in to all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, show users currently logged in to all connected T1600 or T4000 LCCs.

**all-members**—(MX Series routers only) (Optional) Display users currently logged in to all members of the Virtual Chassis configuration.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show users currently logged in to a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, show users currently logged in to a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display users currently logged in to the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display users currently logged in to the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**no-resolve**—(Optional) Do not attempt to resolve IP addresses to hostnames.

**scc**—(TX Matrix routers only) (Optional) Show users currently logged in to the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Show users currently logged in to the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system users** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields** [Table 115 on page 1872](#) describes the output fields for the **show system users** command. Output fields are listed in the approximate order in which they appear.

*Table 115: show system users Output Fields*

Field Name	Field Description
<b>time and up</b>	Current time, in the local time zone, and how long the router or switch has been operational.
<b>users</b>	Number of users logged in to the router or switch.
<b>load averages</b>	Load averages for the last 1 minute, 5 minutes, and 15 minutes.
<b>USER</b>	Username.
<b>TTY</b>	Terminal through which the user is logged in.
<b>FROM</b>	System from which the user has logged in. A hyphen indicates that the user is logged in through the console.
<b>LOGIN@</b>	Time when the user logged in.
<b>IDLE</b>	How long the user has been idle.
<b>WHAT</b>	Processes that the user is running.

## Sample Output

### show system users

```
user@host> show system users
 7:30PM up 4 days, 2:26, 2 users, load averages: 0.07, 0.02, 0.01
USER   TTY FROM          LOGIN@  IDLE WHAT
root   d0  -              Fri05PM 4days -csh (csh)
blue   p0  level5.company.net 7:30PM  - cli
```

### show system users lcc no-resolve (TX Matrix, TX Matrix Plus Router)

```
user@host> show system users lcc 2 no-resolve

lcc2-re0:
```

```

-----
10:34AM PDT up 1 day, 7:11, 5 users, load averages: 0.03, 0.01, 0.00

## test access profile

<b>Syntax</b>	<code>test access profile <i>profile-name</i> user <i>username</i> password <i>password</i> &lt;detail&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.1.
<b>Description</b>	Specify a profile to use to get information from a RADIUS server, which includes all the information from the <b>test access radius-server</b> command.
<b>Options</b>	<p><b>detail</b>—(Optional) Show the RADIUS attributes returned by the server.</p> <p><b>profile-name</b>—Access profile name configured.</p> <p><b>password</b>—Password for the username.</p> <p><b>username</b>—User name to be authenticated to the RADIUS server.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<p><a href="#">test access profile on page 1876</a></p> <p><a href="#">test access profile detail on page 1876</a></p>
<b>Output Fields</b>	<a href="#">Table 116 on page 1875</a> lists the output fields for the <b>test access profile</b> command. Output fields are listed in the approximate order in which they appear.

*Table 116: test access profile Output Fields*

Field Name	Field Description
<b>Profile Name</b>	Name of the configured access profile.
<b>Client Username</b>	The user name authenticated by the RADIUS server.
<b>Client Password</b>	The user password authenticated by the RADIUS server.
<b>Num Servers</b>	Number of RADIUS servers in the configured access profile.
<b>Server List</b>	List of RADIUS servers in the configure access profile.
<b>IP Address</b>	The IP address of the RADIUS server authenticated.
<b>UDP Port</b>	The RADIUS server port utilized during the authentication test.
<b>Source Address</b>	The source IP address of the client making the RADIUS request. If no address is shown, it defaults to the address of the outgoing interface.
<b>Timeout</b>	The RADIUS server timeout period.

Table 116: test access profile Output Fields (continued)

Field Name	Field Description
<b>Retry Count</b>	The number of authentication attempts allowed by the RADIUS server.
<b>Secret</b>	The shared secret used for authentication with the RADIUS server.
<b>Status</b>	The test result status (Accepted or Rejected) and the number of retransmits utilized during authentication.
<b>Attempts</b>	The number of authentication attempts on the RADIUS server.
<b>Attribute List</b>	The list of returned RADIUS attributes, sorted by the attribute name, and including parameter length and value. See your RADIUS server documentation for attribute descriptions.
<b>(Attribute) Name</b>	The name of the attribute.
<b>(Attribute) Length</b>	The attribute length in bytes.
<b>(Attribute) Value</b>	The attribute value.

## Sample Output

### test access profile

The following example uses the **test access profile** command to access and display basic information about the RADIUS server(s) shown in the resulting output:

```

user@host> test access profile alpha user TEST password TEST

user@host> test access profile alpha user TEST password TEST
Test Radius Profile Access
  Profile Name       : alpha
  Client Username    : TEST
  Client Password    : TEST
  Num Servers        : 5
    Server List
      IP Address      UDP    Source      Timeout  Retry   Secret   Status
      Attempts        Port   Address      Count
1.1.1.1             1812  10.10.10.10    2         1     TEST    Timeout
2
1.2.3.4             1812  Default        1         2     TEST    Timeout
3
192.168.10.10       1812  Default        3         3     TEST    Accepted
1

```

### test access profile detail

The following example uses the **test access profile detail** command to access and display detailed information about the RADIUS server(s) shown in the resulting output:

```
user@host> test access profile alpha user TEST password TEST detail
```

```
user@host> test access profile alpha user TEST password TEST detail
```

```
Test Radius Profile Access Detailed
```

```
Profile Name      : alpha
Client Username   : TEST
Client Password   : TEST
Num Servers       : 5
```

#### Radius Server List

```
IP Address        : 1.2.3.4
UDP Port          : 1812
Source Address     : 192.168.10.10
Timeout           : 2
Retry Count       : 1
Secret            : TEST
Status            : Timeout
Attempts          : 2
```

```
IP Address        : 1.2.3.5
UDP Port          : 1812
Source Address     : Default
Timeout           : 1
Retry Count       : 2
Secret            : TEST
Status            : Timeout
Attempts          : 3
```

```
IP Address        : 192.168.10.10
UDP Port          : 1812
Source Address     : Default
Timeout           : 3
Retry Count       : 3
Secret            : TEST
Status            : Accepted
Attempts          : 1
```

## test access radius-server

**Syntax** `test access radius-server address user username password password secret secret  
<authentication-port port>  
<retry number>  
<source-address address>  
<timeout number>`

**Release Information** Command introduced in Junos OS Release 9.1.

**Description** Verify RADIUS server authentication parameters.

**Options** ***address***—RADIUS server under test IP address.

***password***—Password for the user.

***secret***—Secret shared with the RADIUS server.

***user***—User name to be authenticated to the RADIUS server.

***authentication-port***—(Optional) RADIUS server authentication port number (1through 65535).

***retry***—(Optional) Retry attempts (1through 10).

***source-address***—(Optional) Use an alternate address as the source address.

***timeout***—(Optional) Request timeout period (1through 90 seconds).

**Required Privilege Level** view

**List of Sample Output** [test access radius-server user password secret on page 1880](#)

**Output Fields** [Table 117 on page 1879](#) lists the output fields for the **test access radius-server** command. Output fields are listed in the approximate order in which they appear.

*Table 117: test access radius-server Output Fields*

Field Name	Field Description
Server	The IP address of the RADIUS server authenticated.
UDP port	The RADIUS server port utilized during the authentication test.
Source IP Address	“Default” is shown if the IP address is the same as that of the RADIUS server. Alternatively, an IP address specified for authentication is shown.
Server timeout	The RADIUS server timeout period.

*Table 117: test access radius-server Output Fields (continued)*

Field Name	Field Description
<b>Sever retry count</b>	The number of authentication attempts allowed by the RADIUS server.
<b>Secret</b>	The shared secret used for authentication with the RADIUS server.
<b>Client Username</b>	The user name authenticated by the RADIUS server.
<b>Client Password</b>	The user password authenticated by the RADIUS server.
<b>Status</b>	The test result status ( <b>Accepted</b> or <b>Rejected</b> ) and the number of retransmits utilized during authentication.

## Sample Output

### test access radius-server user password secret

The following example command tests RADIUS authentication with a specific server (172.28.30.95), user (JOHNDOE), secret (No1Knows), and password (JohnPass); and displays the resulting output:

```
user@host> test access radius-server 172.28.30.95 user JOHNDOE password JohnPass secret No1Knows
```

```
Test Radius Server Access
  Server           : 172.28.30.95
  UDP port         : 1812
  Source IP Address : Default
  Server timeout   : 3
  Sever retry count : 3
  Secret           : No1Knows
  Client Username   : JOHNDOE
  Client Password   : JohnPass
  Status            : Accepted, retransmits: 0
```
