| Release Information | Statement introduced in Junos OS Release 13.2 for PTX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Description         | <p>Enable or disable pre-forward error correction (FEC) bit error rate (BER) monitoring.</p> <p>With pre-FEC BER monitoring enabled, when the configured pre-FEC BER signal degrade threshold is reached, the PIC stops forwarding packets to the remote interface and raises an interface alarm. Ingress packets continue to be processed. If pre-FEC BER monitoring is used with MPLS fast reroute or another link protection method, then traffic is rerouted to a different interface.</p> <p>You can also configure backward fast reroute to insert local pre-FEC BER status into transmitted OTN frames, notifying the remote interface of signal degradation. The remote interface can use the information to reroute traffic to a different interface. If you use pre-FEC BER monitoring together with backward fast reroute, then notification of signal degradation and rerouting of traffic occurs in less time than that required through a Layer 3 protocol. To configure backward fast reroute, include the <b>backward-frr-enable</b> statement at the same hierarchy level.</p> <hr/> <div style="display: flex; align-items: flex-start;"> <div style="margin-right: 10px;">  </div> <div> <p><b>NOTE:</b> When you configure pre-FEC BER signal degrade monitoring, we recommend that you configure both the <b>signal-degrade-monitor-enable</b> and <b>backward-frr-enable</b> statements.</p> </div> </div> <hr/> <p>You can also configure the pre-FEC BER thresholds that raise or clear a signal degrade alarm and the time interval for the thresholds. If the BER thresholds and interval are not configured, the default values are used. Include the <b>ber-threshold-signal-degrade value</b>, <b>ber-threshold-clear value</b>, and <b>interval value</b> statements at the [edit interfaces <i>interface-name</i> <b>otn-options signal-degrade</b>] hierarchy level to configure the BER thresholds and time interval. See “Understanding Pre-FEC BER Monitoring and BER Thresholds” on <a href="#">page 420</a> for more information about pre-FEC BER monitoring and determining BER threshold settings.</p> |
| Default             | By default, pre-FEC BER signal degrade monitoring is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## start-measurement

**Syntax** (no-start-measurement | start-measurement);

**Hierarchy Level** [edit interfaces *interface-name* otn-options odu-delay-management]

**Release Information** Statement introduced in Junos OS Release 13.2 for PTX Series routers.

**Description** Start or do not start a delay measurement (DM) session.

**Default** By default, do not start a DM session.

**Options** **no-start-measurement**—Do not start a DM session.  
**start-measurement**—Start a DM session.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>         | <p>TCAs can give the management system an early indication as to the state of the associated entity when it crosses a certain threshold. TCAs can be set for both minimum and maximum values for gauges and only maximum values for counters. The timely detection of TCAs is essential to proactively manage the interface. TCAs are not an indication of a fault, but rather an indication that the entity may be close to a fault. You can choose which TCAs you want monitored by enabling the TCA. You can either keep the default threshold settings or change the settings.</p> <p>Enable threshold crossing alerts (TCAs) for the following:</p> <ul style="list-style-type: none"> <li>• Optical channel data unit (ODU)</li> <li>• Optical channel transport unit (OTU)</li> <li>• Laser power</li> <li>• Laser temperature</li> </ul>                                                                             |
| <b>Default</b>             | By default, TCAs are not enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## transport-monitoring

**Syntax** transport-monitoring;

**Hierarchy Level** [edit interfaces]

**Release Information** Statement introduced in Junos OS Release 14.2 for PTX5000 and PTX3000 routers.

**Description** Monitor the performance and state of packet transport for OTN and optics modules. The following statistics are monitored:

- Packet transport for ninety-six 15-minute intervals for the current 24 hours.
- Cumulative data of the current 24 hours.
- Cumulative data of the previous 24 hours.

If this statement is configured, transport monitoring related information is shown in the output of **show interface transport** command and corresponding MIBs are available. If this option is disabled, an error is shown in the output and corresponding MIBs are not available.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

- **odu-tca-uas**—(MX Series routers only) ODU Unavailable Seconds Threshold crossing defect trigger.
- **odu-ttim**—ODU Trail Trace Identifier Mismatch defect trigger.
- **opu-ptim**—(MX Series routers only) Payload Type Identifier Mismatch defect trigger.
- **odu-uas-th**—ODU Unavailable Seconds Threshold defect trigger.
- **opu-ptm**—Optical Channel Payload (OPU) Payload Type Mismatch defect trigger.
- **otu-ais**—Optical Channel Transport Unit (OTU) Alarm Indication Signal defect trigger.
- **otu-bbe-th**—OTU Background Block Error Threshold defect trigger.
- **otu-bdi**—OTU Backward Defect Indication defect trigger.
- **otu-es-th**—OTU Errored Seconds Threshold defect trigger.
- **otu-fec-deg**—OTU FEC Degrade defect trigger.
- **otu-fec-exe**—OTU FEC Excessive Error defect trigger.
- **otu-iae**—OTU Incoming Alignment defect trigger.
- **otu-sd**—OTU Signal Degrade defect trigger.
- **otu-ses-th**—OTU Severely Errored Seconds Threshold defect trigger.
- **otu-tca-es**—(MX Series routers only) OTU Errored Seconds Threshold crossing defect trigger.
- **otu-tca-ses**—(MX Series routers only) OTU Severely Errored Seconds Threshold crossing defect trigger.
- **otu-tca-uas**—(MX Series routers only) OTU Unavailable Seconds Threshold crossing defect trigger.
- **otu-ttim**—OTU Trail Trace Identifier Mismatch defect trigger.
- **otu-uas-th**—OTU Unavailable Seconds Threshold defect trigger.

*trigger-identifier*—(For PTX Series routers only) Trigger identifier. It can be one of the following:

- **oc-lof**—Optical channel Loss of Frame defect trigger.
- **oc-lom**—Optical channel Loss of Multiframe defect trigger.
- **oc-los**—Optical channel Loss of Signal defect trigger.
- **oc-tsfc**—Optical channel TOE security functionality (TSF) defect trigger.
- **oc-wavelength-lock**—Optical channel Wavelength Lock defect trigger.
- **odu-ais**—ODU Alarm Indication Signal defect trigger.
- **odu-bdi**—ODU Backward Defect Indication defect trigger.
- **odu-bei**—ODU Backward Error Indication defect trigger.
- **odu-iae**—ODU IAE defect trigger.
- **odu-lck**—ODU Locked defect trigger.
- **odu-oci**—ODU Open Connection Indication defect trigger.
- **odu-sd**—ODU Signal Degrade defect trigger.
- **odu-tca-bbe**—ODU Background Block Error Threshold crossing defect trigger.
- **odu-tca-bbe-fe**—ODU far-end Background Block Error (BEI) Threshold crossing defect trigger.
- **odu-tca-es**—ODU Errored Seconds Threshold crossing defect trigger.
- **odu-tca-es-fe**—ODU far-end Errored Seconds Threshold crossing defect trigger.
- **odu-tca-ses**—ODU Severely Errored Seconds Threshold crossing defect trigger.
- **odu-tca-ses-fe**—ODU far-end Severely Errored Seconds Threshold crossing defect trigger.
- **odu-tca-uas**—ODU Unavailable Seconds Threshold crossing defect trigger.
- **odu-tca-uas-fe**—ODU far-end Unavailable Seconds Threshold crossing defect trigger.
- **odu-ttim**—ODU Trail Trace Identifier Mismatch defect trigger.
- **opu-ptim**—Payload Type Identifier Mismatch defect trigger.
- **otu-ais**—OTU Alarm Indication Signal defect trigger.
- **otu-bdi**—OTU Backward Defect Indication defect trigger.
- **otu-fec-deg**—OTU FEC Degrade defect trigger.
- **otu-fec-exe**—OTU FEC Excessive Error defect trigger.
- **otu-iae**—OTU Incoming Alignment defect trigger.
- **otu-sd**—OTU Signal Degrade defect trigger.
- **otu-tca-bbe**—OTU Background Block Error Threshold crossing defect trigger.
- **otu-tca-bbe-fe**—OTU far-end Background Block Error (BEI) Threshold crossing defect trigger.
- **otu-tca-es**—OTU Errored Seconds Threshold crossing defect trigger.

- **otu-tca-es-fe**—OTU far-end Errored Seconds Threshold crossing defect trigger.
- **otu-tca-ses**—OTU Severely Errored Seconds Threshold crossing defect trigger.
- **otu-tca-ses-fe**—OTU far-end Severely Errored Seconds Threshold crossing defect trigger.
- **otu-tca-uas**—OTU Unavailable Seconds Threshold crossing defect trigger.
- **otu-tca-uas-fe**—OTU far-end Unavailable Seconds Threshold crossing defect trigger.
- **otu-ttim**—OTU Trail Trace Identifier Mismatch defect trigger.

hold-time *hold-time-value*—Hold time value. It can be one of the following:

- **down**—Delay before marking interface down when defect occurs (1.65534 milliseconds).
- **up**—Delay before marking interface up when defect is absent (1.65534 milliseconds).

**NOTE:** The trigger hold time value alone does not mark an interface to be up when the defect is absent or mark an interface to be down when the defect occurs. The hold time value only impacts the alarm reporting time. To mark an interface up or down, you must also configure the physical interface hold time at the [edit interfaces *interface-name* hierarchy level].

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>         | For 10-Gigabit or 100-Gigabit Ethernet DWDM interfaces only, configure full C-band ITU-Grid tunable optics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>             | <p><code>nm</code>—Wavelength value. It can be one of the following:</p> <div style="border: 1px solid #ccc; padding: 10px; margin: 10px 0;"> <p> <b>NOTE:</b> All values are displayed. However, if you configure a value that is not supported by the device, an error message is displayed and the device is not tuned to the specified wavelength.</p> </div> <ul style="list-style-type: none"> <li>• <b>1528.38</b>—1528.38 nanometers (nm), corresponds to a 50-GHz grid</li> <li>• <b>1528.77</b>—1528.77 nm, corresponds to 50-GHz and 100-GHz grids</li> <li>• <b>1529.16</b>—1529.16 nm, corresponds to a 50-GHz grid</li> <li>• <b>1529.55</b>—1529.55 nm, corresponds to 50-GHz and 100-GHz grids</li> <li>• <b>1529.94</b>—1529.94 nm, corresponds to a 50-GHz grid</li> <li>• <b>1530.33</b>—1530.33 nm, corresponds to 50-GHz and 100-GHz grids</li> <li>• <b>1530.72</b>—1530.72 nm, corresponds to a 50-GHz grid</li> <li>• <b>1531.12</b>—1531.12 nm, corresponds to 50-GHz and 100-GHz grids</li> <li>• <b>1531.51</b>—1531.51 nm, corresponds to a 50-GHz grid</li> <li>• <b>1531.90</b>—1531.90 nm, corresponds to 50-GHz and 100-GHz grids</li> <li>• <b>1532.29</b>—1532.29 nm, corresponds to a 50-GHz grid</li> <li>• <b>1532.68</b>—1532.68 nm, corresponds to 50-GHz and 100-GHz grids</li> <li>• <b>1533.07</b>—1533.07 nm, corresponds to a 50-GHz grid</li> <li>• <b>1533.47</b>—1533.47 nm, corresponds to 50-GHz and 100-GHz grids</li> <li>• <b>1533.86</b>—1533.86 nm, corresponds to a 50-GHz grid</li> <li>• <b>1534.25</b>—1534.25 nm, corresponds to 50-GHz and 100-GHz grids</li> </ul> |

- **1534.64**—1534.64 nm, corresponds to a 50-GHz grid
- **1535.04**—1535.04 nm, corresponds to 50-GHz and 100-GHz grids
- **1535.43**—1535.43 nm, corresponds to a 50-GHz grid
- **1535.82**—1535.82 nm, corresponds to 50-GHz and 100-GHz grids
- **1536.22**—1536.22 nm, corresponds to a 50-GHz grid
- **1536.61**—1536.61 nm, corresponds to 50-GHz and 100-GHz grids
- **1537.00**—1537.00 nm, corresponds to a 50-GHz grid
- **1537.40**—1537.40 nm, corresponds to 50-GHz and 100-GHz grids
- **1537.79**—1537.79 nm, corresponds to a 50-GHz grid
- **1538.19**—1538.19 nm, corresponds to 50-GHz and 100-GHz grids
- **1538.58**—1538.58 nm, corresponds to a 50-GHz grid
- **1538.98**—1538.98 nm, corresponds to 50-GHz and 100-GHz grids
- **1539.37**—1539.37 nm, corresponds to a 50-GHz grid
- **1539.77**—1539.77 nm, corresponds to 50-GHz and 100-GHz grids
- **1540.16**—1540.16 nm, corresponds to a 50-GHz grid
- **1540.56**—1540.56 nm, corresponds to 50-GHz and 100-GHz grids
- **1540.95**—1540.95 nm, corresponds to a 50-GHz grid
- **1541.35**—1541.35 nm, corresponds to 50-GHz and 100-GHz grids
- **1541.75**—1541.75 nm, corresponds to a 50-GHz grid
- **1542.14**—1542.14 nm, corresponds to 50-GHz and 100-GHz grids
- **1542.54**—1542.54 nm, corresponds to a 50-GHz grid
- **1542.94**—1542.94 nm, corresponds to 50-GHz and 100-GHz grids
- **1543.33**—1543.33 nm, corresponds to a 50-GHz grid
- **1543.73**—1543.73 nm, corresponds to 50-GHz and 100-GHz grids
- **1544.13**—1544.13 nm, corresponds to a 50-GHz grid
- **1544.53**—1544.53 nm, corresponds to 50-GHz and 100-GHz grids
- **1544.92**—1544.92 nm, corresponds to a 50-GHz grid
- **1545.32**—1545.32 nm, corresponds to 50-GHz and 100-GHz grids
- **1545.72**—1545.72 nm, corresponds to a 50-GHz grid
- **1546.12**—1546.12 nm, corresponds to 50-GHz and 100-GHz grids
- **1546.52**—1546.52 nm, corresponds to a 50-GHz grid
- **1546.92**—1546.92 nm, corresponds to 50-GHz and 100-GHz grids
- **1547.32**—1547.32 nm, corresponds to a 50-GHz grid

- **1547.72**—1547.72 nm, corresponds to 50-GHz and 100-GHz grids
- **1548.11**—1548.11 nm, corresponds to a 50-GHz grid
- **1548.51**—1548.51 nm, corresponds to 50-GHz and 100-GHz grids

## action-profile (Defining for CFM)

**Syntax**

```

action-profile profile-name {
 event {
 ais-trigger-condition {
 adjacency-loss;
 all-defects;
 cross-connect-ccm;
 erroneous-ccm;
 receive-ais;
 }
 interface-status-tlv (down | lower-layer-down);
 port-status-tlv blocked;
 rdi;
 }
 action {
 interface-down;
 log-and-generate-ais {
 interval(1m | 1s);
 level value;
 priority value;
 }
 }
 default-actions {
 interface-down;
 }
}

```

**Hierarchy Level** [edit protocols oam ethernet [connectivity-fault-management](#)]

**Release Information** Statement introduced in Junos OS Release 8.4.

**Description** Configure a name and default action for an action profile.

**Options** *profile-name*—Name of the action profile.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| Release Information      | Statement introduced in Junos OS Release 15.1 for MX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Description              | <p>Configure the threshold value for average frame delay, in microseconds, for two-way Ethernet frame delay measurement (ETH-DM). When the configured threshold for average frame delay is exceeded, an SNMP trap is generated for ETH-DM. SNMP traps are triggered if you configure either the average frame-delay threshold or the average inter-frame delay variance threshold. If you do not configure either the frame-delay threshold or the frame delay variation threshold, no SNMP traps are generated. You can configure these threshold values only with a two-way ETH-DM SLA iterator.</p> <p>Frame delay refers to the difference, in microseconds, between the time a frame is sent and when it is received. Frame delay variation refers to the difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.” For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet frame delay measurement, only the initiator MEP (on the local system) collects statistics.</p> |

| Description              | <p>Configure the threshold value for average frame delay variation, in microseconds, for two-way Ethernet frame delay measurement (ETH-DM). When the configured threshold for average frame delay variation is exceeded, an SNMP trap is generated for ETH-DM. SNMP traps are triggered if you configure either the average frame-delay threshold or the average inter-frame delay variance threshold. If you do not configure either the frame-delay threshold or the frame delay variation threshold, no SNMP traps are generated. You can configure these threshold values only with a two-way ETH-DM SLA iterator.</p> <p>Frame delay refers to the difference, in microseconds, between the time a frame is sent and when it is received. Frame delay variation refers to the difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.” For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet frame delay measurement, only the initiator MEP (on the local system) collects statistics. In two-way ETH-DM mode, frame delay and frame delay variation values are based on the time difference between when the initiator MEP transmits a request frame and receives a reply frame from the responder MEP, subtracting the time elapsed at the responder MEP.</p> |

| Release Information      | Statement introduced in Junos OS Release 15.1 for MX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Description              | <p>Configure the threshold value for average frame loss ratio, in milli-percent, in the upstream or forward direction for Ethernet loss measurement (ETH-LM) and Ethernet synthetic loss measurement (ETH-SLM). When the configured threshold for average forward frame loss ratio is exceeded, an SNMP trap is generated for ETH-LM and ETH-SLM. SNMP traps are triggered if you configure either the average backward frame loss ratio threshold or the average forward frame loss ratio threshold. If you do not configure either the average backward frame loss ratio threshold or the average forward frame loss ratio threshold, no SNMP traps are generated. You can configure these threshold values with an SLA iterator for ETH-SLM and ETH-LM.</p> <p>ETH-SLM is an application that enables the calculation of frame loss by using synthetic frames instead of data traffic. This mechanism can be considered as a statistical sample to approximate the frame loss ratio of data traffic.</p> |
| Options                  | <p><b><i>avg-flr-forward-threshold-value</i></b>—Threshold value for average frame loss ratio in the forward or upstream direction, in milli-percent, for ETH-SLM and ETH-LM.<br/> <b>Range:</b> 1 through 100000 milli-percent</p> <p><b><i>flap-trap-monitor seconds</i></b>—Duration in seconds, for summarizing flap occurrences and send out a single jnxSoamPm ThresholdFlapAlarm notification to the network management system (NMS).<br/> <b>Range:</b> 1 through 360 seconds</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Release Information      | Statement introduced in Junos OS Release 15.1 for MX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Description              | <p>Configure the threshold value for average frame loss ratio, in milli-percent, in the backward or downstream direction for Ethernet loss measurement (ETH-LM) and Ethernet synthetic loss measurement (ETH-SLM). When the configured threshold for average backward frame loss ratio is exceeded, an SNMP trap is generated for ETH-LM and ETH-SLM. SNMP traps are triggered if you configure either the average backward frame loss ratio threshold or the average forward frame loss ratio threshold. If you do not configure either the average backward frame loss ratio threshold or the average forward frame loss ratio threshold, no SNMP traps are generated. You can configure these threshold values with an SLA iterator for ETH-SLM and ETH-LM.</p> <p>ETH-SLM is an application that enables the calculation of frame loss by using synthetic frames instead of data traffic. This mechanism can be considered as a statistical sample to approximate the frame loss ratio of data traffic.</p> |
| Options                  | <p><b><i>avg-flr-backward-threshold-value</i></b>—Threshold value for average frame loss ratio in the backward or downstream direction, in milli-percent, for ETH-SLM and ETH-LM.<br/> <b>Range:</b> 1 through 100000 milli-percent</p> <p><b><i>flap-trap-monitor seconds</i></b>—Duration in seconds, for summarizing flap occurrences and send out a single jnxSoamPm ThresholdFlapAlarm notification to the network management system (NMS).<br/> <b>Range:</b> 1 through 360 seconds</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## calculation-weight

---

**Syntax**

```
calculation-weight {
 delay delay-value;
 delay-variation delay-variation-value;
}
```

**Hierarchy Level** [edit protocols oam ethernet connectivity-fault-management performance-monitoring sla-iterator-profiles *profile-name*]

**Release Information** Statement introduced in Junos OS Release 11.1.  
Statement introduced in Junos OS Release 11.4 for EX Series switches.

**Description** Configure the calculation weight for delay and delay variation.

**NOTE:** This option is applicable only for two-way delay measurement.

---

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** Configure—To enter configuration mode.  
Control—To modify any configuration.

| <b>Description</b>              | <p>Enable loss-threshold-tlv transmission.</p> <p>During a unified ISSU, the control plane may go down for several seconds and cause CFM continuity check packets to get dropped. This may cause the remote maintenance endpoint (MEP) to detect a connectivity loss and mark the MEP as down. To keep the MEP active during a unified ISSU, the loss threshold TLV communicates the minimum threshold value the receiving MEP requires to keep the MEP active. The receiving MEP parses the TLV and updates the loss threshold value, but only if the new threshold value is greater than the locally configured threshold value. You can control the transmission of the loss threshold TLV in continuity check messages PDUs. The <b>convey-loss-threshold</b> statement specifies that the loss threshold TLV must be transmitted as part of the continuity check messages. If the statement is not specified, continuity check messages transmit this TLV only when a unified ISSU is in progress.</p> |

| Release Information      | Statement introduced in Junos OS Release 17.2R1 for MX Series routers.                                                                                                                                                                                                                                                                         |
| Description              | Enables enhanced CFM mode. When you enable enhanced CFM mode, Junos OS supports 32,000 maintenance association end points (MEPs) and maintenance intermediate points (MIPs) each per chassis for bridge, VPLS, L2VPN, and CCC domains. To support enhanced CFM mode, configure the network services mode on the router as <b>enhanced-ip</b> . |
|                          | <div> <b>NOTE:</b> After enabling CFM mode, restart CFM for the changes to take effect. If you do not restart CFM, CFM automatically restarts after 1 minute.</div>                                                                                           |
| Required Privilege Level | Routing                                                                                                                                                                                                                                                                                                                                        |

| Release Information      | Statement introduced in Junos OS Release 17.2R1 for MX Series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Description              | Enables damping of jnxSoamPmThresholdCrossingAlarm traps sent to the network management system (NMS) by summarizing the flap occurrences over a period of time and sends a single jnxSoamPmThresholdFlapAlarm notification to the NMS. You can enable damping at the global level for the iterator or you can enable damping at the individual threshold type of an iterator. You can specify the duration of time for summarizing flap occurrences.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | <p>For Ethernet interfaces on Enhanced and Enhanced Queuing Dense Port Concentrators (DPCs) in MX Series routers only, enable hardware-assisted timestamping support for Ethernet frame delay measurement.</p> <p>By default, the ETH-DM feature calculates frame delays using software-based timestamping of the ETH-DM PDU frames sent and received by the MEPs in the session. As an option that can increase the accuracy of ETH-DM calculations when the DPC is loaded with heavy traffic in the receive direction, you can enable hardware-assisted timestamping of session frames in the receive direction.</p> |

| <b>Description</b>         | <p>For Ethernet interfaces on Modular Port Concentrators (MPCs) in MX Series routers only, delegate the transmission of the continuity check messages (CCMs) to the forwarding ASIC (that is, to the hardware) by enabling inline transmission of CCMs. Inline transmission of CCMs is also known as Inline-KA.</p> <p>By default, CCMs are transmitted by the CPU of the MPC and not by the hardware. If the duration between transmissions of CCMs is low or if the CCMs for a specific line card scale, we recommend that you enable delegation of the transmission of CCMs to the hardware. By enabling inline transmission of CCMs, you can achieve maximum scaling of CCMs.</p> <p> <b>NOTE:</b> Starting in Junos OS Release 16.1R1, the inline support for 1s interval is supported on MPC1 to MPC7 (except MPC3 and MPC4) line cards.</p> |
| <b>Default</b>             | Inline transmission is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>             | <p><b>enable</b>—Enable inline transmission of CCMs.</p> <p> <b>NOTE:</b> Inline transmission of CCMs is not enabled when there is a CFM session already established. To enable inline transmission, you must first deactivate the CFM session using the <code>deactivate</code> command and then reactivate the CFM session using the <code>activate</code> command.</p> <p><b>disable</b>—Disable inline transmission of CCMs.</p> <p> <b>NOTE:</b> After disabling inline transmission of CCMs, you must reboot the router for the changes to take effect.</p>                                                                                                                                                                                               |

## hold-interval (OAM)

**Syntax** hold-interval *minutes*;

**Hierarchy Level** [edit protocols oam ethernet connectivity-fault-management maintenance-domain *domain-name* maintenance-association *ma-name* **continuity-check**]

**Release Information** Statement introduced in Junos OS Release 8.4.  
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.

**Description** The time to wait in minutes before flushing the maintenance association end point (MEP) database, if no updates occur. The configurable range is 1 minute through 30240 minutes. The default value is 10 minutes.

**NOTE:** Hold timer based flushing is applicable only for auto discovered remote MEPs and not for statically configured remote MEPs.

**Options** *minutes*—Time to wait, in minutes.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 17.3R1 for MX Series Routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | <p>Configure CFM to propagate the status of the provider edge device via the remote defect indication (RDI) bit in the CC messages when the interface is down. When the status of the EVPN provider edge device is standby, the EVPN VPWS service is notified and it sets the interface status to CCC-down. When the interface status is CCC-down, it indicates that the provider edge service is down. When you enable CFM monitoring, CFM propagates the status of the provider edge device via the remote defect indication (RDI) bit in the CC messages. Thus, the customer edge device is aware that the provider edge device is down.</p> <p>Usually, when the interface goes down, CFM propagates the status of the provider edge device via the interface status TLV. If the customer edge device does not support the interface status TLV, you can use the RDI bit to propagate the status of the provider edge device.</p> |

| Description         | <p>Configure the interval between successive transmissions of continuity check messages (CCMs) as part of the connectivity fault detection strategy. When the receiving maintenance association end point (MEP) does not receive a CCM at the configured interval, the <b>loss-threshold</b> statement determines how many CCMs can be lost before the sending MEP is marked as down. The <b>hold-interval</b> statement then determines the frequency at which the database of MEPs in the maintenance association (MA) is flushed in the absence of updates.</p> <p>During a unified in-service software upgrade (ISSU), Junos OS connectivity fault management (CFM) works when the peer device is not a Juniper Networks router. Interoperating with the router of another vendor, the Juniper Networks router retains session information and continues to transmit CCM (continuity check message) PDUs during the unified ISSU upgrade. For this feature to work, you must enable Packet Forwarding Engine keepalives with the <b>hardware-assisted-keepalives</b> statement, and configure the interval between CCMs to be 1 second with <b>interval</b> statement.</p> |
|                     | <p> <b>NOTE:</b> For the continuity check message interval to be configured for 10 milliseconds, periodic packet management (PPM) runs on the Routing Engine and Packet Forwarding Engine by default. You can disable PPM only on the Packet Forwarding Engine. To disable PPM on the Packet Forwarding Engine, use the <b>no-delegate-processing</b> statement at the <code>[edit routing-options ppm]</code> hierarchy level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                     | <p> <b>NOTE:</b> A continuity check interval of 10 milliseconds is not supported for CFM sessions over a label-switched interface (LSI).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## interval (CFM MEP)

**Syntax** interval (1m | 1s);

**Hierarchy Level** [edit protocols oam ethernet connectivity-fault-management action-profile  
*action-profile-name* action log-and-generate-ais]

**Release Information** Statement introduced in Junos OS Release 14.2.

**Description** Configure the interval between AIS messages that are to be received by the MEP as either 1 minute or 1 second.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## maintenance-domain

**Syntax**

```

maintenance-domain domain-name {
 bridge-domain name <vlan-id [vlan-ids]>;
 instance vpls-instance-name;
 level number;
 maintenance-association ma-name {
 protect-maintenance-association protect-ma-name;
 remote-maintenance-association remote-ma-name;
 short-name-format (character-string | vlan | 2octet | rfc-2685-vpn-id);
 continuity-check {
 hold-interval minutes;
 interval (10m | 10s | 1m | 1s | 100ms);
 loss-threshold number
 }
 mep mep-id {
 auto-discovery;
 direction (up | down);
 interface interface-name (protect | working);
 lowest-priority-defect (all-defects | err-xcon | mac-rem-err-xcon | no-defect |
 rem-err-xcon | xcon);
 priority number;
 remote-mep mep-id {
 action-profile profile-name;
 sla-iterator-profile profile-name {
 data-tlv-size size;
 iteration-count count-value;
 priority priority-value;
 }
 }
 }
 }
 mip-half-function (none | default | explicit);
 name-format (character-string | none | dns | mac+2oct);
}
virtual-switch name {
 bridge-domain name <vlan-id [vlan-ids]>;
}
}

```

**Hierarchy Level** [edit protocols **oam ethernet connectivity-fault-management**]

**Release Information** Statement introduced in Junos OS Release 8.4.  
Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.  
Support for multiple down MEP introduced in Junos OS Release 15.1R1 for MX Series Routers.

**Description** Configure the name of the maintenance domain in IEEE-compliant format.

**NOTE:** For MX Series Routers, you can configure multiple down MEPs for a single instance of maintenance domain identifier and maintenance association name to monitor services provided on Virtual Private LAN Service (VPLS), bridge, circuit cross-connect (CCC), and IPv4 domains.

**Options**    *domain-name*—Name of the maintenance domain.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege**    interface—To view this statement in the configuration.  
**Level**    interface-control—To add this statement to the configuration.

- [Configuring a MEP to Generate and Respond to CFM Protocol Messages on page 551](#)

## measurement-interval

---

**Syntax**    measurement-interval (5|15|30|60)

**Hierarchy Level**    [edit protocols oam ethernet cfm performance-monitoring]  
[edit protocols oam ethernet cfm performance-monitoring sla-iterator-profiles *profile-name*]

### Release Information

**Description**    Configure measurement interval to be used for a performance monitoring session. You must configure the measurement-interval at the [edit protocols oam ethernet cfm performance-monitoring] hierarchy level, which is a global level parameter. You can override the configured value by specifying a measurement-interval for the iterator profile at the [edit protocols oam ethernet cfm performance-monitoring sla-iterator-profiles *profile-name*] hierarchy level.

**NOTE:** When you configure when MEF-36-compliant performance monitoring, you must also configure an enhanced-sla-iterator at the [edit protocols oam ethernet cfm performance-monitoring] hierarchy level.

---

**Default**    15 minutes

**Required Privilege Level**    configure—To enter configuration mode.  
control—To modify any configuration.

## performance-monitoring

**Syntax**

```
performance-monitoring {
 delegate-server-processing;
 hardware-assisted-timestamping;
 hardware-assisted-keepalives;
 sla-iterator-profiles {
 profile-name {
 avg-fd-twoway-threshold;
 avg-ifdv-twoway-threshold;
 avg-flr-forward-threshold;
 avg-flr-backward-threshold;
 disable;
 calculation-weight {
 delay delay-weight;
 delay-variation delay-variation-weight;
 }
 cycle-time milliseconds;
 iteration-period connections;
 measurement-type (loss | statistical-frame-loss | two-way-delay);
 }
 }
}
```

**Hierarchy Level** [edit protocols [oam](#) [ethernet](#) [connectivity-fault-management](#)]

**Release Information** Statement introduced in Junos OS Release 9.5.

**Description** Specify performance monitoring support for Ethernet frame delay measurement.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** Configure—To enter configuration mode.  
Control—To modify any configuration.

| <b>Description</b>              | <p>Configures Junos OS to send the sender ID TLV along with the packets. The sender ID TLV is an optional TLV that is sent in continuity check messages (CCMs), loopback messages, and Link Trace Messages (LTMs), as specified in the IEEE 802.1ag standard. TLVs (type, length, and value) are described in the IEEE 802.1ag standard for Connectivity Fault Management (CFM) as a method of encoding variable-length and optional information in a protocol data unit (PDU).</p> |

## sla-iterator-profiles

**Syntax**

```
sla-iterator-profiles {
 profile-name {
 avg-fd-twoway-threshold;
 avg-ifdv-twoway-threshold;
 avg-flr-forward-threshold;
 avg-flr-backward-threshold;
 calculation-weight {
 delay delay-weight;
 delay-variation delay-variation-weight;
 }
 cycle-time milliseconds;
 flap-trap-monitor seconds
 iteration-period iteration-period-value;
 measurement-type (loss | statistical-frame-loss | two-way-delay);
 }
}
```

**Hierarchy Level** [edit protocols [oam](#) [ethernet](#) [connectivity-fault-management](#) [performance-monitoring](#)]

**Release Information** Statement introduced in Junos OS Release 11.1.

**Description** Configure an iterator application and specify the iterator profile options.

**Options** *profile-name*—Name of the iterator profile. For more information about configuring the iterator profile, see [“Configuring an Iterator Profile” on page 692](#).

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** Configure—To enter configuration mode.  
Control—To modify any configuration.

| Description              | Specify aggregated Ethernet logical interface number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Options                  | <p><b>bundle</b>—Join an aggregated Ethernet interface.</p> <p><b>ae <i>interface-number</i></b>—Aggregated Ethernet logical interface number. For MX Series routers running Junos release 14.2R3 and later you can configure a maximum of 1000 aggregated interfaces. On MX2010 and MX2020 routers you can configure a maximum of 800 aggregated interfaces.</p> <p><b>primary   backup</b>—For link protection configurations, specify the link as primary link or backup link for egress traffic.</p> <p><b>lacp</b>—Configure Link Aggregation Control Protocol. Specify the port priority in the range 0 through 65535. Default port-priority is 127.</p> <p><b>link-index</b>—Specify the desired child link index within the aggregated Ethernet Interface. Index number of the logical interface reflects its initialization sequence.</p> <p><b>distribution-list</b>—For targeted distribution, specify the distribution list to which the interface belongs.</p> |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Description</b>         | <p>For Gigabit Ethernet intelligent queuing (IQ) interfaces only, accept traffic from and to the specified remote media access control (MAC) address.</p> <p>The <b>accept-source-mac</b> statement is equivalent to the <b>source-address-filter</b> statement, which is valid for aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only. To allow the interface to receive packets from specific MAC addresses, include the <b>accept-source-mac</b> statement.</p> <p>On untagged Gigabit Ethernet interfaces, you should not configure the <b>source-address-filter</b> statement and the <b>accept-source-mac</b> statement simultaneously. On tagged Gigabit Ethernet interfaces, you should not configure the <b>source-address-filter</b> statement and the <b>accept-source-mac</b> statement with an identical MAC address specified in both filters.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p> |

**NOTE:** The **policer** statement is not supported on PTX Series Packet Transport Routers.

**NOTE:** On QFX platforms, if you configure source MAC addresses for an interface using the *static-mac* or *persistent-learning* statements and later configure a different MAC address for the same interface using the **accept-source-mac** statement, the MAC addresses that you previously configured for the interface remain in the ethernet-switching table and can still be used to send packets to the interface.

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

| Description         | Correct a genuine traffic imbalance by using a feedback mechanism to distribute the traffic across the links of an aggregated Ethernet bundle.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the interface address.

**NOTE:** If you configure the same address on multiple interfaces in the same routing instance, Junos OS uses only the first configuration, and the remaining address configurations are ignored and can leave interfaces without an address. Interfaces that do not have an assigned address cannot be used as a donor interface for an unnumbered Ethernet interface.

For example, in the following configuration the address configuration of interface xe-0/0/1.0 is ignored:

```
interfaces {
 xe-0/0/0 {
 unit 0 {
 family inet {
 address 192.168.1.1/8;
 }
 }
 }
 xe-0/0/1 {
 unit 0 {
 family inet {
 address 192.168.1.1/8;
 }
 }
 }
}
```

For more information on configuring the same address on multiple interfaces, see *Configuring the Interface Address*.

- In Junos OS Release 13.3 and later, when you configure an IPv6 host address and an IPv6 subnet address on an interface, the commit operation fails.
- In releases earlier than Junos OS Release 13.3, when you use the same configuration on an interface, the commit operation succeeds, but only one of the IPv6 addresses that was entered is assigned to the interface. The other address is not applied.

**Options** *address*—Address of the interface.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**NOTE:** The `edit logical-systems` hierarchy is not available on QFabric systems.

| Description         | <p>Specify the action taken by the interface for the specified agent circuit identifier/agent remote identifier (ACI/ARI) pair when the interface receives a PPPoE Active Discovery Initiation (PADI) control packet that includes the vendor-specific tag with ACI/ARI pair information. You can configure an ACI/ARI pair for a named service, <b>empty</b> service, or <b>any</b> service in a PPPoE service name table. A maximum of 8000 ACI/ARI pairs are supported per PPPoE service name table. You can distribute the ACI/ARI pairs in any combination among the named, <b>empty</b>, and <b>any</b> service entries in the service name table.</p> <p>You can use an asterisk (*) as a wildcard character to match ACI/ARI pairs, the ACI alone, or the ARI alone. The asterisk can be placed only at the beginning, the end, or both the beginning and end of the identifier string. You can also specify an asterisk alone for either the ACI or the ARI. You cannot specify only an asterisk for both the ACI and the ARI. When you specify a single asterisk as the identifier, that identifier is ignored in the PADI packet.</p> <p>For example, suppose you care about matching only the ACI and do not care what value the ARI has in the PADI packet, or even whether the packet contains an ARI value. In this case you can set the <b>remote-id-string</b> to a single asterisk. Then the interface ignores the ARI received in the packet and the interface takes action based only on matching the specified ACI.</p> |
| Default             | The default action is terminate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## aggregated-devices

```
Syntax aggregated-devices {
 ethernet {
 device-count number;
 lacp {
 link-protection {
 non-revertive;
 }
 system-priority;
 }
 }
 sonet {
 device-count number;
 }
 maximum-links maximum-links-limit;
}
```

Hierarchy Level [edit chassis]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Support for LACP link protection and system priority introduced in Junos OS Release 9.3.

**Description** Configure properties for aggregated devices on the router. Aggregate Ethernet links are logical interfaces defined on the device that bundle together multiple physical interfaces into a single interface for the use of redundancy and bandwidth aggregation. When interconnecting devices you can create aggregate ethernet interfaces to bundle together multiple physical ethernet links to increase bandwidth and redundancy between devices.

Link aggregation enables you to group Ethernet interfaces to form a single link layer interface. Link Aggregation Control Protocol (LACP) is supported in chassis cluster deployments, where aggregated Ethernet interfaces and redundant Ethernet interfaces are supported simultaneously.

You must first configure the system to enable configuring the Aggregated Ethernet (ae) Interfaces. By default, Juniper devices do not have any aggregated ethernet interfaces created. To configure the device to support a given number of ae interfaces, you must define it on a per chassis basis using the **set chassis aggregated-devices devices {1-32}** in configuration mode. The number of devices you define will be the number of aggregated ethernet interfaces that the system will create which can be configured just like any other ethernet interface. Also you can view the interfaces created by using the **show interface terse** command. Once you have defined the number of aggregated ethernet devices on the chassis you can then continue to configure the LAG members on a per ethernet interface basis.

**Options** The remaining statements are explained separately.

**Hierarchy Level** `[edit system]`

`[edit interfaces interface-name unit logical-unit-number family inet address address],`

`[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family inet address address]`

**NOTE:** The edit logical-systems hierarchy is not available on QFabric systems.

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.  
Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description** For Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only, configure Address Resolution Protocol (ARP) table entries, mapping IP addresses to MAC addresses. You can enable backup VRRP routers to learn ARP requests for VRRP-IP to VRRP-MAC address translation. You can also set the time interval between ARP updates.

**NOTE:** By default, an ARP policer is installed that is shared among all the Ethernet interfaces on which you have configured the family inet statement. By including the arp statement at the `[edit interfaces interface-name unit`

*logical-unit-number* family inet policer] hierarchy level, you can apply a specific ARP-packet policer to an interface. This feature is not available on EX Series switches.

When you need to conserve IP addresses, you can configure an Ethernet interface to be unnumbered by including the unnumbered-address statement at the [edit interfaces *interface-name* unit *logical-unit-number* family inet] hierarchy level.

**NOTE:** For EX-Series switches, set only the time interval between ARP updates.

---

**Options** **ip-address**—IP address to map to the MAC address. The IP address specified must be part of the subnet defined in the enclosing **address** statement.

**mac mac-address**—MAC address to map to the IP address. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, **0000.5e00.5355** or **00:00:5e:00:53:55**.

**multicast-mac mac-address**—Multicast MAC address to map to the IP address. Specify the multicast MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, **0000.5e00.5355** or **00:00:5e:00:53:55**.

**publish**—(Optional) Have the router or switch reply to ARP requests for the specified IP address. If you omit this option, the router or switch uses the entry to reach the destination but does not reply to ARP requests.

**NOTE:** For unicast MAC addresses only, if you include the **publish** option, the router or switch replies to proxy ARP requests.

---

**aging-timer**—Time interval in minutes between ARP updates. In environments where the number of ARP entries to update is high (for example, on routers only, metro Ethernet environments), increasing the time between updates can improve system performance.

**gratuitous-arp-delay**—(T Series only) Configure a delay for gratuitous ARP requests at the system level. By default, Junos OS sends gratuitous ARP requests immediately after network-related configuration changes are made on an interface (for example, a VLAN ID, MAC address, or IP address change). This might lead to the Packet Forwarding Engine dropping some initial request packets if the configuration updates have not been fully processed. To avoid such request packets being dropped, you can configure a delay in gratuitous ARP requests.

**Values:**

- *seconds*—Configure the ARP request delay in seconds. We recommend configuring a value in the range of 3 through 6 seconds.

**gratuitous-arp-on-ifup**—(ACX Series, SRX Series, T Series only) Add this statement to the **[edit system arp]** hierarchy to configure Junos OS to automatically issue a gratuitous ARP announcement when an interface is online.

**interfaces**—(T Series only) Specify the ARP aging timer in minutes for a logical interface of family type **inet**.

**Values:** aging-timer *minutes*—Time between ARP updates, in minutes.

**Default:** 20

**Range:** 1 through 6,00,000

**passive-learning**—(M Series, MX Series, PTX Series, SRX Series, T Series only) Configure backup VRRP routers or switches to learn the ARP mappings (IP-to-MAC address) for hosts sending the requests. By default, the backup VRRP router drops these requests; therefore, if the master router fails, the backup router must learn all entries present in the ARP cache of the master router. Configuring passive learning reduces transition delay when the backup router is activated. Learning of ARP mappings (IP-to-MAC address) by backup VRRP routers or switches for hosts sending the requests is disabled unless this statement is configured.

**purging**—(M Series, MX Series, PTX Series, SRX Series, T Series only) Purge obsolete ARP entries from the cache when an interface or link goes offline.

| <b>Release Information</b>       | Statement introduced in Junos OS Release 7.6.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.<br>Statement introduced in Junos OS Releases 18.4R1S2, 18.4R2, and 19.2R1 and later for ACX5448 Universal Metro Routers.                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>               | <p>For Gigabit Ethernet interfaces on M Series, MX Series, T Series, TX Matrix routers, and ACX Series routers explicitly enable autonegotiation and remote fault. For EX Series switches, explicitly enable autonegotiation only.</p> <ul style="list-style-type: none"> <li>• <b>auto-negotiation</b>—Enables autonegotiation. This is the default.</li> <li>• <b>no-auto-negotiation</b>—Disable autonegotiation. When autonegotiation is disabled, you must explicitly configure the link mode and speed.</li> </ul> <p>When you configure Tri-Rate Ethernet copper interfaces to operate at 1 Gbps, autonegotiation must be enabled.</p> |

**NOTE:** On EX Series switches, an interface configuration that disables autonegotiation and manually sets the link speed to 1 Gbps is accepted when you commit the configuration; however, if the interface you are configuring is a Tri-Rate Ethernet copper interface, the configuration is ignored as invalid and autonegotiation is enabled by default.

To correct the invalid configuration and disable autonegotiation:

1. Delete the **no-auto-negotiation** statement and commit the configuration.
2. Set the link speed to 10 or 100 Mbps, set **no-auto-negotiation**, and commit the configuration.

On EX Series switches, if the link speed and duplex mode are also configured, the interfaces use the values configured as the desired values in the negotiation. If autonegotiation is disabled, the link speed and link mode must be configured.

**NOTE:** On T4000 routers, the `auto-negotiation` command is ignored for interfaces other than Gigabit Ethernet.

**NOTE:** On ACX Series routers, when you configure fiber interfaces (fiber media mode) to operate at 1 Gbps, autonegotiation is enabled by default to negotiate the speed and duplex settings. You can disable autonegotiation by using the `(no-auto-negotiation)` statement, and commit the configuration. in the fiber media mode. In copper interfaces (copper media mode), autonegotiation is enabled by default. To disable autonegotiation, you need to explicitly configure the link speed to 10 or 100 Mbps, set `no-auto-negotiation`, and commit the configuration.

**Default** Autonegotiation is automatically enabled. No explicit action is taken after the autonegotiation is complete or if the negotiation fails.

**Options** `remote-fault (local-interface-online | local-interface-offline)`—(Optional) For M Series, MX Series, T Series, TX Matrix routers, and ACX Series routers only, manually configure remote fault on an interface.

**Default:** `local-interface-online`

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## bfd-liveness-detection (LAG)

**Syntax**

```

bfd-liveness-detection {
 authentication {
 algorithm algorithm-name;
 key-chain key-chain-name;
 loose-check;
 }
 detection-time {
 threshold milliseconds;
 }
 holddown-interval milliseconds;
 local-address bfd-local-address;
 minimum-interval milliseconds;
 minimum-receive-interval milliseconds;
 multiplier number;
 neighbor bfd-neighbor-address;
 no-adaptation;
 transmit-interval {
 minimum-interval milliseconds;
 threshold milliseconds;
 }
 version (1 | automatic);
}

```

**Hierarchy Level** [edit interfaces *aex* aggregated-ether-options]

**Release Information** Statement introduced in Junos OS Release 13.3.

**Description** Configure Bidirectional Forwarding Detection (BFD) timers and authentication for aggregated Ethernet interfaces.

**Options** **holddown-interval *milliseconds***— Specify a time limit, in milliseconds, indicating the time that a BFD session remains up before a state change notification is sent. If the BFD session goes down and then comes back up during the hold-down interval, the timer is restarted.

**Range:** 0 through 255,000

**Default:** 0

**local-address *bfd-local-address***— Specify the loopback address or the AE interface address of the source of the BFD session.

**NOTE:** Beginning with Release 16.1R2, Junos OS checks and validates the configured micro BFD *local-address* against the interface or loopback IP address before the configuration commit. Junos OS performs this

check on both IPv4 and IPv6 micro BFD address configurations, and if they do not match, the commit fails.

**minimum-interval *milliseconds***— Specify a minimum time interval after which the local routing device transmits a BFD packet and then expects to receive a reply from the BFD neighbor. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the **transmit-interval minimum-interval** statement.

**Range:** 1 through 255,000

**minimum-receive-interval *milliseconds***— Specify the minimum time interval after which the routing device expects to receive a reply from the BFD neighbor.

**Range:** 1 through 255,000

**multiplier *number***— Specify the number of BFD packets that were not received by the BFD neighbor before the originating interface is declared down.

**Range:** 1 through 255

**neighbor *bfd-neighbor-address***— Specify the loopback address or the AE interface address of a remote destination to send BFD packets.

**no-adaptation**— Disable the BFD adaptation. Include this statement if you do not want the BFD sessions to adapt to changing network conditions. We recommend that you do not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

**version**— Configure the BFD version to detect (BFD version 1) or autodetect (the BFD version).

**NOTE:** The version option is not supported on the QFX Series.

**Default:** automatic

The remaining statements are explained separately. See [CLI Explorer](#).

| <b>Description</b>              | <p>Disable distributed periodic packet management (PPM) processing for Link Aggregation Control Protocol (LACP) packets and run all PPM processing for LACP packets on the Routing Engine.</p> <p>This statement disables distributed PPM processing for only LACP packets. You can disable distributed PPM processing for all packets that use PPM and run all PPM processing on the Routing Engine by configuring the <b>no-delegate-processing</b> statement in the [edit routing-options ppm] hierarchy.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 20px;">  <p><b>BEST PRACTICE:</b> We generally recommend that you disable distributed PPM only if Juniper Networks Customer Service advises you to do so. You should disable distributed PPM only if you have a compelling reason to disable it.</p> </div> |
| <b>Default</b>                  | Distributed PPM processing is enabled for all packets that use PPM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers. Statement introduced in Junos OS Release 17.3R1 for MX10003 Universal Routing Platforms.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | <p>Specifies the connectivity association key name (CKN) for a pre-shared key.</p> <p>A pre-shared key includes a CKN and a connectivity association key (CAK). A pre-shared key is exchanged between two devices at each end of a point-to-point link to enable MACsec using dynamic security keys. The MACsec Key Agreement (MKA) protocol is enabled once the pre-shared keys are successfully exchanged. The pre-shared key—the CKN and CAK—must match on both ends of a link</p>                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Default</b>                  | No CKN exists, by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                  | <p><b><i>hexadecimal-number</i></b>—The key name, in hexadecimal format.</p> <p>The key name is 32 hexadecimal characters in length. If you enter a key name that is less than 32 characters long, the remaining characters are set to 0.</p> <ul style="list-style-type: none"> <li>On MX10003 router, if you configure the length of CKN to the value less than 64 hexadecimal digits, then the following warning message is displayed:           <p><b>warning: To maximize security, recommend configuring all 64 digits of pre-shared-key ckn</b></p> </li> <li>On MX10003 router, if you configure the length of CKN to an odd value, then the commit will not be successful and the following error message is displayed:           <p><b>error: ckn: 'abcde': Must be an even-length string up to 64 hexadecimal digits (0-9, a-f, A-F)</b></p> </li> </ul> |

```

**Hierarchy Level** [edit security macsec]

**Release Information** Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.

**Description** Create or configure a MACsec connectivity association.

A connectivity association is not applying MACsec to traffic until it is associated with an interface. MACsec connectivity associations are associated with interfaces using the **interfaces** statement in the **[edit security macsec]** hierarchy.

**Default** No connectivity associations are present, by default.

**Options** ***connectivity-association-name***—Name of the MACsec connectivity association.  
**Range:** 1 through 32 alphanumeric characters. Allowed characters are [a-z, A-Z, 0-9]

The remaining statements are explained separately.

Hierarchy Level [edit protocols [oam](#) ethernet]

Release Information Statement introduced in Junos OS Release 8.4.

**Description** For Ethernet interfaces on M7i and M10i routers with Enhanced CFEB (CFEB-E), and on M120, M320, MX Series, and T Series routers, specify connectivity fault management for IEEE 802.1ag Operation, Administration, and Management (OAM) support. In Junos OS Release 9.3 and later, this statement is also supported on aggregated Ethernet interfaces.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## control-channel

**Syntax**

```
control-channel channel-name {
 vlan vlan-id;
 interface name interface-name
}
```

**Hierarchy Level** [edit protocols [protection-group ethernet-ring name](#) ([east-interface](#) | [west-interface](#))]

**Release Information** Statement introduced in Junos OS Release 9.4.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.  
Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.

**Description** Configure the Ethernet RPS control channel logical interface to carry the RAPS PDU. The related physical interface is the physical ring port.

**Options** **vlan *vlan-id***—If the control channel logical interface is a trunk port, then a dedicated **vlan *vlan-id*** defines the dedicated VLAN channel to carry the RAPS traffic. Only configure the **vlan-id** when the control channel logical interface is the trunk port.

**interface name *interface-name***—Interface name of the control channel.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure the number of aggregated logical devices available to the router.</p> <p>Starting in Junos release 14.2, for MX series routers, aggregated Ethernet interfaces created under a logical system can be individually named. Prior to 14.2, ae interfaces were named automatically (AE1, AE2) etc. upon setting the device count. This change allows administrators to use custom naming schemes. System resources are only allocated for named ae interfaces, regardless of how many were declared in the device count. (In Junos 14.2 and earlier, ae naming occurred automatically up to the number specified for device count, and system resources were allocated whether a given ae interface was used or not.)</p> |
| <b>Options</b>                  | <p><i>number</i>—Set the number of aggregated logical devices that will be available for configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|                                 | <p> <b>NOTE:</b> Starting with Junos OS Release 13.2, a maximum of 64 aggregated interfaces are supported for link aggregation of SONET/SDH interfaces. In releases before Junos OS Release 13.2, a maximum of 16 aggregated interfaces are supported for link aggregation of SONET/SDH interfaces.</p> <p>For Junos OS Evolved, you can specify up to 512 aggregated Ethernet devices.</p>                                                                                                                                                                                                                                                     |

| Release Information      | Statement introduced in Junos OS Release 10.0.<br>Support at [edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i> <b>agent-specifier</b> aci <i>circuit-id-string</i> ari <i>remote-id-string</i> ] hierarchy level introduced in Junos OS Release 10.2.                                                                                                                                              |
| Description              | Direct the router to drop (ignore) a PPPoE Active Discovery Initiation (PADI) control packet received from a PPPoE client that contains the specified service name tag or agent circuit identifier/agent remote identifier (ACI/ARI) information. This action effectively denies the client's request to provide the specified service, or to accept requests from the subscriber or subscribers represented by the ACI/ARI information. |

| <b>Description</b>              | <p>Specify a dynamic profile to instantiate a dynamic PPPoE interface. You can associate a dynamic profile with a named service entry, <b>empty</b> service entry, or <b>any</b> service entry configured in a PPPoE service name table, or with an agent circuit identifier/agent remote identifier (ACI/ARI) pair defined for these services.</p> <p>The dynamic profile associated with a service entry in a PPPoE service name table overrides the dynamic profile associated with the PPPoE underlying interface on which the dynamic PPPoE interface is created.</p> <p>If you include the <b>dynamic-profile</b> statement at the <code>[edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i> <b>agent-specifier</b> aci <i>circuit-id-string</i> ari <i>remote-id-string</i>]</code> hierarchy level, you cannot also include the <b>static-interface</b> statement at this level. The <b>dynamic-profile</b> and <b>static-interface</b> statements are mutually exclusive for ACI/ARI pair configurations.</p> |
| <b>Options</b>                  | <b><i>profile-name</i></b> —Name of the dynamic profile that the router uses to instantiate a dynamic PPPoE interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## east-interface

**Syntax**

```
east-interface {
 node-id mac-address;
 control-channel channel-name {
 vlan number;
 interface name interface-name
 }
 interface-none
 ring-protection-link-end;
}
```

**Hierarchy Level** [edit protocols [protection-group ethernet-ring ring-name](#)]

**Release Information** Statement introduced in Junos OS Release 9.4.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.  
Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.

**Description** Define one of the two interface ports for Ethernet ring protection, the other being defined by the **west-interface** statement at the same hierarchy level. The interface must use the control channel's logical interface name. The control channel is a dedicated VLAN channel for the ring port.

EX Series switches do not use the node-id statement--the node ID is automatically configured on the switches using the MAC address.

**NOTE:** Always configure this port first, before configuring the **west-interface** statement.

**NOTE:** The Node ID is not configurable on EX Series switches. The node ID is automatically configured using the MAC address.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers ( <b>ethernet</b> , <b>vlan-ccc</b> , and <b>vlan-tcc</b> options only).<br>Statement introduced in Junos OS Release 12.2 for the ACX Series Universal Metro Routers. Only the <b>atm-ccc-cell-relay</b> and <b>atm-ccc-vc-mux</b> options are supported on ACX Series routers.<br>Statement introduced in Junos OS Release 17.3R1 for QFX10000 Series switches ( <b>ethernet-ccc</b> and <b>vlan-ccc</b> options only).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>         | Configure a logical link-layer encapsulation type. Not all encapsulation types are supported on the switches. See the switch CLI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>             | <p><b>atm-ccc-cell-relay</b>—Use ATM cell-relay encapsulation.</p> <p><b>atm-ccc-vc-mux</b>—Use ATM virtual circuit (VC) multiplex encapsulation on CCC circuits. When you use this encapsulation type, you can configure the <b>ccc</b> family only.</p> <p><b>atm-cisco-nlpid</b>—Use Cisco ATM network layer protocol identifier (NLPID) encapsulation. When you use this encapsulation type, you can configure the <b>inet</b> family only.</p> <p><b>atm-mlppp-llc</b>—For ATM2 IQ interfaces only, use Multilink Point-to-Point (MLPPP) over AAL5 LLC. For this encapsulation type, your router must be equipped with a Link Services or Voice Services PIC. MLPPP over ATM encapsulation is not supported on ATM2 IQ OC48 interfaces.</p> <p><b>atm-nlpid</b>—Use ATM NLPID encapsulation. When you use this encapsulation type, you can configure the <b>inet</b> family only.</p> <p><b>atm-ppp-llc</b>—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over AAL5 LLC encapsulation.</p> |

**atm-ppp-vc-mux**—(ATM2 IQ interfaces and MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP only) Use PPP over ATM AAL5 multiplex encapsulation.

**atm-snap**—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM subnetwork attachment point (SNAP) encapsulation.

**atm-tcc-snap**—Use ATM SNAP encapsulation on translational cross-connect (TCC) circuits.

**atm-tcc-vc-mux**—Use ATM VC multiplex encapsulation on TCC circuits. When you use this encapsulation type, you can configure the **tcc** family only.

**atm-vc-mux**—(All interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) Use ATM VC multiplex encapsulation. When you use this encapsulation type, you can configure the **inet** family only.

**ether-over-atm-llc**—(All IP interfaces including MX Series routers with MPC/MIC interfaces using the ATM MIC with SFP) For interfaces that carry IP traffic, use Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces.

**ether-vpls-over-atm-llc**—For ATM2 IQ interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

**ether-vpls-over-fr**—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Frame Relay encapsulation to support Bridged Ethernet over Frame Relay encapsulated TDM interfaces for VPLS applications, per RFC 2427, *Multiprotocol Interconnect over Frame Relay*.

**NOTE:** The SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, the Channelized SONET/SDH OC3/STM1 (Multi-Rate) MIC with SFP, and the DS3/E3 MIC do not support Ethernet over Frame Relay encapsulation.

**ether-vpls-over-ppp**—For E1, T1, E3, T3, and SONET interfaces only, use the Ethernet virtual private LAN service (VPLS) over Point-to-Point Protocol (PPP) encapsulation to support Bridged Ethernet over PPP-encapsulated TDM interfaces for VPLS applications.

**ethernet**—Use Ethernet II encapsulation (as described in RFC 894, *A Standard for the Transmission of IP Datagrams over Ethernet Networks*).

**ethernet-ccc**—Use Ethernet CCC encapsulation on Ethernet interfaces.

**ethernet-vpls**—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard Tag Protocol ID (TPID) values.

**NOTE:** The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

**ethernet-vpls-fr**—Use in a VPLS setup when a CE device is connected to a PE router over a time-division multiplexing (TDM) link. This encapsulation type enables the PE router to terminate the outer layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.

**frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**frame-relay-ether-type**—Use Frame Relay ether type encapsulation for compatibility with Cisco Frame Relay. The physical interface must be configured with flexible-frame-relay encapsulation.

**frame-relay-ether-type-tcc**—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. The physical interface must be configured with flexible-frame-relay encapsulation.

**frame-relay-ppp**—Use PPP over Frame Relay circuits. When you use this encapsulation type, you can configure the **ppp** family only.

**frame-relay-tcc**—Use Frame Relay encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the **tcc** family only.

**gre-fragmentation**—For adaptive services interfaces only, use GRE fragmentation encapsulation to enable fragmentation of IPv4 packets in GRE tunnels. This encapsulation clears the do not fragment (DF) bit in the packet header. If the packet's size exceeds the tunnel's maximum transmission unit (MTU) value, the packet is fragmented before encapsulation.

**multilink-frame-relay-end-to-end**—Use MLFR FRF.15 encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

**multilink-ppp**—Use MLPPP encapsulation. This encapsulation is used only on multilink, link services, and voice services interfaces and their constituent T1 or E1 interfaces.

**ppp-over-ether**—Use PPP over Ethernet encapsulation to configure an underlying Ethernet interface for a dynamic PPPoE logical interface on M120 and M320 routers with Intelligent Queuing 2 (IQ2) PICs, and on MX Series routers with MPCs.

**ppp-over-ether-over-atm-llc**—(MX Series routers with MPCs using the ATM MIC with SFP only) For underlying ATM interfaces, use PPP over Ethernet over ATM LLC encapsulation. When you use this encapsulation type, you cannot configure the interface address. Instead, configure the interface address on the PPP interface.

**vlan-bridge**—Use Ethernet VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q tagging, flexible-ethernet-services, and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

**vlan-ccc**—Use Ethernet virtual LAN (VLAN) encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**vlan-vci-ccc**—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**vlan-tcc**—Use Ethernet VLAN encapsulation on TCC circuits. When you use this encapsulation type, you can configure the **tcc** family only.

**vlan-vpls**—Use Ethernet VLAN encapsulation on VPLS circuits.

**vxlan**—Use VXLAN data plane encapsulation for EVPN.

| <b>Description</b>                                                                           | <p>For M Series, MX Series, QFX Series, T Series, PTX Series, specify the physical link-layer encapsulation type.</p> <p>For SRX Series, specify logical link layer encapsulation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**NOTE:** Not all encapsulation types are supported on the switches. See the switch CLI.

**Default** `ppp`—Use serial PPP encapsulation.

**Physical Interface  
Options and Logical  
Interface Options**

[Warning: element unresolved in stylesheets: <title> (in <config-options>). This is probably a new element that is not yet supported in the stylesheets.]

Physical Interface Options and Logical Interface Options

For physical interfaces:

**NOTE:** Frame Relay, ATM, PPP, SONET, and SATSOP options are not supported on EX Series switches.

---

- **atm-ccc-cell-relay**—Use ATM cell-relay encapsulation.
- **atm-pvc**—Defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*. When you configure physical ATM interfaces with ATM PVC encapsulation, an RFC 2684-compliant ATM Adaptation Layer 5 (AAL5) tunnel is set up to route the ATM cells over a Multiprotocol Label Switching (MPLS) path that is typically established between two MPLS-capable routers using the Label Distribution Protocol (LDP).
- **cisco-hdlc**—Use Cisco-compatible High-Level Data Link Control (HDLC) framing. E1, E3, SONET/SDH, T1, and T3 interfaces can use Cisco HDLC encapsulation. Two related versions are supported:
  - CCC version (**cisco-hdlc-ccc**)—The logical interface does not require an encapsulation statement. When you use this encapsulation type, you can configure the **ccc** family only.
  - TCC version (**cisco-hdlc-tcc**)—Similar to CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.
- **cisco-hdlc-ccc**—Use Cisco-compatible HDLC framing on CCC circuits.
- **cisco-hdlc-tcc**—Use Cisco-compatible HDLC framing on TCC circuits for connecting different media.
- **ethernet-bridge**—Use Ethernet bridge encapsulation on Ethernet interfaces that have bridging enabled and that must accept all packets.
- **ethernet-over-atm**—For interfaces that carry IPv4 traffic, use Ethernet over ATM encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces. As defined in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*, this encapsulation type allows ATM interfaces to connect to devices that support only bridge protocol data units (BPDUs). Junos OS does not completely support bridging, but accepts BPDUs packets as a default gateway. If you use the router as an edge device, then the router acts as a default gateway. It accepts Ethernet LLC/SNAP frames with IP or ARP in the payload, and drops the rest. For packets destined to the Ethernet LAN, a route lookup is done using the destination IP address. If the route lookup yields a full address match, the packet is encapsulated with an LLC/SNAP and MAC header, and the packet is forwarded to the ATM interface.
- **ethernet-tcc**—For interfaces that carry IPv4 traffic, use Ethernet TCC encapsulation on interfaces that must accept packets carrying standard TPID values. For 8-port, 12-port, and 48-port Fast Ethernet PICs, TCC is not supported.

- **ethernet-vpls**—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard TPID values. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.
- **ethernet-vpls-fr**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.
- **ethernet-vpls-ppp**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 PPP connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use it to forward the packet into a given VPLS instance.
- **ether-vpls-over-atm-llc**—For ATM intelligent queuing (IQ) interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.
- **extended-frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to CCC. When you use this encapsulation type, you can configure the **ccc** family only.
- **extended-frame-relay-ether-type-tcc**—Use extended Frame Relay ether type TCC for Cisco-compatible Frame Relay for DLCIs 1 through 1022. This encapsulation type is used for circuits with different media on either side of the connection.
- **extended-frame-relay-tcc**—Use Frame Relay encapsulation on TCC circuits to connect different media. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to TCC.
- **extended-vlan-bridge**—Use extended VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q VLAN tagging and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.
- **extended-vlan-ccc**—Use extended VLAN encapsulation on CCC circuits with Gigabit Ethernet and 4-port Fast Ethernet interfaces that must accept packets carrying 802.1Q values. Extended VLAN CCC encapsulation supports TPIDs 0x8100, 0x9100, and 0x9901. When you use this encapsulation type, you can configure the **ccc** family only. For 8-port, 12-port, and 48-port Fast Ethernet PICs, extended VLAN CCC is not supported. For 4-port Gigabit Ethernet PICs, extended VLAN CCC is not supported.
- **extended-vlan-tcc**—For interfaces that carry IPv4 traffic, use extended VLAN encapsulation on TCC circuits with Gigabit Ethernet interfaces on which you want to use 802.1Q tagging. For 4-port Gigabit Ethernet PICs, extended VLAN TCC is not supported.

- **extended-vlan-vpls**—Use extended VLAN VPLS encapsulation on Ethernet interfaces that have VLAN 802.1Q tagging and VPLS enabled and that must accept packets carrying TPIDs 0x8100, 0x9100, and 0x9901. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

**NOTE:** The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

- **flexible-ethernet-services**—For Gigabit Ethernet IQ interfaces and Gigabit Ethernet PICs with small form-factor pluggable transceivers (SFPs) (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and for Gigabit Ethernet interfaces, use flexible Ethernet services encapsulation when you want to configure multiple per-unit Ethernet encapsulations. Aggregated Ethernet bundles can use this encapsulation type. This encapsulation type allows you to configure any combination of route, TCC, CCC, Layer 2 virtual private networks (VPNs), and VPLS encapsulations on a single physical port. If you configure flexible Ethernet services encapsulation on the physical interface, VLAN IDs from 1 through 511 are no longer reserved for normal VLANs.
- **flexible-frame-relay**—For IQ interfaces only, use flexible Frame Relay encapsulation when you want to configure multiple per-unit Frame Relay encapsulations. This encapsulation type allows you to configure any combination of TCC, CCC, and standard Frame Relay encapsulations on a single physical port. Also, each logical interface can have any DLCI value from 1 through 1022.
- **frame-relay**—Use Frame Relay encapsulation is defined in RFC 1490, *Multiprotocol Interconnect over Frame Relay*. E1, E3, link services, SONET/SDH, T1, T3, and voice services interfaces can use Frame Relay encapsulation.
- **frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation is same as standard Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to CCC. The logical interface must also have **frame-relay-ccc** encapsulation. When you use this encapsulation type, you can configure the **ccc** family only.
- **frame-relay-ether-type**—Use Frame Relay ether type encapsulation for compatibility with the Cisco Frame Relay. IETF frame relay encapsulation identifies the payload format using NLPID and SNAP formats. Cisco-compatible Frame Relay encapsulation uses the Ethernet type to identify the type of payload.

**NOTE:** When the encapsulation type is set to Cisco-compatible Frame Relay encapsulation, ensure that the LMI type is set to ANSI or Q933-A.

- **frame-relay-ether-type-tcc**—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media. This encapsulation is Cisco-compatible Frame Relay for DLCIs 0 through 511. DLCIs 512 through 1022 are dedicated to TCC.

- **frame-relay-port-ccc**—Use Frame Relay port CCC encapsulation to transparently carry all the DLCIs between two customer edge (CE) routers without explicitly configuring each DLCI on the two provider edge (PE) routers with Frame Relay transport. The connection between the two CE routers can be either user-to-network interface (UNI) or network-to-network interface (NNI); this is completely transparent to the PE routers. When you use this encapsulation type, you can configure the **ccc** family only.
- **frame-relay-tcc**—This encapsulation is similar to Frame Relay CCC and has the same configuration restrictions, but used for circuits with different media on either side of the connection.
- **generic-services**—Use generic services encapsulation for services with a hierarchical scheduler.
- **multilink-frame-relay-uni-nni**—Use MLFR UNI NNI encapsulation. This encapsulation is used on link services, voice services interfaces functioning as FRF.16 bundles, and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.
- 
- **ppp**—Use serial PPP encapsulation. This encapsulation is defined in RFC 1661, *The Point-to-Point Protocol (PPP) for the Transmission of Multiprotocol Datagrams over Point-to-Point Links*. PPP is the default encapsulation type for physical interfaces. E1, E3, SONET/SDH, T1, and T3 interfaces can use PPP encapsulation.
- **ppp-ccc**—Use serial PPP encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.
- **ppp-tcc**—Use serial PPP encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the **tcc** family only.
- **vlan-ccc**—Use Ethernet VLAN encapsulation on CCC circuits. VLAN CCC encapsulation supports TPID 0x8100 only. When you use this encapsulation type, you can configure the **ccc** family only.

- **vlan-vci-ccc**—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only. All logical interfaces configured on the Ethernet interface must also have the encapsulation type set to **vlan-vci-ccc**.
- **vlan-vpls**—Use VLAN VPLS encapsulation on Ethernet interfaces with VLAN tagging and VPLS enabled. Interfaces with VLAN VPLS encapsulation accept packets carrying standard TPID values only. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

---

**NOTE:**

- Label-switched interfaces (LSIs) do not support VLAN VPLS encapsulation. Therefore, you can only use VLAN VPLS encapsulation on a PE-router-to-CE-router interface and not a core-facing interface.
  - Starting with Junos OS release 13.3, a commit error occurs when you configure **vlan-vpls** encapsulation on a physical interface and configure **family inet** on one of the logical units. Previously, it was possible to commit this invalid configuration.
- 

For logical interfaces:

- **frame-relay**—Configure a Frame Relay encapsulation when the physical interface has multiple logical units, and the units are either point to point or multipoint.
- **multilink-frame-relay-uni-nni**—Link services interfaces functioning as FRF.16 bundles can use Multilink Frame Relay UNI NNI encapsulation.
- **ppp**—For normal mode (when the device is using only one ISDN B-channel per call). Point-to-Point Protocol is for communication between two computers using a serial interface.
- **ppp-over-ether**—This encapsulation is used for underlying interfaces of pp0 interfaces.

## ethernet-ring

**Syntax**

```
ethernet-ring ring-name {
 control-vlan (vlan-id | vlan-name);
 data-channel {
 vlan number
 }
 east-interface {
 control-channel channel-name {
 vlan number;
 interface name interface-name
 }
 }
 guard-interval number;
 node-id mac-address;
 restore-interval number;
 ring-protection-link-owner;
 west-interface {
 control-channel channel-name {
 vlan number;
 }
 }
}
```

**Hierarchy Level** [edit protocols [protection-group](#)]

**Release Information** Statement introduced in Junos OS Release 9.4.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.  
Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.

**Description** For Ethernet PICs on MX Series routers or for EX Series switches, , specify the Ethernet ring in an Ethernet ring protection switching configuration.

**Options** *ring-name*—Name of the Ethernet protection ring.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Hierarchy Level** [edit interfaces *interface-name* **unit** *logical-unit-number*],  
[edit logical-systems *logical-system-name* interfaces *interface-name* **unit** *logical-unit-number*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Option **max-sessions-vs-a-ignore** introduced in Junos OS Release 11.4.

**Description** Configure protocol family information for the logical interface.

**NOTE:** Not all subordinate statements are available to every protocol family.

Options *family*—Protocol family:

- **any**—Protocol-independent family used for Layer 2 packet filtering

**NOTE:** This option is not supported on T4000 Type 5 FPCs.

- **bridge**—(M Series and T Series routers only) Configure only when the physical interface is configured with **ethernet-bridge** type encapsulation or when the logical interface is configured with **vlan-bridge** type encapsulation. You can optionally configure this protocol family for the logical interface on which you configure VPLS.
- **ethernet-switching**—(M Series and T Series routers only) Configure only when the physical interface is configured with **ethernet-bridge** type encapsulation or when the logical interface is configured with **vlan-bridge** type encapsulation
- **ccc**—Circuit cross-connect protocol suite. You can configure this protocol family for the logical interface of CCC physical interfaces. When you use this encapsulation type, you can configure the **ccc** family only.
- **inet**—Internet Protocol version 4 suite. You must configure this protocol family for the logical interface to support IP protocol traffic, including Open Shortest Path First (OSPF), Border Gateway Protocol (BGP), Internet Control Message Protocol (ICMP), and Internet Protocol Control Protocol (IPCP).
- **inet6**—Internet Protocol version 6 suite. You must configure this protocol family for the logical interface to support IPv6 protocol traffic, including Routing Information Protocol for IPv6 (RIPng), Intermediate System-to-Intermediate System (IS-IS), BGP, and Virtual Router Redundancy Protocol for IPv6 (VRRP).
- **iso**—International Organization for Standardization Open Systems Interconnection (ISO OSI) protocol suite. You must configure this protocol family for the logical interface to support IS-IS traffic.
- **mlfr-end-to-end**—Multilink Frame Relay FRF.15. You must configure this protocol or multilink Point-to-Point Protocol (MLPPP) for the logical interface to support multilink bundling.
- **mlfr-uni-nni**—Multilink Frame Relay FRF.16. You must configure this protocol or **mlfr-end-to-end** for the logical interface to support link services and voice services bundling.
- **multilink-ppp**—Multilink Point-to-Point Protocol. You must configure this protocol (or **mlfr-end-to-end**) for the logical interface to support multilink bundling.
- **mpls**—Multiprotocol Label Switching (MPLS). You must configure this protocol family for the logical interface to participate in an MPLS path.
- **pppoe**—Point-to-Point Protocol over Ethernet
- **tcc**—Translational cross-connect protocol suite. You can configure this protocol family for the logical interface of TCC physical interfaces.

- **tnp**—Trivial Network Protocol. This protocol is used to communicate between the Routing Engine and the router's packet forwarding components. The Junos OS automatically configures this protocol family on the router's internal interfaces only, as discussed in *Understanding Internal Ethernet Interfaces*.
- **vpls**—(M Series and T Series routers only) Virtual private LAN service. You can optionally configure this protocol family for the logical interface on which you configure VPLS. VPLS provides an Ethernet-based point-to-multipoint Layer 2 VPN to connect customer edge (CE) routers across an MPLS backbone. When you configure a VPLS encapsulation type, the **family vpls** statement is assumed by default.

MX Series routers support dynamic profiles for VPLS pseudowires, VLAN identifier translation, and automatic bridge domain configuration.

For more information about VPLS, see the *Junos OS VPNs Library for Routing Devices*.

The remaining statements are explained separately. See [CLI Explorer](#).

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 in EX Series switches.<br>Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | For aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only, explicitly enable flow control, which regulates the flow of packets from the router or switch to the remote side of the connection. Enabling flow control is useful when the remote device is a Gigabit Ethernet switch. Flow control is not supported on the 4-port Fast Ethernet PIC.                                                                                                                                                                 |
|                                 | <div>  <p><b>NOTE:</b> On the Type 5 FPC, to prioritize control packets in case of ingress oversubscription, you must ensure that the neighboring peers support MAC flow control. If the peers do not support MAC flow control, then you must disable flow control.</p> </div>                                                                                                                                                                     |
| <b>Default</b>                  | Flow control is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## fnp

**Syntax**

```
fnp {
 interval <100ms | 1s | 10s | 1m | 10m>;
 loss-threshold number
 interface interface name {
 domain-id domain-id
 }
}
```

**Hierarchy Level** [edit protocols [oam ethernet](#)]

**Release Information** Command introduced in Junos OS Release 11.4.

**Description** On routers with **ge**, **xe**, or **ae** interfaces, configure an OAM Ethernet failure notification protocol.

**Options**

**interval *number***—Specifies the time between the transmission of FNP messages.

**loss-threshold *number***—FNP messages that can be lost before the FNP message is considered aged out and flushed.

**interface *interface-name***—Name of the Ethernet interface.

**domain-id *number***—Domain ID of the access network.

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Threshold for sending frame error events or taking the action specified in the action profile.</p> <p>A frame error is any frame error on the underlying physical layer. The threshold is reached when the number of frame errors reaches the configured value within the window.</p> <p>The window or period during which frame errors are counted is 5 seconds or multiples of it (with a maximum value of 1 minute). This window denotes the duration as intervals of 100 milliseconds, encoded as a 16-bit unsigned integer. This window is not configurable in Junos OS. According to the IEEE 802.3ah standard, the default value of the frame-errors window is 1 second. This window has a lower bound of 1 second and an upper bound of 1 minute.</p> |
| <b>Options</b>                  | <p><b>count</b>—Threshold count for frame error events.</p> <p><b>Range:</b> 0 through 100</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Description              | <p>Threshold for sending frame period error events or taking the action specified in the action profile.</p> <p>A frame error is any frame error on the underlying physical layer. The frame period threshold is reached when the number of frame errors reaches the configured value within the period window. The default period window is the number of minimum-size frames that can be transmitted on the underlying physical layer in 1 second. The window is not configurable.</p> |

## framing (10-Gigabit Ethernet Interfaces)

|                            |                                                                                                                                                                                                                     |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>framing (lan-phy   wan-phy);</code>                                                                                                                                                                           |
| <b>Hierarchy Level</b>     | <code>[edit interfaces xe-fpc/pic/port]</code><br><code>[edit interfaces et-fpc/pic/port]</code> (PTX Series Packet Transport Routers and MX Series Routers)                                                        |
| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 8.0.</p> <p>Statement introduced in Junos OS Release 12.3R2 for PTX Series Packet Transport Routers.</p>                                                                |
| <b>Description</b>         | For routers supporting the 10-Gigabit Ethernet interface, configure the framing format. WAN PHY mode is supported on MX240, MX480, MX960, T640, T1600, T4000, and PTX Series Packet Transport Routers routers only. |

### NOTE:

- The T4000 Core Router supports only LAN PHY mode in Junos OS Release 12.1R1. Starting with Junos OS Release 12.1R2, WAN PHY mode is supported on the T4000 routers with the 12-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-12XGE-SFPP). Starting with Junos OS Release 12.2, WAN PHY mode is supported on the T4000 routers with the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (PF-24XGE-SFPP).
- On PTX Series routers, WAN PHY mode is supported only on the 24-port 10-Gigabit Ethernet LAN/WAN PIC with SFP+ .
- When the PHY mode changes, interface traffic is disrupted because of port reinitialization.
- In Junos OS Releases 17.4R2, 17.4R3, and later, on the following MPCs or routers, you cannot configure wan-phy mode at 10-Gbps, 40-Gbps, and 100-Gbps on a per-port basis:
  - MPC7E-10G, MPC7E-MRATE, MX2K-MPC8E, and MX2K-MPC9E
  - MPC10003
  - MX204 router
  - JNP10K-LC2101 MPC

**Default** Operates in LAN PHY mode.

**Options**    **lan-phy**—10GBASE-R interface framing format that bypasses the WIS sublayer to directly stream block-encoded Ethernet frames on a 10-Gigabit Ethernet serial interface.

**wan-phy**—10GBASE-W interface framing format that allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and SONET devices.

**Required Privilege**    interface—To view this statement in the configuration.

**Level**                interface-control—To add this statement to the configuration.

| Description              | When a link goes down, the ring protection link (RPL) activates. When the downed link comes back up, the RPL link receives notification, restores the link, and waits for the restore interval before issuing another block on the same link. This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value. |
| Options                  | <b><i>number</i></b> —Guard timer interval, in milliseconds.<br><b>Range:</b> 10 through 2000 ms<br><b>Default:</b> 500 ms                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Description              | <p>Specifies the time period for which the Link Aggregation Control Protocol (LACP) maintains the state of a child (member) link as expired or default.</p> <p>When a child link goes from the current state to the expired state, the LACP monitors the reception of protocol data units (PDUs) on the child link for the configured hold-up time interval and does not allow the child link to transition back to the current state. This configuration thus prevents excessive flapping of a child link on an aggregated Ethernet interface.</p> <p>The configured hold-up timer value is applicable to all the child links within a link aggregated (LAG) interface. By default, this feature is disabled.</p> |
| Options                  | <p><b>timer-value</b>—Hold-up interval in seconds.</p> <p><b>Range:</b> 1 to 6000 seconds</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## iccp

**Syntax**

```
iccp {
 traceoptions {
 file <filename> <files number> <match regular-expression> <microsecond-stamp>
 <size size> <world-readable | no-world-readable>;
 flag flag;
 no-remote-trace;
 }
 local-ip-address ip address;
 session-establishment-hold-time value;
 authentication-key string;
 peer ip-address {
 local-ip-address ip address;
 session-establishment-hold-time value;
 authentication-key string;
 redundancy-group-id-list redundancy-group-id-list;
 liveness-detection;
 }
}
```

**Hierarchy Level**

```
[edit protocols iccp]
[edit logical-systems logical-system-name protocols iccp]
```

**Release Information** Statement introduced in Junos OS Release 10.0.  
Support for logical systems introduced in Junos OS Release 14.1.

**Description** Configure Interchassis Control Protocol (ICCP) between the multichassis link aggregation group (MC-LAG) peers. ICCP replicates forwarding information, validates configurations, and propagates the operational state of the MC-LAG members.

**Default** If you do not include this statement, no ICCP protocol tracing operations are performed.

**Options**

- traceoptions**—Set Interchassis Control Protocol (ICCP) tracing options.
- local-ip-address**—Specify the source address where the ICCP packet is routed.
- session-establishment-hold-time**—Specify if the chassis takes over as the master at the ICCP session.
- authentication-key**—Specify TCP Message Digest 5 (MD5) option for an ICCP TCP session.
- peer ip-address**—Specify the IP address of the peer that hosts an MC-LAG. You must configure ICCP for both peers that host the MC-LAG.
- redundancy-group-id-list**—Specify the redundancy groups between two ICCP peers.
- liveness-detection**—Specify Bidirectional Forwarding Detection (BFD) protocol options.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## ieee802.1p

---

**Syntax** `ieee802.1p premium [ values ];`

**Hierarchy Level** [edit interfaces *interface-name* gigether-options ethernet-switch-profile [ethernet-policer-profile input-priority-map](#)]  
[edit interfaces *interface-name* ether-options ethernet-switch-profile [ethernet-policer-profile input-priority-map](#)]

**Release Information** Statement introduced before Junos Release 7.4.  
Statement introduced in Junos OS Release 13.2 for the QFX Series.

**Description** For Gigabit Ethernet IQ and 10-Gigabit Ethernet interfaces only, configure premium priority values for IEEE 802.1p input traffic.

**Options** *values*—Define IEEE 802.1p priority values to be treated as premium.  
**Range:** 0 through 7

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Description** Configure IGMP snooping to constrain multicast traffic to only the ports that have receivers attached. IGMP snooping enables the device to selectively send out multicast packets on only the ports that need them. Without IGMP snooping, the device floods the packets on every port. The device listens for the exchange of IGMP messages by the device and the end hosts. In this way, the device builds an IGMP snooping table that has a list of all the ports that have requested a particular multicast group. The factory default configuration enables IGMP snooping on all VLANs.

**NOTE:** IGMP snooping must be disabled on the device before enabling ISSU.

**NOTE:** Starting with Junos OS Release 18.1R1, QFX5110 switches support IGMP snooping in an EVPN-VXLAN multihoming environment, but in this environment you must enable IGMP snooping on all VLANs associated with any configured VXLANs. You cannot selectively enable IGMP snooping only on those VLANs that might have interested listeners, because all the VXLANs share VXLAN tunnel endpoints (VTEPs) between the same multihoming peers and must have the same settings.

**Default** For most devices, IGMP snooping is disabled on the device by default, and you must configure IGMP snooping parameters in this statement hierarchy to enable it on one or more VLANs.

On legacy switches that do not support the Enhanced Layer 2 Software (ELS) configuration style, IGMP snooping is enabled by default on all VLANs, and the **vlan** statement includes a **disable** option if you want to disable IGMP snooping selectively on some VLANs or disable it on all VLANs.

**Options** The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Add the configured number of bytes to the length of a packet entering the interface.</p> <p>Configure a policer overhead to control the rate of traffic received on an interface. Use this feature to help prevent denial-of-service (DoS) attacks or to enforce traffic rates to conform to the service-level agreement (SLA). When you configure a policer overhead, the configured policer overhead value (bytes) is added to the length of the final Ethernet frame. This calculated length of frame is used to determine the policer or the rate-limiting action.</p> <p>Traffic policing combines the configured policy bandwidth limits and the burst size to determine how to meter the incoming traffic. If you configure a policer overhead on an interface, Junos OS adds those bytes to the length of incoming Ethernet frames. This added overhead fills each frame closer to the burst size, allowing you to control the rate of traffic received on an interface.</p> <p>You can configure the policer overhead to rate-limit queues and Layer 2 and Layer 3 policers, for standalone (SA) and high-availability (HA) deployments. The policer overhead and the shaping overhead can be configured simultaneously on an interface.</p> |

**NOTE:** vSRX supports policer overhead on Layer 3 policers only.

The policer overhead applies to all interfaces on the PIC. In the following example, Junos OS adds 10 bytes of overhead to all incoming Ethernet frames on ports ge-0/0/0 through ge-0/0/4.

```
set chassis fpc 0 pic 0 ingress-policer-overhead 10
```

**NOTE:** vSRX only supports fpc 0 pic 0. When you commit the `ingress-policer-overhead` statement, the vSRX takes the PIC offline and then back online.

You need to craft the policer overhead size to match your network traffic. A value that is too low will have minimal impact on traffic bursts. A value that is too high will rate-limit too much of your incoming traffic.

In this example, the policer overhead of 255 bytes is configured for ge-0/0/0 through ge-0/0/4. The firewall policer is configured to discard traffic when the burst size is over 1500 bytes. This policer is applied to ge-0/0/0 and ge 0/0/1. Junos OS adds 255 bytes to every Ethernet frame that comes into the configured ports. If, during a burst of traffic, the combined length of incoming frames and the overhead bytes exceeds 1500 bytes, the policer starts to discard further incoming traffic.

```
set chassis fpc 0 pic 0 ingress-policer-overhead 255
set interfaces ge-0/0/0 unit 0 family inet policer input overhead_policer
set interfaces ge-0/0/0 unit 0 family inet address 10.9.1.2/24
set interfaces ge-0/0/1 unit 0 family inet policer input overhead_policer
set interfaces ge-0/0/1 unit 0 family inet address 10.9.2.2/24
set firewall policer overhead_policer if-exceeding bandwidth-limit 32k
set firewall policer overhead_policer if-exceeding burst-size-limit 1500
set firewall policer overhead_policer then discard
```

**Options** *bytes*—Number of bytes added to a frame entering an interface.

**Range:** 0–255 bytes

**Default:** 0

```
[edit chassis fpc 0 pic 0]
user@host# set ingress-policer-overhead 10;
```

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>For Gigabit Ethernet IQ, IQ2 and IQ2-E interfaces, and for aggregated Ethernet interfaces using Gigabit Ethernet IQ2 and IQ2-E or 10-Gigabit Ethernet PICs on MX Series routers or 100-Gigabit Ethernet Type 5 PIC with CFP, or on Ethernet interfaces on EX Series switches, specify the VLAN ID to rewrite for the inner tag of the final packet.</p> <p>You cannot include the <b>inner-vlan-id</b> statement with the <b>swap</b> statement, <b>swap-push</b> statement, <b>push-push</b> statement, or <b>push-swap</b> statement and the <b>inner-vlan-id</b> statement at the <code>[edit interfaces <i>interface-name</i> <b>unit</b> <i>logical-unit-number</i> <b>output-vlan-map</b>]</code> hierarchy level. If you include any of those statements in the output VLAN map, the VLAN ID in the outgoing frame is rewritten to the <b>inner-vlan-id</b> statement you include at the <code>[edit interfaces <i>interface-name</i> <b>unit</b> <i>logical-unit-number</i>]</code> hierarchy level.</p> |
| <b>Options</b>                  | <p><i>number</i>—VLAN ID number.</p> <p><b>Range:</b> 0 through 4094</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 19.1R1 for MX Series routers with MPC line cards.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | <p>(MX Series routers with MPC line cards only) To enable the inline Link Aggregation Control Protocol (LACP) PDU transmission processing.</p> <p>This statement disables the default distributed periodic packet management (PPM) processing for Link Aggregation Control Protocol (LACP) packets and run all Link Aggregation Control Protocol (LACP) PDU transmission processing inline. The inline option can be used in scenarios where the line card CPU is under heavy load and cannot schedule the PPM processing for LACP packets. PPM, by default, delegates the transmission of PDUs to the PPMAN process on the PFE/line card. But when the inline option is configured, it delegates the transmission of LCAP PDUs even further away from the line card CPU and into the forwarding chipset.</p> <p>For example, in a system with both MPCs and DPCs, upon configuration of <b>[protocols lacp ppm inline]</b>, the PDUs are sent inline on the MPCs and performed by periodic packet management (PPM) on DPCs.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 20px;">  <p><b>BEST PRACTICE:</b> We recommend to retain the default and disable distributed PPM or enable inline processing only if Juniper Networks Customer Service advises you to do so. You should disable distributed PPM or enable inline processing only if you have a compelling reason to disable it.</p> </div> <p>Refer <i>Disabling or Enabling Inline Periodic Packet Management for LACP Packets</i> for more details.</p> |
| <b>Default</b>                  | Distributed PPM processing is enabled for all packets that use PPM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.2.<br>Starting in Junos OS Release 17.3R1, input-vlan-map for outer vlan is supported for L2 circuit over aggregated Ethernet interfaces for QFX10000 Series switches.                                                                                                                                                                                   |
| <b>Description</b>              | <p>Define the rewrite profile to be applied to incoming frames on this logical interface. On MX Series routers, this statement only applies to aggregated Ethernet interfaces using Gigabit Ethernet IQ, 10-Gigabit Ethernet IQ2 and IQ2-E interfaces and 100-Gigabit Ethernet Type 5 PIC with CFP.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p> |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                             |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | <p>Specifies the static security key to exchange to enable MACsec using static secure association key (SAK) security mode.</p> <p>The key string is a 32-digit hexadecimal number. The key string and the security association must match on both sides of an Ethernet connection to secure traffic using MACsec when enabling MACsec using SAK security mode.</p> <p>You must configure at least two security associations with unique security association numbers and key strings to enable MACsec using static SAK security mode. MACsec initially establishes a secure connection when a security association number and key match on both ends of an Ethernet link. After a certain number of Ethernet frames are securely transmitted across the Ethernet link, MACsec automatically rotates to a new security association with a new security association number and key to maintain the secured Ethernet link. This rotation continues each time a certain number of Ethernet frames are securely transmitted across the secured Ethernet link, so you must always configure MACsec to have at least two security associations.</p> |
| <b>Default</b>                  | This statement does not have a default value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>                  | <b><i>key-string</i></b> —Specifies the key to exchange with the other end of the link on the secure channel. The <i>key-string</i> is a 32-digit hexadecimal string that is created by the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Required Privilege Level</b> | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## lacp (Aggregated Ethernet)

**List of Syntax**    [Syntax \(NFX Series\) on page 1147](#)  
                           [Syntax \(EX Series\) on page 1147](#)

**Syntax (NFX Series)**

```
lacp (active | passive) {
 admin-key key;
 fast-failover;
 link-protection {
 disable;
 (revertive | non-revertive);
 }
 periodic interval
 system-ID mac-address;
 system-priority priority;
 force-up;
}
```

**Syntax (EX Series)**

```
lacp {
 (active | passive);
 admin-key key;
 accept-data;
 fast-failover;
 link-protection {
 disable;
 (revertive | non-revertive);
 }
 periodic interval;
 system-id mac-address;
 system-priority priority;
}
```

**Hierarchy Level (EX Series)**    [edit interfaces aex [aggregated-ether-options](#)]  
                                   [edit logical-systems *logical-system-name* interfaces aeX aggregated-ether-options]

**Hierarchy Level (NFX Series)**    [edit interfaces *interface-name* aggregated-ether-options]

**Release Information**    Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                                   Statement introduced in Junos OS Release 11.1 for the QFX Series.  
                                   Statement introduced in Junos OS Release 14.1X53-D20 for the OCX Series.

**Description**    Configure the Link Aggregation Control Protocol (LACP) parameters for interfaces. The remaining statement is explained separately.

For EX Series, when you configure the **accept-data** statement at the **[edit interfaces aex aggregated-ether-options lacp]** hierarchy level, the router processes packets received on a member link irrespective of the LACP state if the aggregated Ethernet bundle is up.

**NOTE:** When you configure the `accept-data` statement at the `[edit interfaces aeX aggregated-ether-options lacp]` hierarchy level, this behavior occurs:

- By default, the `accept-data` statement is not configured when LACP is enabled.
- You can configure the `accept-data` statement to improve convergence and reduce the number of dropped packets when member links in the bundle are enabled or disabled.
- When LACP is down and a member link receives packets, the router or switch does not process packets as defined in the IEEE 802.1ax standard. According to this standard, the packets should be dropped, but they are processed instead because the `accept-data` statement is configured.

**NOTE:** The `force-up` statement is not supported on QFX10002 switches.

**Default** If you do not specify LACP as either **active** or **passive**, LACP remains passive.

**Options** **active**—Initiate transmission of LACP packets.

**admin-key *number***—Specify an administrative key for the router or switch.

**NOTE:** You must also configure multichassis link aggregation (MC-LAG) when you configure the `admin-key`.

**fast-failover**—Specify to override the IEEE 802.3ad standard and allow the standby link to receive traffic. Overriding the default behavior facilitates subsecond failover.

**passive**—Respond to LACP packets.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege Level** **interface**—To view this statement in the configuration.  
**interface-control**—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 8.2.                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | For Ethernet interfaces on EX Series switches, and M320, M120, MX Series, and T Series routers, specify the discovery mode used for IEEE 802.3ah Operation, Administration, and Management (OAM) support. The discovery process is triggered automatically when OAM 802.3ah functionality is enabled on a port. Link monitoring is done when the interface sends periodic OAM PDUs. |
| <b>Options</b>                  | <b>(active   passive)</b> —Passive or active mode. In active mode, the interface discovers and monitors the peer on the link if the peer also supports IEEE 802.3ah OAM functionality. In passive mode, the peer initiates the discovery process. Once the discovery process is initiated, both sides participate in discovery.                                                     |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                             |

| Release Information      | Statement introduced in Junos OS Release 15.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Description              | <p>Configure link degrade monitoring on an interface and specify the corrective action to be triggered when a link degrade event is detected. Deleting the configuration disables the feature. When configured, the feature monitors the quality of physical links on Ethernet interfaces (10-Gigabit, 40-Gigabit, and 100-Gigabit) and triggers the user-configured action when the link's bit error rate (BER) value breaches the preconfigured threshold. This feature can detect a BER value as low as <math>10^{-13}</math> to <math>10^{-5}</math>.</p> |
| Options                  | <p><b>actions media based</b>—Action to be taken when a link degrade event is detected. A media-based action brings down the physical link at both local and remote ends of the interface, and stops BER monitoring at the local end until an autorecovery is triggered.</p> <p>The remaining statements are described separately.</p>                                                                                                                                                                                                                        |
| Required Privilege Level | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Release Information** Statement introduced in Junos OS Release 8.2.

**Description** For Ethernet interfaces on M320, M120, MX Series, and T Series routers and EX Series switches, specify fault signaling and detection for IEEE 802.3ah Operation, Administration, and Management (OAM) support.

The remaining statements are explained separately. See [CLI Explorer](#).

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

| <b>Options</b>             | <p><i>mode</i>—Link characteristics:</p> <ul style="list-style-type: none"> <li>• <b>automatic</b>—Link mode is negotiated. This is the default for EX Series switches.</li> <li>• <b>full-duplex</b>—Connection is full duplex.</li> <li>• <b>half-duplex</b>—Connection is half duplex.</li> </ul> <p><b>Default:</b> Fast Ethernet interfaces can operate in either full-duplex or half-duplex mode. The router's or switch's management Ethernet interface, <b>fxp0</b> or <b>em0</b>, and the built-in Fast Ethernet interfaces on the FIC (M7i router) autonegotiate whether to operate in full-duplex or half-duplex mode. Unless otherwise noted here, all other interfaces operate only in full-duplex mode.</p> |

**NOTE:** On EX Series switches, if **no-auto-negotiation** is specified in `[edit interfaces interface-name ether-options]`, you can select only **full-duplex** or **half-duplex**. If **auto-negotiation** is specified, you can select any mode.

**NOTE:**

- Member links of an aggregated Ethernet bundle must not be explicitly configured with a link mode. You must remove any such link-mode configuration before committing the aggregated Ethernet configuration.
- Starting with Junos OS release 17.4R1 and later, the link-mode configuration is not supported for 10-Gigabit Ethernet interfaces.
- Starting in Junos OS release 18.4R1, half-duplex mode is supported on SRX340 and SRX345 devices.

| Description              | <p>On the router, for aggregated Ethernet interfaces only, configure link protection. In addition to enabling link protection, a primary and a secondary (backup) link must be configured to specify what links egress traffic should traverse. To configure primary and secondary links on the router, include the <b>primary</b> and <b>backup</b> statements at the <b>[edit interfaces ge-fpc/pic/port gigether-options 802.3ad aex]</b> hierarchy level or the <b>[edit interfaces fe-fpc/pic/port fastether-options 802.3ad aex]</b> hierarchy level.</p> <p>On the switch, you can configure either Junos OS link protection for aggregated Ethernet interfaces or the LACP standards link protection for aggregated Ethernet interfaces.</p> <p>For Junos OS link protection, specify <b>link-protection</b> at the following hierarchy levels:</p> <ul style="list-style-type: none"> <li>• <b>[edit interfaces ge-fpc/pic/port ether-options 802.3ad aex]</b></li> <li>• <b>[edit interfaces xe-fpc/pic/port ether-options 802.3ad aex]</b> hierarchy level or at the <b>[edit interfaces xe-fpc/pic/port ether-options 802.3ad aex]</b> hierarchy level.</li> </ul> <p>To disable link protection, use the <b>delete interface ae aggregate-ether-options link-protection</b> statement at the <b>[edit interfaces aex aggregated-ether-options]</b> hierarchy level or the <b>[edit interfaces aex aggregated-ether-options lacp]</b> hierarchy level.</p> |
| Options                  | The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Release Information      | Statement introduced in Junos OS Release 17.3R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Description              | <p>User can specify the <i>link-protection-revertive</i> statement in the link protection configuration at the aggregated Ethernet interface level to set revertive mode. In revertive mode, adding a higher-priority link to the aggregated Ethernet bundle results in recalculation of the priorities and traffic will switch from the currently active link to the newly added, higher-priority link. Recalculation of priorities is performed only while link event such as addition\deletion and UP/Down operation on link, that is, configuration of this option will not result in any recalculation immediately until next link-event occurs.</p> <p>In addition to enabling static link protection, a primary and a secondary (backup) link must be configured to specify what links egress traffic should traverse. To configure primary and secondary links on the router, include the <b>primary</b> and <b>backup</b> statements at the [edit interfaces <i>ge-fpc/pic/port</i> <b>gigether-options 802.3ad aex</b>] hierarchy level or the [edit interfaces <i>fe-fpc/pic/port</i> <b>fastether-options 802.3ad aex</b>] hierarchy level.</p> <p>For static link protection, specify <b>link-protection</b> at the following hierarchy levels:</p> <ul style="list-style-type: none"> <li>• [edit interfaces <i>ge-fpc/pic/port</i> <b>ether-options 802.3ad aex</b>]</li> <li>• [edit interfaces <i>xe-fpc/pic/port</i> <b>ether-options 802.3ad aex</b>] hierarchy level or at the [edit interfaces <i>xe-fpc/pic/port</i> <b>ether-options 802.3ad aex</b>] hierarchy level.</li> </ul> <p>To disable static link protection, use the <b>delete interface ae aggregate-ether-options link-protection</b> statement at the [edit interfaces aex <a href="#">aggregated-ether-options</a>] hierarchy level.</p> |
| Options                  | The remaining statements are explained separately. See <a href="#">CLI Explorer</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Description</b>                 | For aggregated Ethernet interfaces only, set the required link speed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                     | <p><b><i>speed</i></b>—For aggregated Ethernet links, you can specify <b><i>speed</i></b> in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).</p> <p>Aggregated Ethernet links on the M120 router can have one of the following speeds:</p> <ul style="list-style-type: none"> <li>• <b>100m</b>—Links are 100 Mbps.</li> <li>• <b>10g</b>—Links are 10 Gbps.</li> <li>• <b>1g</b>—Links are 1 Gbps.</li> <li>• <b>oc192</b>—Links are OC192 or STM64c.</li> </ul> <p>Aggregated Ethernet links on EX Series switches can be configured to operate at one of the following speeds:</p> <ul style="list-style-type: none"> <li>• <b>10m</b>—Links are 10 Mbps.</li> <li>• <b>100m</b>—Links are 100 Mbps.</li> <li>• <b>1g</b>—Links are 1 Gbps.</li> <li>• <b>10g</b>—Links are 10 Gbps.</li> </ul> <p>Aggregated Ethernet links on T Series, MX Series, PTX Series routers, and QFX5100, QFX10002, QFX10008, and QFX10016 switches can be configured to operate at one of the following speeds:</p> <ul style="list-style-type: none"> <li>• <b>100g</b>—Links are 100 Gbps.</li> <li>• <b>100m</b>—Links are 100 Mbps.</li> <li>• <b>10g</b>—Links are 10 Gbps.</li> <li>• <b>1g</b>—Links are 1 Gbps.</li> </ul> |

- **40g**—Links are 40 Gbps.
- **50g**—Links are 50 Gbps.
- **80g**—Links are 80 Gbps.
- **8g**—Links are 8 Gbps.
- **mixed**—Links are of various speeds.
- **oc192**—Links are OC192.

**mixed**—Enables bundling of different Ethernet rate links in the same Aggregated Ethernet interface.

## lmi (Ethernet OAM)

**Syntax**

```
lmi {
 status-counter count;
 polling-verification-timer value;
 interface name {
 uni-id uni-name;
 status-counter number;
 polling-verification-timer value;
 evc-map-type (all-to-one-bundling | bundling | service-multiplexing);
 evc evc-name {
 default-evc;
 vlan-list vlan-id-list;
 }
 }
}
```

**Hierarchy Level** [edit protocols [oam ethernet](#)]

**Release Information** Statement introduced in Junos OS Release 9.5.

**Description** On routers with **ge**, **xe**, or **ae** interfaces, configure an OAM Ethernet Local Management Interface (E-LMI).

**NOTE:** On MX Series routers, E-LMI is supported on Gigabit Ethernet (**ge**), 10-Gigabit Ethernet (**xe**), and Aggregated Ethernet (**ae**) interfaces configured on MX Series routers with DPC only.

**Options**

- status-counter *count***—Status counter (N393), defaults to 4.
- interface *name***—Polling verification timer (T392), defaults to 15 seconds.
- uni-id *uni-name***—(Optional) Defaults to the physical interface name.
- status-counter *number***—(Optional) Defaults to a global value.
- polling-verification-timer *value***—(Optional) Defaults to a global value.
- evc-map-type (all-to-one-bundling | bundling | service-multiplexing)**—Specify the Ethernet virtual connection (EVC) map type.
- evc *evc-name***—Specify the name of the EVC.
- default-evc**—Set the specified EVC as the default EVC.
- vlan-list *vlan-id-list***—Specify a group of VLANs to assign to the EVC.

| <b>Description</b>              | <p>Define the capability to perform uniform load balancing and also perform rebalancing is introduced on MX Series routers with MPCs, except MPC3Es and MPC4Es. Rebalancing is not supported when load-balancing is skewed or distorted owing to a change in the number of flows. The mechanism to record and retain states for the flows and distribute the traffic load accordingly is added. As a result, for m number of flows, they are distributed among n member links of a LAG bundle or among the unilist of next-hops in an ECMP link. This method of splitting the load among member links is called stateful load balancing and it uses 5-tuple information (source and destination addresses, protocol, source and destination ports). Such a method can be mapped directly to the flows, or to a precompute hash based on certain fields in the flow. As a result, the deviation observed on each child link is reduced.</p> |
| <b>Options</b>                  | <b>stateful</b> —Define the stateful load-distribution mechanism for traffic flows on aggregated Ethernet interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.2R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | Define the load-balancing type to inform the Packet Forwarding Engine regarding the appropriate memory pattern to be used for traffic flows. The approximate number of flows for effective load-balancing for each keyword is a derivative.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <p><b>low</b>—Define a low load-balancing method if the number of flows that flow on the specified aggregated Ethernet interface is less or minimal (between 1 and 100 flows).</p> <p><b>medium</b>—Define a medium or moderate load-balancing method if the number of flows that flow on the specified aggregated Ethernet interface is relatively higher (between 100 and 1000 flows).</p> <p><b>large</b>—Define a high load-balancing method if the number of flows that flow on the specified aggregated Ethernet interface is excessive or reaches the maximum supported flows (between 1000 and 10,000 flows).</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Support at the <code>[edit firewall three-color-policer <i>policer-name</i>]</code> hierarchy level introduced in Junos OS Release 8.2.</p> <p>Logical systems support introduced in Junos OS Release 9.3.</p> <p>Support at the <code>[edit dynamic-profiles ... policer <i>policer-name</i>]</code> and <code>[edit dynamic-profiles ... three-color-policer <i>name</i>]</code> hierarchy levels introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Support for PTX series routers with third-generation FPCs added in Junos OS Release 18.3R1.</p>                                     |
| <b>Description</b>         | <p>Configure a logical interface policer. For PTX series routers running Junos OS Release 18.3R1 or later, you can use this command to configure separate firewall filters for different family address types (IPv4 and IPv6) that share the same interface, and configure the same policer as an action for the filter.</p> <p>To configure the aggregate policer, configure the firewall policer you want to use as <b>logical-interface-policer</b>. And at the <b>firewall family <i>family-name</i> filter <i>filter-name</i></b> hierarchy level where you will reference the policer, make the policer an <b>interface-specific</b> firewall filter action.</p> <p>The sample configuration shows the relationship.</p> |

```

firewall {
 policer Shared_Policer {
 logical-interface-policer;
 if-exceeding {
 bandwidth-limit 100m;
 burst-size-limit 500k;
 }
 then {
 discard;
 }
 }
}

```

```
family inet {
 filter filter_name {
 interface-specific;
 term term_name {
 then {
 policer Shared_Policer;
 count cinet;
 }
 }
 }
}
```

**NOTE:** Starting in Junos OS Release 12.2R2, on T Series Core Routers only, you can configure an MPLS LSP policer for a specific LSP to be shared across different protocol family types. You must include the `logical-interface-policer` statement to do so.

## loopback (Local and Remote)

**Syntax** `loopback (local | remote);`

**Hierarchy Level** [edit interfaces *interface-name* [gigether-options](#)]

**Release Information** Statement introduced in Junos OS Release 15.1F3 and 16.1R2 for PTX5000 routers.  
 Statement introduced in Junos OS Release 15.1F6 and 16.1R2 for PTX3000 routers.

**Description** Enables local loopback and enables remote loopback. This allows you to test the transceiver cable connection from the far end to the retimer interface without changing the cable.

**Options** **local**—Enables local loopback  
**remote**—Enables remote loopback

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.2.                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | Enables loopback tracking on Ethernet interfaces. When loopback tracking is enabled and the Ethernet Operation, Administration, and Management (OAM) link-fault management process (lfmd) detects its own generated packets on an interface, it marks the interface as down. When the loopback issue resolves, the interface is brought back up. |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.                                                                                                                                                                                                    |
| <b>Description</b>              | For Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), for Gigabit Ethernet DPCs on MX Series routers, and 100-Gigabit Ethernet Type 5 PIC with CFP, specify a remote MAC address on which to count incoming and outgoing packets.   |
| <b>Options</b>                  | <b><i>mac-address</i></b> —MAC address. Specify the MAC address as six hexadecimal bytes in one of the following formats: <i>nnnn.nnnn.nnnn</i> or <i>nn:nn:nn:nn:nn:nn</i> . For example, 0011.2233.4455 or 00:11:22:33:44:55.<br><br><b><i>policer</i></b> —MAC policer. For more information, see <a href="#">policer (MAC)</a> .          |
| <b>Required Privilege Level</b> | <b>interface</b> —To view this statement in the configuration.<br><b>interface-control</b> —To add this statement to the configuration.                                                                                                                                                                                                       |

| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Support for statement under the <b>[edit interfaces aex aggregated-ether-options ethernet-switch-profile]</b> hierarchy introduced in Junos OS Release 15.1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>For Gigabit Ethernet IQ and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), for Gigabit Ethernet DPCs on MX Series routers, for 100-Gigabit Ethernet Type 5 PIC with CFP, and for MPC3E, MPC4E, MPC5E, MPC5EQ, and MPC6E MPCs, configure dynamic learning of the source and destination MAC addresses. By default, the interface is not allowed to dynamically learn source and destination MAC addresses.</p> <p>To disable dynamic learning of the source and destination MAC addresses after it has been configured, you must delete <b>mac-learn-enable</b> from the configuration.</p> <p>MPCs support MAC address accounting for an individual interface or an aggregated Ethernet interface member link only after the interface has received traffic from the MAC source. If traffic is only exiting an interface, the MAC address is not learned and MAC address accounting does not occur.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | <p>Configure the maximum number of active PPPoE sessions using either static or dynamic PPPoE interfaces that the router can establish with the specified named service, <b>empty</b> service, or <b>any</b> service entry in a PPPoE service name table. The router maintains a count of active PPPoE sessions for each service entry to determine when the maximum sessions limit has been reached.</p> <p>The router uses the <b>max-sessions</b> value for a PPPoE service name table entry in conjunction with the <b>max-sessions</b> value configured for the PPPoE underlying interface, and with the maximum number of PPPoE sessions supported on your router. If your configuration exceeds any of these maximum session limits, the router is unable to establish the PPPoE session.</p> |
| <b>Options</b>                  | <i>number</i> —Maximum number of active PPPoE sessions that the router can establish with the specified PPPoE service name table entry, in the range 1 to the platform-specific maximum PPPoE sessions supported for your router. The default value is equal to the maximum number of PPPoE sessions supported on your routing platform.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | <p>Configure the router to ignore (clear) the value returned by RADIUS in the Max-Clients-Per-Interface Juniper Networks vendor-specific attribute (VSA) [26-143], and restore the PPPoE maximum session value on the underlying interface to the value configured in the CLI with the <b>max-sessions</b> statement. The PPPoE maximum session value specifies the maximum number of concurrent static or dynamic PPPoE logical interfaces (sessions) that the router can activate on the PPPoE underlying interface, or the maximum number of active static or dynamic PPPoE sessions that the router can establish with a particular service entry in a PPPoE service name table.</p>                                                                                                                                                                      |
| <b>Default</b>                  | If you do not include the <b>max-sessions-vsa-ignore</b> statement, the maximum session value returned by RADIUS in the Max-Clients-Per-Interface VSA takes precedence over the PPPoE maximum session value configured with the <b>max-sessions</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b>         | <p>Enable multichassis link aggregation groups (MC-LAG), which enables one device to form a logical LAG interface with two or more other devices.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <p><b>chassis-id</b>—Specify the chassis ID for Link Aggregation Control Protocol (LACP) to calculate the port number of MC-LAG physical member links.</p> <p><b>Values:</b> 0 or 1</p> <p><b>events</b>—Specify an action if a specific MC-LAG event occurs.</p> <p><b>iccp-peer-down</b>—Specify an action if the ICCP peer of this node goes down.</p> <p><b>force-icl-down</b>—If the node's ICCP peer goes down, bring down the interchassis-link logical interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**prefer-status-control-active**—Specify that the node configured as **status-control active** become the active node if the peer of this node goes down.

When ICCP goes down, you can use this keyword to make a mc-lag PE to become the active PE. For example, if you want mc-lag PE1 to be Active on ICCP down, then configure this keyword in PE1. It is not recommended to configure this keyword in both the mc-lag PEs.

**NOTE:** The **prefer-status-control-active** statement can be configured with the **status-control standby** configuration to prevent the LACP MC-LAG system ID from reverting to the default LACP system ID on ICCP failure. Use this configuration only if you can ensure that ICCP will not go down unless the router or switch is down. You must also configure the **hold-time down** value (at the [edit interfaces *interface-name*] hierarchy level) for the interchassis link with the **status-control standby** configuration to be higher than the ICCP BFD timeout. This configuration prevents data traffic loss by ensuring that when the router or switch with the **status-control active** configuration goes down, the router or switch with the **status-control standby** configuration does not go into standby mode.

To make the **prefer-status-control-active** configuration work with the **status-control standby** configuration when an interchassis-link logical interface is configured on aggregate Ethernet interface, you must either configure the **lacp periodic interval** statement at the [edit interface *interface-name* aggregated-ether-options] hierarchy level as **slow** or configure the **detection-time threshold** statement at the [edit protocols iccp peer liveness-detection] hierarchy level as less than 3 seconds.

**init-delay-time seconds**—To minimize traffic loss, specify the number of seconds in which to delay bringing the multichassis aggregated Ethernet interface back to the up state when you reboot an MC-LAG peer.

**NOTE:** On QFX and EX Series switches, the default session establishment hold time is 300 seconds. However, the session establishment time must be at least 100 seconds higher than the init delay time. You can optionally update the session establishment time to be 340 seconds and the init delay time to be 240 seconds.

**mc-ae-id** *mc-ae-id*—Specify the identification number of the MC-LAG device. The two MC-LAG network devices that manage a given MC-LAG must have the same identification number.

**Range:** 1 through 65,535

**mode** (**active-active** | **active-standby**)—Specify whether the MC-LAG is in active-active or active-standby mode.

**NOTE:** You can configure IPv4 (**inet**) and IPv6 (**inet6**) addresses on **mc-ae** interfaces when the **active-standby** mode is configured.

---

**redundancy-group** *group-id*—Specify the redundancy group identification number. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate multiple chassis that perform similar redundancy functions.

**Range:** 1 through 4,294,967,294

**revert-time**—Wait interval (in minutes) before the switchover to the preferred node is performed when the **switchover-mode** is configured as revertive.

**Range:** 1 through 10

**status-control** (**active** | **standby**)—Specify whether the chassis becomes active or remains in standby mode when an interchassis link failure occurs.

**switchover-mode** (**non-revertive** | **revertive**)—Specify whether Junos OS should trigger a link switchover to the preferred node when the active node is available.

**NOTE:** For revertive mode to automatically switch over to the preferred node, the **status-control** statement should be configured as **active**.

---

| <b>Description</b>                                                    | For aggregated Ethernet, SONET/SDH, multilink, link services, and voice services interfaces only, set the minimum number of links that must be up for the bundle to be labeled up.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>                                                        | <p><b><i>number</i></b>—Number of links.</p> <p><b>Range:</b> On M120, M320, MX Series, T Series, and TX Matrix routers with Ethernet interfaces, the valid range for minimum-links number is 1 through 64. When the maximum value (16) is specified, all configured links of a bundle must be up for the bundle to be labeled up. On all other routers and on EX Series switches, other than EX8200 switches, the range of valid values for minimum-links number is 1 through 8. When the maximum value (8) is specified, all configured links of a bundle must be up for the bundle to be labeled up. On EX8200 switches, the range of valid values for minimum-links number is 1 through 12. When the maximum value (12) is specified, all configured links of a bundle must be up for the bundle to be labeled up. On EX4600, QFX Series and Q Fabric Systems, the range of valid values for minimum-links number is 1 through 8. When the maximum value (8) is specified, all configured links of a bundle must be up for the bundle to be labeled up.</p> <p><b>Default:</b> 1</p> |

| Release Information      | Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Description              | <p>Specifies that all traffic travelling on the MACsec-secured link must be MACsec-secured to be forwarded onward.</p> <p>When the <b>must-secure</b> option is enabled, all traffic that is not MACsec-secured that is received on the interface is dropped.</p> <p>When the <b>must-secure</b> option is disabled, all traffic from devices that support MACsec is MACsec-secured while traffic received from devices that do not support MACsec is forwarded through the network.</p> <p>The <b>must-secure</b> option is particularly useful in scenarios where multiple devices, such as a phone and a PC, are accessing the network through the same Ethernet interface. If one of the devices supports MACsec while the other device does not support MACsec, the device that doesn't support MACsec can continue to send and receive traffic over the network—provided the <b>must-secure</b> option is disabled—while traffic to and from the device that supports MACsec is MACsec-secured. In this scenario, traffic to the device that is not MACsec-secured must be VLAN-tagged.</p> |
| Default                  | The <b>must-secure</b> option is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>         | <p>Specify the maximum transmission unit (MTU) size for the media or protocol. The default MTU size depends on the device type. Changing the media MTU or protocol MTU causes an interface to be deleted and added again.</p> <p>To route jumbo data packets on an integrated routing and bridging (IRB) interface or routed VLAN interface (RVI) on EX Series switches, you must configure the jumbo MTU size on the member physical interfaces of the VLAN that you have associated with the IRB interface or RVI, as well as on the IRB interface or RVI itself (the interface named <i>irb</i> or <i>vlan</i>, respectively).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

.....

**CAUTION:** For EX Series switches, setting or deleting the jumbo MTU size on an IRB interface or RVI while the switch is transmitting packets might cause packets to be dropped.

.....

.....

**NOTE:**

The MTU for an IRB interface is calculated by removing the Ethernet header overhead [6(DMAC)+6(SMAC)+2(EtherType)]. Because, the MTU is the lower value of the MTU configured on the IRB interface and the MTU configured on the IRB's associated bridge domain IFDs or IFLs, the IRB MTU is calculated as follows:

- In case of Layer 2 IFL configured with the `flexible-vlan-tagging` statement, the IRB MTU is calculated by including 8 bytes overhead (SVLAN+CVLAN).
  - In case of Layer 2 IFL configured with the `vlan-tagging` statement, the IRB MTU is calculated by including a single VLAN 4 bytes overhead.
- .....

## NOTE:

- If a packet whose size is larger than the configured MTU size is received on the receiving interface, the packet is eventually dropped. The value considered for MRU (maximum receive unit) size is also the same as the MTU size configured on that interface.
- Not all devices allow you to set an MTU value, and some devices have restrictions on the range of allowable MTU values. You cannot configure an MTU for management Ethernet interfaces (fxp0, em0, or me0) or for loopback, multilink, and multicast tunnel devices.
- On ACX Series routers, you can configure the protocol MTU by including the `mtu` statement at the [edit interfaces *interface-name* unit *logical-unit-number* family inet] or [edit interfaces *interface-name* unit *logical-unit-number* family inet6] hierarchy level.
  - If you configure the protocol MTU at any of these hierarchy levels, the configured value is applied to all families that are configured on the logical interface.
  - If you are configuring the protocol MTU for both inet and inet6 families on the same logical interface, you must configure the same value for both the families. It is not recommended to configure different MTU size values for inet and inet6 families that are configured on the same logical interface.
- Starting in Release 14.2, MTU for IRB interfaces is calculated by removing the Ethernet header overhead (6(DMAC)+6(SMAC)+2(EtherType)), and the MTU is a minimum of the two values:
  - Configured MTU
  - Associated bridge domain's physical or logical interface MTU
    - For Layer 2 logical interfaces configured with flexible-vlan-tagging, IRB MTU is calculated by including 8 bytes overhead (SVLAN+CVLAN).
    - For Layer 2 logical interfaces configured with vlan-tagging, IRB MTU is calculated by including single VLAN 4 bytes overhead.

NOTE: Changing the Layer 2 logical interface option from vlan-tagging to flexible-vlan-tagging or vice versa adjusts the logical interface MTU by 4 bytes with the existing MTU size. As a result, the Layer 2 logical interface is deleted and re-added, and the IRB MTU is re-computed appropriately.

For more information about configuring MTU for specific interfaces and router or switch combinations, see *Configuring the Media MTU*.

**Options** *bytes*—MTU size.

**Range:** 256 through 9192 bytes, 256 through 9216 (EX Series switch interfaces), 256 through 9500 bytes (Junos OS 12.1X48R2 for PTX Series routers), 256 through 9500 bytes (Junos OS 16.1R1 for MX Series routers)

**NOTE:** Starting in Junos OS Release 16.1R1, the MTU size for a media or protocol is increased from 9192 to 9500 for Ethernet interfaces on the following MX Series MPCs:

- MPC1
- MPC2
- MPC2E
- MPC3E
- MPC4E
- MPC5E
- MPC6E

---

**Default:** 1500 bytes (INET, INET6, and ISO families), 1448 bytes (MPLS), 1514 bytes (EX Series switch interfaces)

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 19.1R1 for MX Series Routers.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | Configure the maximum receive unit (MRU) of the interface in bytes. The maximum receive unit of an interface indicates the largest size of a packet that the interface can accept. You can configure the parameters so that the value of MRU equals the value of MTU. You can also configure different values for MRU and MTU. When a device receives packets whose size is greater than the interface MRU, those packets are dropped by the device's forwarding plane. |
| <b>Options</b>                  | <b><i>mru</i></b> —MRU size in bytes.<br><b>Range:</b> 256 through 16008 bytes.                                                                                                                                                                                                                                                                                                                                                                                         |

## multi-chassis-protection

**Syntax**

```
multi-chassis-protection {
 peer a.b.c.d {
 interface interface-name;
 }
}
```

**Hierarchy Level** [edit interfaces *interface-name*]

**Release Information** Statement introduced in Junos OS Release 11.1.

**Description** For MX Series routers with multichassis aggregated Ethernet (MC-AE) interfaces, you can use this statement under the physical interface level to reduce the configuration at the logical interface level if the following assumption exists:

If there are  $n + 1$  logical interfaces under **ae0**, from **ae0.0** through **ae0.n**, there will be  $n + 1$  logical interfaces under **ge-0/0/0** as well, from **ge-0/0/0.0** through **ge-0/0/0.n**, and each **ge-0/0/0** logical interface will be a protection link for the **ae0** logical interface.

**NOTE:** A bridge domain cannot have MC-AE logical interfaces which belong to different redundancy groups.

If the Inter-Chassis Control Protocol (ICCP) connection is UP and the interchassis data link (ICL) comes UP, the router configured as standby will bring up the MC-AE interfaces shared with the peer.

The remaining statements are explained separately. See [CLI Explorer](#).

**Options** **interface *interface-name***—Specify the interface: **interface *interface-name-fpc/pic/port***

**Required Privilege Level**

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Specify disabling the control queue for all ports on the 10-Gigabit Ethernet LAN/WAN PIC. Deleting this configuration re-enables the control queue feature on all ports of the 10-Gigabit Ethernet LAN/WAN PIC.</p> <div> <b>NOTE:</b> For the 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (model number PD-5-10XGE-SFPP), the control queue has a rate limiter to limit the control traffic to 2 Mbps (fixed, not user-configurable) per port. If the transit control traffic crosses this limit, then it can cause drops on locally terminating control traffic, causing flap of protocols such as BGP and OSPF. To avoid the control traffic being dropped, configure the no-pre-classifier statement to disable the control queue.</div> |
| <b>Default</b>                  | The no-pre-classifier statement is not configured and the control queue is operational.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | <p>Prevent the router from sending the AC-Name and AC-Cookie tags in the PPPoE Active Discovery Session (PADS) packet. When you configure this statement, it affects PADS packets sent on all PPPoE interfaces configured on the router after the command is issued; it has no effect on previously created PPPoE interfaces. By default, the AC-Name and AC-Cookie tags are transmitted in the PADS packet, along with the Service-Name, Host-Uniq, Relay-Session-Id, and PPP-Max-Payload tags.</p> |
|                                 | <p> <b>NOTE:</b> In Junos OS Release 12.1 and earlier, only the Service-Name, Host-Uniq, Relay-Session-Id, and PPP-Max-Payload tags are contained in the PADS packet by default. The AC-Name and AC-Cookie tags are not transmitted in the PADS packet by default.</p>                                                                                                                                              |

## number-of-sub-ports

**Syntax** `number-of-sub-ports <number-of-sub-ports>;`

**Hierarchy Level** `[edit chassis fpc fpc-slot pic pic-number port port-num]`

**Release Information** Statement introduced in Junos OS Release 19.1R1 for MPC10E-15C-MRATE supported on MX240, MX480, and MX960 routers.  
Statement introduced in Junos OS Evolved Release 19.1R1 for PTX10003-80C and PTX10003-160C router.

**Description** *For PTX10003-80C, PTX10003-160C router:*

To configure the number of optical channels for a particular port if the optics are used in a channelized mode. You can use this configuration option to configure a speed (10, 40, and 100 Gbps) in different number of channels based on the optics used. The default value of **number-of-sub-ports** per optics is 1. Following are the configurable values for the corresponding optic types:

| Optic Type      | QSFP DD 28F (200G) | QSFP 28 (100G) | QSFP+ (40G) | Default |
|-----------------|--------------------|----------------|-------------|---------|
| Channelized     | 2                  | 1              | 4           | 1       |
| Non-channelized | NA                 | 1              | 1           | 1       |

*For MPC10E-15C-MRATE supported on MX240, MX480, MX960 routers:*

To configure the number of sub-channels for a particular port if the optics are used in a channelized mode.

(Channelized mode) To specify the number of IFDs (or interfaces) that need to be created on a physical port for a specified speed, use the **number-of-sub-ports** `<number-of-sub-ports>` configuration statement. For example, on a given port that supports 4x10GE mode, if the **number-of-sub-ports** to 2, then two IFDs are created, namely et-x/y/z:0 and et-x/y/z:1.

The default value of channelized 10-Gigabit Ethernet interface is 4. The number of sub-ports that can be configured are, 1, 2, 3, or 4. You must set the **number-of-sub-ports** to 4, to channelize 40-Gigabit Ethernet interface to four 10-Gigabit Ethernet interfaces.

The **number-of-sub-ports** configuration statement can be used with rate selectability configuration at both PIC level and port level. This configuration statement is effective only when the port speed is 10 Gbps.

**Options** *On PTX10003-80C, PTX10003-160C router:* **number-of-sub-ports**—Specify the number of sub-ports per physical port. Configurable options are 1, 2, and 4.

*On MPC10E-15C-MRATE supported on MX240, MX480, and MX960 routers:*

*number-of-sub-ports*—Specify the number of sub-ports per physical port. Configurable options are 1, 2, 3, and 4.

**NOTE:** You can configure the *number-of-sub-ports* only for 10-Gbps speed. For other speeds, this configuration is not supported.

---

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## otn-options

**Syntax**

```
otn-options {
 bytes (otn-options) transmit-payload-type value;
 fec (efec | gfec | gfec-sdfec | none);
 (is-ma | no-is-ma);
 (laser-enable | no-laser-enable);
 (line-loopback | no-line-loopback);
 (local-loopback | no-local-loopback);
 (odu-ttim-action-enable | no-odu-ttim-action-enable);
 (otu-ttim-action-enable | no-odu-ttim-action-enable);
 odu-delay-management {
 (bypass | no-bypass);
 (monitor-end-point | no-monitor-end-point);
 number-of-frames value;
 (no-start-measurement | start-measurement;
 }
 odu-signal-degrade {
 ber-threshold-clear value;
 ber-threshold-signal-degrade value;
 interval value;
 }
 (prbs | no-prbs);
 preemptive-fast-reroute {
 (backward-frr-enable | no-backward-frr-enable);
 (signal-degrade-monitor-enable | no-signal-degrade-monitor-enable);
 odu-backward-frr-enable | no-odu-backward-frr-enable;
 odu-signal-degrade-monitor-enable | no-odu-signal-degrade-monitor-enable;
 }
 rate {
 (fixed-stuff-bytes | no-fixed-stuff-bytes);
 oc192;
 otu4;
 (pass-through | no-pass-through);
 }
 signal-degrade {
 ber-threshold-clear value;
 ber-threshold-signal-degrade value;
 interval value;
 }
 tca tca-identifier (enable-tca | no-enable-tca) (threshold number | threshold-24hrs number);
 transport-monitoring;
 trigger trigger-identifier;
 tti tti-identifier;
}
```

| Release Information      | Statement introduced in Junos OS Release 13.2R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Description              | Enable the mechanism to perform an even, effective distribution of traffic flows across member links of an aggregated Ethernet interface ( <b>ae</b> ) bundle on MX Series routers with MPCs, except MPC3Es and MPC4Es. When multiple flows are transmitted out of an <b>ae</b> interface, the flows must be distributed across the different member links evenly to enable an effective and optimal load-balancing behavior. To obtain a streamlined and robust method of load-balancing, the member link of the aggregated Ethernet interface bundle that is selected each time for load balancing plays a significant part. |
| Options                  | <b>per-flow</b> —Enable the stateful load-distribution mechanism per traffic flow on an aggregated Ethernet interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | For MX Series routers with multichassis aggregated Ethernet (MC-AE) interfaces, use the <b>multi-chassis-protection</b> statement under the physical interface level to reduce the configuration at the logical interface level. If the interchassis control protocol connection (ICCP) is UP and the interchassis data link (ICL) comes UP, the router configured as standby will bring up the MC-AE interfaces shared with the peer active-active node specified by the <b>peer</b> statement. You must also specify the peer's physical interface.  |
| <b>Options</b>                  | <p><b><i>a.b.c.d</i></b>—Specify the IP address of the peer.</p> <p><b>interface <i>interface-name</i></b>—Specify the peer's physical interface: interface <i>interface-name-fpc/pic/port</i></p>                                                                                                                                                                                                                                                                                                                                                     |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                     |

## **policer (CFM Firewall)**

**Syntax**

```
policer cfm-policer {
 if-exceeding {
 bandwidth-limit 8k;
 burst-size-limit 2k;
 }
 then discard;
}
```

**Hierarchy Level** [edit firewall]

**Release Information** Statement introduced in Junos OS Release 10.0.

**Description** Attach an explicit policer to CFM sessions.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| Release Information      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Description              | <p>For Gigabit Ethernet IQ, Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), and 100-Gigabit Ethernet Type 5 PIC with CFP, define a CoS policer template to specify the premium bandwidth and burst-size limits, and the aggregate bandwidth and burst-size limits. The premium policer is not supported on MX Series routers or for Gigabit Ethernet interfaces with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router).</p> |
| Options                  | <p><b><i>cos-policer-name</i></b>—Name of one policer to specify the premium bandwidth and burst-size limits, and the aggregate bandwidth and burst-size limits.</p> <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>                                                                                                                                                                                                                                                                                                      |

**Hierarchy Level** [edit dynamic-profiles *profile-name* interfaces]

**Release Information** Statement introduced in Junos OS Release 10.1.

**Description** Configure the dynamic PPPoE logical interface in a dynamic profile. When the router creates a dynamic PPPoE logical interface on an underlying Ethernet interface configured with PPPoE (**ppp-over-ether**) encapsulation, it uses the information in the dynamic profile to determine the properties of the dynamic PPPoE logical interface.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure PPM processing options for Link Aggregation Control Protocol (LACP) packets.</p> <p>This command configures the PPM processing options for LACP packets only. You can disable distributed PPM processing for all packets that use PPM and run all PPM processing on the Routing Engine by configuring the <b>no-delegate-processing</b> configuration statement in the <b>[edit routing-options ppm]</b> statement hierarchy.</p> |
| <b>Default</b>                  | Distributed PPM processing is enabled for all packets that use PPM.                                                                                                                                                                                                                                                                                                                                                                            |

| Description         | <p>Configure PPP over Ethernet-specific interface properties.</p> <p>The remaining statements are explained separately. Search for a statement in <a href="#">CLI Explorer</a> or click a linked statement in the Syntax section for details.</p> <p>The maximum payload allowed on an Ethernet frame is 1500 bytes. For a PPPoE interface, the PPPoE header uses 6 bytes and the PPP protocol ID uses 2 bytes. This restricts the maximum MTU size on a PPPoE interface to 1492 bytes, which can cause frequent fragmentation and reassembly of larger PPP packets received over the PPPoE interface. To prevent frequent fragmentation and reassembly for PPP packets over Ethernet, you can configure the maximum transmission unit (MTU) and MRU sizes for PPP subscribers.</p> <p>For PPPoE subscribers, the PPP MRU or PPP MTU size can be greater than 1492 bytes if the PPP-Max-Payload tag is received in the PPPoE Active Discovery Request (PADR) packets.</p> <p>The PPP-Max-Payload option allows you to override the default behavior of the PPPoE client by providing a maximum size that the PPP payload can support in both sending and receiving directions. The PPPoE server might allow the negotiation of an MRU larger than 1492 octets and the ability to use an MTU larger than 1500 octets.</p> <p>It is important to set an appropriate value for the MTU size of the physical interface before setting <b>ppp-max-payload</b>. The value of <b>mtu</b> must be greater than the value of <b>ppp-max-payload</b>.</p> <p>To enable Jumbo frames refer <i>Understanding Jumbo Frames Support for Ethernet Interfaces</i>.</p> |

**Release Information** Statement introduced in Junos OS Release 10.0.

**Description** Configure PPPoE-specific interface properties for the underlying interface on which the router creates a static or dynamic PPPoE logical interface. The underlying interface must be configured with PPPoE (**ppp-over-ether**) encapsulation.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

| Description              | <p>For unnumbered Ethernet interfaces configured with a loopback interface as the donor interface, specify one of the loopback interface's secondary addresses as the preferred source address for the unnumbered Ethernet interface. Configuring the preferred source address enables you to use an IP address other than the primary IP address on some of the unnumbered Ethernet interfaces in your network. To configure the preferred source address dynamically, instead of using this statement, you must include the <code>\$junos-preferred-source-address</code> predefined variable for IPv4 (family inet) addresses or the <code>\$junos-preferred-source-ipv6-address</code> predefined variable for IPv6 (family inet6) addresses.</p> <p>Configuration of a preferred source address for unnumbered Ethernet interfaces is supported for IPv4 and IPv6 address families.</p> |
|                          | <p>.....</p> <div>  <p><b>NOTE:</b> When you specify a static logical interface for the unnumbered interface in a dynamic profile that includes the <code>\$junos-routing-instance</code> predefined variable, you must not configure a preferred source address, whether with the <code>\$junos-preferred-source-address</code> predefined variable, the <code>\$junos-preferred-source-ipv6-address</code> predefined variable, or the <code>preferred-source-address</code> statement. Configuring the preferred source address in this circumstance causes a commit failure.</p> </div> <p>.....</p>                                                                                                                                                                                                  |
| Options                  | <p><b>address</b>—Secondary IP address of the donor loopback interface. Alternatively, use the <code>\$junos-preferred-source-address</code> or the <code>\$junos-preferred-source-ipv6-address</code> predefined variable to dynamically apply a preferred source address to the unnumbered Ethernet interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 9.4.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description** Configure Ethernet ring protection switching.

The statements are explained separately. All statements apply to MX Series routers. EX Series switches do not assign **node-id** and use **control-vlan** instead of **control-channel**.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>              | <p>For Layer 2.5 VPNs on T Series, MX Series, M120, and M320 routers support, configure IS-IS (ISO traffic) or MPLS traffic to traverse a TCC interface. By default, IPv4 (inet) traffic runs on T Series, MX, Series, M120, and M320 routers and over TCC interfaces. You must configure the same traffic type on both ends of the Layer 2.5 VPN.</p> <div>  <p><b>NOTE:</b> Some platform and FPC combinations can not pass TCC encapsulated ISO traffic. See <i>Platforms/FPCs That Cannot Forward TCC Encapsulated ISO Traffic</i> for details.</p> </div> |

| <b>Description</b>              | For Layer 2.5 VPNs using an Ethernet interface as the TCC router, configure the IP address for which the TCC router is proxying. Ethernet TCC is supported on interfaces that carry IPv4 traffic only. Ethernet TCC encapsulation is supported on 1-port Gigabit Ethernet, 2-port Gigabit Ethernet, 4-port Gigabit Ethernet, and 4-port Fast Ethernet PICs only. Ethernet TCC is not supported on the T640 router. |
| <b>Options</b>                  | <b>inet-address</b> —Configure the IP address of the neighbor to the TCC router.                                                                                                                                                                                                                                                                                                                                   |

## recovery

**Syntax**

```
recovery {
 (auto | manual);
 timer timer-value;
}
```

**Hierarchy Level** [edit interfaces *interfaces-name* link-degrade-monitor]

**Release Information** Statement introduced in Junos OS Release 15.1.

**Description** Configure the mechanism to be used to recover a degraded link. The recovery options supported are auto and manual.

**Options** **auto**—Recover a degraded link automatically. Use this option with the media-based action when there are no Layer 2 or Layer 3 protocols configured on the interface. If this option is configured, the degraded link is monitored at user-configured intervals; and if the link quality is found to have improved (if bit error rate hits the clear threshold), the link is automatically recovered. With this configuration, you must configure a timer value.

**manual**—Recover a degraded link manually. Use this option with the media-based action configuration when Layer 2 and Layer 3 protocols are configured on the interface. If this option is configured, you need to use the **request interface link-degrade-recover *interface-name*** statement to recover the link.

**NOTE:** The manual recovery option is recommended for user deployments that have static route configurations causing the remote end of the link to start forwarding packets (as soon as the physical link is up) while autorecovery is in progress.

**timer *timer-value***—Specify the interval value (in seconds) after which autorecovery of the degraded link must be triggered. This option is applicable if you configure the autorecovery option. The interval period starts from the time the link is degraded. The default interval is 1800 seconds. The autorecovery attempt is repeated until the link is recovered or the link monitoring feature is disabled through configuration.

**NOTE:** During autorecovery, you might notice link flaps at the remote end of the link.

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

## remote

**Syntax**

```
remote {
 (inet-address address | mac-address address);
}
```

**Hierarchy Level** [edit interfaces *interface-name* [unit](#) *logical-unit-number* [family](#) tcc],  
 [edit logical-systems *logical-system-name* interfaces *interface-name* [unit](#) *logical-unit-number* [family](#) tcc]

**Release Information** Statement introduced before Junos OS Release 7.4.

**Description** For Layer 2.5 VPNs using an Ethernet interface as the TCC router, configure the location of the remote router. Ethernet TCC is supported on interfaces that carry IPv4 traffic only. Ethernet TCC encapsulation is supported on 1-port Gigabit Ethernet, 2-port Gigabit Ethernet, 4-port Gigabit Ethernet, and 4-port Fast Ethernet PICs only.

**Options** **mac-address**—Configure the MAC address of the remote site.  
**inet-address**—Configure the IP address of the remote site.

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.                                                                                                                                                                   |
| <b>Description</b>              | To configure <b>interfaces</b> and <b>logical-systems</b> , specify the destination routing instance that points to the routing table containing the tunnel destination address.                                    |
| <b>Default</b>                  | The default Internet routing table is <b>inet.0</b> .                                                                                                                                                               |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                             |

| Release Information      | Statement introduced in Junos OS Release 10.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Description              | <p>Use in conjunction with the <b>dynamic-profile</b> statement at the same hierarchy levels to specify the routing instance in which to instantiate a dynamic PPPoE interface. You can associate a routing instance with a named service entry, <b>empty</b> service entry, or <b>any</b> service entry configured in a PPPoE service name table, or with an agent circuit identifier/agent remote identifier (ACI/ARI) pair defined for these services.</p> <p>The routing instance associated with a service entry in a PPPoE service name table overrides the routing instance associated with the PPPoE underlying interface on which the dynamic PPPoE interface is created.</p> <p>If you include the <b>routing-instance</b> statement at the <code>[edit protocols pppoe service-name-tables <i>table-name</i> service <i>service-name</i> agent-specifier aci <i>circuit-id-string</i> ari <i>remote-id-string</i>]</code> hierarchy level, you cannot also include the <b>static-interface</b> statement at this level. The <b>routing-instance</b> and <b>static-interface</b> statements are mutually exclusive for ACI/ARI pair configurations.</p> |
| Options                  | <b><i>routing-instance-name</i></b> —Name of the routing instance in which the router instantiates the dynamic PPPoE interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Specifies the number of one of the security associations in the secure channel when MACsec is enabled using static secure association key (SAK) security mode. Because SAKs are created by the key server when MACsec is enabled using static connectivity association key (CAK) security mode, the <b>security-association</b> statement is not used when enabling MACsec using static CAK security mode.</p> <p>You must configure at least two security associations to enable MACsec using static SAK security mode. MACsec initially establishes a secure connection when a security association number and key match on both ends of an Ethernet link. After a certain number of Ethernet frames are securely transmitted across the Ethernet link, MACsec automatically rotates to a new security association with a new security association number and key to maintain the secured Ethernet link. This rotation continues each time a certain number of Ethernet frames are securely transmitted across the secured Ethernet link, so you must always configure MACsec to have at least two security associations.</p> |
| <b>Default</b>                  | No security keys are configured, by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>                  | <p><b><i>security-association-number</i></b>—Specifies the security association number and creates the SAK.</p> <p>The security association number is a whole number between 0 and 3. ## service (PPPoE)

**Syntax**

```

service service-name {
 drop;
 delay seconds;
 terminate;
 dynamic-profile profile-name;
 routing-instance routing-instance-name;
 max-sessions number;
 agent-specifier {
 aci circuit-id-string ari remote-id-string {
 drop;
 delay seconds;
 terminate;
 dynamic-profile profile-name;
 routing-instance routing-instance-name;
 static-interface interface-name;
 }
 }
}

```

**Hierarchy Level** [edit protocols pppoe [service-name-tables](#) *table-name*]

**Release Information** Statement introduced in Junos OS Release 10.0.  
**any**, **dynamic-profile**, **routing-instance**, **max-sessions**, and **static-interface** options introduced in Junos OS Release 10.2.

**Description** Specify the action taken by the interface on receipt of a PPPoE Active Discovery Initiation (PADI) control packet for the specified named service, **empty** service, or **any** service in a PPPoE service name table. You can also specify the dynamic profile and routing instance that the router uses to instantiate a dynamic PPPoE interface, and the maximum number of active PPPoE sessions that the router can establish with the specified service.

**Default** The default action is terminate.

**Options** **service-name**—Service entry in the PPPoE service name table:

- **service-name**—Named service entry of up to 32 characters; for example, **premiumService**. You can configure a maximum of 512 named service entries across all PPPoE service name tables on the router.
- **empty**—Service entry of zero length that represents an unspecified service. Each PPPoE service name table includes one **empty** service entry by default.
- **any**—Default service for non-empty service entries that do not match the named or **empty** service entries configured in the PPPoE service name table. Each PPPoE service name table includes one **any** service entry by default.

The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

| Release Information      | <p>Statement introduced in Junos OS Release 10.0.</p> <p><b>dynamic-profile</b>, <b>routing-instance</b>, <b>max-sessions</b>, and <b>static-interface</b> options introduced in Junos OS Release 10.2.</p>                                                                                                                                                                                                                                                                                                   |
| Description              | <p>Create and configure a PPPoE service name table. Specify the action taken for each service and remote access concentrator on receipt of a PPPoE Active Discovery Initiation (PADI) packet. You can also specify the dynamic profile and routing instance that the router uses to instantiate a dynamic PPPoE interface, and the maximum number of active PPPoE sessions that the router can establish with the specified service. A maximum of 32 PPPoE service name tables is supported per router.</p>   |
| Options                  | <p><b>table-name</b>—Name of the PPPoE service name table, a string of up to 32 alphanumeric characters.</p> <p>The remaining statements are explained separately. Search for a statement in <a href="#">CLI Explorer</a> or click a linked statement in the Syntax section for details.</p>                                                                                                                                                                                                                  |

| Description              | For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, Gigabit Ethernet IQ interfaces, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), specify the MAC addresses from which the interface can receive packets. For this statement to have any effect, you must include the <b>source-filtering</b> statement in the configuration to enable source address filtering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Options                  | <p><b>mac-address</b>—MAC address filter. You can specify the MAC address as <i>nn:nn:nn:nn:nn:nn</i> or <i>nnnn.nnnn.nnnn</i>, where <i>n</i> is a decimal digit. To specify more than one address, include multiple <b>mac-address</b> options in the <b>source-address-filter</b> statement.</p> <p>If you enable the VRRP on a Fast Ethernet or Gigabit Ethernet interface, as described in <i>VRRP and VRRP for IPv6 Overview</i>, and if you enable MAC source address filtering on the interface, you must include the virtual MAC address in the list of source MAC addresses that you specify in the <b>source-address-filter</b> statement. MAC addresses ranging from <b>00:00:5e:00:01:00</b> through <b>00:00:5e:00:01:ff</b> are reserved for VRRP, as defined in RFC 3768, <i>Virtual Router Redundancy Protocol</i>. When you configure the VRRP group, the group number must be the decimal equivalent of the last hexadecimal byte of the virtual MAC address.</p> <p>On untagged Gigabit Ethernet interfaces, you should not configure the <b>source-address-filter</b> statement and the <b>accept-source-mac</b> statement simultaneously. On tagged Gigabit Ethernet interfaces, you should not configure the <b>source-address-filter</b> statement and the <b>accept-source-mac</b> statement with an identical MAC address specified in both filters.</p> |
| Required Privilege Level | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b>              | <p>For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, and Gigabit Ethernet IQ interfaces only, enable the filtering of MAC source addresses, which blocks all incoming packets to that interface. To allow the interface to receive packets from specific MAC addresses, include the <b>source-address-filter</b> statement.</p> <p>If the remote Ethernet card is changed, the interface is no longer able to receive packets from the new card because it has a different MAC address.</p> |
| <b>Default</b>                  | Source address filtering is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Release Information</b>                                | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.</p> <p>Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.</p> <p>Speed option 2.5Gbps introduced in Junos OS Release 18.1R2 for EX2300 switch.</p> |

Speed option 10Gbps and 5Gbps introduced in Junos OS Release 18.2R1 for EX4300 switch.

Speed option 1-Gbps is introduced in Junos OS Release 19.1R1 on the 4-port 1-Gigabit Ethernet/10-Gigabit Ethernet uplink module on EX4300-48MP switches.

Speed options 100-Mbps, 1-Gbps, and auto is introduced in Junos OS Releases 18.4R1S2, 18.4R2, and 19.2R1 and later for ACX5448 Universal Metro Routers.

Speed option 10Gbps, 40Gbps, and 100Gbps introduced in Junos OS Evolved Release 19.1R1 for PTX10003-80C, PTX10003-160C routers.

**Description** Configure the interface speed. This statement applies to the management Ethernet interface (**fxp0** or **em0**), Fast Ethernet 12-port and 48-port PICs, the built-in Fast Ethernet port on the FIC (M7i router), Combo Line Rate DPCs and Tri-Rate Ethernet Copper interfaces on MX Series routers, and Gigabit Ethernet interfaces on EX Series switches.

When you configure the Tri-Rate Ethernet copper interface to operate at 1 Gbps, autonegotiation must be enabled. When you configure 100BASE-FX SFP, you must set the port speed at 100 Mbps.

**NOTE:** On MX Series routers with Tri-rate Enhanced DPC (DPCE-R-40GE-TX), when you configure the interface speed using the **auto-10m-100m** option, the speed is negotiated to the highest value possible (100 Mbps), if the same value is configured on both sides of the link. However, when you view the interface speed of the DPC, using the **show interfaces** command, the value of the speed is not accurately displayed. For instance, if you configure the speed of the Tri-rate enhanced DPC, as 100Mbps on both sides of the link, the interface speed of the DPC is negotiated to 100 Mbps. However, the interface speed of the DPC displays 1 bps. This is an issue with the **show interfaces** command only. The actual interface speed is 100 Mbps.

---

On 10-Gigabit Ethernet SFP interfaces, autonegotiation is enabled by default and auto-detects the speed to be either 1 Gbps or 10 Gbps. On QFX5100-48S, QFX5100-96S, and QFX5100-24Q devices using 10-Gigabit Ethernet SFP interfaces, the speed is set to 10 Gbps by default and cannot be configured to operate in a different speed. On QFX5100-48S and QFX5100-96S devices using 1-Gigabit Ethernet SFP interfaces, the speed is set to 1 Gbps by default and cannot be configured to operate in a different speed.

---

**NOTE:** In Junos OS Release 14.1X53-D35 on QFX5100-48T-6Q devices using 10-Gigabit Ethernet Copper interfaces, autonegotiation is disabled by default on the copper ports, and the interfaces operate at a speed of 100M. You can, however, enable auto-negotiation by issuing the **set interface name ether-options auto-negotiation** command on the interface for which you want to change the interface speed. With autonegotiation enabled, the interface auto-detects the speed in which to operate.

---

**NOTE:** Only 10 Gbps and 40 Gbps interfaces are supported on OCX Series switches.

---

**NOTE:** When displaying interface information with **show interfaces** commands, you might see speed values for 1 Gbps interfaces displayed as 1000mbps.

---

(For EX2300 only) Starting in Junos OS Release 18.1R2, the multi-rate speed is supported on EX2300-48MP and EX2300-24MP switches. The speed configuration statement is supported on both multi-rate gigabit ethernet interface (mge) and gigabit ethernet (ge) interface. The mge interface is a rate-selectable (multirate) Gigabit Ethernet interface that can support speeds of 10-Gbps, 5-Gbps, and 2.5-Gbps over CAT5e/CAT6/CAT6a cables. In the EX2300, the mge interface supports 100-Mbps, 1-Gbps, and 2.5-Gbps speeds, which can be configured by using the speed configuration statement. Note that 10Mbps speed is supported only on **ge** interfaces of EX2300 switch.

On EX2300-24MP and EX2300-48MP switches, if both Energy Efficient Ethernet (EEE) and 100-Mbps speed are configured on a rate-selectable (or multirate) Gigabit Ethernet (mge) port, the port operates only at 100-Mbps speed but EEE is not enabled on that port. EEE is supported only on mge interfaces that operate at 1-Gbps and 2.5-Gbps speeds.

(For EX4300-48MP only) Starting with Junos OS Release 19.1R1, the 4-port 1-Gigabit Ethernet/10-Gigabit Ethernet uplink module (EX-UM-4SFPP-MR) on EX4300-48MP switches supports 1-Gbps speed. You do not need to explicitly configure 1-Gbps speed on the uplink module as it automatically identifies the installed 1-gigabit SFP transceivers and creates the interface accordingly.

**NOTE:** On EX4300-48MP, the status LED of 1-Gigabit Ethernet uplink module port is solid green (instead of blinking green) because of a device limitation. However, there is no impact on device functionality.

(For ACX5448 only) 100-Mbps speed is supported from interfaces xe-0/0/24 to xe-0/0/47 only.

**Default (EX Series)** If the [auto-negotiation](#) statement at the `[edit interfaces interface-name ether-options]` hierarchy level is enabled, the auto-negotiation option is enabled by default.

**Options** You can specify the speed as either **10m** (10 Mbps), **100m** (100 Mbps), and on MX Series routers, **1g** (1 Gbps). You can also specify the **auto** option on MX Series routers.

For Gigabit Ethernet interfaces on EX Series switches, you can specify one of the following options:

Table 119: Options for speed

| Platforms                           | Speed Supported                                                                                                                                                                                          | Auto-negotiation                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| EX2300                              | <b>10m</b> —10 Mbps (supported on EX series switches and only on <b>ge</b> interfaces of EX2300 switch)                                                                                                  | <i>speed</i> —Specify the interface speed. If the <a href="#">auto-negotiation</a> statement at the <code>[edit interfaces <i>interface-name</i> ether-options]</code> hierarchy level is disabled, you must specify a specific value. This value sets the speed that is used on the link. If the <a href="#">auto-negotiation</a> statement is enabled, you might want to configure a specific speed value to advertise the desired speed to the remote end. |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | On MX Series routers with Combo Line Rate DPCs and Tri-Rate Copper SFPs you can set auto negotiation of speed. To specify the auto negotiation speed, use the <b>speed (auto   1Gbps   100Mbps   10Mbps)</b> statement under the <b>[edit interface ge-<i>fpc/pic/port</i>]</b> hierarchy level. The <b>auto</b> option will attempt to automatically match the rate of the connected interface. To set port speed negotiation to a specific rate, set the port speed to <b>1Gbps</b> , <b>100Mbps</b> , or <b>10Mbps</b> . |
|                                 | <div>  <p><b>NOTE:</b> If the negotiated speed and the interface speed do not match, the link will not be brought up. Half duplex mode is not supported.</p> </div>                                                                                                                                                                                                                                                                        |
| <b>Options</b>                  | You can specify the speed as either <b>auto</b> (autonegotiate), <b>10Mbps</b> (10 Mbps), <b>100Mbps</b> (100 Mbps), or <b>1Gbps</b> (1 Gbps).                                                                                                                                                                                                                                                                                                                                                                              |

| Description              | <p>Reserve the specified static PPPoE interface for use only by the PPPoE client with matching agent circuit identifier (ACI) and agent remote identifier (ARI) information. You can specify only one static interface per ACI/ARI pair configured for a named service entry, <b>empty</b> service entry, or <b>any</b> service entry in the PPPoE service name table.</p> <p>The static interface associated with an ACI/ARI pair takes precedence over the general pool of static interfaces associated with the PPPoE underlying interface.</p> <p>If you include the <b>static-interface</b> statement in the configuration, you cannot also include either the <b>dynamic-profile</b> statement or the <b>routing-instance</b> statement. The <b>dynamic-profile</b>, <b>routing-instance</b>, and <b>static-interface</b> statements are mutually exclusive for ACI/ARI pair configurations.</p> |
| Options                  | <b>interface-name</b> —Name of the static PPPoE interface reserved for use by the PPPoE client with matching ACI/ARI information. Specify the interface in the format <b>pp0.logical</b> , where <b>logical</b> is a logical unit number from 0 through 16385 for static interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | <p>Configure the threshold for sending symbol period events or taking the action specified in the action profile.</p> <p>A symbol error is any symbol code error on the underlying physical layer. The symbol period threshold is reached when the number of symbol errors reaches the configured value within the period window. The default period window is the number of symbols that can be transmitted on the underlying physical layer in 1 second. The window is not configurable.</p> |
| <b>Options</b>                  | <p><b>count</b>—Threshold count for symbol period events.</p> <p><b>Range:</b> 0 through 100</p>                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | <p>Define the LACP system identifier at the aggregated Ethernet interface level.</p> <p>The user-defined system identifier in LACP enables two ports from two separate routers (M Series or MX Series routers) to act as though they were part of the same aggregate group.</p> <p>The system identifier is a 48-bit (6-byte) globally unique field. It is used in combination with a 16-bit system-priority value, which results in a unique LACP system identifier.</p> |

| <b>Description</b>              | <p>Define LACP system priority at the aggregated Ethernet interface level. This system priority value takes precedence over a system priority value configured at the global <code>[edit chassis]</code> hierarchy level.</p> <p>The device with the lower system priority value determines which links between LACP partner devices are active and which are in standby for each LACP group. The device on the controlling end of the link uses port priorities to determine which ports are bundled into the aggregated bundle and which ports are put in standby mode. Port priorities on the other device (the noncontrolling end of the link) are ignored. In priority comparisons, numerically lower values have higher priority. Therefore, the system with the numerically lower value (higher priority value) for LACP system priority becomes the controlling system. If both devices have the same LACP system priority (for example, they are both configured with the default setting of 127), the device MAC address determines which switch is in control.</p> |
| <b>Options</b>                  | <p><b><i>priority</i></b>—Priority for the aggregated Ethernet system. A smaller value indicates a higher priority.</p> <p><b>Range:</b> 0 through 65535</p> <p><b>Default:</b> 127</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>         | <p>Configure primary and backup links, group similar subscribers, and specify a subscriber weight for manual targeting to distribute subscribers across aggregated Ethernet member links.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>             | <p><b>backup</b>—(Optional) Specify a backup member link per subscriber when you configure manual targeting.</p> <p><b>group</b>—(Optional) Assign a group name for subscribers with similar bandwidth usage. Subscribers that are configured for targeted distribution without a group name are added to the <b>default</b> group and distributed evenly across member links. Grouping of subscribers is supported only for static subscribers.</p> <p><b>Default:</b> default</p> <p><b>primary</b>—Specify a primary member link per subscriber when you configure manual targeting. You must always configure a primary link when you configure manual targeting.</p> <p><b>weight (\$junos-interface-target-weight   <i>weight-value</i>)</b>—Specify the weight for targeted subscribers like PPPoE, demux, and conventional VLANs based on factors such as customer preferences, class of service (CoS), or bandwidth requirement. Member links for logical interfaces of aggregated Ethernet logical interfaces are assigned based on the value of the weight. When a new VLAN is added to the same aggregated Ethernet bundle, then the primary member link selected for targeting is the one with the minimum primary load and the backup link selected for targeting is the one with the minimum overall load.</p> <p>The \$junos-interface-target-weight predefined variable is supported for dynamic configuration only. When you configure this predefined variable, the weight value is sourced from VSA 26-213 in the RADIUS Access-Accept message when a dynamic subscriber is authenticated.</p> |

**Range:** 1 through 1000

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

## thresholds

**Syntax**

```
thresholds {
 clear clear-value;
 interval interval-value;
 set set-value;
 warning-clear warning-clear-value;
 warning-set warning-set-value;
}
```

**Hierarchy Level** [edit interfaces *interfaces-name* link-degrade-monitor]

**Release Information** Statement introduced in Junos OS Release 15.1.

**Description** Configure the BER threshold values (such as set and clear thresholds) at which different corrective actions must be triggered on a degraded interface.

**Options** **clear *clear-value***—The BER threshold value at which the degraded link is considered recovered and the corrective action applied to the interface is reverted. You can configure this value in the 1E-*n* format, where 1 is the mantissa (remains constant) and *n* is the exponent. For example, a threshold value of 1E-3 refers to the BER threshold value of  $1 \times 10^{-3}$ . The supported exponent range is 1 through 16, and the default value is 12.

**interval *interval-value***—The number of consecutive link degrade events that are considered before any corrective action is taken. The supported value range for the interval is 1 through 256, and the default interval is 10.

**set *set-value***—The BER threshold value at which the link is considered degraded and a corrective action, specified by the user, is triggered. You can configure this value in the 1E-*n* format, where 1 is the mantissa (remains constant) and *n* is the exponent. For example, a threshold value of 1E-3 refers to the BER threshold value of  $1 \times 10^{-3}$ . The supported exponent range is 1 through 16, and the default value is 7.

**warning clear *warning-clear-value***—The link clear warning threshold. Every time this threshold value is reached, a system message is logged to indicate that the link degrade condition has been cleared on the interface. You can configure this value in the 1E-*n* format, where 1 is the mantissa (remains constant) and *n* is the exponent. For example, a threshold value of 1E-3 refers to the BER threshold value of  $1 \times 10^{-3}$ . The supported exponent range is 1 through 16, and the default value is 11.

**warning set *warning-set-value***—The link degrade warning threshold. Every time this threshold value is reached, a system message is logged to indicate that a link degrade has occurred on the interface. You can configure this value in the 1E-*n* format, where 1 is the mantissa (remains constant) and *n* is the exponent. For example, a threshold value of 1E-3 refers to the BER threshold value of  $1 \times 10^{-3}$ . The supported exponent range is 1 through 16, and the default value is 9.

**NOTE:** The lower the BER with high confidence level, the longer it takes to estimate it. In such cases, a few packet drops might be noticed (based on the bit error distribution) before a link degrade event is detected.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Define tracing operations for individual interfaces.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p>The interfaces <b>traceoptions</b> statement does not support a trace file. The logging is done by the kernel, so the tracing information is placed in the system <b>syslog</b> file in the directory <i>/var/log/dcd</i>.</p> <p>On EX Series, QFX Series, and NFX Series platforms, configure tracing options the link fault management.</p> <p>On ACX Series, SRX Series, MX Series, M Series, and T Series platforms define tracing operations for the interface process (dcd).</p> |
| <b>Default</b>             | If you do not include this statement, no interface-specific tracing operations are performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Options** [Table 120 on page 1298](#) lists options for traceoption command for the following platforms:

Table 120: Options for traceoptions

| Option               | Individual interfaces with PTX Series, ACX Series, EX Series                                                                                                                                                                                                                                                                                                  | Individual interfaces with QFX Series, QFabric System, OCX1100, EX4600, NFX Series                                                                                                                                                                                                                                                                            | Interface Process with OAMLFM with EX Series, QFX Series, NFX Series                                                                                                                                                                                                                                                                                                                                                                                                      | Interface process with ACX Series, SRX Series, MX Series, M Series, T Series                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>         | Define tracing operations for the LACP protocol.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Default</b>             | If you do not include this statement, no LACP protocol tracing operations are performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>             | <p><b>filename</b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. By default, interface process tracing output is placed in the file <b>lacpd</b>.</p> <p><b>files number</b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—All LACP tracing operations</li> <li>• <b>configuration</b>—Configuration code</li> <li>• <b>packet</b>—Packets sent and received</li> <li>• <b>process</b>—LACP process events</li> <li>• <b>protocol</b>—LACP protocol state machine</li> <li>• <b>routing-socket</b>—Routing socket events</li> <li>• <b>startup</b>—Process startup events</li> </ul> <p><b>no-world-readable</b>—(Optional) Prevent any user from reading the log file.</p> |

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option:

**Syntax:** **xk** to specify kilobytes, **xm** to specify megabytes, or **xg** to specify gigabytes

**Range:** 10 KB through the maximum file size supported on your router

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

| Description         | Define tracing operations for PPPoE processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Options             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>disable</b>—Disable this trace flag.</p> <p><b>filter</b>—Additional filter to refine the output to display particular subscribers. Filtering based on the following subscriber identifiers simplifies troubleshooting in a scaled environment.</p> <hr/> <div>  <p><b>BEST PRACTICE:</b> Due to the complexity of agent circuit identifiers and agent remote identifiers, we recommend that you do not try an exact match when filtering on these options. For service names, searching on the exact name is appropriate, but you can also use a regular expression with that option.</p> </div> <hr/> <ul style="list-style-type: none"> <li>• <b>aci <i>regular-expression</i></b>—Regular expression to match the agent circuit identifier provided by PPPoE client.</li> </ul> |

- **ari *regular-expression***—Regular expression to match the agent remote identifier provided by PPPoE client.
- **service *regular-expression***—Regular expression to match the name of PPPoE service.
- **underlying-interface *interface-name***—Name of a PPPoE underlying interface. You cannot use a regular expression for this filter option.

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all**—Trace all operations.
- **config**—Trace configuration events.
- **events**—Trace events.
- **gres**—Trace GRES events.
- **init**—Trace initialization events.
- **interface-db**—Trace interface database operations.
- **memory**—Trace memory processing events.
- **protocol**—Trace protocol events.
- **rtsock**—Trace routing socket events.
- **session-db**—Trace connection events and flow.
- **signal**—Trace signal operations.
- **state**—Trace state handling events.
- **timer**—Trace timer processing.
- **ui**—Trace user interface processing.

**level**—Level of tracing to perform. You can specify any of the following levels:

- **all**—Match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**Default:** **error**

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **sizek** to specify KB, **sizem** to specify MB, or **sizeg** to specify GB

**Range:** 10240 through 1073741824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

**Required Privilege Level** trace—To view this statement in the configuration.  
trace-control—To add this statement to the configuration.

## tx-duration

**Syntax** expected-defect {  
tx-duration ;

**Hierarchy Level** [edit protocols **oam ethernet connectivity-fault-management** expected-defect]

**Release Information** Statement introduced in Junos OS Release 19.1.

**Description** The expected duration for which the peer MEP should suppress the LoC alarms.

**Options** **Minimum value**—The minimum value at which the peer MEP should suppress the LoC alarms is 120 *seconds*.

**Minimum value**—The maximum acceptable value at which the peer MEP should suppress the LoC alarms is 3600 *seconds*.

**Default**—900 *seconds*.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Hierarchy Level** [edit interfaces *interface-name*],  
 [edit logical-systems *logical-system-name* interfaces *interface-name*],  
 [edit interfaces interface-set *interface-set-name* interface *interface-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Range increased for static pseudowire interfaces to 1,073,741,823 in Junos OS Release 18.3R1.

**Description** Configure a logical interface on the physical device. You must configure a logical interface to be able to use the physical device.

**Options** *logical-unit-number*—Number of the logical unit.  
**Range:** 0 through 1,073,741,823 for demux, PPPoE, and pseudowire static interfaces. 0 through 16,385 for all other static interface types.  
*etree-ac-role (leaf | root)*—To configure an interface as either leaf or root.  
 The remaining statements are explained separately. Search for a statement in [CLI Explorer](#) or click a linked statement in the Syntax section for details.

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

| <b>Description</b>         | <p>For Ethernet interfaces, enable the local address to be derived from the specified interface. Configuring unnumbered Ethernet interfaces enables IP processing on the interface without assigning an explicit IP address to the interface. To configure unnumbered address dynamically, include the <code>\$junos-loopback-interface-address</code> predefined variable.</p> <p>You can configure unnumbered address support on Ethernet interfaces for IPv4 and IPv6 address families.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>             | <p><b><i>interface-name</i></b>—Name of the interface from which the local address is derived. The specified interface must have a logical unit number, a configured IP address, and must not be an unnumbered interface. This value can be a specific interface name or the <code>\$junos-loopback-interface</code> predefined variable.</p> <p>When defining the <code>unnumbered-address</code> statement using a static interface, keep the following in mind:</p> <ul style="list-style-type: none"> <li>If you choose to include the <code>routing-instance</code> statement at the [edit dynamic-profiles] hierarchy level, that statement must be configured with a dynamic value by using the <code>\$junos-routing-instance</code> predefined variable. In addition, whatever static unnumbered interface you specify must belong to that routing instance; otherwise, the profile instantiation fails.</li> <li>If you choose to not include the <code>routing-instance</code> statement at the [edit dynamic-profiles] hierarchy level, the unnumbered-address statement uses the default routing instance. The use of the default routing instance requires that the unnumbered interface be configured statically and that it reside in the default routing instance.</li> </ul> |

**NOTE:** When you specify a static logical interface for the unnumbered interface in a dynamic profile that includes the `$junos-routing-instance` predefined variable, you must not configure a preferred source address, whether with the `$junos-preferred-source-address` predefined variable, the `$junos-preferred-source-ipv6-address` predefined variable, or the

**preferred-source-address** statement. Configuring the preferred source address in this circumstance causes a commit failure.

When defining the **unnumbered-address** statement using the **\$junos-loopback-interface** predefined variable, keep the following in mind:

- To use the **\$junos-loopback-interface** predefined variable, the dynamic profile must also contain the **routing-instance** statement configured with the **\$junos-routing-instance** predefined variable at the [edit dynamic-profiles] hierarchy level.
- The applied loopback interface is based on the dynamically obtained routing instance of the subscriber.

**address**—(Optional) Secondary IP address of the donor interface. Configuring the preferred source address enables you to use an IP address other than the primary IP address on some of the unnumbered Ethernet interfaces in your network. This value can be a static IP address, the **\$junos-preferred-source-address** predefined variable for the inet family, or the **\$junos-preferred-source-ipv6-address** predefined variable for the inet6 family.

When defining the **preferred-source-address** value using a static IP address, keep the following in mind:

- The unnumbered interface must be statically configured.
- The IP address specified as the **preferred-source-address** must be configured in the specified unnumbered interface.

When defining the **preferred-source-address** value using the **\$junos-preferred-source-address** or the **\$junos-preferred-source-ipv6-address** predefined variables, keep the following in mind:

- You must configure the **unnumbered-address** statement using the **\$junos-loopback-interface** predefined variable.
- You must configure the **routing-instance** statement using the **\$junos-routing-instance** predefined variable at the [edit dynamic-profiles] hierarchy level.
- The preferred source address chosen is based on the dynamically applied loopback address which is in turn derived from the dynamically obtained routing instance of the subscriber. The configured loopback address with the closest network match to the user IP address is selected as the preferred source address.

| Release Information      | <p>Statement introduced in Junos OS Release 9.5.</p> <p>Statement introduced in Junos OS Release 12.1 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 14.153-D10 for QFX Series switches.</p>                                                                                                                                                                                                                                                                                                                                                                            |
| Description              | <p>Define one of the two interface ports for Ethernet ring protection, the other being defined by the <b>east-interface</b> statement at the same hierarchy level. The interface must use the control channel's logical interface name. The control channel is a dedicated VLAN channel for the ring port.</p>                                                                                                                                                                                                                                                                                   |
|                          | <p> <b>NOTE:</b> Always configure this port second, after configuring the <b>east-interface</b> statement.</p>                                                                                                                                                                                                                                                                                                                                                                                                |
|                          | <p>The remaining statements are explained separately. See <a href="#">CLI Explorer</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>clear interfaces interface-set statistics <i>interface-set-name</i></code>                                                                                                                                    |
| <b>Release Information</b>      | Command introduced in Junos OS Release 8.5.                                                                                                                                                                         |
| <b>Description</b>              | Set interface set statistics to zero.                                                                                                                                                                               |
| <b>Options</b>                  | <i>interface-set-name</i> —Set statistics on a specified interface set to zero. Wildcard values can be used in the interface set name. This command will not clear the statistics of the member logical interfaces. |
| <b>Required Privilege Level</b> | clear                                                                                                                                                                                                               |
| <b>List of Sample Output</b>    | <a href="#">clear interfaces interface-set statistics on page 1330</a>                                                                                                                                              |
| <b>Output Fields</b>            | When you enter this command, you are provided feedback on the status of your request.                                                                                                                               |

### Sample Output

#### clear interfaces interface-set statistics

```
user@host> clear interfaces interface-set statistics
```

## clear interfaces interval

|                                 |                                                                                                                                                                                                               |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>clear interfaces interval <i>interface-name</i></code>                                                                                                                                                  |
| <b>Release Information</b>      | Command introduced before Junos OS Release 7.4.                                                                                                                                                               |
| <b>Description</b>              | Clear the channel service unit (CSU) alarm and defect counters so that only the current time interval is displayed. This operation affects the <b>show interface interval</b> command, but not an SNMP query. |
| <b>Options</b>                  | <i>interface-name</i> —Name of a particular interface.                                                                                                                                                        |
| <b>Required Privilege Level</b> | clear                                                                                                                                                                                                         |

| Release Information      | Command introduced in Junos OS Release 13.2R1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Description              | <p>Clear the specified aggregate Ethernet interface load balancing state and re-create it newly. If the traffic flows become aged frequently, then the device needs to remove or refresh the load balancing states. As a result, you must configure rebalancing or run the clear command at periodic intervals for proper load-balancing. Otherwise, traffic skewing can occur.</p> <p>If you observe load distribution to be not very effective, you can clear the load-balancing states or use rebalancing functionality to cause an automatic clearance of the hardware states. When you configure the rebalancing facility, traffic flows can get redirected to different links, which can cause packet reordering.</p> |
| Options                  | <p><b>aeX</b>—Name of a particular aggregated Ethernet interface.</p> <p><b><i>logical-unit-number</i></b>—Number of the logical unit of the interface.</p> <p><b>forwarding-options load-balance state</b>—Cause the load-balancing state to be cleared for the specific interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### Sample Output

#### clear interfaces aeX aggregate forwarding-options

```
user@host> clear interfaces ae1 aggregate forwarding-options load-balance state
```

---

## clear interfaces aggregate forwarding-options load-balance state

---

**Syntax**      `clear interfaces aggregate forwarding-options load-balance state`

**Release Information**      Command introduced in Junos OS Release 13.2R1.

**Description**      Clear all the aggregate Ethernet interface load balancing states and re-create them newly. If the traffic flows become aged frequently, then the device needs to remove or refresh the load balancing states. As a result, you must configure rebalancing or run the clear command at periodic intervals for proper load-balancing. Otherwise, traffic skewing can occur.

**Options**      *interface-name*—Name of a particular interface.

**Required Privilege Level**      clear

**Related Documentation**      • [show interfaces interval on page 1629](#)

**List of Sample Output**      [clear interfaces aggregate forwarding-options on page 1335](#)

### Sample Output

`clear interfaces aggregate forwarding-options`

```
user@host> clear interfaces aggregate forwarding-options load-balance state
```

## clear interfaces transport pm

### Sample Output

clear oam ethernet connectivity-fault-management continuity-measurement

```
user@host> clear oam ethernet connectivity-fault-management continuity-measurement
maintenance-domain md5 maintenance-association ma5 local-mep 100 remote-mep 102
Continuity measurement restarted.
```

## clear oam ethernet connectivity-fault-management linktrace path-database

---

**Syntax** `clear oam ethernet connectivity-fault-management linktrace path-database mac-address maintenance-association ma-name maintenance-domain md-name`

**Release Information** Command introduced in Junos OS Release 9.0.

**Description** Clear all the linktrace entries and the relevant path information from the database for a particular remote host on M320, MX Series, T320, and T640 routers.

**Options** **mac-address**—Clear connectivity fault management path database information for the specified MAC address of the remote host.

**maintenance-association *ma-name***—Clear connectivity fault management path database information for the specified maintenance association.

**maintenance-domain *md-name***—Clear connectivity fault management path database information for the specified maintenance domain.

**Required Privilege Level** view

### Sample Output

clear oam ethernet connectivity-fault-management linktrace path-database

```
user@host> clear oam ethernet connectivity-fault-management linktrace path-database
maintenance-domain md1 maintenance-association ma3 00058573e483
```

This command produces no output.

| <b>Release Information</b>      | Command introduced in Junos OS Release 8.4.<br>Support for ETH-DM statistics and frame counts added in Junos OS Release 9.5.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>For all routers that support IEEE 802.1ag OAM connectivity-fault management (CFM), clear all statistics maintained by CFM.</p> <p>In addition, for Ethernet interfaces on Dense Port Concentrators (DPCs) in MX Series routers only, also clear any ITU-T Y.1731 Ethernet frame delay measurement (ETH-DM) statistics and ETH-DM frame counts.</p> <p>By default, the command clears CFM statistics and ETH-DM statistics and frame counts for CFM maintenance association end points (MEPs) attached to any interface on the router.</p> |
| <b>Options</b>                  | <p><b><i>ethernet-interface-name</i></b>—(Optional) Clear CFM statistics, ETH-DM statistics, and ETH-DM frame counts only for MEPs attached to the specified Ethernet physical interface.</p> <p><b><i>level</i></b>—(Optional) Clear CFM statistics, ETH-DM statistics, and ETH-DM frame counts only for MEPs within CFM maintenance domains (MDs) of the specified level.</p>                                                                                                                                                              |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### Sample Output

#### clear protection-group ethernet-ring statistics

To clear all Ethernet ring protection group statistics for all protection groups, use the following command:

```
user@host> clear protection-group ethernet-ring statistics
```

### Sample Output

#### clear protection-group ethernet-ring statistics

To clear Ethernet ring protection group statistics for the group *my\_prot\_group*, use the following command:

```
user@host> clear protection-group ethernet-ring statistics group-name my_prot_group
```

## monitor ethernet delay-measurement

**Syntax** monitor ethernet delay-measurement  
 maintenance-domain *md-name*  
 maintenance-association *ma-name*  
 (one-way | two-way)  
 (*remote-mac-address* | mep *remote-mep-id*)  
 <count *frame-count*>  
 <local-mep *mep-id*>  
 <wait *interval-seconds*>  
 <priority *802.1p value*>  
 <size>  
 <no-session-id-tlv>  
 <xml>

**Release Information** Command introduced in Junos OS Release 9.5.  
**local-mep** option introduced in Junos OS Release 15.1.

**Description** Start an ITU-T Y.1731 Ethernet frame delay measurement session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. Frame delay measurement statistics are stored at one of the MEPs for later retrieval.

**NOTE:** If you attempt to monitor delays to a nonexistent MAC address, you must type Ctrl +c to explicitly quit the **monitor ethernet delay-measurement** command and return to the CLI command prompt.

To start an Ethernet frame delay measurement session, the router initiates an exchange of frames carrying one-way or two-way frame delay measurement protocol data units (PDUs) between the local and remote MEPs. The frame counts—the types of and number of Ethernet frame delay measurement PDU frames exchanged to measure frame delay times—are displayed as the runtime output of the **monitor ethernet delay-measurement** command and are also stored at both the initiator and receiver MEPs for later retrieval. Ethernet frame delay measurement statistics, described below, are measured and stored at only one of the MEPs:

**Frame delay**—The difference, in microseconds, between the time a frame is sent and when it is received.

**Frame delay variation**—The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

For one-way Ethernet frame delay measurement, only the receiver MEP (on the remote system) collects statistics. For two-way Ethernet frame delay measurement, only the initiator MEP (on the local system) collects statistics.

- Options**
- maintenance-domain *md-name***—Name of an existing CFM maintenance domain.
  - maintenance-association *ma-name***—Name of an existing CFM maintenance association.
  - one-way**—Measurement type is one-way Ethernet frame delay measurement, which is based on the difference between the time at which the initiator MEP sends a one-way delay measurement request (IDM) frame and the time at which the receiver MEP receives the frame.
  - two-way**—Measurement type is two-way Ethernet frame delay measurement, which is based on the difference between the time at which the initiator MEP sends a two-way delay measurement message (DMM) frame and the time at which the initiator MEP receives an associated two-way delay measurement reply (DMR) frame from the responder MEP, subtracting the time elapsed at the responder MEP.
  - mep *remote-mep-id***—Numeric identifier of the peer MEP with which to perform Ethernet frame delay measurement. The discovered MAC address of the peer MEP is used. The range of values is 1 through 8191.
  - remote-mac-address**—Unicast MAC address of the peer MEP with which to perform Ethernet frame delay measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, **0011.2233.4455** or **00:11:22:33:44:55**. Multicast MAC addresses are not supported.
  - count *frame-count***—(Optional) Number of frames to send to the specified peer MEP. The range of values is 1 through 65,535 frames. The default value is 10 frames.
  - local-mep *mep-id***—(Required when multiple MEPs are configured) Identifier for the local maintenance association end point.
  - wait *interval-seconds***—(Optional) Number of seconds to wait between sending frames. The range of values is from 1 through 255 seconds. The default value is 1 second.
  - priority *802.1p value***—(Optional) Priority of the delay measurement request frame supported by both one-way delay measurement and two-way delay measurement. The range of values is from 0 through 7. The default value is zero.
  - size**—(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.
  - no-session-id-tlv**—(Optional) Prevent insertion of the session ID TLV in the request frame.
  - xml**—(Optional) Allow the output of the command to be displayed in XML format supported by both one-way delay measurement and two-way delay measurement. Note that the only way to get output in XML format is to use the **xml** argument. The **display xml** command does not work.

**Additional Information** To display the frame counts collected at an MEP as the result of this command, see the following command descriptions in the [CLI Explorer](#):

- **show oam ethernet connectivity-fault-management interfaces detail**
- **show oam ethernet connectivity-fault-management mep-database**
- **show oam ethernet connectivity-fault-management mep-statistics**

To display the statistics collected at an MEP as the result of this command, see the following command descriptions in the [CLI Explorer](#).

- **show oam ethernet connectivity-fault-management delay-statistics**
- **show oam ethernet connectivity-fault-management mep-statistics**

To clear both the frame counts and the statistics collected for MEPs, use the **clear oam ethernet connectivity-fault-management statistics** command, described in the [CLI Explorer](#).

For a complete description of Ethernet frame delay measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.

**List of Sample Output** [monitor ethernet delay-measurement one-way on page 1350](#)  
[monitor ethernet delay-measurement two-way on page 1351](#)  
[monitor ethernet delay-measurement two-way \(Invalid DMR Frames Received\) on page 1351](#)

**Output Fields** The **monitor ethernet delay-measurement** command displays different output at the CLI, depending on whether you start a one-way or two-way frame delay measurement:

- [Table 121 on page 1349](#) lists the run-time output fields for the **monitor ethernet delay-measurement one-way** command.
- [Table 122 on page 1350](#) lists the run-time output fields for the **monitor ethernet delay-measurement two-way** command.

Output fields are listed in the approximate order in which they appear.

*Table 121: monitor ethernet delay-measurement one-way Output Fields*

| Output Field Name         | Output Field Description                                                                       |
|---------------------------|------------------------------------------------------------------------------------------------|
| One-way ETH-DM request to | Unicast MAC address of the remote peer MEP.                                                    |
| Interface                 | Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached. |
| 1DM Frames sent           | PDU frames sent to the remote MEP in this ETH-DM session.                                      |
| Packets transmitted       | Total number of 1DM PDU frames sent to the remote MEP during this measurement session.         |

*Table 121: monitor ethernet delay-measurement one-way Output Fields (continued)*

| Output Field Name              | Output Field Description                              |
|--------------------------------|-------------------------------------------------------|
| <b>Average delay</b>           | Average two-way frame delay measured in this session. |
| <b>Average delay variation</b> | Average frame jitter measured in this session.        |
| <b>Best case delay</b>         | Lowest two-way frame delay measured in this session.  |
| <b>Worst case delay</b>        | Highest two-way frame delay measured in this session. |

**NOTE:** For one-way delay measurement, these CLI output fields display **NA** ("not applicable") at the initiator MEP because one-way frame delay measurements occur at the receiver MEP.

*Table 122: monitor ethernet delay-measurement two-way Output Fields*

| Output Field Name                                          | Output Field Description                                                                                        |
|------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Two-way Ethernet frame delay measurement request to</b> | Unicast MAC address of the remote peer MEP.                                                                     |
| <b>Interface</b>                                           | Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.                  |
| <b>DMR received from</b>                                   | Unicast MAC address of the remote MEP that transmitted this DMR frame in response to a DMM frame.               |
| <b>Delay</b>                                               | Two-way delay, in microseconds, for the initiator-transmitted DMM frame.                                        |
| <b>Delay variation</b>                                     | Difference, in microseconds, between the current and previous delay values. This is also known as frame jitter. |
| <b>Packets transmitted</b>                                 | Total number of DMM PDU frames sent to the remote MEP in this measurement session.                              |
| <b>Valid packets received</b>                              | Total number of DMR PDU frames received from the remote MEP in this measurement session.                        |
| <b>Average delay</b>                                       | Average two-way frame delay measured in this session.                                                           |
| <b>Average delay variation</b>                             | Average frame jitter measured in this session.                                                                  |
| <b>Best case delay</b>                                     | Lowest two-way frame delay measured in this session.                                                            |
| <b>Worst case delay</b>                                    | Highest two-way frame delay measured in this session.                                                           |

## Sample Output

### monitor ethernet delay-measurement one-way

```
user@host> monitor ethernet delay-measurement one-way 00:05:85:73:39:4a
maintenance-domain md6 maintenance-association ma6 count 10
```

```

One-way ETH-DM request to 00:05:85:73:39:4a, Interface xe-5/0/0.0
1DM Frames sent : 10
--- Delay measurement statistics ---
Packets transmitted: 10
Average delay: NA, Average delay variation: NA
Best case delay: NA, Worst case delay: NA

```

### monitor ethernet delay-measurement two-way

```

## monitor ethernet loss-measurement

**Syntax**

```
monitor ethernet loss-measurement
maintenance-domain md-name
maintenance-association ma-name
(remote-mac-address | mep remote-mep-id)
<count frame-count>
<local-mep mep-id>
<wait interval-seconds>
<priority 802.1p value>
<no-session-id-tlv>
<xml>
```

**Release Information** Command introduced in Junos OS Release 11.1.  
**local-mep** option introduced in Junos OS Release 15.1

**Description** Start an ITU-T Y.1731 Ethernet frame loss measurement session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a count of transmitted and received data frames between the pair of MEPs. Frame loss measurement statistics are stored at one of the MEPs for later retrieval. For MX Series routers, supports point-to-point down MEPs for Ethernet interfaces (as per IEEE 802.1ag over VPWS).

**NOTE:** If you attempt to monitor loss to a nonexistent MAC address, you must type Ctrl + c to explicitly quit the **monitor ethernet loss-measurement** command and return to the CLI command prompt.

To start an Ethernet frame loss measurement session, the router first sends frames with ETH-LM information to a peer MEP and similarly receives frames with ETH-LM information from the peer MEP. Frame loss is calculated by collecting the counter values applicable for ingress and egress service frames where the counters maintain a count of transmitted and received data frames between a pair of MEPs. The loss measurement statistics are retrieved as the output of the **monitor ethernet loss-measurement** command and are also stored at the initiator. The frames counts are stored at both the initiator and the receiver MEPs for later retrieval.

**Options**

- maintenance-domain *md-name***—Name of an existing CFM maintenance domain.
- maintenance-association *ma-name***—Name of an existing CFM maintenance association.
- mep *remote-mep-id***—Numeric identifier of the peer MEP with which to perform Ethernet frame loss measurement. The discovered MAC address of the peer MEP is used. The range of values is from 1 through 8192.
- remote-mac-address***—Unicast MAC address of the peer MEP with which to perform Ethernet frame loss measurement. Specify the MAC address as six hexadecimal

bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn* (for example, **0011.2233.4455** or **00:11:22:33:44:55**). Multicast MAC addresses are not supported.

**count *frame-count***—(Optional) Number of frames to send to the specified peer MEP. The range of values is from 1 through 65535 frames. The default value is 10 frames.

**local-mep *mep-id***—(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.

**wait *interval-seconds***—(Optional) Number of seconds to wait between sending frames. The range of values is from 1 through 255 seconds. The default value is 1 second.

**priority *802.1p value***—(Optional) Priority of the delay measurement request frame. The range of values is from 0 through 7. The default value is 1 second.

**no-session-id-tlv**—(Optional) Disable the **session id TLV** argument set in the request frame.

**xml**—(Optional) Allow the output of the command to be displayed in XML format.

**Additional Information** To display the iterator output for an LM session, run the following command:

- **show oam ethernet connectivity-fault-management sla-iterator-statistics sla-iterator <profile> maintenance-association <MA> maintenance-domain <MD> local-mep <MEP> remote-mep <RMEP>**

To display the frame counts collected at an MEP as the result of this command, see the following command descriptions in the [CLI Explorer](#):

- **show oam ethernet connectivity-fault-management loss-statistics**
- **show oam ethernet connectivity-fault-management interfaces detail**
- **show oam ethernet connectivity-fault-management mep-database**
- **show oam ethernet connectivity-fault-management mep-statistics**

To display the statistics collected at an MEP as the result of this command, see the following command descriptions in the [CLI Explorer](#):

- **show oam ethernet connectivity-fault-management delay-statistics**
- **show oam ethernet connectivity-fault-management mep-statistics**

To clear both the frame counts and the statistics collected for MEPs, use the **clear oam ethernet connectivity-fault-management loss-statistics maintenance-domain *md-name* maintenance-association *ma-name*** command, as described in the [CLI Explorer](#).

For a complete description of Ethernet frame loss measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.

**Output Fields** [Table 123 on page 1354](#) lists the output fields for the **monitor ethernet loss-measurement** command and their descriptions. Output fields are listed in the approximate order in which they appear.

*Table 123: monitor ethernet loss-measurement output fields*

| Output Field Name                          | Output Field Description                                                                                                                                                       |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ethernet loss delay measurement request to | Unicast MAC address of the remote peer MEP.                                                                                                                                    |
| Interface                                  | Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.                                                                                 |
| LMR received from                          | Unicast MAC address of the remote MEP that transmitted this LMR frame in response to a loss measurement message (LMM) frame.                                                   |
| Near-end frame loss                        | Count of frame loss associated with ingress data frames.                                                                                                                       |
| Far-end frame loss                         | Count of frame loss associated with egress data frames.                                                                                                                        |
| Near-end loss ratio                        | Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the ingress interface. |
| Far-end loss ratio                         | Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the egress interface.  |
| LMM packets transmitted                    | Total number of LMM PDU frames sent to the remote MEP in this measurement session.                                                                                             |
| LMR packets received                       | Total number of LMR PDU frames received from the remote MEP in this measurement session.                                                                                       |
| Average near-end frame loss                | Average frame loss measured in this session associated with ingress data frames.                                                                                               |
| Average near-end loss ratio                | Average frame loss ratio measured in this session associated with ingress data frames.                                                                                         |
| Average far-end frame loss                 | Average frame loss measured in this session associated with egress data frames.                                                                                                |
| Average far-end loss ratio                 | Average frame loss ratio measured in this session associated with egress data frames.                                                                                          |
| Near-end best case frame loss              | Lowest frame loss measured in this session associated with ingress data frames.                                                                                                |

Table 123: monitor ethernet loss-measurement output fields (continued)

| Output Field Name              | Output Field Description                                                               |
|--------------------------------|----------------------------------------------------------------------------------------|
| Near-end best case loss ratio  | Lowest frame loss ratio measured in this session associated with ingress data frames.  |
| Near-end worst case frame loss | Highest frame loss measured in this session associated with ingress data frames.       |
| Near-end worst case loss ratio | Highest frame loss ratio measured in this session associated with ingress data frames. |
| Far-end best case frame loss   | Lowest frame loss measured in this session associated with egress data frames.         |
| Far-end best case loss ratio   | Lowest frame loss ratio measured in this session associated with egress data frames.   |
| Far-end worst case frame loss  | Highest frame loss measured in this session associated with egress data frames.        |
| Far-end worst case loss ratio  | Highest frame loss ratio measured in this session associated with egress data frames.  |

Note that in the preceding table, the term *number of service frames not delivered* is the difference between the number of service frames arriving at the ingress Ethernet flow point and the number of service frames delivered at the egress Ethernet flow point in a point-to-point Ethernet connection.

## Sample Output

## monitor ethernet synthetic-loss-measurement

**Syntax** monitor ethernet synthetic-loss-measurement  
 maintenance-domain *md-name*  
 maintenance-association *ma-name*  
 (*remote-mac-address* | mep *remote-mep-id*)  
 <count *frame-count*>  
 <local-mep *mep-id*>  
 <wait *interval-milliseconds*>  
 <priority *802.1p value*>  
 <size>  
 <xml>

**Release Information** Command introduced in Junos OS Release 13.2 for MX Series routers.  
**local-mep** option introduced in Junos OS Release 15.1

**Description** (MX Series routers) Start an ITU-T Y.1731 Ethernet synthetic loss measurement (ETH-SLM) session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. ETH-SLM (also called synthetic frame loss measurement) statistics are stored at one of the MEPs for later retrieval.

**NOTE:** If you attempt to monitor delays to a nonexistent MAC address, you must press Ctrl +c to explicitly quit the **monitor ethernet synthetic-loss-measurement** command and return to the CLI command prompt.

To start an Ethernet synthetic frame loss measurement session, the router initiates an exchange of frames carrying synthetic frame loss measurement protocol data units (PDUs) between the local and remote MEPs. The frame counts—the types of and number of Ethernet synthetic frame loss measurement PDU frames exchanged to measure frame delay times—are displayed as the run-time output of the **monitor ethernet synthetic-loss-measurement** command and are also stored at both the initiator and receiver MEPs for later retrieval. Ethernet synthetic frame loss measurement statistics, described below, are measured and stored at only one of the MEPs:

**Frame delay**—The difference, in microseconds, between the time a frame is sent and when it is received.

**Frame delay variation**—The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

**Options** **maintenance-domain** *md-name*—Name of an existing CFM maintenance domain.  
**maintenance-association** *ma-name*—Name of an existing CFM maintenance association.

**mep remote-mep-id**—Numeric identifier of the peer MEP with which to perform Ethernet synthetic frame loss measurement. The discovered MAC address of the peer MEP is used. The range of values is from 1 through 8191.

**remote-mac-address**—Unicast MAC address of the peer MEP with which to perform Ethernet synthetic frame loss measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, **0011.2233.4455** or **00:11:22:33:44:55**. Multicast MAC addresses are not supported.

**count frame-count**—(Optional) Number of frames to send to the specified peer MEP. The range of values is from 1 through 65,535 frames. The default value is 10 frames.

**local-mep mep-id**—(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.

**wait interval-milliseconds**—(Optional) Number of milliseconds to wait between sending frames. You must specify this value in multiples of 100 milliseconds. The range of values is from 100 through 50000 milliseconds. The default value is 100 milliseconds.

**priority 802.1p value**—(Optional) Priority of the ETH-SLM request frame supported. The range of values is from 0 through 7. The default value is zero.

**size**—(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.

**xml**—(Optional) Allow the output of the command to be displayed in XML format for ETH-SLM. Note that the only way to get output in XML format is to use the **xml** argument. The **display xml** command does not work.

**Additional Information** To display the frame counts collected at a MEP as the result of this command, use the following commands as described in the [CLI Explorer](#):

- **show oam ethernet connectivity-fault-management interfaces detail**
- **show oam ethernet connectivity-fault-management mep-database**
- **show oam ethernet connectivity-fault-management mep-statistics**

To display the statistics collected at a MEP as the result of this command, use the following commands as described in the [CLI Explorer](#).

- **show oam ethernet connectivity-fault-management synthetic-loss-measurement**
- **show oam ethernet connectivity-fault-management mep-statistics**

To clear both the frame counts and the statistics collected for MEPs, use the **clear oam ethernet connectivity-fault-management statistics** command, described in the [CLI Explorer](#).

For a complete description of Ethernet synthetic frame loss measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.

**Output Fields** The **monitor ethernet synthetic-loss-measurement** command displays different output at the CLI, depending on when you start a synthetic frame loss measurement:

- [Table 124 on page 1359](#) lists the run-time output fields for the **monitor ethernet synthetic-loss-measurement** command.

Output fields are listed in the approximate order in which they appear.

*Table 124: monitor ethernet synthetic-loss-measurement Output Fields*

| Output Field Name                 | Output Field Description                                                                                                                                                                                                                                                                                                          |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ETH-SLM request to                | Unicast MAC address of the remote peer MEP.                                                                                                                                                                                                                                                                                       |
| Interface                         | Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.                                                                                                                                                                                                                                    |
| SLM packets sent                  | Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.                                                                                                                                                                                                   |
| SLR packets received              | Total number of synthetic loss reply (SLR) PDU frames received by the source MEP from the remote MEP during this measurement session.                                                                                                                                                                                             |
| Local TXFC1 value                 | Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.   |
| Local RXFC1 value                 | Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet. |
| Last Received SLR frame TXFCf(tc) | Value of the local counter TxFC1 at the time of SLM frame transmission.                                                                                                                                                                                                                                                           |
| Last Received SLR frame TXFCb(t)  | Value of the local counter RxFC1 at the time of SLR frame transmission.                                                                                                                                                                                                                                                           |
| Frame loss (near-end)             | Count of frame loss associated with ingress data frames.                                                                                                                                                                                                                                                                          |
| Frame loss (far-end)              | Count of frame loss associated with egress data frames.                                                                                                                                                                                                                                                                           |

## monitor ethernet synthetic-loss-measurement

**Syntax** monitor ethernet synthetic-loss-measurement  
 maintenance-domain *md-name*  
 maintenance-association *ma-name*  
 (*remote-mac-address* | mep *remote-mep-id*)  
 <count *frame-count*>  
 <local-mep *mep-id*>  
 <wait *interval-milliseconds*>  
 <priority *802.1p value*>  
 <size>  
 <xml>

**Release Information** Command introduced in Junos OS Release 13.2 for MX Series routers.  
**local-mep** option introduced in Junos OS Release 15.1

**Description** (MX Series routers) Start an ITU-T Y.1731 Ethernet synthetic loss measurement (ETH-SLM) session between the specified local connectivity fault management (CFM) maintenance association end point (MEP) and the specified remote MEP, and display a summary of the frames exchanged in the measurement session. ETH-SLM (also called synthetic frame loss measurement) statistics are stored at one of the MEPs for later retrieval.

**NOTE:** If you attempt to monitor delays to a nonexistent MAC address, you must press Ctrl +c to explicitly quit the **monitor ethernet synthetic-loss-measurement** command and return to the CLI command prompt.

To start an Ethernet synthetic frame loss measurement session, the router initiates an exchange of frames carrying synthetic frame loss measurement protocol data units (PDUs) between the local and remote MEPs. The frame counts—the types of and number of Ethernet synthetic frame loss measurement PDU frames exchanged to measure frame delay times—are displayed as the run-time output of the **monitor ethernet synthetic-loss-measurement** command and are also stored at both the initiator and receiver MEPs for later retrieval. Ethernet synthetic frame loss measurement statistics, described below, are measured and stored at only one of the MEPs:

**Frame delay**—The difference, in microseconds, between the time a frame is sent and when it is received.

**Frame delay variation**—The difference, in microseconds, between consecutive frame delay values. Frame delay variation is sometimes called “frame jitter.”

**Options** **maintenance-domain** *md-name*—Name of an existing CFM maintenance domain.  
**maintenance-association** *ma-name*—Name of an existing CFM maintenance association.

**mep remote-mep-id**—Numeric identifier of the peer MEP with which to perform Ethernet synthetic frame loss measurement. The discovered MAC address of the peer MEP is used. The range of values is from 1 through 8191.

**remote-mac-address**—Unicast MAC address of the peer MEP with which to perform Ethernet synthetic frame loss measurement. Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*. For example, **0011.2233.4455** or **00:11:22:33:44:55**. Multicast MAC addresses are not supported.

**count frame-count**—(Optional) Number of frames to send to the specified peer MEP. The range of values is from 1 through 65,535 frames. The default value is 10 frames.

**local-mep mep-id**—(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.

**wait interval-milliseconds**—(Optional) Number of milliseconds to wait between sending frames. You must specify this value in multiples of 100 milliseconds. The range of values is from 100 through 50000 milliseconds. The default value is 100 milliseconds.

**priority 802.1p value**—(Optional) Priority of the ETH-SLM request frame supported. The range of values is from 0 through 7. The default value is zero.

**size**—(Optional) Size of the data TLV to be included in the request frame. The range of values is from 1 through 1400 bytes.

**xml**—(Optional) Allow the output of the command to be displayed in XML format for ETH-SLM. Note that the only way to get output in XML format is to use the **xml** argument. The **display xml** command does not work.

**Additional Information** To display the frame counts collected at a MEP as the result of this command, use the following commands as described in the [CLI Explorer](#):

- **show oam ethernet connectivity-fault-management interfaces detail**
- **show oam ethernet connectivity-fault-management mep-database**
- **show oam ethernet connectivity-fault-management mep-statistics**

To display the statistics collected at a MEP as the result of this command, use the following commands as described in the [CLI Explorer](#).

- **show oam ethernet connectivity-fault-management synthetic-loss-measurement**
- **show oam ethernet connectivity-fault-management mep-statistics**

To clear both the frame counts and the statistics collected for MEPs, use the **clear oam ethernet connectivity-fault-management statistics** command, described in the [CLI Explorer](#).

For a complete description of Ethernet synthetic frame loss measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.

**Output Fields** The **monitor ethernet synthetic-loss-measurement** command displays different output at the CLI, depending on when you start a synthetic frame loss measurement:

- [Table 124 on page 1359](#) lists the run-time output fields for the **monitor ethernet synthetic-loss-measurement** command.

Output fields are listed in the approximate order in which they appear.

*Table 125: monitor ethernet synthetic-loss-measurement Output Fields*

| Output Field Name                 | Output Field Description                                                                                                                                                                                                                                                                                                          |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ETH-SLM request to                | Unicast MAC address of the remote peer MEP.                                                                                                                                                                                                                                                                                       |
| Interface                         | Name of the Ethernet physical, logical, or trunk interface to which the local MEP is attached.                                                                                                                                                                                                                                    |
| SLM packets sent                  | Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.                                                                                                                                                                                                   |
| SLR packets received              | Total number of synthetic loss reply (SLR) PDU frames received by the source MEP from the remote MEP during this measurement session.                                                                                                                                                                                             |
| Local TXFC1 value                 | Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.   |
| Local RXFC1 value                 | Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet. |
| Last Received SLR frame TXFCf(tc) | Value of the local counter TxFC1 at the time of SLM frame transmission.                                                                                                                                                                                                                                                           |
| Last Received SLR frame TXFCb(t)  | Value of the local counter RxFC1 at the time of SLR frame transmission.                                                                                                                                                                                                                                                           |
| Frame loss (near-end)             | Count of frame loss associated with ingress data frames.                                                                                                                                                                                                                                                                          |
| Frame loss (far-end)              | Count of frame loss associated with egress data frames.                                                                                                                                                                                                                                                                           |

## Sample Output

### monitor ethernet synthetic-loss-measurement

```
user@host> monitor ethernet synthetic-loss-measurement 00:05:85:73:39:4a
maintenance-domain md6 maintenance-association ma6 count 10
```

```
ETH-SLM request to 00:05:85:73:39:4a, interface ge-1/0/0.0
```

```
Synthetic Loss measurement statistics:
```

```
SLM packets sent : 100
```

```
SLR packets received : 100
```

```
Accumulated SLM statistics:
```

```
Local TXFC1 value : 100
```

```
Local RXFC1 value : 100
```

```
Last Received SLR frame TXFCf(tc) : 100
```

```
Last Received SLR frame TXFCb(tc) : 100
```

```
SLM Frame Loss:
```

```
Frame Loss (far-end) : 0 (0.00 %)
```

```
Frame Loss (near-end) : 0 (0.00 %)
```

## prbs-test-start

**Syntax** `test interfaces ifd-name prbs-test-start pattern-type type direction 0/1 flip 0/1`

**Release Information** Command introduced in Junos OS Release 19.2R1 for MX10003 and MX204 router.

**Description** You can check the physical link connectivity by issuing this command that starts collecting the Pseudo Random Binary Sequence (PRBS) statistics. The PRBS pattern generation and verification validates the physical link connectivity in a routers. If the PRBS test passes with PRBS31 pattern type consistently, it indicates that the quality of signal received is good.

This command provides the PRBS test statistics while test is in progress. Use the **clear interfaces statistics** command to clear the collected statistics.

Use the **show interfaces interface-name prbs-stats** command to view the collected statistics.

### NOTE:

- While running PRBS statistics, the link will be down.
- The interface link status goes down when PRBS is enabled and the interface state is back to the original state when PRBS is disabled.
- On MX10003 routers, the PRBS58 pattern is supported only on JNP-MIC1-MACSEC MIC.

Issue the **prbs-test-stop** command to stop collecting the PRBS statistics .

For the step-by-step procedure on how to collect and view the PRBS statistics, refer [“Verifying Link and Transceivers using Pseudo Random Binary Sequence \(PRBS\) Test”](#) on page 844.

**Options** *ifd-name*—Name of the interface.

*type*—Specifies the pattern type, that is in the range from 7 to 58.

Following pattern types are supported:

| Pattern Type | Pattern Name |
|--------------|--------------|
| 7            | PRBS7        |
| 9            | PRBS9        |
| 11           | PRBS11       |

| Pattern Type | Pattern Name                                                                          |
|--------------|---------------------------------------------------------------------------------------|
| 15           | PRBS15                                                                                |
| 23           | PRBS23                                                                                |
| 31           | PRBS31<br><i>NOTE:</i> Recommended pattern to check the quality of the received link. |
| 58           | PRBS58                                                                                |

**direction**—Specifies to configure transmit or receive PRBS pattern.

**flip**—Specifies if the pattern bits needs to be flipped or not.

**Required Privilege Level**

## Sample Output

### Stopping PRBS test statistics collection

```
user@host> test interface et-0/1/2 prbs-test-stop direction 1
```

## request interface link-degrade-recover

|                                 |                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>request interface link-degrade-recover <i>interfaces-name</i></code>                                                                                                                                                                                                                                                                                  |
| <b>Release Information</b>      | Command introduced in Junos OS Release 15.1.                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | Manually recover a degraded physical link. Manual recovery is used when the interface has any Layer 2 and Layer 3 protocols that prevents autorecovery. This command is applicable only if you have configured the manual link recovery option on the interface.                                                                                            |
|                                 | <div>  <p><b>NOTE:</b> Manual recovery option is recommended for user deployments that have static route configurations causing the remote end of the link to start forwarding packets (as soon as the physical link is up) while auto-recovery is in progress.</p> </div> |
| <b>Options</b>                  | <i>interfaces-name</i> —Name of the interface.                                                                                                                                                                                                                                                                                                              |
| <b>Required Privilege Level</b> | View                                                                                                                                                                                                                                                                                                                                                        |

request interface mc-ae switchover immediate mcae-id

```
user@host >request interface mc-ae switchover immediate mcae-id 2
MCAE: Switchover Done
```

## Sample Output

`request interface mc-ae switchover mcae-id`

```
user@host >request interface mc-ae switchover mcae-id 2
```

```
Switchover In Progress: Please check after 1 minutes,
```

```
Use "show interfaces mc-ae revertive-info" to check for the status
```

## request interface (revert | switchover) (Aggregated Ethernet Link Protection)

**Syntax** `request interface (revert | switchover) aex`

**Release Information** Command introduced in Junos OS Release 8.3.

**Description** Manually revert egress traffic from the designated backup link to the designated primary link of an aggregated Ethernet interface for which link protection is enabled, or manually switch egress traffic from the primary link to the backup link. This traffic includes transit traffic and local traffic originated on the router itself.

**NOTE:** When link protection is enabled on an aggregated Ethernet interface, if the primary link fails, the router automatically routes egress traffic to the backup link. However, the router does not automatically route egress traffic back to the primary link when the primary link is subsequently reestablished. Instead, you manually control when to have traffic diverted back to the primary link by issuing the `request interface (revert | switchover) (Aggregated Ethernet Link Protection)` operational command and specifying the `revert` keyword.

On M Series and T Series routers, use the `request interface (revert | switchover) (Adaptive Services)` operational command to manually revert to the primary adaptive services interface or link services interface, or to switch from the primary to the secondary interface. For information about this command, see *request interface (revert | switchover) (Adaptive Services)*.

**Options** `revert`—Restores egress traffic processing to the primary link.

`switchover`—Transfers egress traffic processing to the secondary (backup) link.

`aex`—Aggregated Ethernet logical interface number: 0 through 15.

**Required Privilege Level** view

**List of Sample Output** [request interface revert on page 1373](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

### Sample Output

`request interface revert`

```
user@host >request interface revert ae1
```

## request lacp link-switchover

---

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>request lacp link-switchover aex</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Release Information</b>      | Command introduced in Junos OS Release 9.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Manually switch aggregated Ethernet active or standby LACP links.<br><br><div> <b>NOTE:</b> Because this command overrides LACP priority calculations, we strongly recommend that you use this command only when the actor (in this case, the Juniper Networks router) is controlling the active or standby link and the partner (peer) is following. This scenario occurs when you configure only the actor for link protection.</div> |
| <b>Options</b>                  | <b>aex</b> —Aggregated Ethernet logical interface number: 0 through 15.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>List of Sample Output</b>    | <a href="#">request lacp link-switchover aeX on page 1374</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Output Fields</b>            | When you enter this command, you are provided feedback on the status of your request. To view the switchover, use the <b>show lacp interfaces</b> command.                                                                                                                                                                                                                                                                                                                                                               |

## Sample Output

### request lacp link-switchover aeX

```
user@host >request lacp link-switchover ae0ae0: Request succeeded
```

## show chassis hardware

|                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Release Information** Command introduced before Junos OS Release 7.4.  
**models** option introduced in Junos OS Release 8.2.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
**sfc** option introduced in Junos OS Release 9.6 for the TX Matrix Plus router.  
 Command introduced in Junos OS Release 11.1 for QFX Series.  
 Command introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.  
 Command introduced in Junos OS Release 12.2 for ACX Series Universal Metro Routers.  
 Command introduced in Junos OS Release 12.3 for MX2010 and MX2020 Universal Routing Platforms.  
 Information for **disk** and **usb** introduced in Junos OS Release 15.1X53-D60 for QFX10002, QFX10008, and QFX10016 switches.  
 Command introduced in Junos OS Release 15.1X54-D20 for ACX5048 and ACX5096 Routers.  
 Command introduced in Junos OS Release 17.2 for MX2008 Universal Routing Platforms.  
 Command introduced in Junos OS Release 17.2 for PTX10008 Routers.  
 Command introduced in Junos OS Release 17.3 for MX10003 Universal Routing Platforms.  
 Command introduced in Junos OS Release 17.3 for MX150 Router Appliance.  
 Command introduced in Junos OS Release 17.4 for MX204 Routers.  
 Command introduced in Junos OS Release 18.1R1 for EX9251 Switches.  
 Command introduced in Junos OS Release 18.2 for EX9253 Switches.  
 Command introduced in Junos OS Release 18.2R1 for MX10008 Routers

**NOTE:** Routers and routing platforms use the basic syntax, unless otherwise listed. For example, the EX Series has an additional satellite parameter available.

**Description** Display a list of all Flexible PIC Concentrators (FPCs) and PICs installed in the router or switch chassis, including the hardware version level and serial number.

In the EX Series switch command output, FPC refers to the following:

- On EX2200 switches, EX3200 switches, EX4200 standalone switches, and EX4500 switches—Refers to the switch; *FPC number* is always 0.
- On EX4200 switches in a Virtual Chassis configuration—Refers to the member of a Virtual Chassis; *FPC number* equals the member ID, from 0 through 9.
- On EX8208 and EX8216 switches—Refers to a line card; *FPC number* equals the slot number for the line card.

On QFX3500, QFX5100, and OCX Series standalone switches, and PTX1000 routers both the FPC and *FPC number* are always 0.

On T4000 Type 5 FPCs, there are no **top temperature sensor** or **bottom temperature sensor** parameters. Instead, **fan intake temperature sensor** and **fan exhaust temperature sensors** parameters are displayed.

Starting from Junos OS Release 11.4, the output of the **show chassis hardware models** operational mode command displays the enhanced midplanes FRU model numbers (CHAS-BP3-MX240-S, CHAS-BP3-MX480-S or CHAS-BP3-MX960-S) based on the router. Prior to release 11.4, the FRU model numbers are left blank when the router has enhanced midplanes. Note that the enhanced midplanes are introduced through the Junos OS Release 13.3, but can be supported on all Junos OS releases.

Starting with Junos OS Release 14.1, the output of the **show chassis hardware detail | extensive | clei-models | models** operational mode command displays the new DC power supply module (PSM) and power distribution unit (PDU) that are added to provide power to the high-density FPC (FPC2-PTX-P1A) and other components in a PTX5000 Packet Transport Router.

**NOTE:** The output samples provided here are intended only as representative examples of the various types of **show chassis hardware** outputs. They are not exhaustive samples of every possible option or platform variant.

- Options** **none**—Display information about hardware. For a TX Matrix router, display information about the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display information about the TX Matrix Plus router and its attached routers.
- clei-models**—(Optional) Display Common Language Equipment Identifier (CLEI) barcode and model number for orderable field-replaceable units (FRUs).
- detail**—(Optional) Include RAM and disk information in output.
- extensive**—(Optional) Display ID EEPROM information.
- all-members**—(MX Series routers only) (Optional) Display hardware-specific information for all the members of the Virtual Chassis configuration.
- interconnect-device *name***—(QFabric systems only) (Optional) Display hardware-specific information for the Interconnect device.
- lcc *number***—(TX Matrix routers and TX Matrix Plus router only) (Optional) On a TX Matrix router, display hardware information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display hardware information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display hardware-specific information for the local Virtual Chassis members.

**member *member-id***—(MX Series routers and EX Series switches) (Optional) Display hardware-specific information for the specified member of the Virtual Chassis configuration. Replace *member-id* variable with a value 0 or 1.

**models**—(Optional) Display model numbers and part numbers for orderable FRUs and, for components that use ID EEPROM format v2, the CLEI code.

**node-device *name***—(QFabric systems only) (Optional) Display hardware-specific information for the Node device.

**satellite [*slot-id slot-id* | device-alias *alias-name*]**—(Junos Fusion only) (Optional) Display hardware information for the specified satellite device in a Junos Fusion, or for all satellite devices in the Junos Fusion if no satellite devices are specified.

**scc**—(TX Matrix router only) (Optional) Display hardware information for the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus router only) (Optional) Display hardware information for the TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with 0.

**Additional Information** The **show chassis hardware detail** command now displays DIMM information for the following Routing Engines, as shown in [Table 126 on page 1378](#).

**Table 126: Routing Engines Displaying DIMM Information**

Routing Engines	Routers
RE-S-1800x2 and RE-S-1800x4	MX240, MX480, and MX960 routers
RE-A-1800x2	M120 and M320 routers

In Junos OS Release 11.4 and later, the output for the **show chassis hardware models** operational mode command for MX Series routers display the enhanced midplanes FRU model numbers—CHAS-BP3-MX240-S, CHAS-BP3-MX480-S, or CHAS-BP3-MX960-S—based on the router. In releases before Junos OS Release 11.4,

the FRU model numbers are left blank when the router has enhanced midplanes. Note that the enhanced midplanes are introduced through Junos OS Release 13.3, but can be supported on all Junos OS releases.

Starting with Junos OS Release 17.3R1, the output of the **show chassis hardware** command displays the mode in which vMX is running (performance mode or lite mode) in the part number field for the FPC. **RIOT-PERF** indicates performance mode and **RIOT-LITE** indicates lite mode.

**Output Fields**

[Table 127 on page 1380](#) lists the output fields for the **show chassis hardware** command. Output fields are listed in the approximate order in which they appear.

Table 127: show chassis hardware Output Fields

Field Name	Field Description	Level of Output
<b>Item</b>	<p>Chassis component:</p> <ul style="list-style-type: none"> <li>(EX Series switches)—Information about the chassis, Routing Engine (SRE and Routing Engine modules in EX8200 switches), power supplies, fan trays, and LCD panel. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs). Information about the backplane, midplane, and SIBs (SF modules) is displayed for EX8200 switches.</li> <li>(MX Series routers and EX Series switches)—Information about the backplane, Routing Engine, Power Entry Modules (PEMs), and fan trays. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs), Modular Port Concentrators (MPCs) and associated Modular Interface Cards (MICs), or Dense Port Concentrators (DPCs). MX80 routers have a single Routing Engine and a built-in Packet Forwarding Engine that attaches directly to MICs. The Packet Forwarding Engine has two “pseudo” FPCs (FPC 0 and FPC1). MX80 routers also have a Forwarding Engine Board (FEB). MX104 routers have a built-in Packet forwarding Engine and a Forwarding Engine Board (FEB). The Packet Forwarding Engine of the MX104 router has three “pseudo” FPCs (FPC0, FPC1, and FPC2).</li> <li>(M Series routers, except for the M320 router)—Information about the backplane; power supplies; fan trays; Routing Engine; maxicab (the connection between the Routing Engine and the backplane, for the M40 router only); SCB, SSB, SFM, or FEB; MCS and PCG (for the M160 router only); each FPC and PIC; and each fan, blower, and impeller.</li> <li>(M120, M320, and T Series routers)—Information about the backplane, power supplies, fan trays, midplane, FPM (craft interface), CIP, PEM, SCG, CB, FPC, PIC, SFP, SPMB, and SIB.</li> <li>(QFX Series)—Information about the chassis, Pseudo CB, Routing Engine, power supplies, fan trays, Interconnect devices, and Node devices. Also displays information about Flexible PIC Concentrators (FPCs) and associated Physical Interface Cards (PICs).</li> <li>(PTX Series)—Information about the chassis, midplane, craft interface (FPM), power distribution units (PDUs) and Power Supply Modules (PSMs), Centralized Clock Generators (CCGs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Flexible PIC Concentrators (FPCs), PICs, Switch Interface Boards (SIBs), and fan trays (vertical and horizontal).</li> <li>(MX2010, MX2020, and MX2008 routers)—Information about the chassis, midplane, craft interface (FPM), power midplane (PMP), Power Supply Modules (PSMs), Power Distribution Modules (PDMs), Routing Engines, Control Boards (CBs) and Switch Processor Mezzanine Boards (SPMBs), Switch Fabric Boards (SFBs), Flexible PIC Concentrators (FPCs), PICs, adapter cards (ADCs) and fan trays.</li> <li>(vMX routers)—Information about the chassis, midplane, Routing Engines, and Control Boards (CBs). Also displays information about Flexible PIC Concentrators (FPCs) and associated Modular Interface Cards (MICs) and Physical Interface Cards (PICs).</li> </ul>	All levels
<b>Version</b>	Revision level of the chassis component.	All levels
<b>Part number</b>	Part number of the chassis component.	All levels

Table 127: show chassis hardware Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Serial number</b>	Serial number of the chassis component. The serial number of the backplane is also the serial number of the router chassis. Use this serial number when you need to contact Juniper Networks Customer Support about the router or switch chassis.	All levels
<b>Assb ID or Assembly ID</b>	( <b>extensive</b> keyword only) Identification number that describes the FRU hardware.	<b>extensive</b>
<b>Assembly Version</b>	( <b>extensive</b> keyword only) Version number of the FRU hardware.	<b>extensive</b>
<b>Assembly Flags</b>	( <b>extensive</b> keyword only) Flags.	<b>extensive</b>
<b>FRU model number</b>	( <b>clei-models</b> , <b>extensive</b> , and <b>models</b> keyword only) Model number of the FRU hardware component.	none specified
<b>CLEI code</b>	( <b>clei-models</b> and <b>extensive</b> keyword only) Common Language Equipment Identifier code. This value is displayed only for hardware components that use ID EEPROM format v2. This value is not displayed for components that use ID EEPROM format v1.	none specified
<b>EEPROM Version</b>	ID EEPROM version used by the hardware component: <b>0x00</b> (version 0), <b>0x01</b> (version 1), or <b>0x02</b> (version 2).	<b>extensive</b>
<b>Description</b>	<p>Brief description of the hardware item:</p> <ul style="list-style-type: none"> <li>• Type of power supply.</li> <li>• Type of PIC. If the PIC type is not supported on the current software release, the output states <b>Hardware Not Supported</b>.</li> <li>• Type of FPC: <b>FPC Type 1</b>, <b>FPC Type 2</b>, <b>FPC Type 3</b>, <b>FPC Type 4</b>, or <b>FPC TypeOC192</b>.</li> </ul> <p>On EX Series switches, a brief description of the FPC.</p> <p>The following list shows the PIM abbreviation in the output and the corresponding PIM name.</p> <ul style="list-style-type: none"> <li>• <b>2x FE</b>—Either two built-in Fast Ethernet interfaces (fixed PIM) or dual-port Fast Ethernet PIM</li> <li>• <b>4x FE</b>—4-port Fast Ethernet ePIM</li> <li>• <b>1x GE Copper</b>—Copper Gigabit Ethernet ePIM (one 10-Mbps, 100-Mbps, or 1000-Mbps port)</li> <li>• <b>1x GE SFP</b>—SFP Gigabit Ethernet ePIM (one fiber port)</li> <li>• <b>2x Serial</b>—Dual-port serial PIM</li> <li>• <b>2x T1</b>—Dual-port T1 PIM</li> <li>• <b>2x E1</b>—Dual-port E1 PIM</li> <li>• <b>2x CT1E1</b>—Dual-port channelized T1/E1 PIM</li> <li>• <b>1x T3</b>—T3 PIM (one port)</li> <li>• <b>1x E3</b>—E3 PIM (one port)</li> <li>• <b>4x BRI S/T</b>—4-port ISDN BRI S/T PIM</li> <li>• <b>4x BRI U</b>—4-port ISDN BRI U PIM</li> <li>• <b>1x ADSL Annex A</b>—ADSL 2/2+ Annex A PIM (one port, for POTS)</li> </ul>	All levels

Table 127: show chassis hardware Output Fields (continued)

Field Name	Field Description	Level of Output
	<ul style="list-style-type: none"> <li>• <b>1x ADSL Annex B</b>—ADSL 2/2+ Annex B PIM (one port, for ISDN)</li> <li>• <b>2x SHDSL (ATM)</b>—G SHDSL PIM (2-port two-wire module or 1-port four-wire module)</li> <li>• <b>1x TGM550</b>—TGM550 Telephony Gateway Module (Avaya VoIP gateway module with one console port, two analog <b>LINE</b> ports, and two analog <b>TRUNK</b> ports)</li> <li>• <b>1x DS1 TIM510</b>—TIM510 E1/T1 Telephony Interface Module (Avaya VoIP media module with one E1 or T1 trunk termination port and ISDN PRI backup)</li> <li>• <b>4x FXS, 4x FXO, TIM514</b>—TIM514 Analog Telephony Interface Module (Avaya VoIP media module with four analog <b>LINE</b> ports and four analog <b>TRUNK</b> ports)</li> <li>• <b>4x BRI TIM521</b>—TIM521 BRI Telephony Interface Module (Avaya VoIP media module with four ISDN BRI ports)</li> <li>• <b>Crypto Accelerator Module</b>—For enhanced performance of cryptographic algorithms used in IP Security (IPsec) services</li> <li>• <b>MPC M16x10GE</b>—16-port 10-Gigabit Module Port Concentrator that supports SFP+ optical transceivers. (Not on EX Series switches.)</li> <li>• For hosts, the Routing Engine type.</li> <li>• For small form-factor pluggable transceiver (SFP) modules, the type of fiber: <b>LX, SX, LH, or T</b>.</li> <li>• LCD description for EX Series switches (except EX2200 switches).</li> <li>• <b>MPC2</b>—1-port MPC2 that supports two separate slots for MICs.</li> <li>• <b>MPC3E</b>—1-port MPC3E that supports two separate slots for MICs (MIC-3D-1X100GE-CFP and MIC-3D-20GE-SFP) on MX960, MX480, and MX240 routers. The MPC3E maps one MIC to one PIC (1 MIC, 1 PIC), which differs from the mapping of legacy MPCs.</li> <li>• 100GBASE-LR4, pluggable CFP optics</li> <li>• Supports the Enhanced MX Switch Control Board with fabric redundancy and existing SCBs without fabric redundancy.</li> <li>• Interoperates with existing MX Series line cards, including Flexible Port Concentrators (FPC), Dense Port Concentrators (DPCs), and Modular Port Concentrators (MPCs).</li> <li>• <b>MPC4E</b>—Fixed configuration MPC4E that is available in two flavors: MPC4E-3D-32XGE-SFPP and MPC4E-3D-2CGE-8XGE on MX2020, MX960, MX480, and MX240 routers.</li> <li>• LCD description for MX Series routers</li> </ul>	

## Sample Output

The following output samples are intended to serve as representative examples only and are not exhaustive representations of every single possible command or hardware variation.

Description	Display status information about the PIC installed in the specified Flexible PIC Concentrator (FPC) and PIC slot.
Options	<p><b>fpc-slot <i>slot-number</i></b>—Display information about the PIC in this particular FPC slot:</p> <ul style="list-style-type: none"> <li>On a TX Matrix router, if you specify the number of the T640 router by using the <b>lcc <i>number</i></b> option (the recommended method), replace <b><i>slot-number</i></b> with a value from 0 through 7. Otherwise, replace <b><i>slot-number</i></b> with a value from 0 through 31.</li> </ul> <p>Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 router by using the <b>lcc <i>number</i></b> option (the recommended method), replace <b><i>slot-number</i></b> with a value from 0 through 7. Otherwise, replace <b><i>slot-number</i></b> with a value from 0 through 31. For example, the following commands have the same result:</p> <pre> user@host&gt; show chassis pic fpc-slot 1 lcc 1 pic-slot 1 user@host&gt; show chassis pic fpc-slot 9 pic-slot 1 </pre> <ul style="list-style-type: none"> <li>M120 routers only—Replace <b><i>slot-number</i></b> with a value from 0 through 5.</li> </ul>

- MX80 routers only—Replace **slot-number** with a value from 0 through 1.
- MX104 routers only—Replace **slot-number** with a value from 0 through 2.
- MX240 routers only—Replace **slot-number** with a value from 0 through 2.
- MX480 routers only—Replace **slot-number** with a value from 0 through 5.
- MX960 routers only—Replace **slot-number** with a value from 0 through 11.
- MX2010 routers only—Replace **slot-number** with a value from 0 through 9.
- MX2020 routers only—Replace **slot-number** with a value from 0 through 19.
- MX2008 routers only—Replace **slot-number** with a value from 0 through 9.
- MX10003 routers only—Replace **slot-number** with a value from 0 through 1.
- Other routers—Replace **slot-number** with a value from 0 through 7.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace **slot-number** with 0.
  - EX4200 switches in a Virtual Chassis configuration—Replace **slot-number** with a value from 0 through 9 (switch's member ID).
  - EX8208 switches—Replace **slot-number** with a value from 0 through 7 (line card).
  - EX8216 switches—Replace **slot-number** with a value from 0 through 15 (line card).
- QFX Series:
  - QFX3500, QFX3600, QFX5100, and OCX Series standalone switches—Replace **slot-number** with 0. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.
  - QFabric systems—Replace **slot-number** with any number between 0 and 15. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.

**all-members**—(MX Series routers and EX Series switches only) (Optional) Display PIC information for all member routers in the Virtual Chassis configuration.

**interconnect-device name**—(QFabric systems only) (Optional) Display PIC information for a specified Interconnect device.

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display PIC information for a specified T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display PIC information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the local Virtual Chassis member.

**member *member-id***—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**node-device *name***—(QFabric systems only) (Optional) Display PIC information for a specified Node device.

**pic-slot *slot-number***—Display information about the PIC in this particular PIC slot. For routers, replace *slot-number* with a value from 0 through 3. For EX3200 and EX4200 switches, replace *slot-number* with 0 for built-in network interfaces and 1 for interfaces on uplink modules. For EX8208 and EX8216 switches, replace *slot-number* with 0. For the QFX3500 standalone switch and the QFabric system, replace *slot-number* with 0 or 1.

**transport**—Display PIC information for optical transport network.

**Output Fields** [Table 128 on page 1395](#) lists the output fields for the **show chassis pic** command. Output fields are listed in the approximate order in which they appear.

*Table 128: show chassis pic Output Fields*

Field Name	Field Description
Type	<p>PIC type.</p> <p><b>NOTE:</b> On the 1-port OC192/STM64 MICs with the SDH framing mode, the type is displayed as <b>MIC-3D-1STM64-XFP</b> and with the SONET framing mode, the type is displayed as <b>MIC-3D-1OC192-XFP</b>. By default, the 1-port OC192/STM64 MICs displays the type as <b>MIC-3D-1OC192-XFP</b>.</p>
Account Layer2 Overhead	(MX Series routers) Indicates whether functionality to count the Layer 2 overhead bytes in the interface statistics at the PIC level is enabled or disabled.
ASIC type	Type of ASIC on the PIC.
State	<p>Status of the PIC. State is displayed only when a PIC is in the slot.</p> <ul style="list-style-type: none"> <li>• <b>Online</b>— PIC is online and running.</li> <li>• <b>Offline</b>—PIC is powered down.</li> <li>• <b>Empty</b>—No PIC is present.</li> <li>• <b>Present</b>—PIC is plugged in. The PIC is not powered on or operational.</li> <li>• <b>Onlining</b>—PIC is in the process of going online. PICs and rest of the hardware is initializing.</li> <li>• <b>Offlining</b>—PIC is in the process of going offline. PIC and rest of the hardware is being shutdown down to take the offline gracefully.</li> <li>• <b>Fault</b>—PIC is in an alarmed state and the PIC is not operational.</li> </ul>
PIC version	PIC hardware version.
Uptime	How long the PIC has been online.

Table 128: show chassis pic Output Fields (continued)

Field Name	Field Description
Package	(Multiservices PICs only) Services package supported: <b>Layer-2</b> or <b>Layer-3</b> .
Port Number	Port number for the PIC.
Cable Type	Type of cable connected to the port: <b>LH</b> , <b>LX</b> , or <b>SX</b> .
PIC Port Information (MX480 Router 100-Gigabit Ethernet CFP)	Port-level information for the PIC. <ul style="list-style-type: none"> <li>• Port—Port number</li> <li>• Cable type—Type of optical transceiver installed.</li> <li>• Fiber type—Type of fiber. SM is single-mode.</li> <li>• Xcvr vendor—Transceiver vendor name.</li> <li>• Xcvr vendor part number—Transceiver vendor part number.</li> <li>• Wavelength—Wavelength of the transmitted signal. Uplinks and downlinks are always 1550 nm. There is a separate fiber for each direction</li> <li>• Xcvr Firmware—Transceiver firmware version.</li> </ul>
PIC Port Information (MX960 Router Bidirectional Optics )	Port-level information for the PIC. <ul style="list-style-type: none"> <li>• Port—Port number</li> <li>• Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed. Uplink interfaces display -U. Down link interfaces display -D.</li> <li>• Fiber type—Type of fiber. SM is single-mode.</li> <li>• Xcvr vendor—Transceiver vendor name.</li> <li>• Xcvr vendor part number—Transceiver vendor part number.               <ul style="list-style-type: none"> <li>• BX10-10-km bidirectional optics.</li> <li>• BX40-40-km bidirectional optics.</li> <li>• SFP-LX-40-km SFP optics.</li> </ul> </li> <li>• Wavelength—Wavelength of the transmitted signal. Uplinks are always 1310 nm. Downlinks are either 1490 nm or 1550 nm.</li> </ul>
PIC Port Information (Next-Generation SONET/SDH SFP)	Port-level information for the next-generation SONET/SDH SFP PIC. <ul style="list-style-type: none"> <li>• Port—Port number.</li> <li>• Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed.</li> <li>• Fiber type—Type of fiber: <b>SM</b> (single-mode) or <b>MM</b> (multimode).</li> <li>• Xcvr vendor—Transceiver vendor name.</li> <li>• Xcvr vendor part number—Transceiver vendor part number.</li> <li>• Wavelength—Wavelength of the transmitted signal. Next-generation SONET/SDH SFPs use 1310 nm.</li> </ul>

Table 128: show chassis pic Output Fields (continued)

Field Name	Field Description
<b>PIC port information (MX104 router)</b>	Port-level information for the PIC. <ul style="list-style-type: none"> <li>Port—Port number</li> <li>Cable type—Type of optical transceiver installed.</li> <li>Fiber type—Type of fiber. SM is single-mode.</li> <li>Xcvr vendor—Transceiver vendor name.</li> <li>Xcvr vendor part number—Transceiver vendor part number.</li> <li>Wavelength—Wavelength of the transmitted signal.</li> <li>Xcvr Firmware—Firmware version of the transceiver.</li> </ul>
Port speed information	Information pertaining to port speed: <ul style="list-style-type: none"> <li>Port—Port number.</li> <li>PFE—Packet Forwarding Engine slot number.</li> <li>Capable Port Speed—Speed supported by each port.</li> </ul>
<b>Multirate Mode</b>	Rate-selectability status for the MIC: <b>Enabled</b> or <b>Disabled</b> .
<b>Channelization</b>	Indicates whether channelization is enabled or disabled on the DS3/E3 MIC.
<b>Administrative State</b>	Indicates the administrative state of the PIC. Possible values are: In Service (Default) and Out of Service.
<b>Operational State</b>	Indicates the operational state of the PIC. Possible values are: Normal and Fault.

## show ethernet-switching redundancy-groups

<b>Syntax</b>	<pre>show ethernet-switching redundancy-groups &lt;redundancy-group-id [0 to 4294967294]&gt; arp-statistics nd-statistics remote-macs</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 13.2.</p> <p>Command introduced in Junos OS Release 15.1R1 for EX Series switches</p>
<b>Description</b>	<p>Display ARP statistics, Neighbor Discovery statistics, or remote MAC addresses for the Multi-Chassis Aggregated Ethernet (MC-AE) nodes for all or specified redundancy groups on a router or switch. Note that the Redundancy Group ID is inherited by the bridging domain or VLAN from member AE interfaces.</p>
<b>Options</b>	<p><b>redundancy-group-id</b>—(Optional) The redundancy group identification number. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate the routing or switching devices contained in a redundancy group.</p> <p><b>arp-statistics</b>—(Optional) Count of ARP packets sent and received by the two MC-AE nodes.</p> <p><b>nd-statistics</b>—(Optional) Count of Neighbor Discovery packets sent and received by the two MC-AE nodes.</p> <p><b>remote-macs</b> —(Optional) List of remote MAC addresses in the “Installed” state, as learned from the remote MC-AE node.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Configuring Multichassis Link Aggregation on EX Series Switches</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show ethernet-switching redundancy-groups arp-statistics on page 1420</a></p> <p><a href="#">show ethernet-switching redundancy-groups nd-statistics on page 1420</a></p> <p><a href="#">show ethernet-switching redundancy-groups remote-macs on page 1421</a></p> <p><a href="#">show ethernet-switching redundancy-groups group-id on page 1421</a></p>
<b>Output Fields</b>	Output fields are listed in the approximate order in which they appear.

Table 129: show ethernet-switching redundancy-groups arp-statistics Output Fields

Field Name	Field Description
Redundancy Group ID	Redundancy Group to which the following details apply.

**Table 129: show ethernet-switching redundancy-groups arp-statistics Output Fields (continued)**

Field Name	Field Description
MCLAG ARP Statistics Group ID	ARP statistics for this Multichassis Link Aggregation Group (MC-LAG) instance.
ARP Rx Count From Line	Total number of ARPs received from the Line.
ARP Tx Count To Peer	Total number of ARPs sent to the peer.
ARP Rx Count From Peer	Total number of ARPs received from the peer.
ARP Drop Count received from line	Total number of ARPs sent by the peer that were received.
ARP Drop Count received from peer	Total number of ARPs sent by the peer that were dropped
ARP Install Count	ARP Install Count

**Table 130: show ethernet-switching redundancy-groups nd-statistics Output Fields**

Field Name	Field Description
Redundancy Group ID	Redundancy Group to which the following details apply.
MCLAG ND Statistics Group ID	Neighbor Discovery statistics for this Multichassis Link Aggregation Group (MC-LAG) instance.
ND Rx Count From Line	Total number of Neighbor Discovery packets received from the Line.
ND Tx Count To Peer	Total number of Neighbor Discovery packets sent to the peer.
ND Rx Count From Peer	Total number of Neighbor Discovery packets received from the peer.
ND Drop Count received from line	Total number of Neighbor Discovery packets sent by the peer that were received.
ND Drop Count received from peer	Total number of Neighbor Discovery packets sent by the peer that were dropped
ND Install Count	ND Install Count

**Table 131: show ethernet-switching redundancy-groups remote-macs Output Fields**

Field Name	Field Description
Redundancy Group ID	Redundancy Group to which the following details apply.

Table 131: show ethernet-switching redundancy-groups remote-macs Output Fields (continued)

Field Name	Field Description
Service ID	Service ID (configured at the routing instance level).
Peer-Addr	IP address of the remote peer.
VLAN	Virtual LAN identifier associated with the redundancy group.
MAC	Hardware media access control address associated with the redundancy group.
MCAE-ID	ID number of the MC-AE used by the redundancy group.
Flags	Connection state: local connect or Remote connect. If no flag is shown, the redundancy group may not be connected.
Status	Installation state: Installed or Not Installed.

## Sample Output

### show ethernet-switching redundancy-groups arp-statistics

```

user@host> show ethernet-switching redundancy-groups arp-statistics

Redundancy Group ID : 1 Flags : Local Connect, Remote Connect

MCLAG ARP Statistics
Group ID : 1
ARP Rx Count From Line : 3493
ARP Tx Count To Peer : 647
ARP Rx Count From Peer : 0
ARP Install Count : 0
ARP Drop Count received from line : 2846
ARP Drop Count received from peer : 0

```

### show ethernet-switching redundancy-groups nd-statistics

```

user@host> show ethernet-switching redundancy-groups nd-statistics

Redundancy Group ID : 1 Flags : Local Connect, Remote Connect

MCLAG ND Statistics
Group ID : 1
ND Rx Count From Line : 52
ND Tx Count To Peer : 15
ND Rx Count From Peer : 39
ND Install Count : 34
ND Drop Count received from line : 37
ND Drop Count received from peer : 5

```

**show ethernet-switching redundancy-groups remote-macs**

```
user@host> show ethernet-switching redundancy-groups <redundancy-group-id> remote-macs
```

```
Redundancy Group ID : 1 Flags : Local Connect, Remote Connect

Service-id Peer-Addr VLAN MAC MCAE-ID Subunit Opcode
Flags Status
10 10.3.3.2 100 80:ac:ac:1f:10:a1 1 0 1
0 Installed
```

**show ethernet-switching redundancy-groups group-id**

```
user@host> show ethernet-switching redundancy-groups 1
```

```
Redundancy Group ID : 1 Flags : Local Connect, Remote Connect
```

## show interfaces (Adaptive Services)

<b>Syntax</b>	<pre>show interfaces <i>interface-type</i> &lt;brief   detail   extensive   terse&gt; &lt;descriptions&gt; &lt;media&gt; &lt;snmp-index <i>snmp-index</i>&gt; &lt;statistics&gt;</pre>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Display status information about the specified adaptive services interface.
<b>Options</b>	<p><b><i>interface-type</i></b>—On M Series and T Series routers, the interface type is <b>sp-<i>fpc/pic/port</i></b>.</p> <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b>descriptions</b>—(Optional) Display interface description strings.</p> <p><b>media</b>—(Optional) Display media-specific information about network interfaces.</p> <p><b>snmp-index <i>snmp-index</i></b>—(Optional) Display information for the specified SNMP index of the interface.</p> <p><b>statistics</b>—(Optional) Display static interface statistics.</p>

<b>List of Sample Output</b>	<p><a href="#">show interfaces (Adaptive Services) on page 1427</a></p> <p><a href="#">show interfaces brief (Adaptive Services) on page 1427</a></p> <p><a href="#">show interfaces detail (Adaptive Services) on page 1427</a></p> <p><a href="#">show interfaces extensive (Adaptive Services) on page 1428</a></p>
<b>Output Fields</b>	Table 132 on page 1422 lists the output fields for the <b>show interfaces</b> (adaptive services and redundant adaptive services) command. Output fields are listed in the approximate order in which they appear.

Table 132: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields

Field Name	Field Description	Level of Output
<b>Physical Interface</b>		
<b>Physical interface</b>	Name of the physical interface.	All levels
<b>Enabled</b>	State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .	All levels
<b>Interface index</b>	Physical interface's index number, which reflects its initialization sequence.	<b>detail extensive none</b>

Table 132: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Type	Encapsulation being used on the interface.	All levels
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	MTU size on the physical interface.	All levels
Clocking	Reference clock source: can be <b>Internal</b> or <b>External</b> .	All levels
Speed	Speed at which the interface is running.	All levels
Device flags	Information about the physical device. Possible values are described in the "Device Flags" section under <i>Common Output Fields Description</i> .	All levels
Interface flags	Information about the interface. Possible values are described in the "Interface Flags" section under <i>Common Output Fields Description</i> .	All levels
Link type	Physical interface link type: <b>Full-Duplex</b> or <b>Half-Duplex</b> .	detail extensive none
Link flags	Information about the link. Possible values are described in the "Link Flags" section under <i>Common Output Fields Description</i> .	detail extensive none
Physical info	Information about the physical interface.	detail extensive
Hold-times	Current interface hold-time up and hold-time down, in milliseconds.	detail extensive
Current address	Configured MAC address.	detail extensive none
Hardware address	MAC address of the hardware.	detail extensive none
Alternate link address	Backup address of the link.	detail extensive none
Last flapped	Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .	detail extensive none
Input Rate	Input rate in bits per second (bps) and packets per second (pps).	None specified
Output Rate	Output rate in bps and pps.	None specified
Statistics last cleared	Time when the statistics for the interface were last set to zero.	detail extensive

Table 132: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Traffic statistics</b>	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <p><b>NOTE:</b> With static NAT configured as basic NAT44 or destination NAT44 on MX Series routers with MS-MICs and MS-MPCs, the Input bytes field might show 16 more bytes than the Output bytes field. This is caused by the accounting of 16 bytes of the Juniper Forwarding Module cookie.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>	<b>detail extensive</b>
<b>Input errors</b>	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Frames received smaller than the runt threshold.</li> <li>• <b>Giants</b>—Frames received larger than the giant threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	<b>extensive</b>
<b>Output errors</b>	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>MTU errors</b>—Number of packets larger than the MTU threshold.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	<b>extensive</b>
<b>Logical Interface</b>		
<b>Logical interface</b>	Name of the logical interface.	All levels
<b>Index</b>	Logical interface index number, which reflects its initialization sequence.	<b>detail extensive none</b>
<b>SNMP ifIndex</b>	SNMP interface index number.	<b>detail extensive none</b>

Table 132: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Flags</b>	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .	All levels
<b>Encapsulation</b>	Encapsulation on the logical interface.	All levels
<b>Input packets</b>	Number of packets received on the logical interface.	None specified
<b>Output packets</b>	Number of packets transmitted on the logical interface.	None specified
<b>Traffic statistics</b>	<p>Number and rate of bytes and packets received and transmitted on the logical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>	<b>detail extensive</b>
<b>Local statistics</b>	Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes awhile (generally, less than 1 second) for this counter to stabilize.	<b>detail extensive</b>
<b>Transit statistics</b>	Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It takes generally less than 1 second for the counter to stabilize.	<b>detail extensive</b>
<b>protocol-family</b>	Protocol family configured on the logical interface. If the protocol is <b>inet</b> , the IP address of the interface is also displayed.	<b>brief</b>
<b>Protocol</b>	Protocol family configured on the logical interface, such as <b>iso</b> , <b>inet6</b> , <b>mpls</b> .	<b>detail extensive none</b>
<b>MTU</b>	MTU size on the logical interface.	<b>detail extensive none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Route table</b>	Routing table in which the logical interface address is located. For example, <b>0</b> refers to the routing table <b>inet.0</b> .	<b>detail extensive</b>
<b>Flags</b>	Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .	<b>detail extensive none</b>
<b>Addresses, Flags</b>	Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .	<b>detail extensive none</b>
<b>Destination</b>	IP address of the remote side of the connection.	<b>detail extensive none</b>
<b>Local</b>	IP address of the logical interface.	<b>detail extensive none</b>

*Table 132: Adaptive Services and Redundant Adaptive Services show interfaces Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Broadcast</b>	Broadcast address.	<b>detail extensive none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>

## Sample Output

### show interfaces (Adaptive Services)

```
user@host> show interfaces sp-1/2/0

Physical interface: sp-1/2/0, Enabled, Physical link is Up
 Interface index: 147, SNMP ifIndex: 72
 Type: Adaptive-Services, Link-level type: Adaptive-Services, MTU: 9192,
 Speed: 800mbps
 Device flags : Present Running
 Interface flags: Point-To-Point SNMP-Traps Internal: 0x4000
 Link type : Full-Duplex
 Link flags : None
 Last flapped : 2006-03-06 11:37:18 PST (00:57:29 ago)
 Input rate : 0 bps (0 pps)
 Output rate : 0 bps (0 pps)

Logical interface sp-1/2/0.16383 (Index 68) (SNMP ifIndex 73)
 Flags: Point-To-Point SNMP-Traps Encapsulation: Adaptive-Services
 Input packets : 3057
 Output packets: 3044
 Protocol inet, MTU: 9192
 Flags: Receive-options, Receive-TTL-Exceeded
 Addresses, Flags: Is-Preferred Is-Primary
 Destination: 10.0.0.34, Local: 10.0.0.1
```

### show interfaces brief (Adaptive Services)

```
user@host> show interfaces sp-1/2/0 brief

Physical interface: sp-1/2/0, Enabled, Physical link is Up
 Type: Adaptive-Services, Link-level type: Adaptive-Services, MTU: 9192,
 Clocking: Unspecified, Speed: 800mbps
 Device flags : Present Running
 Interface flags: Point-To-Point SNMP-Traps Internal: 0x4000

Logical interface sp-1/2/0.16383
 Flags: Point-To-Point SNMP-Traps Encapsulation: Adaptive-Services
 inet 10.0.0.1 --> 10.0.0.34
```

### show interfaces detail (Adaptive Services)

```
user@host> show interfaces sp-1/2/0 detail

Physical interface: sp-1/2/0, Enabled, Physical link is Up
 Interface index: 147, SNMP ifIndex: 72, Generation: 30
 Type: Adaptive-Services, Link-level type: Adaptive-Services, MTU: 9192,
 Clocking: Unspecified, Speed: 800mbps
 Device flags : Present Running
 Interface flags: Point-To-Point SNMP-Traps Internal: 0x4000
 Link type : Full-Duplex
 Link flags : None
 Physical info : Unspecified
 Hold-times : Up 0 ms, Down 0 ms
 Current address: Unspecified, Hardware address: Unspecified
 Alternate link address: Unspecified
 Last flapped : 2006-03-06 11:37:18 PST (00:57:56 ago)
 Statistics last cleared: Never
```

```

Traffic statistics:
Input bytes : 125147 0 bps
Output bytes : 1483113 0 bps
Input packets: 3061 0 pps
Output packets: 3048 0 pps

Logical interface sp-1/2/0.16383 (Index 68) (SNMP ifIndex 73) (Generation 7)
Flags: Point-To-Point SNMP-Traps Encapsulation: Adaptive-Services
Traffic statistics:
Input bytes : 125147
Output bytes : 1483113
Input packets: 3061
Output packets: 3048
Local statistics:
Input bytes : 125147
Output bytes : 1483113
Input packets: 3061
Output packets: 3048
Transit statistics:
Input bytes : 0 0 bps
Output bytes : 0 0 bps
Input packets: 0 0 pps
Output packets: 0 0 pps
Protocol inet, MTU: 9192, Generation: 20, Route table: 1
Flags: Receive-options, Receive-TTL-Exceeded
Addresses, Flags: Is-Preferred Is-Primary
Destination: 10.0.0.34, Local: 10.0.0.1, Broadcast: Unspecified,
Generation: 22

```

### show interfaces extensive (Adaptive Services)

```
user@host> show interfaces sp-1/2/0 extensive
```

```

Physical interface: sp-1/2/0, Enabled, Physical link is Up
Interface index: 147, SNMP ifIndex: 72, Generation: 30
Type: Adaptive-Services, Link-level type: Adaptive-Services, MTU: 9192,
Clocking: Unspecified, Speed: 800mbps
Device flags : Present Running
Interface flags: Point-To-Point SNMP-Traps Internal: 0x4000
Link type : Full-Duplex
Link flags : None
Physical info : Unspecified
Hold-times : Up 0 ms, Down 0 ms
Current address: Unspecified, Hardware address: Unspecified
Alternate link address: Unspecified
Last flapped : 2006-03-06 11:37:18 PST (00:58:40 ago)
Statistics last cleared: Never
Traffic statistics:
Input bytes : 125547 0 bps
Output bytes : 1483353 0 bps
Input packets: 3065 0 pps
Output packets: 3052 0 pps
Input errors:
Errors: 0, Drops: 0, Framing errors: 0, Runts: 0, Giants: 0,
Policed discards: 0, Resource errors: 0
Output errors:
Carrier transitions: 2, Errors: 0, Drops: 0, MTU errors: 0,
Resource errors: 0

Logical interface sp-1/2/0.16383 (Index 68) (SNMP ifIndex 73) (Generation 7)

```

```
Flags: Point-To-Point SNMP-Traps Encapsulation: Adaptive-Services
Traffic statistics:
 Input bytes : 125547
 Output bytes : 1483353
 Input packets: 3065
 Output packets: 3052
Local statistics:
 Input bytes : 125547
 Output bytes : 1483353
 Input packets: 3065
 Output packets: 3052
Transit statistics:
 Input bytes : 0 0 bps
 Output bytes : 0 0 bps
 Input packets: 0 0 pps
 Output packets: 0 0 pps
Protocol inet, MTU: 9192, Generation: 20, Route table: 1
 Flags: Receive-options, Receive-TTL-Exceeded
 Addresses, Flags: Is-Preferred Is-Primary
 Destination: 10.0.0.34, Local: 10.0.0.1, Broadcast: Unspecified,
 Generation: 22
```

## show interfaces (Aggregated Ethernet)

**Syntax** `show interfaces aenumber`  
`<brief | detail | extensive | terse>`  
`<descriptions>`  
`<media>`  
`<snmp-index snmp-index>`  
`<statistics>`

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** (M Series, T Series, MX Series, and PTX Series routers) Display status information about the specified aggregated Ethernet interfaces.

**Options** ***aenumber***—Display standard information about the specified aggregated Fast Ethernet or Gigabit Ethernet interface.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**descriptions**—(Optional) Display interface description strings.

**media**—(Optional) Display media-specific information.

**snmp-index *snmp-index***—(Optional) Display information for the specified SNMP index of the interface.

**statistics**—(Optional) Display static interface statistics.

**NOTE:** On Junos OS Evolved, in untagged aggregated ethernet (ae) interfaces with no logical interface configuration, the ae interface will not be shown as "down" and the speed will not be shown as "unspecified." The speed will be the aggregate speed of all the child member interfaces which are "up." In Junos OS, the speed is shown as "unspecified" in this case.

**Output Fields** Table 133 on page 1431 lists the output fields for the **show interfaces** (Aggregated Ethernet) command. Output fields are listed in the approximate order in which they appear.

*Table 133: Aggregated Ethernet show interfaces Output Fields*

Field Name	Field Description	Level of Output
<b>Physical Interface</b>		
<b>Physical interface</b>	Name of the physical interface and state of the interface.	All levels
<b>Enabled</b>	State of the physical interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .	All levels
<b>Interface index</b>	Index number of the physical interface, which reflects its initialization sequence.	All levels
<b>SNMP ifIndex</b>	SNMP index number for the physical interface.	<b>detail extensive</b> none
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Link-level type</b>	Encapsulation being used on the physical interface.	All levels
<b>MTU</b>	Maximum transmission unit size on the physical interface.	All levels
<b>Speed</b>	Speed at which the interface is running.	All levels
<b>Loopback</b>	Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .	All levels
<b>Source filtering</b>	Source filtering status: <b>Enabled</b> or <b>Disabled</b> .	All levels
<b>Flow control</b>	Flow control status: <b>Enabled</b> or <b>Disabled</b> .	All levels
<b>Minimum links needed</b>	Number of child links that must be operational for the aggregate interface to be operational.	All levels
<b>Device flags</b>	Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .	All levels
<b>Interface flags</b>	Information about the interface. Possible values are described in the “Interfaces Flags” section under <i>Common Output Fields Description</i> .	All levels
<b>Current address</b>	Configured MAC address.	<b>detail extensive</b>
<b>Hardware address</b>	Hardware MAC address.	<b>detail extensive</b>
<b>Last flapped</b>	Date, time, and how long ago the interface went from down to up or from up to down. The format is <b>Last flapped: year-month-day hours:minutes:seconds timezone (hours:minutes:seconds ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .	<b>detail extensive</b>
<b>Input Rate</b>	Input rate in bits per second (bps) and packets per second (pps).	None specified

Table 133: Aggregated Ethernet show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Output Rate</b>	Output rate in bps and pps.	None specified
<b>Statistics last cleared</b>	Time when the statistics for the interface were last set to zero.	<b>detail extensive</b>
<b>Traffic statistics</b>	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes and rate, in bps, at which bytes are received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes and rate, in bps, at which bytes are transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets and rate, in pps, at which packets are received on the interface.</li> <li>• <b>Output packets</b>—Number of packets and rate, in pps, at which packets are transmitted on the interface.</li> </ul>	<b>detail extensive</b>
<b>Input errors</b>	<p>Input errors on the interface:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of incoming frame aborts and frame check sequence (FCS) errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's random early detection (RED) mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or were not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	<b>detail extensive</b>
<b>Output errors</b>	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b> —Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), then the cable, the far-end system, or the PIC is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	<b>detail extensive</b>

Table 133: Aggregated Ethernet show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
IPv6 transit statistics	<p>Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>	detail extensive
Queue counters	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the <b>show interfaces</b> command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs</p>	detail extensive
<b>Logical Interface</b>		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface (which reflects its initialization sequence).	detail extensive none
SNMP ifIndex	SNMP interface index number of the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the "Logical Interface Flags Field" section under <i>Common Output Fields Description</i> .	All levels
VLAN-Tag	Tag Protocol Identifier (TPID) and VLAN identifier.	All levels
Demux	<p>IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Source Family Inet</b></li> <li>• <b>Destination Family Inet</b></li> </ul>	detail extensive none
Encapsulation	Encapsulation on the logical interface.	All levels

Table 133: Aggregated Ethernet show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Statistics	<p>Information about the number of packets, packets per second, number of bytes, and bytes per second on this aggregate interface.</p> <ul style="list-style-type: none"> <li>• <b>Bundle</b>—Information about input and output bundle rates. For, Junos OS Evolved, LACP packets on the members of an AE interface are not counted as part of the AE bundle input statistics.</li> <li>• <b>Link</b>—(<b>detail</b> and <b>extensive</b> only) Information about specific links in the aggregate, including link state and input and output rates.</li> <li>• <b>Adaptive Statistics</b>—(<b>extensive</b> only) Information about adaptive load balancing counter statistics. <ul style="list-style-type: none"> <li>• <b>Adaptive Adjusts</b>—Number of times traffic flow imbalance was corrected by implementation of adaptive load balancing.</li> <li>• <b>Adaptive Scans</b>—Number of times the link utilization on each member link of the AE bundle was scanned by for adaptive load balancing</li> <li>• <b>Adaptive Tolerance</b>—Tolerance level, in percentage, for load imbalance on link utilization on each member link of the AE bundle.</li> <li>• <b>Adaptive Updates</b>—Number of times traffic flow loads have been updated on an AE bundle.</li> </ul> </li> <li>• <b>Marker Statistics</b>—(<b>detail</b> and <b>extensive</b> only) Information about 802.3ad marker protocol statistics on the specified links. <ul style="list-style-type: none"> <li>• <b>Marker Rx</b>—Number of valid marker protocol data units (PDUs) received on this aggregation port.</li> <li>• <b>Resp Tx</b>—Number of marker response PDUs transmitted on this aggregation port.</li> <li>• <b>Unknown Rx</b>—Number of frames received that either carry the slow protocols Ethernet type value (43B.4) but contain an unknown PDU, or are addressed to the slow protocols group MAC address (43B.3) but do not carry the slow protocols Ethernet type.</li> <li>• <b>Illegal Rx</b>—Number of frames received that carry the slow protocols Ethernet type value (43B.4) but contain a badly formed PDU or an illegal value of protocol subtype (43B.4).</li> </ul> </li> </ul>	<b>detail extensive none</b>
LACP info	<p>Link Aggregation Control Protocol (LACP) information for each aggregated interface.</p> <ul style="list-style-type: none"> <li>• <b>Role</b> can be one of the following: <ul style="list-style-type: none"> <li>• <b>Actor</b>—Local device participating in LACP negotiation.</li> <li>• <b>Partner</b>—Remote device participating in LACP negotiation.</li> </ul> </li> <li>• <b>System priority</b>—Priority assigned to the system (by management or administrative policy), encoded as an unsigned integer.</li> <li>• <b>System identifier</b>—Actor or partner system ID, encoded as a MAC address.</li> <li>• <b>Port priority</b>—Priority assigned to the port by the actor or partner (by management or administrative policy), encoded as an unsigned integer.</li> <li>• <b>Unknown Rx</b>—Number of frames received that either carry the slow protocols Ethernet type value (43B.4) but contain an unknown protocol data unit (PDU), or are addressed to the slow protocols group MAC address (43B.3) but do not carry the slow protocols Ethernet type.</li> <li>• <b>Port key</b>—Operational key value assigned to the port by the actor or partner, encoded as an unsigned integer.</li> </ul>	

Table 133: Aggregated Ethernet show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
LACP Statistics	<p>LACP statistics for each aggregated interface.</p> <ul style="list-style-type: none"> <li>• <b>LACP Rx</b>—LACP received counter that increments for each normal hello.</li> <li>• <b>LACP Tx</b>—Number of LACP transmit packet errors logged.</li> <li>• <b>Unknown Rx</b>—Number of unrecognized packet errors logged.</li> <li>• <b>Illegal Rx</b>—Number of invalid packets received.</li> </ul> <p><b>NOTE:</b> For <b>LACP Rx</b> and <b>LACP Tx</b>, Packet count is updated only on snmp timer expiry (30 secs).</p>	detail extensive none
<i>protocol-family</i>	Protocol family configured on the logical interface. Possible values are described in the "Protocol Field" section under <i>Common Output Fields Description</i> .	brief
Protocol	Protocol family configured on the logical interface. Possible values are described in the "Protocol Field" section under <i>Common Output Fields Description</i> .	detail extensive none
MTU	Maximum transmission unit size on the logical interface.	detail extensive none
Maximum labels	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Route Table	Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	detail extensive
Flags	Information about protocol family flags. Possible values are described in the "Family Flags Field" section under <i>Common Output Fields Description</i> .	detail extensive none
Mac-Validate Failures	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	detail extensive none
Addresses, Flags	Information about address flags. Possible values are described in the "Addresses Flags" section under <i>Common Output Fields Description</i> .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address of the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive

## Sample Output

### show interfaces (Aggregated Ethernet)

```
user@host> show interfaces ae0
```

```
Physical interface: ae0, Enabled, Physical link is Up
Interface index: 153, SNMP ifIndex: 59
Link-level type: Ethernet, MTU: 1514, Speed: 300mbps, Loopback: Disabled,
Source filtering: Disabled, Flow control: Disabled, Minimum links needed: 1
Device flags : Present Running
Interface flags: SNMP-Traps 16384
Current address: 00:00:5e:00:53:f0, Hardware address: 00:00:5e:00:53:f0
Last flapped : Never
Input rate : 0 bps (0 pps)
Output rate : 0 bps (0 pps)

Logical interface ae0.0 (Index 72) (SNMP ifIndex 60)
Flags: SNMP-Traps 16384 Encapsulation: ENET2

## show interfaces demux0 (Demux Interfaces)

<b>Syntax</b>	<pre>show interfaces demux0.logical-interface-number &lt;brief   detail   extensive   terse&gt; &lt;descriptions&gt; &lt;media&gt; &lt;snmp-index snmp-index&gt; &lt;statistics&gt;</pre>
<b>Release Information</b>	Command introduced in Junos OS Release 9.0.
<b>Description</b>	(MX Series and M Series routers only) Display status information about the specified demux interface.
<b>Options</b>	<p><b>none</b>—Display standard information about the specified demux interface.</p> <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b>descriptions</b>—(Optional) Display interface description strings.</p> <p><b>media</b>—(Optional) Display media-specific information about network interfaces.</p> <p><b>snmp-index snmp-index</b>—(Optional) Display information for the specified SNMP index of the interface.</p> <p><b>statistics</b>—(Optional) Display static interface statistics.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Verifying and Managing Agent Circuit Identifier-Based Dynamic VLAN Configuration</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show interfaces demux0 (Demux) on page 1447</a></p> <p><a href="#">show interfaces demux0 (PPPoE over Aggregated Ethernet) on page 1448</a></p> <p><a href="#">show interfaces demux0 extensive (Targeted Distribution for Aggregated Ethernet Links) on page 1449</a></p> <p><a href="#">show interfaces demux0 (ACI Interface Set Configured) on page 1449</a></p>
<b>Output Fields</b>	Table 134 on page 1441 lists the output fields for the <b>show interfaces demux0 (Demux Interfaces)</b> command. Output fields are listed in the approximate order in which they appear.

Table 134: show interfaces demux0 (Demux Interfaces) Output Fields

Field Name	Field Description	Level of Output
------------	-------------------	-----------------

Physical Interface

Table 134: *show interfaces demux0 (Demux Interfaces) Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Physical interface</b>	Name of the physical interface.	brief detail extensive none
<b>Interface index</b>	Index number of the physical interface, which reflects its initialization sequence.	brief detail extensive none
<b>Enabled</b>	State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .	brief detail extensive none
<b>Physical link</b>	Status of the physical link ( <b>Up</b> or <b>Down</b> ).	detail extensive none
<b>Admin</b>	Administrative state of the interface ( <b>Up</b> or <b>Down</b> ).	terse
<b>Interface index</b>	Index number of the physical interface, which reflects its initialization sequence.	detail extensive none
<b>Link</b>	Status of the physical link ( <b>Up</b> or <b>Down</b> ).	terse
<b>Targeting summary</b>	Status of aggregated Ethernet links that are configured with targeted distribution ( <b>primary</b> or <b>backup</b> )	extensive
<b>Bandwidth</b>	Bandwidth allocated to the aggregated Ethernet links that are configured with targeted distribution.	extensive
<b>Proto</b>	Protocol family configured on the interface.	terse
<b>SNMP ifIndex</b>	SNMP index number for the physical interface.	detail extensive none
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	detail extensive
<b>Type</b>	Type of interface. <b>Software-Pseudo</b> indicates a standard software interface with no associated hardware device.	brief detail extensive none
<b>Link-level type</b>	Encapsulation being used on the physical interface.	brief detail extensive
<b>MTU</b>	Maximum transmission unit size on the physical interface.	brief detail extensive
<b>Clocking</b>	Reference clock source: <b>Internal</b> (1) or <b>External</b> (2).	brief detail extensive
<b>Speed</b>	Speed at which the interface is running.	brief detail extensive
<b>Device flags</b>	Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .	brief detail extensive none
<b>Interface flags</b>	Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .	brief detail extensive none
<b>Link type</b>	Data transmission type.	detail extensive none

Table 134: *show interfaces demux0 (Demux Interfaces) Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Link flags</b>	Information about the link. Possible values are described in the “Link Flags” section under <i>Common Output Fields Description</i> .	<b>detail extensive none</b>
<b>Physical info</b>	Information about the physical interface.	<b>detail extensive</b>
<b>Hold-times</b>	Current interface hold-time up and hold-time down, in milliseconds.	<b>detail extensive</b>
<b>Current address</b>	Configured MAC address.	<b>detail extensive</b>
<b>Hardware address</b>	Hardware MAC address.	<b>detail extensive</b>
<b>Alternate link address</b>	Backup address of the link.	<b>detail extensive</b>
<b>Last flapped</b>	Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .	<b>detail extensive none</b>
<b>Statistics last cleared</b>	Time when the statistics for the interface were last set to zero.	<b>detail extensive</b>
<b>Traffic statistics</b>	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> <li>• <b>IPv6 transit statistics</b>—Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled.</li> </ul> <p><b>NOTE:</b> These fields include dropped traffic and exception traffic, as those fields are not separately defined.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>	<b>detail extensive</b>

Table 134: show interfaces demux0 (Demux Interfaces) Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Input errors</b>	Input errors on the interface whose definitions are as follows: <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant packet threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	<b>extensive</b>
<b>Input Rate</b>	Input rate in bits per second (bps) and packets per second (pps).	<b>none</b>
<b>Output errors</b>	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious: <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	<b>extensive</b>
<b>Output Rate</b>	Output rate in bps and pps.	<b>none</b>
<b>Logical Interface</b>		
<b>Logical interface</b>	Name of the logical interface.	<b>brief detail extensive none</b>
<b>Index</b>	Index number of the logical interface, which reflects its initialization sequence.	<b>detail extensive none</b>
<b>SNMP ifIndex</b>	SNMP interface index number for the logical interface.	<b>detail extensive none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail</b>
<b>Flags</b>	Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under <i>Common Output Fields Description</i> .	<b>brief detail extensive none</b>
<b>Encapsulation</b>	Encapsulation on the logical interface.	<b>brief extensive none</b>

Table 134: *show interfaces demux0 (Demux Interfaces) Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>ACI VLAN: Dynamic Profile</b>	Name of the dynamic profile that defines the agent circuit identifier (ACI) interface set. If configured, the ACI interface set enables the underlying demux interface to create dynamic VLAN subscriber interfaces based on ACI information.	<b>brief detail extensive</b> none
<b>Demux</b>	Specific IP demultiplexing (demux) values: <ul style="list-style-type: none"> <li>• <b>Underlying interface</b>—The underlying interface that the demux interface uses.</li> <li>• <b>Index</b>—Index number of the logical interface.</li> <li>• <b>Family</b>—Protocol family configured on the logical interface.</li> <li>• <b>Source prefixes, total</b>—Total number of source prefixes for the underlying interface.</li> <li>• <b>Destination prefixes, total</b>—Total number of destination prefixes for the underlying interface.</li> <li>• <b>Prefix</b>—inet family prefix.</li> </ul>	<b>detail extensive</b> none
<b><i>protocol-family</i></b>	Protocol family configured on the logical interface.	<b>brief</b>
<b>Traffic statistics</b>	Number and rate of bytes and packets received and transmitted on the specified interface set. <ul style="list-style-type: none"> <li>• <b>Input bytes, Output bytes</b>—Number of bytes received and transmitted on the interface set.</li> <li>• <b>Input packets, Output packets</b>—Number of packets received and transmitted on the interface set.</li> <li>• <b>IPv6 transit statistics</b>—Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.</li> </ul> <p><b>NOTE:</b> The packet and byte counts in these fields include traffic that is dropped and does not leave the router.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>	<b>detail extensive</b>
<b>Local statistics</b>	Number of transit bytes and packets received and transmitted on the local interface. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>	<b>detail extensive</b>

Table 134: *show interfaces demux0 (Demux Interfaces) Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Transit statistics</b>	<p>Number and rate of bytes and packets transiting the switch.</p> <p><b>NOTE:</b> The packet and byte counts in these fields include traffic that is dropped and does not leave the router.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>	<b>detail extensive</b>
<b>IPv6 Transit statistics</b>	<p>Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.</p> <p><b>NOTE:</b> The packet and byte counts in these fields include traffic that is dropped and does not leave the router.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>	<b>detail extensive</b>
<b>Input packets</b>	Number of packets received on the interface.	none
<b>Output packets</b>	Number of packets transmitted on the interface.	none
<b>Protocol</b>	Protocol family. Possible values are described in the “Protocol Field” section under <i>Common Output Fields Description</i> .	<b>detail extensive</b> none
<b>MTU</b>	Maximum transmission unit size on the logical interface.	<b>detail extensive</b> none
<b>Maximum labels</b>	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	<b>detail extensive</b> none
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Route table</b>	Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	<b>detail extensive</b>
<b>Flags</b>	Information about protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .	<b>detail extensive</b> none
<b>Mac-Validate Failures</b>	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	<b>detail extensive</b> none
<b>Addresses, Flags</b>	Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .	<b>detail extensive</b> none
<b>Destination</b>	IP address of the remote side of the connection.	<b>detail extensive</b> <b>statistics</b> none

Table 134: `show interfaces demux0` (Demux Interfaces) Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Local</b>	IP address of the logical interface.	<b>detail extensive terse</b> none
<b>Remote</b>	IP address of the remote interface.	<b>terse</b>
<b>Broadcast</b>	Broadcast address of the logical interlace.	<b>detail extensive</b> none
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Link</b>	Name of the physical interfaces for member links in an aggregated Ethernet bundle for a PPPoE over aggregated Ethernet configuration. PPPoE traffic goes out on these interfaces.	<b>detail extensive</b> none
<b>Dynamic-profile</b>	Name of the PPPoE dynamic profile assigned to the underlying interface.	<b>detail extensive</b> none
<b>Service Name Table</b>	Name of the PPPoE service name table assigned to the PPPoE underlying interface.	<b>detail extensive</b> none
<b>Max Sessions</b>	Maximum number of dynamic PPPoE logical interfaces that the router can activate on the underlying interface.	<b>detail extensive</b> none
<b>Duplicate Protection</b>	State of duplicate protection: <b>On</b> or <b>Off</b> . Duplicate protection prevents the activation of another dynamic PPPoE logical interface on the same underlying interface when a dynamic PPPoE logical interface for a client with the same MAC address is already active on that interface.	<b>detail extensive</b> none
<b>Direct Connect</b>	State of the configuration to ignore DSL Forum VSAs: <b>On</b> or <b>Off</b> . When configured, the router ignores any of these VSAs received from a directly connected CPE device on the interface.	<b>detail extensive</b> none
<b>AC Name</b>	Name of the access concentrator.	<b>detail extensive</b> none

## Sample Output

### `show interfaces demux0` (Demux)

```
user@host> show interfaces demux0

## show interfaces diagnostics optics (Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, 100-Gigabit Ethernet, and Virtual Chassis Port)

**Syntax** `show interfaces diagnostics optics interface-name`

**Release Information** Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 12.1 for PTX Series routers.  
Command introduced in Junos OS Release 19.2R1 for QSFP-100GE-DWDM2 transceiver on MX10003, MX10008, MX10016, and MX204 routers.

**Description** Display diagnostics data, warnings, and alarms for Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, 100-Gigabit Ethernet, or Virtual Chassis port interfaces.

**Options** *interface-name*—Interface name. For example:

*ge-fpc/pic/port*

*et-fpc/pic/port*

*et-fpc/pic/port:channel*

*xe-fpc/pic/port*

*vcp-fpc/pic/port*

**Additional Information** The transceivers are polled in 1-second intervals for diagnostics data, warnings, and alarms. The alarms do not cause the links to go down or the LEDs to change color, nor generate SNMP traps. Changes in alarm and warning status generate system log messages.

Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transceiver vendors. Generally, a high alarm or low alarm indicates that the optics module is not operating properly. This information can be used to diagnose why a device is not working.

**NOTE:** Some transceivers do not support all optical diagnostics features described in the output fields.

If optics measures transmit or receive power as zero, then, the measured power is displayed as 0.000 mW / - Inf dBm

You can configure the P2-10G-40G-QSFPP PIC to operate either in 10-Gigabit Ethernet mode or in 40-Gigabit Ethernet mode. When the PIC is in 40-Gigabit Ethernet mode, you must execute the `show interfaces diagnostics optics et-fpc/pic/port` command. The output of this command displays the diagnostic optics information about the corresponding

40-Gigabit Ethernet port of the PIC. However, when the PIC is in 10-Gigabit Ethernet mode, you must execute the **show interfaces diagnostics optics et-fpc/pic/port:channel** command. The output of this command displays the diagnostic optics information about the corresponding 10-Gigabit Ethernet port of the PIC. For information about the P2-10G-40G-QSFPP PIC, see “[P2-10G-40G-QSFPP PIC Overview](#)” on page 256.

**Output Fields** [Table 135 on page 1452](#) lists the output fields for the **show interfaces diagnostics optics** command for DWDM and DWDM OTN PICs. Output fields are listed in the approximate order in which they appear.

*Table 135: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet DWDM and DWDM OTN PICs*

Field Name	Field Description
Physical interface	Name of the physical interface.
Laser bias current	Magnitude of the laser bias power setting current, in milliamperes (mA). The laser bias provides direct modulation of laser diodes and modulates currents.

**Table 135: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet DWDM and DWDM OTN PICs (continued)**

Field Name	Field Description
Laser output power	Laser output power, in milliwatts (mW) and decibels, referenced to 1.0 mW (dBm). This is a software equivalent to the <b>LsPOWMON</b> pin in hardware.
Receiver signal average optical power	Average received optical power, in mW and dBm. This indicator is a software equivalent to the <b>RxPOWMON</b> pin in hardware. Average optical power is vendor-specific.
Laser end-of-life alarm	Laser end-of-life alarm: <b>On</b> or <b>Off</b> .
Laser wavelength alarm	Laser wavelength alarm: <b>On</b> or <b>Off</b> .
Laser bias current alarm	Laser bias current alarm: <b>On</b> or <b>Off</b> .
Laser temperature alarm	Laser temperature alarm: <b>On</b> or <b>Off</b> .
Laser power alarm	Laser power alarm: <b>On</b> or <b>Off</b> .
Modulator temperature alarm	Modulator temperature alarm: <b>On</b> or <b>Off</b> . Transceivers from some vendors do not support this field.
Modulator bias alarm	Modulator bias alarm: <b>On</b> or <b>Off</b> .
Tx multiplexer FIFO error alarm	Transmit multiplexer first in, first out (FIFO) error alarm: <b>On</b> or <b>Off</b> .
Tx loss of PLL lock alarm	Transmit loss of phase-locked loop (PLL) lock alarm: <b>On</b> or <b>Off</b> .
Rx loss of average optical power alarm	Receive loss of average optical power alarm: <b>On</b> or <b>Off</b> .
Rx loss of AC power alarm	Receive loss of AC power alarm: <b>On</b> or <b>Off</b> . Transceivers from some vendors do not support this field.
Rx loss of PLL lock alarm	Receive loss of phase-locked loop (PLL) lock alarm: <b>On</b> or <b>Off</b> .

[Table 136 on page 1453](#) lists the output fields for the **show interfaces diagnostics optics** command when the router is operating with bidirectional SFP optics. Output fields are listed in the approximate order in which they appear.

**Table 136: show interfaces diagnostics optics Output Fields for Gigabit Ethernet Bidirectional SFP Optics**

Field Name	Field Description
Physical interface	Name of the physical interface.

Table 136: show interfaces diagnostics optics Output Fields for Gigabit Ethernet Bidirectional SFP Optics (continued)

Field Name	Field Description
Laser bias current	Magnitude of the laser bias power setting current, in milliamperes (mA). The laser bias provides direct modulation of laser diodes and modulates currents.
Laser output power	Laser output power, in milliwatts (mW) and decibels, referenced to 1.0 mW (dBm).
Module temperature	Temperature of the optics module, in Celsius and Fahrenheit.
Module voltage	Internally measured module voltage.
Receiver signal average optical power	Average received optical power, in mW and dBm.
Wavelength Channel number	Wavelength channel number set in the optics module.
Wavelength setpoint	Wavelength set in the optics module.
Tx Dither	Transmit dither status. Displays whether transmit dither is enabled or disabled.
Frequency Error	Frequency error reported from optics module.
Wavelength Error	Wavelength error reported from optics module.
Laser bias current high alarm	Laser bias power setting high alarm. Displays <b>on</b> or <b>off</b> .
Laser bias current low alarm	Laser bias power setting low alarm. Displays <b>on</b> or <b>off</b> .
Laser bias current high warning	Laser bias power setting high warning. Displays <b>on</b> or <b>off</b> .
Laser bias current low warning	Laser bias power setting low warning. Displays <b>on</b> or <b>off</b> .
Laser output power high alarm	Laser output power high alarm. Displays <b>on</b> or <b>off</b> .
Laser output power low alarm	Laser output power low alarm. Displays <b>on</b> or <b>off</b> .
Laser output power high warning	Laser output power high warning. Displays <b>on</b> or <b>off</b> .
Laser output power low warning	Laser output power low warning. Displays <b>on</b> or <b>off</b> .
Module temperature high alarm	Module temperature high alarm. Displays <b>on</b> or <b>off</b> .

Table 136: show interfaces diagnostics optics Output Fields for Gigabit Ethernet Bidirectional SFP Optics (continued)

Field Name	Field Description
Module temperature low alarm	Module temperature low alarm. Displays <b>on</b> or <b>off</b> .
Module temperature high warning	Module temperature high warning. Displays <b>on</b> or <b>off</b> .
Module temperature low warning	Module temperature low warning. Displays <b>on</b> or <b>off</b> .
Module voltage high alarm	Module voltage high alarm. Displays <b>on</b> or <b>off</b> .
Module voltage low alarm	Module voltage low alarm. Displays <b>on</b> or <b>off</b> .
Module voltage high warning	Module voltage high warning. Displays <b>on</b> or <b>off</b> .
Module voltage low warning	Module voltage high warning. Displays <b>on</b> or <b>off</b> .
Laser rx power high alarm	Receive laser power high alarm. Displays <b>on</b> or <b>off</b> .
Laser rx power low alarm	Receive laser power low alarm. Displays <b>on</b> or <b>off</b> .
Laser rx power high warning	Receive laser power high warning. Displays <b>on</b> or <b>off</b> .
Laser rx power low warning	Receive laser power low warning. Displays <b>on</b> or <b>off</b> .
TEC fault alarm	TEC fault alarm. Displays <b>on</b> or <b>off</b> .
Wavelength unlocked alarm	Wavelength unlocked alarm. Displays <b>on</b> or <b>off</b> .
TxTune	Optical transmit side status. Displays whether optical transmit side is not ready due to tuning.
Laser bias current high alarm threshold	Vendor-specified threshold for the laser bias current high alarm: <b>70.000 mA</b> .
Laser bias current low alarm threshold	Vendor-specified threshold for the laser bias current low alarm: <b>0.0002 mA</b> .
Laser bias current high warning threshold	Vendor-specified threshold for the laser bias current high warning: <b>65.000 mA</b> .

Table 136: show interfaces diagnostics optics Output Fields for Gigabit Ethernet Bidirectional SFP Optics (continued)

Field Name	Field Description
Laser bias current low warning threshold	Vendor-specified threshold for the laser bias current low warning: <b>0.0002 mA</b> .
Laser output power high alarm threshold	Vendor-specified threshold for the laser output power high alarm: <b>1.0000 mW</b> or <b>0.00 dBm</b> .
Laser output power low alarm threshold	Vendor-specified threshold for the laser output power low alarm: <b>0.0560 mW</b> or <b>-12.52 dBm</b> .
Laser output power high warning threshold	Vendor-specified threshold for the laser output power high warning: <b>0.6300 mW</b> or <b>-2.01 dBm</b> .
Laser output power low warning threshold	Vendor-specified threshold for the laser output power low warning: <b>0.0890 mW</b> or <b>-10.51 dBm</b> .
Module temperature high alarm threshold	Vendor-specified threshold for the module temperature high alarm: <b>100° C</b> or <b>212° F</b> .
Module temperature low alarm threshold	Vendor-specified threshold for the module temperature low alarm: <b>-50° C</b> or <b>-58° F</b> .
Module temperature high warning threshold	Vendor-specified threshold for the module temperature high warning: <b>95° C</b> or <b>203° F</b> .
Module temperature low warning threshold	Vendor-specified threshold for the module temperature low warning: <b>-48° C</b> or <b>-54° F</b> .
Module voltage high alarm threshold	Module voltage high alarm threshold: <b>3.700 v</b> .
Module voltage low alarm threshold	Module voltage low alarm threshold: <b>2.900 v</b> .
Module voltage high warning threshold	Module voltage high warning threshold: <b>3.7600 v</b> .
Module voltage low warning threshold	Module voltage low warning threshold: <b>3.000 v</b> .
Laser rx power high alarm threshold	Vendor-specified threshold for the laser Rx power high alarm: <b>1.9953 mW</b> or <b>3.00 dBm</b> .
Laser rx power low alarm threshold	Vendor-specified threshold for the laser Rx power low alarm: <b>0.0001 mW</b> or <b>-40.00 dBm</b> .
Laser rx power high warning threshold	Vendor-specified threshold for the laser Rx power high warning: <b>1.0000 mW</b> or <b>0.00 dBm</b> .

*Table 136: show interfaces diagnostics optics Output Fields for Gigabit Ethernet Bidirectional SFP Optics (continued)*

Field Name	Field Description
Laser rx power low warning threshold	Vendor-specified threshold for the laser Rx power low warning: 0.0010 mW or -30.00 dBm.

Table 137 on page 1457 lists the output fields for the **show interfaces diagnostics optics** command for SFP transceivers. Output fields are listed in the approximate order in which they appear.

*Table 137: show interfaces diagnostics Output Fields for Gigabit Ethernet SFP Transceivers*

Field Name	Field Description
Physical interface	Name of the physical interface.
Laser bias current	Measured laser bias current in uA.
Laser output power	Measured laser output power in mW.
Module temperature	Internally measured module temperature.
Module voltage	Internally measured module voltage.
Laser rx power	Measured receive optical power in mW.
Laser bias current high alarm	Laser bias current high alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.
Laser bias current low alarm	Laser bias current low alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.
Laser output power high alarm	Laser output power high alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.
Laser output power low alarm	Laser output power low alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.
Module temp high alarm	Module temperature high alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.
Module temp low alarm	Module temperature low alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.
Laser rx power high alarm	Laser receive power high alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.
Laser rx power low alarm	Laser receive power low alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.
Laser bias current high warning	Laser bias current high warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific.

Table 137: show interfaces diagnostics Output Fields for Gigabit Ethernet SFP Transceivers (continued)

Field Name	Field Description
Laser bias current low warning	Laser bias current low warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific.

Module temperature high warning	Module temperature high warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific.
Module temperature low warning	Module temperature low warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific.
Laser rx power high warning	Laser receive power high warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific.
Laser rx power low warning	Laser receive power low warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific.

*Table 138: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet Transceivers (continued)*

Field Name	Field Description
<b>Laser bias current high alarm threshold</b>	Laser bias current high alarm threshold. Alarm threshold ranges are vendor-specific.
<b>Laser bias current low alarm threshold</b>	Laser bias current low alarm threshold. Alarm threshold ranges are vendor-specific.
<b>Laser output power high alarm threshold</b>	Laser output power high alarm threshold. Alarm threshold ranges are vendor-specific.
<b>Laser output power low alarm threshold</b>	Laser output power low alarm threshold. Alarm threshold ranges are vendor-specific.
<b>Module temperature high alarm threshold</b>	Module temperature high alarm threshold. Alarm threshold ranges are vendor-specific.
<b>Module temperature low alarm threshold</b>	Module temperature low alarm threshold. Alarm threshold ranges are vendor-specific.
<b>Laser rx power high alarm threshold</b>	Laser receive power high alarm threshold. Alarm threshold ranges are vendor-specific.
<b>Laser rx power low alarm threshold</b>	Laser receive power low alarm threshold. Alarm threshold ranges are vendor-specific.
<b>Laser bias current high warning threshold</b>	Laser bias current high warning threshold. Warning ranges are vendor-specific.
<b>Laser bias current low warning threshold</b>	Laser bias current low warning threshold. Warning ranges are vendor-specific.
<b>Laser output power high warning threshold</b>	Laser output power high warning threshold. Warning ranges are vendor-specific.
<b>Laser output power low warning threshold</b>	Laser output power low warning threshold. Warning ranges are vendor-specific.
<b>Module temperature high warning threshold</b>	Module temperature high warning threshold. Warning ranges are vendor-specific.
<b>Module temperature low warning threshold</b>	Module temperature low warning threshold. Warning ranges are vendor-specific.
<b>Laser rx power high warning threshold</b>	Laser receive power high warning threshold. Warning threshold ranges are vendor-specific.
<b>Laser rx power low warning threshold</b>	Laser receive power low warning threshold. Warning threshold ranges are vendor-specific.

Table 139 on page 1462 lists the output fields for the **show interfaces diagnostics optics** command for 100-Gigabit Ethernet transceivers. Output fields are listed in the approximate order in which they appear.

*Table 139: show interfaces diagnostics optics Output Fields for 100-Gigabit Ethernet Transceivers*

Field Name	Field Description
<b>Physical interface</b>	Name of the physical interface.
<b>Grid Channel Number</b>	Set of wavelengths are divided into 40 grids. At a time transceiver will be programmed in one of this set (grid). Mapping of center wavelength to grid number is presented by this parameter.
<b>Corrected Error Ratio</b>	Indicates accumulated Bit Error Ratio.
<b>Uncorrected Words Ratio</b>	Monitors the error rate for either the full 100G link or on a channel-by-channel basis. Indicates the frame errors.
<b>Laser bias current</b>	Measured laser bias current in mA.
<b>Laser output power</b>	Measured laser output power in mW.
<b>Module temperature</b>	Internally measured module temperature.
<b>Laser rx power</b>	Measured receive optical power in mW.
<b>Laser bias current high alarm</b>	Laser bias current high alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.
<b>Laser bias current low alarm</b>	Laser bias current low alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.
<b>Laser output power high alarm</b>	Laser output power high alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.
<b>Laser output power low alarm</b>	Laser output power low alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.
<b>Module temp high alarm</b>	Module temperature high alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.
<b>Module temp low alarm</b>	Module temperature low alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.
<b>Laser rx power high alarm</b>	Laser receive power high alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.
<b>Laser rx power low alarm</b>	Laser receive power low alarm: <b>On</b> or <b>Off</b> . Alarm ranges are vendor-specific.
<b>Laser bias current high warning</b>	Laser bias current high warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific.

Table 139: show interfaces diagnostics optics Output Fields for 100-Gigabit Ethernet Transceivers (continued)

Laser output power low warning	Laser output power low warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific.
Module temperature high warning	Module temperature high warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific.
Module temperature low warning	Module temperature low warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific.
Laser rx power high warning	Laser receive power high warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific.
Laser rx power low warning	Laser receive power low warning: <b>On</b> or <b>Off</b> . Warning ranges are vendor-specific.
Laser bias current high alarm threshold	Laser bias current high alarm threshold. Alarm threshold ranges are vendor-specific.
Laser bias current low alarm threshold	Laser bias current low alarm threshold. Alarm threshold ranges are vendor-specific.
Laser output power high alarm threshold	Laser output power high alarm threshold. Alarm threshold ranges are vendor-specific.
Laser output power low alarm threshold	Laser output power low alarm threshold. Alarm threshold ranges are vendor-specific.
Module temperature high alarm threshold	Module temperature high alarm threshold. Alarm threshold ranges are vendor-specific.
Module temperature low alarm threshold	Module temperature low alarm threshold. Alarm threshold ranges are vendor-specific.
Laser rx power high alarm threshold	Laser receive power high alarm threshold. Alarm threshold ranges are vendor-specific.
Laser rx power low alarm threshold	Laser receive power low alarm threshold. Alarm threshold ranges are vendor-specific.
Laser bias current high warning threshold	Laser bias current high warning threshold. Warning ranges are vendor-specific.

**Table 139: show interfaces diagnostics optics Output Fields for 100-Gigabit Ethernet Transceivers (continued)**

Field Name	Field Description
Laser bias current low warning threshold	Laser bias current low warning threshold. Warning ranges are vendor-specific.
Laser output power high warning threshold	Laser output power high warning threshold. Warning ranges are vendor-specific.
Laser output power low warning threshold	Laser output power low warning threshold. Warning ranges are vendor-specific.
Module temperature high warning threshold	Module temperature high warning threshold. Warning ranges are vendor-specific.
Module temperature low warning threshold	Module temperature low warning threshold. Warning ranges are vendor-specific.
Laser rx power high warning threshold	Laser receive power high warning threshold. Warning threshold ranges are vendor-specific.
Laser rx power low warning threshold	Laser receive power low warning threshold. Warning threshold ranges are vendor-specific.
Lane carrier frequency offset	Difference (in frequency units) between the target frequency and the actual frequency.
Lane SNR	Signal-to-noise ratio of the electrical data present on the channel.
TEC Current	Monitors the amount of current flowing to the TEC of a cooled laser. It is a 16-bit signed 2s complement value with a LSB unit of 0.1 mA. Thus the total range is from -3.2768 A to +3.2767 A.
Residual ISI	Measures the amount of correction being done by the module to account for residual inter- symbol interference (ISI). The usual cause for this is optical dispersion so this measurement is a proxy for residual (uncorrected) optical dispersion that is being corrected by the module. The parameter is unitless and the threshold alarm and warning values will give an indication of the severity of the uncorrected dispersion.
PAM Histogram	Provides the rate of measured signal on the line that has an analog level near the cutoff for a PAM bit transition (for example, 0 <-> 1, 1 <-> 2, 2 <-> 3).

[Table 140 on page 1464](#) lists the output fields for the **show interfaces diagnostics optics** command for XFP transceivers. Output fields are listed in the approximate order in which they appear.

**Table 140: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet XFP Transceivers**

Field Name	Field Description
Physical interface	Name of the physical interface.

*Table 140: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet XFP Transceivers (continued)*

Field Name	Field Description
<b>Laser bias current</b>	Magnitude of the laser bias power setting current, in milliamperes (mA). The laser bias provides direct modulation of laser diodes and modulates currents.
<b>Laser output power</b>	Laser output power, in milliwatts (mW) and decibels, referenced to 1.0 mW (dBm). This is a software equivalent to the <b>LsPOWMON</b> pin in hardware.
<b>Module temperature</b>	Temperature of the XFP optics module, in Celsius and Fahrenheit.
<b>Laser rx power</b>	Laser received optical power, in mW and dBm.
<b>Laser bias current high alarm</b>	Laser bias power setting high alarm. Displays <b>on</b> or <b>off</b> .
<b>Laser bias current low alarm</b>	Laser bias power setting low alarm. Displays <b>on</b> or <b>off</b> .
<b>Laser bias current high warning</b>	Laser bias power setting high warning. Displays <b>on</b> or <b>off</b> .
<b>Laser bias current low warning</b>	Laser bias power setting low warning. Displays <b>on</b> or <b>off</b> .
<b>Laser output power high alarm</b>	Laser output power high alarm. Displays <b>on</b> or <b>off</b> .
<b>Laser output power low alarm</b>	Laser output power low alarm. Displays <b>on</b> or <b>off</b> .
<b>Laser output power high warning</b>	Laser output power high warning. Displays <b>on</b> or <b>off</b> .
<b>Laser output power low warning</b>	Laser output power low warning. Displays <b>on</b> or <b>off</b> .
<b>Module temperature high alarm</b>	Module temperature high alarm. Displays <b>on</b> or <b>off</b> .
<b>Module temperature low alarm</b>	Module temperature low alarm. Displays <b>on</b> or <b>off</b> .
<b>Module temperature high warning</b>	Module temperature high warning. Displays <b>on</b> or <b>off</b> .
<b>Module temperature low warning</b>	Module temperature low warning. Displays <b>on</b> or <b>off</b> .
<b>Laser rx power high alarm</b>	Receive laser power high alarm. Displays <b>on</b> or <b>off</b> .

Table 140: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet XFP Transceivers (continued)

Field Name	Field Description
Laser rx power low alarm	Receive laser power low alarm. Displays <b>on</b> or <b>off</b> .
Laser rx power high warning	Receive laser power high warning. Displays <b>on</b> or <b>off</b> .
Laser rx power low warning	Receive laser power low warning. Displays <b>on</b> or <b>off</b> .
Module not ready alarm	Module not ready alarm. When <b>on</b> , indicates the module has an operational fault. Displays <b>on</b> or <b>off</b> .
Module power down alarm	Module power down alarm. When <b>on</b> , module is in a limited power mode, low for normal operation. Displays <b>on</b> or <b>off</b> .
Tx data not ready alarm	Any condition leading to invalid data on the transmit path. Displays <b>on</b> or <b>off</b> .
Tx not ready alarm	Any condition leading to invalid data on the transmit path. Displays <b>on</b> or <b>off</b> .
Tx laser fault alarm	Laser fault condition. Displays <b>on</b> or <b>off</b> .
Tx CDR loss of lock alarm	Transmit clock and data recovery (CDR) loss of lock. Loss of lock on the transmit side of the CDR. Displays <b>on</b> or <b>off</b> .
Rx not ready alarm	Any condition leading to invalid data on the receive path. Displays <b>on</b> or <b>off</b> .
Rx loss of signal alarm	Receive Loss of Signal alarm. When <b>on</b> , indicates insufficient optical input power to the module. Displays <b>on</b> or <b>off</b> .
Rx CDR loss of lock alarm	Receive CDR loss of lock. Loss of lock on the receive side of the CDR. Displays <b>on</b> or <b>off</b> .
Laser bias current high alarm threshold	Vendor-specified threshold for the laser bias current high alarm: 130.000 mA.
Laser bias current low alarm threshold	Vendor-specified threshold for the laser bias current low alarm: 10.000 mA.
Laser bias current high warning threshold	Vendor-specified threshold for the laser bias current high warning: 120.000 mA.
Laser bias current low warning threshold	Vendor-specified threshold for the laser bias current low warning: 12.000 mA.
Laser output power high alarm threshold	Vendor-specified threshold for the laser output power high alarm: 0.8910 mW or -0.50 dBm.
Laser output power low alarm threshold	Vendor-specified threshold for the laser output power low alarm: 0.2230 mW or -6.52 dBm.

**Table 140: show interfaces diagnostics optics Output Fields for 10-Gigabit Ethernet XFP Transceivers (continued)**

Field Name	Field Description
Laser output power high warning threshold	Vendor-specified threshold for the laser output power high warning: <b>0.7940 mW</b> or <b>-100 dBm</b> .
Laser output power low warning threshold	Vendor-specified threshold for the laser output power low warning: <b>0.2510 mW</b> or <b>-600 dBm</b> .
Module temperature high alarm threshold	Vendor-specified threshold for the module temperature high alarm: <b>90° C</b> or <b>194° F</b> .
Module temperature low alarm threshold	Vendor-specified threshold for the module temperature low alarm: <b>-5° C</b> or <b>23° F</b> .
Module temperature high warning threshold	Vendor-specified threshold for the module temperature high warning: <b>85 ° C</b> or <b>185 ° F</b> .
Module temperature low warning threshold	Vendor-specified threshold for the module temperature low warning: <b>0° C</b> or <b>32° F</b> .
Laser rx power high alarm threshold	Vendor-specified threshold for the laser Rx power high alarm: <b>1.2589 mW</b> or <b>1.00 dBm</b> .
Laser rx power low alarm threshold	Vendor-specified threshold for the laser Rx power low alarm: <b>0.0323 mW</b> or <b>-14.91 dBm</b> .
Laser rx power high warning threshold	Vendor-specified threshold for the laser Rx power high warning: <b>1.1220 mW</b> or <b>0.50 dBm</b> .
Laser rx power low warning threshold	Vendor-specified threshold for the laser Rx power low warning: <b>0.0363 mW</b> or <b>-14.40 dBm</b> .

[Table 141 on page 1467](#) lists the output fields for the **show interfaces diagnostics optics** command for VCP. Output fields are listed in the approximate order in which they appear.

**Table 141: show interfaces diagnostics optics Output for Virtual Chassis Ports**

Field Name	Field Description
Physical interface	Name of the physical interface.
Laser bias current	Magnitude of the laser bias power setting current, in milliamperes (mA). The laser bias provides direct modulation of laser diodes and modulates currents.
Laser output power	Laser output power, in milliwatts (mW) and decibels, referenced to 1.0 mW (dBm).
Module temperature	Temperature of the optics module, in Celsius and Fahrenheit.
Module voltage	Internally measured module voltage.

Table 141: show interfaces diagnostics optics Output for Virtual Chassis Ports (continued)

Field Name	Field Description
Receiver signal average optical power	Average received optical power, in mW and dBm.
Laser bias current high alarm	Laser bias power setting high alarm. Displays <b>on</b> or <b>off</b> .
Laser bias current low alarm	Laser bias power setting low alarm. Displays <b>on</b> or <b>off</b> .
Laser bias current high warning	Laser bias power setting high warning. Displays <b>on</b> or <b>off</b> .
Laser bias current low warning	Laser bias power setting low warning. Displays <b>on</b> or <b>off</b> .
Laser output power high alarm	Laser output power high alarm. Displays <b>on</b> or <b>off</b> .
Laser output power low alarm	Laser output power low alarm. Displays <b>on</b> or <b>off</b> .
Laser output power high warning	Laser output power high warning. Displays <b>on</b> or <b>off</b> .
Laser output power low warning	Laser output power low warning. Displays <b>on</b> or <b>off</b> .
Module temperature high alarm	Module temperature high alarm. Displays <b>on</b> or <b>off</b> .
Module temperature low alarm	Module temperature low alarm. Displays <b>on</b> or <b>off</b> .
Module temperature high warning	Module temperature high warning. Displays <b>on</b> or <b>off</b> .
Module temperature low warning	Module temperature low warning. Displays <b>on</b> or <b>off</b> .
Module voltage high alarm	Module voltage high alarm. Displays <b>on</b> or <b>off</b> .
Module voltage low alarm	Module voltage low alarm. Displays <b>on</b> or <b>off</b> .
Module voltage high warning	Module voltage high warning. Displays <b>on</b> or <b>off</b> .

Table 141: show interfaces diagnostics optics Output for Virtual Chassis Ports (continued)

Field Name	Field Description
Module voltage low warning	Module voltage high warning. Displays <b>on</b> or <b>off</b> .
Laser rx power high alarm	Receive laser power high alarm. Displays <b>on</b> or <b>off</b> .
Laser rx power low alarm	Receive laser power low alarm. Displays <b>on</b> or <b>off</b> .
Laser rx power high warning	Receive laser power high warning. Displays <b>on</b> or <b>off</b> .
Laser rx power low warning	Receive laser power low warning. Displays <b>on</b> or <b>off</b> .
Laser bias current high alarm threshold	Vendor-specified threshold for the laser bias current high alarm.
Laser bias current low alarm threshold	Vendor-specified threshold for the laser bias current low alarm.
Laser bias current high warning threshold	Vendor-specified threshold for the laser bias current high warning.
Laser bias current low warning threshold	Vendor-specified threshold for the laser bias current low warning.
Laser output power high alarm threshold	Vendor-specified threshold for the laser output power high alarm.
Laser output power low alarm threshold	Vendor-specified threshold for the laser output power low alarm.
Laser output power high warning threshold	Vendor-specified threshold for the laser output power high warning.
Laser output power low warning threshold	Vendor-specified threshold for the laser output power low warning.
Module temperature high alarm threshold	Vendor-specified threshold for the module temperature high alarm.
Module temperature low alarm threshold	Vendor-specified threshold for the module temperature low alarm.
Module temperature high warning threshold	Vendor-specified threshold for the module temperature high warning.

Table 141: show interfaces diagnostics optics Output for Virtual Chassis Ports (continued)

Field Name	Field Description
Module temperature low warning threshold	Vendor-specified threshold for the module temperature low warning.
Module voltage high alarm threshold	Module voltage high alarm threshold.
Module voltage low alarm threshold	Module voltage low alarm threshold.
Module voltage high warning threshold	Module voltage high warning threshold.
Module voltage low warning threshold	Module voltage low warning threshold.
Laser rx power high alarm threshold	Vendor-specified threshold for the laser Rx power high alarm.
Laser rx power low alarm threshold	Vendor-specified threshold for the laser Rx power low alarm.
Laser rx power high warning threshold	Vendor-specified threshold for the laser Rx power high warning.
Laser rx power low warning threshold	Vendor-specified threshold for the laser Rx power low warning.

## Sample Output

### show interfaces diagnostics optics (DWDM and DWDM OTN)

```

user@host> show interfaces diagnostics optics ge-5/0/0

Physical interface: ge-5/0/0
 Laser bias current : 79.938 mA
 Laser output power : 1.592 mW / 2.02 dBm
 Receiver signal average optical power : 1.3854 mW / 1.42 dBm
 Laser end-of-life alarm : Off
 Laser wavelength alarm : Off
 Laser bias current alarm : Off
 Laser temperature alarm : Off
 Laser power alarm : Off
 Modulator temperature alarm : Off
 Modulator bias alarm : Off
 Tx multiplexer FIFO error alarm : Off
 Tx loss of PLL lock alarm : Off
 Rx loss of average optical power alarm: Off
 Rx loss of AC power alarm : Off
 Rx loss of PLL lock alarm : Off

```

## show interfaces diagnostics optics (MPC6E with OTN MIC)

```
user@host> show interfaces diagnostics optics xe-3/0/0
```

```
Physical interface: xe-3/0/0
 Laser bias current : 7.806 mA
 Laser output power : 0.5660 mW / -2.47 dBm
 Module temperature : 32 degrees C / 89 degrees F
 Module voltage : 3.3560 V
 Receiver signal average optical power : 0.5501 mW / -2.60 dBm
 Laser bias current high alarm : Off
 Laser bias current low alarm : Off
 Laser bias current high warning : Off
 Laser bias current low warning : Off
 Laser output power high alarm : Off
 Laser output power low alarm : Off
 Laser output power high warning : Off
 Laser output power low warning : Off
 Module temperature high alarm : Off
 Module temperature low alarm : Off
 Module temperature high warning : Off
 Module temperature low warning : Off
 Module voltage high alarm : Off
 Module voltage low alarm : Off
 Module voltage high warning : Off
 Module voltage low warning : Off
 Laser rx power high alarm : Off
 Laser rx power low alarm : Off
 Laser rx power high warning : Off
 Laser rx power low warning : Off
 Laser bias current high alarm threshold : 11.800 mA
 Laser bias current low alarm threshold : 4.000 mA
 Laser bias current high warning threshold : 10.800 mA
 Laser bias current low warning threshold : 5.000 mA
 Laser output power high alarm threshold : 0.8310 mW / -0.80 dBm
 Laser output power low alarm threshold : 0.2510 mW / -6.00 dBm
 Laser output power high warning threshold : 0.6600 mW / -1.80 dBm
 Laser output power low warning threshold : 0.3160 mW / -5.00 dBm
 Module temperature high alarm threshold : 78 degrees C / 172 degrees F
 Module temperature low alarm threshold : -13 degrees C / 9 degrees F
 Module temperature high warning threshold : 73 degrees C / 163 degrees F
 Module temperature low warning threshold : -8 degrees C / 18 degrees F
 Module voltage high alarm threshold : 3.700 V
 Module voltage low alarm threshold : 2.900 V
 Module voltage high warning threshold : 3.600 V
 Module voltage low warning threshold : 3.000 V
 Laser rx power high alarm threshold : 1.0000 mW / 0.00 dBm
 Laser rx power low alarm threshold : 0.0100 mW / -20.00 dBm
 Laser rx power high warning threshold : 0.7943 mW / -1.00 dBm
 Laser rx power low warning threshold : 0.0158 mW / -18.01 dBm
```

## show interfaces diagnostics optics (Bidirectional SFP)

```
user@host> show interfaces diagnostics optics ge-3/0/6
```

```
Physical interface: ge-3/0/6
 Laser bias current : 13.356 mA
 Laser output power : 0.2210 mW / -6.56 dBm
 Module temperature : 36 degrees C / 96 degrees F
```

```

## show interfaces (far-end-interval)

<b>Syntax</b>	<code>show interfaces far-end-interval <i>interface-fpc/pic/port</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.4.
<b>Description</b>	On channelized interfaces, display the far end interval data for the specified interface.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show interfaces far-end-interval coc12-5/2/0 on page 1490</a> <a href="#">show interfaces far-end-interval coc1-5/2/1:1 on page 1491</a>
<b>Output Fields</b>	Table 142 on page 1490 lists the output fields for the <b>show interfaces far-end-interval</b> command. Output fields are listed in the approximate order in which they appear.

*Table 142: show interfaces far-end-interval Output Fields*

Field Name	Field Description
Physical interface	Interface FPC/PIC/port values.
SNMP ifIndex	SNMP interface index value.
ES-L/P	Error detection—Errored seconds.
SES-L/P	Error detection—Severely errored seconds.
UAS-L/P	Error detection—Unavailable seconds.

## Sample Output

### show interfaces far-end-interval coc12-5/2/0

```

user@host> show interfaces far-end-interval coc12-5/2/0
Physical interface: coc12-5/2/0, SNMP ifIndex: 121

## show interfaces (Fast Ethernet)

<b>Syntax</b>	<pre>show interfaces <i>interface-type</i> &lt;brief   detail   extensive   terse&gt; &lt;descriptions&gt; &lt;media&gt; &lt;snmp-index <i>snmp-index</i>&gt; &lt;statistics&gt;</pre>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Display status information about the specified Fast Ethernet interface.
<b>Options</b>	<p><b><i>interface-type</i></b>—On M Series and T Series routers, the interface type is <b><i>fe-fpc/pic/port</i></b>.</p> <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b>descriptions</b>—(Optional) Display interface description strings.</p> <p><b>media</b>—(Optional) Display media-specific information about network interfaces.</p> <p><b>snmp-index <i>snmp-index</i></b>—(Optional) Display information for the specified SNMP index of the interface.</p> <p><b>statistics</b>—(Optional) Display static interface statistics.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<p><a href="#">show interfaces (Fast Ethernet) on page 1505</a></p> <p><a href="#">show interfaces brief (Fast Ethernet) on page 1506</a></p> <p><a href="#">show interfaces detail (Fast Ethernet) on page 1506</a></p> <p><a href="#">show interfaces extensive (Fast Ethernet) on page 1506</a></p>
<b>Output Fields</b>	Table 143 on page 1492 lists the output fields for the <b>show interfaces</b> (Fast Ethernet) command. Output fields are listed in the approximate order in which they appear.

Table 143: show interfaces Fast Ethernet Output Fields

Field Name	Field Description	Level of Output
Physical Interface		
<b>Physical interface</b>	Name of the physical interface.	All levels
<b>Enabled</b>	State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .	All levels
<b>Interface index</b>	Index number of the physical interface, which reflects its initialization sequence.	<b>detail extensive none</b>

Table 143: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
SNMP ifIndex	SNMP index number for the physical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Link-level type	Encapsulation being used on the physical interface.	All levels
MTU	Maximum transmission unit size on the physical interface.	All levels
Link-mode	Type of link connection configured for the physical interface: <b>Full-duplex</b> or <b>Half-duplex</b>	extensive
Speed	Speed at which the interface is running.	All levels
Loopback	Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .	All levels
Source filtering	Source filtering status: <b>Enabled</b> or <b>Disabled</b> .	All levels
LAN-PHY mode	10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.	All levels
WAN-PHY mode	10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.	All levels
Unidirectional	Unidirectional link mode status for 10-Gigabit Ethernet interface: <b>Enabled</b> or <b>Disabled</b> for parent interface; <b>Rx-only</b> or <b>Tx-only</b> for child interfaces.	All levels
Flow control	Flow control status: <b>Enabled</b> or <b>Disabled</b> .	All levels
Auto-negotiation	(Gigabit Ethernet interfaces) Autonegotiation status: <b>Enabled</b> or <b>Disabled</b> .	All levels
Remote-fault	(Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> <li>• <b>Online</b>—Autonegotiation is manually configured as online.</li> <li>• <b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul>	All levels
Device flags	Information about the physical device. Possible values are described in the "Device Flags" section under <i>Common Output Fields Description</i> .	All levels
Interface flags	Information about the interface. Possible values are described in the "Interface Flags" section under <i>Common Output Fields Description</i> .	All levels
Link flags	Information about the link. Possible values are described in the "Links Flags" section under <i>Common Output Fields Description</i> .	All levels
Wavelength	(10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).	All levels

Table 143: *show interfaces Fast Ethernet Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Frequency</b>	(10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).	All levels
<b>CoS queues</b>	Number of CoS queues configured.	<b>detail extensive</b> none
<b>Schedulers</b>	(GigabitEthernet intelligent queuing 2 (IQ2) interfaces only) Number of CoS schedulers configured.	<b>extensive</b>
<b>Hold-times</b>	Current interface hold-time up and hold-time down, in milliseconds.	<b>detail extensive</b>
<b>Current address</b>	Configured MAC address.	<b>detail extensive</b> none
<b>Hardware address</b>	Hardware MAC address.	<b>detail extensive</b> none
<b>Last flapped</b>	Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .	<b>detail extensive</b> none
<b>Input Rate</b>	Input rate in bits per second (bps) and packets per second (pps).	None specified
<b>Output Rate</b>	Output rate in bps and pps.	None specified
<b>Statistics last cleared</b>	Time when the statistics for the interface were last set to zero.	<b>detail extensive</b>
<b>Traffic statistics</b>	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> <p>Gigabit Ethernet and 10-Gigabit Ethernet IQ PICs count the overhead and CRC bytes.</p> <p>For Gigabit Ethernet IQ PICs, the input byte counts vary by interface type. For more information, see Table 31 under the <a href="#">show interfaces</a> command.</p>	<b>detail extensive</b>

Table 143: *show interfaces Fast Ethernet Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Input errors</b>	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	<b>extensive</b>

Table 143: *show interfaces Fast Ethernet Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Output errors</b>	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	<b>extensive</b>
<b>Egress queues</b>	<p>Total number of egress queues supported on the specified interface.</p> <p><b>NOTE:</b> In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the <b>show interfaces</b> command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs</p>	<b>detail extensive</b>
<b>Queue counters (Egress)</b>	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>	<b>detail extensive</b>

Table 143: *show interfaces Fast Ethernet Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Ingress queues</b>	Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.	<b>extensive</b>
<b>Queue counters (Ingress)</b>	CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces. <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>	<b>extensive</b>
<b>Active alarms and Active defects</b>	Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the routing device configuration, an alarm can ring the red or yellow alarm bell on the routing device, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value <b>None</b> or <b>Link</b> . <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul>	<b>detail extensive none</b>
<b>OTN FEC statistics</b>	The forward error correction (FEC) counters provide the following statistics: <ul style="list-style-type: none"> <li>• <b>Corrected Errors</b>—The count of corrected errors in the last second.</li> <li>• <b>Corrected Error Ratio</b>—The corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits.</li> </ul>	
<b>PCS statistics</b>	(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device. <ul style="list-style-type: none"> <li>• <b>Bit errors</b>—The number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode.</li> <li>• <b>Errored blocks</b>—The number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode.</li> </ul>	<b>detail extensive</b>

Table 143: *show interfaces Fast Ethernet Output Fields (continued)*

Field Name	Field Description	Level of Output
MAC statistics	<p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> <li>• <b>Total octets and total packets</b>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see Table 31 under the <a href="#">show interfaces</a> command.</li> <li>• <b>Unicast packets, Broadcast packets, and Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—Number of frames that exceed 1518 octets.</li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul>	extensive
OTN Received Overhead Bytes	APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08	extensive
OTN Transmitted Overhead Bytes	APS/PCC0: 0x00, APS/PCC1: 0x00, APS/PCC2: 0x00, APS/PCC3: 0x00 Payload Type: 0x08	extensive

Table 143: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Filter statistics</b>	<p><b>Receive</b> and <b>Transmit</b> statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> <li>• <b>Input packet count</b>—Number of packets received from the MAC hardware that the filter processed.</li> <li>• <b>Input packet rejects</b>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</li> <li>• <b>Input DA rejects</b>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting).</li> <li>• <b>Input SA rejects</b>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</li> <li>• <b>Output packet count</b>—Number of packets that the filter has given to the MAC hardware.</li> <li>• <b>Output packet pad count</b>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</li> <li>• <b>Output packet error count</b>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</li> <li>• <b>CAM destination filters, CAM source filters</b>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.</li> </ul>	<b>extensive</b>
<b>PMA PHY</b>	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:</p> <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Number of seconds the defect has been active.</li> <li>• <b>Count</b>—Number of times that the defect has gone from inactive to active.</li> <li>• <b>State</b>—State of the error. Field Name	Field Description	Level of Output
Autonegotiation information	<p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> <li>• <b>Negotiation status:</b> <ul style="list-style-type: none"> <li>• <b>Incomplete</b>—Ethernet interface has the speed or link mode configured.</li> <li>• <b>No autonegotiation</b>—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.</li> <li>• <b>Complete</b>—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> </ul> </li> <li>• <b>Link partner status</b>—OK when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> <li>• <b>Link partner:</b> <ul style="list-style-type: none"> <li>• <b>Link mode</b>—Depending on the capability of the attached Ethernet device, either <b>Full-duplex</b> or <b>Half-duplex</b>.</li> <li>• <b>Flow control</b>—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is <b>None</b>. For Gigabit Ethernet interfaces, types are <b>Symmetric</b> (link partner supports <b>PAUSE</b> on receive and transmit), <b>Asymmetric</b> (link partner supports <b>PAUSE</b> on transmit), and <b>Symmetric/Asymmetric</b> (link partner supports both <b>PAUSE</b> on receive and transmit or only <b>PAUSE</b> receive).</li> <li>• <b>Remote fault</b>—Remote fault information from the link partner—<b>Failure</b> indicates a receive link error. <b>OK</b> indicates that the link partner is receiving. <b>Negotiation error</b> indicates a negotiation error. <b>Offline</b> indicates that the link partner is going offline.</li> </ul> </li> <li>• <b>Local resolution</b>—Information from the link partner: <ul style="list-style-type: none"> <li>• <b>Flow control</b>—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are <b>Symmetric</b> (link partner supports <b>PAUSE</b> on receive and transmit), <b>Asymmetric</b> (link partner supports <b>PAUSE</b> on transmit), and <b>Symmetric/Asymmetric</b> (link partner supports both <b>PAUSE</b> on receive and transmit or only <b>PAUSE</b> receive).</li> <li>• <b>Remote fault</b>—Remote fault information. <b>Link OK</b> (no error detected on receive), <b>Offline</b> (local interface is offline), and <b>Link Failure</b> (link error detected on receive).</li> </ul> </li> </ul>	extensive
Received path trace, Transmitted path trace	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other routing device manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the routing device at the other end of the fiber. The transmitted path trace value is the message that this routing device transmits.</p>	extensive
Packet Forwarding Engine configuration	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> <li>• <b>Destination slot</b>—FPC slot number.</li> </ul>	extensive

Table 143: *show interfaces Fast Ethernet Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>CoS information</b>	Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> <li>• <b>CoS transmit queue</b>—Queue number and its associated user-configured forwarding class name.</li> <li>• <b>Bandwidth %</b>—Percentage of bandwidth allocated to the queue.</li> <li>• <b>Bandwidth bps</b>—Bandwidth allocated to the queue (in bps).</li> <li>• <b>Buffer %</b>—Percentage of buffer space allocated to the queue.</li> <li>• <b>Buffer usec</b>—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time.</li> <li>• <b>Priority</b>—Queue priority: <b>low</b> or <b>high</b>.</li> <li>• <b>Limit</b>—Displayed if rate limiting is configured for the queue. Possible values are <b>none</b> and <b>exact</b>. If <b>exact</b> is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If <b>none</b> is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.</li> </ul>	<b>extensive</b>
<b>Logical Interface</b>		
<b>Logical interface</b>	Name of the logical interface.	All levels
<b>Index</b>	Index number of the logical interface, which reflects its initialization sequence.	<b>detail extensive</b> none
<b>SNMP ifIndex</b>	SNMP interface index number for the logical interface.	<b>detail extensive</b> none
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Flags</b>	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .	All levels
<b>VLAN-Tag</b>	Rewrite profile applied to incoming or outgoing frames on the outer ( <b>Out</b> ) VLAN tag or for both the outer and inner ( <b>In</b> ) VLAN tags. <ul style="list-style-type: none"> <li>• <b>push</b>—An outer VLAN tag is pushed in front of the existing VLAN tag.</li> <li>• <b>pop</b>—The outer VLAN tag of the incoming frame is removed.</li> <li>• <b>swap</b>—The outer VLAN tag of the incoming frame is overwritten with the user specified VLAN tag information.</li> <li>• <b>push-pop</b>—An outer VLAN tag is pushed in front of the existing VLAN tag, and then removed.</li> <li>• <b>push-push</b>—Two VLAN tags are pushed in from the incoming frame.</li> <li>• <b>swap-push</b>—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame.</li> <li>• <b>swap-swap</b>—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user specified VLAN tag value.</li> <li>• <b>pop-swap</b>—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame.</li> <li>• <b>pop-pop</b>—Both the outer and inner VLAN tags of the incoming frame are removed.</li> </ul>	<b>brief detail extensive</b> none

Table 143: show interfaces Fast Ethernet Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Demux:</b>	IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following: <ul style="list-style-type: none"> <li>Source Family Inet</li> <li>Destination Family Inet</li> </ul>	<b>detail extensive none</b>
<b>Encapsulation</b>	Encapsulation on the logical interface.	All levels
<b>Protocol</b>	Protocol family. Possible values are described in the "Protocol Field" section under <i>Common Output Fields Description</i> .	<b>detail extensive none</b>
<b>MTU</b>	Maximum transmission unit size on the logical interface.	<b>detail extensive none</b>
<b>Maximum labels</b>	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	<b>detail extensive none</b>
<b>Traffic statistics</b>	Number and rate of bytes and packets received and transmitted on the specified interface set. <ul style="list-style-type: none"> <li><b>Input bytes, Output bytes</b>—Number of bytes received and transmitted on the interface set</li> <li><b>Input packets, Output packets</b>—Number of packets received and transmitted on the interface set.</li> </ul>	<b>detail extensive</b>
<b>IPv6 transit statistics</b>	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.	<b>extensive</b>
<b>Local statistics</b>	Number and rate of bytes and packets destined to the routing device.	<b>extensive</b>
<b>Transit statistics</b>	Number and rate of bytes and packets transiting the switch. <p><b>NOTE:</b> For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the <b>Output bytes</b> and <b>Output packets</b> interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.</p>	<b>extensive</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Route Table</b>	Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	<b>detail extensive none</b>
<b>Flags</b>	Information about protocol family flags. Possible values are described in the "Family Flags" section under <i>Common Output Fields Description</i> .	<b>detail extensive</b>
<b>Donor interface</b>	(Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.	<b>detail extensive none</b>

Table 143: *show interfaces Fast Ethernet Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Preferred source address</b>	(Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.	<b>detail extensive none</b>
<b>Input Filters</b>	Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	<b>detail extensive</b>
<b>Output Filters</b>	Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	<b>detail extensive</b>
<b>Mac-Validate Failures</b>	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	<b>detail extensive none</b>
<b>Addresses, Flags</b>	Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .	<b>detail extensive none</b>
<b><i>protocol-family</i></b>	Protocol family configured on the logical interface. If the protocol is <b>inet</b> , the IP address of the interface is also displayed.	<b>brief</b>
<b>Flags</b>	Information about address flag (possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> ).	<b>detail extensive none</b>
<b>Destination</b>	IP address of the remote side of the connection.	<b>detail extensive none</b>
<b>Local</b>	IP address of the logical interface.	<b>detail extensive none</b>
<b>Broadcast</b>	Broadcast address of the logical interface.	<b>detail extensive none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>

## Sample Output

### show interfaces (Fast Ethernet)

```
user@host> show interfaces fe-0/0/0
```

```
Physical interface: fe-0/0/0, Enabled, Physical link is Up
Interface index: 128, SNMP ifIndex: 22
Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback: Disabled,
Source filtering: Disabled, Flow control: Enabled
Device flags : Present Running
Interface flags: SNMP-Traps Internal: 0x4000
CoS queues : 4 supported, 4 maximum usable queues
Current address: 00:00:5e:00:53:38, Hardware address: 00:00:5e:00:53:38
Last flapped : 2006-01-20 14:50:58 PST (2w4d 00:44 ago)
Input rate : 0 bps (0 pps)
Output rate : 0 bps (0 pps)
Active alarms : None
Active defects : None
Logical interface fe-0/0/0.0 (Index 66) (SNMP ifIndex 198)
```

```

Flags: SNMP-Traps Encapsulation: ENET2
Protocol inet, MTU: 1500
Flags: None
Addresses, Flags: Is-Preferred Is-Primary
Destination: 203.0.113/24, Local: 203.0.113.1, Broadcast: 203.0.113.255

```

### show interfaces brief (Fast Ethernet)

```
user@host> show interfaces fe-0/0/0 brief
```

```

Physical interface: fe-0/0/0, Enabled, Physical link is Up
Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback: Disabled,
Source filtering: Disabled, Flow control: Enabled
Device flags : Present Running
Interface flags: SNMP-Traps Internal: 0x4000
Logical interface fe-0/0/0.0
Flags: SNMP-Traps Encapsulation: ENET2
inet 203.0.113.1/24

**Release Information** Command introduced before Junos OS Release 7.4 for Gigabit interfaces.  
Command introduced in Junos OS Release 8.0 for 10 Gigabit interfaces.  
Command modified in Junos OS Release 9.5 for SRX Series devices.  
Command introduced in Junos OS Release 18.1 for Gigabit interfaces.

**Description** Display status information about the specified Gigabit Ethernet interface.

(M320, M120, MX Series, and T Series routers only) Display status information about the specified 10-Gigabit Ethernet interface.

Display the IPv6 interface traffic statistics about the specified Gigabit Ethernet interface for MX series routers. The input and output bytes (bps) and packets (pps) rates are not displayed for IFD and local traffic.

Display status information and statistics about interfaces on SRX Series appliance running Junos OS.

**NOTE:** On SRX Series appliances, on configuring identical IPs on a single interface, you will not see a warning message; instead, you will see a syslog message.

Starting in Junos OS Release 18.4R1, Output fields **Next-hop** and **vpls-status** is displayed in the **show interfaces *interface name* detail** command, only for Layer 2 protocols on MX480 routers.

**Options** For Gigabit interfaces:

**ge-fpc/pic/port**—Display standard information about the specified Gigabit Ethernet interface.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**descriptions**—(Optional) Display interface description strings.

**media**—(Optional) Display media-specific information about network interfaces.

**snmp-index *snmp-index***—(Optional) Display information for the specified SNMP index of the interface.

**statistics**—(Optional) Display static interface statistics.

For 10 Gigabit interfaces:

**xe-fpc/pic/port**—Display standard information about the specified 10-Gigabit Ethernet interface.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**descriptions**—(Optional) Display interface description strings.

**media**—(Optional) Display media-specific information about network interfaces.

**snmp-index *snmp-index***—(Optional) Display information for the specified SNMP index of the interface.

**statistics**—(Optional) Display static interface statistics.

For SRX interfaces:

- **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace *pim* with the PIM slot and port with the port number.
  - **at-*pim*/0/*port***—ATM-over-ADSL or ATM-over-SHDSL interface.
  - **ce1-*pim*/0/*port***—Channelized E1 interface.
  - **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
  - **ct1-*pim*/0/*port***—Channelized T1 interface.
  - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
  - **e1-*pim*/0/*port***—E1 interface.
  - **e3-*pim*/0/*port***—E3 interface.
  - **fe-*pim*/0/*port***—Fast Ethernet interface.
  - **ge-*pim*/0/*port***—Gigabit Ethernet interface.
  - **se-*pim*/0/*port***—Serial interface.
  - **t1-*pim*/0/*port***—T1 (also called DS1) interface.
  - **t3-*pim*/0/*port***—T3 (also called DS3) interface.
  - **wx-slot/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).
- **interface-name**—(Optional) Display standard information about the specified interface. Following is a list of typical interface names. Replace *pim* with the PIM slot and port with the port number.
  - **at-*pim*/0/*port***—ATM-over-ADSL or ATM-over-SHDSL interface.
  - **ce1-*pim*/0/*port***—Channelized E1 interface.
  - **cl-0/0/8**—3G wireless modem interface for SRX320 devices.
  - **ct1-*pim*/0/*port***—Channelized T1 interface.
  - **dl0**—Dialer Interface for initiating ISDN and USB modem connections.
  - **e1-*pim*/0/*port***—E1 interface.
  - **e3-*pim*/0/*port***—E3 interface.
  - **fe-*pim*/0/*port***—Fast Ethernet interface.
  - **ge-*pim*/0/*port***—Gigabit Ethernet interface.

- **se-pim/0/port**—Serial interface.
- **t1-pim/0/port**—T1 (also called DS1) interface.
- **t3-pim/0/port**—T3 (also called DS3) interface.
- **wx-slot/0/0**—WAN acceleration interface, for the WXC Integrated Services Module (ISM 200).

**Additional Information** In a logical system, this command displays information only about the logical interfaces and not about the physical interfaces.

**Required Privilege Level** view

**Release History Table**

Release	Description
18.4R1	Starting in Junos OS Release 18.4R1, Output fields <b>Next-hop</b> and <b>vpls-status</b> is displayed in the <b>show interfaces interface name detail</b> command, only for Layer 2 protocols on MX480 routers.

**Output Fields** [Table 144 on page 1514](#) describes the output fields for the **show interfaces** (Gigabit Ethernet) command. Output fields are listed in the approximate order in which they appear. For Gigabit Ethernet IQ and IQE PICs, the traffic and MAC statistics vary by interface type. For more information, see [Table 145 on page 1541](#).

Table 144: show interfaces (Gigabit Ethernet) Output Fields

Field Name	Field Description	Level of Output
<b>Physical Interface</b>		
<b>Physical interface</b>	Name of the physical interface.	All levels
<b>Enabled</b>	State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .	All levels
<b>Interface index</b>	Index number of the physical interface, which reflects its initialization sequence.	<b>detail extensive none</b>
<b>SNMP ifIndex</b>	SNMP index number for the physical interface.	<b>detail extensive none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Link-level type</b>	Encapsulation being used on the physical interface.	All levels
<b>MTU</b>	Maximum transmission unit size on the physical interface.	All levels
<b>Speed</b>	Speed at which the interface is running.	All levels
<b>Loopback</b>	Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .	All levels
<b>Source filtering</b>	Source filtering status: <b>Enabled</b> or <b>Disabled</b> .	All levels
<b>LAN-PHY mode</b>	10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.	All levels
<b>WAN-PHY mode</b>	10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.	All levels
<b>Unidirectional</b>	Unidirectional link mode status for 10-Gigabit Ethernet interface: <b>Enabled</b> or <b>Disabled</b> for parent interface; <b>Rx-only</b> or <b>Tx-only</b> for child interfaces.	All levels
<b>Flow control</b>	Flow control status: <b>Enabled</b> or <b>Disabled</b> .	All levels
<b>Auto-negotiation</b>	(Gigabit Ethernet interfaces) Autonegotiation status: <b>Enabled</b> or <b>Disabled</b> .	All levels
<b>Remote-fault</b>	(Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> <li><b>Online</b>—Autonegotiation is manually configured as online.</li> <li><b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul>	All levels
<b>Device flags</b>	Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .	All levels
<b>Interface flags</b>	Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .	All levels

Table 144: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Link flags</b>	Information about the link. Possible values are described in the “Links Flags” section under <i>Common Output Fields Description</i> .	All levels
<b>Wavelength</b>	(10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).	All levels
<b>Frequency</b>	(10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).	All levels
<b>CoS queues</b>	Number of CoS queues configured.	<b>detail extensive</b> none
<b>Schedulers</b>	(Gigabit Ethernet intelligent queuing 2 [IQ2] interfaces only) Number of CoS schedulers configured.	<b>extensive</b>
<b>Hold-times</b>	Current interface hold-time up and hold-time down, in milliseconds (ms).	<b>detail extensive</b>
<b>Current address</b>	Configured MAC address.	<b>detail extensive</b> none
<b>Hardware address</b>	Hardware MAC address.	<b>detail extensive</b> none
<b>Last flapped</b>	Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .	<b>detail extensive</b> none
<b>Input Rate</b>	Input rate in bits per second (bps) and packets per second (pps). The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None
<b>Output Rate</b>	Output rate in bps and pps. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None
<b>Statistics last cleared</b>	Time when the statistics for the interface were last set to zero.	<b>detail extensive</b>
<b>Egress account overhead</b>	Layer 2 overhead in bytes that is accounted in the interface statistics for egress traffic.	<b>detail extensive</b>
<b>Ingress account overhead</b>	Layer 2 overhead in bytes that is accounted in the interface statistics for ingress traffic.	<b>detail extensive</b>

Table 144: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Traffic statistics</b>	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface. The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> <p>Gigabit Ethernet and 10-Gigabit Ethernet IQ PICs count the overhead and CRC bytes.</p> <p>For Gigabit Ethernet IQ PICs, the input byte counts vary by interface type. For more information, see Table 31 under the <a href="#">show interfaces</a> command.</p>	<b>detail extensive</b>
<b>Input errors</b>	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	<b>extensive</b>

Table 144: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Output errors</b>	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the <b>Drops</b> field does not always use the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> <ul style="list-style-type: none"> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number must always be 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field must never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	<b>extensive</b>
<b>Egress queues</b>	<p>Total number of egress queues supported on the specified interface.</p> <p><b>NOTE:</b> In DPCs that are not of the enhanced type, such as DPC 40x 1GER, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the <b>show interfaces</b> command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs</p>	<b>detail extensive</b>

Table 144: show interfaces (Gigabit Ethernet) Output Fields (continued)

Field Name	Field Description	Level of Output
Queue counters (Egress)	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the <b>Dropped packets</b> field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p>	detail extensive
Ingress queues	Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.	extensive
Queue counters (Ingress)	<p>CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>	extensive
Active alarms and Active defects	<p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul>	detail extensive none
Interface transmit statistics	<p>(On MX Series devices) Status of the <b>interface-transmit-statistics</b> configuration: Enabled or Disabled.</p> <ul style="list-style-type: none"> <li>• <b>Enabled</b>—When the <b>interface-transmit-statistics</b> statement is included in the configuration. If this is configured, the interface statistics show the actual transmitted load on the interface.</li> <li>• <b>Disabled</b>—When the <b>interface-transmit-statistics</b> statement is not included in the configuration. If this is not configured, the interface statistics show the offered load on the interface.</li> </ul>	detail extensive
OTN FEC statistics	<p>The forward error correction (FEC) counters provide the following statistics:</p> <ul style="list-style-type: none"> <li>• <b>Corrected Errors</b>—Count of corrected errors in the last second.</li> <li>• <b>Corrected Error Ratio</b>—Corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits.</li> </ul>	detail extensive

Table 144: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>PCS statistics</b>	<p>(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device.</p> <ul style="list-style-type: none"> <li>• <b>Bit errors</b>—Number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode.</li> <li>• <b>Errored blocks</b>—Number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode.</li> </ul>	<b>detail extensive</b>
<b>Link Degrad</b>	<p>Shows the link degrade status of the physical link and the estimated bit error rates (BERs). This field is available only for the PICs supporting the physical link monitoring feature.</p> <ul style="list-style-type: none"> <li>• <b>Link Monitoring</b>—Indicates if physical link degrade monitoring is enabled on the interface. <ul style="list-style-type: none"> <li>• <b>Enable</b>—Indicates that link degrade monitoring has been enabled (using the <b>link-degrade-monitor</b> statement) on the interface.</li> <li>• <b>Disable</b>—Indicates that link degrade monitoring has not been enabled on the interface. If link degrade monitoring has not been enabled, the output does not show any related information, such as BER values and thresholds.</li> </ul> </li> <li>• <b>Link Degrad Set Threshold</b>—The BER threshold value at which the link is considered degraded and a corrective action is triggered.</li> <li>• <b>Link Degrad Clear Threshold</b>—The BER threshold value at which the degraded link is considered recovered and the corrective action applied to the interface is reverted.</li> <li>• <b>Estimated BER</b>—The estimated bit error rate.</li> <li>• <b>Link-degrade event</b>—Shows link degrade event information. <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Time (in seconds) elapsed after a link degrade event occurred.</li> <li>• <b>Count</b>—The number of link degrade events recorded.</li> <li>• <b>State</b>—Shows the link degrade status (example: <b>Defect Active</b>).</li> </ul> </li> </ul>	<b>detail extensive</b>

Table 144: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

Field Name	Field Description	Level of Output
MAC statistics	<p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> <li>• <b>Total octets</b> and <b>total packets</b>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type. For more information, see Table 31 under the <code>show interfaces</code> command.</li> <li>• <b>Unicast packets</b>, <b>Broadcast packets</b>, and <b>Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—There are two possible conditions regarding the number of oversized frames: <ul style="list-style-type: none"> <li>• Packet length exceeds interface MTU, or</li> <li>• Packet length exceeds MRU</li> </ul> </li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. <p><b>NOTE:</b> The 20-port Gigabit Ethernet MIC (MIC-3D-20GE-SFP) does not have hardware counters for VLAN frames. Therefore, the <b>VLAN tagged frames</b> field displays 0 when the <code>show interfaces</code> command is executed on a 20-port Gigabit Ethernet MIC. In other words, the number of VLAN tagged frames cannot be determined for the 20-port Gigabit Ethernet MIC.</p> </li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul>	extensive
OTN Received Overhead Bytes	APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08	extensive
OTN Transmitted Overhead Bytes	APS/PCC0: 0x00, APS/PCC1: 0x00, APS/PCC2: 0x00, APS/PCC3: 0x00 Payload Type: 0x08	extensive

Table 144: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

Field Name	Field Description	Level of Output
Filter statistics	<p>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet may enter the system or be rejected.</p> <ul style="list-style-type: none"> <li>• <b>Input packet count</b>—Number of packets received from the MAC hardware that the filter processed.</li> <li>• <b>Input packet rejects</b>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</li> <li>• <b>Input DA rejects</b>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the router from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local router (which the router is rejecting).</li> <li>• <b>Input SA rejects</b>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field must increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</li> <li>• <b>Output packet count</b>—Number of packets that the filter has given to the MAC hardware.</li> <li>• <b>Output packet pad count</b>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</li> <li>• <b>Output packet error count</b>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field must not increment.</li> <li>• <b>CAM destination filters, CAM source filters</b>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields must be 0.</li> </ul>	extensive
PMA PHY	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:</p> <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Number of seconds the defect has been active.</li> <li>• <b>Count</b>—Number of times that the defect has gone from inactive to active.</li> <li>• <b>State</b>—State of the error. Any state other than <b>OK</b> indicates a problem.</li> </ul> <p>Subfields are:</p> <ul style="list-style-type: none"> <li>• <b>PHY Lock</b>—Phase-locked loop</li> <li>• <b>PHY Light</b>—Loss of optical signal</li> </ul>	extensive

Table 144: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

Field Name	Field Description	Level of Output
Autonegotiation information	<p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> <li>• <b>Negotiation status:</b> <ul style="list-style-type: none"> <li>• <b>Incomplete</b>—Ethernet interface has the speed or link mode configured.</li> <li>• <b>No autonegotiation</b>—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.</li> <li>• <b>Complete</b>—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> </ul> </li> <li>• <b>Link partner status</b>—OK when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> <li>• <b>Link partner</b>—Information from the remote Ethernet device: <ul style="list-style-type: none"> <li>• <b>Link mode</b>—Depending on the capability of the link partner, either <b>Full-duplex</b> or <b>Half-duplex</b>.</li> <li>• <b>Flow control</b>—Types of flow control supported by the link partner. For Gigabit Ethernet interfaces, types are <b>Symmetric</b> (link partner supports <b>PAUSE</b> on receive and transmit), <b>Asymmetric</b> (link partner supports <b>PAUSE</b> on transmit), <b>Symmetric/Asymmetric</b> (link partner supports <b>PAUSE</b> on receive and transmit or only <b>PAUSE</b> on transmit), and <b>None</b> (link partner does not support flow control).</li> <li>• <b>Remote fault</b>—Remote fault information from the link partner—<b>Failure</b> indicates a receive link error. <b>OK</b> indicates that the link partner is receiving. <b>Negotiation error</b> indicates a negotiation error. <b>Offline</b> indicates that the link partner is going offline.</li> </ul> </li> <li>• <b>Local resolution</b>—Information from the local Ethernet device: <ul style="list-style-type: none"> <li>• <b>Flow control</b>—Types of flow control supported by the local device. For Gigabit Ethernet interfaces, advertised capabilities are <b>Symmetric/Asymmetric</b> (local device supports <b>PAUSE</b> on receive and transmit or only <b>PAUSE</b> on receive) and <b>None</b> (local device does not support flow control). Depending on the result of the negotiation with the link partner, local resolution flow control type will display <b>Symmetric</b> (local device supports <b>PAUSE</b> on receive and transmit), <b>Asymmetric</b> (local device supports <b>PAUSE</b> on receive), and <b>None</b> (local device does not support flow control).</li> <li>• <b>Remote fault</b>—Remote fault information. <b>Link OK</b> (no error detected on receive), <b>Offline</b> (local interface is offline), and <b>Link Failure</b> (link error detected on receive).</li> </ul> </li> </ul>	extensive
Received path trace, Transmitted path trace	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.</p>	extensive
Packet Forwarding Engine configuration	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> <li>• <b>Destination slot</b>—FPC slot number.</li> </ul>	extensive

Table 144: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

Field Name	Field Description	Level of Output
CoS information	Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> <li>• <b>CoS transmit queue</b>—Queue number and its associated user-configured forwarding class name.</li> <li>• <b>Bandwidth %</b>—Percentage of bandwidth allocated to the queue.</li> <li>• <b>Bandwidth bps</b>—Bandwidth allocated to the queue (in bps).</li> <li>• <b>Buffer %</b>—Percentage of buffer space allocated to the queue.</li> <li>• <b>Buffer usec</b>—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time.</li> <li>• <b>Priority</b>—Queue priority: <b>low</b> or <b>high</b>.</li> <li>• <b>Limit</b>—Displayed if rate limiting is configured for the queue. Possible values are <b>none</b> and <b>exact</b>. If <b>exact</b> is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If <b>none</b> is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.</li> </ul>	extensive
Logical Interface		
Logical interface	Name of the logical interface.	All levels
Index	Index number of the logical interface, which reflects its initialization sequence.	detail extensive none
SNMP ifIndex	SNMP interface index number for the logical interface.	detail extensive none
Generation	Unique number for use by Juniper Networks technical support only.	detail extensive
Flags	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .	All levels
VLAN-Tag	Rewrite profile applied to incoming or outgoing frames on the outer (Out) VLAN tag or for both the outer and inner (In) VLAN tags. <ul style="list-style-type: none"> <li>• <b>push</b>—An outer VLAN tag is pushed in front of the existing VLAN tag.</li> <li>• <b>pop</b>—The outer VLAN tag of the incoming frame is removed.</li> <li>• <b>swap</b>—The outer VLAN tag of the incoming frame is overwritten with the user-specified VLAN tag information.</li> <li>• <b>push</b>—An outer VLAN tag is pushed in front of the existing VLAN tag.</li> <li>• <b>push-push</b>—Two VLAN tags are pushed in from the incoming frame.</li> <li>• <b>swap-push</b>—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame.</li> <li>• <b>swap-swap</b>—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user-specified VLAN tag value.</li> <li>• <b>pop-swap</b>—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame.</li> <li>• <b>pop-pop</b>—Both the outer and inner VLAN tags of the incoming frame are removed.</li> </ul>	brief detail extensive none

Table 144: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Demux</b>	<p>IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following:</p> <ul style="list-style-type: none"> <li>• Source Family Inet</li> <li>• Destination Family Inet</li> </ul>	<b>detail extensive none</b>
<b>Encapsulation</b>	Encapsulation on the logical interface.	All levels
<b>ACI VLAN</b>	<p>Information displayed for agent circuit identifier (ACI) interface set configured with the <b>agent-circuit-id</b> autoconfiguration stanza.</p> <p><b>Dynamic Profile</b>—Name of the dynamic profile that defines the ACI interface set.</p> <p>If configured, the ACI interface set enables the underlying Ethernet interface to create dynamic VLAN subscriber interfaces based on ACI information.</p> <p><b>NOTE:</b> The ACI VLAN field is replaced with the Line Identity field when an ALI interface set is configured with the <b>line-identity</b> autoconfiguration stanza.</p>	<b>brief detail extensive none</b>
<b>Line Identity</b>	<p>Information displayed for access-line-identifier (ALI) interface sets configured with the <b>line-identity</b> autoconfiguration stanza.</p> <ul style="list-style-type: none"> <li>• <b>Dynamic Profile</b>—Name of the dynamic profile that defines the ALI interface set.</li> <li>• Trusted option used to create the ALI interface set: <b>Circuit-id</b>, <b>Remote-id</b>, or <b>Accept-no-ids</b>. More than one option can be configured.</li> </ul> <p>If configured, the ALI interface set enables the underlying Ethernet interface to create dynamic VLAN subscriber interfaces based on ALI information.</p> <p><b>NOTE:</b> The Line Identity field is replaced with the ACI VLAN field when an ACI interface set is configured with the <b>agent-circuit-id</b> autoconfiguration stanza.</p>	<b>detail</b>
<b>Protocol</b>	Protocol family. Possible values are described in the "Protocol Field" section under <i>Common Output Fields Description</i> .	<b>detail extensive none</b>
<b>MTU</b>	Maximum transmission unit size on the logical interface.	<b>detail extensive none</b>
<b>Neighbor Discovery Protocol (NDP) Queue Statistics</b>	<p>NDP statistics for protocol <b>inet6</b> under logical interface statistics.</p> <ul style="list-style-type: none"> <li>• <b>Max nh cache</b>—Maximum interface neighbor discovery nexthop cache size.</li> <li>• <b>New hold nh limit</b>—Maximum number of new unresolved nexthops.</li> <li>• <b>Curr nh cnt</b>—Current number of resolved nexthops in the NDP queue.</li> <li>• <b>Curr new hold cnt</b>—Current number of unresolved nexthops in the NDP queue.</li> <li>• <b>NH drop cnt</b>—Number of NDP requests not serviced.</li> </ul>	All levels
<b>Dynamic Profile</b>	Name of the dynamic profile that was used to create this interface configured with a Point-to-Point Protocol over Ethernet (PPPoE) family.	<b>detail extensive none</b>
<b>Service Name Table</b>	Name of the service name table for the interface configured with a PPPoE family.	<b>detail extensive none</b>

Table 144: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Max Sessions</b>	Maximum number of PPPoE logical interfaces that can be activated on the underlying interface.	<b>detail extensive none</b>
<b>Duplicate Protection</b>	State of PPPoE duplicate protection: <b>On</b> or <b>Off</b> . When duplicate protection is configured for the underlying interface, a dynamic PPPoE logical interface cannot be activated when an existing active logical interface is present for the same PPPoE client.	<b>detail extensive none</b>
<b>Direct Connect</b>	State of the configuration to ignore DSL Forum VSAs: <b>On</b> or <b>Off</b> . When configured, the router ignores any of these VSAs received from a directly connected CPE device on the interface.	<b>detail extensive none</b>
<b>AC Name</b>	Name of the access concentrator.	<b>detail extensive none</b>
<b>Maximum labels</b>	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	<b>detail extensive none</b>
<b>Traffic statistics</b>	<p>Number and rate of bytes and packets received and transmitted on the specified interface set.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes, Output bytes</b>—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.</li> <li>• <b>Input packets, Output packets</b>—Number of packets received and transmitted on the interface set.</li> </ul>	<b>detail extensive</b>
<b>IPv6 transit statistics</b>	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.	<b>extensive</b>
<b>Local statistics</b>	Number and rate of bytes and packets destined to the router.	<b>extensive</b>
<b>Transit statistics</b>	<p>Number and rate of bytes and packets transiting the switch.</p> <p><b>NOTE:</b> For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the <b>Output bytes</b> and <b>Output packets</b> interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.</p>	<b>extensive</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Route Table</b>	Route table in which the logical interface address is located. For example, <b>0</b> refers to the routing table inet.0.	<b>detail extensive none</b>
<b>Flags</b>	Information about protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .	<b>detail extensive</b>

Table 144: *show interfaces (Gigabit Ethernet) Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Donor interface</b>	(Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.	<b>detail extensive none</b>
<b>Preferred source address</b>	(Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.	<b>detail extensive none</b>
<b>Input Filters</b>	Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parentheses next to all interfaces.	<b>detail extensive</b>
<b>Output Filters</b>	Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parentheses next to all interfaces.	<b>detail extensive</b>
<b>Mac-Validate Failures</b>	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	<b>detail extensive none</b>
<b>Addresses, Flags</b>	Information about the address flags. Possible values are described in the "Addresses Flags" section under <i>Common Output Fields Description</i> .	<b>detail extensive none</b>
<b><i>protocol-family</i></b>	Protocol family configured on the logical interface. If the protocol is <b>inet</b> , the IP address of the interface is also displayed.	<b>brief</b>
<b>Flags</b>	Information about the address flag. Possible values are described in the "Addresses Flags" section under <i>Common Output Fields Description</i> .	<b>detail extensive none</b>
<b>Destination</b>	IP address of the remote side of the connection.	<b>detail extensive none</b>
<b>Local</b>	IP address of the logical interface.	<b>detail extensive none</b>
<b>Broadcast</b>	Broadcast address of the logical interface.	<b>detail extensive none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>

The following table describes the output fields for the **show interfaces** (10-Gigabit Ethernet) command.

Field Name	Field Description	Level of Output
<b>Physical interface</b>	Name of the physical interface.	All levels
<b>Enabled</b>	State of the interface. Possible values are described in the "Enabled Field" section under <i>Common Output Fields Description</i> .	All levels
<b>Interface index</b>	Index number of the physical interface, which reflects its initialization sequence.	<b>detail extensive none</b>

<b>SNMP ifIndex</b>	SNMP index number for the physical interface.	<b>detail extensive</b> none
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Link-level type</b>	Encapsulation being used on the physical interface.	All levels
<b>MTU</b>	Maximum transmission unit size on the physical interface.	All levels
<b>Speed</b>	Speed at which the interface is running.	All levels
<b>Loopback</b>	Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .	All levels
<b>Source filtering</b>	Source filtering status: <b>Enabled</b> or <b>Disabled</b> .	All levels
<b>LAN-PHY mode</b>	10-Gigabit Ethernet interface operating in Local Area Network Physical Layer Device (LAN PHY) mode. LAN PHY allows 10-Gigabit Ethernet wide area links to use existing Ethernet applications.	All levels
<b>WAN-PHY mode</b>	10-Gigabit Ethernet interface operating in Wide Area Network Physical Layer Device (WAN PHY) mode. WAN PHY allows 10-Gigabit Ethernet wide area links to use fiber-optic cables and other devices intended for SONET/SDH.	All levels
<b>Unidirectional</b>	Unidirectional link mode status for 10-Gigabit Ethernet interface: <b>Enabled</b> or <b>Disabled</b> for parent interface; <b>Rx-only</b> or <b>Tx-only</b> for child interfaces.	All levels
<b>Flow control</b>	Flow control status: <b>Enabled</b> or <b>Disabled</b> .	All levels
<b>Auto-negotiation</b>	(Gigabit Ethernet interfaces) Autonegotiation status: <b>Enabled</b> or <b>Disabled</b> .	All levels
<b>Remote-fault</b>	(Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> <li>• <b>Online</b>—Autonegotiation is manually configured as online.</li> <li>• <b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul>	All levels
<b>Device flags</b>	Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .	All levels
<b>Interface flags</b>	Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .	All levels
<b>Link flags</b>	Information about the link. Possible values are described in the “Links Flags” section under <i>Common Output Fields Description</i> .	All levels
<b>Wavelength</b>	(10-Gigabit Ethernet dense wavelength-division multiplexing [DWDM] interfaces) Displays the configured wavelength, in nanometers (nm).	All levels
<b>Frequency</b>	(10-Gigabit Ethernet DWDM interfaces only) Displays the frequency associated with the configured wavelength, in terahertz (THz).	All levels
<b>CoS queues</b>	Number of CoS queues configured.	<b>detail extensive</b> none

<b>Schedulers</b>	(Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces only) Number of CoS schedulers configured.	<b>extensive</b>
<b>Hold-times</b>	Current interface hold-time up and hold-time down, in milliseconds.	<b>detail extensive</b>
<b>Current address</b>	Configured MAC address.	<b>detail extensive</b> none
<b>Hardware address</b>	Hardware MAC address.	<b>detail extensive</b> none
<b>Last flapped</b>	Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .	<b>detail extensive</b> none
<b>Input Rate</b>	Input rate in bits per second (bps) and packets per second (pps). The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None specified
<b>Output Rate</b>	Output rate in bps and pps. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.	None specified
<b>Statistics last cleared</b>	Time when the statistics for the interface were last set to zero.	<b>detail extensive</b>
<b>Egress account overhead</b>	Layer 2 overhead in bytes that is accounted in the interface statistics for egress traffic.	<b>detail extensive</b>
<b>Ingress account overhead</b>	Layer 2 overhead in bytes that is accounted in the interface statistics for ingress traffic.	<b>detail extensive</b>
<b>Traffic statistics</b>	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface. The value in this field also includes the Layer 2 overhead bytes for ingress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface. The value in this field also includes the Layer 2 overhead bytes for egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>	<b>detail extensive</b>

<b>Input errors</b>	Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:	<b>extensive</b>
	<ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	
<b>Output errors</b>	Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:	<b>extensive</b>
	<ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	

<b>Egress queues</b>	<p>Total number of egress queues supported on the specified interface.</p> <p><b>NOTE:</b> In DPCs that are not of the enhanced type, such as DPC 40x 1GE R, DPCE 20x 1GE + 2x 10GE R, or DPCE 40x 1GE R, you might notice a discrepancy in the output of the <b>show interfaces</b> command because incoming packets might be counted in the Egress queues section of the output. This problem occurs on non-enhanced DPCs because the egress queue statistics are polled from IMQ (Inbound Message Queuing) block of the I-chip. The IMQ block does not differentiate between ingress and egress WAN traffic; as a result, the combined statistics are displayed in the egress queue counters on the Routing Engine. In a simple VPLS scenario, if there is no MAC entry in DMAC table (by sending unidirectional traffic), traffic is flooded and the input traffic is accounted in IMQ. For bidirectional traffic (MAC entry in DMAC table), if the outgoing interface is on the same I-chip then both ingress and egress statistics are counted in a combined way. If the outgoing interface is on a different I-chip or FPC, then only egress statistics are accounted in IMQ. This behavior is expected with non-enhanced DPCs</p>	<b>detail extensive</b>
<b>Queue counters (Egress)</b>	<p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>	<b>detail extensive</b>
<b>Ingress queues</b>	<p>Total number of ingress queues supported on the specified interface. Displayed on IQ2 interfaces.</p>	<b>extensive</b>
<b>Queue counters (Ingress)</b>	<p>CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>	<b>extensive</b>
<b>Active alarms and Active defects</b>	<p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the routing device configuration, an alarm can ring the red or yellow alarm bell on the routing device, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul>	<b>detail extensive</b> none
<b>OTN alarms</b>	<p>Active OTN alarms identified on the interface.</p>	<b>detail extensive</b>
<b>OTN defects</b>	<p>OTN defects received on the interface.</p>	<b>detail extensive</b>
<b>OTN FEC Mode</b>	<p>The FECmode configured on the interface.</p> <ul style="list-style-type: none"> <li>• <b>efec</b>—Enhanced forward error correction (EFEC) is configured to detect and correct bit errors.</li> <li>• <b>gfec</b>—G.709 Forward error correction (GFEC) mode is configured to detect and correct bit errors.</li> <li>• <b>none</b>—FEC mode is not configured.</li> </ul>	<b>detail extensive</b>

<b>OTN Rate</b>	OTN mode.  <ul style="list-style-type: none"> <li>• <b>fixed-stuff-bytes</b>—Fixed stuff bytes 11.0957 Gbps.</li> <li>• <b>no-fixed-stuff-bytes</b>—No fixed stuff bytes 11.0491 Gbps.</li> <li>• <b>pass-through</b>—Enable OTN passthrough mode.</li> <li>• <b>no-pass-through</b>—Do not enable OTN passthrough mode.</li> </ul>	<b>detail extensive</b>
<b>OTN Line Loopback</b>	Status of the line loopback, if configured for the DWDM OTN PIC. Its value can be: <b>enabled</b> or <b>disabled</b> .	<b>detail extensive</b>
<b>OTN FEC statistics</b>	The forward error correction (FEC) counters for the DWDM OTN PIC.  <ul style="list-style-type: none"> <li>• <b>Corrected Errors</b>—The count of corrected errors in the last second.</li> <li>• <b>Corrected Error Ratio</b>—The corrected error ratio in the last 25 seconds. For example, 1e-7 is 1 error per 10 million bits.</li> </ul>	<b>detail extensive</b>
<b>OTN FEC alarms</b>	OTN FEC excessive or degraded error alarms triggered on the interface.  <ul style="list-style-type: none"> <li>• <b>FEC Degrade</b>—OTU FEC Degrade defect.</li> <li>• <b>FEC Excessive</b>—OTU FEC Excessive Error defect.</li> </ul>	<b>detail extensive</b>
<b>OTN OC</b>	OTN OC defects triggered on the interface.  <ul style="list-style-type: none"> <li>• <b>LOS</b>—OC Loss of Signal defect.</li> <li>• <b>LOF</b>—OC Loss of Frame defect.</li> <li>• <b>LOM</b>—OC Loss of Multiframe defect.</li> <li>• <b>Wavelength Lock</b>—OC Wavelength Lock defect.</li> </ul>	<b>detail extensive</b>
<b>OTN OTU</b>	OTN OTU defects detected on the interface  <ul style="list-style-type: none"> <li>• <b>AIS</b>—OTN AIS alarm.</li> <li>• <b>BDI</b>—OTN OTU BDI alarm.</li> <li>• <b>IAE</b>—OTN OTU IAE alarm.</li> <li>• <b>TTIM</b>—OTN OTU TTIM alarm.</li> <li>• <b>SF</b>—OTN ODU bit error rate fault alarm.</li> <li>• <b>SD</b>—OTN ODU bit error rate defect alarm.</li> <li>• <b>TCA-ES</b>—OTN ODU ES threshold alarm.</li> <li>• <b>TCA-SES</b>—OTN ODU SES threshold alarm.</li> <li>• <b>TCA-UAS</b>—OTN ODU UAS threshold alarm.</li> <li>• <b>TCA-BBE</b>—OTN ODU BBE threshold alarm.</li> <li>• <b>BIP</b>—OTN ODU BIP threshold alarm.</li> <li>• <b>BBE</b>—OTN OTU BBE threshold alarm.</li> <li>• <b>ES</b>—OTN OTU ES threshold alarm.</li> <li>• <b>SES</b>—OTN OTU SES threshold alarm.</li> <li>• <b>UAS</b>—OTN OTU UAS threshold alarm.</li> </ul>	<b>detail extensive</b>
<b>Received DAPI</b>	Destination Access Port Interface (DAPI) from which the packets were received.	<b>detail extensive</b>
<b>Received SAPI</b>	Source Access Port Interface (SAPI) from which the packets were received.	<b>detail extensive</b>
<b>Transmitted DAPI</b>	Destination Access Port Interface (DAPI) to which the packets were transmitted.	<b>detail extensive</b>

<b>Transmitted SAPI</b>	Source Access Port Interface (SAPI) to which the packets were transmitted.	<b>detail extensive</b>
<b>PCS statistics</b>	<p>(10-Gigabit Ethernet interfaces) Displays Physical Coding Sublayer (PCS) fault conditions from the WAN PHY or the LAN PHY device.</p> <ul style="list-style-type: none"> <li>• <b>Bit errors</b>—The number of seconds during which at least one bit error rate (BER) occurred while the PCS receiver is operating in normal mode.</li> <li>• <b>Errored blocks</b>—The number of seconds when at least one errored block occurred while the PCS receiver is operating in normal mode.</li> </ul>	<b>detail extensive</b>
<b>MAC statistics</b>	<p><b>Receive and Transmit</b> statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> <li>• <b>Total octets and total packets</b>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type.</li> <li>• <b>Unicast packets, Broadcast packets, and Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—Number of frames that exceed 1518 octets.</li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul>	<b>extensive</b>
<b>OTN Received Overhead Bytes</b>	APS/PCC0: 0x02, APS/PCC1: 0x11, APS/PCC2: 0x47, APS/PCC3: 0x58 Payload Type: 0x08	<b>extensive</b>
<b>OTN Transmitted Overhead Bytes</b>	APS/PCC0: 0x00, APS/PCC1: 0x00, APS/PCC2: 0x00, APS/PCC3: 0x00 Payload Type: 0x08	<b>extensive</b>

Filter statistics	<p><b>Receive and Transmit</b> statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> <li>• <b>Input packet count</b>—Number of packets received from the MAC hardware that the filter processed.</li> <li>• <b>Input packet rejects</b>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</li> <li>• <b>Input DA rejects</b>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the routing device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local routing device (which the routing device is rejecting).</li> <li>• <b>Input SA rejects</b>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</li> <li>• <b>Output packet count</b>—Number of packets that the filter has given to the MAC hardware.</li> <li>• <b>Output packet pad count</b>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</li> <li>• <b>Output packet error count</b>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</li> <li>• <b>CAM destination filters, CAM source filters</b>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields should be 0.</li> </ul>	extensive
PMA PHY	<p>(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information:</p> <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Number of seconds the defect has been active.</li> <li>• <b>Count</b>—Number of times that the defect has gone from inactive to active.</li> <li>• <b>State</b>—State of the error. Any state other than <b>OK</b> indicates a problem.</li> </ul>	extensive

<b>WIS section</b>	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET error information: <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Number of seconds the defect has been active.</li> <li>• <b>Count</b>—Number of times that the defect has gone from inactive to active.</li> <li>• <b>State</b>—State of the error. Any state other than <b>OK</b> indicates a problem.</li> </ul> Subfields are: <ul style="list-style-type: none"> <li>• <b>BIP-B1</b>—Bit interleaved parity for SONET section overhead</li> <li>• <b>SEF</b>—Severely errored framing</li> <li>• <b>LOL</b>—Loss of light</li> <li>• <b>LOF</b>—Loss of frame</li> <li>• <b>ES-S</b>—Errored seconds (section)</li> <li>• <b>SES-S</b>—Severely errored seconds (section)</li> <li>• <b>SEFS-S</b>—Severely errored framing seconds (section)</li> </ul>	<b>extensive</b>
<b>WIS line</b>	(10-Gigabit Ethernet interfaces, WAN PHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information. <ul style="list-style-type: none"> <li>• <b>Seconds</b>—Number of seconds the defect has been active.</li> <li>• <b>Count</b>—Number of times that the defect has gone from inactive to active.</li> <li>• <b>State</b>—State of the error. State other than <b>OK</b> indicates a problem.</li> </ul> Subfields are: <ul style="list-style-type: none"> <li>• <b>BIP-B2</b>—Bit interleaved parity for SONET line overhead</li> <li>• <b>REI-L</b>—Remote error indication (near-end line)</li> <li>• <b>RDI-L</b>—Remote defect indication (near-end line)</li> <li>• <b>AIS-L</b>—Alarm indication signal (near-end line)</li> <li>• <b>BERR-SF</b>—Bit error rate fault (signal failure)</li> <li>• <b>BERR-SD</b>—Bit error rate defect (signal degradation)</li> <li>• <b>ES-L</b>—Errored seconds (near-end line)</li> <li>• <b>SES-L</b>—Severely errored seconds (near-end line)</li> <li>• <b>UAS-L</b>—Unavailable seconds (near-end line)</li> <li>• <b>ES-LFE</b>—Errored seconds (far-end line)</li> <li>• <b>SES-LFE</b>—Severely errored seconds (far-end line)</li> <li>• <b>UAS-LFE</b>—Unavailable seconds (far-end line)</li> </ul>	<b>extensive</b>

**WIS path** (10-Gigabit Ethernet interfaces, WANPHY mode) Active alarms and defects, plus counts of specific SONET errors with detailed information. **extensive**

- **Seconds**—Number of seconds the defect has been active.
- **Count**—Number of times that the defect has gone from inactive to active.
- **State**—State of the error. Any state other than **OK** indicates a problem.

Subfields are:

- **BIP-B3**—Bit interleaved parity for SONET section overhead
- **REI-P**—Remote error indication
- **LOP-P**—Loss of pointer (path)
- **AIS-P**—Path alarm indication signal
- **RDI-P**—Path remote defect indication
- **UNEQ-P**—Path unequipped
- **PLM-P**—Path payload label mismatch
- **ES-P**—Errored seconds (near-end STS path)
- **SES-P**—Severely errored seconds (near-end STS path)
- **UAS-P**—Unavailable seconds (near-end STS path)
- **SES-PFE**—Severely errored seconds (far-end STS path)
- **UAS-PFE**—Unavailable seconds (far-end STS path)

**Autonegotiation information** Information about link autonegotiation. **extensive**

- **Negotiation status:**
  - **Incomplete**—Ethernet interface has the speed or link mode configured.
  - **No autonegotiation**—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.
  - **Complete**—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
- **Link partner status**—**OK** when Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.
- **Link partner:**
  - **Link mode**—Depending on the capability of the attached Ethernet device, either **Full-duplex** or **Half-duplex**.
  - **Flow control**—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is **None**. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports both **PAUSE** on receive and transmit or only **PAUSE** receive).
  - **Remote fault**—Remote fault information from the link partner—**Failure** indicates a receive link error. **OK** indicates that the link partner is receiving. **Negotiation error** indicates a negotiation error. **Offline** indicates that the link partner is going offline.
- **Local resolution**—Information from the link partner:
  - **Flow control**—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are **Symmetric** (link partner supports **PAUSE** on receive and transmit), **Asymmetric** (link partner supports **PAUSE** on transmit), and **Symmetric/Asymmetric** (link partner supports both **PAUSE** on receive and transmit or only **PAUSE** receive).
  - **Remote fault**—Remote fault information. **Link OK** (no error detected on receive), **Offline** (local interface is offline), and **Link Failure** (link error detected on receive).

<b>Received path trace, Transmitted path trace</b>	(10-Gigabit Ethernet interfaces, WAN PHY mode) SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the routing device at the other end of the fiber. The transmitted path trace value is the message that this routing device transmits.	<b>extensive</b>
<b>Packet Forwarding Engine configuration</b>	Information about the configuration of the Packet Forwarding Engine: <ul style="list-style-type: none"> <li>• <b>Destination slot</b>—FPC slot number.</li> </ul>	<b>extensive</b>
<b>CoS information</b>	Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> <li>• <b>CoS transmit queue</b>—Queue number and its associated user-configured forwarding class name.</li> <li>• <b>Bandwidth %</b>—Percentage of bandwidth allocated to the queue.</li> <li>• <b>Bandwidth bps</b>—Bandwidth allocated to the queue (in bps).</li> <li>• <b>Buffer %</b>—Percentage of buffer space allocated to the queue.</li> <li>• <b>Buffer usec</b>—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time.</li> <li>• <b>Priority</b>—Queue priority: <b>low</b> or <b>high</b>.</li> <li>• <b>Limit</b>—Displayed if rate limiting is configured for the queue. Possible values are <b>none</b> and <b>exact</b>. If <b>exact</b> is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If <b>none</b> is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.</li> </ul>	<b>extensive</b>
<b>Logical Interface</b>		
<b>Logical interface</b>	Name of the logical interface.	All levels
<b>Index</b>	Index number of the logical interface, which reflects its initialization sequence.	<b>detail extensive</b> <b>none</b>
<b>SNMP ifIndex</b>	SNMP interface index number for the logical interface.	<b>detail extensive</b> <b>none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Flags</b>	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .	All levels

<b>VLAN-Tag</b>	<p>Rewrite profile applied to incoming or outgoing frames on the outer (<b>Out</b>) VLAN tag or for both the outer and inner (<b>In</b>) VLAN tags.</p> <ul style="list-style-type: none"> <li>• <b>push</b>—An outer VLAN tag is pushed in front of the existing VLAN tag.</li> <li>• <b>pop</b>—The outer VLAN tag of the incoming frame is removed.</li> <li>• <b>swap</b>—The outer VLAN tag of the incoming frame is overwritten with the user specified VLAN tag information.</li> <li>• <b>push</b>—An outer VLAN tag is pushed in front of the existing VLAN tag.</li> <li>• <b>push-push</b>—Two VLAN tags are pushed in from the incoming frame.</li> <li>• <b>swap-push</b>—The outer VLAN tag of the incoming frame is replaced by a user-specified VLAN tag value. A user-specified outer VLAN tag is pushed in front. The outer tag becomes an inner tag in the final frame.</li> <li>• <b>swap-swap</b>—Both the inner and the outer VLAN tags of the incoming frame are replaced by the user specified VLAN tag value.</li> <li>• <b>pop-swap</b>—The outer VLAN tag of the incoming frame is removed, and the inner VLAN tag of the incoming frame is replaced by the user-specified VLAN tag value. The inner tag becomes the outer tag in the final frame.</li> <li>• <b>pop-pop</b>—Both the outer and inner VLAN tags of the incoming frame are removed.</li> </ul>	<b>brief detail</b> <b>extensive</b> none
<b>Demux:</b>	<p>IP demultiplexing (demux) value that appears if this interface is used as the demux underlying interface. The output is one of the following:</p> <ul style="list-style-type: none"> <li>• Source Family Inet</li> <li>• Destination Family Inet</li> </ul>	<b>detail</b> <b>extensive</b> none
<b>Encapsulation</b>	Encapsulation on the logical interface.	All levels
<b>Protocol</b>	Protocol family. Possible values are described in the “Protocol Field” section under <i>Common Output Fields Description</i> .	<b>detail</b> <b>extensive</b> none
<b>MTU</b>	Maximum transmission unit size on the logical interface.	<b>detail</b> <b>extensive</b> none
<b>Maximum labels</b>	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	<b>detail</b> <b>extensive</b> none
<b>Traffic statistics</b>	<p>Number and rate of bytes and packets received and transmitted on the specified interface set.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes, Output bytes</b>—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.</li> <li>• <b>Input packets, Output packets</b>—Number of packets received and transmitted on the interface set.</li> </ul>	<b>detail</b> <b>extensive</b>
<b>IPv6 transit statistics</b>	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.	<b>extensive</b>
<b>Local statistics</b>	Number and rate of bytes and packets destined to the routing device.	<b>extensive</b>

<b>Transit statistics</b>	Number and rate of bytes and packets transiting the switch.  <b>NOTE:</b> For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the <b>Output bytes</b> and <b>Output packets</b> interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.	<b>extensive</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Route Table</b>	Route table in which the logical interface address is located. For example, <b>0</b> refers to the routing table inet.0.	<b>detail extensive</b> none
<b>Flags</b>	Information about protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .	<b>detail extensive</b>
<b>Donor interface</b>	(Unnumbered Ethernet) Interface from which an unnumbered Ethernet interface borrows an IPv4 address.	<b>detail extensive</b> none
<b>Preferred source address</b>	(Unnumbered Ethernet) Secondary IPv4 address of the donor loopback interface that acts as the preferred source address for the unnumbered Ethernet interface.	<b>detail extensive</b> none
<b>Input Filters</b>	Names of any input filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	<b>detail extensive</b>
<b>Output Filters</b>	Names of any output filters applied to this interface. If you specify a precedence value for any filter in a dynamic profile, filter precedence values appear in parenthesis next to all interfaces.	<b>detail extensive</b>
<b>Mac-Validate Failures</b>	Number of MAC address validation failures for packets and bytes. This field is displayed when MAC address validation is enabled for the logical interface.	<b>detail extensive</b> none
<b>Addresses, Flags</b>	Information about the address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .	<b>detail extensive</b> none
<b><i>protocol-family</i></b>	Protocol family configured on the logical interface. If the protocol is <b>inet</b> , the IP address of the interface is also displayed.	<b>brief</b>
<b>Flags</b>	Information about address flag (possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .	<b>detail extensive</b> none
<b>Destination</b>	IP address of the remote side of the connection.	<b>detail extensive</b> none
<b>Local</b>	IP address of the logical interface.	<b>detail extensive</b> none
<b>Broadcast</b>	Broadcast address of the logical interlace.	<b>detail extensive</b> none
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>

For Gigabit Ethernet IQ PICs, traffic and MAC statistics output varies. The following table describes the traffic and MAC statistics for two sample interfaces, each of which is sending traffic in packets of 500 bytes (including 478 bytes for the Layer 3 packet, 18 bytes for the Layer 2 VLAN traffic header, and 4 bytes for cyclic redundancy check [CRC] information). The **ge-0/3/0** interface is the inbound physical interface, and the **ge-0/0/0** interface is the outbound physical interface. On both interfaces, traffic is carried on logical unit **.50** (VLAN 50).

**Table 145: Gigabit and 10 Gigabit Ethernet IQ PIC Traffic and MAC Statistics by Interface Type**

Interface Type	Sample Command	Byte and Octet Counts Include	Comments
Inbound physical interface	<b>show interfaces ge-0/3/0 extensive</b>	Traffic statistics:  Input bytes: 496 bytes per packet, representing the Layer 2 packet  MAC statistics:  Received octets: 500 bytes per packet, representing the Layer 2 packet + 4 bytes	The additional 4 bytes are for the CRC.
Inbound logical interface	<b>show interfaces ge-0/3/0.50 extensive</b>	Traffic statistics:  Input bytes: 478 bytes per packet, representing the Layer 3 packet	
Outbound physical interface	<b>show interfaces ge-0/0/0 extensive</b>	Traffic statistics:  Input bytes: 490 bytes per packet, representing the Layer 3 packet + 12 bytes  MAC statistics:  Received octets: 478 bytes per packet, representing the Layer 3 packet	For input bytes, the additional 12 bytes include 6 bytes for the destination MAC address plus 4 bytes for VLAN plus 2 bytes for the Ethernet type.
Outbound logical interface	<b>show interfaces ge-0/0/0.50 extensive</b>	Traffic statistics:  Input bytes: 478 bytes per packet, representing the Layer 3 packet	

[Table 146 on page 1542](#) lists the output fields for the **show interfaces** command. Output fields are listed in the approximate order in which they appear.

Table 146: show interfaces Output Fields

Field Name	Field Description	Level of Output
<b>Physical Interface</b>		
<b>Physical interface</b>	Name of the physical interface.	All levels
<b>Enabled</b>	State of the interface.	All levels
<b>Interface index</b>	Index number of the physical interface, which reflects its initialization sequence.	<b>detail extensive none</b>
<b>SNMP ifIndex</b>	SNMP index number for the physical interface.	<b>detail extensive none</b>
<b>Link-level type</b>	Encapsulation being used on the physical interface.	All levels
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>MTU</b>	Maximum transmission unit size on the physical interface.	All levels
<b>Link mode</b>	Link mode: Full-duplex or Half-duplex.	
<b>Speed</b>	Speed at which the interface is running.	All levels
<b>BPDU error</b>	Bridge protocol data unit (BPDU) error: Detected or None	
<b>Loopback</b>	Loopback status: <b>Enabled</b> or <b>Disabled</b> . If loopback is enabled, type of loopback: <b>Local</b> or <b>Remote</b> .	All levels
<b>Source filtering</b>	Source filtering status: <b>Enabled</b> or <b>Disabled</b> .	All levels
<b>Flow control</b>	Flow control status: <b>Enabled</b> or <b>Disabled</b> .	All levels
<b>Auto-negotiation</b>	(Gigabit Ethernet interfaces) Autonegotiation status: <b>Enabled</b> or <b>Disabled</b> .	All levels
<b>Remote-fault</b>	(Gigabit Ethernet interfaces) Remote fault status: <ul style="list-style-type: none"> <li>• <b>Online</b>—Autonegotiation is manually configured as online.</li> <li>• <b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul>	All levels
<b>Device flags</b>	Information about the physical device.	All levels
<b>Interface flags</b>	Information about the interface.	All levels
<b>Link flags</b>	Information about the physical link.	All levels
<b>CoS queues</b>	Number of CoS queues configured.	<b>detail extensive none</b>
<b>Current address</b>	Configured MAC address.	<b>detail extensive none</b>

Table 146: *show interfaces Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Last flapped</b>	Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .	<b>detail extensive none</b>
<b>Input Rate</b>	Input rate in bits per second (bps) and packets per second (pps).	None
<b>Output Rate</b>	Output rate in bps and pps.	None
<b>Active alarms and Active defects</b>	<p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul>	<b>detail extensive none</b>
<b>Statistics last cleared</b>	Time when the statistics for the interface were last set to zero.	<b>detail extensive</b>
<b>Traffic statistics</b>	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>	<b>detail extensive</b>

Table 146: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Input errors</b>	<p>Input errors on the interface.</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored by configuring the <code>ignore-l3-incompletes</code>.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	<b>extensive</b>
<b>Output errors</b>	<p>Output errors on the interface.</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation; therefore, for Gigabit Ethernet PICs, this number must always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field must never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	<b>extensive</b>

Table 146: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Ingress queues	Total number of ingress queues supported on the specified interface.	extensive
Queue counters and queue number	CoS queue number and its associated user-configured forwarding class name. <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>	detail extensive
MAC statistics	<p>Receive and Transmit statistics reported by the PIC's MAC subsystem, including the following:</p> <ul style="list-style-type: none"> <li>• <b>Total octets and total packets</b>—Total number of octets and packets.</li> <li>• <b>Unicast packets, Broadcast packets, and Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC or a cable is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—There are two possible conditions regarding the number of oversized frames: <ul style="list-style-type: none"> <li>• Packet length exceeds 1518 octets, or</li> <li>• Packet length exceeds MRU</li> </ul> </li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul>	extensive

Table 146: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
Filter statistics	<p>Receive and Transmit statistics reported by the PIC's MAC address filter subsystem. The filtering is done by the content-addressable memory (CAM) on the PIC. The filter examines a packet's source and destination MAC addresses to determine whether the packet should enter the system or be rejected.</p> <ul style="list-style-type: none"> <li>• <b>Input packet count</b>—Number of packets received from the MAC hardware that the filter processed.</li> <li>• <b>Input packet rejects</b>—Number of packets that the filter rejected because of either the source MAC address or the destination MAC address.</li> <li>• <b>Input DA rejects</b>—Number of packets that the filter rejected because the destination MAC address of the packet is not on the accept list. It is normal for this value to increment. When it increments very quickly and no traffic is entering the device from the far-end system, either there is a bad ARP entry on the far-end system, or multicast routing is not on and the far-end system is sending many multicast packets to the local device (which the router is rejecting).</li> <li>• <b>Input SA rejects</b>—Number of packets that the filter rejected because the source MAC address of the packet is not on the accept list. The value in this field should increment only if source MAC address filtering has been enabled. If filtering is enabled, if the value increments quickly, and if the system is not receiving traffic that it should from the far-end system, it means that the user-configured source MAC addresses for this interface are incorrect.</li> <li>• <b>Output packet count</b>—Number of packets that the filter has given to the MAC hardware.</li> <li>• <b>Output packet pad count</b>—Number of packets the filter padded to the minimum Ethernet size (60 bytes) before giving the packet to the MAC hardware. Usually, padding is done only on small ARP packets, but some very small IP packets can also require padding. If this value increments rapidly, either the system is trying to find an ARP entry for a far-end system that does not exist or it is misconfigured.</li> <li>• <b>Output packet error count</b>—Number of packets with an indicated error that the filter was given to transmit. These packets are usually aged packets or are the result of a bandwidth problem on the FPC hardware. On a normal system, the value of this field should not increment.</li> <li>• <b>CAM destination filters, CAM source filters</b>—Number of entries in the CAM dedicated to destination and source MAC address filters. There can only be up to 64 source entries. If source filtering is disabled, which is the default, the values for these fields must be 0.</li> </ul>	extensive
Autonegotiation information	<p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> <li>• <b>Negotiation status:</b> <ul style="list-style-type: none"> <li>• <b>Incomplete</b>—Ethernet interface has the speed or link mode configured.</li> <li>• <b>No autonegotiation</b>—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.</li> <li>• <b>Complete</b>—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> </ul> </li> </ul>	extensive
Packet Forwarding Engine configuration	<p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> <li>• <b>Destination slot</b>—FPC slot number.</li> </ul>	extensive

Table 146: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
<b>CoS information</b>	Information about the CoS queue for the physical interface. <ul style="list-style-type: none"> <li>• <b>CoS transmit queue</b>—Queue number and its associated user-configured forwarding class name.</li> <li>• <b>Bandwidth %</b>—Percentage of bandwidth allocated to the queue.</li> <li>• <b>Bandwidth bps</b>—Bandwidth allocated to the queue (in bps).</li> <li>• <b>Buffer %</b>—Percentage of buffer space allocated to the queue.</li> <li>• <b>Buffer usec</b>—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time.</li> <li>• <b>Priority</b>—Queue priority: <b>low</b> or <b>high</b>.</li> <li>• <b>Limit</b>—Displayed if rate limiting is configured for the queue. Possible values are <b>none</b> and <b>exact</b>. If <b>exact</b> is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If <b>none</b> is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.</li> </ul>	<b>extensive</b>
<b>Interface transmit statistics</b>	Status of the <b>interface-transmit-statistics</b> configuration: Enabled or Disabled.	<b>detail extensive</b>
<b>Queue counters (Egress)</b>	CoS queue number and its associated user-configured forwarding class name. <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>	<b>detail extensive</b>
<b>Logical Interface</b>		
<b>Logical interface</b>	Name of the logical interface.	All levels
<b>Index</b>	Index number of the logical interface, which reflects its initialization sequence.	<b>detail extensive none</b>
<b>SNMP ifIndex</b>	SNMP interface index number for the logical interface.	<b>detail extensive none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Flags</b>	Information about the logical interface.	All levels
<b>Encapsulation</b>	Encapsulation on the logical interface.	All levels
<b>Traffic statistics</b>	Number and rate of bytes and packets received and transmitted on the specified interface set. <ul style="list-style-type: none"> <li>• <b>Input bytes, Output bytes</b>—Number of bytes received and transmitted on the interface set. The value in this field also includes the Layer 2 overhead bytes for ingress or egress traffic on Ethernet interfaces if you enable accounting of Layer 2 overhead at the PIC level or the logical interface level.</li> <li>• <b>Input packets, Output packets</b>—Number of packets received and transmitted on the interface set.</li> </ul>	<b>detail extensive</b>

Table 146: show interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Local statistics</b>	Number and rate of bytes and packets destined to the device.	<b>extensive</b>
<b>Transit statistics</b>	Number and rate of bytes and packets transiting the switch.  <b>NOTE:</b> For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the <b>Output bytes</b> and <b>Output packets</b> interface counters. However, correct values display for both of these egress statistics when per-unit scheduling is enabled for the Gigabit Ethernet IQ2 physical interface, or when a single logical interface is actively using a shared scheduler.	<b>extensive</b>
<b>Security</b>	Security zones that interface belongs to.	<b>extensive</b>
<b>Flow Input statistics</b>	Statistics on packets received by flow module.	<b>extensive</b>
<b>Flow Output statistics</b>	Statistics on packets sent by flow module.	<b>extensive</b>
<b>Flow error statistics (Packets dropped due to)</b>	Statistics on errors in the flow module.	<b>extensive</b>
<b>Protocol</b>	Protocol family.	<b>detail extensive none</b>
<b>MTU</b>	Maximum transmission unit size on the logical interface.	<b>detail extensive none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Route Table</b>	Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	<b>detail extensive none</b>
<b>Flags</b>	Information about protocol family flags. .	<b>detail extensive</b>
<b>Addresses, Flags</b>	Information about the address flags..	<b>detail extensive none</b>

```

**NOTE:** For Gigabit Ethernet intelligent queuing 2 (IQ2) interfaces, the logical interface egress statistics displayed in the **show interfaces** command output might not accurately reflect the traffic on the wire when output shaping is applied. Traffic management output shaping might drop packets after they are tallied by the interface counters. For detailed information, see the description of the logical interface **Transit statistics** fields in [Table 144 on page 1514](#).

### show interfaces (Gigabit Ethernet Unnumbered Interface)

### show interfaces media (SONET/SDH)

The following example displays the output fields unique to the **show interfaces media** command for a SONET interface (with no level of output specified):

```
user@host> show interfaces media so-4/1/2
```

```
Physical interface: so-4/1/2, Enabled, Physical link is Up
Interface index: 168, SNMP ifIndex: 495
Link-level type: PPP, MTU: 4474, Clocking: Internal, SONET mode, Speed: OC48,
Loopback: None, FCS: 16, Payload scrambler: Enabled
Device flags : Present Running
Interface flags: Point-To-Point SNMP-Traps 16384
Link flags : Keepalives
Keepalive settings: Interval 10 seconds, Up-count 1, Down-count 3
Keepalive: Input: 1783 (00:00:00 ago), Output: 1786 (00:00:08 ago)
LCP state: Opened
NCP state: inet: Not-configured, inet6: Not-configured, iso: Not-configured,
mpls: Not-configured
CHAP state: Not-configured
CoS queues : 8 supported
Last flapped : 2005-06-15 12:14:59 PDT (04:31:29 ago)
Input rate : 0 bps (0 pps)
Output rate : 0 bps (0 pps)
SONET alarms : None
SONET defects : None
SONET errors:
 BIP-B1: 121, BIP-B2: 916, REI-L: 0, BIP-B3: 137, REI-P: 16747, BIP-BIP2: 0
Received path trace: routerb so-1/1/2
Transmitted path trace: routera so-4/1/2
```

### show interfaces policers (SRX devices)

```
user@host> show interfaces policers
```

Interface	Admin	Link	Proto	Input	Policer	Output	Policer

			inet6				

### show interfaces queue (SRX devices)

The following truncated example shows the CoS queue sizes for queues 0, 1, and 3. Queue 1 has a queue buffer size (guaranteed allocated memory) of 9192 bytes.

```
user@host> show interfaces queue
```

```
Physical interface: ge-0/0/0, Enabled, Physical link is Up
 Interface index: 134, SNMP ifIndex: 509
 Forwarding classes: 8 supported, 8 in use
 Egress queues: 8 supported, 8 in use
 Queue: 0, Forwarding classes: class0
 Queued:
 Packets : 0 0 pps
 Bytes : 0 0 bps
 Transmitted:
 Packets : 0 0 pps
 Bytes : 0 0 bps
 Tail-dropped packets : 0 0 pps
 RL-dropped packets : 0 0 pps
 RL-dropped bytes : 0 0 bps
 RED-dropped packets : 0 0 pps
 Low : 0 0 pps
 Medium-low : 0 0 pps
 Medium-high : 0 0 pps
 High : 0 0 pps
 RED-dropped bytes : 0 0 bps
 Low : 0 0 bps
 Medium-low : 0 0 bps
 Medium-high : 0 0 bps
 High : 0 0 bps
 Queue Buffer Usage:
 Reserved buffer : 118750000 bytes
 Queue-depth bytes :
 Current : 0
 ..
 ..
 Queue: 1, Forwarding classes: class1
 ..
 ..
 Queue Buffer Usage:
 Reserved buffer : 9192 bytes
 Queue-depth bytes :
 Current : 0
 ..
 ..
 Queue: 3, Forwarding classes: class3
 Queued:
 ..
 ..
 Queue Buffer Usage:
 Reserved buffer : 6250000 bytes
```

```

Queue-depth bytes :
Current : 0
..
..

```

### show interfaces redundancy (SRX devices)

```
user@host> show interfaces redundancy
```

**Output Fields** Table 147 on page 1590 lists the output fields for the **show interfaces** (management) command on the M Series routers, T Series routers, TX Matrix Plus routers, and PTX Series. Output fields are listed in the approximate order in which they appear.

*Table 147: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface*

Field Name	Field Description	Level of Output
<b>Physical Interface</b>		
<b>Physical interface</b>	Name of the physical interface.	All levels
<b>Enabled</b>	State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .	All levels

**Table 147: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface (continued)**

Field Name	Field Description	Level of Output
<b>Interface index</b>	Physical interface index number, which reflects its initialization sequence.	<b>detail extensive none</b>
<b>SNMP ifIndex</b>	SNMP index number for the physical interface.	<b>detail extensive none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Type</b>	Type of interface.	All levels
<b>Link-level type</b>	Encapsulation type used on the physical interface.	All levels
<b>MTU</b>	Maximum transmission unit (MTU)—Size of the largest packet to be transmitted.	All levels
<b>Clocking</b>	Reference clock source of the interface.	All levels
<b>Speed</b>	Network speed on the interface.	All levels
<b>Device flags</b>	Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .	All levels
<b>Interface flags</b>	Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .	All levels
<b>Link type</b>	Data transmission type.	<b>detail extensive none</b>
<b>Link flags</b>	Information about the link. Possible values are described in the “Link Flags” section under <i>Common Output Fields Description</i> .	<b>detail extensive</b>
<b>Physical info</b>	Information about the physical interface.	<b>detail extensive</b>
<b>Hold-times</b>	Current interface hold-time up and hold-time down. Value is in milliseconds.	<b>detail extensive</b>
<b>Current address</b>	Configured MAC address.	<b>detail extensive none</b>
<b>Hardware address</b>	Media access control (MAC) address of the interface.	<b>detail extensive none</b>
<b>Alternate link address</b>	Backup link address.	<b>detail extensive</b>
<b>Last flapped</b>	Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .	<b>detail extensive none</b>
<b>Input packets</b>	Number of packets received on the physical interface.	None specified
<b>Output packets</b>	Number of packets transmitted on the physical interface.	None specified

**Table 147: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface (continued)**

Field Name	Field Description	Level of Output
<b>Statistics last cleared</b>	Time when the statistics for the interface were last set to zero.	<b>detail extensive</b>
<b>Traffic statistics</b>	<p>Number and rate of bytes and packets received and transmitted on the logical and physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes, Output bytes</b>—Number of bytes received and transmitted on the interface.</li> <li>• <b>Input packets, Output packets</b>—Number of packets received and transmitted on the interface.</li> </ul>	<b>detail extensive</b>
<b>Input errors</b>	<ul style="list-style-type: none"> <li>• <b>Errors</b>—Input errors on the interface.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Frames received smaller than the runt threshold.</li> <li>• <b>Giants</b>—Frames received larger than the giant threshold.</li> <li>• <b>Policed Discards</b>—Frames that the incoming packet match code discarded because they were not recognized or were not of interest. Usually, this field reports protocols that Junos does not support.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	<b>extensive</b>
<b>Output errors</b>	<ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly, possibly once every 10 seconds, the cable, the remote system, or the interface is malfunctioning.</li> <li>• <b>Errors</b>—Sum of outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet dropped by the ASIC RED mechanism.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	<b>extensive</b>
<b>Logical Interface</b>		
<b>Logical interface</b>	Name of the logical interface	All levels
<b>Index</b>	Logical interface index number, which reflects its initialization sequence.	<b>detail extensive none</b>
<b>SNMP ifIndex</b>	Logical interface SNMP interface index number.	<b>detail extensive none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Flags</b>	Information about the logical interface; values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .	All levels
<b>Encapsulation</b>	Encapsulation on the logical interface.	<b>detail extensive none</b>

*Table 147: show interfaces Output Fields for M Series, MX Series, T Series, and PTX Series Routers Management Ethernet Interface (continued)*

Field Name	Field Description	Level of Output
<b>inet</b>	IP address of the logical interface.	<b>brief</b>
<b>Protocol</b>	Protocol family configured on the logical interface (such as <b>iso</b> or <b>inet6</b> ).	<b>detail extensive none</b>
<b>MTU</b>	MTU size on the logical interface.	<b>detail extensive none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Route table</b>	Route table in which this address exists. For example, <b>Route table:0</b> refers to inet.0.	<b>detail extensive</b>
<b>Flags</b>	Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .	<b>detail extensive none</b>
<b>Addresses, Flags</b>	Information about address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .	<b>detail extensive none</b>
<b>Destination</b>	IP address of the remote side of the connection.	<b>detail extensive none</b>
<b>Local</b>	IP address of the logical interface.	<b>detail extensive none</b>
<b>Broadcast</b>	Broadcast address.	<b>detail extensive none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>

## Sample Output

### show interfaces brief (Management Ethernet)

```
user@host> show interfaces fxp0 brief
```

```

## show interfaces (PPPoE)

<b>Syntax</b>	<pre>show interfaces pp0.<i>logical</i> &lt;brief   detail   extensive   terse&gt; &lt;descriptions&gt; &lt;media&gt; &lt;snmp-index <i>snmp-index</i>&gt; &lt;statistics&gt;</pre>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	(M120 routers, M320 routers, and MX Series routers only). Display status information about the PPPoE interface.
<b>Options</b>	<p><b>pp0.<i>logical</i></b>—Display standard status information about the PPPoE interface.</p> <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b>descriptions</b>—(Optional) Display interface description strings.</p> <p><b>media</b>—(Optional) Display media-specific information about PPPoE interfaces.</p> <p><b>snmp-index <i>snmp-index</i></b>—(Optional) Display information for the specified SNMP index of the interface.</p> <p><b>statistics</b>—(Optional) Display PPPoE interface statistics.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<p><a href="#">show interfaces (PPPoE) on page 1612</a></p> <p><a href="#">show interfaces (PPPoE over Aggregated Ethernet) on page 1612</a></p> <p><a href="#">show interfaces brief (PPPoE) on page 1613</a></p> <p><a href="#">show interfaces detail (PPPoE) on page 1613</a></p> <p><a href="#">show interfaces extensive (PPPoE on M120 and M320 Routers) on page 1614</a></p>
<b>Output Fields</b>	<p><a href="#">Table 148 on page 1606</a> lists the output fields for the <b>show interfaces (PPPoE)</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 148: show interfaces (PPPoE) Output Fields

Field Name	Field Description	Level of Output
<b>Physical Interface</b>		
<b>Physical interface</b>	Name of the physical interface.	All levels
<b>Enabled</b>	State of the interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .	All levels

Table 148: *show interfaces (PPPoE) Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Interface index</b>	Physical interface index number, which reflects its initialization sequence.	<b>detail extensive none</b>
<b>SNMP ifIndex</b>	SNMP index number for the physical interface.	<b>detail extensive none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Type</b>	Physical interface type (PPPoE).	All levels
<b>Link-level type</b>	Encapsulation on the physical interface (PPPoE).	All levels
<b>MTU</b>	MTU size on the physical interface.	All levels
<b>Clocking</b>	Reference clock source. It can be <b>Internal</b> or <b>External</b> .	All levels
<b>Speed</b>	Speed at which the interface is running.	All levels
<b>Device flags</b>	Information about the physical device. Possible values are described in the "Device Flags" section under <i>Common Output Fields Description</i> .	All levels
<b>Interface flags</b>	Information about the interface. Possible values are described in the "Interface Flags" section under <i>Common Output Fields Description</i> .	All levels
<b>Link type</b>	Physical interface link type: <b>full duplex</b> or <b>half duplex</b> .	All levels
<b>Link flags</b>	Information about the interface. Possible values are described in the "Link Flags" section under <i>Common Output Fields Description</i> .	All levels
<b>Input rate</b>	Input rate in bits per second (bps) and packets per second (pps).	None specified
<b>Output rate</b>	Output rate in bps and pps.	None specified
<b>Physical Info</b>	Physical interface information.	All levels
<b>Hold-times</b>	Current interface hold-time up and hold-time down, in milliseconds.	<b>detail extensive</b>
<b>Current address</b>	Configured MAC address.	<b>detail extensive</b>
<b>Hardware address</b>	MAC address of the hardware.	<b>detail extensive</b>
<b>Alternate link address</b>	Backup address of the link.	<b>detail extensive</b>
<b>Statistics last cleared</b>	Time when the statistics for the interface were last set to zero.	<b>detail extensive</b>

Table 148: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Traffic statistics</b>	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>	<b>detail extensive</b>
<b>IPv6 transit statistics</b>	<p>Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled.</p> <p><b>NOTE:</b> These fields include dropped traffic and exception traffic, as those fields are not separately defined.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>	<b>detail extensive</b>
<b>Input errors</b>	<p>Input errors on the interface:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>Resource errors</b>—Sum of B chip Tx drops and IXP Tx net transmit drops.</li> </ul>	<b>extensive</b>
<b>Output errors</b>	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b> —Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), then the cable, the far-end system, or the PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of B chip Tx drops and IXP Tx net transmit drops.</li> </ul>	<b>extensive</b>

---

#### Logical Interface

---

Table 148: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Logical interface</b>	Name of the logical interface.	All levels
<b>Index</b>	Logical interface index number (which reflects its initialization sequence).	<b>detail extensive none</b>
<b>SNMP ifIndex</b>	Logical interface SNMP interface index number.	<b>detail extensive none</b>
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Flags</b>	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .	All levels
<b>Encapsulation</b>	Type of encapsulation configured on the logical interface.	All levels
<b>PPP parameters</b>	PPP status: <ul style="list-style-type: none"> <li>• LCP restart timer—Length of time (in milliseconds) between successive Link Control Protocol (LCP) configuration requests.</li> <li>• NCP restart timer—Length of time (in milliseconds) between successive Network Control Protocol (NCP) configuration requests.</li> </ul>	<b>detail</b>
<b>PPPoE</b>	PPPoE status: <ul style="list-style-type: none"> <li>• <b>State</b>—State of the logical interface (<b>up</b> or <b>down</b>).</li> <li>• <b>Session ID</b>—PPPoE session ID.</li> <li>• <b>Service name</b>—Type of service required. Can be used to indicate an Internet service provider (ISP) name or a class or quality of service.</li> <li>• <b>Configured AC name</b>—Configured access concentrator name.</li> <li>• <b>Auto-reconnect timeout</b>—Time after which to try to reconnect after a PPPoE session is terminated, in seconds.</li> <li>• <b>Idle Timeout</b>—Length of time (in seconds) that a connection can be idle before disconnecting.</li> <li>• <b>Underlying interface</b>—Interface on which PPPoE is running.</li> </ul>	All levels
<b>Link</b>	Name of the physical interfaces for member links in an aggregated Ethernet bundle for a PPPoE over aggregated Ethernet configuration. PPPoE traffic goes out on these interfaces.	All levels
<b>Traffic statistics</b>	Total number of bytes and packets received and transmitted on the logical interface. These statistics are the sum of the local and transit statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize.	<b>detail extensive</b>

Table 148: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
IPv6 transit statistics	<p>Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.</p> <p><b>NOTE:</b> The packet and byte counts in these fields include traffic that is dropped and does not leave the router.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>	detail extensive
Local statistics	<p>Statistics for traffic received from and transmitted to the Routing Engine. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize.</p>	detail extensive
Transit statistics	<p>Statistics for traffic transiting the router. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. This counter usually takes less than 1 second to stabilize.</p> <p><b>NOTE:</b> The packet and byte counts in these fields include traffic that is dropped and does not leave the router.</p>	detail extensive
Keepalive settings	<p>(PPP and HDLC) Configured settings for keepalives.</p> <ul style="list-style-type: none"> <li>• <b>interval seconds</b>—The time in seconds between successive keepalive requests. The range is 10 seconds through 32,767 seconds, with a default of 10 seconds.</li> <li>• <b>down-count number</b>—The number of keepalive packets a destination must fail to receive before the network takes a link down. The range is 1 through 255, with a default of 3.</li> <li>• <b>up-count number</b>—The number of keepalive packets a destination must receive to change a link's status from down to up. The range is 1 through 255, with a default of 1.</li> </ul>	detail extensive
Keepalive statistics	<p>(PPP and HDLC) Information about keepalive packets.</p> <ul style="list-style-type: none"> <li>• <b>Input</b>—Number of keepalive packets received by PPP. <ul style="list-style-type: none"> <li>• <b>(last seen 00:00:00 ago)</b>—Time the last keepalive packet was received, in the format <i>hh:mm:ss</i>.</li> </ul> </li> <li>• <b>Output</b>—Number of keepalive packets sent by PPP and how long ago the last keepalive packets were sent and received. <ul style="list-style-type: none"> <li>• <b>(last seen 00:00:00 ago)</b>—Time the last keepalive packet was sent, in the format <i>hh:mm:ss</i>.</li> </ul> </li> </ul> <p>(MX Series routers with MPCs/MICs) When an MX Series router with MPCs/MICs is using PPP fast keepalive for a PPP link, the display does not include the number of keepalive packets received or sent, or the amount of time since the router received or sent the last keepalive packet.</p>	detail extensive
Input packets	Number of packets received on the logical interface.	None specified
Output packets	Number of packets transmitted on the logical interface.	None specified

Table 148: *show interfaces (PPPoE) Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>LCP state</b>	(PPP) Link Control Protocol state.  <ul style="list-style-type: none"> <li>• <b>Conf-ack-received</b>—Acknowledgement was received.</li> <li>• <b>Conf-ack-sent</b>—Acknowledgement was sent.</li> <li>• <b>Conf-req-sent</b>—Request was sent.</li> <li>• <b>Down</b>—LCP negotiation is incomplete (not yet completed or has failed).</li> <li>• <b>Not-configured</b>—LCP is not configured on the interface.</li> <li>• <b>Opened</b>—LCP negotiation is successful.</li> </ul>	none <b>detail extensive</b>
<b>NCP state</b>	(PPP) Network Control Protocol state.  <ul style="list-style-type: none"> <li>• <b>Conf-ack-received</b>—Acknowledgement was received.</li> <li>• <b>Conf-ack-sent</b>—Acknowledgement was sent.</li> <li>• <b>Conf-req-sent</b>—Request was sent.</li> <li>• <b>Down</b>—NCP negotiation is incomplete (not yet completed or has failed).</li> <li>• <b>Not-configured</b>—NCP is not configured on the interface.</li> <li>• <b>Opened</b>—NCP negotiation is successful.</li> </ul>	<b>detail extensive</b> none
<b>CHAP state</b>	(PPP) Displays the state of the Challenge Handshake Authentication Protocol (CHAP) during its transaction.  <ul style="list-style-type: none"> <li>• <b>Chap-Chal-received</b>—Challenge was received but response not yet sent.</li> <li>• <b>Chap-Chal-sent</b>—Challenge was sent.</li> <li>• <b>Chap-Resp-received</b>—Response was received for the challenge sent, but CHAP has not yet moved into the Success state. (Most likely with RADIUS authentication.)</li> <li>• <b>Chap-Resp-sent</b>—Response was sent for the challenge received.</li> <li>• <b>Closed</b>—CHAP authentication is incomplete.</li> <li>• <b>Failure</b>—CHAP authentication failed.</li> <li>• <b>Not-configured</b>—CHAP is not configured on the interface.</li> <li>• <b>Success</b>—CHAP authentication was successful.</li> </ul>	none <b>detail extensive</b>
<b>Protocol</b>	Protocol family configured on the logical interface.	<b>detail extensive</b> none
<i><b>protocol-family</b></i>	Protocol family configured on the logical interface. If the protocol is <b>inet</b> , the IP address of the interface is also displayed.	<b>brief</b>
<b>MTU</b>	MTU size on the logical interface.	<b>detail extensive</b> none
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Route table</b>	Routing table in which the logical interface address is located. For example, <b>0</b> refers to the routing table <b>inet.0</b> .	<b>detail extensive</b> none
<b>Flags</b>	Information about the protocol family flags. Possible values are described in the “Family Flags” section under <i>Common Output Fields Description</i> .	<b>detail extensive</b> none

Table 148: show interfaces (PPPoE) Output Fields (continued)

Field Name	Field Description	Level of Output
Addresses, Flags	Information about the addresses configured for the protocol family. Possible values are described in the "Addresses Flags" section under <i>Common Output Fields Description</i> .	detail extensive none
Destination	IP address of the remote side of the connection.	detail extensive none
Local	IP address of the logical interface.	detail extensive none
Broadcast	Broadcast address.	detail extensive none

## Sample Output

### show interfaces (PPPoE)

```

user@host> show interfaces pp0
Physical interface: pp0, Enabled, Physical link is Up
 Interface index: 128, SNMP ifIndex: 24
 Type: PPPoE, Link-level type: PPPoE, MTU: 1532
 Device flags : Present Running
 Interface flags: Point-To-Point SNMP-Traps
 Link type : Full-Duplex
 Link flags : None
 Input rate : 0 bps (0 pps)
 Output rate : 0 bps (0 pps)

Logical interface pp0.0 (Index 72) (SNMP ifIndex 72)
 Flags: Hardware-Down Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPPoE
 PPPoE:
 State: SessionDown, Session ID: None,
 Service name: None, Configured AC name: sapphire,
 Auto-reconnect timeout: 100 seconds, Idle timeout: Never,
 Underlying interface: at-5/0/0.0 (Index 70)
 Input packets : 0
 Output packets: 0
 LCP state: Not-configured
 NCP state: inet: Not-configured, inet6: Not-configured, iso: Not-configured,
 mpls: Not-configured
 CHAP state: Closed
 Protocol inet, MTU: 100
 Flags: User-MTU, Negotiate-Address

```

### show interfaces (PPPoE over Aggregated Ethernet)

```

user@host> show interfaces pp0.1073773821
Logical interface pp0.1073773821 (Index 80) (SNMP ifIndex 32584)
 Flags: Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPPoE
 PPPoE:
 State: SessionUp, Session ID: 1,
 Session AC name: alcor, Remote MAC address: 00:00:5e:00:53:01,
 Underlying interface: demux0.100 (Index 88)
 Link:

```

```

 ge-1/0/0.32767
 ge-1/0/1.32767
 Input packets : 6
 Output packets: 6
 LCP state: Opened
 NCP state: inet: Opened, inet6: Not-configured, iso: Not-configured, mp1s:
Not-configured
 CHAP state: Closed
 PAP state: Success
 Protocol inet, MTU: 1500
 Flags: Sendbroadcast-pkt-to-re
 Addresses, Flags: Is-Primary
 Local: 203.0.113.1

```

### show interfaces brief (PPPoE)

```
user@host> show interfaces pp0 brief
```

```

Physical interface: pp0, Enabled, Physical link is Up
 Type: PPPoE, Link-level type: PPPoE, MTU: 1532, Speed: Unspecified
 Device flags : Present Running
 Interface flags: Point-To-Point SNMP-Traps

Logical interface pp0.0
 Flags: Hardware-Down Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPPoE
 PPPoE:
 State: SessionDown, Session ID: None,
 Service name: None, Configured AC name: sapphire,
 Auto-reconnect timeout: 100 seconds, Idle timeout: Never,
 Underlying interface: at-5/0/0.0 (Index 70)
 inet

```

### show interfaces detail (PPPoE)

```
user@host> show interfaces pp0 detail
```

```

Physical interface: pp0, Enabled, Physical link is Up
 Interface index: 128, SNMP ifIndex: 24, Generation: 9
 Type: PPPoE, Link-level type: PPPoE, MTU: 1532, Speed: Unspecified
 Device flags : Present Running
 Interface flags: Point-To-Point SNMP-Traps
 Link type : Full-Duplex
 Link flags : None
 Physical info : Unspecified
 Hold-times : Up 0 ms, Down 0 ms
 Current address: Unspecified, Hardware address: Unspecified
 Alternate link address: Unspecified
 Statistics last cleared: Never
 Traffic statistics:
 Input bytes : 0 0 bps
 Output bytes: 0 0 bps
 Input packets: 0 0 pps
 Output packets: 0 0 pps
 Logical interface pp0.0 (Index 72) (SNMP ifIndex 72) (Generation 14)
 Flags: Hardware-Down Point-To-Point SNMP-Traps 0x4000 Encapsulation: PPPoE
 PPPoE:
 State: SessionDown, Session ID: None,
 Service name: None, Configured AC name: sapphire,
 Auto-reconnect timeout: 100 seconds, Idle timeout: Never,

```

```

 Underlying interface: at-5/0/0.0 (Index 70)

## show interfaces interface-set (Ethernet Interface Set)

<b>Syntax</b>	<code>show interfaces interface-set <i>interface-set-name</i> &lt;detail   terse&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 8.5.
<b>Description</b>	<p>Display information about the specified gigabit or 10-Gigabit Ethernet interface set.</p> <p>You can also use the <b>show interfaces interface-set</b> command to display information about agent circuit identifier (ACI) interface sets.</p>
<b>Options</b>	<p><b>interface-set <i>interface-set-name</i></b>—Display information about the specified Gigabit Ethernet, 10-Gigabit Ethernet, ACI, or ALI interface set.</p> <p><b>detail   terse</b>—(Optional) Display the specified level of output.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Verifying and Managing Agent Circuit Identifier-Based Dynamic VLAN Configuration</a></li> <li><a href="#">Verifying and Managing Configurations for Dynamic VLANs Based on Access-Line Identifiers</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show interfaces interface-set terse on page 1618</a></p> <p><a href="#">show interfaces interface-set detail on page 1618</a></p> <p><a href="#">show interfaces interface-set (ACI Interface Set based on ACI) on page 1618</a></p> <p><a href="#">show interfaces interface-set (ACI Interface Set based on ACI Trusted Option) on page 1619</a></p> <p><a href="#">show interfaces interface-set (ACI Interface Set based on ARI Trusted Option) on page 1619</a></p> <p><a href="#">show interfaces interface-set (ACI Interface Set based on ARI Trusted Option when both ACI and ARI are received) on page 1619</a></p> <p><a href="#">show interfaces interface-set (ACI Interface Set based on Accept-No-IDs Trusted Option when neither ACI nor ARI is received) on page 1619</a></p> <p><a href="#">show interfaces interface-set (L2BSA and PPPoE Subscribers) on page 1620</a></p>
<b>Output Fields</b>	Table 149 on page 1616 describes the information for the <b>show interfaces interface-set</b> command. Output fields are listed in the approximate order in which they appear.

Table 149: Ethernet show interfaces interface-set Output Fields

Field Name	Field Description	Level of Output
------------	-------------------	-----------------

### Physical Interface

Table 149: Ethernet show interfaces interface-set Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Interface set</b>	<p>Name of the interface set or sets.</p> <p>For ACI interface sets, the set name is prefixed with <b>aci-</b>.</p> <p>For ALI interface sets, the set name is prefixed with the trusted option that the interface set is based on:</p> <ul style="list-style-type: none"> <li>• <b>aci</b>— The ACI is configured as the trusted option.</li> <li>• <b>ari</b>— The ARI is configured as the trusted option.</li> <li>• <b>aci+ari</b>— Both ACI and ARI are configured as the trusted option.</li> <li>• <b>no-ids</b>— Neither the ACI nor the ARI is configured as the trusted option and neither ACI nor ARI is received.</li> </ul>	All levels
<b>Interface set index</b>	Index number of the interface set.	<b>detail none</b>
<b>ACI VLAN</b>	<p>For ACI interface sets, the string received in DHCP or PPPoE control packets that uniquely identifies the subscriber's access node and the DSL line on the access node. Only the <b>Agent Circuit ID</b> can be used to create the interface set.</p> <p><b>NOTE:</b> The ACI VLAN field is replaced with the Line Identity field when an ALI interface set is configured with the <b>line-identity</b> autoconfiguration stanza.</p>	<b>detail none</b>
<b>Line Identity</b>	<p>For ALI interface sets, the trusted option received in DHCP or PPPoE control packets that uniquely identifies the subscriber's access node and the DSL line on the access node. The trusted option can be either or both of the following:</p> <ul style="list-style-type: none"> <li>• <b>Agent Circuit ID</b>—The ACI value</li> <li>• <b>Agent Remote ID</b>—The ARI value.</li> </ul> <p><b>NOTE:</b> When only <b>accept-no-ids</b> is configured as the trusted option, this field is not displayed.</p> <p><b>NOTE:</b> The Line Identity field is replaced with the ACI VLAN field when an ACI interface set is configured with the <b>agent-circuit-id</b> autoconfiguration stanza.</p>	<b>detail none</b>
<b>PPPoE</b>	Dynamic PPPoE subscriber interface that the router creates using the ACI or ALI interface set.	<b>detail none</b>
<b>Max Sessions</b>	For dynamic PPPoE subscriber interfaces, maximum number of PPPoE logical interfaces that that can be activated on the underlying interface.	<b>detail none</b>
<b>Max Sessions VSA Ignore</b>	For dynamic PPPoE subscriber interfaces, whether the router is configured to ignore (clear) the PPPoE maximum session value returned by RADIUS in the Max-Clients-Per-Interface Juniper Networks VSA [26-143] and restore the PPPoE maximum session value on the underlying interface to the value configured with the <b>max-sessions</b> statement: <b>Off</b> (default) or <b>On</b> .	<b>detail none</b>

Table 149: Ethernet show interfaces interface-set Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Traffic statistics</b>	Number and rate of bytes and packets received and transmitted on the specified interface set.  <ul style="list-style-type: none"> <li><b>Input bytes, Output bytes</b>—Number of bytes and number of bytes per second received and transmitted on the interface set</li> <li><b>Input packets, Output packets</b>—Number of packets and number of packets per second received and transmitted on the interface set.</li> </ul>	<b>detail</b>
<b>Egress queues supported</b>	Total number of egress queues supported on the specified interface set.	<b>detail</b>
<b>Egress queues in use</b>	Total number of egress queues used on the specified interface set.	<b>detail</b>
<b>Queue counters</b>	<b>Queued packets, Transmitted packets, and Dropped packets</b> statistics for the four forwarding classes.	<b>detail</b>
<b>Members</b>	List of all interface sets or, for ACI interface sets, list of all subscriber interfaces belonging to the specified ACI interface set.	<b>detail none</b>

## show interfaces interface-set queue

<b>Syntax</b>	<code>show interfaces interface-set queue <i>interface-set-name</i> &lt;aggregate   remaining-traffic&gt; &lt;forwarding-class <i>class-name</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 8.5.
<b>Description</b>	Display information about the gigabit or 10-Gigabit Ethernet interface set queue. Supported in MX Series routers with enhanced queuing DPCs.
<b>Options</b>	<p><b><i>interface-set-name</i></b>—(Optional) Display information about the specified gigabit or 10-Gigabit Ethernet interface set. Wildcard values can be used in the interface set name.</p> <p><b>aggregate</b>—(Optional) Display the aggregated queuing statistics of all member logical interfaces for interface sets that have traffic-control profiles configured.</p> <p><b>both-ingress-egress</b>—(Optional) On Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs, display both ingress and egress queue statistics.</p> <p><b>egress</b>—(Optional) Display egress queue statistics.</p> <p><b>forwarding-class <i>class-name</i></b>—(Optional) Display queuing statistics for the specified forwarding class.</p> <p><b>ingress</b>—(Optional) On Gigabit Ethernet IQ2 PICs, display ingress queue statistics.</p> <p><b>remaining-traffic</b>—(Optional) Display the queuing statistics of all member logical interfaces for interface sets that do not have traffic-control profiles configured.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<p><a href="#">show interfaces interface-set queue (Gigabit Ethernet) on page 1622</a></p> <p><a href="#">show interfaces interface-set queue both-ingress-egress (Enhanced DPC) on page 1623</a></p> <p><a href="#">show interfaces interface-set queue egress (Enhanced DPC) on page 1625</a></p> <p><a href="#">show interfaces interface-set queue forwarding-class (Gigabit Ethernet) on page 1626</a></p> <p><a href="#">show interfaces interface-set queue (Enhanced DPC) on page 1627</a></p> <p><a href="#">show interfaces interface-set queue remaining-traffic (Gigabit Ethernet) on page 1628</a></p>
<b>Output Fields</b>	<a href="#">Table 150 on page 1621</a> describes the information for the <b>show interfaces interface-set queue</b> command.

Table 150: Ethernet show interfaces interface-set queue Output Fields

Field Name	Field Description	Level of Output
------------	-------------------	-----------------

Physical Interface

Table 150: Ethernet show interfaces interface-set queue Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Interface set</b>	Name of the interface set.	All levels
<b>Interface set index</b>	Index number of the interface set.	All levels
<b>Forwarding classes supported</b>	Total number of forwarding classes supported on the specified interface set.	All levels
<b>Forwarding classes in use</b>	Total number of forwarding classes used on the specified interface set.	All levels
<b>Egress queues supported</b>	Total number of egress queues supported on the specified interface set.	All levels
<b>Egress queues in use</b>	Total number of egress queues used on the specified interface set.	All levels
<b>Ingress queues supported</b>	Total number of ingress queues supported on the specified interface set.	All levels
<b>Ingress queues in use</b>	Total number of ingress queues used on the specified interface set.	All levels
<b>Queue</b>	Egress or ingress queue number for the statistics being displayed.	All levels
<b>Forwarding classes</b>	Forwarding class name for the statistics being displayed.	All levels
<b>Queued</b>	<b>Packet and Byte</b> statistics for the specified queue. <ul style="list-style-type: none"> <li><b>Packets</b>—Number of packets queued and input rate in packets per second.</li> <li><b>Bytes</b>—Number of bytes queued and input rate in bytes per second.</li> </ul>	All levels
<b>Transmitted</b>	<b>Packet and Byte</b> statistics for the specified forwarding class. <ul style="list-style-type: none"> <li><b>Packets</b>—Number of packets transmitted and transmit rate in packets per second.</li> <li><b>Bytes</b>—Number of bytes transmitted and transmit rate in bytes per second.</li> <li><b>Tail-dropped packets</b>—Number of packets tail dropped.</li> <li><b>RED-dropped packets</b>—Number of RED-dropped packets for the <b>low</b>, <b>medium-low</b>, <b>medium-high</b>, and <b>high</b> loss priorities.</li> <li><b>RED-dropped bytes</b>—Number of RED-dropped bytes for the <b>low</b>, <b>medium-low</b>, <b>medium-high</b>, and <b>high</b> loss priorities.</li> </ul>	All levels

## Sample Output

### show interfaces interface-set queue (Gigabit Ethernet)

```
user@host> show interfaces interface-set queue ge-2/2/0-0
```

```

Interface set: ge-2/2/0-0
Interface set index: 3

## show interfaces interval

**Syntax** `show interfaces interval  
<interface-name>`

**Release Information** Command introduced before Junos OS Release 7.4.

**Description** Display the channel service unit (CSU) interface alarm and error count in 15-minute intervals for the past 24 hours. If the system has been operational for less than 24 hours, the maximum number of intervals available is displayed.

**Options** *interface-name*—(Optional) Name of a particular interface.

**Required Privilege Level** view

**Related Documentation**

- [clear interfaces interval on page 1331](#)

**List of Sample Output** [show interfaces interval \(Channelized OC12\) on page 1631](#)  
[show interfaces interval \(E3\) on page 1631](#)  
[show interfaces interval \(SONET/SDH\) on page 1631](#)

**Output Fields** [Table 151 on page 1629](#) lists the output fields for the **show interfaces interval** command. Output fields are listed in the approximate order in which they appear.

*Table 151: show interfaces interval Output Fields*

Field Name	Field Description
Physical interface	Name of the interface.
SNMP ifIndex	SNMP index number for the physical interface.
hh:mm-current	Time of day (in hours and minutes) at the beginning of the latest counter interval. The value of the latest counter interval is always less than 15 minutes.
hh:mm-hh:mm	Time of day (in hours and minutes) at the beginning and end of each 15-minute interval.
alarm or event: n	Count of alarms and events within each 15-minute interval. The specific alarm or event depends on the interface media type. For a description of the alarm or event listed, see the <i>interface-type media</i> field (for example, <b>T1 media</b> ) under the <b>show interfaces</b> command for the particular interface type in which you are interested.
Interval Total	Sum of all the alarm and defect counters for the last 24-hour period.

*Table 151: show interfaces interval Output Fields (continued)*

Field Name	Field Description
<b>Interval Total</b>	Sum of all the alarm and defect counters for the last 24-hour period.
<b>Current Day Interval Total</b>	Sum of all the alarm and defect counters in the current day.  <b>NOTE:</b> The <b>Current Day Interval</b> output field is reset after 24 hours.
<b>Previous Day Interval Total</b>	Sum of all the alarm and defect counters in the previous day.

## Sample Output

### show interfaces interval (Channelized OC12)

## show interfaces irb

**Syntax** `show interfaces irb`  
`<brief | detail | extensive | terse>`  
`<descriptions>`  
`<media>`  
`<snmp-index snmp-index>`  
`<statistics>`

**Release Information** Command introduced in Junos OS Release 8.4.

**Description** Display integrated routing and bridging interfaces information.

**Options** `brief | detail | extensive | terse`—(Optional) Display the specified level of output.

`descriptions`—(Optional) Display interface description strings.

`mac`—Display hardware MAC address

`media`—(Optional) Display media-specific information about network interfaces.

`snmp-index snmp-index`—(Optional) Display information for the interface with the specified SNMP index.

`statistics`—(Optional) Display static interface statistics.

**Additional Information** Integrated routing and bridging (IRB) provides simultaneous support for Layer 2 bridging and Layer 3 IP routing on the same interface. IRB enables you to route local packets to another routed interface or to another bridging domain that has a Layer 3 protocol configured.

**Required Privilege Level** view

**List of Sample Output** [show interfaces irb extensive on page 1637](#)  
[show interfaces irb snmp-index on page 1638](#)

**Output Fields** [Table 152 on page 1633](#) lists the output fields for the `show interfaces irb` command. Output fields are listed in the approximate order in which they appear.

*Table 152: show interfaces irb Output Fields*

Field Name	Field Description	Level of Output
<b>Physical Interface</b>		
<b>Physical interface</b>	Name of the physical interface.	All levels

Table 152: *show interfaces irb* Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Enabled</b>	State of the physical interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .	All levels
<b>Proto</b>	Protocol configured on the interface.	<b>terse</b>
<b>Interface index</b>	Physical interface index number, which reflects its initialization sequence.	<b>detail extensive none</b>
<b>SNMP ifIndex</b>	SNMP index number for the physical interface.	<b>detail extensive none</b>
<b>Type</b>	Physical interface type.	<b>detail extensive none</b>
<b>Link-level type</b>	Encapsulation being used on the physical interface.	<b>detail extensive brief none</b>
<b>MTU</b>	MTU size on the physical interface.	<b>detail extensive brief none</b>
<b>Clocking</b>	Reference clock source: <b>Internal</b> or <b>External</b> . Always unspecified on IRB interfaces.	<b>detail extensive brief</b>
<b>Speed</b>	Speed at which the interface is running. Always unspecified on IRB interfaces.	<b>detail extensive brief</b>
<b>Device flags</b>	Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .	<b>detail extensive brief none</b>
<b>Interface flags</b>	Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .	<b>detail extensive brief none</b>
<b>Link type</b>	Physical interface link type: <b>full duplex</b> or <b>half duplex</b> .	<b>detail extensive none</b>
<b>Link flags</b>	Information about the link. Possible values are described in the “Links Flags” section under <i>Common Output Fields Description</i> .	<b>detail extensive none</b>
<b>Physical Info</b>	Physical interface information.	All levels
<b>Hold-times</b>	Current interface hold-time up and hold-time down, in milliseconds.	<b>detail extensive</b>
<b>Current address</b>	Configured MAC address.	<b>detail extensive none</b>
<b>Hardware address</b>	MAC address of the hardware.	<b>detail extensive none</b>
<b>Alternate link address</b>	Backup address of the link.	<b>detail extensive</b>
<b>Last flapped</b>	Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hours:minutes:seconds timezone (hours:minutes:seconds ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .	<b>detail extensive none</b>

Table 152: *show interfaces irb Output Fields (continued)*

Field Name	Field Description	Level of Output
<b>Statistics last cleared</b>	Time when the statistics for the interface were last set to zero.	<b>detail extensive</b>
<b>Traffic statistics</b>	<p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>	<b>detail extensive</b>
<b>IPv6 transit statistics</b>	<p>Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>	<b>detail extensive</b>
<b>Input errors</b>	<p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runs</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	<b>detail extensive</b>
<b>Output errors</b>	<p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the DPC is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>	<b>detail extensive</b>

Table 152: *show interfaces irb* Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Logical Interface</b>		
<b>Logical interface</b>	Name of the logical interface.	All levels
<b>Index</b>	Index number of the logical interface (which reflects its initialization sequence).	<b>detail extensive</b> none
<b>SNMP ifIndex</b>	SNMP interface index number of the logical interface.	<b>detail extensive</b> none
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Flags</b>	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .	<b>detail extensive</b>
<b>Encapsulation</b>	Encapsulation on the logical interface.	<b>detail extensive</b>
<b>Bandwidth</b>	Dummy value that is ignored by an IRB interface. IRB interfaces are pseudo interfaces and do not have physical bandwidth associated with them.	<b>detail extensive</b>
<b>Routing Instance</b>	Routing instance IRB is configured under.	<b>detail extensive</b>
<b>Bridging Domain</b>	Bridging domain IRB is participating in.	<b>detail extensive</b>
<b>Traffic statistics</b>	Number and rate of bytes and packets received and transmitted on the logical interface. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>	<b>detail extensive</b>
<b>IPv6 transit statistics</b>	Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>	<b>detail extensive</b>
<b>Local statistics</b>	Statistics for traffic received from and transmitted to the Routing Engine.	<b>detail extensive</b>
<b>Transit statistics</b>	Statistics for traffic transiting the router.	<b>detail extensive</b>
<b>Protocol</b>	Protocol family configured on the local interface. Possible values are described in the “Protocol Field” section under <i>Common Output Fields Description</i> .	<b>detail extensive</b>
<b>MTU</b>	Maximum transmission unit size on the logical interface.	<b>detail extensive</b>

Table 152: show interfaces irb Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Maximum labels</b>	Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.	<b>detail extensive</b> none
<b>Generation</b>	Unique number for use by Juniper Networks technical support only.	<b>detail extensive</b>
<b>Route table</b>	Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.	<b>detail extensive</b>
<b>Addresses, Flags</b>	Information about address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .	<b>detail extensive</b>
<b>Policer</b>	The policer that is to be evaluated when packets are received or transmitted on the interface.	<b>detail extensive</b>
<b>Flags</b>	Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .	<b>detail extensive</b>

## show interfaces mac-database

<b>Syntax</b>	<code>show interfaces mac-database (ge-fpc/pic/port   ge-fpc/pic/port.n   aex  xe-fpc/pic/port   xe-fpc/pic/port.n   et-fpc/pic/port   et-fpc/pic/port.n) &lt;mac-address mac-address&gt;</code>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced on PTX Series Packet Transport Routers for Junos OS Release 12.1.</p> <p>Support for statement with the <b>aex</b> option introduced in Junos OS Release 15.1.</p>
<b>Description</b>	(M Series, T Series, MX Series routers, and PTX Series Packet Transport Routers only) Display media access control (MAC) address information for the specified interface.
<b>Options</b>	<p><b>ge-fpc/pic/port</b>—Display MAC addresses that have been learned on all logical interfaces on a particular physical interface.</p> <p><b>ge-fpc/pic/port.n</b>—Display MAC addresses that have been learned on a particular logical interface.</p> <p><b>aex</b>—Display MAC addresses that have been learned on a particular aggregated Ethernet interface.</p> <p><b>xe-fpc/pic/port</b>—Display MAC addresses that have been learned on all logical interfaces on a particular physical interface.</p> <p><b>xe-fpc/pic/port.n</b>—Display MAC addresses that have been learned on a particular logical interface.</p> <p><b>et-fpc/pic/port</b>—Display MAC addresses that have been learned on all logical interfaces on a particular physical interface.</p> <p><b>et-fpc/pic/port.n</b>—Display MAC addresses that have been learned on a particular logical interface.</p> <p><b>mac-address mac-address</b>—(Optional) Display detailed MAC address statistics, including policer information for <b>ge</b>, <b>xe</b>, and <b>et</b> interfaces.</p>
<b>Additional Information</b>	On IQ2 PIC interfaces, the default value for maximum retention of entries in the MAC address table has changed, for cases in which the table is not full. The new holding time is 12 hours. The previous retention time of 3 minutes is still in effect when the table is full.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<p><a href="#">show interfaces mac-database (All MAC Addresses on a Port) on page 1642</a></p> <p><a href="#">show interfaces mac-database (All MAC Addresses on an Aggregated Ethernet Interface) on page 1643</a></p>

**Output Fields** [Table 153 on page 1641](#) lists the output fields for the **show interfaces mac-database** command. Output fields are listed in the approximate order in which they appear.

*Table 153: show interfaces mac-database Output Fields*

Field Name	Field Description
<b>Physical Interface</b>	
<b>Physical interface</b>	Name of the physical interface.
<b>Enabled</b>	State of the physical interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> .
<b>Interface index</b>	Physical interface index number, which reflects its initialization sequence.
<b>SNMP ifIndex</b>	SNMP index number for the physical interface.
<b>Description</b>	Description and name of the interface.
<b>Link-level type</b>	Encapsulation being used on the physical interface.
<b>MTU</b>	MTU size on the physical interface.
<b>Speed</b>	Speed at which the interface is running.
<b>Loopback</b>	Whether loopback is enabled and the type of loopback: <b>local</b> or <b>remote</b> .
<b>Source filtering</b>	Whether source filtering is configured.
<b>Flow control</b>	Whether flow control is enabled or disabled.
<b>Minimum links needed</b>	(Aggregated Ethernet interfaces only) Number of child links that must be operational for the aggregated interface to be operational.
<b>Minimum bandwidth needed</b>	(Aggregated Ethernet interfaces only) Minimum amount of bandwidth of child links that must be operational for the aggregated interface to be operational.
<b>Device flags</b>	Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .
<b>Current address</b>	(Aggregated Ethernet interfaces only) Configured MAC address.
<b>Hardware address</b>	(Aggregated Ethernet interfaces only) Hardware MAC address.
<b>Last flapped</b>	(Aggregated Ethernet interfaces only) Date, time, and how long ago the interface went from down to up or from up to down. The format is <b>Last flapped: year-month-day hours:minutes:seconds timezone (wwksddays hours:minutes ago)</b> . For example, <b>Last flapped: 2013-12-18 04:33:22 PST (1w5d 22:23 ago)</b> .

Table 153: show interfaces mac-database Output Fields (continued)

Field Name	Field Description
<b>Input Rate</b>	(Aggregated Ethernet interfaces only) Input rate in bits per second (bps) and packets per second (pps).
<b>Output Rate</b>	(Aggregated Ethernet interfaces only) Output rate in bps and pps.
<b>Interface flags</b>	Information about the interface. Possible values are described in the “Links Flags” section under <i>Common Output Fields Description</i> .
<b>Link flags</b>	Information about the link. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .
<b>Logical Interface</b>	
<b>Logical interface</b>	Name of the logical interface.
<b>Index</b>	Logical interface index number, which reflects its initialization sequence.
<b>SNMP ifIndex</b>	Logical interface SNMP interface index number.
<b>Flags</b>	Information about the logical interface (possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> ).
<b>Encapsulation</b>	Encapsulation on the logical interface.
<b>MAC address, Input frames, Input bytes, Output frames, Output bytes</b>	MAC address and corresponding number of input frames, input bytes, output frames, and output bytes.
<b>Number of MAC addresses</b>	Number of MAC addresses configured.
<b>Policer Statistics</b>	<p>(Displayed for <b>mac-address</b> option for <b>ge</b>, <b>xe</b>, and <b>et</b> interface types only) Display information about policers applied to a logical interface-MAC pair.</p> <ul style="list-style-type: none"> <li>• <b>Policer type</b>—Type of policer that is out of spec with respect to the configuration. It can be one or more of the following: <ul style="list-style-type: none"> <li>• <b>Input premium</b>—Number of high-priority rating out-of-spec frames or bytes received.</li> <li>• <b>Output premium</b>—Number of high-priority rating out-of-spec frames or bytes sent.</li> <li>• <b>Input aggregate</b>—Total number of out-of-spec frames or bytes received.</li> <li>• <b>Output aggregate</b>—Total number of out-of-spec frames or bytes sent.</li> </ul> </li> <li>• <b>Discarded Frames</b>—Number of discarded frames.</li> <li>• <b>Discarded Bytes</b>—Number of discarded bytes.</li> </ul>

## show interfaces mc-ae

<b>Syntax</b>	<b>show interfaces mc-ae</b> <b>extensive</b> <b>revertive-info</b> <b>&lt;id identifier unit number&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 9.6. <b>revertive-info</b> statement introduced in Junos OS Release 13.3 <b>extensive</b> statement introduced in Junos OS Release 16.1R1
<b>Description</b>	On MX Series routers with multichassis aggregated Ethernet ( <b>aeX</b> ) interfaces, displays information about the <b>aeX</b> interfaces.
<b>Options</b>	<b>extensive</b> —(Optional) Display extensive information for multichassis aggregated Ethernet interface.  <b>revertive-info</b> —(Optional) Display revertive mode information for multichassis aggregated Ethernet interface.  <b>identifier</b> —(Optional) Identifier of the multichassis aggregated Ethernet interface.  <b>number</b> —(Optional) Specify the logical interface by unit number.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Configuring Multichassis Link Aggregation on MX Series Routers</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show interfaces mc-ae on page 1647</a> <a href="#">show interfaces mc-ae (Active/Active Bridging and VRRP over IRB on MX Series Routers) on page 1648</a> <a href="#">show interfaces mc-ae revertive-info on page 1648</a> <a href="#">show interfaces mc-ae extensive on page 1648</a> <a href="#">show interfaces mc-ae extensive (MX Series Router after a configuration exchange error) on page 1649</a>
<b>Output Fields</b>	Table 154 on page 1646 lists the output fields for the <b>show interfaces mc-ae</b> command. Output fields are listed in the approximate order in which they appear.

Table 154: show interfaces mc-ae Output Fields

Output Field Name	Field Description
Member Link	Identifiers of the configured multichassis link aggregate interfaces configured interfaces.

Table 154: *show interfaces mc-ae* Output Fields (continued)

Output Field Name	Field Description
Local Status	Status of the local link: <b>active</b> or <b>standby</b> .
Peer Status	Status of the peer link: <b>active</b> or <b>standby</b> .
Local State	Up or down state of the local device.
Peer State	<p>Status of the local and peer links in an <b>active/active</b> bridge or VRRP over integrated routing and bridging (IRB) configuration on MX Series routers, including:</p> <p><b>Logical Interface</b>—Aggregated Ethernet (AE) aggregate number and unit number.</p> <p><b>Topology Type</b>—The bridge or VRRP topology type configured on the AE.</p> <p><b>Local State</b>—Up or down state of the local device.</p> <p><b>Peer State</b>—Up or down state of the peer device.</p> <p><b>Peer Ip/ICL-PL/State</b>—Address, interface and state of the peer device.</p>
Logical Interface	Identifier and unit of the multichassis aggregated Ethernet interface.
Core Facing Interface	Label: <b>pseudowire interface</b> or <b>Ethernet interface</b> .
ICL-PL	Label: <b>pseudowire interface</b> or <b>Ethernet interface</b> .
switchover mode	The configured switchover mode for the multichassis aggregated Ethernet interface: <b>revertive</b> or <b>non-revertive</b> .
switchover status	Status of the switchover if the <b>revert-time</b> statement is configured at the <b>[edit interfaces aex mc-ae]</b> hierarchy level.
revert time	Revert time configured for the multichassis aggregated Ethernet interface.
switchover time remaining	Seconds left to trigger the switchover if the switchover is in progress.
Configuration Error Status	Reason for the configuration error.

## Sample Output

## show interfaces transport pm

<b>Syntax</b>	<code>show interfaces transport pm (all   optics   otn) (all   current   currentday   interval   previousday) (all   <i>interface-name</i>)</code>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 14.2 on the PTX Series.</p> <p>Command introduced in Junos OS Release 16.1 on the MX Series.</p> <p>Command introduced in Junos OS Release 19.2R1 for QSFP-100GE-DWDM2 transceiver on MX10003, MX10008, MX10016, and MX204 routers.</p>
<b>Description</b>	Display diagnostic data, warnings, and alarms for transport performance monitoring interfaces.
<b>Options</b>	<p>(all   optics   otn)—Display both optics and OTN information or either only optics or only OTN information.</p> <p>(all   current   currentday   interval   previousday)—Display information for the current 15-minute interval, the current day, the ninety-six 15-minute intervals, and the previous day; information only for the current 15-minute interval; information only for the current 24 hours; information only for the ninety-six 15-minute intervals; information only for the previous day.</p> <p>(all   <i>interface-name</i>)—Display information for all interfaces or only for the specified interface (for example, <i>et-fpc/pic/port</i>).</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear interfaces transport pm on page 1336</a></li> <li>• <a href="#">tca on page 926</a></li> <li>• <a href="#">transport-monitoring on page 928</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show interfaces transport pm on page 1653</a></p> <p><a href="#">show interfaces transport (MX960 Router with MPC3E and 100-Gigabit DWDM OTN MIC) on page 1654</a></p> <p><a href="#">show interfaces transport pm (MX960 Router with MPC3E and 100-Gigabit DWDM OTN MIC) on page 1654</a></p> <p><a href="#">show interfaces transport (PTX3000 router with 5-port 100-Gigabit DWDM OTN PIC) on page 1656</a></p> <p><a href="#">show interfaces transport pm optics (PTX3000 router with 5-port 100-Gigabit DWDM OTN PIC) on page 1656</a></p> <p><a href="#">show interfaces transport pm otn (PTX3000 router with 5-port 100-Gigabit DWDM OTN PIC) on page 1656</a></p> <p><a href="#">show interfaces transport pm optics (MX10003, MX10008, MX10016, and MX204 router with QSFP-100GE-DWDM2 transceiver) on page 1657</a></p>

**Output Fields** Table 155 on page 1652 lists the output fields for the **show interfaces transport pm optics** command. Fields are listed in the approximate order in which they appear.

*Table 155: show interfaces transport pm Output Fields*

Field Name	Field Description
Physical interface	Name of the physical interface.
Interval	The 15 minute interval for performance monitoring.
Suspect Flag	TRUE if the performance monitoring data for the interval appears to
Reason	Reason for setting the suspect flag.
COUNT	Measured value.
THRESHOLD	Threshold value set.
TCA-ENABLED	Threshold crossing alert. Set to TRUE if enabled.
TCA-RAISED	TRUE if enabled and the value crosses the threshold.
Near End PM	Near end threshold crossing defect trigger. For more information abo
Far End PM	Far end threshold crossing defect trigger. For more information abou
FEC PM	Forwarding equivalence class threshold crossing defect trigger. For m see <a href="#">tca</a> .
BER PM	Bit error rate threshold crossing defect trigger. For more information a
CURRENT	Current value measured.
PM	Performance monitor.
MIN	Minimum value measured.
MAX	Maximum value measured.
AVG	Average value.
Lane Chromatic dispersion	Residual chromatic dispersion measured.
Lane differential group delay	Measured differential group delay.
q Value	Measured Quality factor value.
SNR	Signal to noise ratio.

Table 155: show interfaces transport pm Output Fields (continued)

Field Name	Field Description
Tx output power	The transmit laser output power.
Rx input power	The laser's received optical power.
Module temperature (Celsius)	The laser's temperature.
Tx Laser bias current (0.1mA)	Magnitude of the laser bias power setting current. The laser bias provides and modulates currents.
Rx Laser bias current (0.1mA)	Magnitude of the laser bias power setting current.
Carrier frequency offset (MHz)	Measured carrier frequency offset.

## show l2-learning instance

<b>Syntax</b>	<b>show l2-learning instance</b>
<b>Release Information</b>	(MX Series routers only) Command introduced in Junos OS Release 8.4.
<b>Description</b>	Display Layer 2 learning properties for all the configured routing instances.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show l2-learning instance on page 1660</a>
<b>Output Fields</b>	<a href="#">Table 156 on page 1659</a> describes the output fields for the <b>show l2-learning instance</b> command. Output fields are listed in the approximate order in which they appear.

*Table 156: show l2-learning instance Output Fields*

Field Name	Field Description
<b>Routing Instance</b>	Name of routing instance.
<b>Bridging Domain</b>	Name of bridging domain.  On MX Series routers you can use the <b>show l2-learning instance &lt;extensive&gt;</b> command option to display the Bridge Service-id information which includes the Config Service ID and the Active Service ID.
<b>Index</b>	Number associated with the routing instance or bridging domain.
<b>Logical System</b>	Name of logical system or <b>Default</b> if no logical system is configured.
<b>Routing instance flags</b>	Status of Layer 2 learning properties for each routing instance: <ul style="list-style-type: none"> <li><b>DL</b>—MAC learning is disabled.</li> <li><b>SE</b>—MAC accounting is enabled.</li> <li><b>AD</b>—Packets are dropped after MAC address limit is reached.</li> <li><b>LH</b>—The maximum number of MAC addresses has been learned on the routing instance. The routing instance is not able to learn any additional MAC addresses.</li> </ul>
<b>MAC limit</b>	Maximum number of MAC addresses that can be learned from each interface in the routing instance or bridging domain.

## Sample Output

### show l2-learning instance

```
user@host> show l2-learning instance
```

```
Information for routing instance:
```

```
Routing Instance flags (DL -disable learning, SE -stats enabled,
AD -packet action drop, LH -mac limit hit)
```

Routing Instance	Bridging Domain	Index	Logical System	Routing flags	MAC limit
__juniper_private1__		1	Default		5000
vs1	vlan100	3	Default		5120
vs1	vlan200	4	Default		5120

## show l2-learning redundancy-groups

<b>Syntax</b>	<pre>show l2-learning redundancy-groups logical-system [system-name   all] &lt;redundancy-group-id [0 to 4294967294]&gt; arp-statistics nd-statistics remote-macs</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 13.2.</p> <p>Support for logical systems added in Junos OS Release 14.1.</p> <p>Command introduced in Junos OS Release 15.1R1 for EX Series switches</p>
<b>Description</b>	<p>(MX Series routers only) Display ARP statistics, Neighbor Discovery statistics, or remote MAC addresses for the Multi-Chassis Aggregated Ethernet (MC-AE) nodes for all or specified redundancy groups on a router or switch or logical systems on a router or switch. Note that the Redundancy Group ID is inherited by the bridging domain or VLAN from member AE interfaces.</p>
<b>Options</b>	<p><b>logical-system [system-name   all]</b>—(Optional) Display information for a specified logical system or all systems.</p> <p><b>redundancy-group-id</b>—(Optional) The redundancy group identification number. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate the routing or switching devices contained in a redundancy group.</p> <p><b>arp-statistics</b>—(Optional) Count of ARP packets sent and received by the two MC-AE nodes.</p> <p><b>nd-statistics</b>—(Optional) Count of Neighbor Discovery packets sent and received by the two MC-AE nodes.</p> <p><b>remote-macs</b> —(Optional) List of remote MAC addresses in the “Installed” state, as learned from the remote MC-AE node.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Multichassis Link Aggregation on MX Series Routers</i></li> <li>• <a href="#">show interfaces mc-ae on page 1646</a></li> <li>• <i>Configuring Active-Active Bridging and VRRP over IRB in Multichassis Link Aggregation on MX Series Routers and QFX Series Switches</i></li> <li>• <i>Configuring Multichassis Link Aggregation on EX Series Switches</i></li> </ul>

**Output Fields** Output fields are listed in the approximate order in which they appear.

**Table 157: show l2-learning redundancy-groups arp-statistics Output Fields**

Field Name	Field Description
Redundancy Group ID	Redundancy Group to which the following details apply.
MCLAG ARP Statistics Group ID	ARP statistics for this Multichassis Link Aggregation Group (MC-LAG) instance.
ARP Rx Count From Line	Total number of ARPs received from the Line.
ARP Tx Count To Peer	Total number of ARPs sent to the peer.
ARP Rx Count From Peer	Total number of ARPs received from the peer.
ARP Drop Count received from line	Total number of ARPs sent by the peer that were received.
ARP Drop Count received from peer	Total number of ARPs sent by the peer that were dropped
Service-id	Service ID (configured at the routing instance level).

**Table 158: show l2-learning redundancy-groups nd-statistics Output Fields**

Field Name	Field Description
Redundancy Group ID	Redundancy Group to which the following details apply.
MCLAG ND Statistics Group ID	Neighbor Discovery statistics for this Multichassis Link Aggregation Group (MC-LAG) instance.
ND Rx Count From Line	Total number of Neighbor Discovery packets received from the Line.
ND Tx Count To Peer	Total number of Neighbor Discovery packets sent to the peer.
NDRx Count From Peer	Total number of Neighbor Discovery packets received from the peer.

*Table 158: show l2-learning redundancy-groups nd-statistics Output Fields (continued)*

Field Name	Field Description
ND Drop Count received from line	Total number of Neighbor Discovery packets sent by the peer that were received.
ND Drop Count received from peer	Total number of Neighbor Discovery packets sent by the peer that were dropped
Service-id	Service ID (configured at the routing instance level).

*Table 159: show l2-learning redundancy-groups remote-macs Output Fields*

Field Name	Field Description
Redundancy Group ID	Redundancy Group to which the following details apply.
Peer-Addr	IP address of the remote peer.
VLAN	Virtual LAN identifier associated with the redundancy group.
MAC	Hardware media access control address associated with the redundancy group.
MCAE-ID	ID number of the MC-AE used by the redundancy group.
Flags	Connection state: local connect or Remote connect. If no flag is shown, the redundancy group may not be connected.
Status	Installation state: Installed or Not Installed.

## Sample Output

### show l2-learning redundancy-groups arp-statistics

```

user@host> show l2-learning redundancy-groups arp-statistics

Logical System : default
Redundancy Group ID : 1 Flags : Local Connect, Remote Connect

MCLAG ARP Statistics
Group ID : 1
ARP Rx Count From Line : 52
ARP Tx Count To Peer : 15
ARP Rx Count From Peer : 39
ARP Install Count : 34
ARP Drop Count received from line : 37
ARP Drop Count received from peer : 5

```

### show l2-learning redundancy-groups nd-statistics

```

user@host> show l2-learning redundancy-groups nd-statistics

```

```

Logical System : default
Redundancy Group ID : 1 Flags : Local Connect, Remote Connect

MCLAG ND Statistics

```

## show lacp interfaces

**Syntax** `show lacp interfaces`  
`<interface-name>`  
`extensive`

**Release Information** Command introduced in Junos OS Release 7.6.  
**extensive** statement introduced in Junos OS Release 16.1R1  
 Command introduced in Junos OS Release 10.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.  
 Command introduced in Junos OS Release 14.1X53-D20 for the OCX Series.  
 Command introduced in Junos OS Release 14.2R3

**Description** Display Link Aggregation Control Protocol (LACP) information about the specified aggregated Ethernet, Fast Ethernet, or Gigabit Ethernet interface.

**Options** **none**—Display LACP information for all interfaces.

**interface-name**—(Optional) Display LACP information for the specified interface:

- Aggregated Ethernet—**aenumber**
- Fast Ethernet—**fe-fpc/pic/port**
- Gigabit Ethernet—**ge-fpc/pic/port**
- 10 Gigabit Ethernet—**xe-fpc/pic/port**

**extensive**—Display LACP information for the interface in detail.

**NOTE:** The `show lacp interfaces` command returns the following error message if your system is not configured in either active or passive LACP mode:

“Warning: lacp subsystem not running – not needed by configuration”

**Required Privilege Level** view

[show lacp interfaces \(10 Gigabit Ethernet\) on page 1670](#)

**Output Fields**    [Table 160 on page 1667](#) lists the output fields for the **show lacp interfaces** command. Output fields are listed in the approximate order in which they appear.

*Table 160: show lacp interfaces Output Fields*

Field Name	Field Description	Level of Output
LACP State	For a child interface configured with the force-up statement, LACP state displays FUP along with the interface name.	All Levels
Aggregated interface	Aggregated interface value.	All Levels
LACP State	<p>LACP state information for each aggregated interface:</p> <ul style="list-style-type: none"> <li>• <b>Role</b>—Role played by the interface. It can be one of the following: <ul style="list-style-type: none"> <li>• <b>Actor</b>—Local device participating in LACP negotiation.</li> <li>• <b>Partner</b>—Remote device participating in LACP negotiation.</li> </ul> </li> <li>• <b>Exp</b>—Expired state. <b>Yes</b> indicates the actor or partner is in an expired state. <b>No</b> indicates the actor or partner is not in an expired state.</li> <li>• <b>Def</b>—Default. <b>Yes</b> indicates that the actor's receive machine is using the default operational partner information, administratively configured for the partner. <b>No</b> indicates the operational partner information in use has been received in an LACP PDU.</li> <li>• <b>Dist</b>—Distribution of outgoing frames. <b>No</b> indicates distribution of outgoing frames on the link is currently disabled and is not expected to be enabled. Otherwise, the value is <b>Yes</b>.</li> <li>• <b>Col</b>—Collection of incoming frames. <b>Yes</b> indicates collection of incoming frames on the link is currently enabled and is not expected to be disabled. Otherwise, the value is <b>No</b>.</li> <li>• <b>Syn</b>—Synchronization. If the value is <b>Yes</b>, the link is considered synchronized. It has been allocated to the correct link aggregation group, the group has been associated with a compatible aggregator, and the identity of the link aggregation group is consistent with the system ID and operational key information transmitted. If the value is <b>No</b>, the link is not synchronized. It is currently not in the right aggregation.</li> <li>• <b>Aggr</b>—Ability of aggregation port to aggregate (<b>Yes</b>) or to operate only as an individual link (<b>No</b>).</li> <li>• <b>Timeout</b>—LACP timeout preference. Periodic transmissions of LACP PDUs occur at either a slow or fast transmission rate, depending upon the expressed LACP timeout preference (<b>Long Timeout</b> or <b>Short Timeout</b>).</li> <li>• <b>Activity</b>—Actor or partner's port activity. <b>Passive</b> indicates the port's preference for not transmitting LAC PDUs unless its partner's control value is <b>Active</b>. <b>Active</b> indicates the port's preference to participate in the protocol regardless of the partner's control value.</li> <li>• <b>Core isolation state down (CDN)</b>— LACP interface state. Down indicates the LACP interface is down because all the eBGP sessions for Ethernet VPN (EVPN) are down.</li> </ul>	All Levels

Table 160: show lacp interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
LACP Protocol	<p>LACP protocol information for each aggregated interface:</p> <ul style="list-style-type: none"> <li>• Link state (active or standby) indicated in parentheses next to the interface when link protection is configured.</li> <li>• <b>Receive State</b>—One of the following values: <ul style="list-style-type: none"> <li>• <b>Current</b>—The state machine receives an LACP PDU and enters the <b>Current</b> state.</li> <li>• <b>Defaulted</b>—If no LACP PDU is received before the timer for the <b>Current</b> state expires a second time, the state machine enters the <b>Defaulted</b> state.</li> <li>• <b>Expired</b>—If no LACP PDU is received before the timer for the <b>Current</b> state expires once, the state machine enters the <b>Expired</b> state.</li> <li>• <b>Initialize</b>—When the physical connectivity of a link changes or a Begin event occurs, the state machine enters the <b>Initialize</b> state.</li> <li>• <b>LACP Disabled</b>—If the port is operating in half duplex, the operation of LACP is disabled on the port, forcing the state to <b>LACP Disabled</b>. This state is similar to the <b>Defaulted</b> state, except that the port is forced to operate as an individual port.</li> <li>• <b>Port Disabled</b>—If the port becomes inoperable and a Begin event has not occurred, the state machine enters the <b>Port Disabled</b> state.</li> </ul> </li> <li>• <b>Transmit State</b>—Transmit state of state machine. One of the following values: <ul style="list-style-type: none"> <li>• <b>Fast Periodic</b>—Periodic transmissions are enabled at a fast transmission rate.</li> <li>• <b>No Periodic</b>—Periodic transmissions are disabled.</li> <li>• <b>Periodic Timer</b>—Transitory state entered when the periodic timer expires.</li> <li>• <b>Slow Periodic</b>—Periodic transmissions are enabled at a slow transmission rate.</li> </ul> </li> <li>• <b>Mux State</b>—State of the multiplexer state machine for the aggregation port. The state is one of the following values: <ul style="list-style-type: none"> <li>• <b>Attached</b>—Multiplexer state machine initiates the process of attaching the port to the selected aggregator.</li> <li>• <b>Collecting—Yes</b> indicates that the receive function of this link is enabled with respect to its participation in an aggregation. Received frames are passed to the aggregator for collection. <b>No</b> indicates the receive function of this link is not enabled.</li> <li>• <b>Collecting Distributing</b>—Collecting and distributing states are merged together to form a combined state (coupled control). Because independent control is not possible, the coupled control state machine does not wait for the partner to signal that collection has started before enabling both collection and distribution.</li> <li>• <b>Detached</b>—Process of detaching the port from the aggregator is in progress.</li> <li>• <b>Distributing—Yes</b> indicates that the transmit function of this link is enabled with respect to its participation in an aggregation. Frames may be passed down from the aggregator's distribution function for transmission. <b>No</b> indicates the transmit function of this link is not enabled.</li> <li>• <b>Waiting</b>—Multiplexer state machine is in a holding process, awaiting an outcome.</li> </ul> </li> </ul>	All Levels

Table 160: show lacp interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
LACP info	<ul style="list-style-type: none"> <li>• <b>Role</b> can be one of the following: <ul style="list-style-type: none"> <li>• <b>Actor</b>—Local device participating in LACP negotiation.</li> <li>• <b>Partner</b>—Remote device participating in LACP negotiation.</li> </ul> </li> <li>• <b>System priority</b>—Priority assigned to the system (by management or administrative policy), encoded as an unsigned integer.</li> <li>• <b>System identifier</b>—Actor or partner system ID, encoded as a MAC address.</li> <li>• <b>Port priority</b>—Priority assigned to the port by the actor or partner (by management or administrative policy), encoded as an unsigned integer.</li> <li>• <b>Port number</b>—Port number assigned to the port by the actor or partner, encoded as an unsigned integer.</li> <li>• <b>Port key</b>—Operational key value assigned to the port by the actor or partner, encoded as an unsigned integer.</li> </ul>	Extensive

**Output Fields** Table 161 on page 1672 lists the output fields for the **show oam ethernet connectivity-fault-management delay-statistics** command and the **show oam ethernet connectivity-fault-management mep-statistics** command. Output fields are listed in the approximate order in which they appear.

*Table 161: show oam ethernet connectivity-fault-management delay-statistics and mep-statistics Output Fields*

Output Field Name	Field Description
MEP identifier	Maintenance association end point (MEP) numeric identifier.
MAC address	Unicast MAC address configured for the MEP.
Remote MEP count	Number of remote MEPs (unless you specify the <b>remote-mep</b> option).
Remote MEP identifier	Numeric identifier of the remote MEP.
Remote MAC address	Unicast MAC address of the remote MEP.
Index	Index number that corresponds to the ETH-DM entry in the CFM database.
One-way delay (usec)	For a one-way ETH-DM session, the frame delay time, in microseconds, measured at the receiver MEP.  For a detailed description of one-way Ethernet frame delay measurement, see the <i>ITU-T Y.1731 Ethernet Service OAM</i> topics in the <i>Junos OS Network Interfaces Library for Routing Devices</i> .
Two-way delay (usec)	For a two-way ETH-DM session, the frame delay time, in microseconds, measured at the initiator MEP.  For a detailed description of two-way Ethernet frame delay measurement, see the <i>ITU-T Y.1731 Ethernet Service OAM</i> topics in the <i>Junos OS Network Interfaces Library for Routing Devices</i> .
Average one-way delay	Average one-way frame delay for the statistics displayed.
Average one-way delay variation	Average one-way “frame jitter” for the statistics displayed.
Best-case one-way delay	Lowest one-way frame delay for the statistics displayed.
Worst-case one-way delay	Highest one-way frame delay for the statistics displayed.
Average two-way delay	Average two-way frame delay for the statistics displayed.
Average two-way delay variation	Average two-way “frame jitter” for the statistics displayed.
Best-case two-way delay	Lowest two-way frame delay for the statistics displayed.
Worst-case two-way delay	Highest two-way frame delay calculated in this session.

## show oam ethernet connectivity-fault-management forwarding-state

**Syntax** `show oam ethernet connectivity-fault-management forwarding-state  
interface interface-name | instance instance-name  
<brief | detail | extensive>`

**Release Information** Command introduced in Junos OS Release 8.4.

**Description** On M7i and M10i with the Enhanced CFEB (CFEB-E), M320, MX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management forwarding state information for Ethernet interfaces.

**Options** `interface interface-name`—Display forwarding state information for the specified Ethernet interface only.

`instance instance-name`—Display forwarding state information for the specified forwarding instance only.

`brief | detail | extensive`—(Optional) Display the specified level of output.

**Required Privilege Level** view

**List of Sample Output** [show oam ethernet connectivity-fault-management forwarding-state instance on page 1676](#)  
[show oam ethernet connectivity-fault-management forwarding-state interface on page 1676](#)  
[show oam ethernet connectivity-fault-management forwarding-state interface detail on page 1677](#)  
[show oam ethernet connectivity-fault-management forwarding-state interfaceinterface-name on page 1678](#)

**Output Fields** [Table 162 on page 1675](#) lists the output fields for the `show oam ethernet connectivity-fault-management forwarding-state` command. Output fields are listed in the approximate order in which they appear.

*Table 162: show oam ethernet connectivity-fault-management forwarding-state Output Fields*

Field Name	Field Description	Level of Output
Interface name	Interface identifier.	All levels
Link (Status)	Local link status.	All levels
Filter action	Filter action for messages at the level.	All levels
Next hop type	Next-hop type.	All levels

Table 162: show oam ethernet connectivity-fault-management forwarding-state Output Fields (continued)

Field Name	Field Description	Level of Output
Next index	Next-hop index number.	brief
Level	Maintenance domain (MD) level.	detail
Direction	MEP direction configured.	none
Instance name	Forwarding instance name.	All levels
CEs	Number of customer edge (CE) interfaces.	All levels
VEs	Number of VPN endpoint (VE) interfaces.	All levels

**Output Fields** Table 163 on page 1680 lists the output fields for the **show oam ethernet connectivity-fault-management interfaces** command. Output fields are listed in the approximate order in which they appear.

*Table 163: show oam ethernet connectivity-fault-management interfaces Output Fields*

Field Name	Field Description	Level of Output
<b>Interface</b>	Interface identifier.	All levels
<b>Interface status</b>	Local interface status.	All levels
<b>Link status</b>	Local link status. <b>Up</b> , <b>down</b> , or <b>oam-down</b> .	All levels
<b>Maintenance domain name</b>	Maintenance domain name.	<b>detail extensive</b>
<b>Format (Maintenance domain)</b>	Maintenance domain name format configured.	<b>detail extensive</b>
<b>Level</b>	Maintenance domain level configured.	All levels
<b>Maintenance association name</b>	Maintenance association name.	<b>detail extensive</b>
<b>Format (Maintenance association)</b>	Maintenance association name format configured.	<b>detail extensive</b>
<b>Continuity-check status</b>	Continuity-check status.	<b>detail extensive</b>
<b>Ethernet-ais status</b>	Status of alarm indication signal (AIS). <b>active</b> or <b>in-active</b> .	<b>detail extensive</b>
<b>Interval</b>	Continuity-check message interval.	<b>detail extensive</b>
<b>Loss-threshold</b>	Lost continuity-check message threshold.	<b>detail extensive</b>
<b>Interface status TLV</b>	Status of the interface status TLV, if configured on the MEP interface: <b>none</b> , <b>up</b> , <b>down</b> , <b>testing</b> , <b>unknown</b> , <b>dormant</b> , <b>notPresent</b> , <b>lowerLayerDown</b>	<b>detail extensive</b>
<b>Port status TLV</b>	Status of the port status TLV, if configured on the MEP interface: <b>none</b> , <b>no</b> , <b>yes</b>	<b>detail extensive</b>

Table 163: show oam ethernet connectivity-fault-management interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Connection Protection TLV</b>	Status of the connection protection TLV if configured on the MEP interface: <b>no</b> , <b>yes</b>  If <b>yes</b> , then the transmitted connection protection TLV is decoded and the following three fields are displayed: <b>Prefer me</b> , <b>Protection in use</b> , <b>FRR Flag</b>	<b>detail extensive</b>
<b>Prefer me</b>	If set to <b>yes</b> , the path through which CCM was transmitted is preferred (unless the path fails). It is used for signaling a manual-switch command to the remote side.  Its value can be <b>yes</b> or <b>no</b> .	<b>detail extensive</b>
<b>Protection in use</b>	Used for protection decision coordination. Its value is set to <b>yes</b> if the endpoint transmitting the CCM is currently transmitting the user traffic to protection path.  Its value can be <b>yes</b> or <b>no</b> .	<b>detail extensive</b>
<b>FRR Flag</b>	LSR/LER forwarding the CCM Frame into a bypass tunnel is set.  Its value can be <b>yes</b> or <b>no</b> .	<b>detail extensive</b>
<b>MEP identifier</b>	Maintenance association end point (MEP) identifier.	All levels
<b>Neighbors</b>	Number of MEP neighbors.	All levels
<b>Direction</b>	MEP direction configured.	<b>detail extensive</b>
<b>MAC address</b>	MAC address configured for the MEP.	<b>detail extensive</b>
<b>MEP status</b>	Indicates the status of the connectivity fault management (CFM) protocol running on the MEP: <b>Running</b> , <b>inactive</b> , <b>disabled</b> , or <b>unsupported</b> .	<b>detail extensive</b>
<b>Remote MEP not receiving CCM</b>	Whether the remote MEP is not receiving connectivity check messages (CCMs).	<b>detail extensive</b>
<b>Erroneous CCM received</b>	Whether erroneous CCMs have been received.	<b>detail extensive</b>
<b>Cross-connect CCM received</b>	Whether cross-connect CCMs have been received.	<b>detail extensive</b>
<b>RDI sent by some MEP</b>	Whether the remote defect indication (RDI) bit is set in messages that have been received. The absence of the RDI bit in a CCM indicates that the transmitting MEP is receiving CCMs from all configured MEPs.	<b>detail extensive</b>
<b>Some remote MEP's MAC in error state</b>	Indicates whether the remote MEP's MAC is in error state.	<b>detail extensive</b>
<b>Alarm Indication Signal</b>	Indicates whether the AIS is triggered or is cleared.	<b>detail extensive</b>

Table 163: show oam ethernet connectivity-fault-management interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
CCMs sent	Number of CCMs transmitted.	detail extensive
CCMs received out of sequence	Number of CCMs received out of sequence.	detail extensive
LBM sent	Number of loopback request messages (LBMs) sent.	detail extensive
Valid in-order LBRs received	Number of loopback response messages (LBRs) received that were valid messages and in sequence.	detail extensive
Valid out-of-order LBRs received	Number of LBRs received that were valid messages and not in sequence.	detail extensive
LBRs received with corrupted data	Number of LBRs received that were corrupted.	detail extensive
LBRs sent	Number of LBRs transmitted.	detail extensive
LTMs sent	Linktrace messages (LTMs) transmitted.	detail extensive
LTMs received	Linktrace messages received.	detail extensive
LTRs sent	Linktrace responses (LTRs) transmitted.	detail extensive
LTRs received	Linktrace responses received.	detail extensive
Sequence number of next LTM request	Sequence number of next LTM request to be transmitted.	detail extensive
1DMs sent	<p>If the interface is attached to an initiator MEP for a one-way ETH-DM session: Number of one-way delay measurement (1DM) PDU frames sent to the peer MEP in this session.</p> <p>For all other cases, this field displays 0.</p>	detail extensive
Valid 1DMs received	<p>If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of valid 1DM frames received.</p> <p>For all other cases, this field displays 0.</p>	detail extensive
Invalid 1DMs received	<p>If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of invalid 1DM frames received.</p> <p>For all other cases, this field displays 0.</p>	detail extensive
Out of sync 1DMs received	<p>If the interface is attached to a receiver MEP for a one-way ETH-DM session: Number of out-of-sync one-way delay measurement request packets received.</p>	detail extensive

Table 163: show oam ethernet connectivity-fault-management interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
<b>DMMs sent</b>	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of Delay Measurement Message (DMM) PDU frames sent to the peer MEP in this session.  For all other cases, this field displays 0.	<b>detail extensive</b>
<b>Valid DMMs received</b>	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of valid two-way delay measurement request packets received.	<b>detail extensive</b>
<b>Invalid DMMs received</b>	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of invalid two-way delay measurement request packets received.	<b>detail extensive</b>
<b>DMRs sent</b>	If the interface is attached to a responder MEP for a two-way ETH-DM session: Number of delay measurement reply (DMR) frames sent.  For all other cases, this field displays 0.	<b>detail extensive</b>
<b>Valid DMRs received</b>	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of valid DMRs received.  For all other cases, this field displays 0.	<b>detail extensive</b>
<b>Invalid DMRs received</b>	If the interface is attached to an initiator MEP for a two-way ETH-DM session: Number of invalid DMRs received.  For all other cases, this field displays 0.	<b>detail extensive</b>
<b>LMM sent</b>	If the interface is attached to an initiator MEP for a ETH-LM session: Number of loss measurement message (LMM) PDU frames sent to the peer MEP in this session.	<b>detail extensive</b>
<b>Valid LMM received</b>	If the interface is attached to an initiator MEP for a ETH-LM session: Number of valid loss measurement request packets received.	<b>detail extensive</b>
<b>Invalid LMM received</b>	If the interface is attached to an initiator MEP for a ETH-LM session: Number of invalid loss measurement request packets received.	<b>detail extensive</b>
<b>LMR sent</b>	If the interface is attached to a responder MEP for a ETH-LM session: Number of loss measurement reply (LMR) frames sent.	<b>detail extensive</b>
<b>Valid LMR received</b>	If the interface is attached to an initiator MEP for a ETH-LM session: Number of valid LMR frames received.	<b>detail extensive</b>
<b>Invalid LMR received</b>	If the interface is attached to an initiator MEP for a ETH-LM session: Number of invalid LMR frames received.	<b>detail extensive</b>
<b>Valid AIS frames transmitted</b>	Number of valid AIS frames transmitted to the peer MEPs.	<b>detail extensive</b>
<b>Valid AIS frames received</b>	Number of valid AIS frames received from the peer MEPs.	<b>detail extensive</b>

Table 163: show oam ethernet connectivity-fault-management interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
<b>SLM sent</b>	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of synthetic loss measurement (SLM) request packets transmitted from the source MEP to the remote or destination MEP in this session.	<b>detail extensive</b>
<b>Valid SLM received</b>	If the interface is attached to a responder MEP for a ETH-SLM session: Number of valid SLM PDUs transmitted from the source MEP to the remote or destination MEP.	<b>detail extensive</b>
<b>Invalid SLM received</b>	If the interface is attached to a responder MEP for a ETH-SLM session: Number of invalid SLM PDUs transmitted from the source MEP to the remote or destination MEP.	<b>detail extensive</b>
<b>SLR sent</b>	If the interface is attached to a responder MEP for a ETH-SLM session: Number detail extensive of synthetic loss reply (SLR) frames sent.	<b>detail extensive</b>
<b>Valid SLR received</b>	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of valid SLR PDUs that the source MEP received from the remote or destination MEP.	<b>detail extensive</b>
<b>Invalid SLR received</b>	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of invalid SLR PDUs that the source MEP received from the remote or destination MEP.	<b>detail extensive</b>
<b>Remote MEP count</b>	Number of remote MEPs.	<b>extensive</b>
<b>Identifier (remote MEP)</b>	MEP identifier of the remote MEP.	<b>extensive</b>
<b>MAC address (remote MEP)</b>	MAC address of the remote MEP.	<b>extensive</b>
<b>State (remote MEP)</b>	State of the remote MEP.	<b>extensive</b>
<b>Interface (remote MEP)</b>	Interface of the remote MEP.	<b>extensive</b>

## show oam ethernet connectivity-fault-management linktrace path-database

<b>Syntax</b>	<b>show oam ethernet connectivity-fault-management linktrace path-database mac-address maintenance-association <i>ma-name</i> maintenance-domain <i>md-name</i></b>
<b>Release Information</b>	Command introduced in Junos OS Release 9.0.
<b>Description</b>	On M320, MX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management maintenance linktrace database information.
<b>Options</b>	<p><b>mac-address</b>—Display connectivity fault management path database information for the specified MAC address of the remote host.</p> <p><b>maintenance-association <i>ma-name</i></b>—Display connectivity fault management path database information for the specified maintenance association.</p> <p><b>maintenance-domain <i>md-name</i></b>—Display connectivity fault management path database information for the specified maintenance domain.</p>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<p><a href="#">show oam ethernet connectivity-fault-management linktrace path-database on page 1691</a></p> <p><a href="#">show oam ethernet connectivity-fault-management linktrace path-database (Two traceroute Commands) on page 1691</a></p>
<b>Output Fields</b>	<a href="#">Table 164 on page 1690</a> lists the output fields for the <b>show oam ethernet connectivity-fault-management linktrace path-database</b> command. Output fields are listed in the approximate order in which they appear.

*Table 164: show oam ethernet connectivity-fault-management linktrace path-database Output Fields*

Field Name	Field Description
<b>Linktrace to</b>	MAC address of the 802.1ag node to which the linktrace message is targeted.
<b>Interface</b>	Interface used by the local MEP to send the linktrace message (LTM).
<b>Maintenance Domain</b>	Maintenance domain identifier specified in the traceroute command.
<b>Maintenance Association</b>	Maintenance association identifier specified in the traceroute command.
<b>Level</b>	Maintenance domain level configured for the maintenance domain.
<b>Local Mep</b>	MEP identifier of the local MEP originating the linktrace.

Table 164: show oam ethernet connectivity-fault-management linktrace path-database Output Fields (continued)

Field Name	Field Description
<b>Hop</b>	Sequential hop count of the linktrace path.
<b>TTL</b>	Number of hops remaining in the linktrace message (LTM). The time to live (TTL) is decremented at each hop.
<b>Source MAC address</b>	MAC address of the 802.1ag node responding to the LTM or the source MAC address of the LTR.
<b>Next hop MAC address</b>	MAC address of the egress interface of the node to which the LTM is forwarded or the next-hop MAC address derived from the next egress identifier in the Egress-ID TLV of the LTR PDU.
<b>Transaction Identifier</b>	4-byte identifier maintained by the MEP. Each LTM uses a transaction identifier. The transaction identifier is maintained globally across all maintenance domains. Use the transaction identifier to match an incoming linktrace responses (LTR), with a previously sent LTM.

## Sample Output

### show oam ethernet connectivity-fault-management linktrace path-database

```

## show oam ethernet connectivity-fault-management loss-statistics

<b>Syntax</b>	<pre>show oam ethernet connectivity-fault-management loss-statistics maintenance-domain <i>md-name</i> maintenance-association <i>ma-name</i> &lt;count <i>entry-count</i>&gt; &lt;local-mep <i>local-mep-id</i>&gt; &lt;remote-mep <i>remote-mep-id</i>&gt;</pre>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1.
<b>Description</b>	On MX Series and ACX series routers with Ethernet interfaces, display ETH-LM statistics for on-demand mode only.
<b>Options</b>	<p><b>maintenance-domain <i>md-name</i></b>—Name of an existing CFM maintenance domain.</p> <p><b>maintenance-association <i>ma-name</i></b>—Name of an existing CFM maintenance association.</p> <p><b>count <i>entry-count</i></b>—(Optional) Number of entries to display from the statistics table. The range of values is from 1 through 100. The default value is 100.</p> <p><b>local-mep <i>local-mep-id</i></b>—(Optional) Numeric identifier of the local MEP. The range of values is from 1 through 8191.</p> <p><b>remote-mep <i>remote-mep-id</i></b>—(Optional) Numeric identifier of the remote MEP. The range of values is from 1 through 8191.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">show oam ethernet connectivity-fault-management mep-statistics on page 1709</a></li> </ul>
<b>Output Fields</b>	Table 165 on page 1693 lists the output fields for the <b>show oam ethernet connectivity-fault-management loss-statistics</b> command. Output fields are listed in the approximate order in which they appear.

Table 165: show oam ethernet connectivity-fault-management loss-statistics Output Fields

Output Field Name	Field Description
MEP identifier	Maintenance association end point (MEP) numeric identifier.
MAC address	Unicast MAC address configured for the MEP.
Remote MEP count	Number of remote MEPs (unless you specify the <b>remote-mep</b> option).
Remote MEP identifier	Numeric identifier of the remote MEP.

Table 165: show oam ethernet connectivity-fault-management loss-statistics Output Fields (continued)

Output Field Name	Field Description
Remote MAC address	Unicast MAC address of the remote MEP.
Index	Index number that corresponds to the ETH-LM entry in the CFM database.
Near-end frame loss	Count of frame loss associated with ingress data frames.
Far-end frame loss	Count of frame loss associated with egress data frames.
Near-end loss ratio	Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the ingress interface.
Far-end loss ratio	Ratio, expressed as a percentage, of the number of service frames not delivered divided by the total number of service frames during time interval T at the egress interface.
Average near-end frame loss	Average frame loss measured in this session associated with ingress data frames.
Average near-end loss ratio	Average frame loss ratio measured in this session associated with ingress data frames.
Average far-end frame loss	Average frame loss measured in this session associated with egress data frames.
Average far-end loss ratio	Average frame loss ratio measured in this session associated with egress data frames.
Near-end best case loss	Lowest frame loss measured in this session associated with ingress data frames.
Near-end best case loss ratio	Lowest frame loss ratio measured in this session associated with ingress data frames.
Near-end worst case loss	Highest frame loss measured in this session associated with ingress data frames.
Near-end worst case loss ratio	Highest frame loss ratio measured in this session associated with ingress data frames.
Far-end best case frame loss	Lowest frame loss measured in this session associated with egress data frames.
Far-end best case loss ratio	Lowest frame loss ratio measured in this session associated with egress data frames.
Far-end worst case loss	Highest frame loss measured in this session associated with egress data frames.
Far-end worst case loss ratio	Highest frame loss ratio measured in this session associated with egress data frames.

## show oam ethernet connectivity-fault-management mep-database

**Syntax**    **show oam ethernet connectivity-fault-management mep-database**  
                  maintenance-domain *domain-name*  
                  maintenance-association *ma-name*  
                  <local-mep *local-mep-id*>  
                  <remote-mep *remote-mep-id*>  
                  extensive

**Release Information**    Command introduced in Junos OS Release 8.4.  
                  Support for ITU-T Y.1731 frame delay measurement added in Junos OS Release 9.5.  
                  Support for ITU-T Y.1731 synthetic frame loss measurement added in Junos OS Release 13.2 for MX Series routers.  
                  Support for ITU-T Y.1731 ethernet expected defect function (ETH-ED) added in Junos OS Release 19.1 for MX Series routers

**NOTE:** Ethernet expected defect function (ETH-ED) will be supported on all MX series routers only when enhanced-ip mode is enabled. ETH-ED will not be supported if CFM is running in centralized mode.

**Description**    On M7i and M10i routers with Enhanced CFEB (CFEB-E), and on M320, M120, MX Series, ACX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

In addition, on M120, M320, and MX series routers, also display port status TLV, interface status TLV, and action profile information.

In addition, for Ethernet interfaces on MX Series routers, also display any ITU-T Y.1731 frame delay measurement (ETH-DM) frame counts.

For Ethernet interfaces on MX Series routers, display any ITU-T Y.1731 synthetic frame loss measurement (ETH-SLM) statistics and frame counts.

**Options**    **maintenance-association *ma-name***—Name of the maintenance association.

**maintenance-domain *domain-name***—Name of the maintenance domain.

***local-mep-id***—(Optional) Numeric identifier of local MEP.

***remote-mep-id***—(Optional) Numeric identifier of the remote MEP.

- Output Fields** Table 166 on page 1698 lists the output fields for the **show oam ethernet connectivity-fault-management mep-database** command. Output fields are listed in the approximate order in which they appear.

*Table 166: show oam ethernet connectivity-fault-management mep-database Output Fields*

Field Name	Field Description
Maintenance domain name	Maintenance domain name.
Format (Maintenance domain)	Maintenance domain name format configured.
Level	Maintenance domain level configured.
Maintenance association name	Maintenance association name.
Format (Maintenance association)	Maintenance association name format configured.
Continuity-check status	Continuity-check status.
Interval	Continuity-check message interval.
Loss-threshold	Lost continuity-check message threshold.

Table 166: show oam ethernet connectivity-fault-management mep-database Output Fields (continued)

Field Name	Field Description
<b>Connection Protection TLV</b>	Status of the connection protection TLV, if configured on the MEP interface: <b>no</b> , <b>yes</b>  If <b>yes</b> , then the transmitted connection protection TLV is decoded and the following three fields are displayed: <b>Prefer me</b> , <b>Protection in use</b> , <b>FRR Flag</b>
<b>Prefer me</b>	If set to <b>yes</b> , the path through which CCM was transmitted is preferred (unless the path fails). It is used for signaling a manual-switch command to remote side.  Its value can be <b>yes</b> or <b>no</b> .
<b>Protection in use</b>	Used for protection decision coordination. Its value is set to <b>yes</b> if the endpoint transmitting the CCM is currently transmitting the user traffic to protection path.  Its value can be <b>yes</b> or <b>no</b> .
<b>FRR Flag</b>	LSR/LER forwarding the CCM Frame into a bypass tunnel is set.  Its value can be <b>yes</b> or <b>no</b> .
<b>MEP identifier</b>	Maintenance association end point (MEP) identifier.
<b>Direction</b>	MEP direction configured.
<b>MAC address</b>	MAC address configured for the MEP.
<b>Auto-discovery</b>	Whether automatic discovery is enabled or disabled.
<b>Priority</b>	Priority used for CCMs and linktrace messages transmitted by the MEP.
<b>Interface name</b>	Interface identifier.
<b>Interface status</b>	Local interface status.
<b>Link status</b>	Local link status.
<b>Remote MEP not receiving CCM</b>	Whether the remote MEP is not receiving CCMs.
<b>Erroneous CCM received</b>	Whether erroneous CCMs have been received.
<b>Cross-connect CCM received</b>	Whether cross-connect CCMs have been received.
<b>RDI sent by some MEP</b>	Whether the remote defect indication (RDI) bit is set in messages that have been received. The absence of the RDI bit in a CCM indicates that the transmitting MEP is receiving CCMs from all configured MEPs.
<b>CCMs sent</b>	Number of CCMs transmitted.

*Table 166: show oam ethernet connectivity-fault-management mep-database Output Fields (continued)*

Field Name	Field Description
<b>CCMs received out of sequence</b>	Number of CCMs received out of sequence.
<b>LBMs sent</b>	Number of loopback messages (LBMs) sent.
<b>Valid in-order LBRs received</b>	Number of loopback response messages (LBRs) received that were valid messages and in sequence.
<b>IDMs sent</b>	<p>If the MEP is an initiator for a one-way ETH-DM session: Number of one-way delay measurement (IDM) PDU frames sent to the peer MEP in this session.</p> <p>For all other cases, this field displays 0.</p>
<b>Valid IDMs received</b>	<p>If the MEP is a receiver for a one-way ETH-DM session: Number of valid IDM frames received.</p> <p>For all other cases, this field displays 0.</p>
<b>Invalid IDMs received</b>	<p>If the MEP is a receiver for a one-way ETH-DM session: Number of invalid IDM frames received.</p> <p>For all other cases, this field displays 0.</p>
<b>Out of sync IDMs received</b>	If the MEP is a receiver for a one-way ETH-DM session: Number of out-of-sync one-way delay measurement request packets received.
<b>DMMs sent</b>	<p>If the MEP is an initiator for a two-way ETH-DM session: Number of Delay Measurement Message (DMM) PDU frames sent to the peer MEP in this session.</p> <p>For all other cases, this field displays 0.</p>
<b>Valid DMMs received</b>	If the MEP is an initiator for a two-way ETH-DM session: Number of valid two-way delay measurement packets received.
<b>Invalid DMMs received</b>	If the MEP is an initiator for a two-way ETH-DM session: Number of invalid two-way delay measurement packets received.
<b>DMRs sent</b>	<p>If the MEP is a responder for a ETH-DM session: Number of Delay Measurement Reply (DMR) frames sent.</p> <p>For all other cases, this field displays 0.</p>
<b>Valid DMRs received</b>	<p>If the MEP is an initiator for a two-way ETH-DM session: Number of valid DMRs received.</p> <p>For all other cases, this field displays 0.</p>
<b>Invalid DMRs received</b>	<p>If the MEP is an initiator for a two-way ETH-DM session: Number of invalid DMRs received.</p> <p>For all other cases, this field displays 0.</p>
<b>Valid out-of-order LBRs received</b>	Number of LBRs received that were valid messages and not in sequence.

Table 166: show oam ethernet connectivity-fault-management mep-database Output Fields (continued)

Field Name	Field Description
<b>LBRs received with corrupted data</b>	Number of LBRs received that were corrupted.
<b>LBRs sent</b>	Number of LBRs transmitted.
<b>LTMs sent</b>	Linktrace messages (LTMs) transmitted.
<b>LTMs received</b>	Linktrace messages received.
<b>LTRs sent</b>	Linktrace responses (LTRs) transmitted.
<b>LTRs received</b>	Linktrace responses received.
<b>Sequence number of next LTM request</b>	Sequence number of the next linktrace message request to be transmitted.
<b>LMM sent</b>	If the interface is attached to an initiator MEP for a ETH-LM session: Number of loss measurement message (LMM) PDU frames sent to the peer MEP in this session.
<b>Valid LMM received</b>	If the interface is attached to an initiator MEP for a ETH-LM session: Number of valid loss measurement request packets received.
<b>Invalid LMM received</b>	If the interface is attached to an initiator MEP for a ETH LM session: Number of invalid loss measurement request packets received.
<b>LMR sent</b>	If the interface is attached to a responder MEP for a ETH-LM session: Number of loss measurement reply (LMR) frames sent.
<b>Valid LMR received</b>	If the interface is attached to an initiator MEP for a ETH LM session: Number of valid LMR frames received.
<b>Invalid LMR received</b>	If the interface is attached to an initiator MEP for a ETH-LM session: Number of invalid LMR frames received.
<b>SLM sent</b>	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of synthetic loss measurement (SLM) request packets transmitted from the source MEP to the remote or destination MEP in this session.
<b>Valid SLM received</b>	If the interface is attached to a responder MEP for a ETH-SLM session: Number of valid SLM PDUs transmitted from the source MEP to the remote or destination MEP.
<b>Invalid SLM received</b>	If the interface is attached to a responder MEP for a ETH-SLM session: Number of invalid SLM PDUs transmitted from the source MEP to the remote or destination MEP.
<b>SLR sent</b>	If the interface is attached to a responder MEP for a ETH-SLM session: Number detail extensive of synthetic loss reply (SLR) frames sent.
<b>Valid SLR received</b>	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of valid SLR PDUs that the source MEP received from the remote or destination MEP.

Table 166: show oam ethernet connectivity-fault-management mep-database Output Fields (continued)

Field Name	Field Description
Invalid SLR received	If the interface is attached to an initiator MEP for a ETH-SLM session: Number of invalid SLR PDUs that the source MEP received from the remote or destination MEP.
Remote MEP identifier	MEP identifier of the remote MEP.
State (remote MEP)	State of the remote MEP: <b>idle</b> , <b>start</b> , <b>ok</b> , or <b>failed</b> .
MAC address	MAC address of the remote MEP.
Type	Whether the remote MEP MAC address was learned using automatic discovery or configured.
Interface	Interface of the remote MEP. A seven-digit number is appended if CFM is configured to run on a routing instance of type VPLS.
Last flapped	Date, time, and how long ago the remote MEP interface went from down to up. The format is <b>Last flapped: year-month-day hours:minutes:seconds timezone (hours:minutes:seconds ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> .
Remote defect indication	Whether the remote defect indication (RDI) bit is set in messages that have been received or transmitted.
Port status TLV	<ul style="list-style-type: none"> <li>In the Maintenance domain section, displays the last transmitted port status TLV value.</li> <li>In the Remote MEP section, displays the last value of port status TLV received from the remote MEP.</li> </ul> <p>In the Action profile section, displays, the last occurred event <b>port-status-tlv blocked</b> event. This event occurred due to the reception of <b>blocked</b> value in the port status TLV from remote MEP.</p>
Interface status TLV	<ul style="list-style-type: none"> <li>In the Maintenance domain section, displays the last transmitted interface status TLV value.</li> <li>In the Remote MEP section, displays the last value of interface status TLV received from the remote MEP.</li> </ul> <p>In the Action profile section, if displays, the last occurred event interface-status-tlv event ( either <b>lower-layer-down</b> or <b>down</b>). This event occurred due to the reception of either lower or <b>down</b> value in the interface status TLV from remote MEP.</p>
Action profile	Name of the action profile occurrence associated with a remote MEP.
Last event	When an action profile occurs, displays the last event that triggered it.
Last event cleared	When all the configured and occurred events (under action profile) are cleared, then the action taken gets reverted (such as down interface is made up) and the corresponding time is noted and displayed.
Action	Action taken and the corresponding time of the action occurrence.

### show oam ethernet connectivity-fault- management mep-database (Connection Protection TLV Configured)

```

user@host>show oam ethernet connectivity-fault-management mep-database
maintenance-domain md5 maintenance-association ma5

```

If connection-protection is not enabled on down MEPs, but connection-protection TLV is used, MX always sets the protection-in-use flag in connection-protection tlv, while CCMs are sent out. During reversion, this is an indicator to the receiver that protect-path is in use, otherwise the peer (receiver) assumes working is active and reversion does not work as expected. Setting this bit does not affect protection-switching/traffic-loss.

**Output Fields** Table 167 on page 1710 lists the output fields for the **show oam ethernet connectivity-fault-management mep-statistics** command. Output fields are listed in the approximate order in which they appear.

*Table 167: show oam ethernet connectivity-fault-management delay-statistics and mep-statistics Output Fields*

Output Field Name	Field Description
MEP identifier	Maintenance association end point (MEP) numeric identifier.
MAC address	Unicast MAC address configured for the MEP.
Remote MEP count	Number of remote MEPs (unless you specify the <b>remote-mep</b> option).
CCMs sent	Number of continuity check messages (CCMs) sent.
CCMs received	Number of continuity check messages (CCMs) received for a specific remote MEP and maintenance association.
CCMs received out of sequence	Number of continuity check messages (CCMs) received that were not in sequence.
Remote MEP identifier	Numeric identifier of the remote MEP.
Remote MAC address	Unicast MAC address of the remote MEP.
Index	Index number that corresponds to the ETH-DM entry in the CFM database.
One-way delay (usec)	<p>For a one-way ETH-DM session, the frame delay time, in microseconds, measured at the receiver MEP.</p> <p>For a detailed description of one-way Ethernet frame delay measurement, see the <i>ITU-T Y.1731 Ethernet Service OAM</i> topics in the <i>Junos OS Network Interfaces Library for Routing Devices</i>.</p>
Two-way delay (usec)	<p>For a two-way ETH-DM session, the frame delay time, in microseconds, measured at the initiator MEP.</p> <p>For a detailed description of two-way Ethernet frame delay measurement, see the <i>ITU-T Y.1731 Ethernet Service OAM</i> topics in the <i>Junos OS Network Interfaces Library for Routing Devices</i>.</p>
Average one-way delay	Average one-way frame delay for the statistics displayed.

**Table 167: show oam ethernet connectivity-fault-management delay-statistics and mep-statistics Output Fields (continued)**

Output Field Name	Field Description
Average one-way delay variation	Average one-way “frame jitter” for the statistics displayed.
Best-case one-way delay	Lowest one-way frame delay for the statistics displayed.
Worst-case one-way delay	Highest one-way frame delay for the statistics displayed.
Average two-way delay	Average two-way frame delay for the statistics displayed.
Average two-way delay variation	Average two-way “frame jitter” for the statistics displayed.
Best-case two-way delay	Lowest two-way frame delay for the statistics displayed.
Worst-case two-way delay	Highest two-way frame delay calculated in this session.
SLM packets sent	Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.
SLM packets received	Total number of synthetic loss message (SLM) PDU frames that the remote MEP received from the source MEP during this ETH-SLM session.
SLR packets sent	Total number of synthetic loss reply (SLR) PDU frames that the remote MEP sent to the source MEP during this measurement session.
SLR packets received	Total number of synthetic loss reply (SLR) PDU frames that the source MEP received from the remote MEP during this measurement session.
Local TXFC1 value	Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.
Local RXFC1 value	Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet.
Last Received SLR frame TXFCf(tc)	Value of the local counter TxFC1 at the time of SLM frame transmission.
Last Received SLR frame TXFCb(t	Value of the local counter RxFC1 at the time of SLR frame transmission.
Frame loss (near-end)	Count of frame loss associated with ingress data frames.
Frame loss (far-end)	Count of frame loss associated with egress data frames.

## show oam ethernet connectivity-fault-management path-database

**Syntax** `show oam ethernet connectivity-fault-management path-database`  
`<host-mac-address>`  
`<maintenance-association ma-name>`  
`<maintenance-domain domain-name>`

**Release Information** Command introduced in Junos OS Release 8.4.

**Description** On M7i and M10i with Enhanced CFEB (CFEB-E), M320, MX Series, ACX Series, T320, and T640 routers, display IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management path database information for a host configured with an MEP.

**Options** ***host-mac-address***—(Optional) Display connectivity fault management path database information for a specified Ethernet host.

***maintenance-association ma-name***—(Optional) Display connectivity fault management path database information for the specified maintenance association.

***maintenance-domain domain-name***—(Optional) Display connectivity fault management path database information for the specified maintenance domain.

**Required Privilege Level** view

**List of Sample Output** [show oam ethernet connectivity-fault-management path-database on page 1722](#)

**Output Fields** [Table 168 on page 1721](#) lists the output fields for the **show oam ethernet connectivity-fault-management path-database** command. Output fields are listed in the approximate order in which they appear.

*Table 168: show oam ethernet connectivity-fault-management path-database Output Fields*

Field Name	Field Description
Linktrace to	MAC address of the remote MEPs in the path.
Interface	Interface identifier.
Maintenance domain name	Maintenance domain name.
Format (Maintenance domain)	Maintenance domain name format configured.
Level	Maintenance domain level configured.

*Table 168: show oam ethernet connectivity-fault-management path-database Output Fields (continued)*

Field Name	Field Description
Maintenance association name	Maintenance association name.
Local Mep	Local MEP identifier.

## Sample Output

```
show oam ethernet
connectivity-fault
-management
path-database
```

```
user@host> show oam ethernet connectivity-fault-management path-database
maintenance-domain md1 maintenance-association ma1 00:05:85:79:39:ef
```

```
Linktrace to 00:05:85:79:39:ef, Interface : ge-3/0/0
 Maintenance Domain: md1, Level: 7
 Maintenance Association: ma1, Local Mep: 201
```

## show oam ethernet connectivity-fault-management policer

<b>Syntax</b>	<code>show oam ethernet connectivity-fault-management policer &lt;maintenance-domain <i>md-name</i>&gt; &lt;maintenance-association <i>ma-name</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.0.
<b>Description</b>	On M120, M320, MX Series, T320, and T640 routers displays connectivity-fault-management policer statistics.
<b>Options</b>	<p>This command has the following options:</p> <p><b>maintenance-domain <i>md-name</i></b>—Name of an existing CFM maintenance domain. If this option is not specified, policer statistics are displayed for all maintenance associations for all maintenance domains.</p> <p><b>maintenance-association <i>ma-name</i></b>—Name of an existing CFM maintenance association. If this option is not specified, policer statistics are displayed for all maintenance associations for given maintenance domain. This option cannot be specified without specifying maintenance-domain name.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear oam ethernet connectivity-fault-management policer on page 1340</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show oam ethernet connectivity-fault-management policer on page 1724</a></p> <p><a href="#">show oam ethernet connectivity-fault-management policer maintenance-domain <i>md-name</i> on page 1724</a></p> <p><a href="#">show oam ethernet connectivity-fault-management policer maintenance-domain <i>md-name</i> maintenance-association <i>ma-name</i> on page 1725</a></p>
<b>Output Fields</b>	<a href="#">Table 169 on page 1723</a> lists the output fields for the <b>show oam ethernet connectivity-fault-management policer</b> command. Output fields are listed in the approximate order in which they appear.

*Table 169: show oam ethernet connectivity-fault-management policer Output Fields*

Field Name	Field Description
<b>Legend for Policer</b>	<p>Describes the symbols used under the <b>Scope</b> and <b>Type</b> headings:</p> <ul style="list-style-type: none"> <li>• G - Global scope</li> <li>• S - Service scope</li> <li>• cc - Continuity check (Type)</li> </ul>
<b>Maintenance Domain</b>	Displays the maintenance domain name.

Table 169: show oam ethernet connectivity-fault-management policer Output Fields (continued)

Field Name	Field Description
Level	Displays the maintenance domain level configured.
Maintenance association	Displays the maintenance association name.
Policer	Displays the policer name.
Type	Policer type. Value <b>cc</b> means this policer is used only to police continuity check CFM messages. Value <b>other</b> means this policer is used only to police non-continuity check CFM messages. Value <b>all</b> means this policer is used to police all CFM messages.
Scope	Policer scope. Displays whether the <i>global</i> (G) policer configuration is applicable or the session (S) specific policer config is applicable.
Drop count	Displays the number of packets dropped by the indicated policer.

## Sample Output

```
show oam ethernet
connectivity-fault
-management
policer
```

Displays the policer information for all maintenance associations and their maintenance domains.

```
show oam ethernet connectivity-fault-management policer
```

Legend for Policer

G - Global scope

S - Service scope

cc - Continuity check

Maintenance Domain: md1 Level: 1

**Output Fields** [Table 170 on page 1727](#) lists the output fields for the **show oam ethernet connectivity-fault-management sla-iterator-statistics** command. Output fields are listed in the approximate order in which they appear.

*Table 170: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields*

Output Field Name	Output Field Description
Maintenance domain	Name of the maintenance domain.
Level	Level of the maintenance domain level configured.
Maintenance association	Name of the maintenance association.
Local MEP id	Numeric identifier of the local MEP.
Remote MEP id	Numeric identifier of the remote MEP.
Remote MAC address	Unicast MAC address of the remote MEP.
Iterator name	Name of iterator.
Iterator Id	Numeric identifier of the iterator.
Iterator cycle time	Number of cycles (in milliseconds) taken between back-to-back transmission of SLA frames for this connection
Iteration period	Maximum number of cycles per iteration
Iterator status	Current status of iterator whether running or stopped.
Infinite iterations	Status of iteration as infinite or finite.
Counter reset time	Date and time when the counter was reset.
Reset reason	Reason to reset counter.
Delay weight	Calculation weight of delay.

Table 170: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields (continued)

Output Field Name	Output Field Description
<b>Delay variation weight</b>	Calculation weight of delay variation.
<b>DMM sent</b>	Delay measurement message (DMM) PDU frames sent to the peer MEP in this session.
<b>DMM skipped for threshold hit</b>	Number of DMM frames sent to the peer MEP in this session skipped during threshold hit.
<b>DMM skipped for threshold hit window</b>	Number of DMM frames sent to the peer MEP in this session skipped during the last threshold hit window.
<b>DMR received</b>	Number of delay measurement reply (DMR) frames received.
<b>DMR out of sequence</b>	Total number of DMR out of sequence packets received.
<b>DMR received with invalid time stamps</b>	Total number of DMR frames received with invalid timestamps.
<b>Average two-way delay</b>	Average two-way frame delay for the statistics displayed.
<b>Average two-way delay variation</b>	Average two-way "frame jitter" for the statistics displayed.
<b>Average one-way forward delay variation</b>	Average one-way forward delay variation for the statistics displayed in microseconds.
<b>Average one-way backward delay variation</b>	Average one-way backward delay variation for the statistics displayed in microseconds.
<b>Weighted average two-way delay</b>	Weighted average two-way delay for the statistics displayed in microseconds.
<b>Weighted average two-way delay variation</b>	Weighted average two-way delay variation for the statistics displayed in microseconds.
<b>Weighted average one-way backward delay variation</b>	Weighted average one-way backward delay variation for the statistics displayed in microseconds.
<b>Weighted average one-way forward delay variation</b>	Weighted average one-way forward delay variation for the statistics displayed in microseconds.
<b>SLM packets sent</b>	Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.
<b>SLM packets received</b>	Total number of synthetic loss message (SLM) PDU frames that the remote MEP received from the source MEP during this ETH-SLM session.
<b>SLR packets sent</b>	Total number of synthetic loss reply (SLR) PDU frames that the remote MEP sent to the source MEP during this measurement session.

Table 170: show oam ethernet connectivity-fault-management sla-iterator-statistics Output Fields (continued)

Output Field Name	Output Field Description
<b>SLR packets received</b>	Total number of synthetic loss reply (SLR) PDU frames that the source MEP received from the remote MEP during this measurement session.
<b>Local TXFC1 value</b>	Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.
<b>Local RXFC1 value</b>	Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TXFC1 is sent in the packet.
<b>Last Received SLR frame TXFCf(tc)</b>	Value of the local counter TxFC1 at the time of SLM frame transmission.
<b>Last Received SLR frame TXFCb(t)</b>	Value of the local counter RxFC1 at the time of SLR frame transmission.
<b>Frame loss (near-end)</b>	Count of frame loss associated with ingress data frames.
<b>Frame loss (far-end)</b>	Count of frame loss associated with egress data frames.

### show oam ethernet connectivity-fault-management state - To verify the Connectivity Fault Management (CFM) state

The following command is to verify whether the CFM state is in enhanced-cfm mode or not.

```
user@router> show oam ethernet connectivity-fault-management state
```

```
Connectivity fault management state:
 CFM Mode Of Operation: Enhanced
 Enhanced IP Mode: Enabled
 CFM Config State: Ok
 CFM Cleanup State: Ok
 CFM Restart Timer State: Cleanup Timer State stopped Rebooting in 0 sec
 CFM CFMMAN Job State: Not Pending
 Number of sessions: 1
 Number of sessions created: 1
 Number of sessions deleted: 0
 Number of sessions freed: 0
 Number of sessions enqueued: 1
 Number of sessions dequeued: 1
 VPLS feature: enabled
 Token based forwarding feature: enabled
 Forwarding table filtering simulation feature: disabled
 Hardware assisted flooding feature: enabled
 Flood resynchronization for GRES feature: enabled
 Shared interface filter feature: disabled
 Hardware timestamping feature: disabled
 Marking of connection protection TLV feature: disabled
 CFMD config memory resource limit(in bytes): 3221225472
 CFMD max resident set (peak) size (in bytes): 24158208

Packet processing state:
 State of the connection to packet processing daemon: down
 State of the flow to packet processing daemon: ready
 State of the packet processing job: ready
 Number of times the connection to packet processing daemon was blocked: 0
 State of the connection to cfmmman: slots: 2 3 4 5

Filter state:
 State of the connection to firewall daemon: Connected
 Number of reconnects made to firewall daemon: 0
 Number of requests sent to firewall daemon: 13
 Number of requests accepted by firewall daemon: 13
 Number of requests rejected by firewall daemon: 0
 Number of requests lost due to disconnection: 0
```

## show oam ethernet connectivity-fault-management synthetic-loss-statistics

Syntax	<pre>show oam ethernet connectivity-fault-management synthetic-loss-statistics &lt;local-mep local-mep-id&gt; maintenance-association ma-name &lt;count entry-count&gt; maintenance-domain md-name &lt;remote-mep remote-mep-id&gt;</pre>
Release Information	Command introduced in Junos OS Release 13.2 for MX Series routers.
Description	On MX Series routers with Modular Port Concentrators (MPCs) with Ethernet interfaces, display the on-demand ETH-SLM statistics.
Options	<p><b>count</b> <i>entry-count</i>—(Optional) Number of entries to display from the statistics table. The range of values is from 1 through 100. The default value is 100.</p> <p><b>local-mep</b> <i>local-mep-id</i>—(Optional) Numeric identifier of the local MEP. The range of values is from 1 through 8192.</p> <p><b>maintenance-association</b> <i>ma-name</i>—Name of an existing CFM maintenance association.</p> <p><b>maintenance-domain</b> <i>md-name</i>—Name of an existing connectivity fault management (CFM) maintenance domain.</p> <p><b>remote-mep</b> <i>remote-mep-id</i>—(Optional) Numeric identifier of the remote MEP. The range of values is from 1 through 8192.</p>
Required Privilege Level	view

Output Fields	<a href="#">Table 171 on page 1737</a> lists the output fields for the <b>show oam ethernet connectivity-fault-management synthetic-loss-statistics</b> command. Output fields are listed in the approximate order in which they appear.

Table 171: show oam ethernet connectivity-fault-management synthetic-loss-statistics Output Fields

Output Field Name	Field Description
MEP identifier	Maintenance association end point (MEP) numeric identifier.
MAC address	Unicast MAC address configured for the MEP.
Remote MEP count	Number of remote MEPs (unless you specify the <b>remote-mep</b> option).
Remote MEP identifier	Numeric identifier of the remote MEP.
Remote MAC address	Unicast MAC address of the remote MEP.
SLM packets sent	Total number of synthetic loss message (SLM) PDU frames sent from the source MEP to the remote MEP during this ETH-SLM session.
SLM packets received	Total number of synthetic loss message (SLM) PDU frames that the remote MEP received from the source MEP during this ETH-SLM session.
SLR packets sent	Total number of synthetic loss reply (SLR) PDU frames that the remote MEP sent to the source MEP during this measurement session.
SLR packets received	Total number of synthetic loss reply (SLR) PDU frames that the source MEP received from the remote MEP during this measurement session.
Local TXFC1 value	Number of synthetic frames transmitted to the peer MEP for a test ID. A test ID is used to distinguish each synthetic loss measurement because multiple measurements can be simultaneously activated also on a given CoS and MEP pair. It must be unique at least within the context of any SLM for the MEG and initiating MEP.
Local RXFC1 value	Number of synthetic frames received from the peer MEP for a test ID. The MEP generates a unique Test ID for the session, adds the source MEP ID, and initializes the local counters for the session before SLM initiation. For each SLM PDU transmitted for the session (test ID), the local counter TxFC1 is sent in the packet.
Last Received SLR frame TXFCf(tc)	Value of the local counter TxFC1 at the time of SLM frame transmission.
Last Received SLR frame TXFCb(t)	Value of the local counter RxFC1 at the time of SLR frame transmission.
Frame loss (near-end)	Count of frame loss associated with ingress data frames.
Frame loss (far-end)	Count of frame loss associated with egress data frames.

```

## show oam ethernet evc

<b>Syntax</b>	<b>show oam ethernet evc &lt;evc-id&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 9.5.
<b>Description</b>	On MX Series routers with OAM Ethernet Virtual Connection (EVC) configurations, displays the EVC configuration and status information.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	View
<b>Output Fields</b>	<a href="#">Table 172 on page 1739</a> lists the output fields for the <b>show oam ethernet evc</b> command. Output fields are listed in the approximate order in which they appear.

*Table 172: show oam ethernet evc Output Fields*

Field Name	Field Description
EVC identifier	Header for the EVC information showing the EVC name, configuration, and active/inactive status.
UNI count	Number of configured and active UNIs.
Protocol	Protocol configured between the UNIs.
Local UNIs	Heading for the list of local UNIs
UNI Identifier	Name of the UNI.
Interface	Interface type-dpc/pic/port.unit-number.
Status	Status operational or not operational.

## Sample Output

### show oam ethernet evc

```

user@host> show oam ethernet evc

EVC identifier: evc1, Point-to-Point, Active
UNI count: Configured(2), Active(2)
Protocol: cfm, Management domain: md, Management association: ma
Local UNIs:
 UNI Identifier Interface Status
 uni1 ge-1/1/1 Operational
 uni2 ge-1/1/1 Not Operational

```

## show oam ethernet fnp interface

**Syntax** `show oam ethernet fnp interface`  
`<ethernet-interface-name>`  
`<routing-instance routing-instance-name>`

**Release Information** Command introduced in Junos OS Release 11.4.

**Description** On MX Series routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet PICs, displays OAM Ethernet Failure Notification Protocol (FNP) information for Ethernet interfaces.

**Options** *interface-name*—(Optional) Display Ethernet FNP information for the specified Ethernet interface only.

*routing-instance-name*—(Optional) Display FNP for the specified routing instance.

**Required Privilege Level** view

**List of Sample Output** [show oam ethernet fnp interface on page 1741](#)

**Output Fields** [Table 173 on page 1741](#) lists the output fields for the `show oam ethernet fnp interface` command. Output fields are listed in the approximate order in which they appear.

*Table 173: show oam ethernet fnp interface Output Fields*

Field Name	Field Description
<b>Interface</b>	Name of the interface for the displayed information.
<b>VLAN</b>	Name of the VLAN.
<b>State</b>	Displays state of the interface.
<b>FNP Message Interface</b>	Displays the message interface type.
<b>FNP Message Source MAC</b>	Displays the source MAC address.

## Sample Output

### show oam ethernet fnp interface

```
user@host> show oam ethernet fnp interface
```

```
The FNP controlled interfaces are:
Interface VLAN State FNP message FNP message
Interface Source MAC
```

ge-0/0/0.30	30	down	lsi.1054976	a0:aa:aa:aa:aa:aa
ge-0/0/0.20	20	down	lsi.1054976	a0:aa:aa:aa:aa:aa

## show oam ethernet fnp messages

**Syntax** `show oam ethernet fnp messages`  
`<interface interface-name>`  
`<routing instance routing-instance-name>`

**Release Information** Command introduced in Junos OS Release 11.4

**Description** On MX Series routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet PICs, displays OAM Ethernet Failure Notification Protocol (FNP) messages.

**Options** *interface-name*—(Optional) Display Ethernet FNP messages for the specified Ethernet interface only.

*routing-instance-name*—(Optional) Display FNP messages for the specified routing instance.

**Required Privilege Level** view

**List of Sample Output** [show oam ethernet fnp messages on page 1744](#)

**Output Fields** [Table 174 on page 1743](#) lists the output fields for the **show oam ethernet fnp messages** command. Output fields are listed in the approximate order in which they appear.

*Table 174: show oam ethernet fnp messages Output Fields*

Field Name	Field Description
Message from source MAC address	The source MAC address of the message.
Originating port number	Port number of the original message.
Time since last message	Elapsed time in hours, minutes, and seconds since the last message was received.
Time since last message update	Elapsed time in hours, minutes, and seconds since the last message was updated.
Total messages received	Number of messages received.
Domain ID	Domain ID of the message.
STP Root ID	The spanning tree Root ID of the message.
Trigger Reason	The reason why the message was triggered.

*Table 174: show oam ethernet fnp messages Output Fields (continued)*

Field Name	Field Description
Effectuated VLANs	Number of VLANs that are affected.
Disabled interfaces	Name of the interfaces that are disabled.

## Sample Output

### show oam ethernet fnp messages

```
user@host> show oam ethernet fnp messages
Active FNP messages on interface lsi.1054465
Message source MAC: a0:aa:aa:aa:aa:aa
Originating port number: 141077
Time since last message: 00:00:00
Time since last message update: 00:00:00
Total messages received: 1
Domain ID: 0
STP Root ID: 0.f0:ff:ff:ff:ff:ff
Trigger reason: todo
Effectuated VLANs: 10
Disabled interfaces:
 Interface VLAN
 ge-0/0/0.10 10
```

## show oam ethernet fnp status

**Syntax** `show oam ethernet fnp status`  
`<interface interface-name>`  
`<routing instance routing-instance-name>`

**Release Information** Command introduced in Junos OS Release 11.4

**Description** On MX Series routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet PICs, displays OAM Ethernet Failure Notification Protocol (FNP) status.

**Options** *interface-name*—(Optional) Display Ethernet FNP information for the specified Ethernet interface only.

*routing-instance-name*—(Optional) Display FNP for the specified routing instance.

**Required Privilege Level** view

**List of Sample Output** [show oam ethernet fnp status on page 1745](#)

**Output Fields** [Table 175 on page 1745](#) lists the output fields for the `show oam ethernet fnp status` command. Output fields are listed in the approximate order in which they appear.

*Table 175: show oam ethernet fnp status Output Fields*

Field Name	Field Description
FNP interval	The time interval between messages.
Loss threshold	The number of messages that can be lost before FNP is marked as down.
FNP enabled interfaces	Displays interfaces that are enabled.
Interface	The name of the interface.
Domain ID	Domain ID of the message.
STP Root ID	The spanning tree Root ID of the message.
FNP Messages	The total number of messages received.

## Sample Output

### show oam ethernet fnp status

```
user@host> show oam ethernet status
```

```
FNP interval:
Loss threshold
FNP enabled interfaces
Interface Domain ID STP Root ID FNP Messages
ge-0/0/0.1278 100 0.f0:ff:ff:ff:ff:ff 0
```

## show oam ethernet link-fault-management

**Syntax**     `show oam ethernet link-fault-management`  
                  `<brief | detail>`  
                  `<interface-name>`

**Release Information**     Command introduced in Junos OS Release 8.2.

**Description**     On EX Series switches and M320, M120, MX Series, T320, and T640 routers, display Operation, Administration, and Management (OAM) link fault management information for Ethernet interfaces.

**Options**     **brief | detail**—(Optional) Display the specified level of output.

**interface-name**—(Optional) Display link fault management information for the specified Ethernet interface only.

**Required Privilege Level**     view

**List of Sample Output**     [show oam ethernet link-fault-management brief on page 1752](#)  
                  [show oam ethernet link-fault-management brief \(Loopback tracking\) on page 1752](#)  
                  [show oam ethernet link-fault-management detail on page 1752](#)  
                  [show oam ethernet link-fault-management detail \(backup Routing Engine\) on page 1753](#)

**Output Fields**     [Table 176 on page 1747](#) lists the output fields for the **show oam ethernet link-fault-management** command. Output fields are listed in the approximate order in which they appear.

*Table 176: show oam ethernet link-fault-management Output Fields*

Field Name	Field Description	Level of Output
<b>Status</b>	Indicates the status of the OAM discovery state mechanism . <ul style="list-style-type: none"> <li>• <b>Down</b>—Discovery mechanism is not running..</li> <li>• <b>Running</b>—Discovery mechanism is running.</li> </ul>	All levels
<b>Discovery state</b>	State of the discovery mechanism. If the status of the discovery mechanism is Down then the state of discovery mechanism is Fault. However, if the status of the discovery mechanism is Running then the state can be any one of the following: <ul style="list-style-type: none"> <li>• <b>Passive Wait</b></li> <li>• <b>Active Send Local</b></li> <li>• <b>Send Any</b></li> <li>• <b>Send Local Remote</b></li> <li>• <b>Send Local Remote Ok</b></li> <li>• <b>Fault</b></li> </ul>	All levels

Table 176: show oam ethernet link-fault-management Output Fields (continued)

Field Name	Field Description	Level of Output
ISSU	Specifies that the local end is undergoing a unified in-service software upgrade (ISSU).	All levels
Peer address	Address of the OAM peer.	All levels
Flags	<p>Information about the interface. Possible values are described in the “Link Flags” section under <i>Common Output Fields Description</i>.</p> <ul style="list-style-type: none"> <li>• <b>Remote-Stable</b>—Indicates remote OAM client acknowledgment of and satisfaction with local OAM state information. <b>False</b> indicates that remote DTE either has not seen or is unsatisfied with local state information. <b>True</b> indicates that remote DTE has seen and is satisfied with local state information.</li> <li>• <b>Local-Stable</b>—Indicates local OAM client acknowledgment of and satisfaction with remote OAM state information. <b>False</b> indicates that local DTE either has not seen or is unsatisfied with remote state information. <b>True</b> indicates that local DTE has seen and is satisfied with remote state information.</li> <li>• <b>Remote-State-Valid</b>—Indicates the OAM client has received remote state information found within Local Information TLVs of received Information OAM PDUs. <b>False</b> indicates that OAM client has not seen remote state information. <b>True</b> indicates that the OAM client has seen remote state information.</li> </ul>	All levels
Remote loopback status	Indicates the remote loopback status. An OAM entity can put its remote peer into loopback mode using the Loopback control OAM PDU. In loopback mode, every frame received is transmitted back on the same port (except for OAM PDUs, which are needed to maintain the OAM session).	All levels
Remote entity information	<p>Remote entity information.</p> <ul style="list-style-type: none"> <li>• <b>Remote MUX action</b>—Indicates the state of the multiplexer functions of the OAM sublayer. Device is forwarding non-OAM PDUs to the lower sublayer or discarding non-OAM PDUs.</li> <li>• <b>Remote parser action</b>—Indicates the state of the parser function of the OAM sublayer. Device is forwarding non-OAM PDUs to higher sublayer, looping back non-OAM PDUs to the lower sublayer, or discarding non-OAM PDUs.</li> <li>• <b>Discovery mode</b>—Indicates whether discovery mode is active or inactive.</li> <li>• <b>Unidirectional mode</b>—Indicates the ability to operate a link in a unidirectional mode for diagnostic purposes.</li> <li>• <b>Remote loopback mode</b>—Indicates whether remote loopback is supported or unsupported.</li> <li>• <b>Link events</b>—Indicates whether interpreting link events is supported or unsupported on the remote peer.</li> <li>• <b>Variable requests</b>—Indicates whether variable requests are supported. The Variable Request OAM PDU, is used to request one or more MIB variables from the remote peer.</li> <li>• <b>Remote in ISSU</b>—Indicates that the remote end is undergoing a unified in-service software upgrade (ISSU).</li> </ul>	All levels
Loopback Tracking	Indicates that loopback detection is enabled or disabled.	All levels

Table 176: show oam ethernet link-fault-management Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Loop Status</b>	Indicates that a loopback issue is either found, not found, or unknown when loopback tracking is enabled.	All levels
<b>Detect LOC</b>	Indicates that loss-of-continuity (LOC) detection is enabled or disabled.	All levels
<b>LOC status</b>	Indicates that a LOC issue is either found, not found, or unknown when Detect LOC is enabled. Status is unknown when LOC detection is disabled.	All levels
<b>OAM Receive Statistics</b>		
<b>Information</b>	The total number of information PDUs received.	<b>detail</b>
<b>Event</b>	The total number of loopback control PDUs received.	<b>detail</b>
<b>Variable request</b>	The total number of variable request PDUs received.	<b>detail</b>
<b>Variable response</b>	The total number of variable response PDUs received.	<b>detail</b>
<b>Loopback control</b>	The total number of loopback control PDUs received.	<b>detail</b>
<b>Organization specific</b>	The total number of vendor organization specific PDUs received.	<b>detail</b>
<b>OAM Transmit Statistics</b>		
<b>Information</b>	The total number of information PDUs transmitted.	<b>detail</b>
<b>Event</b>	The total number of event notification PDUs transmitted.	<b>detail</b>
<b>Variable request</b>	The total number of variable request PDUs transmitted.	<b>detail</b>
<b>Variable response</b>	The total number of variable response PDUs transmitted.	<b>detail</b>
<b>Loopback control</b>	The total number of loopback control PDUs transmitted.	<b>detail</b>
<b>Organization specific</b>	The total number of vendor organization specific PDUs transmitted.	<b>detail</b>
<b>OAM Received Symbol Error Event information</b>		
<b>Events</b>	The number of symbol error event TLVs that have been received since the OAM sublayer was reset.	<b>detail</b>
<b>Window</b>	The symbol error event window in the received PDU.  The protocol default value is the number of symbols that can be received in one second on the underlying physical layer.	<b>detail</b>
<b>Threshold</b>	The number of errored symbols in the period required for the event to be generated.	<b>detail</b>

Table 176: show oam ethernet link-fault-management Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Errors in period</b>	The number of symbol errors in the period reported in the received event PDU.	<b>detail</b>
<b>Total errors</b>	The number of errored symbols that have been reported in received event TLVs since the OAM sublayer was reset.  Symbol errors are coding symbol errors.	<b>detail</b>
<b>OAM Received Frame Error Event Information</b>		
<b>Events</b>	The number of errored frame event TLVs that have been received since the OAM sublayer was reset.	<b>detail</b>
<b>Window</b>	The duration of the window in terms of the number of 100 ms period intervals.	<b>detail</b>
<b>Threshold</b>	The number of detected errored frames required for the event to be generated.	<b>detail</b>
<b>Errors in period</b>	The number of detected errored frames in the period.	<b>detail</b>
<b>Total errors</b>	The number of errored frames that have been reported in received event TLVs since the OAM sublayer was reset.  A frame error is any frame error on the underlying physical layer.	<b>detail</b>
<b>OAM Received Frame Period Error Event Information</b>		
<b>Events</b>	The number of frame seconds errors event TLVs that have been received since the OAM sublayer was reset.	<b>detail</b>
<b>Window</b>	The duration of the frame seconds window.	<b>detail</b>
<b>Threshold</b>	The number of frame seconds errors in the period.	<b>detail</b>
<b>Errors in period</b>	The number of frame seconds errors in the period.	<b>detail</b>
<b>Total errors</b>	The number of frame seconds errors that have been reported in received event TLVs since the OAM sublayer was reset.	<b>detail</b>
<b>OAM Transmitted Symbol Error Event Information</b>		
<b>Events</b>	The number of symbol error event TLVs that have been transmitted since the OAM sublayer was reset.	<b>detail</b>
<b>Window</b>	The symbol error event window in the transmitted PDU.	<b>detail</b>
<b>Threshold</b>	The number of errored symbols in the period required for the event to be generated.	<b>detail</b>
<b>Errors in period</b>	The number of symbol errors in the period reported in the transmitted event PDU.	<b>detail</b>

Table 176: show oam ethernet link-fault-management Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Total errors</b>	The number of errored symbols reported in event TLVs that have been transmitted since the OAM sublayer was reset.	<b>detail</b>
<b>OAM Current Symbol Error Event Information</b>		
<b>Events</b>	The number of symbol error TLVs that have been generated regardless of whether the threshold for sending event TLVs has been crossed.	<b>detail</b>
<b>Window</b>	The symbol error event window in the transmitted PDU.	<b>detail</b>
<b>Threshold</b>	The number of errored symbols in the period required for the event to be generated.	<b>detail</b>
<b>Errors in period</b>	The total number of symbol errors in the period reported.	<b>detail</b>
<b>Total errors</b>	The number of errored symbols reported in event TLVs that have been generated regardless of whether the threshold for sending event TLVs has been crossed.	<b>detail</b>
<b>OAM Transmitted Frame Error Event Information</b>		
<b>Events</b>	The number of errored frame event TLVs that have been transmitted since the OAM sublayer was reset.	<b>detail</b>
<b>Window</b>	The duration of the window in terms of the number of 100 ms period intervals.	<b>detail</b>
<b>Threshold</b>	The number of detected errored frames required for the event to be generated.	<b>detail</b>
<b>Errors in period</b>	The number of detected errored frames in the period.	<b>detail</b>
<b>Total errors</b>	The number of errored frames that have been detected since the OAM sublayer was reset.	<b>detail</b>
<b>OAM Current Frame Error Event Information</b>		
<b>Events</b>	The number of errored frame event TLVs that have been generated regardless of whether the threshold for sending event TLVs has been crossed.	<b>detail</b>
<b>Window</b>	The duration of the window in terms of the number of 100 ms period intervals.	<b>detail</b>
<b>Threshold</b>	The number of detected errored frames required for the event to be generated.	<b>detail</b>
<b>Errors in period</b>	The number of errored frames in the period.	<b>detail</b>
<b>Total errors</b>	The number of errored frames detected regardless of whether the threshold for transmitting event TLVs has been crossed.	<b>detail</b>

## show oam ethernet lmi

**Syntax** `show oam ethernet lmi (interface <interface-name>)`

**Release Information** Command introduced in Junos OS Release 9.5.

**Description** On routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet, and OAM Ethernet Local Management Interface (E-LMI) configuration, display the LMI information for the configured interfaces or optionally for a specified interface.

**NOTE:** On MX Series routers, E-LMI is supported on Gigabit Ethernet (ge), 10-Gigabit Ethernet (xe), and Aggregated Ethernet (ae) interfaces configured on MX Series routers with DPC only.

**Options** **interface**—(Optional) Display LMI information for a specified interface.

**interface-name**—(Optional) Display Ethernet LMI information for the specified interface only.

**Required Privilege Level** View

**Output Fields** [Table 177 on page 1755](#) lists the output fields for the **show oam ethernet lmi** command. Output fields are listed in the approximate order in which they appear.

*Table 177: show oam ethernet lmi Output Fields*

Field Name	Field Description
Physical Interface	Header for the EVC information showing the Ethernet virtual circuit (EVC) name, configuration, and active/inactive status.
UNI Identifier	Name of the UNI.
EVC map type	EVC configuration.
Polling verification timer	Polling verification timer status.
E-LMI state	Operational status of the E-LMI configuration in the interfaces or specified interface.
Priority/Untagged VLAN ID	To be provided.
Default EVC	The EVC set as the default EVC.

Table 177: show oam ethernet lmi Output Fields (continued)

Field Name	Field Description
Associated EVCs	Heading for the list of configured EVCs.
EVC Identifier	EVC name.
Reference ID	To be provided.
Status	Status active or not active.
CE VLAN IDs	Customer edge VLAN ID numbers.

## Sample Output

### show oam ethernet lmi interface

```

user@host> show oam ethernet lmi interface ge-1/1/1
Physical interface: ge-1/1/1, Physical link is Up
UNI identifier: uni-ce1, EVC map type: Bundling
Polling verification timer: Enabled, E-LMI state: Operational
Priority/Untagged VLAN ID: 20, Default EVC: evc1
Associated EVCs:
 EVC Reference Status CE VLAN IDs
 Identifier ID
 evc1 1 Active (New) 1-2048
 evc2 2 Not Active 2049-4096

```

## show oam ethernet lmi statistics

**Syntax** `show oam ethernet lmi statistics <interface interface-name>`

**Release Information** Command introduced in Junos OS Release 9.5.

**Description** On MX Series routers with Gigabit Ethernet, Fast Ethernet, or aggregated Ethernet PICs, displays OAM Ethernet Local Management Interface (LMI) statistics.

**Options** **interface**—(Optional) Display LMI statistics for a specified interface.

**interface-name**—(Optional) Display Ethernet LMI information for the specified Ethernet interface only.

**Required Privilege Level** view

**List of Sample Output** [show oam ethernet lmi statistics on page 1758](#)

**Output Fields** [Table 178 on page 1757](#) lists the output fields for the **show oam ethernet lmi statistics** command. Output fields are listed in the approximate order in which they appear.

*Table 178: show oam ethernet lmi statistics Output Fields*

Field Name	Field Description
Physical interface	Name of the interface for the displayed statistics.
Reliability errors	Number of E-LMI reliability errors logged.
Protocol errors	Number of E-LMI protocol errors.
Status check received	Number of E-LMI status check receive errors.
Status check sent	Number of E-LMI status check sent errors.
Full status received	Number of E-LMI full status receive errors.
Full status sent	Number of E-LMI full status sent errors.
Full status continued received	Number of E-LMI status continued received errors.
Full status continued sent	Number of E-LMI full status continued sent errors.
Asynchronous status sent	Number of E-LMI asynchronous status sent errors.

## Sample Output

### show oam ethernet lmi statistics

```
user@host> show oam ethernet lmi statistics interface ge-1/1/1

Physical interface: ge-1/1/1
Reliability errors 4 Protocol errors
0
Status check received 0 Status check sent
0
Full status received 694 Full status sent
694
Full status continued received 0 Full status continued sent

Asynchronous status sent 0
```

## show pppoe interfaces

<b>Syntax</b>	show pppoe interfaces <brief   detail <pp0.logical>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	Display session-specific information about PPPoE interfaces.
<b>Options</b>	<p><b>none</b>—Display interface information for all PPPoE interfaces.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>pp0.logical</b>—(Optional) Name of an interface. The logical unit number for static interfaces can be a value from 0 through 16385. The logical unit number for dynamic interfaces can be a value from 1073741824 through the maximum number of logical interfaces supported on your router.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Verifying and Managing Agent Circuit Identifier-Based Dynamic VLAN Configuration</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">show pppoe interfaces on page 1761</a> <a href="#">show pppoe interfaces (Status for the Specified Interface) on page 1761</a> <a href="#">show pppoe interfaces brief on page 1761</a> <a href="#">show pppoe interfaces detail on page 1762</a> <a href="#">show pppoe interfaces (PPPoE Subscriber Interface with ACI Interface Set) on page 1762</a>
<b>Output Fields</b>	<p>Table 179 on page 1759 lists the output fields for the <b>show pppoe interfaces</b> command. Output fields are listed in the approximate order in which they appear. Not all fields are displayed for PPPoE interfaces on M120 and M320 routers in server mode.</p>

Table 179: show pppoe interfaces Output Fields

Field Name	Field Description	Level of Output
Logical Interface		
<b>Logical interface</b>	Name of the logical interface.	All levels
<b>Index</b>	Index number of the logical interface, which reflects its initialization sequence.	<b>detail extensive none</b>
<b>State</b>	State of the logical interface: <b>up</b> or <b>down</b> .	All levels
<b>Session ID</b>	Session ID.	All levels

Table 179: show pppoe interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Type</b>	Origin of the logical interface: <b>Static</b> or <b>Dynamic</b> . Indicates whether the interface was statically or dynamically created.	<b>detail extensive none</b>
<b>Service name</b>	Type of service required (can be used to indicate an ISP name or a class or quality of service).	<b>detail extensive none</b>
<b>Configured AC name</b>	Configured access concentrator name.	<b>detail extensive none</b>
<b>Session AC name</b>	Name of the access concentrator.	<b>detail extensive none</b>
<b>Remote MAC address or Remote MAC</b>	MAC address of the remote side of the connection, either the access concentrator or the PPPoE client.	All levels
<b>Session uptime</b>	Length of time the session has been up, in <i>hh:mm:ss</i> .	<b>detail extensive none</b>
<b>Dynamic Profile</b>	Name of the dynamic profile that was used to create this interface. If the interface was statically created, this field is not displayed.	<b>detail extensive none</b>
<b>Underlying interface</b>	Interface on which PPPoE is running.	All levels
<b>Agent Circuit ID</b>	Agent circuit identifier (ACI) that corresponds to the DSLAM interface that initiated the client service request. An asterisk is interpreted as a wildcard character and can appear at the beginning, the end, or both the beginning and end of the string. If the agent circuit ID is not configured, this field is not displayed.	<b>detail extensive none</b>
<b>Agent Remote ID</b>	Agent remote identifier that corresponds to the subscriber associated with the DSLAM interface that initiated the service request. An asterisk is interpreted as a wildcard character and can appear at the beginning, the end, or both at the beginning and end of the string. If the agent remote ID is not configured, this field is not displayed.	<b>detail extensive none</b>
<b>ACI Interface Set</b>	Internally-generated name of the dynamic ACI interface set, if configured, and the set index number of the ACI entry in the session database.	<b>detail extensive none</b>

Table 179: show pppoe interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Packet Type</b>	<p>Number of packets sent and received during the PPPoE session, categorized by packet type and packet errors:</p> <ul style="list-style-type: none"> <li>• <b>PADI</b>—PPPoE Active Discovery Initiation packets.</li> <li>• <b>PADO</b>—PPPoE Active Discovery Offer packets.</li> <li>• <b>PADR</b>—PPPoE Active Discovery Request packets.</li> <li>• <b>PADS</b>—PPPoE Active Discovery Session-Confirmation packets.</li> <li>• <b>PADT</b>—PPPoE Active Discovery Termination packets.</li> <li>• <b>Service name error</b>—Packets for which the Service-Name request could not be honored.</li> <li>• <b>AC system error</b>—Packets for which the access concentrator experienced an error in performing the host request. For example, the host had insufficient resources to create a virtual circuit.</li> <li>• <b>Generic error</b>—Packets that indicate an unrecoverable error occurred.</li> <li>• <b>Malformed packets</b>—Malformed or short packets that caused the packet handler to discard the frame as unreadable.</li> <li>• <b>Unknown packets</b>—Unrecognized packets.</li> </ul>	<b>extensive</b>

## Sample Output

### show pppoe interfaces

```
user@host> show pppoe interfaces
pp0.0 Index 66
 State: Down, Session ID: None,

## show pppoe service-name-tables

**Syntax** `show pppoe service-name-tables  
<table-name>`

**Release Information** Command introduced in Junos OS Release 10.0.

**Description** Display configuration information about PPPoE service name tables.

**Options** **none**—Display the names of configured PPPoE service name tables.  
**table-name**—(Optional) Name of a configured PPPoE service name table.

**Required Privilege Level** view

**Related Documentation**

- [Verifying a PPPoE Configuration on page 206](#)
- [Verifying and Managing Dynamic PPPoE Configuration](#)

**List of Sample Output** [show pppoe service-name-tables on page 1764](#)  
[show pppoe service-name-tables \(For the Specified Table Name\) on page 1764](#)

**Output Fields** [Table 180 on page 1763](#) lists the output fields for the **show pppoe service-name-tables** command. Output fields are listed in the approximate order in which they appear.

*Table 180: show pppoe service-name-tables Output Fields*

Field Name	Field Description	Level of Output
<b>Service Name Table</b>	Name of the PPPoE service name table.	none
<b>Service Name</b>	Name of a configured service in the PPPoE service name table: <ul style="list-style-type: none"> <li>• <b>&lt;empty&gt;</b>—Service of zero length that represents an unspecified service</li> <li>• <b>&lt;any&gt;</b>—Default service for non-empty service entries that do not match the configured empty or named service entries</li> <li>• <b>service-name</b>—Named service entry</li> </ul>	none
<b>Action</b>	Action taken when the PPPoE underlying interface receives a PPPoE Active Discovery Initiation (PADI) packet with the specified named service, <b>empty</b> service, <b>any</b> service, or ACI/ARI pair: <ul style="list-style-type: none"> <li>• <b>Delay seconds</b>—Number of seconds that the interface delays before responding with a PPPoE Active Discovery Offer (PADO) packet</li> <li>• <b>Drop</b>—Interface drops (ignores) the packet.</li> <li>• <b>Terminate</b>—Interface responds immediately with a PADO packet</li> </ul>	none

Table 180: show pppoe service-name-tables Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Dynamic Profile</b>	Name of the dynamic profile with which the router creates a dynamic PPPoE subscriber interface. A dynamic profile can be assigned to a named service, <b>empty</b> service, <b>any</b> service, or ACI/ARI pair.	none
<b>Routing Instance</b>	Name of the routing instance in which to instantiate the dynamic PPPoE subscriber interface. A routing instance can be assigned to a named service, <b>empty</b> service, <b>any</b> service, or ACI/ARI pair.	none
<b>Max Sessions</b>	Maximum number of active PPPoE sessions that the router can establish with the specified named service, <b>empty</b> service, or <b>any</b> service.	none
<b>Active Sessions</b>	Current count of active PPPoE sessions created using the specified named service, <b>empty</b> service, or <b>any</b> service. The Active Sessions value cannot exceed the Max Sessions value.	none
<b>ACI</b>	Agent circuit identifier (ACI) that corresponds to the DSLAM interface that initiated the client service request. An asterisk is interpreted as a wildcard character and can appear at the beginning, the end, or both the beginning and end of the string. An ACI can be configured as part of an ACI/ARI pair for a named service, <b>empty</b> service, or <b>any</b> service.	none
<b>ARI</b>	Agent remote identifier (ARI) that corresponds to the subscriber associated with the DSLAM interface that initiated the service request. An asterisk is interpreted as a wildcard character and can appear at the beginning, the end, or both at the beginning and end of the string. An ARI can be configured as part of an ACI/ARI pair for a named service, <b>empty</b> service, or <b>any</b> service.	none
<b>Static Interface</b>	Name of the static PPPoE interface reserved for exclusive use by the PPPoE client with matching ACI/ARI information. A static interface can be configured only for an ACI/ARI pair.	none

## Sample Output

### show pppoe service-name-tables

```
user@host> show pppoe service-name-tables

Service Name Table: test1
Service Name Table: test2
Service Name Table: test3
```

### show pppoe service-name-tables (For the Specified Table Name)

```
user@host> show pppoe service-name-tables Table1

Service Name Table: Table1
Service Name: <empty>
Action: Terminate
Dynamic Profile: BasicPppoeProfile
Max Sessions: 100
Active Sessions: 3
Service Name: <any>
```

```
Action: Drop
ACI: velorum-ge-2/0/3
ARI: westford
 Action: Terminate
 Static Interface: pp0.100

Dynamic Profile: WholesalePppoeProfile
Routing Instance: WholesaleRI
Max Sessions: 16000
Active Sessions: 4
```

## show pppoe sessions

**Syntax** `show pppoe sessions`  
`<aci circuit-id-string>`  
`<ari remote-id-string>`  
`<service service-name>`

**Release Information** Command introduced in Junos OS Release 10.2.

**Description** Display information about all active PPPoE sessions on the router, or about the active PPPoE sessions established for a specified service name, agent circuit identifier (ACI), or agent remote identifier (ARI).

**Options** **none**—Display information for all active PPPoE sessions on the router.

**aci circuit-id-string**—(Optional) Display information only for active PPPoE sessions established with the specified agent circuit identifier. The agent circuit identifier corresponds to the DSLAM interface that initiated the service request.

**ari remote-id-string**—(Optional) Display information only for active PPPoE sessions established with the specified agent remote identifier. The agent remote identifier corresponds to the subscriber associated with the DSLAM interface that initiated the service request.

**service service-name**—(Optional) Display information only for active PPPoE sessions established with the specified service, where *service-name* can be **empty**, **any**, or a named service.

**Required Privilege Level** view

**Related Documentation**

## show pppoe underlying-interfaces

<b>Syntax</b>	<pre>show pppoe underlying-interfaces &lt;brief   detail   extensive&gt; &lt;lockout&gt; &lt;logical-interface-name&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 10.0.</p> <p><b>lockout</b> option added in Junos OS Release 11.4.</p>
<b>Description</b>	Display information about PPPoE underlying interfaces.
<b>Options</b>	<p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>lockout</b>—(Optional) Display summary information about the lockout condition and the lockout grace period for PPPoE clients on the PPPoE underlying interface.</p> <p><b>logical-interface-name</b>—(Optional) Name of a PPPoE underlying logical interface.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Verifying and Managing Dynamic PPPoE Configuration</i></li> <li>• <i>Configuring an Underlying Interface for Dynamic PPPoE Subscriber Interfaces</i></li> <li>• <i>Configuring the PPPoE Family for an Underlying Interface</i></li> <li>• <i>Verifying and Managing Agent Circuit Identifier-Based Dynamic VLAN Configuration</i></li> <li>• <i>Verifying and Managing Configurations for Dynamic VLANs Based on Access-Line Identifiers</i></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show pppoe underlying-interfaces brief on page 1773</a></p> <p><a href="#">show pppoe underlying-interfaces detail on page 1773</a></p> <p><a href="#">show pppoe underlying-interfaces extensive on page 1774</a></p> <p><a href="#">show pppoe underlying-interfaces extensive (PPPoE client in lockout condition) on page 1774</a></p> <p><a href="#">show pppoe underlying-interfaces lockout on page 1775</a></p> <p><a href="#">show pppoe underlying-interfaces detail (Autosensing Configured for ACI-based Dynamic VLANs) on page 1775</a></p> <p><a href="#">show pppoe underlying-interfaces detail (Autosensing Configured for ALI-based Dynamic VLANs) on page 1775</a></p>
<b>Output Fields</b>	<p><a href="#">Table 183 on page 1771</a> lists the output fields for the <b>show pppoe underlying-interfaces</b> command. Output fields are listed in the approximate order in which they appear.</p>

Table 183: show pppoe underlying-interfaces Output Fields

Field Name	Field Description	Level of Output
<b>Underlying Interface</b>	Name of the PPPoE underlying logical interface.	All levels
<b>Service Name Table</b>	Name of the service name table.	All levels
<b>Dynamic Profile</b>	Name of the dynamic profile that was used to create this interface. If the interface was statically created, then the value is <b>none</b> .	All levels
<b>Index</b>	Index number of the logical interface, which reflects its initialization sequence.	<b>detail extensive</b>
<b>State</b>	Origin of the logical interface: <b>Static</b> or <b>Dynamic</b> . Indicates whether the interface was statically or dynamically created.	<b>detail extensive</b>
<b>Operational States</b>	Fields in this block are actual operational values rather than simply the configured values. The operational values can be the result of RADIUS-initiated changes.	<b>detail extensive</b>
<b>Max Sessions</b>	Maximum number of PPPoE logical interfaces that can be activated on the underlying interface. When this number of logical interfaces has been established, all subsequent PPPoE Active Discovery Initiation (PADI) packets are dropped and all subsequent PPPoE Active Discovery Request (PADR) packets trigger PPPoE Active Discovery Session (PADS) error responses.	<b>detail extensive</b>
<b>Max Sessions VSA Ignore</b>	Whether the router is configured to ignore (clear) the PPPoE maximum session value returned by RADIUS in the Max-Clients-Per-Interface Juniper Networks VSA [26-143] and restore the PPPoE maximum session value on the underlying interface to the value configure with the <b>max-sessions</b> statement: <b>Off</b> (default) or <b>On</b> .	<b>detail extensive none</b>
<b>Active Sessions</b>	Number of active PPPoE sessions on the underlying interface. If a dynamic profile is listed, then it is the number of active PPPoE sessions on the underlying interface that are using this profile. The Active Sessions value must not exceed the Max Sessions value.	<b>detail extensive</b>
<b>Agent Circuit Identifier</b>	<p>Whether the underlying interface is configured with the <b>agent-circuit-identifier</b> statement to enable creation of autosensed dynamic VLAN subscriber interfaces based on agent circuit identifier (ACI) information.</p> <p><b>Autosensing</b> indicates that creation of ACI-based dynamic VLAN interfaces is enabled on the underlying interface. If creation of ACI-based dynamic VLANs is not configured on the underlying interface, this field does not appear.</p> <p><b>NOTE:</b> The Agent Circuit Identifier field is replaced with the Line Identity field when an ALI interface set is configured with the <b>line-identity</b> autoconfiguration stanza.</p>	<b>detail extensive none</b>

Table 183: show pppoe underlying-interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Line Identity</b>	<p>Whether the underlying interface is configured with the <b>line-identity</b> statement to enable creation of autosensed dynamic VLAN subscriber interfaces based on the specified trusted option: ACI, ARI, both, or neither.</p> <p><b>Autosensing</b> indicates that creation of ALI-based dynamic VLAN interfaces is enabled on the underlying interface. If creation of ALI dynamic VLANs based on trusted options is not configured on the underlying interface, this field does not appear.</p> <p><b>NOTE:</b> The Line Identity field is replaced with the ACI VLAN field when an ACI interface set is configured with the <b>agent-circuit-id</b> autoconfiguration stanza.</p>	<b>detail extensive none</b>
<b>Duplicate Protection</b>	State of PPPoE duplicate protection: <b>On</b> or <b>Off</b> . When duplicate protection is configured for the underlying interface, a dynamic PPPoE logical interface cannot be activated when an existing active logical interface is present for the same PPPoE client. The uniqueness of the PPPoE client is determined by the client's MAC address.	<b>detail extensive</b>
<b>Short Cycle Protection</b>	State of PPPoE short cycle protection: <b>mac-address</b> , <b>circuit-id</b> , or <b>Off</b> . Enabling short cycle protection, also known as PPPoE lockout, on the PPPoE underlying interface temporarily prevents (locks out) a failed or short-lived (short-cycle) PPPoE subscriber session from reconnecting to the router for a default or configurable period of time. PPPoE client sessions are identified by their unique media access control (MAC) source address or agent circuit identifier (ACI) value.	<b>detail extensive</b>
<b>Direct Connect</b>	State of the configuration to ignore DSL Forum VSAs: <b>On</b> or <b>Off</b> . When configured, the router ignores any of these VSAs received from a directly connected CPE device on the interface.	<b>detail extensive none</b>
<b>AC Name</b>	Name of the access concentrator.	<b>detail extensive</b>
<b>PacketType</b>	<p>Number of packets sent and received during the PPPoE session, categorized by packet type and packet errors:</p> <ul style="list-style-type: none"> <li>• <b>PADI</b>—PPPoE Active Discovery Initiation packets.</li> <li>• <b>PADO</b>—PPPoE Active Discovery Offer packets.</li> <li>• <b>PADR</b>—PPPoE Active Discovery Request packets.</li> <li>• <b>PADS</b>—PPPoE Active Discovery Session-Confirmation packets.</li> <li>• <b>PADT</b>—PPPoE Active Discovery Termination packets.</li> <li>• <b>Service name error</b>—Packets for which the Service-Name request could not be honored.</li> <li>• <b>AC system error</b>—Packets for which the access concentrator experienced an error in performing the host request. For example, the host had insufficient resources to create a virtual circuit.</li> <li>• <b>Generic error</b>—Packets that indicate an unrecoverable error occurred.</li> <li>• <b>Malformed packets</b>—Malformed or short packets that caused the packet handler to discard the frame as unreadable.</li> <li>• <b>Unknown packets</b>—Unrecognized packets.</li> </ul>	<b>detail extensive</b>

Table 183: show pppoe underlying-interfaces Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Lockout Time (sec)</b>	The PPPoE lockout time range, the number of PPPoE clients in lockout condition, and the number of PPPoE clients in a lockout grace period if <b>Short Cycle Protection</b> is enabled (On): <ul style="list-style-type: none"> <li><b>Min</b>—Minimum lockout time, in seconds, configured on the PPPoE underlying interface.</li> <li><b>Max</b>—Maximum lockout time, in seconds, configured on the PPPoE underlying interface.</li> <li><b>Total clients in lockout</b>—Number of PPPoE clients currently undergoing lockout.</li> <li><b>Total clients in lockout grace period</b>—Number of PPPoE clients currently in a lockout grace period. A <i>lockout grace period</i> occurs when the time between lockout events is greater than either 15 minutes or the maximum lockout time.</li> </ul>	<b>extensive</b>
<b>Client Address</b>	MAC source address of the PPPoE client.	<b>extensive</b>
<b>Current</b>	Current lockout time, in seconds; displays 0 (zero) if the PPPoE client is not undergoing lockout.	<b>extensive</b>
<b>Elapsed</b>	Time elapsed into the lockout period, in seconds; displays 0 if the PPPoE client is not undergoing lockout	<b>extensive</b>
<b>Next</b>	Lockout time, in seconds, that the router uses for the next lockout event; displays a nonzero value if the PPPoE client is currently in a lockout grace period.	<b>extensive</b>

## show pppoe version

<b>Syntax</b>	show pppoe version
<b>Release Information</b>	Command introduced before Junos OS Release 7.4.
<b>Description</b>	( M120 routers and M320 routers only) Display version information about PPPoE.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show pppoe version on page 1777</a>
<b>Output Fields</b>	<a href="#">Table 184 on page 1777</a> lists the output fields for the <b>show pppoe version</b> command. Output fields are listed in the approximate order in which they appear.

*Table 184: show pppoe version Output Fields*

Field Name	Field Description
version <i>n</i>	PPPoE version number and RFC. For example, <b>version 1, rfc 2516</b> .
PPPoE protocol	State of the PPPoE protocol: <b>enabled</b> or <b>disabled</b> .
Maximum Sessions	Maximum active sessions supported per router. The default is 256 sessions.
PADI resend timeout	Initial time, in seconds, that the router waits to receive a PPoE Active Discovery Offer (PADO) packet for the PPoE Active Discovery Initiation (PADI) packet sent. This timeout doubles for each successive PADI packet sent. Not displayed for M120 and M320 routers.
PADR resend timeout	Initial time, in seconds, that the router waits to receive a PPoE Active Discovery Session Confirmation (PADS) packet for the PPoE Active Discovery Request (PADR) packet sent. This timeout doubles for each successive PADR packet sent. Not displayed for M120 and M320 routers.
Max resend timeout	Maximum value, in seconds, that the PADI or PADR resend timer can accept. The maximum value is 64. Not displayed for M120 and M320 routers.
Max Configured AC timeout	Time, in seconds, during which the configured access concentrator must respond. Not displayed for M120 and M320 routers.

## Sample Output

### show pppoe version

```
user@host> show pppoe version
```

**Point-to-Point Protocol Over Ethernet, version 1. rfc2516**

PPPoE protocol	= Enabled
Maximum Sessions	= 256
PADI resend timeout	= 2 seconds
PADR resend timeout	= 16 seconds
Max resend timeout	= 64 seconds
Max Configured AC timeout	= 4 seconds

## show protection-group ethernet-ring aps

<b>Syntax</b>	<b>show protection-group ethernet-ring aps</b>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.4.</p> <p>Command introduced in Junos OS Release 12.1 for EX Series switches.</p> <p>Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.</p>
<b>Description</b>	Display the status of the Automatic Protection Switching (APS) and Ring APS (RAPS) messages on an Ethernet ring.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show protection-group ethernet-ring data-channel on page 1790</a></li> <li>• <a href="#">show protection-group ethernet-ring interface on page 1795</a></li> <li>• <a href="#">show protection-group ethernet-ring node-state on page 1799</a></li> <li>• <a href="#">show protection-group ethernet-ring statistics on page 1804</a></li> <li>• <a href="#">show protection-group ethernet-ring vlan on page 1810</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show protection-group ethernet-ring aps (EX Switches) on page 1780</a></p> <p><a href="#">show protection-group ethernet-ring aps (Owner Node, Normal Operation on ACX and MX Routers) on page 1780</a></p> <p><a href="#">show protection-group ethernet-ring aps detail (Owner Node, Normal Operation on ACX and MX Routers) on page 1781</a></p> <p><a href="#">show protection-group ethernet-ring aps (MX RPL Owner Ring Node, Failure condition on non-RPL link of the ring) on page 1781</a></p> <p><a href="#">show protection-group ethernet-ring aps (MX Interconnection Ring Node, Failure condition in major ring on non-RPL link of the ring) on page 1781</a></p> <p><a href="#">show protection-group ethernet-ring aps (MX Series router) on page 1781</a></p> <p><a href="#">show protection-group ethernet-ring aps detail (MX Series router) on page 1781</a></p> <p><a href="#">show protection-group ethernet-ring aps (MX Interconnection Ring Node as RPL owner of major ring, rings in IDLE state) on page 1782</a></p> <p><a href="#">show protection-group ethernet-ring aps detail (EX2300 and EX3400 Switches) on page 1782</a></p>
<b>Output Fields</b>	<a href="#">Table 185 on page 1780</a> lists the output fields for the <b>show protection-group ethernet-ring aps</b> command. Output fields are listed in the approximate order in which they appear.

Table 185: show protection-group ethernet-ring aps Output Fields

Field Name	Field Description
<b>Ethernet Ring</b>	Name configured for the Ethernet ring.
<b>Request/State</b>	<p>Status of the Ethernet ring RAPS messages.</p> <ul style="list-style-type: none"> <li><b>NR</b>—Indicates that there is no request for APS on the ring.</li> <li><b>SF</b>—Indicates that there is a signal failure on the ring.</li> <li><b>FS</b>—Indicates that there are active forced-switch requests in the ring.</li> <li><b>MS</b>—Indicates that there are active manual-switch requests in the ring.</li> </ul> <p><b>NOTE:</b> Both <b>FS</b> and <b>MS</b> values are valid only when G.8032v2 is supported.</p>
<b>Ring Protection Link Blocked</b>	Blocking on the ring protection link: <b>Yes</b> or <b>No</b> .
<b>No Flush</b>	Indicates the value of the Do Not Flush (DNF) flag in the received RAPS PDU. If the value is Yes, then FDB flush is not triggered as part of processing of the received RAPS PDU.
<b>Blocked Port Reference</b>	This parameter is the reference to the blocked ring port. If the east ring port is blocked, the Blocked Port Reference (BPR) value is 0. If the west ring port is blocked, the BPR value is 1. If both ring ports are blocked, this parameter can take any value. If both east and west ports are blocked or not blocked, the value would be 0. This field is valid only when G.8032v2 is supported.
<b>Blocked Port Reference</b>	Reference of the ring port on which traffic is blocked.
<b>Originator</b>	Indicates whether the node is the originator of the RAPS messages.
<b>Remote Node ID</b>	Identifier (in MAC address format) of the remote node.

## Sample Output

### show protection-group ethernet-ring aps (EX Switches)

```
user@switch>show protection-group ethernet-ring aps
```

Ring Name	Request/state	No Flush	RPL Blocked	Originator	Remote Node ID
erp1	NR	No	Yes	No	00:1F:12:30:B8:81

## Sample Output

### show protection-group ethernet-ring aps (Owner Node, Normal Operation on ACX and MX Routers)

```
user@host> show protection-group ethernet-ring aps
```

Ethernet Ring	Request/state	RPL Blocked	No Flush	BPR	Originator	Remote Node ID
erp1	NR	No	No	0	No	00:1F:12:30:B8:81

Erp_1	NR	Yes	No	1	No
00:00:00:02:00:01					

## Sample Output

### show protection-group ethernet-ring aps detail (Owner Node, Normal Operation on ACX and MX Routers)

```

## show protection-group ethernet-ring configuration

<b>Syntax</b>	<b>show protection-group ethernet-ring configuration</b>
<b>Release Information</b>	Command introduced in Junos OS Release 12.1 for EX Series switches. Command introduced in Junos OS Release 14.1 for MX Series routers. Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.
<b>Description</b>	Display the configuration of Ethernet ring protection group on EX Switches and MX Series routers.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show protection-group ethernet-ring aps on page 1779</a></li> <li>• <a href="#">show protection-group ethernet-ring data-channel on page 1790</a></li> <li>• <a href="#">show protection-group ethernet-ring interface on page 1795</a></li> <li>• <a href="#">show protection-group ethernet-ring node-state on page 1799</a></li> <li>• <a href="#">show protection-group ethernet-ring statistics on page 1804</a></li> <li>• <a href="#">show protection-group ethernet-ring vlan on page 1810</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show protection-group ethernet-ring configuration (EX Switch) on page 1785</a> <a href="#">show protection-group ethernet-ring configuration detail (MX Series Router) on page 1786</a> <a href="#">show protection-group ethernet-ring configuration (MX Series Router) on page 1786</a> <a href="#">show protection-group ethernet-ring configuration detail (MX Series Router) on page 1786</a> <a href="#">show protection-group ethernet-ring configuration detail (MX Series Router) on page 1787</a> <a href="#">show protection-group ethernet-ring configuration (MX Series Router) on page 1787</a> <a href="#">show protection-group ethernet-ring configuration detail (MX Series Router) on page 1788</a>
<b>Output Fields</b>	<a href="#">Table 186 on page 1783</a> lists the output fields for the <b>show protection-group ethernet-ring configuration</b> command. Output fields are listed in the approximate order in which they appear.

*Table 186: show protection-group ethernet-ring configuration Output Fields*

Output Fields	Field Description
<b>G8032 Compatability Version</b>	This is the compatibility version mode of ERP. This parameter always takes the value 1 in the case of G8032v1. This parameter is valid only for MX Series routers.
<b>East Interface</b>	One of the two switch interfaces that participates in a ring link. When Junos supports G8032v2, this interface is treated as interface 0.
<b>West Interface</b>	One of the two interfaces in a switch that participates in a ring link. When Junos supports G8032v2, this interface is treated as interface 1.

Table 186: show protection-group ethernet-ring configuration Output Fields (continued)

Output Fields	Field Description
<b>Restore Interval</b>	<p>Configured interval of wait time after a link is restored. When a link goes down, the RPL link is activated. When the down link becomes active again, the RPL owner receives a notification. The RPL owner waits for the restore interval before issuing a block on the RPL link. The configured restore interval can be 5 through 12 minutes for ERIPv1 and 1 through 12 minutes for ERIPv2. This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value.</p> <p><b>NOTE:</b> Wait to Restore (WTR) configuration values on EX2300 and EX3400 switches must be 5-12 minutes.</p>
<b>Wait to Block Interval</b>	<p>Configured interval of wait time for link restoration when a manual command (manual switch or force switch) is cleared. On clearing the manual command, the RPL owner receives NR messages, which starts a timer with interval 'Wait to Block' to restore the RPL link after its expiration. This delay timer is set to be 5 seconds longer than the guard timer. The configured number can be from 5 seconds through 10 seconds. The parameter is valid only for G.8032v2.</p> <p><b>NOTE:</b> The Wait To Block Timer (WTB) is always disabled on EX2300 and EX3400 switches because it is not supported in ERPSv1. Any configuration you make to the WTB setting has no effect. The output from the CLI command 'show protection-group ethernet-ring node-state detail' lists a WTB setting but that setting has no effect.</p>
<b>Guard Interval</b>	<p>Configured number of milliseconds (in 10 millisecond intervals, 10 milliseconds through 2000 milliseconds) that the node does not process any Ethernet ring protection protocol data units (PDUs). This configuration is a global configuration and applies to all Ethernet rings if the Ethernet ring does not have a more specific configuration for this value. If no parameter is configured at the protection group level, the global configuration of this parameter uses the default value.</p>
<b>Hold off interval</b>	<p>This is the interval at which the link is held down even before declaring that the link is down. Because the parameter is not supported at present, its value is always considered 0. This parameter is valid only for MX Series routers.</p>
<b>Node ID</b>	<p>Node ID for the switch or router. If the node ID is not configured, it is assigned by default. For EX Series switches, the Node ID value cannot be configured, whereas for MX Series routers, it can be configured.</p>
<b>Ring ID</b>	<p>In G8032v2, the ring ID can be within the range 1–239. All the nodes in a ring should have the same ring ID. In the case of G8032v1, the value of the ring ID is always 1. This parameter is valid only for MX Series routers.</p>
<b>Node Role</b>	<p>Indicates whether the ring node is operating as a normal ring-node or RPL-owner or RPL-neighbor. For G8032v1 RPL-neighbor role is not supported. This parameter is valid only for MX Series routers.</p>

Table 186: show protection-group ethernet-ring configuration Output Fields (continued)

Output Fields	Field Description
<b>Revertive Mode of Operation</b>	This parameter indicates whether the ring is operating in revertive mode or nonrevertive mode. In nonrevertive mode of operation, when all links in the ring and Ethernet Ring Nodes have recovered and no external requests are active, the Ethernet Ring does not automatically revert. G8032v1 supports only revertive mode of operation. This parameter is valid only for MX Series routers.
<b>RAPS Tx Dot1p priority</b>	The RAPS Tx Dot1p priority is a parameter with which the RAPS is transmitted from the ring node. For G8032v1, the value of this parameter is always 0. For G8032v2, the value of this parameter can be within the range 0–7. This parameter is valid only for MX Series routers.
<b>Node type</b>	Indicates whether ring node is a normal ring node having two ring-links or a open ring-node having only a single ring-link or a interconnection ring-node. An interconnection ring node can be connected to major ring in non virtual-channel mode or in virtual channel mode. Ring interconnection is not supported for G8032v1. This parameter is valid only for MX Series routers.
<b>Major ring name</b>	If the node type is interconnection in the ring, this parameter takes the name of the major ring to which the sub-ring node is connected. This parameter is valid only for MX Series routers.
<b>Interconnection mode</b>	Indicates the interconnection mode if the type of the node is interconnection. An interconnection ring node can be connected to major ring in non-virtual channel mode or in virtual channel mode. This parameter is valid only for MX Series routers.
<b>Propagate Topology Change event</b>	When Propagate Topology Change event is set to 1, the change in the topology of sub-ring is propagated to the major ring, enabling the transmission of EVENT FLUSH RAPS PDU in the major ring. When the parameter is set to 0, the topology change in the sub-ring is not propagated to the major ring blocking EVENT FLUSH RAPS PDU transmission in the major ring. This parameter is valid only for MX Series routers.
<b>Control Vlan</b>	The VLAN that transfers ERP PDUs from one node to another.
<b>Physical Ring</b>	Physical ring if the east and west interfaces are nontrunk ports. For MX Series routers, the ring is termed a physical ring if no data channels are defined for the ring and the entire physical port forwarding is controlled by ERP.
<b>Data Channel VLAN(s)</b>	Data VLANs for which forwarding behavior is controlled by the ring instance.

## Sample Output

### show protection-group ethernet-ring configuration (EX Switch)

```

user@switch>show protection-group ethernet-ring configuration

Ethernet ring configuration parameters for protection group erp1

## show protection-group ethernet-ring data-channel

<b>Syntax</b>	<pre>show protection-group ethernet-ring data-channel &lt;brief   detail&gt; &lt;group-name group-name&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 10.2.</p> <p>Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.</p>
<b>Description</b>	Display the configuration of Ethernet ring protection group on EX Switches and MX Series routers.
<b>Options</b>	<p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>group-name</b>—(Optional) Protection group for which to display statistics. If you omit this optional field, all protection group statistics for configured groups will be displayed.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show protection-group ethernet-ring aps on page 1779</a></li> <li>• <a href="#">show protection-group ethernet-ring interface on page 1795</a></li> <li>• <a href="#">show protection-group ethernet-ring node-state on page 1799</a></li> <li>• <a href="#">show protection-group ethernet-ring statistics on page 1804</a></li> <li>• <a href="#">show protection-group ethernet-ring vlan on page 1810</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show protection-group ethernet-ring data-channel on page 1791</a></p> <p><a href="#">show protection-group ethernet-ring data-channel detail on page 1791</a></p> <p><a href="#">show protection-group ethernet-ring data-channel detail (EX2300 and EX3400 Switches) on page 1792</a></p>
<b>Output Fields</b>	<p><a href="#">Table 187 on page 1790</a> lists the output fields for the <b>show protection-group ethernet-ring data-channel</b> command. Output fields are listed in the approximate order in which they appear.</p>

*Table 187: show protection-group ethernet-ring data-channel Output Fields*

Field Name	Field Description
Interface	Name of the interface configured for the Ethernet ring.

*Table 187: show protection-group ethernet-ring data-channel Output Fields (continued)*

Field Name	Field Description
<b>STP Index</b>	The Spanning Tree Protocol (STP) index number used by each interface in an Ethernet ring. The STP index controls the forwarding behavior for a set of VLANs on a data channel on an Ethernet ring port. For multiple Ethernet ring instances on an physical ring port, there are multiple STP index numbers. Different ring instances will have different STP index numbers and may have different forwarding behavior.
<b>Forward State</b>	Forwarding state on the Ethernet ring. <ul style="list-style-type: none"> <li>• <b>forwarding</b>—Indicates packets are being forwarded.</li> <li>• <b>discarding</b>—Indicates packets are being discarded.</li> </ul>

## Sample Output

### show protection-group ethernet-ring data-channel

```

user@host> show protection-group ethernet-ring data-channel
Ethernet ring data channel information for protection group pg301

Interface STP index Forward State
xe-5/0/2 78 forwarding
xe-2/2/0 79 discarding

Ethernet ring data channel parameters for protection group pg302

Interface STP index Forward State
xe-5/0/2 80 forwarding
xe-2/2/0 81 forwarding

```

### show protection-group ethernet-ring data-channel detail

```

user@host> show protection-group ethernet-ring data-channel detail
Ethernet ring data channel parameters for protection group pg301

Interface name : xe-5/0/2
STP index : 78
Forward State : forwarding

Interface name : xe-2/2/0
STP index : 79
Forward State : discarding

Ethernet ring data channel parameters for protection group pg302

Interface name : xe-5/0/2
STP index : 80
Forward State : forwarding

Interface name : xe-2/2/0

```

STP index	: 81
Forward State	: forwarding

#### show protection-group ethernet-ring data-channel detail (EX2300 and EX3400 Switches)

```
user@switch>show protection-group ethernet-ring data-channel detail
```

Ethernet ring data channel parameters for protection group pg1001

Interface name	: ge-0/0/42
STP index	: 52
Forward State	: discarding

Interface name	: ge-0/0/38
STP index	: 53
Forward State	: forwarding

## show protection-group ethernet-ring flush-info

<b>Syntax</b>	<code>show protection-group ethernet-ring flush-info</code>
<b>Release Information</b>	Command introduced in Junos OS Release 14.2.
<b>Description</b>	Display information about flush ports in an Ethernet ring.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show protection-group ethernet-ring data-channel on page 1790</a></li> <li>• <a href="#">show protection-group ethernet-ring aps on page 1779</a></li> <li>• <a href="#">show protection-group ethernet-ring node-state on page 1799</a></li> <li>• <a href="#">show protection-group ethernet-ring statistics on page 1804</a></li> <li>• <a href="#">show protection-group ethernet-ring vlan on page 1810</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show protection-group ethernet-ring flush-info (ACX and MX Series Routers) on page 1794</a> <a href="#">show protection-group ethernet-ring flush-info detail (ACX and MX Series Routers) on page 1794</a>
<b>Output Fields</b>	<p><a href="#">Table 188 on page 1793</a> lists the output fields for the <b>show protection-group ethernet-ring flush-info</b> command. Output fields are listed in the approximate order in which they appear.</p>

*Table 188: show protection-group ethernet-ring flush-info Output Fields*

Field Name	Field Description
<b>Interface</b>	Physical interface configured for the Ethernet ring. This can be an aggregated Ethernet link also.
<b>Originating Node</b>	Node from which RAPS protocol data units originates on the Ethernet Ring.
<b>Blocked Port Reference</b>	Reference of the ring port on which traffic is blocked.

## Sample Output

### show protection-group ethernet-ring flush-info (ACX and MX Series Routers)

```
user@host> show protection-group ethernet-ring flush-info

Ethernet ring flush port information for protection group pg100

Interface Originating Node Blocked Port Reference
xe-5/0/2.4001 00:00:00:00:00:00 0
xe-2/2/0.4001 00:00:00:00:00:00 0
```

### show protection-group ethernet-ring flush-info detail (ACX and MX Series Routers)

```
user@host> show protection-group ethernet-ring flush-info detail

Ethernet ring flush port information for protection group pg100

Interface name : xe-5/0/2.4001
Originating Node : 00:00:00:00:00:00
Blocked Port Reference : 0

Interface name : xe-2/2/0.4001
Originating Node : 00:00:00:00:00:00
Blocked Port Reference : 0
```

## show protection-group ethernet-ring interface

<b>Syntax</b>	<b>show protection-group ethernet-ring interface</b>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.4.</p> <p>Command introduced in Junos OS Release 12.3X54 for ACX Series routers.</p> <p>Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.</p>
<b>Description</b>	Displays the status of the Automatic Protection Switching (APS) interfaces on an Ethernet ring.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show protection-group ethernet-ring data-channel on page 1790</a></li> <li>• <a href="#">show protection-group ethernet-ring aps on page 1779</a></li> <li>• <a href="#">show protection-group ethernet-ring node-state on page 1799</a></li> <li>• <a href="#">show protection-group ethernet-ring statistics on page 1804</a></li> <li>• <a href="#">show protection-group ethernet-ring vlan on page 1810</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show protection-group ethernet-ring interface (EX Series Switch Owner Node) on page 1796</a></p> <p><a href="#">show protection-group ethernet-ring interface (Owner Node MX Series Router ) on page 1796</a></p> <p><a href="#">show protection-group ethernet-ring interface detail (Owner Node MX Series Router ) on page 1796</a></p> <p><a href="#">show protection-group ethernet-ring interface (EX Series Switch Ring Node) on page 1797</a></p> <p><a href="#">show protection-group ethernet-ring interface detail (ACX Series and MX Series) on page 1797</a></p> <p><a href="#">show protection-group ethernet-ring interface detail (EX2300 and EX3400 Switches) on page 1797</a></p> <p><a href="#">show protection-group ethernet-ring interface detail (EX2300 and EX3400 Switches) on page 1798</a></p>
<b>Output Fields</b>	<p><a href="#">Table 189 on page 1796</a> lists the output fields for both the EX Series switch, and the ACX Series and MX Series router <b>show protection-group ethernet-ring interface</b> commands. Output fields are listed in the approximate order in which they appear.</p>

*Table 189: MX Series Routers show protection-group ethernet-ring interface Output Fields*

Field Name	Field Description
Ethernet ring port parameters for protection group <i>group-name</i>	Output is organized by configured protection group.
Interface	Physical interfaces configured for the Ethernet ring. This can be an aggregated Ethernet link also.
Control Channel	(MX Series router only) Logical unit configured on the physical interface.
Direction	Direction of the traffic.
Forward State	State of the ring forwarding on the interface: <b>discarding</b> or <b>forwarding</b> .
Ring Protection Link End	Whether this interface is the end of the ring: <b>Yes</b> or <b>No</b> .
Signal Failure	Whether there a signal failure exists on the link: <b>Clear</b> or <b>Set</b> .
Admin State	State of the interface: For EX switches, <b>ready</b> , <b>ifl ready</b> , or <b>waiting</b> . For MX routers, <b>IFF ready</b> or <b>IFF disabled</b> .

## Sample Output

### show protection-group ethernet-ring interface (EX Series Switch Owner Node)

```
user@host> show protection-group ethernet-ring interface
Ethernet ring port parameters for protection group pg101
```

Interface	Forward State	RPL End	Signal Failure	Admin State
ge-0/0/3.0	discarding	Yes	Clear	ready
ge-0/0/9.0	forwarding	No	Clear	ready

### show protection-group ethernet-ring interface (Owner Node MX Series Router )

```
user@host> show protection-group ethernet-ring interface
Ethernet ring port parameters for protection group pg101
```

Interface	Control Channel	Direction	Forward State	RPL End	SF	Admin State
ge-1/2/0	ge-1/2/0.100	east	forwarding	No	Clear	IFF ready
ge-1/2/2	ge-1/2/2.100	west	forwarding	No	Clear	IFF ready

### show protection-group ethernet-ring interface detail (Owner Node MX Series Router )

```

```

Ethernet ring port parameters for protection group pg101

```
Interface name : ge-1/2/0
Control channel name : ge-1/2/0.100
Interface direction : east
Ring Protection Link End : No
Signal Failure : Clear
Forward State : forwarding
Interface Admin State : IFF ready
```

```
Interface name : ge-1/2/2
Control channel name : ge-1/2/2.100
Interface direction : west
Ring Protection Link End : No
Signal Failure : Clear
Forward State : forwarding
Interface Admin State : IFF ready
```

### show protection-group ethernet-ring interface (EX Series Switch Ring Node)

```
user@host> show protection-group ethernet-ring interface
```

Ethernet ring port parameters for protection group pg102

Ethernet ring port parameters for protection group pg101

Interface	Forward State	RPL End	Signal Failure	Admin State
ge-0/0/3.0	discarding	Yes	Clear	ready
ge-0/0/9.0	forwarding	No	Clear	ready

### show protection-group ethernet-ring interface detail (ACX Series and MX Series)

```
user@host> show protection-group ethernet-ring interface detail
```

Ethernet ring port parameters for protection group Erp\_1

```
Interface name : xe-0/0/0
Control channel name : xe-0/0/0.1
Interface direction : east
Ring Protection Link End : No
Signal Failure : Clear
Forward State : forwarding
Interface Admin State : IFF ready
```

```
Interface name : et-0/0/48
Control channel name : et-0/0/48.1
Interface direction : west
Ring Protection Link End : No
Signal Failure : Clear
Forward State : forwarding
Interface Admin State : IFF ready
```

### show protection-group ethernet-ring interface detail (EX2300 and EX3400 Switches)

```
user@switch> show protection-group ethernet-ring interface detail
```

## Ethernet ring port parameters for protection group pg1001

Interface name	: ge-0/0/14
Control channel name	: ge-0/0/14.0
Interface direction	: east
Ring Protection Link End	: No
Signal Failure	: Clear
Forward State	: forwarding
Interface Admin State	: IFF ready

Interface Admin State	: IFF ready

## show protection-group ethernet-ring node-state

<b>Syntax</b>	<b>show protection-group ethernet-ring node-state</b>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.4 for MX Series routers.</p> <p>Command introduced in Junos OS Release 12.1 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.3X54 for ACX Series routers.</p> <p>Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.</p>
<b>Description</b>	Display the status of the Automatic Protection Switching (APS) nodes on an Ethernet ring.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show protection-group ethernet-ring data-channel on page 1790</a></li> <li>• <a href="#">show protection-group ethernet-ring aps on page 1779</a></li> <li>• <a href="#">show protection-group ethernet-ring interface on page 1795</a></li> <li>• <a href="#">show protection-group ethernet-ring statistics on page 1804</a></li> <li>• <a href="#">show protection-group ethernet-ring vlan on page 1810</a></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">show protection-group ethernet-ring node-state (MX Series Router - RPL Owner Node, Normal Operation) on page 1801</a></p> <p><a href="#">show protection-group ethernet-ring node-state (MX Series Router - Normal Ring Node, Normal Operation) on page 1801</a></p> <p><a href="#">show protection-group ethernet-ring node-state (MX Series Router - RPL Owner Node, Remote Failure Condition) on page 1801</a></p> <p><a href="#">show protection-group ethernet-ring node-state detail (ACX Series and MX Series Router) on page 1801</a></p> <p><a href="#">show protection-group ethernet-ring node-state detail (MX Series Router - RPL Owner Node, Normal Operation) on page 1802</a></p> <p><a href="#">show protection-group ethernet-ring node-state detail (MX Series Router with WTR Timer) on page 1802</a></p> <p><a href="#">show protection-group ethernet-ring node-state detail (MX Series Router with WTB Timer) on page 1802</a></p> <p><a href="#">show protection-group ethernet-ring node-state detail (EX2300 and EX3400 Switches) on page 1803</a></p>
<b>Output Fields</b>	<a href="#">Table 190 on page 1800</a> lists the output fields for the <b>show protection-group ethernet-ring node-state</b> command. Output fields are listed in the approximate order in which they appear.

Table 190: show protection-group ethernet-ring node-state Output Fields

Field Name	Field Description
Ring Name/Ethernet Ring	Name configured for the Ethernet ring.
APS State	<p>State of the Ethernet ring APS.</p> <ul style="list-style-type: none"> <li>• <b>idle</b>—Indicates that the ring is working in normal condition and there is no active or pending protection-switching request in the ring. When the ring is in idle state, it is blocked at the RPL link.</li> <li>• <b>protected</b>—Indicates that there is a protection switch on the ring because of a signal failure condition on the ring link.</li> <li>• <b>MS</b>—Indicates that the manual switch command is active in the ring.</li> <li>• <b>FS</b>—Indicates that the forced switch command is active in the ring.</li> <li>• <b>pending</b>—Indicates that the ring is in pending state.</li> </ul>
Event	<p>Events on the ring.</p> <ul style="list-style-type: none"> <li>• <b>NR-RB</b>—Indicates that there is no APS request and the ring link is blocked on the ring owner node.</li> <li>• <b>NR</b>—Indicates that there is no APS request pending in the ring.</li> <li>• <b>local SF</b>—Indicates that there is signal failure on one or both of the ring links of the node.</li> <li>• <b>remote SF</b>—Indicates that there is signal failure on one or more ring links of any other node of the ring.</li> <li>• <b>local FS</b>—Indicates that there is a forced switched command active on one or both of the ring links of the node.</li> <li>• <b>remote FS</b>—Indicates that there is a forced switch command active on one or more ring links of any other node of the ring.</li> <li>• <b>local MS</b>—Indicates that there is a manual switch command active on one of the ring links of the node.</li> <li>• <b>remote MS</b>—Indicates that there is a manual switch command active on one or more ring links of any other node of the ring.</li> <li>• <b>WTR running</b>—Indicates that the wait to restore timer is running on the RPL owner.</li> <li>• <b>WTB running</b>—Indicates that the wait to block timer is running on the RPL owner.</li> </ul>
RPL Owner / Ring Protection Link Owner	Whether this node is the ring owner: <b>Yes</b> or <b>No</b> .
WTR Timer / Restore Timer	Restoration timer: <b>running</b> or <b>disabled</b> .
WTB Timer / Wait to block timer	<p>Wait to block timer: <b>running</b> or <b>disabled</b>.</p> <p><b>NOTE:</b> The Wait To Block Timer (WTB) is always disabled on EX2300 and EX3400 switches because it is not supported in ERPSv1. Any configuration you make to the WTB setting has no effect. The output from the CLI command 'show protection-group ethernet-ring node-state detail' lists a WTB setting but that setting has no effect.</p>

Table 190: show protection-group ethernet-ring node-state Output Fields (continued)

Field Name	Field Description
Wait to block timer (WTB Timer)	Wait to block interval.  <b>NOTE:</b> The Wait To Block Timer (WTB) is always disabled on EX2300 and EX3400 switches because it is not supported in ERPSv1. Any configuration you make to the WTB setting has no effect. The output from the CLI command 'show protection-group ethernet-ring node-state detail' lists a WTB setting but that setting has no effect.
Guard Timer	Guard timer: <b>running</b> or <b>disabled</b> .
Op State / Operational State	State of the node: <b>Operational</b> or <b>any internal wait state</b> .

## Sample Output

### show protection-group ethernet-ring node-state (MX Series Router - RPL Owner Node, Normal Operation)

```
user@host> show protection-group ethernet-ring node-state
```

Ethernet ring	APS State	Event	RPL Owner	WTR Timer	WTB Timer	Guard
pg101	idle	NR-RB	Yes	disabled	disabled	disabled
operational						
pg102	idle	NR-RB	No	disabled	disabled	disabled
operational						

### show protection-group ethernet-ring node-state (MX Series Router - Normal Ring Node, Normal Operation)

```
user@host> show protection-group ethernet-ring node-state
```

Ethernet ring	APS State	Event	RPL Owner
pg102	idle	NR-RB	No

WTR Timer	WTB Timer	Guard Timer	Operation state
disabled	disabled	disabled	operational

### show protection-group ethernet-ring node-state (MX Series Router - RPL Owner Node, Remote Failure Condition)

```
user@host> show protection-group ethernet-ring node-state
```

Ethernet ring	APS State	Event	RPL Owner
pg101	protected	remote SF	Yes

WTR Timer	WTB Timer	Guard Timer	Operation state
disabled	disabled	disabled	operational

### show protection-group ethernet-ring node-state detail (ACX Series and MX Series Router)

```
user@host> show protection-group ethernet-ring node-state detail
```

Ethernet-Ring name	: Erp_1
APS State	: idle
Event	: NR-RB

```

Ring Protection Link Owner : No
Wait to Restore Timer : disabled
Wait to Block Timer : disabled
Guard Timer : disabled
Operation state : operational

```

#### show protection-group ethernet-ring node-state detail (MX Series Router - RPL Owner Node, Normal Operation)

```
user@host> show protection-group ethernet-ring node-state detail
```

```

Ethernet-Ring name : pg101
APS State : idle

<b>Output Fields</b>	Table 191 on page 1805 lists the output fields for the <b>show protection-group ethernet-ring statistics</b> command.

*Table 191: show protection-group ethernet-ring statistics Output Fields*

Field Name	Field Description
<b>Ethernet Ring Statistics for PG</b>	Name of the protection group for which statistics are displayed.
<b>RAPS event sent</b>	Number of times Ring Automatic Protection Switching (RAPS) message transmission event occurred locally. This field is applicable only to MX Series routers.
<b>RAPS event received</b>	Number of RAPS messages received and processed by ERP state-machine and which resulted in state transition. This field is applicable only to MX Series routers.
<b>Local SF</b>	Number of times a signal failure has occurred locally.
<b>Remote SF</b>	Number of times a signal failure has occurred anywhere else on the ring.
<b>NR event</b>	Number of times a No Request event has occurred on the ring. This field is applicable only to EX Series switches.
<b>NR event sent</b>	Number of times a No Request event has occurred locally. This field is applicable only to MX Series routers.
<b>NR event received</b>	Number of times a No Request event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.
<b>NR-RB event</b>	Number of times a No Request, Ring Blocked event has occurred on the ring. This field is applicable only to EX Series switches.
<b>NR-RB event sent</b>	Number of times a No Request, Ring Blocked event has occurred locally. This field is applicable only to MX Series routers.
<b>NR-RB event received</b>	Number of times a No Request, Ring Blocked event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.
<b>Flush event sent</b>	Number of times flush-event RAPS message transmission event occurred locally. This field is applicable only to MX Series routers.
<b>Flush event received</b>	Number of flush-event RAPS messages received and processed by the ring instance control process. This field is applicable only to MX Series routers.
<b>Local FS event sent</b>	Number of times a forced switch event has occurred locally. This field is applicable only to MX Series routers.
<b>Remote FS event received</b>	Number of times a forced switch event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.
<b>Local MS event sent</b>	Number of times a manual switch event has occurred locally. This field is applicable only to MX Series routers.

*Table 191: show protection-group ethernet-ring statistics Output Fields (continued)*

Field Name	Field Description
Remote MS event received	Number of times a manual switch event has occurred anywhere else on the ring. This field is applicable only to MX Series routers.

Table 192 on page 1806 lists the output fields for the **show protection-group ethernet-ring statistics** command when the **detail** option is used. These fields are valid only for MX Series routers.

*Table 192: show protection-group ethernet-ring statistics detail Output Fields (for MX Series Routers)*

Field Name	Field Description
Total number of FDB flush	Number of times forwarding database (FDB) flush has happened for the ring instance.
Flush-logic triggered flush	Number of times FDB flush has happened because of flush-logic based on node ID and Blocked Port Reference (BPR).
Remote RAPS PDU received	Number of valid RAPS PDU messages received. This counter counts only RAPS messages generated by other devices on the ring.
Remote RAPS dropped due to guard-timer	Number of RAPS messages dropped by the device because the guard timer is running.
Invalid remote RAPS PDU dropped	Number of RAPS messages dropped by the device because the messages are invalid.
RAPS dropped due to miscellaneous errors	Number of RAPS messages dropped because of any other reason. For example, messages dropped because of unsupported functionality.
Local received RAPS PDU dropped	Number of self-generated RAPS messages received and dropped.

## Sample Output

### show protection-group ethernet-ring statistics (EX Series Switch)

## show protection-group ethernet-ring vlan

<b>Syntax</b>	<pre>show protection-group ethernet-ring vlan &lt;brief   detail&gt; &lt;group-name group-name&gt;</pre>				
<b>Release Information</b>	<p>Command introduced in Junos OS Release 10.2.</p> <p>Command introduced in Junos OS Release 18.1 for EX2300 and EX3400 switches.</p>				
<b>Description</b>	On MX Series routers, display all data channel logical interfaces and the VLAN IDs controlled by a ring instance data channel.				
<b>Options</b>	<p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>group-name</b>—(Optional) Protection group for which to display details such as data channel interfaces, vlan, and bridge-domain. If you omit this optional field, details for all configured protection groups will be displayed.</p>				
<b>Required Privilege Level</b>	view				
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show protection-group ethernet-ring aps on page 1779</a></li> <li>• <a href="#">show protection-group ethernet-ring data-channel on page 1790</a></li> <li>• <a href="#">show protection-group ethernet-ring interface on page 1795</a></li> <li>• <a href="#">show protection-group ethernet-ring node-state on page 1799</a></li> <li>• <a href="#">show protection-group ethernet-ring statistics on page 1804</a></li> </ul>				
<b>List of Sample Output</b>	<p><a href="#">show protection-group ethernet-ring vlan on page 1811</a></p> <p><a href="#">show protection-group ethernet-ring vlan brief on page 1812</a></p> <p><a href="#">show protection-group ethernet-ring vlan detail on page 1812</a></p> <p><a href="#">show protection-group ethernet-ring vlan group-name vkm01 on page 1813</a></p> <p><a href="#">show protection-group ethernet-ring vlan detail (EX2300 and EX3400 Switches) on page 1813</a></p>

Output fields are listed in the approximate order in which they appear.</p> <p><i>Table 193: show protection-group ethernet-ring vlan Output Fields</i></p> <table> <tr> <th>Field Name</th><th>Field Description</th></tr> <tr> <td>Interface</td><td>Name of the interface configured for the Ethernet protection ring.</td></tr> </table>	Field Name	Field Description	Interface	Name of the interface configured for the Ethernet protection ring.
Field Name	Field Description				
Interface	Name of the interface configured for the Ethernet protection ring.				

Table 193: show protection-group ethernet-ring vlan Output Fields (continued)

Field Name	Field Description
<b>Vlan</b>	Name of the VLAN associated with the interface configured for the Ethernet protection ring.
<b>STP Index</b>	The Spanning Tree Protocol (STP) index number used by each interface in an Ethernet ring. The STP index controls the forwarding behavior for a set of VLANs on a data channel on an Ethernet ring port. For multiple Ethernet ring instances on an physical ring port, there are multiple STP index numbers. Different ring instances will have different STP index numbers and may have different forwarding behavior.
<b>Bridge Domain</b>	Name of the bridge domain that is associated with the VLAN configured for the Ethernet protection ring.

## show security macsec statistics (MX Series)

**Syntax** show security macsec statistics  
<brief | detail>  
<interface *interface-name*>

**Release Information** Command introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers. Support for MPC7E-10G introduced in Junos OS Release 16.1R1 for MX240, MX480, and MX960 routers.

**Description** Display Media Access Control Security (MACsec) statistics.

**Options** **none**—Display MACsec statistics in brief form for all interfaces on the router.

**brief | detail**—(Optional) Display the specified level of output. Using the **brief** option is equivalent to entering the command with no options (the default). The **detail** option displays additional fields that are not visible in the **brief** output.

**NOTE:** The field names that only appear in this command output when you enter the **detail** option are mostly useful for debugging purposes by Juniper Networks support personnel.

**interface *interface-name***—(Optional) Display MACsec statistics for the specified interface only.

**Required Privilege Level** view

**List of Sample Output** [show security macsec statistics interface detail on page 1817](#)  
[show security macsec statistics \(MX480 router with MPC7E-10G\) on page 1818](#)  
[show security macsec statistics \(MX480 router with MPC7E-10G\) on page 1818](#)  
[show security macsec statistics detail \(MX480 router with MPC7E-10G\) on page 1819](#)

**Output Fields** [Table 194 on page 1815](#) lists the output fields for the **show security macsec statistics** command. Output fields are listed in the approximate order in which they appear.

The field names that appear in this command's output only when you enter the **detail** option are mostly useful for debugging purposes by Juniper Networks support personnel. Those field names are, therefore, not included in this table.

*Table 194: show security macsec statistics Output Fields*

Field Name	Field Description	Level of Output
Interface name	Name of the interface.	All levels

Table 194: show security macsec statistics Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Fields for Secure Channel transmitted</b>		
<b>Encrypted packets</b>	<p>Total number of packets transmitted out of the interface in the secure channel that were secured and encrypted using MACsec.</p> <p>Data packets are sent in the secure channel when MACsec is enabled, and are secured using a secure association key (SAK).</p>	All levels
<b>Encrypted bytes</b>	<p>Total number of bytes transmitted out of the interface in the secure channel that were secured and encrypted using MACsec.</p> <p>Data packets are sent in the secure channel when MACsec is enabled, and are secured using a secure association key (SAK).</p>	All levels
<b>Protected packets</b>	<p>Total number of packets transmitted out of the interface in the secure channel that were secured but not encrypted using MACsec.</p> <p>Data packets are sent in the secure channel when MACsec is enabled, and are secured using a secure association key (SAK).</p>	All levels
<b>Protected bytes</b>	<p>Total number of bytes transmitted out of the interface in the secure channel that were secured but not encrypted using MACsec.</p> <p>Data packets are sent in the secure channel when MACsec is enabled, and are secured using a secure association key (SAK).</p>	All levels
<b>Fields for Secure Association transmitted</b>		
<b>Encrypted packets</b>	<p>Total number of packets transmitted out of the interface in the connectivity association that were secured and encrypted using MACsec.</p> <p>The total includes the data packets transmitted in the secure channel and secured using a SAK and the control packets secured using a connectivity association key (CAK).</p>	All levels
<b>Protected packets</b>	<p>Total number of packets transmitted out of the interface in the connectivity association that were secured but not encrypted using MACsec.</p> <p>The total includes the data packets transmitted in the secure channel and secured using a SAK and the control packets secured using a connectivity association key (CAK).</p>	All levels
<b>Fields for Secure Channel received</b>		
<b>Accepted packets</b>	<p>The number of received packets that have been accepted by the secure channel on the interface. The secure channel is used to send all data plane traffic on a MACsec-enabled link.</p> <p>A packet is considered accepted for this counter when it has been received by this interface and it has passed the MACsec integrity check.</p> <p>This counter increments for traffic that is and is not encrypted using MACsec.</p>	All levels

Table 194: show security macsec statistics Output Fields (continued)

Field Name	Field Description	Level of Output
<b>Validated bytes</b>	<p>The number of bytes that have been validated by the MACsec integrity check and received on the secure channel on the interface. The secure channel is used to send all data plane traffic on a MACsec-enabled link.</p> <p>This counter does not increment when MACsec encryption is disabled.</p>	All levels
<b>Decrypted bytes</b>	<p>The number of bytes received in the secure channel on the interface that have been decrypted. The secure channel is used to send all data plane traffic on a MACsec-enabled link.</p> <p>An encrypted byte has to be decrypted before it can be received on the receiving interface. The decrypted bytes counter is incremented for received traffic that was encrypted using MACsec.</p>	All levels
<b>Fields for Secure Association received</b>		
<b>Accepted packets</b>	<p>The number of received packets that have been accepted in the connectivity association on the interface. The counter includes all control and data plane traffic accepted on the interface.</p> <p>A packet is considered accepted for this counter when it has been received by this interface and it has passed the MACsec integrity check.</p>	All levels
<b>Validated bytes</b>	<p>The number of bytes that have been validated by the MACsec integrity check and received on the connectivity association on the interface. The counter includes all control and data plane traffic accepted on the interface.</p> <p>This counter does not increment when MACsec encryption is disabled.</p>	All levels
<b>Decrypted bytes</b>	<p>The number of bytes received in the connectivity association on the interface that have been decrypted. The counter includes all control and data plane traffic accepted on the interface.</p> <p>An encrypted byte has to be decrypted before it can be received on the receiving interface. The decrypted bytes counter is incremented for received traffic that was encrypted using MACsec.</p>	All levels

## show security mka statistics (MX Series)

<b>Syntax</b>	<code>show security mka statistics</code> <code>&lt;interface <i>interface-name</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 15.1 for MX240, MX480, and MX960 routers. Support for MPC7E-10G introduced in Junos OS Release 16.1R1 for MX240, MX480, and MX960 routers.
<b>Description</b>	Display MACsec Key Agreement (MKA) protocol statistics.  The output for this command does not include statistics for MACsec data traffic. For MACsec data traffic statistics, see <i>show security macsec statistics</i> .
<b>Options</b>	<ul style="list-style-type: none"> <li><b>interface <i>interface-name</i></b>—(Optional) Display the MKA information for the specified interface only.</li> <li><b>none</b>—Display the MKA information for all interfaces.</li> </ul>
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show security mka statistics on page 1821</a> <a href="#">show security mka statistics (MX480 routers with MPC7E-10G) on page 1821</a> <a href="#">show security mka statistics (MX480 routers with MPC7E-10G) on page 1822</a>
<b>Output Fields</b>	<a href="#">Table 195 on page 1820</a> lists the output fields for the <b>show security mka statistics</b> command. Output fields are listed in the approximate order in which they appear.

*Table 195: show security mka statistics Output Fields*

Field Name	Field Description
<b>Received packets</b>	<p>Number of received MKA control packets.</p> <p>This counter increments for received MKA control packets only. This counter does not increment when data packets are received.</p>
<b>Transmitted packets</b>	<p>Number of transmitted MKA packets</p> <p>This counter increments for transmitted MKA control packets only. This counter does not increment when data packets are transmitted.</p>
<b>Version mismatch packets</b>	Number of version mismatch packets.
<b>CAK mismatch packets</b>	<p>Number of Connectivity Association Key (CAK) mismatch packets.</p> <p>This counter increments when the connectivity association key (CAK) and connectivity association key name (CKN), which are user-configured values that have to match to enable MACsec, do not match for an MKA control packet.</p>

Table 195: show security mka statistics Output Fields (continued)

Field Name	Field Description
ICV mismatch packets	Number of ICV mismatched packets.  This counter increments when the connectivity association key (CAK) value does not match on both ends of a MACsec-secured Ethernet link.
Duplicate message identifier packets	Number of duplicate message identifier packets.
Duplicate message number packets	Number of duplicate message number packets.
Duplicate address packets	Number of duplicate source MAC address packets.
Invalid destination address packets	Number of invalid destination MAC address packets.
Formatting error packets	Number of formatting error packets.
Old Replayed message number packets	Number of old replayed message number packets.

## Sample Output

### show security mka statistics

```
user@host> show security mka statistics
```

```

Received packets: 1525844
Transmitted packets: 1525841
Version mismatch packets: 0
CAK mismatch packets: 0
ICV mismatch packets: 0
Duplicate message identifier packets: 0
Duplicate message number packets: 0
Duplicate address packets: 0
Invalid destination address packets: 0
Formatting error packets: 0
Old Replayed message number packets: 0
```

### show security mka statistics (MX480 routers with MPC7E-10G)

```
user@host> show security mka statistics
```

```

Interface name: xe-4/0/18
Received packets: 73009
Transmitted packets: 73011
Version mismatch packets: 0
CAK mismatch packets: 1
ICV mismatch packets: 0
Duplicate message identifier packets: 0
Duplicate message number packets: 0
Duplicate address packets: 0
Invalid destination address packets: 0
```

```
Formatting error packets: 0
Old Replayed message number packets: 0
```

#### show security mka statistics (MX480 routers with MPC7E-10G)

```
user@host> show security mka statistics interface xe-1/0/7
```

```
Received packets: 179211
 Transmitted packets: 179186
 Version mismatch packets: 0
 CAK mismatch packets: 0
 ICV mismatch packets: 0
 Duplicate message identifier packets: 0
 Duplicate message number packets: 0
 Duplicate address packets: 0
 Invalid destination address packets: 0
 Formatting error packets: 0
 Old Replayed message number packets: 0
```

## traceroute ethernet

<b>Syntax</b>	<pre> traceroute ethernet local-mep <i>mep-id</i> maintenance-association <i>ma-name</i> maintenance-domain <i>md-name</i> &lt;ttl <i>value</i>&gt; &lt;wait <i>seconds</i>&gt; <i>mac-address</i>   <i>mep-id</i> &lt;detail&gt; </pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.0.</p> <p><b>mep-id</b> option introduced in Junos OS Release 9.1.</p> <p><b>local-mep</b> option introduced in Junos OS Release 15.1</p>
<b>Description</b>	<p>Triggers the linktrace protocol to trace the route between two maintenance points. The result of the traceroute protocol is stored in the path database. To display the path database, use the <b>show oam ethernet connectivity-fault-management path-database</b> command.</p> <p>Before using the traceroute command, you can verify the remote MEP's MAC address using the <b>show oam ethernet connectivity-fault-management path-database</b> command.</p>
<b>Options</b>	<p><b>local-mep <i>mep-id</i></b>—(Required when multiple MEPs are configured) Identifier for the local maintenance endpoint.</p> <p><b>detail</b>—(Optional) Provide detailed information of the responder hostname, ingress port name, egress port name, TTL, and relay action.</p> <p><b>mac-address</b>—Destination unicast MAC address of the remote maintenance point.</p> <p><b>mep-id</b>—MEP identifier of the remote maintenance point. The range of values is 1 through 8191.</p> <p><b>maintenance-association <i>ma-name</i></b>—Specifies an existing maintenance association from the set of configured maintenance associations.</p> <p><b>maintenance-domain <i>md-name</i></b>—Specifies an existing maintenance domain from the set of configured maintenance domains.</p> <p><b>ttl <i>value</i></b>—Number of hops to use in the linktrace request. The range is 1 to 255 hops. The default is 4.</p> <p><b>wait <i>seconds</i></b>—(Optional) Maximum time to wait for a response to the traceroute request. The range is 1 to 255 seconds. The default is 5.</p>
<b>Required Privilege Level</b>	network

List of Sample Output [traceroute ethernet on page 1825](#)  
[traceroute ethernet detail on page 1825](#)

**Output Fields** [Table 196 on page 1824](#) lists the output fields for the **traceroute ethernet** command. Output fields are listed in the approximate order in which they appear.

*Table 196: traceroute ethernet Output Fields*

Field Name	Field Description
<b>Linktrace to</b>	MAC address of the destination maintenance point.
<b>Interface</b>	Local interface used to send the linktrace message (LTM).
<b>Maintenance Domain</b>	Maintenance domain specified in the traceroute command.
<b>Level</b>	Maintenance domain level configured.
<b>Maintenance Association</b>	Maintenance association specified in the traceroute command.
<b>Local Mep</b>	The local maintenance end point identifier.
<b>Transaction Identifier</b>	4-byte identifier maintained by the MEP. Each LTM uses a transaction identifier. The transaction identifier is maintained globally across all Maintenance Domains. Use the transaction identifier to match an incoming linktrace response (LTR), with a previously sent LTM.
<b>Hop</b>	Sequential hop count of the linktrace path.
<b>TTL</b>	Number of hops remaining in the linktrace message. The time to live (TTL) is decremented at each hop.
<b>Source MAC address</b>	MAC address of the 802.1ag node responding to the LTM or the source MAC address of the LTR.
<b>Next-hop MAC address</b>	MAC address of the egress interface of the node to which the LTM is forwarded or  the next-hop MAC address derived from the next egress identifier in the Egress-ID TLV of the LTR PDU.
<b>Responder Hostname</b>	The hostname of the responding router. A valid hostname is received only when the responding system is a Juniper Networks router.
<b>Ingress port name</b>	The port name for ingress connections.
<b>Egress port name</b>	The port name for egress connections.

*Table 196: traceroute ethernet Output Fields (continued)*

Field Name	Field Description
<b>Flags</b>	<p>The configurable flags can include:</p> <ul style="list-style-type: none"> <li>• H— Hardware only, incoming LT frame has hardware bit set.</li> <li>• T— Terminal MEP, responder is a terminating MEP.</li> <li>• F— FWD yes, LTM frame is relayed further.</li> </ul>
<b>Relay Action</b>	<p>The associated relay action. Relay action can be one of the following:</p> <ul style="list-style-type: none"> <li>• RlyHit— Relay hit; target MAC address matches the MP mac address.</li> <li>• RlyFDB— Relay FDB; output port decided by consulting forwarding database.</li> <li>• RlyMPDB— Relay MIP; output port decided by consulting MIP database.</li> </ul>

## Sample Output

### traceroute ethernet

```
user@host> traceroute ethernet maintenance-domain md1 maintenance-association ma1
00:01:02:03:04:05
```

```
Linktrace to 00:01:02:03:04:05, Interface : ge-5/0/0.0
Maintenance Domain: MD1, Level: 7
Maintenance Association: MA1, Local Mep: 1
```

Hop	TTL	Source MAC address	Next hop MAC address
Transaction Identifier:100001			
1	63	00:00:aa:aa:aa:aa	00:00:ab:ab:ab:ab
2	62	00:00:bb:bb:bb:bb	00:00:bc:bc:bc:bc
3	61	00:00:cc:cc:cc:cc	00:00:cd:cd:cd:cd
4	60	00:01:02:03:04:05	00:00:00:00:00:00

### traceroute ethernet detail

```
user@host> run traceroute ethernet maintenance-domain md6 maintenance-association ma6
mep 101 detail
```

```
Linktrace to 00:00:5E:00:53:CC, Interface : ge-1/0/0.1
Maintenance Domain: md6, Level: 6
Maintenance Association: ma6, Local Mep: 201
Transaction Identifier: 2077547465
```

#### Legend for RelayAction:

```
RlyHit -- Relay hit, Target MAC address matches the MP mac address
RlyFDB -- Relay FDB, output port decided by consulting FDB database
RlyMPDB -- Relay MIP, output port decided by consulting MIP database
```

#### Legend for Flags:

```
H -- Hardware only,incoming LT frame has hardware bit set
T -- Terminal MEP, responder is a terminating MEP
F -- FWD yes, LTM frame is relayed further
```
